- 4382 Leaves linear flat, Scape simple, Nerves of petals undivided
- 4383 Leaves cordate acuminate, Cor. funnel-shaped
- 4384 Leaves ovate acuminate, Limb of cor. campanulate
- § 1. *Flowers small. Cor. bilabiate. (AFICRA. W.)*
- 4385 Leaves spreading ovate 3 cornered, Edge and keel with short subulate teeth
- 4386 Leaves spirally trifarious spreading blackish, on the outside smooth, Stem much twisted
- 4387 Nearly stemless, Leaves multifarious green not spotted: the upper horizontal rugose
- 4388 Leaves trifarious orbicular ovate acuminate green beneath very rough, Stem erect
- 4389 Leaves trifarious ovate acute very green not warted, Stems upright simple
- 4390 Leaves polished mucronate whitish, Edges and keel cartilaginous
- 4391 Leaves cymbiform obtuse glaucous very hollow above, Suckers numerous
- 4392 Leaves equilaterally triquetrous obtuse glaucous netted above concave
- 4393 Leaves subulate thick erect recurved concave above warted beneath, Edges obscurely pearly
- 4394 Leaves 6-farious at the end retuse deltoid pale-green lined above
- 4395 Leaves ciliate spiny 5-farious deltoid cuspidate at the edge and keel ciliate spiny, Obsoletely netted below
- 4396 Proliferous, Leaves multifarious lanceolate rounded elegantly ciliated; at end with obl. pellicud spots

and Miscellaneous Particulars.

formed in this country: it was left to Ashmole, from whom it came to the university of Oxford, bearing his name. All the species are of the easiest culture, but few of them can be called beautiful. *T. virginica* is usually admitted as a border-flower.

766. *Dichorizandra*. A name contrived by Mikan, from *dis*, two, *choris*, separately, and *andros*, in botanical composition, a stamen; to express the separation of two anthers, upon which the character of the genus depends. Beautiful herbaceous stove plants, with the foliage of Commelina or Tradescantia.

767. *Agapanthus*. From *αγανθος*, to love, and *ανθος*, a flower; lovely-flower. The blossoms are of a bright agreeable blue color, and the plant itself much prized. It is nearly hardy, and cultivated without any trouble, in large pots of common earth.

768. *Blandfordia*. In compliment to George, Marquis of Blandford, son of the second Duke of Marlborough, a lover of plants, but not of honor. Beautiful New Holland liliaceous plants, very rarely seen in collections. Their flowers resemble those of *Cyrtanthus*.

769. *Hemerocallis*. From *ημερα*, the day, and *καλος*, beautiful: beautiful day-lily. This is an ornamental genus of the easiest culture. The species are remarkable among border flowers for their fine orange, yellow, or blue flowers. The *Hemerocallis carulea* has been considered a distinct genus by Mr. Salisbury, and called *Saussurea*.

770. *Aloe*. A word for which several derivations have been offered. That it has been obtained from the Arabic *alooch*, seems most probable. The genus has been divided by Mr. A. H. Haworth and others into

History, Use, Propagation, Culture,

many genera, but their opinion has not been adopted by men of science. The species consist of odd looking succulents; some of them may be classed as trees, others as shrubs, but the greater number have more the habit and appearance of evergreen herbaceous plants. One or two species are used in medicine or the arts.

A. vulgaris purpurascens, soccotrina, and arborescens, which some consider as not specifically different

- 4397 Leaves very green, Spines marginal herbaceous, Tubercles numerous  
 4398 Leaves expanded lanceolate flat above, with the edges cartilaginous thick ciliated  
 4399 Leaves erect recurved subulate all over rough, Tubercles very minute numerous and pearly  
 4400 Leaves erect recurved subulate, Tubercles above large pearly below very minute  
 4401 Leaves spreading ovate acuminate with very numerous small warts  
 4402 Leaves long oblong acuminate with middle-sized pearly warts in rows  
 4403 Dichotomous, Leaves long ovate acuminate with great pearly warts, Capsules wrinkled across  
 4404 Stemless, Lvs. ovate acum. cuspidate upw. 3-cor. keeled, Edges and keeled cren. with coarse pearly warts  
 4405 Leaves rigid spirally 5-farious ovate acuminate sparingly warted with dark-green tubercles  
 4406 Leaves spirally trifarious recurved at end covered all over with minute dark-green warts  
 4407 Lvs. multifarious cordate very hard deep-green twice keeled, with dark-green raised warts on under side

§ 2. *Flowers small. Cor. regular.*

- 4408 Leaves very spiral 5-farious ovate acum. smooth dark-green with some obscure spots beneath  
 4409 Leaves very spiral 5-farious lanc. acumin. smooth pale-green with some obscure spots beneath  
 4410 Leaves 5-farious and spiral smooth green obsolete spotted beneath

- 4411 Erect rounded, Cor. rugose, Leaves multifarious erect polished not spotted  
 4412 Leaves multifarious very short and close together orbic. ovate horizontal polished bright-green  
 4413 Stemless dichotomous, Leaves dark-green erect ovate obl. acum. mucronate  
 4414 Leaves upright straight the old ones incurved ovate-obl. abruptly acuminate with small warts  
 4415 Soboliferous, Leaves spreading ovate acute with large warts  
 4416 Leaves erect lanc. acuminate above flat and smooth barred with large warts beneath  
 4417 Leaves semi-cylindrical 3-cornered thickened upwards very rough except at base  
 4418 Leaves attenuated erect with large white warts depressed in the centre  
 4419 Stem twisted, Leaves trifarious spiral imbricated spreading ovate acute smooth  
 4420 Leaves nearly trifarious densely imbricated spreading with an obtuse recurved point  
 4421 Leaves very rigid cordate stem-clasping thick dark-green above keeled and rough, Edge rough  
 4422 Leaves rigid rounded cordate closely inflexed dark-green edged a little rough above  
 4423 Leaves spirally trifarious blackish-green equilaterally triangular very rough  
 4424 Leaves close spirally trifarious blackish quite smooth outside, Stem much branched

§ 3. *Flowers curved. (GASTERIA. Haw.)*

- 4425 Differs from *A. acinacifolia* only in having blunter points to the leaves  
 4426 Leaves lorate lanceolate with a long bristly point keeled above at the edge fringed with memb. bristles  
 4427 Leaves spirally multifarious mottled narrow linguiform obtuse with a point  
 4428 Leaves tongue-shaped smooth pointed, Flowers racemose cernuous curved  
 4429 Differs from *A. lingua* only in having broader and shorter leaves  
 4430 Smooth, Lvs. multifarious acuminate spotted deeply keeled beneath with a cartilaginous edge and keel  
 4431 Stemless, Leaves acinaciform papillose  
 4432 Leaves distichous tongue-shaped acute spotted serrated with tubercles at edge  
 4433 Leaves distichous tongue-shaped retuse with a point obscurely spotted curved to one side  
 4434 Stemless, Leaves distichous acinaciform with cartilaginous prickly edges  
 4435 Leaves exactly distichous parabolically tongue-shaped short obtuse with edges smooth upwards  
 4436 Leaves bifarious ensiform bright-green  
 4437 Leaves ensiform acute papillose distichous  
 4438 Leaves spiral multifarious shining deeply keeled at the sides obscurely spotted, Edges cartilaginous  
 4439 Lvs. bright-green multifarious spreading with white warts obtuse with a point, Edges densely cartilaginous  
 4440 Leaves oblong acute entire above towards the end swollen pellucid with darker markings

§ 4. *Flowers large. (ALOE.)*

\* *Stemless.*

- 4441 Leaves acuminate glaucous above flat smooth sparingly prickly beneath very rough  
 4442 Leaves acuminate above a little hollow very prickly all over  
 4443 Stemless, Leaves spiny ascending 3-cornered subulate  
 4444 Leaves distichous ensate lean smooth beneath white with warts running together  
 4445 Leaves oblong lanceolate green sparingly spotted, Edges with a few distant green spines  
 4446 Stem dichotomous, Leaves ensiform serrated, Stamens longer than cor.  
 4447 Stem shrubby simple, Lvs. revol. recurved narrow ensiform glauc. Warts prickly scatt. over both sides  
 4448 Leaves very green erect recurved, marginal and dorsal spines at the end red  
 4449 Leaves oblong lanceolate spiny toothed beneath white with warts, Petals unequal

\*\* *With a stem.*

- 4450 Leaves spreading ascending spiny at edge, Pedunc. branched, Branches with a double bract  
 4451 Leaves ensiform glaucous recurved at end, Marginal serratures white  
 4452 Leaves oblong ensiform somewhat spotted, Edges cernuous white with straight spines  
 4453 Leaves stem-clasping reflexed spiny at edge  
 4454 Leaves ovate ensiform glaucous deflexed covered over especially beneath with scattered spines  
 4455 Leaves oblong ensiform glaucous incurved above smooth beneath covered with scattered prickly warts

and *Miscellaneous Particulars.*

are cultivated in Barbadoes and other West India islands, to obtain the hepatic aloes, which are brought to England and used chiefly for horses. The aloes known by the name of Succotrine, is made chiefly from the species of that name, and *A. spicata*; being originally manufactured in the island of Socotra or Socotora, in the straits of Babelmandel it retains the name: this drug is lighter colored, and not so coarse as the horse or

History, Use, Propagation, Culture,

hepatic aloes. *A. spicata* is cultivated extensively at the Cape of Good Hope, and a considerable part of what is sold as coming from Socotora is from that quarter. All the medicinal aloes are grown on the poorest soil. In preparing the drug, the leaves are cut off close to the stem, then cut in pieces, and the juice expressed; this is allowed to remain at rest for forty-eight hours, during which time a feculent matter is deposited; after which the supernatant liquor is poured off into flat dishes and evaporated in the sun. At the Cape, in the month of July, the leaves are pulled, then cut into pieces, the juice expressed, and inspissated by means of heat.

The month of March is the period for cutting the aloes in the island of Barbadoes. The leaves are cut off close to the stem, and disposed in tube, in such a manner that the juice runs out. After a sufficient quantity of it is collected, it is exposed to heat in copper boilers; and as it becomes more inspissated by a constant and regular fire, it is ladled from one boiler to another, and fresh juice added, until that in the last, which is called the *teache*, acquires the consistence of honey; when it is poured into calabashes, and hardens by age. It is

- 4456 Suckers from the root, *Lvs. obl. acum. glauc. spread. cover. at side and back with very broad brown spines*  
 4457 Caulcescent, Leaves ensiform toothed mottled spreading  
 4458 Leaves ovate lanc. pale-green with obl. obsolete whitish barred spots, Spines rufous  
 4459 Leaves obl. lanc. dull green rather glaucous with obl. large transverse spots and rufous spines  
 4460 Leaves spotted, Edges and keel serrulate at end  
 4461 Leaves thick spiny at edge below spinulose appressed not dotted, Racemes in umbels  
 4462 Leaves erect broadly ovate acute, Spines marginal numerous white  
 4463 Leaves erect spreading remote ovate acute, Spines marg. few large yellow  
 4464 Leaves ovate acum. green, Edge and keel very spiny, Spines long very white  
 4465 Leaves caespitose very short glaucous 3-cornered at end, Angles with numerous white spines  
 4466 Distinguished from *A. serra* by the spines not being united at base  
 4467 Leaves acuminate above flat smooth beneath warted  
 4468 Leaves glaucous streaked, Edges obsolete toothletted
- 4469 Leaves green lined, Spines red  
 4470 Leaves very glaucous, Spines red  
 4471 Leaves lorate ensiform downward spotted with white, Marginal spines middle-sized red  
 4472 Leaves broad ensiform recurved smooth hard, Spines marginal and dorsal red at end
- 4473 Leaves tongue-shaped smooth distichous, Flowers racemose pendulous cylindrical  
 4474 Leaves trifurcous painted channelled, Angles cartilaginous  
 4475 Leaves ovate oblong attenuate spreading glaucous, The edge and keel upwards with white spines  
 4476 Caudex leafy, Leaves lorate ensiform channelled spreading green serrulate  
 4477 Glaucous polished, Leaves oblong acuminate with a deep white entire cartilaginous edge  
 4478 Leaves tufted with the spines of the edge united at base, Scape toothed  
 4479 Leaves smooth pale-green straight erect-spreading soft  
 4480 Leaves lorate lanceolate acuminate green, Edge red with many white teeth  
 4481 Stem shrubby, Leaves long-lanceolate recurved at end glaucous smooth spotted with red spines  
 4482 *Lvs. narrow sword-shaped beneath spotted with white, Spots warty scatt. Edge with minute white spines*  
 4483 Caulcescent, *Lvs. ovate acum. glaucous spreading at the edge and back spiny, Spines very broad yellow*
- 4484 Leaves lanc. scattered narrowed at base, Cor. camp. smooth inside  
 4485 Leaves scattered lanc. Cor. cernuous campanulate  
 4486 Leaves scattered lanceolate, Cor. tubular campan. Stem smooth  
 4487 Leaves nerveless whorled cuneate-lanceolate, Flowers solitary with revolute spotted sepals
- 4488 Leaves scattered, Cor. campan. upright rough inside  
 4489 Leaves scattered lanc. : the upper whorled, Stem 1-flowered winged
- 4490 Leaves scatt. lanc. obl. Cor. erect revol. camp. within papillose without smooth  
 4491 Leaves scatt. lin. lanc. Stem 1-flowered, Cor. erect, Pet. with long claws wavy at edge reflexed at end  
 4492 Leaves whorled, Flowers erect, Cor. campan. Petals clawed
- 4493 Leaves whorled linear, Flowers reflexed, Cor. revolute campanulate
- 4494 Lower leaves whorled ; upper scatt. Flowers racemose reflexed, Cor. revolute  
 4495 Leaves whorled ovate lanceolate, Flowers reflexed, Cor. revolute  
 4496 Leaves ternate or scattered lin. falc. 3-nerved ciliated, Pedunc. pubes. Cor. erect rough inside  
 4497 Leaves ternate or scattered linear 3-nerved ciliated, Pedunc. tomentose, Flowers erect rough inside  
 4498 Leaves lin. lanc. scattered, Flowers reflexed, Cor. revolute dotted inside  
 4499 Leaves scattered linear, Pedunc. long, Flowers reflexed, Cor. revolute papillose inside  
 4500 Leaves scattered lin. subulate, Flowers reflexed, Cor. revolute toothed and warted inside  
 4501 Like a Martagon, but the stamens are united in a tube  
 4502 Leaves scattered sessile 5-nerved, The upper cord. ovate, Cor. revolute papillose inside  
 4503 Leaves linear subulate scattered smooth, Flowers reflexed, Sepals revolute smooth inside

## and Miscellaneous Particulars.

brought home in these calabashes, or large gourd-shells, which contain from sixty to seventy pounds weight each. (*Thomson's Mat. Med.* 141.)

In the West Indies, the Cape, and most countries where the woody prickly species abound naturally, they are planted as hedges, and the fibres of the leaves, after being macerated for juice, manufactured into cordage or coarse cloth

*A. picta*, *latifolia*, and *saponaria* are so named from the spots of the leaves, which are of the color of soft soap.

The curious species of aloes, inhabitants of the greenhouse, require but little water : sandy loam, mixed with a little lime rubbish or gravel, suits them best ; and they flower more abundantly by being exposed to the open air in summer. They are increased by suckers ; or leaves, stripped off the plants and laid on a pot of mould, or planted shallow in it, will produce young plants. (*Bot. Cult.* 150.)

771. *Lilium*. From the Celtic word *Lí*, which signifies whiteness. The lily has always been considered the

History, Use, Propagation, Culture,

emblem of whiteness. This is a splendid genus, all the species of which are considered border flowers of great beauty. The more common sorts, species, and varieties, will thrive in any soil and situation, even under the shade of trees. The Canadian, Pomponian, and Philadelphia martagons are somewhat tender, and require the protection of ashes or rotten bark in winter. They are generally planted in borders, and need not be taken up oftener than every three or four years in September, and replanted six inches deep in the October following. None of the species can be safely transplanted after they have pushed leaves, without weakening them so as to prevent their flowering for several years. This remark, indeed, will apply to most bulbous rooted plants. Mr. Griffin, of South Lambeth, whose superior skill in the cultivation of bulbous plants is well known (*Hort. Trans.* iv. 544.), has been in the practice of keeping the *lilium japonicum* in pots, protected by a greenhouse or garden frame; but he thinks they thrive best in the former. He places the bulb in twenty-four sized pots, not lower than an inch from the surface of the mould, which is composed of about two-thirds peat and one-third loam, the bottom of the pot being covered to the depth of two inches, with broken pieces of tile and the rough siftings of peat. The plants are kept entirely from frost, and are watered very little when in a dormant state, for they are then very impatient of wet in excess. The pots kept in the greenhouse are placed at a distance from the flue to prevent the mould drying quickly. (*Hort. Trans.* iv. 554.) Mr. S. Brooks grows in a brick-pit, which he can cover with mats or glasses at pleasure; but he says, it "appears to be sufficiently hardy to endure our winters, as I have had a bed of them two years in the open ground without protection." (*Hort. Trans.* iv. 552.)

772. *Tulipa*. Linnæus classed this among barbarous names. In Persian it is called *thodiyân* (*De Souza*), whence undoubtedly its origin. In old French it is called *tulipan*. T. Gesneriana (Gesner, a Zurich botanist), may be called the king of florists' flowers, having been a prime object of attention with this class of cultivators for nearly three centuries. It appears to have been brought to Europe from Persia by way of Constantinople in 1559, and in a century afterwards to have become an object of considerable trade in the Netherlands, and a sort of mania among the growers, who bought and sold bulbs at prices amounting to 500l. sterling and upwards; in those days an immense sum. The taste for tulips in England was at its greatest height about the end of the seventeenth and the beginning of the eighteenth century. It afterwards declined, and gave way to a taste for rare plants from foreign countries. The tulip, however, is still extensively cultivated in Holland, from which all Europe is supplied with bulbs, and also to a considerable extent in England, both in tradesmen's gardens and in those of the opulent. It is, however, like the auricula, pink, &c. more the poor man's flower than that of the botanists or country gentleman.

The varieties of the tulip are endless, and their names arbitrary, like those of all florists' flowers. One of the latest London catalogues (Mason's) enumerates six sorts of early blowing tulips; four perroquets or middle blowers; twenty-two double sorts; and upwards of 600 single late sorts; the last being the only sorts valued by florists as competition flowers. These late sorts are classed by the Dutch as under:—

Prime baguets (*baguette*, Fr., a rod or wand); very tall; fine cups with white bottoms, well broken with fine brown, and all from the same breeder.

Baguets Rigaut's (supposed from Rigaud, some eminent florist's name, or *rougeaude*, red face); not quite so tall, but with strong stems, and very large well-formed cups, with white bottoms, well broken with fine brown, and all from the same breeder.

- 4504 Stem 1-fl. smooth, Flower nodding, Petals acute bearded at end, Leaves lanceolate  
 4505 Flower erect, Petals lanceol. acuminate, Leaves lanceolate linear  
 4506 Coat of bulb woolly inside, Leaves ciliated glaucous, Stem and flower smooth  
 4507 Stem 1-fl. smooth, Flower erect, Petals obtuse smooth, Leaves ovate lanceolate  
 4508 Stem 1-fl. pubescent, Flower erect, Petals obtuse smooth, Leaves ovate lanceolate  
 4509 Flower erect stellate with a dark eye, Leaves linear lanceolate  
 4510 Leaves lin. lanc. convolute, Petals lanceolate greenish outside  
 4511 One-flowered, Flower from fusiform spreading, Sepals very long caudate  
 4512 Flowers erect flat, Stem 2-leaved 2-3-flowered, Leaves linear subulate

4513 Raceme comose naked below, Leaves entire

4514 Raceme naked, Leaves oblique

- 4515 Leaves glaucous numerous oblique, Cor. turbinate  
 4516 Leaves lanc. alternate remote, Stem 1-flowered naked upwards, Angles of caps. obtuse  
 4517 Leaves linear whorled opp. and alternate when old cirrhose, Stem many-flowered, Capsule winged  
 4518 Lower leaves opp. Inner flowers among the leaves  
 4519 Leaves scattered flat coriaceous glaucous, Cor. campanulate revolute at end  
 4520 Leaves alternate linear nerved flat, Stem 1-flowered  
 4521 Leaves lin. lanc. alternate; the upper approximated shorter than the terminal solitary flower  
 4522 Leaves lanc. approximated, the upper opp. as long as the terminal solitary flower, Capsule obtuse angled  
 4523 Leaves alternate linear channelled, Stem one-flowered  
 4524 Leaves whorled, Flower erect, Cor. campanulate, Petals sessile

- 4525 Leaves fleshy spiny at end  
 4526 Herbaceous caulescent, Leaves ensiform

Incomparable Verports; very perfect cups, cherry and rose, and white bottoms, well broken with shining brown.

Byblomens, or mixt flowers, the *flamands* of the French florists, with bottoms white, or nearly so, from different breeders, and broken with variety of colors.

Bizarres (*ôizarre*, Fr. odd, irregular); ground yellow, from different breeders, and broken with variety of colors.

What are called breeders are procured from seed, and consist of one plain color on a white or yellow bottom. These being cultivated on a dry and rather poor soil, become broken or variegated, and produce new varieties. The time that elapses before they break, varies from one to twenty years or more, and sometimes this change never takes place, so that whoever thinks of raising new varieties of tulips from seed, must be possessed of an ample fund of patience and perseverance. The early dwarf tulip, known among florists as the Van Tholl, is a distinct species, *T. suaveolens*.

In raising tulips from seed, the florists pursue a mode in some respects the reverse of that practised with other plants. Instead of saving the seed to be sown from the finest variegated tulips, they prefer unbroken flowers or breeders, selecting such of these as have tall strong stems, with large well-formed cups, clear in the bottom. Plants raised from seed saved from the finer variegated sorts, form poor weak breeders of no value. The seed is sown on fine light soil, thinly covered, and protected and shaded by a frame. At the end of the second year the bulbs are taken up and replanted three inches apart; and again at the end of the fourth year. Some will bloom the fourth year, most the fifth, and all of them the seventh year. Being now furnished with a set of breeders, all that the florist can do is to take up and replant till they break or shew variegation, which, as already observed, some will do in a year or two, and some not for a long period, or never. Some vary the soil to promote breaking, but in doing this there is often danger of weakening the strength of the flower.

In cultivating choice tulips, an open airy situation, dry at bottom, is made choice of; there excavations are made commonly in the form of beds four feet broad, of any convenient length, and two and a half or three feet deep. In the bottom a layer of well rotten hot-bed dung is laid and well trod in, and on this two or two and a half feet of rich fresh sandy loam. On this the roots are planted six inches apart, and covered four inches. The best season is the beginning of November. In very severe winters, protection by mats or by a layer of decayed tanner's bark, may be requisite; but the tulip is very hardy, and almost the only protection it requires is shading and shielding from rain and winds during full bloom. The bulbs should be taken up annually, as soon as the flowers are decayed, and kept in a dry airy situation till wanted for planting. (See *Madocks, Hogg, Emerton, &c.*)

*T. clusiana* and *T. celsiana* are both elegant little border bulbs, inferior indeed to their prototypes in splendour of coloring, but more elegant in their simplicity.

773. *Fritillus*. *Fritillus* signifies a dice-box, and is said to have been the origin of this name. This is a genus with flowers shrewy and singular in appearance. They require a deep loamy soil, and are readily increased by offsets or seeds. They will grow in the shade of trees and shrubs, and do not require to be taken up above once in three years.

774. *Dracæna*. From *Δρακων*, the female of *δρακων*, a dragon, because the inspissated juice becomes a red powder very like the eastern dragon's blood. *D. draco* has the habit of a palm. The trunk is nearly

History, Use, Propagation, Culture,

equal in size, which is rarely more than eight or ten inches the whole length; the inner part very pithy, next to this a circle of strong fibres, and the outside soft; the same diameter the whole length; circular marks or rings are left the whole length where the leaves have fallen off. The top sustains a large head of these, coming out singly all round it.

775. *Phylloma*. From *φυλλον*, a leaf, and *λωμα*, an edge, in reference to the broad red edge of the leaves. The plant resembles an aloe in foliage and flowers, and requires the same culture.

776. *Aletris*. From *αλειας*, meal, in allusion to the powdery dust with which the whole plant appears to be covered. Small North American plants, which may be cultivated with a little attention in rich leaf mould.

777. *Tritoma*. From *τριες*, three, and *τριων*, to cut, in allusion to the three sharp edges of the ends of the leaves. (v. *Ker. in Bot. Mag. fol. 744.*) The species of this genus thrive best in peat soil, but will do very well in any other light earth. They are hardy enough to endure our mildest winters in the open air, and only require the protection of a frame in severe frosts. There being also a genus of insects called *Tritoma*, Professor Link calls this genus *Tritomantha*.

778. *Veltheimia*. Frederick Augustus de Veltheim was a German botanical amateur, of whom nothing more is known. This genus resembles the last, and is of easy culture in any light loamy soil; and readily increased

- 4527 Leaves lanceolate narrowed each way, Corymb very short terminal many-flowered  
 4528 Leaves lanc. obliquely bent, Panicle hanging down divaricating  
 4529 Leaves lanceolate acute discolored  
 4530 Leaves lanceolate lax, Flowers very fragrant  
 4531 Head of flowers sessile in the centre of the ovate leaves

4532 Leaves tooth-spiny, Racemes axillary

- 4533 Flowers stalked oblong tubular, Cor. in fruit smooth mealy, Leaves broad lanceolate mucronate  
 4534 Flowers sub-sessile campanulate, Cor. in fruit rugose very rough, Leaves lanc. ensiform acute

- 4535 Leaves with the keel and edge rough, Cor. clavate cylindrical  
 4536 Leaves with keel and edge smooth, Cor. clavate cylindrical  
 4537 Leaves with keel and edge rough, Cor. globose at end

- 4538 Leaves lanc. plaited wavy obtuse, Teeth of the limb rounded straight  
 4539 Leaves lanc. glaucous curled at edge mucronate at end, Limb spreading

- 4540 Leaves about 11 spreading flaccid broadly lanceol. ensiform glaucous obscurely barred  
 4541 Leaves beneath convex lined channelled not barred  
 4542 Leaves about 19 sub-erect rigid brittle broad lanceolate ensiform glaucous obscurely barred  
 4543 Leaves lanc. uniform, Style twice as long as stamens, Bractes thrice as short as tube of cor. Flow. sessile  
 4544 Leaves about three flaccid lanc. ensiform pale-green with scarcely any bars  
 4545 Leaves lanc. revolute recurved dull green slightly edged with fulvous  
 4546 Leaves about eleven nearly erect rigid brittle lanc. ensif. with very obscure bars  
 4547 Leaves smooth oblong acute flat and lin. lanceolate channelled, Style the length of stamens  
 4548 Leaves with woolly nerves : lower oblong ; rest lin. Pedunc. without bractes  
 4549 Leaves about 12 sub-erect lanc. ensif. much barred with a small bristle at end  
 4550 Leaves about 20 spreading lanc. ensif. much barred, with 4-6 strong lines beneath  
 4551 Leaves distichous lanceolate ensiform keeled, Flowers solitary sessile

- 4552 Nectary 1-leaved 6-toothed  
 4553 Nectary 3-leaved

- 4554 Leaves quite entire  
 4555 Leaves crenulate straight  
 4556 Leaves linear very narrow stiff closely curved back into a semicircle serrulate at edge  
 4557 Leaves crenate nodding  
 4558 Leaves erect incurved rough on both sides dull glaucous with strong white marginal threads  
 4559 Leaves lorate linear lanc. obliquely bent glaucous, Suckers tuberos

- 4560 Leaves all very flaccid weakly recurved with very strong brownish threads  
 4561 Leaves in a close head very stiff green rough at edge  
 4562 Leaves recurved deflexed with a few threads  
 4563 Leaves a little plaited mucronate, Flowers very close together camp. not opening curved outwards at end  
 4564 Leaves linear lanc. narrow glaucous with fine white marginal threads  
 4565 Leaves erect recurved broadly channelled with very strong twisted brown marginal threads

and Miscellaneous Particulars.

by offsets from the bulbs ; or by pulling off the leaves close to the bulb, and then planting them in pots of mould, when, like most other bulbous rooted plants, they will produce bulbs at their base. The species are quite hardy, although usually treated as greenhouse plants.

779. *Sansevieria*. This is a succulent genus, of the easiest culture and propagation in sandy loam with little water. It is probable that nearly all the numerous kinds adopted here from the works of Mr. A. H. Haworth, are varieties of one common stock, which in the woods of Guinea sports into an infinite number of forms.

780. *Tulbaghia*. This was named in honor of — Tulbagh, a Dutch governor of the Cape of Good Hope, who patronized travelling naturalists. Very pretty plants, less fragrant than beautiful ; they are rarely seen in collections, but may be cultivated in very light sandy peat in a good greenhouse.

781. *Yucca*. The inhabitants of St. Domingo call this plant *Yuca*. The species are considered highly desirable from their palm, or oriental pine-apple, or aloe character, and as being evergreens. For this reason they make a striking contrast in gardens and shrubberies, with European shrubs. They grow slowly, and do not flower freely. They are well adapted for a conservatory, as even the reputed hardy species do not thrive generally in the open air.

History, Use, Propagation, Culture,

782. *Erythronium*. From *ερυθρος*, red, in allusion to the color of the flower and leaves. Beautiful little vernal bulbs, the favorites of gardeners, from the cottager's border to the nobleman's flower garden. The *E. americanum* runs very much at the root, and will not flower unless confined and prevented wasting its vigour in long subterranean surculi.

783. *Gloriosa*. So named on account of the glorious colors of its flowers, and the elegance of their form. This is a splendid and curious genus, which requires considerable care in its treatment so as to make it flower freely. The late John Sweet, of Bristol, has given the following directions: "When the stalks and foliage have decayed in the autumn, and left the root, like a well-ripened potatoe, in a dormant state, the pot in which it is, must be removed from the bark-bed (to a dry part of the house) at some distance from the fire: all the warmth at this time necessary being merely what is sufficient to keep the earth in the pot free from damp; and to prevent the waterings of the house, or other moisture, falling on the earth in the pot, it should be covered, by inverting upon it another pot of the same size; or if larger, it will hang over its edges, and more effectually exclude the wet. If the roots are small, two or three may be placed together in the same pot, whilst in their dormant state; but if they are thus shifted, the mould must be well shaken down in the pot, in order to prevent the access of air to them: the old mould in which they grew must also be used; for fresh earth or sand would stimulate them to move too early. About the second week in March, the roots must be replanted, putting one or two, according to their size, into pots measuring six inches over. The best compost for them is fresh loam, mixed with an equal quantity of peat-mould, of good quality; the loam should be good, not over rich with dung, nor too heavy. The roots are to be covered about two inches deep; and care must be taken not to break them, unless nature has shown where it is practicable to divide them easily. The pots, when filled, must be plunged into the bark-bed, where the heat should be equal to ninety-five degrees of Fahrenheit's scale. Water is to be given very sparingly at first; and though, as they grow,

- 4566 Leaves erect lin. lanc. flaccid glaucous green quite smooth with a slight red edge  
 4567 Stemless, Leaves linear very straight, Scape branched at base, Cor. round campanulate  
 4568 Leaves few loosely headed long lanceolate, their edges rough  
 4569 Leaves erect rigid narrow ensiform glaucous with a broad white edge and a few threads  
 4570 Leaves a little recurved glaucous lin. lanc. at the edge and keel rough, beneath glaucous  
 4571 Leaves lin. lanceolate recurved almost into a circle deep green 7-8 lines broad roundish at edge
- 4572 Style filiform  
 4573 Style clavate 3-cornered
- 4574 Leaves cirriferous  
 4575 Leaves acuminate
- 4576 A small plant like a Crocus
- 4577 Leaves perfoliate ovate  
 4578 Leaves perfoliate elliptic oblong obtuse, Cor. narrowed at base scabrous within, Anthers cuspidate  
 4579 Leaves perfoliate ovate lanceolate acute  
 4580 Leaves perfoliate oblong acute, Petals smooth on both sides, Nect. roundish  
 4581 Leaves sessile  
 4582 Leaves stalked
- 4583 Leaves stem-clasping and stem smooth  
 4584 Smooth shining, Leaves stem-clasping serrulate ciliated, Anthers short 2-horned  
 4585 Downy hoary, Leaves sessile cordate acuminate, Pedicels in pairs on a very short stalk
- 4586 Scape naked smooth, Leaves ovate

- 4587 Leaves ovate oblong obtuse ciliated, Scape leafless, Umbel capitate  
 4588 Leaves radical elliptical, Umbel terminal  
 4589 Leaves cordate, Flowers tetrandrous  
 4590 Leaves stem-clasping in threes, Raceme terminal simple  
 4591 Leaves alternate stem-clasping elliptical acute, Raceme terminal simple  
 4592 Leaves alternate sessile ovate acuminate, Panicle terminal naked
- 4593 Leaves whorled  
 4594 Stem furrowed, Leaves alternate amplexicaul. oblong pubescent at edge, Pedunc. axillary 2-fl.  
 4595 Stem rounded furrowed, Leaves amplexicaul. ovate downy beneath, Pedunc. axill. about 2-fl.  
 4596 Leaves alternate stem-clasping, Pedunc. axillary 1-fl.  
 4597 Leaves alternate stem-clasping, Stem round, Pedunc. axillary many-fl.  
 4598 Leaves alternate stem-clasping acuminate, Stem angular, Pedunc. axillary many-fl.  
 4599 Stem round, Leaves opposite oblong acuminate shining, Pedunc. umbell. 3-5-flowered

and Miscellaneous Particulars.

they will require a more liberal supply, yet it is necessary at all times to be very moderate in giving it. The heat must be well kept up; and as the roots extend, they must be supported. Under such treatment as I have described, I have known one plant grow ten feet in the course of a season, and to have numerous blossom-stems upon it." It is readily increased by dividing the roots. (*Hort. Trans.* iii. 2, 3.) The flowers are at first green, they afterwards assume those beautiful markings of yellow for which they are so much esteemed.

784. *Bulbocodium*. From *βυλβο*, a bulb, and *κοδιον*, wool; its bulb is enveloped in a rough and velvety covering. A beautiful little vernal flower resembling a small species of Colchicum.

785. *Uvularia*. A diminutive of *uva*, a bunch of grapes. A genus of little beauty and of easy culture, constantly twisted. A plant like an *Uvularia* in habit.

786. *Streptopus*. From *στρεπ*, to turn, and *πυς*, a foot, or, in botanical language, stalk. Its flower-stalks are constantly twisted. A plant like an *Uvularia* in habit.

787. *Consualia*. From *consualis*, a valley, in allusion to the places where it grows. (*Muguet*, Fr.) *C. majalis* is an elegant and delicate scented plant, which has long been a favorite of the florist; though, as it is not a native of hot countries, it is not likely to be the Lily of the Valley of Solomon. Notwithstanding the fragrance of the flowers when green, yet when dried they have a narcotic odour, and if reduced to powder excite sneezing. An extract prepared from the flowers or from the roots partakes of the bitterness, as well as of the purgative properties, of aloes. A beautiful and durable green colour may be prepared from the leaves with lime.

The plant is very common in the woods about Woburn in Bedfordshire, and from thence the London markets are supplied with the flowers. It forces freely, and few plants are more eligible for that operation.

788. *Smilacina*. A diminution of *Smilax*, another genus of plants, which see in its place. These are very pretty little hardy American flowers, requiring some delicacy in their management.

789. *Polygonatum*. From *πολυς*, many, and *γονυ*, a knee; on account of the numerous articulations of its

History, Use, Propagation, Culture,

stem. The English name arises from the roots, which in *P. vulgare* are full of knots, and a transverse section of them shews characters which dreamers have discovered to represent the impress of the famous seal of Solomon.

790. *Ophiopogon*. From *οφις*, a snake, and *πυρον*, a beard: snake's-beard. This plant is best grown in pots, as it requires the protection of a frame during severe frosts.

791. *Eucomis*. From *eu*, well, and *κομμη*, hair; on account of the fine tuft of leaves, in botanical language called *coma*, by which the stem is surmounted. Handsome herbaceous plants which are nearly hardy.

792. *Brodiaea*. Named by Sir James Smith, after James Brodie, Esq. of Brodie House, a gentleman to whom the botany of Scotland is indebted. Highly curious little plants with blue flowers.

793. *Peliosanthes*. From *πελος*, livid, and *ανθος*, a flower, in allusion to the color of the flowers. *Teta* is the name of the plant in India; and having been adopted by Dr. Roxburgh, ought not to have been neglected in this country.

- 4600 Scape naked, Leaves linear thrice as long as scape  
 4601 Scape naked, Raceme spiked, Flowers aggregate
- 4602 Scape clavate, Leaves broad lanceolate acute  
 4603 Scape clavate, Leaves multifarious expanded  
 4604 Scape clavate, Leaves elliptical acute twin lying on the ground  
 4605 Scape cylindrical, Leaves tongue-shaped obtuse lying on the ground  
 4606 Scape cylindrical, Leaves ovate oblong wavy spreading, Crown as long as raceme  
 4607 Scape cylindrical, Leaves oblong lanceolate channelled spreading, Crown short, Racemes long  
 4608 Scape cylindrical, Leaves lanceolate spreading striped, Crown short, Raceme long
- 4609 Flowers large lax, Leaves of corona lanceolate undivided  
 4610 Leaves of the corona subulate  
 4611 Flowers clustered, Leaves of corona bifid
- 4612 Scape shorter than ovate-lanceolate leaves  
 4613 Scape branched longer than leaves
- 4614 The only species  
 4615 The only species

A. Stem leafy. Leaves not fistular.  
 Umbel not bulbiferous. Leaves flat.

- 4616 Umb. globose, Stam. 3 cusp. Sepals with a rough keel  
 4617 Stam. tricuspidate, Root tunicated  
 4618 Umb. globose, Stam. tricuspidate twice as long as flower  
 4619 Umb. capitate, Stam. subulate twice as long as flower  
 4620 Umb. capitate, Stam. lanceolate longer than flower, Leaves elliptical  
 4621 Umb. fastigiate, Stam. subulate, Leaves linear ciliated  
 4622 Stam. filiform thrice as long as flower, Leaves oblique  
 4623 Cauline leaves lanceolate, Umbel dense depressed, Stamens subulate shorter than flower  
 4624 Umb. fastigiate, Sepals emarginate, Stamens very short simple  
 4625 Stam. 3-pointed as long as flower, Leaves very narrow, Scape declinate  
 4626 Very upright, Leaves channelled  
 4627 Umb. loose few-flowered, Leaves smooth  
 4628 Very like *Allium subhirsutum* differing only in the smallness of the flowers, Sepals 3 lines long
- Umbel not bulbiferous. Leaves not flat.
- 4629 Stamens simple, Umbel flat, Leaves half-rounded  
 4630 Outer peduncles shorter than the rest, Stamens 3-pointed  
 4631 Flowers pendulous, Sepals ovate, Stam. longer than flower  
 4632 Flowers pendulous truncated, Stam. simple as long as flower  
 4633 Pedunc. capillary effuse, Stam. simple, Spathe very long  
 4634 Stam. simple twice as long as flower, Spathe as long as flower-stalks: one valve shorter  
 4635 Umbel globose, Stam. 3-pointed, Flowers lateral nodding, Leaves half-round  
 4636 Stamens simple twice as long as flower, Umbel globose, Spathe subulate very long  
 4637 Umbel fastigiate about 6-flowered, Sepals acute, Stamens simple, Leaves setaceous  
 4638 Umbel globose very dense, Spathe lanc. as long as flow.-stalks, Stam. 3-pointed longer than fl. Lvs.  $\frac{1}{2}$  round  
 4639 Flower-stalks nearly equal, Sepals ovate conniving as long as simple stamens, Style longer than stamens  
 4640 Spathe ovate shorter than umbel, Stamens simple shorter than flower  
 4641 Leaves half-round, Stamens 3-pointed longer than flower  
 4642 Umbel globose, Stamens simple longer than flower, Spathe subulate  
 4643 Umbel sub-globose, Stamens 3-pointed shorter than flower

Umbel bulbiferous. Leaves flat.

- 4644 Sheaths of leaves rounded, Spathe blunt, Stamens 3-pointed  
 4645 Umbel spreading, Peduncles nodding, Stamens subulate, Spathe with very long points  
 4646 Flowers all male, Stamens 3-pointed, Spathe with a very long point

and Miscellaneous Particulars.

794. *Aphyllanthes*. From  $\alpha$ , privative,  $\varphi\lambda\lambda\omicron\varsigma$ , leaf, and  $\alpha\nu\theta\omicron\varsigma$ , a flower; leafless flower. Its stems are naked, like a rush, and bear on their summit a little tuft of blue flowers.

795. *Sowerbea*. So named in honor of the late James Sowerby, an excellent draughtsman and ingenious naturalist. The power he possessed of representing the general features of plants within the compass of a few inches, as in his English Botany, has never been possessed in the same degree by any other individual than the late Sydenham Edwards. His execution as an artist is fully attested by the superb plates of the Flora Londinensis, of his own Fungi, and indeed of almost every botanical work of merit which appeared during his life. His talents and his reputation are inherited by his sons. This plant requires plenty of water, and is easily increased by dividing the roots.

796. *Allium*. From the Celtic *al*, which signifies hot or burning. This is a genus of strongly scented bulbous plants, all of them edible, and some of them of the greatest antiquity as potherbs.

History, Use, Propagation, Culture,

A. Porrum. (From *pori*, in Celtic, to eat.) *Leek*, Engl., *Poireau*, Fr., *Lauch*, Ger., and *Poro*, Ital., has a cylindrical scaly imperfect bulb, which is blanched in gardens, and much used in soups and stews. It is sown in March, transplanted in May in shallow drills, and being slightly earthed up as it advances, is fit for use in October, and remains in that state till April or May following.

A. sativum, *Ail*, Fr., *Knoblauch*, Ger., and *Aglio*, Ital., has sobiliferous bulbs, which are used in seasoning, and sometimes in medicine. It is cultivated by dividing the bulb, and planting the soboles in February or March. They are fit to take up in the September following, and laid up in a dry situation till wanted for use.

A. scorodoprasum. (From *σχοδοπρον*, onion, and *λεκρον*, leek, as if both leek and onion.) *Ail d'Espagne*, Fr., *Rockenbolben*, Ger., and *Scorodopraso*, Ital., has bulbs like garlic, but the soboles or cloves are smaller. It is cultivated for the same purposes as that species, and is considered as having a more delicate flavor.

A. ascalonicum (growing near Ascalon). *Eschalôte*, Fr., *Schalotte*, Ger., and *Scalogni*, Ital., is the mildest of cultivated Alliums. It has a sobiliferous bulb, small fistular leaves, and seldom flowers. It is propagated by the clove, planted in autumn or spring, and taken up for use in August or September. It is very subject to insects, which autumn and shallow planting are found to counteract. (*Caled. Mem.* i. 109, and *Hort. Trans.* ii. 98. *Encyc. of Gard.* 3847.)

- 4647 Bulbs compound, Stamens 3-pointed  
 4648 Leaves crenulate, Sheaths 2-edged, Stamens 3-pointed  
 4649 Like *Allium carinatum*, but the stamens are three-pointed  
 4650 Stamens subulate twice as long as flower, Spathe longer than umbel

*Umbel bulbiferous. Leaves not flat.*

- 4651 Leaves half round, Spathes much longer than umbel, Sepals obtuse, Stamens simple exserted  
 4652 Stamens 3-pointed  
 4653 Leaves rough half-round furrowed beneath, Stamens simple

*B. Leaves radical, not fistular.*

- 4654 Scape rounded, Umb. many-fl. fastigate, Leaves linear channelled angular beneath, Stam. subulate  
 4655 Scape rounded, Leaves lin. lanceol. Umb. fastigate, Sepals very narrow, Stamens simple  
 4656 Scape rounded, Leaves lanceolate, Umb. hemispherical, Sepals spreading, Stamens simple  
 4657 Scape rounded, Lvs. lin. lanc. wavy, Umb. hemispherical, Roots very long, Stam. simple twice as long as fl.
- 4658 Scape oblique 4 cornered, Leaves linear, Umb. fastigate, Stamens simple as long as fl.  
 4659 Scape rounded, Leaves half-round, Spathe acum. longer than umbel, Stam. simple longer than flower  
 4660 Scape  $\frac{1}{2}$  rounded, Leaves lanceolate acuminate falcid ciliated sheathing, Umbel fastigate, Sepals obtuse  
 4661 Scape 2-edged angular, Umbel clustered, Stamens simple as long as flower, Leaves linear oblique  
 4662 Scape nearly 2-edged, Umbel capitate, Stamens longer than flower, Leaves linear spiral  
 4663 Scape 2-edged, Umb. drooping before flowering, afterw. erect, Lvs. lin. flat, Stam. 3-pointed longer than fl.  
 4664 Scape rounded, Leaves subulate, Umbel globose, Stamens 3-pointed  
 4665 Scape 2-edged, Leaves linear convex and smooth beneath, Umbel roundish, Stamens subulate  
 4666 Scape rounded very long, Leaves linear channelled, Stamens subulate connate at base  
 4667 Scape 2-edged, Leaves linear channelled angular beneath, Umbel fastigate  
 4668 Scape 3-cornered shorter than the lin. furrowed leaves, Umb. fastigate, Stamens simple, Sepals obtuse  
 4669 Scape rounded longer than the linear, subulate leaves, Umb. fastig. Stamens simple, Sepals mucronate  
 4670 Scape rounded, Leaves linear  
 4671 Scape 3-cornered, Leaves lanceolate stalked, Umbels fastigate  
 4672 Scape and leaves 3-cornered, Stamens simple  
 4673 Scape rounded, Leaves linear flat ciliated, Umb. few-flowered, Sepals obovate concave  
 4674 Scape nearly cylindrical, Leaves lanceolate sessile, Umbel fastigate  
 4675 Scape half-round, Leaves lanceolate oblong flat smooth, Umbel globose, Seeds solitary  
 4676 Scape 4-cornered, Umb. fastigate cernuous, Leaves linear flat, Stamens subulate longer than flower  
 4677 Leaves twisted linear, Umbel loose, Filam. subulate as long as flower  
 4678 Scape rounded longer than leaves, Umb. compact, Stam. subul. as long as flower  
 4679 Scape rounded at end, Umbel half globose, Leaves linear flat chann. at base, Stam. subul. longer than fl.  
 4680 Scape rounded, Umb. fastigate, Leaves half-round compressed, Stam. lanceolate shorter than fl.  
 4681 Scape rounded, Umb. few-flowered fastigate, Leaves lin. channelled, Stam. lanceolate shorter than fl.

*C. Leaves fistular.*

- 4682 Scape leafy, Umb. fastigate, Spathes nearly equal, Sepals mucronate  
 4683 Scape leafy at base  
 4684 Scape fistular twisted, Umb. bulbiferous proliferous, Stamens 3-pointed  
 4685 Scape rounded with an angle, Leaves linear obtuse, Umb. rounded, Stamens setaceous twice as long as fl.  
 4686 Scape ventricose beneath longer than the round leaves  
 4687 Scape as long as the round ventricose leaves  
 4688 Scape as long as the round subulate leaves  
 4689 Scape not quite naked round, Leaves half-round, Stamens subulate, Sepals lanceolate acute  
 4690 Scape round, Leaves setaceous subulate ciliated, Sepals ovate lanceolate emarginate at ends  
 4691 Scape scarcely any, Capsules cernuous, Leaves flat ciliated

§ 1. *Three stamens fertile.*

- 4692 Inner sepals glandular at end inflexed, Leaves subulate channelled recurved  
 4693 Inner sepals glandular at end inflexed, Peduncles spreading, Leaves linear lanc. flat reflexed

*and Miscellaneous Particulars.*

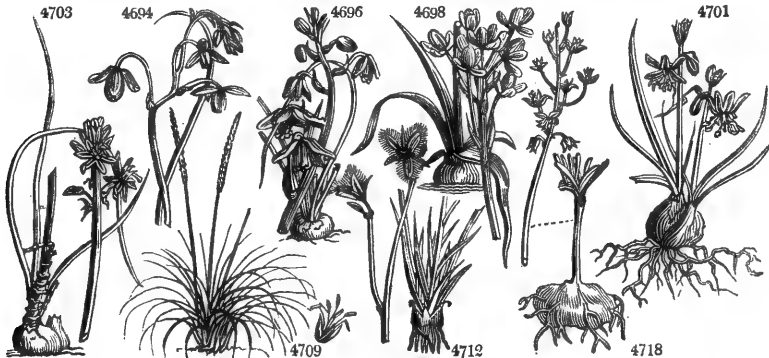

*A. cepa.* (*Cep* signifies head in Celtic.) *Oignon*, Fr., *Zwiebel*, Ger. and *Cipolla*, Ital., is universally cultivated for the kitchen, and is used as a pot-herb, salad, and pickle. It is commonly raised from seed, which is sown on rich, loamy, and rather moist soil, in March; and being thinned, weeded, and the soil stirred, the bulbs will be fit to take up in September, when they may be kept through the winter like potatoes or apples. It is also grown from small bulbs, which are planted on the surface of the soil in March, and swell to a large size (if not earthed up) in the course of the season. Sometimes onion-seeds are sown in autumn in a very dry situation, and the young plants are taken up and transplanted in spring; or a sowing is made very early in spring on a warm border or on a hot-bed, and the crop transplanted from that.

There is a variety called the underground-onion, which multiplies its bulbs by offsets below the surface. The species called the tree onion, like several others, produces its bulbs instead of or among the umbel of flowers. It is occasionally cultivated, but chiefly as matter of curiosity.

*A. fistulosum* is grown chiefly as a scallion, or spring salad onion. It has almost no bulb, but large succulent fistular leaves, strong in flavor. It is sown in autumn, and fit to be used in spring.

797. *Albuca.* Derived from *abous*, white, in allusion to the color of the flowers of this genus. Not a very happy allusion though, because the flowers are mostly green. The stem of the *Asphodel* was called *albuca* by

History, Use, Propagation, Culture,

the Latins. A genus of little beauty, but of easy management in sandy loam and decayed vegetable soil, and propagation is effected by suckers from the old bulbs; or by taking off leaves with a scale, and planting them round the edge of a pot of sandy loam.

798. *Xanthorrhæa*. From *ξανθός*, yellow, and *ῥίζα*, to flow. The plant produces a yellow gum.

799. *Thysanotus*. From *θύσανος*, a fringe, on account of the fringe of the sepals. Elegant little New Holland plants, with bright purple blossoms and slender grassy leaves.

800. *Eriosperrum*. From *εἶσος*, wool, and *σπέρμα*, seed, on account of the envelope of the seed. Very curious little Cape plants, with deformed or unusually shapen leaves.

801. *Gagea*. Named by R. A. Salisbury, Esq., after his friend Sir Thomas Gage, a great amateur of botany. A genus of curious little bulbous plants, none of which exceed the height of more than three or four inches, and principally distinguished from *Ornithogalum* by the yellow color of their flowers.

4694 Inner sepals glandular at end inflexed, Scape erect, Fl. nodding, Lvs. linear subulate channelled smooth  
 4695 Inner sepals glandular at end inflexed, Peduncles spreading at right angles, Lvs. lanc. lin. obliquely bent  
 4696 Inner sepals glandular at end inf. Scape erect wavy, Fl. cernuous, Lvs. lin. subul. chann. outside hairy  
 4697 Inner sepals vaulted at end, Leaves smooth, Peduncles the length of bractes

§ 2. *Six stamens fertile.*

4698 Inner sepals vaulted at end, Leaves lin. flattish, Scape shorter than leaves, Pedunc. very long spreading  
 4699 Inner sepals glandular at end inflexed, Leaves lin. lanc. convol. upright shorter than scape  
 4700 Inner sepals glandular at end inflexed, Leaves lin. lanc. flattish, Pedunc. at right angles, Flowers erect  
 4701 Scape shorter than leaves few-flowered, Flowers nodding, Filam. 2-toothed  
 4702 Leaves lanceolate, Raceme pyramidal before the leaves, Filam. glandular at base  
 4703 Leaves lin. subulate channelled, Scape simple shorter than leaves, Scales of root wrinkled across  
 4704 Inner sepals glandular at end inflexed, Lvs. lin. lanc. flat, Pedunc. very long erect spreading, Fl. upright  
 4705 Inner sepals vaulted at end, Leaves lin. lanceol. channelled upright, Pedunc. shorter than nodding flow.  
 4706 Inner sepals vaulted at end, Leaves lin. lanc. channelled, Pedunc. spreading the length of nodding flow.  
 4707 Inner sepals vaulted at end, Lvs. lin. subul. chann. hairy clammy, Ped. spread. twice as long as nodd. fl.  
 4708 Inner sepals vaulted at end, Leaves lin. subulate convolute at the end spirally twisted villous

4709 Stem very short, Leaves 2-edged lengthwise, Scape very long higher than the spike  
 4710 Stemless, Leaves 3 cornered flat in front beyond the middle hollowed, Scape very long higher than spike  
 4711 Stemless, Leaves 3 cornered below the middle in front little raised above middle concave, Bracts very long

4712 Roots fibrous, Stems branched diffuse rounded striated, Branches somewhat angular, Anthers unequal  
 4713 Bulbs fascicled, Leaves radical channelled nearly as long as the rounded simple stem

4714 Leaves roundish acuminate cucullate at base  
 4715 Leaf sub-cordate acute cucullate pubescent  
 4716 Leaves ovate lanceolate at the edge wavy involute  
 4717 Leaves elliptical obtuse flat  
 4718 Leaf proliferous, Leaflets filiform undivided sessile

4719 Radical leaf linear flat, Peduncles simple umbellate, Sepals obtuse smooth, Bulbs clustered  
 4720 Radical leaf linear lanc. flat, Pedunc. simple somewhat umbellate, Sepals obtuse smooth, Bulb solitary  
 4721 Leaves linear filiform upright, Pedunc. about 3 with a three-leaved involucre  
 4722 Scape angular naked, Pedunc. umbellate branched pubescent, Sepals lanc. acute  
 4723 Scape naked, Pedunc. 3 umbell. pubescent, Leaves filiform, Three outer sepals longer than the others  
 4724 Leaves half cylindrical, Cauline dilated at base

4725 Scape 2-leaved, Leaves opp. Pedunc. 1-fl. Outer sepals lanc. retuse: inner ellipt. twice as broad  
 4726 Scape naked, Flowers umbell. Filam. all 2-forked bearing the anther in the middle  
 4727 Raceme few-flowered, Sepals lanceolate, Leaves filiform channelled, Filam. subulate  
 4728 Corymb few-flowered, Pedunc. longer than bractes, Filam. subulate  
 4729 Raceme spiked many-fl. Lvs. lin. lanc. weak, Every other stamen with two teeth, Bractes longer than fl.  
 4730 Raceme oblong, Filam. lanceolate membranous, Pedunc. and fl. spreading  
 4731 Corymb few-flowered shorter than lanceolate strongly fringed leaves  
 4732 Raceme very long, Sepals linear obtuse, Filam. lanceol. equal, Style the length of stamens  
 4733 Raceme very long, Sepals lanc. oblong, Filam. broad lanceol. alternately shorter  
 4734 Raceme long, Filam. subulate alternate lanceolate, Bractes membranous ovate twice as long as pedunc.  
 4735 Raceme few-flowered, Sepals linear oblong obliquely bent emarginate, Filam. lanc. subul. Leaves linear  
 4736 Leaves short oblong erect, Scape very long, Flowers campanulate the length of stamens  
 4737 Raceme very long, Filam. subulate, Pedunc. much longer than flower, Leaves lanceolate  
 4738 Raceme very long, Filam. subul. Pedunc. length of fl. Bractes the length of pedunc. Lvs. lin. lanc. loose  
 4739 Lvs. glaucous twisted upwards, Raceme divaricating on a long scape, Filaments with an ovate base  
 4740 Raceme very short, Bractes lanc. the length of flower, Sepals obtuse, Filam. subulate  
 4741 Raceme conical, Fl. numerous ascending, Sepals oblong flat, Stam. lanc. equal, Style very short

and Miscellaneous Particulars.

802. *Ornithogalum*. From *ορνιθας*, a bird, and *γαλα*, milk. No good explanation has been offered of the application of this word; that of Tournefort is not worth quoting. *O. squilla* is the officinal squill. It has a bulb almost as big as the human head, pear-shaped, and tunicate like the onion. From the middle of the root arise several shining leaves a foot long, and two inches broad at their base, lessening all the way to the top, where they end in points. They continue green all the winter, and decay in the spring; then the flower-stalk comes out, rising two feet high, naked about half way, and terminated by a pyramidal thyrse of white flowers.

The squill is one of the few medicines known in the early ages of Greece, which is still held in great estimation. It is very nauseous, intensely bitter and acrimonious, without any perceptible smell. It is poisonous to several animals: if much handled it ulcerates the skin; and in large doses frequently repeated, it not only excites nausea, but strangury, bloody urine, and hemorrhoids, with fatal inflammation and gangrene of the stomach and bowels. Under proper management, however, it is a medicine of great practical utility. In

History, Use, Propagation, Culture,

dropsy it has long been esteemed the most certain and effectual diuretic with which we are acquainted, and it is usually employed in asthma.

803. *Scilla*. From σκίλλα, to injure, according to Miller, because its root is a violent poison as well as an article of medicine. In Arabic it is called *dsqyl*; has not the name *scilla* been obtained rather from this root? The genus is so ill defined that botanists are more guided by their blue colour than by any precise mark, in referring plants to this rather than Ornithogalum.

*S. peruviana* or *hyacinth* of Peru is erroneously named, being a native of Spain. It is valuable as an evergreen, or rather wintergreen, its fine lucid green leaves appearing before winter and continuing through that season, till it sends up its thick succulent scapes about the end of April. There are two varieties, one with a deep blue, and the other with a white flower. Like other Spanish bulbs it is liable to be destroyed by an extraordinary severe winter.

*S. verna* is a maritime plant found on the coast of Cornwall, Wales, the Isle of Man, and the Hebrides. *S. non-scripta* is the *Hyacinthus* of that name of Linnæus, the *Jacinte des bois*, of the French, and *Niederlantische* or *Englische Hyacinthe*, of the Germans. The fanciful specific name of *non-scriptus* was

- 4742 Raceme long, Filam. subul. Sepals lanc. at the end callous inflexed, Leaves linear depressed flat  
 4743 Raceme few-fl. Filam. subulate, Sepals lin. obtuse : 3 outer bearded at end; inn. mucron. Leaves filiform  
 4744 Raceme long many-fl. Filam. subulate, Sepals lanc. acute, Leaves filiform subulate  
 4745 Leaves filiform fleshy, Scape few-flowered  
 4746 Corymb many-flowered, Filam. subulate, Cor. broadly campan. Outer sepals obsolete 3-toothed  
 4747 Corymbs many-fl. racemose, Filam. alternately forked, Leaves lanceolate  
 4748 Raceme contracted corymbose, Filam. alternately emarg. Leaves lanc. with cartilaginous teeth  
 4749 Like the last, but the flowers very yellow, and the bractes very narrow the length of the flower-stalk  
 4750 Raceme many-fl. contracted, Altern. filam. emarginate, Leaves linear channelled  
 4751 Raceme very long, Leaves lanc. linear, Flowers spreading, Stam. dilated alternately wedge-shaped  
 4752 Leaf solitary longer than scape, Flowers few spiked sessile  
 4753 Flowers without the leaves, Bractes reflexed

- 4754 Raceme conical oblong  
 4755 Corymb clustered conical  
 4756 Raceme oblong conical, Sepals lined  
 4757 Raceme few-flowered, Peduncles without bractes, Leaves lanceol. lying on the ground  
 4758 Scape angular, Peduncles alternate shorter than flower, Bractes obtuse very short  
 4759 Four-leaved, Scape many half-rounded striated 2-flowered decumbent after flowering  
 4760 Scape angular, Raceme corymbose, Peduncles twice as long as fl. Bractes obsolete  
 4761 Raceme few-flowered with bractes, Flowers campanulate, Leaves linear channelled : radical many  
 4762 Leaf roundish somewhat spiked on one side  
 4763 Raceme cylindrical many-flowered, Sepals half as long again as the ovaries, Peduncles colored  
 4764 Leaves filiform linear, Flowers corymbose, Peduncles naked ascending the length of the flower  
 4765 Flowers racemose, Leaves lanceolate linear about two elevated on a scape  
 4766 Scape rounded, Corymb few-flowered umbelled, Bractes filiform the length of peduncles  
 4767 Flowers campanulate 6-parted, Raceme cernuous  
 4768 A species which has not yet been seen in flower, nor described  
 4769 Raceme many-fl. obl. conical, Flowers campan. erect, Bractes 2-parted longer than pedunc. Lvs. lanceol.  
 4770 Flowers campanulate 6-parted revolute at end

- 4771 Flowers 6-parted, Raceme cernuous, Leaves shorter than scape  
 4772 Flowers funnel-shaped corymbose erect, Scape shorter than the leaves  
 4773 Scape longer than keeled linear leaves, Spike racemose, Five sepals ascending; the lower deflexed  
 4774 Flowers campanulate half six-cleft racemose, Stamens membranous

4775 The only species, like a pale-flowered variety of *Scilla sibirica*

- 4776 Leaves roundish smooth  
 4777 Leaves lanceolate oblong acuminate  
 4778 Leaves roundish smooth towards the end mucronate  
 4779 Leaves roundish veiny warted rough

- 4780 Leaves ovate and lanceolate with hairy tubercles, Sepals filiform  
 4781 Leaves lanceolate and elliptical veinless warted, Warts naked, Sepals ovate  
 4782 Leaves oblong lanceolate flat smooth  
 4783 Leaves lanceolate wavy smooth  
 4784 Leaves lanceolate, Sepals much shorter than the tube, Filam. capillary alternately longer

4785 Scape naked simple, Stamens twice as long as flower, Leaves linear channelled

and Miscellaneous Particulars.

applied to this plant by Dodonæus, because it has not the marks of *Al*, *Al*, on the petals, as other hyacinths are supposed to have, and therefore is not the *Hyacinthus poeticus*. This idea has its origin in the Roman mythology, in which *Apollo*, being much grieved for the death of the youth *Hyacinthus*, changed his blood into a flower which bore his name, &c. It is a native of almost every part of Europe and of Persia.

804. *Puschkinia*. Named after Count *Mussin Pouschkin*, a Russian botanist and patron of botany. A very remarkable little plant, resembling a *Scilla* in appearance, but well defined by the very curious union of its stamens into a cup.

805. *Massonia*. So named by *Thunberg*, after *Mr. Francis Masson*, author of *Stapelie Novæ*; a successful botanical collector at the Cape of Good Hope, Madeira, the West Indies, and finally North America, into whose wildernesses he went to die. Very singular plants, with broad leaves lying flat on the ground, and compact umbels of flowers.

806. *Eremurus*. From *ἐρημος*, desert, and *ὄψα*, a tail: tail of the desert. Its long spikes of yellow flowers may be easily imagined to merit such an appellation in their native abodes.

History, Use, Propagation, Culture,

807. *Bulbine*. From βάλβος, a bulb. The species are deservedly common in flower gardens, being at once showy, fragrant, of easy culture, and rapid increase by suckers.

808. *Asphodelus*. From ασφιδελος, private, and σπυλλος, to supplant: that is to say, a flower which cannot be supplanted or surpassed. *Linn.* The yellow and white species are old inhabitants of our gardens, of easy culture and rapid increase. Immense tracts of land in Apulia are covered with the latter species, which affords very good nourishment to the sheep. It was sacred to Proserpine, and used in funeral ceremonies.

809. *Anthericum*. A name applied by the Greeks to the stem of the asphodel, and not misapplied to this set of plants, which in some sort resemble the asphodel. Plants with fleshy leaves, and spikes of bright yellow flowers; easily cultivated if kept dry.

- 4786 Leaves fleshy rounded, Stem shrubby erect branched  
 4787 Leaves fleshy rounded glaucous, Stem shrubby short rooting  
 4788 Leaves fleshy tongue-shaped lanceolate flat on both sides  
 4789 Leaves fleshy linear acuminate channelled, Scape twice as long as leaves  
 4790 Leaves fleshy subulate half rounded flexuose glaucous 3 times as short as scape  
 4791 Leaves fleshy subulate rounded, Scape racemose  
 4792 Leaves ensiform fleshy 3 cornered fringed, Scape simple, Raceme very long
- 4793 Stem leafy, Leaves 3 cornered striated  
 4794 Stem leafy, Lvs. subul. 3 cornered striated, Bractes membranous lanceol. : the upper longer than flower  
 4795 Stem naked branched, Pedunc. altern. longer than bract, Leaves ensiform carinate smooth  
 4796 Stem naked simple, Pedunc. clustered the length of bractes, Leaves linear keeled smooth  
 4797 Stem naked, Leaves upright striated subulate fistular  
 4798 Leaves linear weak, Scape erect branched, Flowers small  
 4799 Stem leafy naked above branched, Leaves filiform striated toothed ciliated  
 4800 Stem nearly naked, Leaves upright cylindrical fistular
- 4801 Leaves fleshy lanceolate flat concave at base reflexed at end, Raceme nodding at end  
 4802 Leaves fleshy oblong lanceolate acuminate nerved straight 4 times as short as scape  
 4803 Leaves flatish, Scape 1-flowered  
 4804 Leaves flat, Scape branched, Flowers flat, Pistils straight  
 4805 Leaves linear keeled shorter than the branched scape, Flowers clustered in threes pendulous  
 4806 Leaves linear channelled smooth cartilaginous at edge, Scape simple  
 4807 Leaves lanc. linear channelled with an obtuse concave end, Scape and raceme simple, Flowers spreading  
 4808 Raceme simple long many-flowered, Pedunc. spreading in flower, appressed in fruit  
 4809 Roots fibrous, Filaments declinate : the outer not bearded  
 4810 Leaves filiform flexuose reflexed longer than scape, Scape simple filiform, Raceme few-flowered  
 4811 Leaves flaccid glaucous with the edge and nerves rough, Stem panicled branched, Filam. not bearded
- 4812 Leaves oblong, Raceme corymbose, Stamens dilated in middle papillose  
 4813 Leaves fleshy linear-subulate half-rounded upright  
 4814 Leaves fleshy compressed hispid  
 4815 Leaves rounded filiform upright shorter than scape, Scape simple  
 4816 Leaves linear filiform flexuose reflexed at base ciliated the length of the branched scape  
 4817 Leaves filiform rounded roughish, Filaments smooth, Sepals lanceolate  
 4818 Leaves flat smooth linear lanceolate acute, Scape simple, Raceme many-flowered cylindrical compact  
 4819 Leaves 3-cornered rough, Scape branched, Flowers revolute  
 4820 Leaves linear ensiform keeled 3-cornered shorter than the branched scape  
 4821 Leaves linear flat depressed shorter than the branched scape, Alternate sepals wavy  
 4822 Leaves channelled sword-shaped, Scape simple, Bractes remote 3-flowered  
 4823 Leaves fleshy hairy sword-shaped 3-cornered channelled on the narrow side, Scape simple  
 4824 Leaves flat, Scape simple, Flowers flat, Pistil declinate  
 4825 Leaves flat, Scape simple, Flowers campanulate, Stamens declinate
- 4826 Racemes divided, Pedicels clustered, Inner sepals crenulate, Capsules pendulous  
 4827 Raceme divided, Bractes leafy, The bearded half of filam. with 2 appendages at base, Lvs. lanc. ensiform
- 4828 Stemless, Leaves lanceolate radical little longer than simple scapes  
 4829 Leaves flat, Scape branched, Peduncles clustered, Flower flat
- 4830 Lvs. lanceol. acuminate upright spreading, Panicle branched upright many-flowered, Branches smooth
- 4831 Flowers nodding, Stamens propendent, Filaments striped, Leaves flat, Bulbs clustered
- 4832 Leaves ensiform, Filaments woolly  
 4833 Bractes unequal : the lower embracing the stalk ; the upper setaceous

and Miscellaneous Particulars.

810. *Arthropodium*. From ἀρθρον, a joint, and πους, a foot, on account of the jointed footstalks of the flowers. Distinguished by its bearded filaments.  
 811. *Chlorophyllum*. From χλωρος, green, and φυτόν, a plant. Very inconspicuous flowers requiring a bark-bed, but easily cultivated under such circumstances.  
 812. *Cæsia*. Named after Frederick Cæsius, who lived in 1703.  
 813. *Nartheicum*. From νάρθηξ, a rod or wand, in allusion to the slender spike of flowers. This genus resembles a small *Anthericum*, from which genus it has been separated.

History, Use, Propagation, Culture.

814. *Dianella*. A diminution of *Diana*, the name which the genus originally received from Commerson. The species are found in the recesses of forests, where the goddess of hunting may be supposed to inhabit.

815. *Eustrephus*. From *eu*, well, and *strophos*, to turn, in allusion to the twining habit of the species.

816. *Asparagus*. From *asparagos*, to tear, on account of the strong prickles with which some of the species are armed. Some are dicocious, and others are prickly evergreen climbers. *A. officinalis*, *Asperge*, Fr., *Spargel*, Ger., and *Asparago*, Ital., is one of the oldest and most delicate of culinary vegetables. It is found on the sea-shores in different parts of Britain and in many parts of Europe, and is abundant in the inland sandy plains in Russia, Turkey, and Greece. *Asparagus* was in much esteem both among the Greeks and Romans. It is much praised by Cato and Columella, and Pliny mentions a sort which grew near Ravenna, a deep sandy country, three shoots of which would weigh a pound. It is equally admired by the moderns, and assiduously cultivated in private gardens everywhere, and to a great extent round London, Paris, and Vienna. In no part of the world is it grown to such perfection as in the market gardens round London. That of the parish of Mortlake is particularly strong and succulent: the soil is a sandy loam, deeply trenched, and well manured; the seed is sown in drills and thinned out till the plants stand six inches apart in the row, and the rows are a foot asunder. Round Paris and Vienna more pains are taken in preparing the soil, by forming excavations and filling them with layers of turf, durable manure, as bones, wood-chips, &c., sand, manure, loam, &c.; but though plantations on such beds last longer than on ours, they do not yield better shoots, and it may justly be questioned whether they are equally profitable to the cultivator.

The culinary preparations of *asparagus* are few, its very delicate flavor rather being deteriorated than improved by powerful tastes. It is best boiled and served alone, to be eaten with butter and salt; or with the points of the shoots cut in small pieces, and served up as green peas. It is esteemed diuretic, and in Paris

- 4834 Radical leaves sword-shaped flat shorter than the stem with the keel and edges smooth, Panicle simple  
 4835 Radical leaves ensiform long smooth at the edge and keel, Panicle upright  
 4836 Leaves bright-green smooth, Panicle lax decomp. Sepals of pendulous flower reflexed, Filam. strumous  
 4837 Leaves linear-lanceolate at the edge prickly, Keel smooth
- 4838 Stem leaves numerous long ensiform rough at the edge and keel, Branches of panicle short  
 4839 Leaves radical lin.-lanceolate at the keel and edges smooth, Panicle decomposed straggling
- 4840 Leaves ovate or elliptical-lanceolate, Anthers after flowering twisted  
 4841 Leaves linear or linear-lanceolate, Anthers after flowering straight
- 4842 Stem herbaceous round erect, Leaves setaceous  
 4843 Stem herbaceous erect rounded, Leaves setaceous  $\frac{1}{2}$ -whorled and whorled, Stipules solitary unarmed  
 4844 Stem half-climbing, Branches straggling, Leaves setaceous curved, Flowers globose  
 4845 Stem unarmed rounded, Branches declinate, Leaves setaceous  
 4846 Stem much branched wavy, Leaves setaceous pungent, Flowers campanulate  
 4847 Stem herbaceous unarmed decumbent much branched, Branches wavy, Leaves setaceous  
 4848 Herbaceous unarmed twining, Leaves lanceolate falcate  
 4849 Stem herbaceous erect, Branches straight, Leaves bundled setaceous long, Pedunc. sol. nodding  
 4850 Prickly solitary recurved, Branches round, Leaves fascicled linear falcate, Pedunc. 1-f. clustered  
 4851 Prickles solitary, Branches striated, Leaves bundled linear-subulate falcate, Racemes many-f. axillary  
 4852 Branches striated, Leaves linear falcate unequal, Flowers few  
 4853 Prickles solitary, Branches round reflexed bent back, Leaves setaceous bundled  
 4854 Prickles solitary, Stem erect, Branches filiform, Leaves bundled setaceous  
 4855 Prickles solitary reversed, Branches angular, Leaves lanceolate linear  
 4856 Prickles solitary, Branches angular wavy, Leaves bundled 3-cornered blunt deciduous  
 4857 Stem unarmed angular shrubby, Leaves needle-like rigid perennial mucronate equal  
 4858 Herbaceous unarmed, Branches wavy, Leaves lanceolate  
 4859 Stem unarmed angular shrubby, Leaves subulate striated unequal diverging  
 4860 Unarmed, Branches bent back, Leaves rounded subulate  
 4861 Spines 4, Branches clustered rounded, Leaves setaceous  
 4862 Leaves solitary linear lanceolate, Stem wavy, Prickles recurved
- 4863 Leaves oval sub-erect plain, Raceme long cylindrical, Bracts hooked back upon themselves  
 4864 Leaves linear lanc. obliquely bent smooth, Flowers nodding  
 4865 Leaves linear keeled ciliated  
 4866 Leaves lanceolate smooth channelled at base, Flowers erect  
 4867 Leaves wedge-shaped smooth, Scape few-flowered  
 4868 Leaves lanceolate smooth wavy, Peduncles horizontal  
 4869 Leaves linear lanceolate half-round

- 4870 Leaves broad lanceolate erect much shorter than scape, Peduncles very long  
 4871 An undescribed species, said to be in the gardens about London  
 4872 Leaves bright green channelled striated, Sepals oval the length of stamens  
 4873 Leaves glaucous, Raceme lax, Sepals linear much spreading longer than stam.

and Miscellaneous Particulars.

is much resorted to by the sedentary operative classes, as tailors, weavers, &c. when they are troubled with symptoms of gravel or stone.

There are some varieties and subvarieties of asparagus, but excepting the red-topped and green-topped, the others are merely local varieties, and can hardly be said to be obtainable by seed.

In the kitchen garden asparagus is generally grown in beds four feet broad, and in rows a foot or eighteen inches apart by nine inches in the row. The plants are either raised from seed where they are to remain, or raised on a seed-bed the preceding year and transplanted. The value of the crop depends on the soil being dry, sandy, trenched two and a half or three feet deep, and powerfully manured. During winter the beds are covered with dung or litter to protect them from the frost. In spring this is raked off into the alleys and dug in, while the beds are stirred with a fork, to admit the air, heat, rain, &c. to stimulate the rising shoots. Asparagus from seed will be fit to cut the third year, in perfection the fifth, and will continue good for ten or twelve years. The season for cutting is from the middle of April to the middle of June.

Asparagus is extensively forced, generally by taking up the roots and placing them on dung or tan beds; but sometimes a more gentle forcing is given by covering the beds with dung in the manner of forcing sea-cale. By the former mode earlier crops are obtained, but the roots are lost; by the latter, the crop is only forwarded a week or two, but the roots remain to produce the following year.

817. *Drimis*. So called from the Greek word *δριμος*, caustic, because the juice of the roots is so very acrid, as, when applied to the skin, to cause inflammation and even blisters.

818. *Uroselinon*. From *ουρα*, a tail, and *σελαλον*, a petal, in allusion to the manner in which the divisions of the flower are lengthened out. Curious and rare bulbous plants, very nearly related to *Zuccagnia*; perhaps not generically distinct.

History, Use, Propagation, Culture,

819. *Hyacinthus*. Every one knows the fable of Hyacinthus, who was killed by Apollo and changed to this flower. Bochart, however, remarking that the ancients applied the name to a red flower, concludes that the Arabic *yâgdut*, which signifies red, has something to do with the name. A conjecture certainly sufficiently learned, but less plausible.

*H. orientalis* is the origin of one of our finest florist's flowers, and, like the tulip and narcissus, of a considerable commerce to the Dutch. It is a native of the East, and abundant about Aleppo and Bagdat, where it flowers in February. It seems to have been first cultivated as a flower by the Dutch; but when is unknown. Most probably in the beginning of the sixteenth century, soon after the revival of commerce in the west of Europe, when the merchants of Holland traded to the eastern shores of the Mediterranean and the Archipelago. About the end of the sixteenth century there were seven or eight varieties known in England. In 1620, Swertius, in his *Floriilegium*, figured forty varieties; Miller says the Haarlem florists in his time (say 1720) had above 2000 varieties, and though the passion for this flower has greatly declined, they have still upwards of half that number. In England three or four hundred sorts are annually imported from the Dutch florists by the seedsmen.

A fine double hyacinth is characterized by strength and enlargement of all the parts, and by bright distinct colors. The fundamental varieties are double, semidouble, single, red, white, purple, blue, and yellow, in many different shades and variegations. A variety degenerates in a few years; but some have existed undeteriorated upwards of a century. Varieties are raised from seed, and flower the fourth or fifth year: their names are after the growers or their patrons, favorite friends, public characters, or the celebrated names of history and antiquity.

The seeds of the hyacinth are sown in October, after they have ripened, or in the following March. They remain three years with no other culture than covering with a little earth in autumn, but the fourth season they are transplanted into beds, where they remain two or three years longer till all the bulbs have flowered.

The soil is essentially a very sandy loam and vegetable mould; and if in forming the beds this soil can be made to the depth of two feet, and at the bottom of the bed a layer of six or nine inches of cow-dung

4874 Flowers campanulate half 6-cleft cylindrical at base

4875 Flowers funnel-shaped half 6-cleft ventricose at base

4876 Leaves linear channelled longer than scape

4877 Flowers cylindrical ovate uniform horizontal subsessile

4878 Flowers camp. cylindrical half 6-cleft, Pedunc. in fruit very long and horizontal

4879 Flowers cylindrical angular on long stalks, the upper sterile on very long stalks

4880 Flowers campan. cylindrical, Limb erect shorter than tube, Leaves lin. lanc. erect

4881 Flowers globose uniform : the lower remote, Leaves linear upright channelled

4882 Flowers ovate uniform clustered : the upper sessile, Leaves lax dependent linear

4883 Flowers campanulate sessile, Inner sepals longer spreading obtuse, Leaves lin. lanc. smooth

4884 Flowers campanulate sessile, Inner sepals longer spreading obtuse, Lvs. obl. lanc. with cartila. cren. edge

4885 Flowers campanulate sessile, Inner sepals longer spreading obt. Scape ang. at end short. than lin. obl. lvs.

4886 Fl. campanulate sessile, Inner sepals longer spreading emarg. Lvs. lin. chann. lax twice as long as scape

4887 Fl. campan. sessile, Inner sepals longer spreading obov. obt. Lvs. lin. channelled lax longer than scape

4888 Fl. camp. cylind. on short stalks erect, Inner sep. long lanc. obt. erect, Lvs. lin. chann. lax long. than scape

4889 Flowers camp. stalked, Inner sepals longer obovate spreading, Lvs. lanc. channelled shorter than scape

4890 Fl. camp. stalked horizontal, Inner sep. longer obt. Stam. longer than fl. Lvs. lanc. twice as short as scape

4891 Leaves two, Scape not longer than leaves, Fl. short horizontal, Stamens long declinate

4892 Leaves two oblong, Raceme compact, Flowers short campanulate nearly as long as stamens

4893 Leaves three lanceolate blistered shorter than scape, Flowers campanulate erect

4894 Flowers camp. on short stalks, Inner sep. long. obtuse, Scape 3 cornered reclinate, Leaves blistered

4895 Fl. camp. stalked, Inner sep. long obt. revol. Stam. longer than fl. Scape angular at end, Leaves blistered

4896 Leaves two oval-edged, Flower erect conical shorter than spreading stamens

4897 Fl. camp. flat at base length of stalk, Inner sep. long. obt. Stam. longer than fl. Scape ang. at end, Lvs. obl.

4898 Leaves lanceolate erect unequal : the larger cucullate at base, Scape few-flowered shorter than leaves

4899 Lvs. lin. lanc. two-spreading, Flowers whole-colored with the outer sepals nearly as long as the inner

4900 Flowers cylindrical length of stalks, Inner sepals longer obtuse unequal, Leaf one lin. lanceol.

4901 Lvs. two lin. lanc. spreading, Fl. erect sessile clust. ovate with inner sep. much the narrowest and longest

4902 Flowers cylind. stalked, Sepals linear obtuse equal, Scape angular at end, Leaves lanc. deflexed

4903 Flowers cylind. stalked pendulous, Inner sepals longer emarginate, Leaves lanceolate

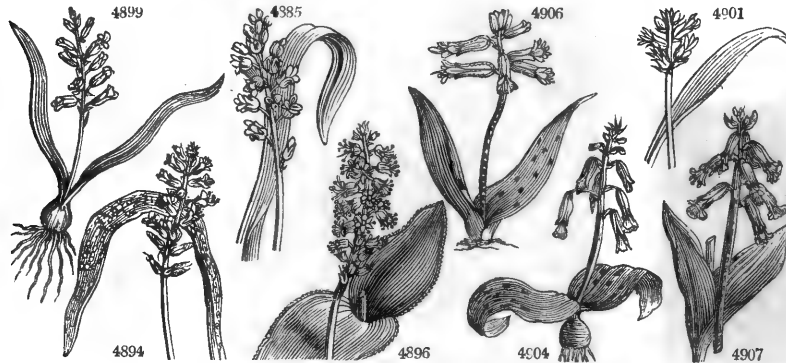

4904 Flowers cylind. stalked pendulous, Inner sepals longer emarginate spreading, Leaves obl. spreading

4905 Leaves twin obl. not spotted, Scape erect not spotted, Flowers cylindrical pendulous

4906 Flowers cylind. on short stalks pendulous, Inner sepals longest, Leaves oblong

4907 Leaves twin lin. lanc. spotted, Scape erect, Flowers pendulous with the inner limb of sepals spreading

4908 Flowers camp. stalked, Outer sepals long spreading : inner connate, Leaves long channelled

and Miscellaneous Particulars.

deposited, the plants will thrive the better. The season of planting is from the middle of October to the middle of November. The bed should be protected from heavy rains and severe frosts by the usual means ; and about the beginning of April, when the flowers begin to open, an awning of canvass should be fixed over them, to exclude all extremes of weather, and the more brilliant moments of sunshine. In three weeks or a month after blooming the bulbs should be taken up, unless they are intended to remain for replanting. They should be dried in the shade, or under a few inches of dry earth, kept dry, and afterwards cleaned and wrapped up in separate papers, or laid on open airy shelves till wanted for replanting.

The hyacinth forces well, especially some of the blue sorts ; it also does better than most bulbs when planted on water.

820. *Zuccagnia*. This plant was named in honor of Attili Zuccagni, superintendent of the garden at Florence. It is scarcely a different genus from *Uropetalon*.

821. *Muscari*. Something which smells of musk, called  $\mu\sigma\sigma\chi\omicron\varsigma$  in Greek, *muscus* in Latin, *misk* in Arabic. (*Forskahl.*) *M. comosum*,  $\beta$  monstrosum, is a most ornamental border flower. The bulb is large, ovate, and solid : the leaves narrow, a foot long, with obtuse points : the flower-stalks rise near a foot and a half high ; they are naked at the bottom for about seven or eight inches, above which the panicles of flowers begin, and terminate the stalks. The flowers stand upon peduncles which are more than an inch long, each sustaining three, four, or five flowers, whose petals are cut into slender filaments like hairs ; they are of a purplish blue color, and, having neither stamina nor germ, never produce seeds. The other species are very pretty hardy flowers.

*M. racemosum* was named starch hyacinth by William Curtis, from the smell of the flower.

822. *Lachenalia*. So named in honor of Wernerus de la Chenal, of Switzerland, author of some medical and botanical tracts printed at Basle. The numerous species of this genus were chiefly introduced from the Cape by Masson : they bear a strong general resemblance, and are yet individually different ; they may be styled diminutive, but pretty ; they grow readily in sand and peat, and may be forced or retarded so as to flower at almost any season. They must be very sparingly watered when not in a growing state.

History, Use, Propagation, Culture,

823. *Phormium*. From *φορμος*, a basket. This plant sends up numerous leaves, which in New Zealand and Norfolk Island are manufactured into matting; or a coarse thread is separated from them and made into cordage and coarse linen, as is done from different species of Aloe, Agave, and Liliaceæ in the Levant and south of Europe. The plant thrives in any rich light soil, increases readily by offsets, and is said to stand the oven air about Cork, where thoughts are entertained of using it as a substitute for flax. The experiments, however, which have been made in New Holland by some spirited individuals respecting its cultivation, have all failed.

824. *Cyanella*. Derived from *κυανος*, blue, in allusion to the color of the flowers of some species; all are very pretty and easily cultivated.

825. *Leontice*. An abridgment of *Leontopetalum*, its ancient name; from *λεων*, a lion, and *πτελον*, a leaf, because the shape of the leaves was thought to resemble the print of a lion's foot.

826. *Caulophyllum*. From *καυλον*, a stem, and *φυλλον*, a leaf. Its leaves are so terminated by the stalk, as to appear a mere continuation of a stem.

827. *Diphyllia*. From *διε*, two, and *φυλλον*, a leaf. The plant has never more than two leaves.

828. *Prinos*. This was the Greek name of the evergreen oak; from *πριος*, to saw, on account of the strongly toothed leaves of that plant. The species are low shrubs of little beauty; but of the easiest culture in any light soil.

829. *Berberis*. *Berbéry*s, according to Golius, (p. 246), is the Arabic name of this plant. *B. vulgaris* is at once an ornamental shrub, a fruit tree, a hedge plant, a dye, a drug, and a reputed enemy to the corn farmer. When covered with flowers in spring, or with fruit in autumn, it is a fine object. The leaves are of a yellowish or bluish green, and gratefully acid to the taste. The smell of the flowers is offensive when near, but pleasant at a certain distance. The berries are so very acid, that birds seldom touch them. The berry, however, is cultivated for the sake of these, which are pickled and used for garnishing dishes; and being boiled with sugar, form a most agreeable rob or jelly; they are used likewise as a sweetmeat, and are put into sugar-plums or confits. As a medicine the fruit is considered a mild restraining acid, agreeable to the stomach, and of efficacy (like other vegetable acids) in hot bilious disorders, and in a putrid disposition of the humours. The roots boiled in a lye yield a yellow colour: and in Poland they dye leather of a fine yellow

- 4909 The only species, resembling an *Agave*
- 4910 Stem leafy paniced, Racemes divaricating, Leaves lanceolate wavy  
4911 Scape naked branched, Racemes erect, Leaves linear lanceolate flat
- 4912 Leaves pinnate, Leaflets whorled lanceolate acute 3-pointed  
4913 Radical leaves biternate; cauline ternate, Fruit ovate
- 4914 Cauline leaf triternate; floral biternate
- 4915 Quite smooth, Leaves palmate angular lobed serrated with taper-pointed lobes
- 4916 Leaves obovate lanceolate acuminate doubly serrated, Veins beneath hairy  
4917 Leaves oval pointed at each end mucronate serrulate pubescent beneath, Female flowers solitary  
4918 Leaves lanceol. serrated acuminate smooth on each side, Flowers all 6-cleft  
4919 Leaves lanceol. very finely and distantly serrated acute at each end quite smooth, Male flow. 3-androus  
4920 Leaves lanceol. obt. smooth serrated at end  
4921 Leaves elliptical acuminate smooth somewhat serrated at end
- 4922 Racemes simple pendulous, Leaves obovate ciliate-toothed
- 4923 Branches dotted, Prickles in 3s, Lvs. simple obovate remotely toothed, Racemes short, Fruit globular  
4924 Spines 3-parted, Leaves oval with a few large spiny teeth, Ped. short 4-fl. Pedicels elongate corymbose  
4925 Spines 3-5-parted, Leaves oval-oblong entire or serrated, Racemes 3-8-flow. almost shorter than leaves  
4926 Spines 3-7-parted, Leaves lanceolate obovate ciliate-toothed, Peduncles 1-flowered shorter than leaf  
4927 Spines 3-parted, Leaves lanceolate obovate ciliate serrate, Racemes pendulous, Petals emarginate  
4928 Spines 3-parted very few, Leaves obl. obtuse entire or a little toothed, Racemes many-fl. nodding  
4929 Lvs. pinnate in 4 or 5 pairs, Leaflets ovate lanceolate spreading toothed, Racemes erect much clustered  
4930 Spines simple scarcely two-toothed at base, Lvs. obl. with 4 or 5 spiny teeth, Racemes spreading many-fl.  
4931 Spines 3-parted, Lvs. ovate lanceolate smooth some entire some three-toothed, Pedicels solitary one-flow.
- 4932 Leaves supra-decompound with lanc. entire leaflets
- 4933 Leaves pinnate lanceolate emarginate
- 4934 Cor. 6-cleft, Segments lanceolate revolute, Leaves ovate acute  
4935 Cor. 4-cleft, Segments ovate, Leaves obovate

and *Miscellaneous Particulars.*

with the bark of the root. The inner bark of the stems also will dye linen of a fine yellow, with the assistance of alum. Kine, sheep, and goats are said to eat it; horses and swine to refuse it. This species varies with red, purple, pale yellow, and stoneless fruit.

Insects of various kinds are remarkably fond of the flowers of the barberry; and the *Æcidium Berberidis*, its particular inhabitant, is supposed to generate the dust which, carried from the bush by winds, and lighting on wheat and other growing corns, gives rise to the Puccinia, a minute fungus, which closes up the pores of the leaves, and appears like rust or mildew. (*Sir J. Banks on Blight, &c.*) Many highly respectable authorities in Britain, on the continent, and in America, are in favor of and against this opinion. Willdenow, Withering, and Dwight have stated various remarkable cases on good authority. Sir J. Banks and his draughtsman Bauer proved the fact of the mildew being a fungus.

Linnaeus observed, that when bees in search of honey touch the filaments, the anthers approximate to the stigma and explode the pollen. Sir J. Smith ascertained that the same effect is produced by touching the inside of the filaments with a small bit of stick. (*Phil. Trans. vol. lxxviii. 1. 158.*)

All the other species are much esteemed as ornamental plants. *B. aristata* is a fine hardy evergreen shrub. *B. ilicifolia* and *emarginata* are also hardy, but less ornamental. *B. fascicularis* is a beautiful ornamental nearly hardy shrub, remarkable for its pinnate leaves.

830. *Nandina*. *Nandina* is the name of this shrub in Japan, where it is a garden shrub: the flowers are in panicles, and succeeded by berries of the size of a pea. In the greenhouse it grows freely in loam and peat, and ripened cuttings, with their leaves on, root in sand under a hand-glass.

831. *Cossiguia*. Named by Commerson, after M. de Cossigny, a French naturalist, then living at Pondicherry. Fine plants with handsome pinnate leaves.

832. *Hilla*. So named by Jacquin, in honor of Sir John Hill, author of many large works on botany and other parts of natural history, as well as general literature. Owing to some differences with his contemporaries, and writing against the Royal Society, after being rejected as a fellow, his memory in England has not met with much respect; in truth it was but little that it deserved. The species are of easy culture, and cuttings root readily in sand.

History, Use, Propagation, Culture,

833. *Richardia*. So named by Houston, after Richard Richardson, an English botanist. Cuttings root in sand under a glass.

834. *Canarina*. That is to say, a plant native of the Canaries. This plant, Sweet observes, "is very desirable, as it flowers in autumn and winter, when few other plants are in bloom. After flowering, the stem lies down, and the roots continue dormant all the summer, when they need but little water. When they begin to grow they had better be placed in the stove, as they will not flower so abundantly in the greenhouse. A light loamy soil suits them best, or a mixture of loam and peat; and they are readily increased by dividing the roots, or from cuttings planted in the same kind of soil under a hand-glass" (*Bot. Cult.* p. 162.)

835. *Frankenia*. In honor of John Frankenia, professor of botany at Upsal, who first enumerated the plants of Sweden in *Speculum Botanicum*, 1638, and *Speculum Botanicum Renovatum* in 1659.

836. *Peplis*. One of the Greek names of the Purslane. The plant now so called resembles the Purslane in some points.

837. *Oryza*. From the Arabic word *êruz*, the Greeks coined their word *ορυζα*, and the various modern nations of Europe their *rice*, *riz*, *reis*, &c. *O. sativa*, the common rice, has the culm from one to six feet in length, annual, erect, simple, round, jointed. Leaves subulate-linear, reflex, embracing, not fleshy. Flowers in a terminating panicle. Calycine leaflets lanceolate. Valves of the corolla equal in length; the inner valve even, awnless; the outer twice as wide, four-grooved, hispid, awned. Style single, two-parted.

*O. mutica*, the dry or mountain rice, cultivated in Ceylon, Java, and of late in Hungary, has the culm three feet high, and more slender. Fruit longish, with awns the longest of all. It is sown on mountains and in dry soils; roots with a long inundation, and perishes with sea water.

The varieties of rice, as of other cultivated grain, are as numerous as the different soils, climates, and other physical circumstances, in which it is cultivated: besides the dry rice, the chief sorts, by some considered species, are the *O. precox*, or early rice, and the *O. glutinosa*, or clammy rice, both cultivated in irrigated lands.

The native place of rice, like that of the other sorts of grain in common use, is unknown; it is cultivated in great abundance all over India, where the country will admit of being flooded; in the southern provinces of China, in Cochinchina, Cambodia, Siam, Japan, &c. In Japan it is very white, and of the best quality. It has also been introduced into cultivation in the southern kingdoms of Europe, Italy, Spain, the south of France, and within a few years into Hungary and Westphalia. In Carolina it has long been a staple commodity. Houghton's account of its introduction there is, that Ashby was encouraged to send a hundred pound bagful of rice to that province, from which, in 1698, sixty tons were imported into England. Dalrymple says, that rice in Carolina is the result of a small bag of *paddy*, given as a present from Dubois, treasurer of the East India Company, to a Carolina trader. A Dutch vessel also, from Madagascar, brought rice into the same province; and to this is attributed their having two kinds. (*Oriental Repertory*, 1.)

In the hilly parts of Java, and in many of the Eastern islands, the mountain rice is planted upon the sides of hills, where no water but rain can come; it is, however, planted in the beginning of the rainy season, and reaped in the beginning of the dry season. The natives call it *Paddy Gunung*, which signifies mountain rice. It is entirely unknown in the western parts of India, but it is well known in Cochinchina, where it thrives in dry light soils, mostly on the sides of hills, not requiring more moisture than the usual rains and dews supply, neither of which are frequent at the season of its vegetation.

There is a kind of hill rice which is hardy enough to grow on the edge of the Himalayan snows. It is almost to be expected, that this will, at some future time, prove an acquisition of value to the European cultivator.

Rice is extensively cultivated in the East Indies and China, and chiefly on low grounds near large rivers,

4936 The only species, Leaves lanceolate ovate rough

4937 The only species, Leaves stalked hastate toothed

4938 Flowers solitary, Petals repand obtuse, Leaves linear ciliated at base

4939 Flowers fasciated, Petals acute, Leaves linear ciliated at base

and Miscellaneous Particulars.

which are liable to be annually inundated, and enriched by the deposition of mud. According to Sir George Staunton's account, the Chinese obtain two crops of rice in a year from the same ground, and cultivate it in this way from generation to generation on the same soil, and without any other manure than the mud deposited by the water of the river used in overflowing it. After the waters of the inundation have withdrawn, a few days are allowed for the mud to get partially dry; then a small spot is enclosed by a bank of clay slightly ploughed and harrowed, and the grain, previously steeped in dung, diluted with animal water, is then sown very thickly on it. A thin sheet of water is immediately brought over it, either by a led stream, or the chain-pump. Thus a seed-bed or nursery is prepared, and, in the meantime, the remainder of the tract is preparing for being planted. When the plants are six or seven inches high, they are transplanted in furrows made by the plough, so as to stand about a foot apart every way; water is then brought over them, and kept on till the crop begins to ripen, when it is withheld; so that when harvest arrives the field is quite dry. It is reaped with a sickle, threshed with a flail or the treading of cattle, and the husk taken off by beating it in a stone mortar, or passing it between two flat stones, as in a common meal mill. The first crop being cut in May, a second is immediately prepared for by burning the stubble, and this second crop ripens in October or November. After removal, the stubble is ploughed in, which is the only vegetable manure such lands can be said to receive from man. In Japan, Ceylon, and Java, according to Thunberg, Davis, and Raffles, aquatic rice is cultivated nearly in the same manner. Mountain-rice is grown much in the same way as our barley.

In Lombardy and Savoy rice is sown on rich lands, the sower often wading to the knees in water: one crop a year only is obtained; but four crops are often taken in succession. In America a similar practice obtains.

In Westphalia, and some other parts of the south of Germany, rice has long been cultivated; there it is sown on lands that admit of irrigation; but the water is not admitted till the seed has germinated, and it is withdrawn, as in Italy, when the crop comes into flower. From long culture in a comparatively cold country, the German rice has acquired a remarkable degree of hardiness and adaptation to the climate; a circumstance which has frequently been alluded to as an encouragement to the acclimating of exotics. It is found, Dr. Walker remarks (*Essays on Nat. Hist.*), that rice seeds direct from India will not ripen in Germany at all, and even that Italian or Spanish seeds are much less early and hardy than those ripened on the spot.

In Hungary rice has not been long cultivated: the mountain sort has chiefly been tried, and that in the manner of our barley or summer-wheat.

In England a crop of rice has been obtained near Windsor, on the banks of the Thames.

In the stove, or in a hot-bed, rice may be grown in pots of rich soil placed in pans of water, and in August they may be set in the greenhouse, or under any glass roof open at the sides, and they will produce perfect grains.

By far the best imported rice is that from Carolina: it is larger and better tasted than that of India, which is small, meagre, and the grains frequently broken. As an article of diet, rice has been extolled as superior almost to any other vegetable: but, whatever it may be in warmer climates, where it is a common, and to many persons almost their only food, it does not appear so well calculated for European constitutions as the potatoe; for we find that the poor constantly reject the use of rice when potatoes are to be had; and whilst these can be obtained, we may venture to predict, that rice will always be considered in this country, rather as a dainty, to be eaten with sweet condiments, spices, fruit, &c. than as ordinary food. (*Willich's Family Cyclopaedia.*)

838. *Atraphaxis*. A name given by the Greeks to the *Atriplex* of the Latins; derived from  $\alpha$ , privative, and  $\tau\rho\phi\alpha\upsilon\upsilon$ , to nourish; that is to say, a plant yielding no nourishment. Cuttings root freely in sand under a glass; but the plants are of neither beauty nor curiosity.

History, Use, Propagation, Culture,

839. *Flagellaria*. From *flagellum*, a thong, in allusion to the length, toughness, and slenderness of its shoots.

840. *Scheuchzeria*. So named by Linnæus, in memory of the two brothers, John James Scheuchzer, professor of mathematics at Zurich, author of *Itinera Alpina*; and John, professor of physic at Zurich, author of a famous Treatise on Grasses. A curious little marsh plant.

841. *Triglöchin*. From *treis*, three, and *γλωχις*, a point, in allusion to the three angles of the capsule. All domestic cattle are fond of the hardy species, which afford an early bite on the sides of Highland mountains, and are greedily eaten where they occur in salt marshes.

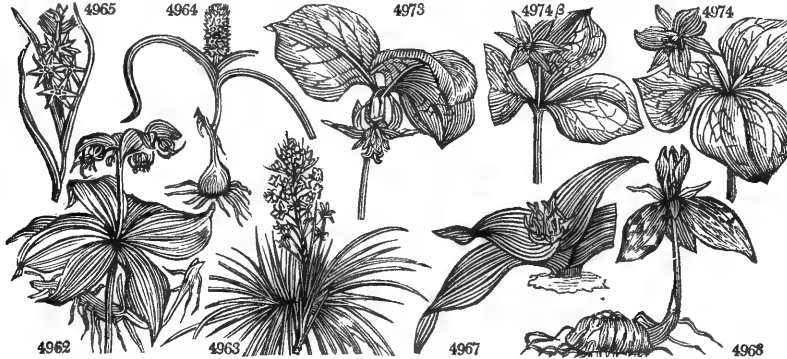

842. *Lichtensteinia*. Named after M. Von Lichtenstein, a Prussian traveller at the Cape of Good Hope.

843. *Myrsiphyllum*. From *μυρσίον*, a myrtle, and *φύλλον*, a leaf, in allusion to the resemblance between the leaves of the species and those of myrtle.

844. *Tofieldia*. Named by Hudson, after a Mr. Tofield, a country gentleman living near Doncaster.

## TRIGYNIA.

- 4946 A shrub with distichous branches, Leaves cirrhous at end  
 4947 A rushy aquatic plant  
 4948 Capsules 3-celled linear  
 4949 Capsules 3-celled smooth linear narrowed at end  
 4950 Capsules 6-celled ovate  
 4951 The only species, Sepals very narrow  
 4952 Leaves ovate cordate at base oblique  
 4953 Leaves alternate ovate-lanceolate  
 4954 Smooth, Flowers clustered in spikes, Sepals obtuse, Capsules oblong  
 4955 Scape rachis and leaf-stalks downy all over  
 4956 Leaves lanceolate bearded at base, Stem 3-flowered, Sepals sessile  
 4957 Stemless, Leaves imbricated grassy, Flowers sessile  
 4958 Leaves linear subulate, the upper dilated at base, Spike wavy, Sepals with claws  
 4959 Leaves linear, Spike one-sided, Sepals with claws  
 4960 Leaves lin. lanc. longer than one-flowered stem, Sepals lanc. with claws  
 4961 Peduncles one-flowered cernuous  
 4962 Leaves whorled in the middle of stem, in threes at the summit  
 4963 Leaves of the stem setaceous  
 4964 Spike many-flowered longer than leaves, Tube twice as long as limb  
 4965 Leaves lanceolate channelled upright, Tube shorter than stellate limb  
 4966 Leaves lanceolate hooded  
 4967 Leaves oblong lanceolate cucullate  
 4968 Flower sessile erect, Petals lanceolate erect twice as long as calyx  
 4969 Flower sessile erect, Petals linear lanceolate erect a little longer than calyx  
 4970 Stalk of flower nearly erect, Petals oval-lanceolate acute recurved about twice as long as narrow calyx  
 4971 Stalk of flower erect, Petals oblong acute spreading a little longer than calyx  
 4972 Stalk of flower erect, Petals scarcely longer than calyx, Leaves oval oblong obtuse sessile  
 4973 Stalk of flower recurved, Petals lanceolate acuminate flat reflexed the length and breadth of calyx  
 4974 Stalk of flower inclining, Flower nodding, Petals scarcely longer but much broader than calyx  
 4975 Flower pendulous, Petals ovate with a short point, Leaves rounded rhomboid acuminate subsessile  
 4976 Flower cernuous, Petals spatulate-lanceolate erect at base much longer than calyx

## and Miscellaneous Particulars.

845. *Melanthium*. A name applied by the Greeks to the *Nigella* of the Latins. What resemblance the modern plant bears to the ancient has not been stated.

846. *Medeola*. A name in remembrance of *Medea*, the famous sorceress, given to this plant on account of supposed powerful effects in medicine, but which it is now thought not to possess.

847. *Xerophyllum*. From *ξερος*, dry, and *φυλλον*, a leaf; its leaves appear as if withered. An American plant with a long spike of white flowers, resembling *Helonias*.

848. *Wurmbeea*. So called by Thunberg, in gratitude for services rendered him at Batavia by one Wurmbe, a Dutch agent there. Jussieu considers this not generically distinct from *Melanthium*.

849. *Androcymbium*. From *ανηρ ανδρος*, a man, or, in botanical language, a stamen, and *κυμβος*, a little boat, in allusion to the peculiar conformation of the stamens and their appendages.

850. *Trillium*. From *τριλις*, triple; the calyx has three sepals, the corolla 3 petals, the pistil 3 styles, and the stem 3 leaves. These are curious little plants, somewhat difficult to keep. Sweet says they do best on a bed of peat, and may be increased, though slowly, by the division of the root or by seeds.

History, Use, Propagation, Culture,

851. *Colchicum*. From Colchis, saith Dioscorides, where this plant grows in abundance; but it is probable that the term Colchicum was applied to all poisonous plants, among which this certainly held no inconsiderable place. The economy of this plant in regard to its bulbs, flowers, and seeds, is singular, and may be classed with other anomalies found in *Crocus*, &c. The bulb, which in *C. autumnale* is about the shape and size of that of a tulip, is formed in the following manner:—

From the permanent, striated, dilated tuber of the old root, sinuated on one side, and clothed with the coats of the preceding root-leaves, a new plant springs, which is tuberosus at the base, throws out fibres at bottom like other bulbs, and is received into the bosom of the former tuber, which embraces it half round. This has an outer radical spathe, which is cylindrical and tubular, cloven at top on one side, and half under ground. From two to six flowers half emerge from this spathe without leaves. In the mean time the fruits, much later than the flowers, sit on the stem rising out of the spathe. As the plant advances the new tuber increases, the old one, deprived of its nutriment, perishes, and at the same time the former pushes forth from its base the germ of a succeeding plant. There are commonly two lateral germs from the same tuber; one lower, just described, bearing the flower and seed; the other superior, caulescent like the former, but more slender, and scarcely floriferous.

The flowers, which arise with long slender tubes from the root, die off in the end of October, without leaving any external appearance of seeds. These lie buried all the winter within the bulb; in spring they grow up on a fruit-stalk, and are ripe about the time of hay-harvest. May not the very great length of the styles account in some measure for the delay in the ripening of the seeds? As this plant blossoms late in the year, and probably would not have time to ripen its seeds before winter, Providence has contrived its structure such, that it may be performed at a depth within the earth, out of the reach of the usual effects of frost; and as seeds buried at such a depth are known not to vegetate, a no less admirable provision is made to raise them above the surface when they are perfected, and to sow them at a proper season.

4977 Leaves flat lanceolate erect

4978 Leaves linear channelled erect, Styles shorter than flower

4979 Leaves 5 ovate-oblong very broad, Flowers very numerous

4980 Leaves wavy spreading

4981 Two or many-flowered, Sepals linear oblong obtuse, Leaves small oval grassy-green

4982 Leaves 4 glaucous spiral, Flowers small very dwarf, Style one

4983 Leaves appearing with flower linear much spreading

4984 Scape leafy, Leaves oblong lanceolate, Flowers diœcious

4985 Leaves lanceolate ensiform nerved, Bractes linear-lanceolate

4986 Scape leafy, Raceme oblong, Bractes short oblong, Leaves smooth lanceolate linear

4987 Leaves channelled nerved, Segments of flower broad ovate with a transverse nectary at base

4988 Root horizontal, Leaves lanc. erect, Bractes longer than flower, Nectaries distinct

4989 Scape leafy, Raceme showy lax, Bractes membranous, Leaves subulate setaceous very long

4990 Raceme oblong lax, Leaves very long and narrow, Caps. oblong

4991 Leaves grassy, Panicle loose, Segments of flower ovate acute

4992 Leaves very long narrow dry, Flowers racemose

4993 Leaves oval, Spike one cylindrical

4994 Spike bifid, Leaves linear oblong floating, Bractes entire

4995 Spike bifid, Leaves linear lanc. erect, Bractes bipartite

4996 The only species

§ 1. *Hermaphrodite. Valves marked with a grain.*

4997 Valves cordate entire : one grained, Leaves ovate lanceolate

4998 Valves entire : one grained, Leaves cordate lanceolate

4999 Valves entire all grained, Leaves lanceolate wavy acute

5000 Valves ovate entire veinless all grained, Fruit-stalks pendulous, Leaves lanceolate

5001 Valves toothed all grained, Leaves lanceolate

5002 Valves trifid setaceous : one grained

5003 Valves toothed all grained, Leaves lanceolate

5004 Valves toothed grained, Leaves linear

5005 Valves lanceolate grained toothed at base, Leaves linear lanc. Whorls distant

5006 Valves toothed all grained, Leaves cordate-oblong obtuse pubescent

5007 Valves toothed all grained, Leaves cordate-oblong acuminate

5008 Valves toothed all grained, Leaves cordate oblong obtuse crenate

5009 Valves toothed : one grained, Radical leaves panduriform

5010 Valves rounded cordate repand : one grained, Leaves cordate oblong wavy at edge

5011 Valves oblong obtuse entire : one grained, Leaves lanceolate

5012 Valves entire lanceol. one grained, Leaves cordate lanceolate

5013 Valves entire lanceolate acute grained, Upper leaves linear-lanceolate

and *Miscellaneous Particulars.*

There are a few varieties of common *Colchicum* cultivated by florists; viz. the white, striped-flowered, striped-leaved, broad-leaved, many-flowered, and double-flowered. No cattle are said to eat it; though it is remarkably abundant in the meadows of the Italian Alps, and the leaves must certainly be frequently made into hay.

*C. autumnale*, as a medicine, has been known since the days of Hippocrates. It possesses diuretic, purgative, and narcotic properties: and on the continent, where it was recommended to notice by Baron Stœrck, it is a favorite remedy in dropsy, particularly hydrothorax, and in humoral asthma. But as it does not differ in its mode of action from squill, and is more uncertain in its operation, it has not been much used in that complaint in this country. In gout and rheumatism, however, its efficacy has been fully ascertained: and in allaying the pain it may be almost said to possess a specific property. It operates on the bowels chiefly, and the nerves, diminishing the action of the arterial system. (*Thomson's Med. Met.* 257.)

All the species are ornamental as border-flowers, and may be blown in water-glasses.

852. *Helonias*. Derived from *lœx*, a marsh. Some of the species grow in bogs in N. America. These plants delight in a moist situation and peat soil: they increase slowly by dividing at the root or by seeds.

853. *Nolina*. Named after an American botanist of French extraction, called P. C. Nolin. This plant is best grown in pots, as it requires protection during winter.

854. *Aponogeton*. A name of the same meaning as *Potamogeton* (see that genus), of which it is probably an incomplete anagram. These plants are bulbous aquatics, and grow freely in loam and peat plunged in a cistern of water. They are very pretty ornaments of the aquarium.

855. *Sabal*. A name employed by Adanson. It is supposed to have no meaning.

856. *Rumex*. A name given by the Latins to a root of thorn.

*R. patientia* (so called from the slowness of its operation as a medicine) and *sanguineus*, were formerly

History, Use, Propagation, Culture,

used as spinage plants. The former is still used on the continent, and mashed with a small proportion of *R. acetosa* or *scutata*, makes a very good spinage.

*R. crispus* has a fusiform yellow root, which, taken in a recent state, and bruised and made into an ointment or decoction, is said to cure the itch.

*R. obtusifolius* is a domestic weed of the worst description: it is found in every country of Europe, but almost confined to cultivated grounds or rubbish, rick-yards, neglected gardens, and places used as retiring grounds by men or cattle. It is never found on poor or wet-bottomed land. It is refused by cattle; but the leaves were formerly used for wrapping round butter and cream-cheese; and the roots, along with those of *R. acutus*, by the dyers. In powder, the roots of most docks are said to be one of the best articles for cleaning the teeth. The leaves of all of them are considered laxative rather than otherwise.

*R. acetosa* has been long cultivated in gardens for its leaves as spinage and salad; but *R. scutatus* is much more delicate. The Laplanders use the leaves of the *R. acetosa* to turn their milk sour: in Ireland they are eaten with fish and other alkaliesent food. The root is powerfully astringent, and considered antiscorbatic: dried and boiled it gives out a beautiful red color. All domestic cattle eat this and most other species of the genus.

*R. acetosella*, where it abounds naturally, is a certain indication of dry, poor, gravelly, iron soil. *R. alpinus*, monk's or bastard rhubarb, was formerly used as true rhubarb, but in larger doses.

The different species of *Rumex* attract the cultivator's attention as weeds more powerfully than as culinary, medicinal, or dying plants. The sorts vulgarly known as docks produce a large quantity of seeds, and ripen them rapidly and perfectly. Fortunately they are heavy, and are not carried to a great distance from the parent; but almost every one grows, and once a year old they are tedious and expensive to eradicate. The first season they may be destroyed by hoeing; but when the tap-root is established, unless it be wholly eradicated by the weeding, or dock-hook, or spade, the ground cannot be considered as cleared. Any part of the

- 5014 Valves veiny toothed grained, Lower leaves cordate oblong, upper oval, all with colored veins
- 5015 Valves toothed one grained, Leaves ovate lanceolate repand entire
- 5016 Like *R. persicarioides* but differing in having auricled leaves and longer teeth to the valves

§ 2. *Hernaphrodite. Valves naked.*

- 5041 Leaves oval cordate 9-nerved
- 5042 Leaves elliptical obtuse, Capsules striated
- 5043 Leaves linear-lanceolate, Capsules 5-cornered incurved

and Miscellaneous Particulars.

root left will generate buds and send them to the surface, and if the plough or spade cut a root into pieces an inch long, each piece will grow, whether near the surface or buried to some depth. The less careful agriculturist often receives dock-seeds with his grass-seeds, brought from the stable-keepers and not properly cleaned: these come up the first year, and establish themselves along with the clover unobserved. The second year they flower, and if the crop is not early cut the seed ripens, and in using the hay is either mixed with the litter of the stable or with the hay-seeds, to be again carried to the field. Such as purchase town-manure cannot avoid receiving dock-seeds; but they may destroy them by fermenting the manure well before using it; others, who desire to get rid and keep clear of this weed, should be most particular in their choice of seeds of every kind, especially of grass-seeds; should weed them out as soon as they can be discovered; and, for such as remain till the second year, they may be pulled by hand when in the flower-stalk, and during or after a day's rain. (See *Encyc. Agr. art. Peren. Weeds.*)

857. *Oxyria*. From *ὄξυς*, acid, in allusion to the qualities of its leaves. The plant is one of those singular individuals which has the character of two distinct genera, and yet is referable to neither. Wahlenberg made it a *Rheum*, Linnaeus a *Rumex*, Mr. Brown what it now is. It was formerly used as a salad.

858. *Wendlandia*. Named in honor of J. C. Wendland, a German botanist. He has published various works upon plants, many of them illustrated with numerous colored figures. This is a climbing plant, referred by Decandolle to *Cocculus*.

859. *Damasonium*. From *δαμασσω*, to take away or diminish. This plant had the reputation of removing the effects of the venom of the sea-dog. Handsome floating aquatics.

860. *Actinocarpus*. From *ἄκτις*, a ray, and *καρπός*, fruit, in allusion to the radiate disposition of the little carpella round a common axis. Pretty floating aquatics.

861. *Aisma*. Derived from *αἶς*, water, in Celtic. *Aisma* Plantago grows in watery places, and is called water-plantain, from the resemblance between its leaf and that of the common plantain.

CLASS VII.—HEPTANDRIA. 7 STAMENS.

A SMALL class, of which the Parinarium, which is a good tropical fruit, and the valuable Horse-chesnut, *Æsculus*, are the only remarkable genera. The *Astranthus* is a curious genus of the natural order of Homalinee.

Order 1. MONOGYNIA.  7 Stamens. 1 Style.

- 862. *Trientalis*. Cal. 7-leaved. Cor. 7-parted, equal, flat. Berry without juice.
- 863. *Disandra*. Cal. about 7-parted. Cor. rotate, 7-parted. Caps. 2-celled, many-seeded.
- 864. *Pisonia*. Cal. campanulate, 5-cleft. Cor. O. Berry 1-celled, 1-seeded.
- 865. *Petiveria*. Cal. 4-leaved. Cor. O. Style lateral. Stigma pencil-shaped. Seed 1, with four reflexed awns at the end.
- 866. *Æsculus*. Cal. 1-leaved, inflated. Cor. 4-5-petaled, unequal, pubescent, inserted in the calyx. Caps. 3-celled. Seeds large, chesnut-like.
- 867. *Jonesia*. Cal. 2-leaved. Cor. funnel-shaped, with a closed fleshy tube and 4-cleft limb. Nectary, a ring inserted in the throat of the tube. A Legumen.

History, Use, Propagation, Culture,

862. *Trientalis*. From *triens*, the third of a thing; why so named we do not understand. Sir J. E. Smith says, "Few persons have seen the fruit of this plant; and it was most unaccountably mistaken, even by Linnæus and Gærtner. The valves of the ripe capsule become concave externally, convex and polished within, and have been taken for a permanent corolla. But they are opposite to the calyx leaves, which the segments of the corolla are not. The beautiful tunics of the seeds were supposed to be the skin of a dried berry, and are not faithfully represented by Gærtner. (*English Flora*, vol. ii. 208.)

863. *Disandra*. From *dis*, difficult, and *andros*, a male, or, in botanical composition, a stamen; that is to say, a plant of which the stamens are subject to vary, and therefore difficult for botanists. A trailing plant with bright yellow flowers.

864. *Pisonia*. So named by Plumier, in honor of William Piso, a physician at Amsterdam, author of the *Natural History of Brazil*, 1648, fol. *P. aculeata* is an inebriant tree with round resinous spiny branches, wanting support. It is common in the savannahs and other low places in the island of Jamaica, and in

866. *Dracontium*. Spathe cymbiform. Spadix covered. Cal. O. Petals 5. A berry.

869. *Calla*. Spathe ovate. Spadix covered. Cal. O. Cor. O. A berry.

870. *Parinarium*. Cal. 5-cleft. Petals 5. Stamens 14, of which 7 are barren. Drupe fleshy cribose. Nut 2-celled, with 1-seeded cells.

Order 2. DIGYNIA.  7 Stamens. 2 Styles.

871. *Limeum*. Cal. 5-leaved. Petals 5, equal. Caps. globose, 2-celled.

Order 3. TETRAGYNIA.  7 Stamens. 4 Styles.

872. *Saururus*. Cal. a spike of 1-flowered scales. Cor. O. Ovaries 4. Berries 4, 1-seeded.

873. *Astranthus*. Cal. O. Cor. hypocateriform, with a 14-cleft limb. Seed 1, small, superior.

Order 4. HEPTAGYNIA.  7 Stamens. 7 Styles.

874. *Septas*. Cal. 7-parted. Petals 7. Ovaries 7. Caps. 7, many seeded.

### MONOGYNIA.

5044 Leaves lanceolate entire

5045 Leaves narrow lanceolate acuminate oblique

5046 Leaves reniform crenate, Flower-stalks in pairs

5047 Spines axillary horizontal, Leaves ovate narrowed at each end, Corymb axillary

5048 Unarmed, Leaves opposite acuminate narrowed into a short stalk very smooth fleshy

5049 Unarmed, Leaves opposite a little narrowed towards the base entire smooth, Lateral nerves parallel

5050 Unarmed, Leaves ovate acuminate, Flowers cymose erect, Fruit berried

5051 Unarmed, Leaves opposite acute scarcely narrowed at the base entire smooth with parallel nerves

5052 Leaves ovate entire villous, Flowers in umbels

5053 Leaves quinate pointed (*Lilac de Madagascar*.)

5054 Leaves oblong acuminate smooth, Cymes compound, Flowers polygamous, Fruit spiny

5055 Flowers hexandrous

5056 Flowers octandrous

5057 Leaves digitate 7, Petals 5 spreading

5058 Leaves quinate smooth unequally toothed, Petals 4 with connivent claws the length of the calyx

5059 Leaves quinate pointed at each end downy beneath unequally toothed, Petals 4

5060 Leaves quinate beneath at the rib pubescent, Petals 4 with connivent claws longer than the calyx

5061 Leaves quinate quite smooth, Petals 4 spreading with claws the length of the calyx, Fruit spiny

#### and Miscellaneous Particulars.

several other islands in the West Indies, where it is very troublesome to whoever passes, fastening itself by its strong crooked thorns to the clothes; and the seeds being glutinous and burry, also fasten themselves to whatever touches them: so that the wings of the ground-doves and other birds, are often so loaded with the seeds, as to prevent their flying, by which means they become an easy prey.

865. *Petiveria*. So named by Plumier, in honor of James Petiver, apothecary of London, and fellow of the Royal Society, author of *Museum*, 1695; *Gazophylacium*, 1702, collected into one volume folio, with many plates. P. alliacea, is common in savannahs and woods in the West Indies, where it is a troublesome weed, and tastes the milk of cows that feed on it. It is so acrid, that on chewing a little, it burns the mouth and leaves the tongue black, dry, and rough, as it appears in a malignant fever. It is thought, however, to be covered by Guinea-hens, and hence its vulgar name of Guinea-hen weed.

866. *Esculus*, or *Esculus*, as Pliny writes it. A name which the Latins gave to a tree which furnished them with an esculent nut: that plant was the *Quercus Esculus* of Linnæus. *Marronnier*, Fr., *Marronien-*

History, Use, Propagation, Culture,

baum, Ger., and Marrone, Ital. *Æ. hippocastanum* (*ξσρος*, horse, horse-chesnut; because it was formerly a veterinary medicine) is a magnificent tree, at once grand from its magnitude and massy form, and beautiful when in blossom, from being covered with spikes of delicate white and pink flowers, protruding from among elegant digitate leaves. It is a rapid growing tree, and speedily produces a considerable bulk of timber, which, however, is of little value as such. The plant is best adapted for an ornamental tree in the outskirts of plantations, in avenues, or singly on lawns. It is much prized by the French as an ornamental avenue tree, and when the geometric style of gardening was in vogue in this country was a good deal planted, as at Bushy park, Canons, Castle Howard, &c. During the rage for the picturesque, it fell into disrepute from its "compact lumphish parabolic form;" but the public are now convinced that there are other beauties besides those peculiarly adapted for representation by painters, and the taste for trees beautiful or interesting from their flowers, foliage, or other details, is now reviving. The nuts or capsules are large and mahogany colored, and have often occasioned regret that they are not edible, like those of the Spanish chesnut. Deer eat them greedily, and may be seen watching about the trees for their fall during windy weather. In Turkey they are ground and mixed with horse provender. According to some, swine and sheep may be fattened on them, and poultry when they are boiled. They are of a saponaceous nature, and broken and steeped in hot water might save soap, where that article is excessively dear. This tree migrated from the northern parts of Asia into England by Constantinople, Vienna, Italy, and France. Parkinson in 1629 places it in his orchard as a fruit tree, and describes the nuts as superior to the ordinary sort.

E. Pavia was so named by Boerhaave, in honor of Peter Paw, a Dutchman, and professor of botany at Leyden, in 1691.

The other species have beautiful flowers, but are not free growing trees.

- 5062 Leaves 6-7-nate obov. acuminate 2-serrate, Petals 4 connivent with claws shorter than cal. Anth. smooth  
 5063 Leaves quinate, Petals spreading with claws shorter than calyx, Stam. twice as long as cor. Fruit spiny  
 5064 Leaves quinate, Petals 4, Stamens twice as long as corolla  
 5065 The only species

- 5066 Leaves supradecomposed, pedate, Segments pinnatifid, Scape much shorter than leaf-stalks  
 5067 Leaves sagittate, Peduncles and petioles prickly  
 5068 Stem climbing, Leaves cordate ovate bored through

- 5069 Leaves sagittate cordate, Spathe cucullate, Spadix male upwards  
 5070 Leaves cordate, Spathe flat, Spadix hermaphrodite all over  
 5071 Leaves cordate acuminate, Spathe boat-shaped hiding the spadix

- 5072 Leaves ovate-oblong green above white beneath  
 5073 Leaves long oblong-lanceolate very white all over

## DIGYNIA.

- 5074 Leaves oblong stalked

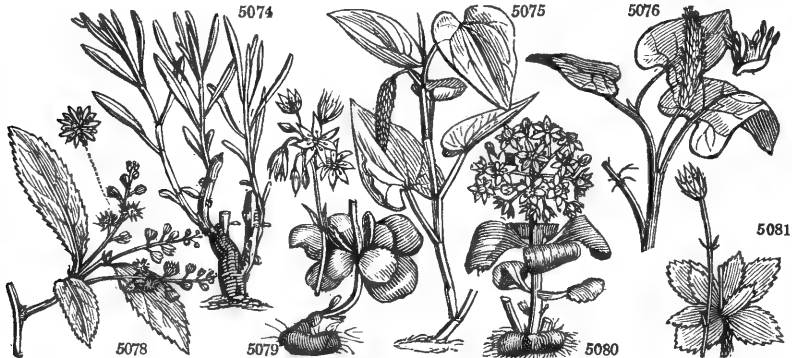

## TETRAGYNIA.

- 5075 Leaves cordate stalked  
 5076 Leaves deeply cordate ovate-lanceolate shining  
 5077 Leaves cordate ovate acuminate shining nerved

- 5078 Leaves ovate lanceolate serrated

## HEPTAGYNIA.

- 5079 Leaves connate crenate roundish, Stem nearly leafless  
 5080 Floral-leaves 4 spatulate doubly crenate, Umbel compound  
 5081 Stem-leaves about two hooded and connate into a skreen, Flowers many minute

## and Miscellaneous Particulars.

867. *Jonesia*. Named in honor of the famous Sir W. Jones, who to his other accomplishments added the knowledge of botany. The most fragrant tree of India. Large cuttings root well in sand under a hand-glass.

868. *Dracontium*. From *δρακων*, a dragon. The stems of some species are mottled like the skin of a snake.

869. *Calla*. A name of one of Pliny's plants, which probably was applied to something of the same natural order as that now called *Calla*.

870. *Parinarium*. The Guiana name of the genus is *Parinari*. Very fine trees with fine bunches of terminal flowers, which are succeeded by plum-like fruits, that in hot climates are esteemed and served up at table. It has been called *Petrocarya* by Schreber and other Linnæan botanists, who fancy science to depend upon names.

871. *Limcum*. An ancient name of a poisonous plant. It is derived from *λοιμος*, pest, poison. It was used, says Pliny, to poison arrows with. The plant to which modern botany has applied this name is a dangerous poison.

872. *Saururus*. From *σαυρος*, a lizard, and *ουρα*, a tail; on account of its long and pyramidal tail, which may be compared to the tail of a lizard. Aquatic plants with neat foliage, but with no beauty in their flowers.

873. *Astrantius*. From *αστρος*, a star, and *ανθεα*, a flower, on account of the star-like disposition of the segments of the flower. A small Chinese bush with serrated leaves, and spikes of pale whitish green flowers.

874. *Septas*. From *septem*, seven. All the parts of the flower are in seven. Very neat little Cape plants, with umbels of white flowers.

## CLASS VIII. — OCTANDRIA. 8 STAMENS.

This is a class, which, with reference to the plants which compose it, is of much consequence to the botanist and gardener. To the former it is recommended by the singular Melastomaceous plants which it contains, the curious *Michauxia*, and the *Jeffersonia*, remarkable for its capsule, which opens like a snuff-box. To the gardener it possesses irresistible attraction, not only in the delightful *Tetradhecas*, *Boronias*, and *Correas* of New Holland, in the *Dimocarpus* of China, celebrated for its truly excellent fruit, and in the *Fuchsias*, *Oenotheras*, *Combretums*, and *Vacciniums*, some of which form the pride of our hardy gardens; but also in the magnificent tribe of *Heaths*, which are certainly the most beautiful of plants, under cultivation. This is abundantly attested by the splendid collections of Lee of Hammersmith, Rollison of Tooting, and last, but not least, of *Lodiges* of Hackney, where the precision of science is combined with the allurements of form and coloring.

Order 1. MONOGYNIA.  8 Stamens. 1 Style.

## § 1. Ovary superior

875. *Tropæolum*. Cal. 1-leaved, 5-cleft, spurred. Petals 5, unequal. Nuts coriaceous, furrowed. Seed 1, roundish.
876. *Roxburghia*. Cal. 4-leaved. Petals 4. Nectary 4 lanceolate leaves inserted in the middle of the petals. Anthers 2, hanging down from the base of each nectarial leaf. Caps. 1-celled, 2-valved, many seeded. Seeds on a spongy placenta.
877. *Grislea*. Cal. 4-cleft. Pet. 4, from the recesses of the calyx. Filaments very long, ascending. Capsule globose, 1-celled, many-seeded.
878. *Boronia*. Cal. 4-cleft, persistent. Petals 4, ovate. Nect. coronate. Filam. ciliated, incurved. Stigma capitate. Caps. 4, 2-valved. Seeds solitary, with an arillus.
879. *Tetradheca*. Cal. 4-cleft. Petals 4. Anthers 4-celled. Caps. 2-celled, 5-valved: with valves bearing the septa in their middle. Seeds about 2.
880. *Correa*. Cal. campanulate. Petals 4. Caps. 4-celled, opening with 4 valves. Cells 1-2-seeded.
881. *Mimusops*. Cal. 4-leaved. Petals 4. Nectary 16-leaved. Drupe pointed.
882. *Oreithrope*. Cal. 4-parted. Petals 4, bearded in the middle. Ovary double. Berries 2, 1-seeded.
883. *Dimocarpus*. Sepals 5. Petals 5, reflexed, villous inside. Berries 2, one of which is often abortive, barked, tubercled, 1-celled, 1-seeded.
884. *Melicocca*. Cal. 3-parted. Petals 4, reflexed below the calyx. Stigma peltate. Drupe with a cork.
885. *Bighia*. Cal. 5-parted. Petals 5. Style very short. Stigmas 3. Seed solitary with a very large arillus.
886. *Metaiba*. Cal. 5-parted. Petals 5, with two scales at their base. Caps. oblong, 1-celled, 2-seeded.
887. *Kölreuteria*. Sepals 5. Petals 4, irregular. Nect. 4 bifid scales. Caps. inflated, 3-celled, with 2-seeded cells.
888. *Guarea*. Cal. 4-toothed. Petals 4. Nectary cylindrical, bearing the anthers on the orifice. Caps. 4-celled, 4-valved. Seeds solitary.
889. *Amyris*. Cal. 4-toothed. Petals 4, oblong, spreading. Stigma capitate. Berry drupaceous, by abortion 1-seeded.
890. *Ximena*. Cal. 4-cleft. Petals 4, hairy, revolute. Drupe 1-seeded.
891. *Becchia*. Cal. 5-cleft. Petals 5. Caps. 3-4-celled, many-seeded, covered with the calyx. Seeds few.
892. *Erica*. Sepals 4, persistent. Cor. 4-cleft, persistent. Filaments inserted in the receptacle. Anthers bifid. Caps. membranous, 4-8-celled.
893. *Menziesia*. Cal. 1-leaved. Cor. 1-petalous, ovate. Filam. inserted in the receptacle. Caps. 4-celled, with the septa from the inflexed edges of the valves. Seeds many, numerous.
894. *Chlora*. Sepals 8 or 10. Cor. 1-petalous, 8-cleft. Caps. 1-celled, 2-valved, many-seeded.
895. *Michauxia*. Cal. many-cleft. Cor. rotate, 8-10-parted, revolute. Nect. 8-valved, stamiferous. Caps. 8-10-celled, many-seeded.
896. *Jeffersonia*. Sepals 5, colored, deciduous. Petals 8, incurved spreading. Stamens surrounding the ovary. Caps. obovate, stipitate, 1-celled, opening below the end.
897. *Dodonæa*. Sepals 4. Cor. O. Filaments very short. Anth. oblong. Caps. 3-celled, 3-winged. Seeds 2.
898. *Lausonia*. Cal. 4-cleft. Petals 4. Stamens in 4 pairs. Caps. 4-celled, many-seeded. Seeds angular.

## § 2. Ovary inferior.

## A. Seeds many.

899. *Osbeckia*. Cal. 4-cleft: its lobes separated by a fringed scale. Cor. of 4 or 5-petals. Anthers rostrate. Caps. 4-5-celled, surrounded by the truncated tube of the calyx. Recept. compressed, half ovate.
900. *Rhæsia*. Cal. urceolate, 4-5-cleft. Petals 4, inserted in the calyx, oblique. Anthers declinate. Caps. setose, 4-celled, inside the calyx. Recept. lunate. Seeds numerous cochleate.
901. *Oenothera*. Cal. tubular, 4-cleft, with deciduous deflexed segments. Petals 4, inserted in the calyx. Stigma 4-cleft. Caps. 4-celled, 4-valved, inferior. Seeds naked, affixed to a 4-cornered central receptacle.
902. *Gaura*. Cal. 4-cleft, tubular. Petals 4, ascending towards the upper side. Nect. inferior, 1-seeded.
903. *Epilobium*. Cal. 4-cleft, tubular. Petals 4. Caps. oblong, inferior. Seeds comose.
904. *Fuchsia*. Cal. funnel-shaped, colored, deciduous. Petals 4, in the throat of calyx, alternate with its segments. Nectary an 8-furrowed gland. Stigma capitate. Berry oblong, obtuse, 4-cornered, 4-celled.
905. *Jambolifera*. Cal. 4-toothed. Petals 4, funnel-shaped. Filaments flattish. Stigma simple. Fruit a 4-celled drupa.
906. *Oxycoocus*. Cal. 4-cleft. Cor. 4-parted, with linear revolute segments. Filaments conniving. Anthers tubular, 2-parted. Berry many-seeded.
907. *Vaccinium*. Cor. urceolate or campanulate, 4-5-cleft, with reflexed segments. Filaments inserted on the ovary. Berry 4-5-celled, many-seeded.

## B. Seed one.

908. *Memecylon*. Cal. with a striated bottom, and an entire edge. Cor. 1-petalous. Anthers inserted on the side of the end of the filament. Berry crowned with the cylindrical calyx.
909. *Lagetta*. Cor. caducous, tubular, 4-toothed, with 4 petal-like glands. Drupe hairy, pisiform, 1-seeded.
910. *Daphne*. Cor. 4-cleft, like a corolla, withering, including the stamens. Drupe 1-seeded.
911. *Dirca*. Cor. tubular, with an obsolete limb. Stamens longer than tube. Berry 1-seeded.

912. *Gnidia*. Cor. funnel-shaped, 4-cleft; with 4-8-petaloid scales at the orifice. Nut somewhat drupaceous.  
 913. *Stellera*. Cor. 4-cleft, inflated in middle. Stam. inserted in throat, very short. Nut 1, beaked.  
 914. *Passerina*. Cor. 4-cleft, naked. Style filiform, lateral, long. Stamens inserted on the tube. Nut 1, coated.  
 915. *Lachnæa*. Flowers in heads. Cor. 4-cleft, with an unequal limb. Filaments long, with an unequal insertion. Nut somewhat drupaceous.  
 916. *Combretum*. Cal. 4-toothed, campanulate, superior. Petals 4, inserted in the calyx. Stamens very long. Caps. 4-angular, with membranous angles, 1-celled. Seed 1, oblong.

Order 2. DIGYNIA.  8 Stamens. 2 Styles.

917. *Galenia*. Cal. 4-cleft. Cor. O. Capsule roundish, 2-seeded.  
 918. *Aphananthe*. Sepals 5. Two stamens opposite 2 sepals, 6 opposite and alternate with three other sepals.  
 919. *Weinmannia*. Sepals 4. Petals 4. Caps. 2-celled, 2-beaked.  
 920. *Möhringia*. Sepals 4. Petals 4. Caps. 1-celled, 4-valved.

Order 3. TRIGYNIA.  8 Stamens. 3 Styles.

921. *Polygonum*. Cal. O. Cor. 5-parted, like a calyx. Seed 1, angular, covered. (Stamens and styles uncertain in number.)  
 922. *Coccoloba*. Cal. 5-parted, colored, finally becoming berried. Cor. O. Berry formed of the calyx, 1-seeded.  
 923. *Paullinia*. Sepals 5. Petals 4. Nect. 4-leaved, unequal. Caps. turbinate, 3-cornered, 3-celled, with 1-seeded cells. Seeds with an arillus.  
 924. *Seriana*. Sepals 5. Petals 4. Nect. 4-leaved. Samaræ 3, longitudinally united, globose, connected downwards in a membranous wing.  
 925. *Cardiospermum*. Sepals 4. Petals 4. Nect. 4-leaved, unequal. Caps. 3, connate, inflated.  
 926. *Sapindus*. Sepals 4. Petals 4. Caps. fleshy, connate, ventricose.

Order 4. TETRAGYNIA.  8 Stamens. 4 Styles.

927. *Verea*. Sepals 4. Cor. hypocrateriform, 4-cleft, with acute segments, and a ventricose tube. Scales 4, at the base of the ovaries, linear. Capsules 4, 1-celled, many-seeded.  
 928. *Bryophyllum*. Sepals 4. Petals 4, connate into a cylinder. Seeds many.  
 929. *Paris*. Sepals 4. Petals 4, narrower. Anth. attached to the middle of filament. Berry 4-celled.  
 930. *Adoza*. Cal. 2-3-cleft, inferior. Cor. 4-5-cleft, superior. Berry 1-celled, 4-5-seeded, united with the calyx.  
 931. *Elatine*. Sepals 4. Petals 4. Caps. 4-celled, 4-valved, depressed, many seeded; the dissepiments opposite the sutures.  
 932. *Haloragis*. Sepals 4, superior. Petals 4, caducous. Drupe dry. Nut 4-celled.  
 933. *Forsköhlea*. Cal. 4-leaved. Petals 8 spatulate. Seeds 4 enveloped in wool.

MONOGYNIA.

History, Use, Propagation, Culture,

875. *Tropæolum*. From *tropæum*, a trophy. The leaf resembles a buckler, and the flower an empty helmet, of which trophies were formed. *T. majus* is an ornamental annual, and also a culinary plant. The flowers are eaten in salads, and are very grateful: they are also used as a garnish. The seeds, which consist of three conjoined berries or nuts, with grooved wrinkled gibbous husks that become fungous when dry, are pickled in salt and vinegar, and used as a substitute for capers, to which some prefer them. In the evening the flowers emit spontaneously at certain intervals visible sparks like those of an electric machine. This was first observed by the daughter of Linnæus.

876. *Roxburghia*. In honor of William Roxburgh, M. D. born in Scotland, and settled in the East Indies; author of a splendid work on the plants of the coast of Coromandel. A singular plant, the natural affinities of which are yet obscure; it grows in loam and peat, and may be increased, though but slowly, by dividing at the root.

877. *Grislea*. So named after G. Grisley, a Portuguese surgeon, author of *Viridarium Lusitanicum*, 1661. A free flowering shrub of considerable beauty; it grows in loam and peat, and cuttings root in sand under a hand-glass in heat.

878. *Boronia*. So named after Francis Borone, an Italian servant of Dr. Sibthorp, who perished from an accident at Athens. Pretty little New Holland plants, generally with red flowers. These are valuable plants, as flowering nearly all the year. They thrive best in sandy peat, with the pots well drained with broken potsherds. They may be propagated by layers or ripened cuttings, taken off at a joint and planted in sandy peat, and placed under a bell-glass, will strike root, if properly managed: the glass must be taken off occasionally to dry them, as they are very liable to damp off.

879. *Tetratheca*. From *τετρα*, four, and *θηκη*, a cell, in allusion to the four cells of the anthers, for which the plants are remarkable. Cuttings root in sand under a bell-glass.

880. *Correa*. So named after Joseph Correa de Serra, a learned Portuguese, who, without publishing much, was one of the most profound theoretical botanists of this age. He died at Lisbon in 1823. "Ripened cuttings

## MONOGYNIA.

- 5082 Leaves peltate repand mucronate, Petals acute  
 5083 Leaves peltate repand, Petals obtuse  
 5084 Leaves peltate 5-lobed palmate toothed, Petals jagged  
 5085 Leaves peltate, Lobes obtuse unequal, Flowers pinnate  
 5086 Leaves peltate 5-lobed, Lobes obtuse repand, Petals cuneate toothed at end  
 5087 Leaves cordate many-nerved  
 5088 Leaves minute tomentose beneath, Corymbs axillary spreading  
 5089 Leaves linear lanceolate entire tomentose beneath  
 5090 Leaves pinnated with an odd one in 2-4-pairs very smooth, Leaflets linear acute, Pedunc. dichotomous  
 5091 Leaves simple trapeziform acute serrulate at end smooth  
 5092 Leaves alternate few lanceolate and branches smooth  
 5093 Leaves ovate downy beneath, Teeth of calyx small acute distant  
 5094 Leaves ovate obtuse beneath rusty with down, Flowers erect, Calyx truncate  
 5095 Leaves ovate-oblong cordate, Flowers pendulous, Calyx with 4 acute teeth  
 5096 Leaves alternate ovate acuminate  
 5097 Leaves alternate clustered at the ends of the branches oblong very obtuse  
 5098 Leaves alternate obovate emarginate, Flowers hexandrous  
 5099 Leaves ternate rough, Leaflets stalked ovate acuminate serrate, Racemes simple  
 5100 Leaves ternate, Leaflets stalked oblong narrowed at each end pubescent beneath, Racemes compound  
 5101 Leaves pinnated, Leaflets flat acute, Fruit scaly, Flowers apetalous  
 5102 Leaves pinnated, Leaflets rugose blunt, Fruit hispid, Flowers pentapetalous  
 5103 The only species  
 5104 The only species

and Miscellaneous Particulars.

will root freely in sand under a bell or hand-glass. The cuttings must not be planted too thick, or they will be liable to damp. *C. speciosa* has generally been reckoned difficult to strike from cuttings, but it roots as freely as the others if properly managed, and requires the same treatment."

881. *Mimusops*. From *μῦμος*, an ape, and *οψίς*, figure. The flowers are thought to resemble the countenance of a monkey. Ripened cuttings root readily in sand under a hand-glass.

882. *Ornitrophe*. From *ορνίς*, a bird, and *τροφή*, nourishment. Its fruit is much eaten by small birds. In the Isle de France it is called *bois de merle*, or *thrush-wood*. Cuttings root in sand under a hand-glass.

883. *Dimocarpus*. From *δίδυμος*, double, and *καρπός*, fruit; its fruit grows in pairs. These are fruit-bearing trees, cultivated in China. The fruit is a berry in bunches of a red color, and rather larger than the grape. The bunches are small; the skin of the berry is tough and leathery; the pulp is colorless, semitransparent, and of a slightly sweet subacid taste. The fruit of *D. Litchi* is frequently brought to England dried like raisins; that of *D. Longan* has been ripened by John Knight, Esq. of Lee Castle, in a lofty stove, erected for the purpose of growing tropical fruits. A bunch was presented to the Horticultural Society, in September 1816, "supposed to be the only one ever produced in Europe, and which persons well acquainted with the long-yen in its native places of growth, pronounced to be quite as good as those grown within or near the tropics." (*Hort. Trans.* ii. 408.)

884. *Melicocca*. From *μέλι*, honey, and *κακός*, fruit; its fruit, which resembles the yolk of an egg, has a very sweet flavour mixed with a little acid. This tree is cultivated in some parts of South America and in Jamaica for its fruit, which grows to the size of a large plum, and is very mellow. The natives suck it for the sake of the salivation which it produces. In our stoves it thrives well in light loamy soil, and cuttings root in sand under a hand-glass in heat.

885. *Blighia*. Named in honor of the famous Captain Bligh, who first carried the bread-fruit to the West Indies. This is an esteemed African fruit tree with a reddish or yellow pome, about the size of a goose's egg,

History, Use, Propagation, Culture.

with the arillus of the seed of a grateful subacid flavor. In the West Indies it is esteemed very wholesome and nourishing. Here it grows well in loam and peat, and ripened cuttings with all their leaves on root best in sand under a hand-glass.

886. *Metaiba*. The vernacular name of the plant in French Guiana. Large cuttings root best under a hand-glass in sand.

887. *Kölreuteria*. So named by Laxmann, in honor of Joseph Gottlieb Kölreuter, who published *De plantis quibusdam Rarioribus, Tubingæ, 1755*, with a dissertation *De Insectis Coleopteris*. He also made many experiments on the pollen of flowers, hybrid plants, &c. published in the Petersburg Transactions.

This shrub should be planted in as sheltered a situation as possible, as it will not flower if too much exposed; and if the wood is not well ripened, the tops of the shoots will be injured by the frost.

888. *Guarea*. The natives of Cuba call the plant *Guara*. This tree, though it has an inconspicuous flower, yet has fine large leaves. All parts of the plant, especially the bark, smell strong of musk, and may be used instead of that perfume for many purposes. The wood is full of a bitter resinous substance, which renders it unfit for rum-hogheads, being observed to communicate both its smell and taste to all spirituous liquors: but it is often cut for staves and heading, when there is a scarcity of other timber. The powder of the bark is said to be a good emetic; and is sometimes used among the negroes for that purpose. Ripened cuttings root in sand under a hand-glass.

889. *Amyris*. Derived from *μύρρα*, myrrh. Its resinous gum has an excellent perfume. Almost every species of this genus produces some valuable gum or resin. *A. gileadensis* produces the celebrated balm of Gilead. It is a shrub with purplish branches, striated a little, with crowded ternate leaves, and protuberant buds loaded with balsamic resin.

5105 Leaves alternate abruptly pinnated in 2-3 or 4 pairs

5106 The only species. Leaves pinnated toothed torn

5107 Stalks of the leaves short tumid inflated

5108 Leaves simple lanceolate entire, Racemes simple axillary numerous

5109 Leaves ternate crenate acute

5110 Peduncles many-flowered, The lower usually changed into spines

5111 Leaves opposite beardless, Teeth of calyx membranous colored

5112 Leaves linear lanceolate, Peduncles axillary umbelled

5113 Leaves imbricated four ways obtuse with a little reflexed point, Teeth of calyx leafy

A. TUBIFLORE. *Corollas long and cylindrical.*

5114 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Bractes distant from calyx

5115 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Flowers solitary, Cor. cylindrical

5116 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Segments of cor. reflexed

5117 Stamens long connivent colored, Lvs. in 3s, Cal. imbricated, Fl. 3, Cor. globose scarcely longer than cal.

5118 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Flowers solitary, Cor. conical

5119 Anth. bearded, Style incl. Cor. cylind. contracted above the base, Fl. pend. Leaves 4 whorled

5120 Stamens long connivent colored, Leaves in threes, Cal. imbricated, Flowers 3, Cor. cylindrical incurved

5121 Anthers bearded, Leaves in threes, Flowers terminal solitary

5122 Stamens exserted colored, Leaves in 3s, Cal. imbricated, Flowers 3, Cor. conical, Leaves recurved

5123 Anth. bearded incl. Style exsert. Cor. tubular clavate pubes. Fl. axill. Leaves 3 imbricated

5124 Stamens beardless exserted, Cor. incurved smooth, Style long, Flowers axillary stalked, Lvs. 6 smooth

5125 Anth. beardless included, Style exserted, Cor. tubular clavate, Cal. pubescent, Fl. capitate, Leaves 6

5126 Ant. beard. incl. Style exsert. Cor. tub. incurv. Cal. simple gland. tooth. Fl. axill. whorl. Lvs. 3 rough

5127 Anthers beardless, Lvs. 3, Flowers solitary or 3 term. Cal. imbric. Cor. villous [at edge

5128 Cor. cylind. Anthers bearded, Lvs. 3, Fl. term. 3, Cal. imbric. Style exserted rounded at end

5129 Anthers beardless, Lvs. 4, Fl. term. Bractes ovate distant from cal. Sepals ovate acumin.

5130 Anthers bearded included, Style exserted, Cor. tubul. clav. Cal. double, Fl. term. 3, Lvs. 3 smooth

5131 Anthers beardless, Leaves 3 smooth, Fl. 3 term. Cal. imbric. Corolla smooth

5132 Anth. bearded, Style incl. Cor. cylind. ventric. Flowers umbelled capitate, Lvs. 8 linear truncate

5133 Anth. beardless exserted, Cor. tub. clavate pubescent, Fl. term. racemose, Leaves 5 or more smooth

5134 Anth. bearded, Style incl. Cor. clav. cylind. Flow. umbell. Lvs. 6 linear reflexed

5135 Anth. beardless included, Style exserted, Cor. ventricose at base, Fl. term. Lvs. 4 pubescent erect

5136 Anth. bearded, Lvs. 4-6, Fl. axill. Cal. imbr. Bract. lanc. Sepals broad lanceol.

5137 Anth. beardless, Lvs. 4 ciliated, Fl. term. Two bractes next cal. one distant, Cor. smooth

and Miscellaneous Particulars.

A. Opobalsamum produces the balsam of Mecca. It has pinnate leaves, with sessile leaflets. It grows near Bederhumin, a village between Mecca and Medina, in a sandy rocky soil, confined to a small tract about a mile in length, and attains the height of fifteen feet. The balsam is obtained by incision. Neither of these species are yet introduced to Britain: those we possess grow in loam and peat, and cuttings root freely in a pot of sand under a hand-glass.

890. *Ximenia*. Francis Ximenes was a Spanish naturalist from whom we have, published in 1615, four works upon the plants and animals useful in medicine in New Spain. The flowers of this tree have an odor like frankincense: the fruit is yellow, shiny, the size of a pigeon's egg, with a thin rind and sweet subacid pulp: it is eaten by negroes and children in the West Indies. Cuttings root in sand under a hand-glass.

891. *Bacchia*. From Abraham Beck, who was physician in ordinary to the king of Sweden, and who communicated plants to Linnaeus, by whom the genus was dedicated. These plants are of free growth in sandy loam and peat, and so hardy as to require little more than protection from frost during winter. Young cuttings root in sand under a bell-glass.

892. *Erica*. From *εἰκω*, to break, in allusion to the brittle branches of the plant. It was also reputed a specific for breaking the stone in the bladder. *La brugère*, Fr., *Heide*, Ger., *Erica*, Ital., and *Brezio*, Span. Ling or common heath abounds in barren wastes in every part of Europe, and especially in the northern countries. Though little regarded in warm climates, the different species of native Erica are made subservient to a great variety of purposes in the bleak and barren highlands of Scotland, and other northern countries. The poorer inhabitants cover their cabins with them instead of thatch, or else twist them into ropes, and bind down the thatch with them in a kind of lattice work. They also make the walls with alternate layers of heath, and a sort of cement made of black earth and straw. The hardy Highlanders frequently

History, Use, Propagation, Culture,

make their beds with it. In most of the western isles they dye their yarn of a yellow color, by boiling it in water with the green tops and flowers of this plant; and woollen cloth boiled in alum water, and afterwards in a strong decoction of the tops, comes out a fine orange color. In some of these islands they tan their leather in a strong decoction of it. Formerly the young tops are said to have been used alone to brew a kind of ale; and Boethius relates that this liquor was much used by the Picts. In some of the isles it is said they still brew ale with one part malt, and two parts of the young tops of heath, sometimes adding hops. In many parts of Great Britain besoms are made of it. The turf, with the heath growing on it, is cut up and dried for the fuel of the cottager, for heating ovens, covering under-ground drains, &c. Sheep and goats will sometimes eat the tender shoots, but they are not fond of them. Cattle not accustomed to browse on heath give bloody

- 5138 Anth. bearded, Lvs. 4-6, Fl. axill. Cal. imbr. Sepals orbicular obovate  
 5139 Anthers bearded, Lvs. 4-6, Flow. axillary, Cal. imbric. Sepals rhomboid with long claws  
 5140 Anth. beardless, Leaves 4-3-cornered ciliated, Flowers terminal subsolitary  
 5141 Anthers included bearded, Cal. leafy, Leaves 4 hairy, Flowers terminal, Style exserted  
 5142 Anthers beardless included, Lvs. 3-4, Flowers terminal few, Cal. imbr. Cor. pubescent  
 5143 Anthers bearded, Lvs. 4-6, Fl. axillary, Cal. imbric. Sepals subulate from a broad base  
 5144 Anth. beardless, Lvs. 4 linear glandular hairy, Cor. clavate, Cal. hispid  
 5145 Anthers bearded, Style incl. Cor. cylind. Sepals membran. Fl. axill. whorl. Lvs. 4 lin. smooth  
 5146 Anth. beardless, Lvs. 4, Fl. term. 4 closely packed in a 4-cornered head, Sep. lin.-subul. Ped. very short  
 5147 Anthers beardless, Flowers solitary or 3, Cal. imbric. Cor. villous  
 5148 Anthers beardless, Flowers 3, Cal. imbricated, Cor. smooth, Leaves pubescent  
 5149 Anth. beardless exserted, Ovary turbinate, Lvs. 4-6, Fl. axillary, Two bractes close to cal. one remote  
 5150 Anthers beardless exserted, Lvs. 4-6, Flowers axill. Bractes remote, Ovary with 8 furrows smooth  
 5151 Anthers beardless included, Bractes next calyx, Cor. hairy solitary, Leaves 4 hairy  
 5152 Anthers exserted gibbous at base, Bractes remote, Cal. leafy, Lvs. 4, Branches hairy, Fl. terminal  
 5153 Anthers beardless, Lvs. 4, Bractes a little distant from cal. Sepals oblong revolute at edge  
 5154 Anthers beardless exserted, Lvs. 4, Bractes linear distant from cal. Sepals ovate acuminate  
 5155 Anth. beardless, Lvs. 4-6, Fl. axill. Two bractes next cal. one remote, Ovary cylind. Cor. pubescent viscid  
 5156 Anthers beardless included, Lvs. 4, Fl. term. few, Bractes lin. remote, Sepals ovate acuminate  
 5157 Anthers beardless, Lvs. 4-6, Fl. axill. Two bractes next cal. one remote, Ovary cylind. Cor. smooth viscid  
 5158 Anthers beardless included, Lvs. 4, Fl. term. few, Bractes remote, Sepals ovate obtuse  
 5159 Anth. beardless, Cor. curved clavate smooth, Fl. solitary term. Leaves 4 linear smooth  
 5160 Anth. beardless included, Cal. leafy imbricated, Leaves 3 smooth spreading, Style exserted  
 5161 Anth. beardless exserted, Cor. cylind. ovate, Sepal col. obl. obt. Leaves 3 appressed erect, Fl. 3 terminal  
 5162 Anth. beardless included, Cor. cylindrical narrowed at base, Fl. term. umbell. Leaves 6 smooth  
 5163 Anth. beardless, Lvs. 4, Fl. term. 4 closely packed in 4-cornered head, Sepals lin. subul. Ped. length of fl.  
 5164 Anth. beardless, Leaves 4, Fl. term. 4 closely packed in a 4-cornered head, Sepals lanceolate  
 5165 A handsome species with tufted hairy leaves. It resembles *E. linnaeana*  
 5166 Anth. beardless, Leaves 4, Fl. term. 4 closely packed in a 4-cornered head, Sepals ovate roundish  
 5167 Anth. beardless, Leaves 4, Fl. axillary, Cor. ribbed, Bractes nearly as long as calyx  
 5168 Anth. beardless included, Leaves 6 ciliated, Flowers terminal, Cor. clavate at first white afterwards red  
 5169 Anth. beardless, Lvs. 4-6, Fl. axillary, Cor. ribbed cylind. with a spreading limb, Bractes  $\frac{1}{2}$  length of cal.  
 5170 Anth. beardless, Lvs. 4-6, Fl. axill. Cor. ribbed widest in middle with a revol. limb, Bractes length of cal.  
 5171 Leaves spreading smooth, Flowers clavate incurved smooth  
 5172 Anth. beardless, Leaves 4-6, Fl. axillary, Cor. not ribbed, Sepals linear  
 5173 Anth. beardless, Leaves 4-6, Fl. axillary, Cor. not ribbed, Sepals from a broad base linear subulate  
 5174 Anth. beardless, Leaves 4-6, Fl. axillary, Cor. not ribbed, Sepals ovate acuminate  
 5175 Leaves upright smooth, Fl. term. 4 turbinate hairy  
 5176 Anth. includ. beardless, Bractes remote from flower, Leaves very short imbricated  
 5177 Leaves 3 smooth spreading distant, Fl. axillary pendulous cylindrical smooth  
 5178 Anth. beardless included, Leaves 4-6, Fl. axill. Two bractes next cal. : one remote, Ovary turbinate  
 5179 Leaves 4 hairy clammy, Fl. cylindrical terminal curved smooth, Style exserted  
 5180 Anth. beardless, Leaves 4-6 hairy, Fl. axill. Two bractes next cal. : one remote, Ovary clavate  
 5181 Leaves short with long hairs, Fl. large axillary pendulous cylindrical with a green mouth  
 5182 Anth. bearded, Leaves 3 ovate rough, Fl. 3 cernuous smooth, Cal. villous colored  
 5183 Anth. beardless exserted, Leaves 4-6, Fl. axill. Bractes remote, Ovary with 4 furrows smooth  
 5184 Anth. beardless included, Lvs. 4-6, Fl. axill. Bractes remote, Limb of cor. revolute, Ovary with 8 furrows  
 [silky upwards]

- 5185 Anth. beardless included, Leaves 4-6, Fl. axill. Bractes remote, Limb of cor. erect spreading  
 5186 Anth. beardless exserted, Leaves 3, Fl. terminal numerous, Bractes remote  
 5187 Anth. beardless included, Leaves 3 hairy, Fl. capitate, Cal. imbr. Cor. very hairy  
 5188 Anth. beardless, Leaves 4 triangular smooth, Fl. term. cylind. smooth

and Miscellaneous Particulars.

milk, but are soon cured by drinking plentifully of water. The branches of heath afford shelter, and the seeds a principal part of their food to many birds, especially those of the grouse kind: and for this purpose the seed-vessel is formed and protected in such a manner, that the seeds are preserved a whole year, or even longer. Bees collect largely from the flowers, and honey made from them was anciently supposed to be of a bad quality, but in fact it is only of a darker color. The foliage affords nourishment to the *Phalæna quercus* or great egger moth. Dodder frequently entwines itself about this plant, and gives it a singular appearance.

Till the latter end of the last century, this genus consisted of three or four humble British shrubs, and the heath of Spain (*E. mediterranea*), a slow growing tree. But when the Cape of Good Hope fell into the hands of the British, collectors were sent out, and soon brought to light some hundreds of species. It may serve as

History, Use, Propagation, Culture,

an easily recollected date, to say that all of them were sent home during the reign of George III., and as a tribute to merit, that most of them were gathered by Mr. Francis Masson. Their beauty needs no encomium; many are pretty, some are graceful or elegant, a few splendid, and there are curious, grotesque, and odiferous species. Their culture and propagation is one of the most delicate branches of the art of gardening; it may be said to have been invented in England, and in the Hammersmith nursery, and places Britain far before all countries in this art as in so many others. The only soil in which heaths will grow is earth of peat: if any substitute can be found, it is in leaf-mould

B. VENTRICOSÆ. *Corolla inflated.*

- 5189 Anthers bearded, Bractes oblong next cal. Cor. twice as long as calyx  
 5190 Anthers bearded, Bractes ovate next cal. Cor. 4-cleft thrice as long as calyx  
 5191 Anthers bearded, Bractes ovate next cal. Cor. 4-parted scarcely twice as long as calyx  
 5192 Anthers bearded included, Cal. leafy, Bractes remote from fl. Leaves 4 spreading smooth  
 5193 Anthers beardless, Flowers terminal, Two bractes next fl. : one remote, Cor. viscid-hairy  
 5194 Cal. rhomboid-spatulate, Cor. woolly inside, Leaves narrow-ovate cuneate pectinate  
 5195 Anth. beardless, Fl. term. Two bractes next fl. : one remote, Cor. smooth, Sepals lin. lanceolate  
 5196 Anth. bearded, Two bractes next fl. ; one remote, Leaves 6, Beards of anth. very short  
 5197 Anth. bearded, Bractes remote, Leaves 4 smooth, Beards of anth. very long  
 5198 Anth. beardless, Fl. term. 8, Bractes remote, Leaves 4, Sepals terminated by 3 or more bristles  
 5199 Anth. beardless, Fl. term. Two bractes next cal. ; one remote, Cor. smooth, Sepals ovate acuminate  
 5200 Pubescent, Two subul. bractes next cal. Leaves decussate 4, Cor. villous many times longer than calyx  
 5201 Cal. minutely ciliated, Tube narrow-cylindrical urceolate, Anthers beardless  
 5202 Anth. beardless, Fl. term. 4, Cal. imbric. Sepals ovate oblong acute, Leaves recurved ciliated  
 5203 Anth. beardless, Fl. term. many, Cal. imbric. Leaves recurved terminated by a bristle

C. LIMBATE. *Corolla elongated, narrowed upwards, with a flat limb.*

- 5204 Anth. beardless, Leaves ciliated and flowers 4, Sepals subulate, Stigma exerted  
 5205 Anth. bearded, Bractes remote, Leaves 4 ciliated, Beards of anth. very short  
 5206 Anth. bearded included, Leaves 4 ciliated, Fl. capitate, Bractes remote  
 5207 Anth. bearded included, Cor. globose ovate, Leaves opposite and scattered fringed with glands linear

- 5208 Anth. beardless, Fl. terminal 3, Leaves 3, Bractes remote, Sepals subulate, Cor. 4-cornered  
 5209 Anth. included beardless, Fl. umbelled, Bractes remote  
 5210 Anth. beardless, Fl. term. 3, Leaves 3, Bractes remote, Sepals ovate oblong  
 5211 Anth. beardless, Fl. term. 4, Leaves 4, Bractes remote  
 5212 Flowers long conical striped, with a flat limb, The whole surface of corolla shining  
 5213 Anth. beardless, Fl. term 8, Leaves 4, Bractes remote, Sepals terminated by a long bristle  
 5214 Anth. beardless, Fl. term. 4, Cal. imbricated, Sepals from a broad base, subulate, entire  
 5215 Anth. beardless, Fl. term. Leaves 4 smooth, Cor. slender, Style included  
 5216 Anth. beardless, Fl. term. 4, Cal. imbricated, Sepals ovate acuminate serrulate  
 5217 Anth. beardless included, Flowers fasciated, Style included, Leaves 4

- 5218 Anth. included beardless, Leaves 4 smooth erect, Fl. term. Cal. imbricated leafy  
 5219 Anth. beardless, Leaves 3, Fl. term. Fl. 3, Bractes remote, Cor. viscid  
 5220 Anth. bearded, Style included, Flowers terminal, Leaves lin. 2 smooth, Branches deflexed  
 5221 Anth. beardless included, Style included, Leaves 4, Flowers clustered

- 5222 Anth. beardless, Cor. somewhat 4-cornered, Sepals lanceolate entire, Fl. term. sessile, Leaves 4 smooth  
 5223 Cal. ovate cuspidate scarcely serrated, Cor. three lines long, Limb twice as short as tube recurved  
 5224 Leaves 4 spreading, Fl. 4 terminal  
 5225 Leaves 4 erect, Fl. simple on little axillary branches, Cor. ovate  
 5226 Leaves 3 smooth erect imbricated, Fl. 3 terminal, Cor. hypocrateriform, Tube slender  
 5227 Anth. beardless included, Sepals membranous ciliate toothed, Fl. term. sessile, Leaves 4 smooth  
 5228 Anth. beardless included, Leaves 4-6, Fl. axill. Bractes remote, Limb of cor. revolute, Ovary smooth  
 5229 Anth. beardless, Fl. terminal, Cal. imbricated, Fl. 4. Sepals oblong obtuse, Leaves recurved setose  
 5230 Anth. beardless, Flowers terminal subsessile 5, Bractes next calyx, Leaves spreading 5

- 5231 Leaves short erect, imbricated, Flowers terminal solitary, Tube ovate, Limb recurved  
 5232 Leaves 3 filiform spreading, Fl. 3 term. rotate, Stamens and styles exerted  
 5233 Leaves dense acerose smooth erect, Fl. axillary, Tube cylindrical  
 5234 Leaves densely imbricated erect, Flowers large axillary, Petals sawed  
 5235 Leaves dense spreading, Fl. 4 terminal, Tube ovate longer than limb  
 5236 Leaves 4 narrow erect smooth, Flowers terminal 4 very numerous, Tube ventricose

D. CALYCINÆ. *Corolla inclosed in the inflated calyx.*

- 5237 Anthers crested, Cor. ovate, Style included, Cal. turbinate, Leaves 3, Flowers umbelled

- 5238 Anthers crested, Bractes remote, Leaves 3 much longer than the joints green  
 5239 Anth. crested, Leaves 3, Cal. imbricated, Style included, Flowers terminal, numerous  
 5240 Anth. crested, Leaves 3, Cal. imbricated, Style included, Flowers terminal three

and Miscellaneous Particulars.

sifted very fine and mixed with fine sand. Earth of peat is obtained by collecting peats from bogs or turf from the surface of peaty wastes and moist places, and laying the peats or turves in a heap to rot and moulder into earth. This they will require several years to do; but in the meanwhile a portion of mould may be obtained whenever it is wanted, by turning the turves and sifting the fragments. Sometimes this peat is found without any mixture of sand; at other times, where streams have run into the bog or lake while the peat was forming, it is mixed with fine sand that had been held suspended in the water. This last is the best sort of peat for the Erica family; and therefore where peat is not sandy naturally, fine white sand

History, Use, Propagation, Culture,

or sand of any color, provided it be free from iron impregnation, should be procured and mixed with it. This sand admits the water to penetrate into the soil and reach the roots of the plant, and also to drain away from the roots so as not to rot them. Pots filled with pure peat-earth are apt to be either hard, dry, and impenetrable to water, or otherwise as wet as a saturated sponge. The free growing kinds (according to Sweet) thrive best in good black peat, and like largish pots to grow in. The dwarf and hard-wooded kinds like a very sandy peat, and smaller pot, well drained with broken potsherds and rough bits of turfy peat; they also require less water than the free growing kinds, as they grow chiefly at the Cape on the tops and sides of mountains, and in the crevices of rocks, &c. chiefly in very sandy soil, and but little of it.

- 5241 Anth. crested, Leaves 3, Cal. imbricated, Sepals carinate, Flowers terminal three, Style included
- 5242 Anth. beardless, Leaves 3 lanceolate smooth, Fl. umbelled surrounded by colored bractes
- 5243 Anthers crested, Leaves 3 mucronate smooth with a white edge, Sepals lanceolate, Flowers terminal
- 5244 Anthers bearded, Leaves 3 oval imbricated, Flowers capitate
- 5245 Anthers bearded, Leaves 3 smooth, Cor. campanulate, Style included, Flowers 3 sessile
- 5246 Anthers bearded, Leaves 4, Appendages subulate pectinate longer than the anther
- 5247 Anthers bearded, Style included, Cor. ovate 4-cornered, Fl. terminal 3, Leaves 3 or 4, Stem pubescent
- 5248 Leaves long ciliated spreading, Fl. axill. Cor. cylindrical, Cal. with keeled sepals
- 5249 Anth. bearded included, Style included, Cor. campan. Fl. axill. nodding, Leaves 3 imbricated 6 ways
- 5250 Anth. beardless exserted, Style exserted, Cor. campan. Fl. terminal capitate, Leaves 4-incurved ciliated
- 5251 Anth. beardless included, Cor. and calyx scarlet, Leaves opposite
- 5252 Anth. beardless, Cor. flat, Tube globose, Style exserted, Leaves 3
- 5253 Anth. beardless included, Cor. ovate, Flowers in umbelled corymbs, Lvs. 3 triangular cartilagin. at edge
- 5254 Anthers beardless exserted, Style exserted, Cor. campanulate, Flowers 3 terminal, Lvs. 3 lanc. smooth
- 5255 Anthers beardless exserted, Cor. campanulate, Cal. imbricated, Style exserted, Leaves 3
- 5256 Anthers much exserted beardless, Cor. campanulate length of the very hairy calyx, Leaves spreading
- 5257 Anthers much exserted beardless, Cor. campanulate longer than the very hairy calyx, Leaves erect
- 5258 Anthers beardless included, Cor. globose campan. Cal. woolly, Flowers sessile, Lvs. 3 lin. obtuse villous
- 5259 Anthers beardless included, Leaves broadish, Fl. terminal, Cal. imbricated
- 5260 Anthers beardless included, Leaves 3 lines long, Fl. capitate, Cal. ciliated
- 5261 Anthers beardless of middle length, Cor. campan. longer than cal. Style exserted, Leaves 3
- 5262 Leaves 4 hairy, Fl. capitate, Sepals and bractes very hairy, Cor. globose, Anthers beardless exserted
- 5263 Anthers beardless exserted, Style exserted, Cor. campan. Leaves 3 imbricated in 6 rows
- 5264 Anthers beardless, Leaves linear 3 smooth, Limb of cor. revolute
- 5265 Anthers beardless, Leaves appressed, Fl. capitate, Cor. limbate
- 5266 Leaves 2 channelled, Fl. term. on short stalks, Sepals ovate acute, Anth. included crested
- 5267 Anth. beardless included, Cor. 3, Style exserted, Leaves 3
- 5268 Anthers bearded, Leaves opposite sagittate

- 5269 Anth. crested, Leaves 3 erect spreading much longer than joints glaucous, Bractes remote from calyx
- 5270 Leaves wedge-shaped, Cal. ovate cuneate, Cor. 4-cornered spherical, Anthers bearded
- 5271 Anth. crested, Leaves 3 ciliated, Cal. imbricated, Style exserted
- 5272 Anth. crested, Leaves 3 smooth, Cal. imbricated, Style exserted
- 5273 Anth. crested, Leaves 4
- 5274 Anth. crested, Leaves opp. appressed, Cal. large cup-shaped, Sepals rounded mucronate
- 5275 Anth. beardless, Leaves 3, Bractes remote, Cor. campan.
- 5276 Anth. beardless, Leaves and flowers 4
- 5277 Anth. beardless, Leaves 4, Flowers 3
- 5278 Anth. crested, Cor. ovate covered, Style included, Leaves 3, Stigma 4-parted
- 5279 Anth. beardless, Leaves opposite imbricated appressed, Umbels terminal many-flowered

E. GLOBOSAE. Corolla small, globose.

- 5280 Cor. globose, Anth. crested, Two bractes next the calyx, the third remote
- 5281 Cor. globose, Anth. crested, All bractes close to calyx
- 5282 Cor. globose, Anth. crested, Bractes remote from cal. Leaves glandular at edge, Sepals ovate
- 5283 Anthers bearded, Cor. campanulate, Style included, Leaves 3, Flowers scattered
- 5284 Anth. bearded, Style exserted, Cor. camp. globose, Leaves 3 or 4 roughish, Branches pubescent
- 5285 Cor. globose glutinous, Anth. crested, Bractes remote, Leaves roughish
- 5286 Cor. globose, Leaves quite smooth, Anth. crested
- 5287 Anth. crested, Leaves 3 ovate smooth, Flowers umbelled ovate, Cal. entire, Branches villous
- 5288 Anth. crested, Leaves 3 linear smooth, Fl. umbelled globose, Cal. lanceolate short, Branches smooth
- 5289 Leaves 3 or 4 spreading finely ciliated, Fl. terminal, Bractes remote, Sepals ovate, Anth. included crested
- 5290 Anth. beardless, Leaves 3 triangular smooth, Fl. racemose globose, Branches downy
- 5291 Anth. crested, Style exserted, Cor. globose campanulate, Fl. terminal umbelled, Leaves 4 smooth erect
- 5292 Anth. crested, Style included, Cor. ovate, Umb. many-fl. terminal, Leaves 4 or 5, Branches pendulous
- 5293 Anth. bearded, Cor. globose camp. Cal. appressed ciliated, Fl. term. and axill. 1-sided, Lvs. 4 horizontal
- 5294 Anth. bearded, Style exserted, Cor. campanulate, Fl. whorled, Leaves 6 linear hairy
- 5295 Anth. beardless exserted, Cor. campanulate, Fl. term. capitate, Leaves 4 incurved ciliated

and Miscellaneous Particulars.

The climate for the heaths is not required to be warm during winter; if the frost is excluded, that will be enough. Some species, as the *E. persoluta* for example, will even bear to have the ground about their roots frozen without injury, provided it is not thawed in the sun, or too suddenly, or in a very warm temperature. In general the heaths may be kept in the coldest part of the greenhouse, and those not in flower in pits, well covered at night with mats or prepared coverings of reeds or straw. Too much fire-heat in winter will hurt them as much as any thing, as they only require to be kept from frost: most of the kinds might be preserved through the winter in frames: the only difficulty is to keep the damp from them.

Heaths require a great deal of air and light, and therefore should be placed near the glass and near such

History, Use, Propagation, Culture,

glass as may be opened to admit air every mild day in the year. They require also very regular supplies of water; not much at a time, but so frequently that the earth may never get dry or the plant droop. Many kinds of plants, if they have suffered for want of water, may be recovered by an abundant supply, and placing them under a bell-glass on a little heat; but if once the roots of a heath are thoroughly dried, no art of the gardener will recover the plant. This is the true reason why so many heaths are destroyed when introduced as chamber plants, and also by gardeners who are ignorant of their nature.

Heaths are propagated by cuttings, seeds, and a few by layers. In propagating by cuttings, the tender tops are taken at whatever season of the year they begin to grow, which with most sorts is about the month of June. The strong growing kinds require the cuttings to be rather larger than the others, and some of the stunted growing kinds should be kept in the hot-house a little while when they begin to grow, to draw them to a sufficient length of young wood, or cuttings cannot be procured. Then take the extreme points of the shoots, and with a sharp penknife cut off their lower ends at right angles, placing the cutting on the nail of the thumb, as in cutting the nib of a pen. The cutting will be from three quarters to an inch long; strip off the leaves from the lower end to nearly half the length of the cutting; and, in order that this may be done

- 5296 Anth. bearded exserted, Cor. campanulate, Leaves 3 or 4 ovate acute fringed with glands  
 5297 Leaves 3 ovate, Fl. very minute 3-6 term. Style long exserted  
 5298 Anth. bearded, Cor. ovate conical, Style middling, Leaves 3 ovate pubescent white beneath  
 5299 Anth. beardless included, Cor. roundish, Leaves 3 ovate acute ciliated, Stem hispid  
 5300 Shoots long, Leaves smooth erect imbricated, Fl. axillary, Cor. globose shorter than stalk nodding  
 5301 Tube of cor. cup-shaped, Fl. axillary, Cal. imbric. Leaves 4  
 5302 Leaves 3 spreading acerose, Cor. campanulate rough with short hairs  
 5303 Bractes remote, Cor. with a short open limb, Anth. included bearded  
 5304 Flowers capitate, Bractes remote, Cor. hairy, Anth. included bearded
- 5305 Leaves hairy, Flowers capitate, Anth. included bearded  
 5306 Bractes remote, Flowers very abundant, Anth. included bearded, Style exserted
- 5307 Leaves 3 ovate ciliated spreading, Fl. term. 3, Bractes remote, Cor. ovate shorter than its stalk  
 5308 Anth. bearded, Style included, Cor. camp. Cal. villous, Fl. axill. whorled, Leaves 4 imbric. villous
- 5309 Anth. included bearded, Fl. capitate, Bractes remote  
 5310 Leaves 3 narrow spreading, Cor. 4 globose campanulate [quite smooth  
 5311 Anth. bearded, Style exserted, Cor. camp. Sepals linear smooth, Fl. terminal umbelled, Leaves 4, Stem  
 5312 Branches slender upright, Leaves 3 short smooth, Fl. clustered terminal, Cor. globose campanulate  
 5313 Anth. bearded, Style included, Cor. camp. Sepals ciliated, Leaves 3-4 smooth, Branches pubescent  
 5314 Leaves 3 spreading very narrow, Leaves 3 terminal, Cor. globose smooth  
 5315 Anth. bearded, Style included, Cor. ovate pubescent, Leaves 3 hairy, Stem hairy  
 5316 Anth. bearded, Leaves 4 or more hairy, Fl. terminal, Cor. pubescent
- 5317 Leaves 4 covered with glandular hairs, Fl. capitate, Bractes none, Cal. hairy, Anth. included bearded  
 5318 Anth. bearded, Cor. globose mucous, Ped. 3 term. longer than fl. Leaves 4 linear with a cartil. serrul. edge  
 5319 Anth. crested, Style included, Cor. globose, Fl. umb. Leaves 4 linear 3-cornered smooth  
 5320 Leaves 4 and branches hairy, Fl. capitate 4 or more, Cal. leafy, Anth. exserted bearded, Style long exserted  
 5321 Anth. beardless, Bractes remote  
 5322 Anth. beardless, Leaves linear 3 smooth, Limb of cor. revolute
- 5323 Leaves 3 short smooth, Fl. solitary term. Cor. ovate smooth, Anth. a little exserted  
 5324 Anth. beardless, Leaves 4 lanceolate villous, Fl. racemose, Cal. downy  
 5325 Anth. beardless included, Cor. ovate campanulate, Style exserted, Stigma funnel-form, Leaves 3  
 5326 Anth. beardless, Leaves 3 linear smooth, Fl. camp. racemose, Bractes remote  
 5327 Anth. beardless, Leaves linear 3 smooth, Limb of cor. spreading recurved  
 5328 Anth. beardless, Leaves linear 3 smooth, Limb of cor. erect  
 5329 Anth. beardless exserted, Leaves 3 ciliated at base, Fl. term. 3, Sepals scarious  
 5330 Anth. beardless included, Stigma calyptrate, Cor. dilated upwards, Bractes remote  
 5331 Anth. beardless exserted, Leaves 3 smooth, Fl. term. Style exsert. Stigma peltate  
 5332 Anth. beardless, Leaves linear 4 smooth, Flowers terminal nearly 12  
 5333 Anth. bearded. exsert. Cor. urceol. smooth, Fl. term. umb. Leaves 3 pointed ciliated imbricated
- 5334 Anth. beardless exserted, Fl. urceolate villous, Leaves 3 revolute villous  
 5335 Anth. beardless exserted, Fl. cernuous turban-shaped covered by calyx, Leaves 3  
 5336 Leaves 3 or 4, Fl. terminal 2, Cor. downy changing from green to crimson  
 5337 Anth. crested, Cor. ovate viscid, Fl. term. umb. Leaves scattered arcuate truncate  
 5338 Leaves 3 erect imbricated smooth, Fl. axill. Cor. urceolate, Style exserted  
 5339 Anth. beardless included, Fl. axillary spiked, Cor. campan. ribbed, Leaves 6 obtuse  
 5340 Anth. beardless, Leaves 3 ovate villous  
 5341 Anth. beardless, Leaves 3, Cal. 4-cleft very densely downy  
 5342 Anth. beardless, Leaves 3 hispid, Sepals hairy upwards, Cor. smooth  
 5343 Anth. bearded included, Cor. very small above, obt. smooth, Fl. umb. erect and cernuous, Lvs. 3-4 smooth  
 5344 Leaves two distant, Fl. numerous very minute globose campanulate, Style exserted

## and Miscellaneous Particulars.

without injuring the shoot, use a sharp penknife or a pair of small scissors, for the least bruise or wound spoils the cutting. This done, dibble the cuttings into pots filled with moistened white sand from pits, or with any small sand from pits or rivers, or, in default of that, with powdered sandstone. When they are all planted, water the whole to fix them still better, and when the moisture has subsided, cover them with a small crystal or greenish crystal bell-glass fitted within the rim of the pot, and place them in the shade on a spent hot-bed, keeping them quite close till rooted. The free-striking sorts will have roots in two months, and the others at different periods from three to twelve months, most of them will be ready for transplanting into pots of the smallest size in the following March. Their rooting is easily known by their beginning to shoot, and then the bell should be taken off an hour or two daily.

Many *Ericas* ripen their seeds in this country, and of other sorts seeds are regularly obtained by the nursery-men from the collectors at the Cape of Good Hope. Imported seeds generally arrive in the winter, and should be sown early in the spring following, in pots filled with equal parts of peat and sand well incorporated; the seeds should be thinly covered with earth gently pressed down, and bell-glasses placed over them as over the cuttings. The soil must be kept moderately moist by gentle waterings, and in about six or seven weeks

History, Use, Propagation, Culture,

the seeds, if fresh, will begin to come up, when the glasses may be removed by degrees, and the pots kept near the glass, and shaded from the mid-day sun till autumn, when they may be transplanted into pots of the smallest size.

Seeds which are saved in this country may be sown as soon as gathered, if they ripen before November; but if after that period, it will be better to preserve them till spring, and then treat them like foreign seeds.

Only a few heaths are propagated by layers, such as *E. Massoni*, *retorta*, *petiolata*, and one or two other delicate sorts, which when layed require two years to throw out roots. On the continent most sorts of heaths are propagated by layers, because there they are ignorant of the easiest mode of managing cuttings.

One of the best growers of heaths in Britain is a gardener of the name of Henderson, at Woodhall, in West Lothian. This judicious cultivator has had an extensive collection of *Erica* for upwards of thirty years under his care, and has given some account of his mode of management in a late volume (vol. iii. p. 323.)

F. OVATE. *Corollas small, not globose.*

- 5345 Anthers crested, Cor. cylindrical, Style exserted, Leaves 3 spreading  
 5346 Anthers crested, Cor. ovate, Leaves 3, Stigma capitate
- 5347 Anth. bearded, Style included, Cor. ovate, Fl. term. umbelled, Leaves 4 lin. horizontal  
 5348 Anth. crested included, Leaves 3 recurved rough at edge, Cal. short, Cor. campanulate viscid  
 5349 Anth. crested, Leaves 4 ovate ciliated, Fl. capitate, Cal. ciliated  
 5350 Anth. crested, Leaves 4 lanc. erect smooth, Fl. capitate cernuous  
 5351 Anth. crested included, Fl. capitate, Leaves 3 or 4 lines long  
 5352 Anth. crested, Cor. ovate, Style included, Leaves 4 ciliated, Fl. capitate
- 5353 Very like *E. cinerea*, but the branches and calyx are downy with long hairs, Leaves 5 ciliated  
 5354 Anth. bearded, Cor. ovate-conical villous, Style included, Sepals lanceolate, Fl. umb. Leaves 3  
 5355 Anth. beardless included, Cor. camp. acute, Style included, Cal. 4 corneled, Leaves 4 spreading  
 5356 Anth. bearded included, Leaves 4 spreading hairy, Cor. dilated at end, Fl. terminal  
 5357 Anth. beardless exsert. Style exsert. Leaves 3, Branches downy  
 5358 Anth. bearded included, Leaves obtuse hairy, Fl. capitate, Bractes remote, Cor. silky
- 5359 Anth. bearded, Cor. ovate, Style included, Cal. acute, Fl. racemose  
 5360 Anth. bearded included, Style included, Cor. slender, Leaves 4 obtuse glandular, Fl. capitate  
 5361 Anth. crested included, Cor. prismatical, Leaves 3, Fl. in bundles, Bractes many imbric. involving the fl.  
 5362 Anth. beardless nearly exserted, Leaves 4 spreading hairy, Fl. terminal umbelled, Sepals ovate  
 5363 Anthers beardless exserted, Cor. oval twice as long as smooth calyx
- 5364 Anthers beardless exserted, Cor. campan. Style exserted, Leaves 3 acerose  
 5365 Anth. exserted, Fl. axill. Leaves linear 3, Filam. very long reflexed  
 5366 Anth. exserted, Fl. axill. Leaves 3 ovate  
 5367 Anth. exserted, Fl. axill. Leaves linear 3 or 4, Bractes in middle of flower-stalks, Cor. conical
- 5368 Anth. exserted, Fl. axill. Leaves 4-5, Bractes above the middle of flower-stalk, Cor. urceolate  
 5369 Leaves short spreading, Fl. terminal urceolate, Style a little spreading  
 5370 Anth. exserted, Fl. axill. Leaves 4-5, Cor. campanulate, Pedunc. the length of cor.
- 5371 Anth. and style much exserted, Flowers axillary on very long slender hairy stalks  
 5372 Cor. conical, Leaves 3 ovate ciliated, Anth. beardless  
 5373 Plant all over hairy, Cor. ovate, Sepals brown at end, Stamens and style exserted  
 5374 Cor. conical, Leaves 3 linear smooth, Anth. beardless  
 5375 Cor. cylindrical, Fl. term. Bractes remote, Anth. beardless, Sepals ovate  
 5376 Cor. cylind. dilated upwards, Fl. term. Bractes remote, Anth. beardless, Sepals subul. from a broad base  
 5377 Cor. cylindrical dilated upwards, Fl. axill. Two bractes next cal. Sepals ovate oblong  
 5378 Cor. cylindrical dilated upwards, Fl. axill. Sepals subulate, Peduncles longer than flower  
 5379 Cor. cylindrical dilated upwards, Fl. axill. Sepals subulate, Peduncles much shorter than flower  
 5380 Cor. cylindrical dilated upwards, Fl. axill. Sepals linear  
 5381 Cor. conical, Anth. beardless, Leaves 4, Limb of cor. erect
- 5382 Anth. beardless, Leaves linear 4 smooth, Fl. terminal 4  
 5383 Anth. beardless included, Fl. term. Bractes remote, Cor. narrowed upwards  
 5384 Leaves 3, Anthers beardless exserted, Flowers terminal  
 5385 Anth. exserted, Fl. axill. Bractes remote, Leaves lin. 5, Cor. camp. Limb reflex. Ped. twice as long as cor  
 5386 Cor. cylindrical, Fl. term. Bractes remote, Anth. bearded
- 5387 Stem spread on the ground, Leaves obtuse, Cor. dewy outside clavate, Anth. bearded  
 5388 Anth. beardless included, Cor. linear downy, Leaves downy 4  
 5389 Anth. crested, Leaves 3 ovate entire smooth, Fl. umb. furrowed, Cal. spreading entire

5390 Anth. bearded, Style included, Cor. globose, Cal. villous reflexed, Fl. term. umbelled, Leaves 4 hairy

## and Miscellaneous Particulars.

of the Caledonian Horticultural Society's Memoirs. He keeps his *Ericas*, he says, "at all times cool and airy, opening the glasses in winter when there is no frost, and letting the wind blow on them, and using no fire but in time of frost." "Never," he says, "shift any plant till the pot is quite full of roots. When the plants get large, several of them will continue in good health for three or four years without shifting, and flower well. I have plants of *E. retorta* here, in pots seven inches in diameter, which are very bushy, being eighteen inches across, and fourteen inches high above the pot; *E. infundibuliformis*, two feet and a half in diameter, and two feet nine inches high; *Erica pilosa* between five and six feet high and three feet across, in pots eleven inches in diameter: these have not been shifted for five years, and are in high health, and covered with strong fine flowers from the mouth of the pot to the top of the plant." (*Caled. Mem.* iii. 327.)

"A prejudice," Page observes, "having spread that the culture of heaths is difficult, one of the greatest ornaments of the greenhouse has hence of late been neglected; although the method of culture is as easy and nearly as certain as that of the *Geranium*, but requiring a little more delicacy in the execution."

History, Use, Propagation, Culture,

(*Prodromus*, &c. art. *Erica*.) Those who complain of the difficulty of growing the heath, are often, as Loddiges remarks, ignorant people who have never had a heath to grow.

One circumstance in favor of the culture of heaths is, that they are not subject to insects, or at least very rarely so. (*Greenhouse Companion*, p. 62.)

The number of species is here reduced to those which are certainly different from each other. Of those enumerated in garden catalogues many are mere repetitions of each other.

893. *Menziesia*. Named in honor of Mr. Archibald Menzies, an assiduous and successful botanist, who accompanied Vancouver, in the capacity of his surgeon, in his voyage round the world. He is still living, and the ornament of the private circle in which he moves. Small heath-like plants, all hardy, and requiring the same cultivation as *Erica*.

894. *Chlora*. From *χλωρος*, green, in allusion to the color of the dried flower of *C. perfoliata*. The whole plant dyes yellow.

895. *Michauxia*. In memory of Andrew Michaux, botanist to the king of France, who travelled into Syria,

- 5391 Anth. crested included, Flowers capitate campan. cernuous, Leaves 4 cernuous  
 5392 Anth. crested included, Fl. 3, Leaves 4 subulate erect mucronate  
 5393 Anth. bearded, Cor. campan. Fl. whorled, Leaves 6 hairy spiral  
 5394 Leaves narrow, Cal. recurved horizontal, Cor. globose with segm. imbricated at base  
 5395 Anth. crested, Leaves 3 lanceolate rough, Fl. 3, Cal. ciliated reflexed
- 5396 Anth. crested included, Cor. urceolate hairy, Fl. umbelled, Leaves 4 ovate  
 5397 Anth. bearded included, Cor. globose much less than colored calyx, Leaves 3 with a membranous edge
- 5398 Anth. 2 horned included, Cor. axill. solitary, Leaves 3 ovate cordate ciliated  
 5399 Anth. bearded included, Style exserted, Cor. camp. smooth, Fl. term. sol. Leaves 3 lin. Branches hairy  
 5400 Anth. bearded, Leaves 3 linear hispid, Fl. umbelled, Cal. rough  
 5401 Anth. bearded, Cor. camp. smooth, Leaves 4 pubescent ciliated  
 5402 Cal. 4-cleft, Cor. linear smooth urceolate with a recurved limb, Capsule hairy  
 5403 Anth. bearded included, Flowers racemose, Leaves 6 clustered  
 5404 Anth. bearded, Leaves 4 ciliated, Fl. umb. Cal. navicular ciliated at end  
 5405 Anth. bearded perforated, Leaves 4, Stem angular downy, Cor. narrow obovate  
 5406 Anth. bearded, Leaves 4, Cal. appressed, Cor. linear pubes. with a very short recurved limb, Caps. hairy
- 5407 Anth. bearded, Leaves 4, Cal. appressed, Cor. linear pubescent, Capsule smooth [smooth  
 5408 Anth. bearded, Leaves 4, Cal. appressed, Cor. linear pubes. with an oval tube and very short limb, Caps.
- 5409 Leaves obov. lanc. beneath, beyond the nerves smooth, Cal. 4-cleft, Fl. urceol. 8-androus  
 5410 Leaves pubescent beneath, Calyx 4-fid, Cor. with a globose tube  
 5411 Leaves oval pubescent, Fl. term. aggregate nodding  
 5412 Leaves beneath densely downy, Cal. 4-parted, Tube of cor. oval
- 5413 Leaves linear obtuse with cartilaginous teeth, Flowers 5-cleft decandrous
- 5414 Leaves perfoliate
- 5415 The only species
- 5416 The only species
- 5417 Leaves obovate oblong viscous, Fl. racemose, Fruit with 2 or 3 wings longer than stalk  
 5418 Leaves lanc. narrowed at both ends viscid, Racemes branched, Fruit always with 2 wings length of stalk  
 5419 Leaves obl. mucronate entire, Fl. term. sessile  
 5420 Leaves lanceolate narrowed at each end, Branches 3-cornered, Fruit with narrow wings  
 5421 Leaves oblong lanceolate with revolute edge, rather clammy, Flowers in short racemes
- 5422 Unarmed, Leaves subsessile ovate acute at each end  
 5423 Branches spiny  
 5424 Leaves subsessile lanceolate with terminal corymbs of flowers
- 5425 Leaves stalked, Calyx hispid  
 5426 Leaves sessile, Calyx smooth  
 5427 Leaves lanc. obl. acumin. 5 nerved and branches hispid, Cal. covered with entangled radiate hairs  
 5428 Leaves lanceolate sessile, Tube of calyx ciliate scaly

## and Miscellaneous Particulars.

Persia, and North America, and discovered this his genus. It is a handsome biennial, which bears a profusion of shevy flowers bearing some distant resemblance to those of the Passion-flower.

896. *Jeffersonia*. Named after Mr. Jefferson, the celebrated President of the United States. A very curious plant, remarkable for the peculiar mode of dehiscence of its capsule.

897. *Dodonæa*. So named in honor of Rambert Dodoens, professor of medicine, a famous botanist of the sixteenth century, author of *Fragum Historia*, 1552; and *Pemptades*, 1583. He was born at Malines, in 1518, and died in 1585. The species are ugly tropical shrubs, of neither use nor beauty.

898. *Lawsonia*. In memory of Isaac Lawson, M. D. author of *A New Voyage to Carolina*, London, 1709. *L. inermis* is the Henna plant, with the leaves of which the Egyptian women dye their nails pink. It is of easy culture and propagation.

899. *Osbeckia*. So named by Linnæus, in honor of Peter Osbeck, a Swedish clergyman, member of the academy of Stockholm, and of the society of Upsal: author of a voyage to China and the East Indies, in 1751. Englished by Forster, in 1771. Little plants resembling *Melastoma*. Young cuttings strike freely under a hand-glass.

History, Use, Propagation, Culture.

900. *Rhexia*. A Greek name employed by Pliny to designate a Boragineous plant. It is derived from *ρῆξω*, to burst; that is to say, good against ruptures. The hardy species thrive best in a bed of peat; or they will grow very well in pots.

901. *Cenothera*. Derived from *οἶνος*, wine, and *θηρῶ*, to hunt. The roots of this plant, *O. biennis*, eaten after meals, are incentives to wine-drinking, as olives are. This is an ornamental genus of easy culture in light rich soil, and they increase either by seeds or cuttings. *O. biennis* is called the night primrose, because the flowers usually open between six and seven o'clock in the evening. The mode of their expanding is curious. The petals are held together at top by the hooks at the end of the calyx, the segments of which first separate at bottom and discover the corolla, a long time before it acquires sufficient expansive force to unhook the calyx at top; when it has accomplished this, it expands very fast, almost instantaneously, to a certain point, and then makes a stop, taking a little time to spread out quite flat; it may be half an hour from the first bursting of the calyx at bottom to the final expansion of the corolla; which commonly becomes flaccid in the course of the next day, sooner or later according to the heat or coolness of the weather. The

- 5429 Lvs. sess. lanc. 8-nerved villous ciliated, Cal. stellate hairy  
 5430 Leaves ovate lanc. 5-nerved hairy on each side, Panic. term. loosely many-fl.  
 5431 Leaves finely hispid at edge, Stem quadrangular smooth, Flowers solitary in an involucre  
 5432 Decandrous, Lvs. sessile smooth ovate obtuse 3-nerved, Caps. 2-valved  
 5433 Lvs. sessile lanceolate 3-nerved serrate ciliated, Cal. glandular ciliated  
 5434 Lvs. opp. cordate crenulate hairy, Pan. term. trichotomous, Branches filiform much spreading  
 5435 Leaves cordate oval silky on each side 7-nerved sessile, Pan. term. Flowers with bracts 10-andr.  
 5436 Lvs. stalked ovate entire 3-nerved villous, Fl. terminal clustered
- 5437 Lvs. ovate-lanceolate flat, Stem muricated villous, Stamens shorter than cor.  
 5438 Lvs. ovate-lanceolate, Stamens declinate, Stem shrubby  
 5439 Lvs. ovate-lanceolate flat, Stem smooth subvillous, Stamens longer than cor.  
 5440 Lvs. lanc. flat, Stem purp. muricated, Stamens length of cor.  
 5441 Lvs. toothletted, Stems simple hairy, Petals distant 2-lobed  
 5442 Lvs. lanceolate wavy  
 5443 Lvs. linear lanceolate toothletted wavy pubescent glaucous, Stem hairy  
 5444 Lvs. lanc. repand toothed pubescent, Stem rounded pubescent  
 5445 Lvs. lanc. villous, Stem angular hairy  
 5446 Lvs. sublinear toothletted, Caps. cylindr. very narrow toothed  
 5447 Lvs. lanceol. somewhat toothed acute, Caps. stalked obl. clavate angular  
 5448 Lvs. lanc. entire obtuse, Caps. somewhat stalked ellipt. ovate angular  
 5449 Lvs. ovate narrowed at each end toothed; lower lyrate, Caps. stalked obovate angular  
 5450 Lvs. glaucous smooth lanceolate entire, Caps. sessile ovate angular
- 5451 Stem upright hispid furrowed, Leaves lanc. repand toothletted, Caps. sess. angular cylindrical  
 5452 Stem muricated, Lower lvs. linear very long toothletted; cauline lanceolate  
 5453 Stem erect pubescent, Lvs. lanc. lin. soft pubescent, Caps. obl. rounded sessile  
 5454 Pubescent, Lvs. lin. lanc. acute at each end entire, Fl. term. aggregate, Caps. clavate 4-cornered  
 5455 Lvs. toothed sinuated, Caps. prismatical  
 5456 Lvs. lanc. pinnatifid at base, Caps. obovate with 4 wings  
 5457 Lvs. lanc. cut-toothed, Caps. obl. sessile, Tube of cal. very long, Pet. 2-lobed  
 5458 Stem branched, Lvs. lanc. stalked with distant glandular teeth, Caps. ellipt. 4-winged on short stalks  
 5459 Leaves broad-oval repand toothed leavigated glaucous, Caps. ovate 4-cornered  
 5460 Stem simple below, Leaves ovate stalked glandular toothletted, Racemes leafy, Caps. obovate 4-cornered  
 5461 Lower leaves oblong, upper linear, Caps. cylindrical straight, Petals crenulate  
 5462 Leaves pinnatifid, with the terminal segment large and toothletted  
 5463 Leaves linear obovate, Caps. cylindrical curved  
 5464 Downy, Leaves oblong lanc. toothed subpinnatifid, Raceme naked, Caps. obovate angular  
 5465 Leaves lyrate and lanceolate toothed, Caps. stalked clavate  
 5466 Hairy, Leaves lanc. toothletted, Caps. axillary curved angular acute  
 5467 Very like *Oenothera acaulis*, from which it is chiefly distinguished by its yellow flowers  
 5468 Finely pubescent, Stem and nerves of leaves white, Leaves pinnatifid, Fl. spiked
- 5469 Leaves lanc. toothed, Pet. obovate ascending spreading, Style and stamens declinate  
 5470 Leaves lin. lanc. toothletted, Spike close, Petals as long as cal. Stigma entire  
 5471 Leaves lin. lanc. toothletted, Style and stamens straight  
 5472 Leaves ovate toothed, Pet. ovate acute cruciate, Style and stamens straight  
 5473 Leaves lin. lanc. deeply toothed, Pet. 3 ascending, Stamens 6 declinate
- 5474 Leaves scattered lin. lanc. entire veiny, Fl. unequal  
 5475 Leaves scattered lin. obsolete toothletted veinless, Petals unequal entire  
 5476 Leaves altern. and opposite lanc. ovate nearly entire pubescent veinless, Fl. unequal

## and Miscellaneous Particulars.

uppermost flowers come out first in June; the stalk keeps continually advancing in height, and there is a constant succession of flowers, till late in autumn. The roots are eaten in some countries in the spring.

*O. longiflora* has flowers uncommonly large and shewy, which continue from July to October. The dwarf North American herbaceous kinds, are among the most beautiful plants of our borders.

902. *Gaura*. A very curious genus, so called from *γαυρος*, superb. Its flowers are rose colored, in fine terminal spikes. Plants with the habit of *Oenothera*, and requiring the same management.

903. *Epilobium*. From *επι*, upon, and *λοβος*, a pod; that is to say, a flower growing upon a pod. *E. angustifolium* is a native of most parts of Europe, from Lapland to Italy. It is valuable in shrubberies as thriving under the drip of trees, and succeeds every where, even in the smoke of cities, and in parks: it is a good plant to adorn pieces of water, being hardy, of rapid increase, not much relished by cattle, and very shewy when in flower. According to Haller, the young shoots are eatable, although an infusion of the plant stupifies: the pith when dried, is boiled, and becoming sweet, is by a proper process made into ale, and this into vinegar by the Kamtschatdales; it is also added to the cow-parsnip, to enrich the spirit that is prepared

History, Use, Propagation, Culture,

from that plant; as fodder, goats are said to be extremely fond of it, and cows and sheep to eat it; the down of the seeds mixed with cotton or fur has been manufactured into stockings and other articles of clothing.

*E. hirsutum* is found only in rich moist soil by water. The leaves smell like scalded codlins or gooseberry pye when green, but lose that odor when dry. Cattle are rather fond of the plant both recent and dried.

904. *Fuchsia*. So named in honor of Leonard Fuchs, a famous German botanist, author of *Historia Stirpium*, in 1542, with 516 excellent engravings in wood. *F. coccinea* is one of the most elegant of deciduous greenhouse shrubs; the young wood and nerves of the leaves are tinged with purplish red: the pendent blossoms, like most produced from the axils of the leaves, as the shoots grow, continue during the greater part of the growing season, and are succeeded as they fade by a purple berry. The finest specimen in England of this species is at Salt-Hill.

Many other species have been lately introduced, some of which will probably be very handsome. South America contains some most splendid species, of which we know nothing in this country.

905. *Jambolifera*. From *fero*, to bear, and *Jambol*, the name of a Malabar fruit. Cuttings strike freely in sand under a hand-glass.

906. *Oxycoocus*. From *oxys*, acid, and *coocus*, fruit; on account of its acidity. A genus well distinguished from *Vaccinium*, by the narrow revolute segments of corolla. These are pretty little trailing evergreen plants, to which a peat soil and rather a moist situation are absolutely necessary: they are very little changed by culture.

*O. palustris* bears edible berries which are gathered wild both in England and Scotland, and made into tarts. Lightfoot says, twenty or thirty pounds worth are sold each market day, for five or six weeks together,

- 5477 Leaves opp. and altern. subplexicil. ovate-lanceolate hairy, Stem much branched hairy
- 5478 Leaves sessile lanc. pubescent, Stem simple villous, Root fibrous
- 5479 Leaves altern. lanceolate serrated hairy
- 5480 Leaves opp. ovate toothed
- 5481 Leaves stalked ovate acute toothed, Stem erect branched square, Petals bifid
- 5482 Leaves on short stalks ovate acute toothed shiny, Stem ascending simple, Petals half bifid
- 5483 Leaves lanceolate toothletted: the lower opposite, Stem square
- 5484 Stem round pubescent, Leaves lanc. serrul. opp. upper alternate smooth very
- 5485 Leaves opp. and alt. ovate toothletted sess. stem, Fl. axill. sess. Caps. 4-cornered
- 5486 Stem erect simple, Leaves toothed pubescent, Ovary with scattered hairs
- 5487 Leaves sessile lanc. toothletted, Stem round, Stigma undivided
- 5488 Leaves on short stalks opp. lanc. ellipt. stem entire, Stem ascending few-flowered

- 5489 Peduncles 1-flowered axillary, Leaves in threes serrated
- 5490 Branches slightly downy, Leaves opposite stalked smooth, Flowers much longer than leaves

- 5491 Peduncles axillary 1-flowered, Leaves ovate alternate
- 5492 Flowers stalked axillary, Sepals reflexed, Leaves ovate-lanceolate about 5

- 5493 Leaves oblong lanceolate smooth, Cymes terminal shorter than the leaves

- 5494 Leaves oval revolute at edge acute white beneath, Segm. of cor. oval
- 5495 Leaves oblong flat obtuse, Segm. of cor. lanceolate

- 5496 Leaves oval acuminate serrulate ciliated, Flower not revolute at first

- 5497 Peduncles 1-flowered, Leaves serrate ovate deciduous, Stem angular

- 5498 Leaves ovate acute serrulate smooth, Racemes with bractes, Cor. cylind. camp.
- 5499 Leaves oval ac. ent. glauc. beneath, Pedic. sol. axill. filif. Cor. open camp. Anth. exserted [exserted
- 5500 Lvs. oval or obov. acute ent. glauc. ben. Nerves and veins pub. Ped. axill. sol. filif. Cor. open camp. Anth.
- 5501 Dwarf tufted glabrous, Leaves cuneate rounded deeply sawed membranous, Fl. sol.
- 5502 Leaves small obov. obt. ent. above smooth, beneath veiny pubescent glaucous, Fl. sol. cor. urceolate
- 5503 Leaves stalked obovate acute at each end serrate, Racemes nodd. Cor. cylind. camp. Anth. included

- 5504 Leaves narr. lanceol. membr. ent. Nerves and edge pubescent beneath, Fl. scatt. sol. nearly sessile

- 5505 Branches and lvs. covered with resin. dots, Lvs. obov. ent. Rac. with bractes, Cor. camp. with round. seg.

- 5506 Lvs. obl. acute serrul. smooth, Racemes aggreg. term. corym. Cor. cylind. with short erect seg. Style exsert

- 5507 Leaves obov. blunt ent. glaucous and resinous beneath, Racemes loose, Cor. ovate campanulate

- 5508 Branches ang. Leaves subsess. erect mucron. lanc. Clusters sessile, Cor. oblong ovate, Fl. stalks none

and Miscellaneous Particulars.

in the town of Langtown, on the borders of Cumberland. The plant might no doubt be cultivated with equal ease as the American species.

*O. macrocarpus* furnishes the cranberries sent from America: it was first cultivated in this country by Sir J. Banks, on the margin of a pond (*Hort. Trans.* l. 71.), and subsequently both in moist and dry situations by different cultivators. Peat earth is essential to every mode of culture; but a much less degree of moisture will do than was at first believed. Salisbry found it do very well in pots of bog earth set in the shade; and Milne found "vigorous shoots and abundant crops produced on red beds of peat earth, even in the warm summer of 1822." The American cranberry he found easier to cultivate than the common sort; but Hallet found both the cranberry and bilberry succeed perfectly under such treatment. (*Hort. Trans.* iv. 483, and v. 279.)

907. *Vaccinium*. A name, the derivation of which is not known. Neither are commentators more decided as to what was the *Vaccinium* of the Latins. The only conclusion to which they have come, is that the *Vaccinia nigra* of Virgil are the same as the *μελαν βακκινίδος* of the Greeks. The species are neat little evergreen under shrubs, and inhabitants of moist alpine or subalpine regions in peat earth.

V. *Myrtillus* is an elegant and also a fruit-bearing plant. The young fresh green leaves, and wax-like red flowers appear in May, and towards autumn the leaves grow darker and more firm, and the ripe berries are gathered in the north for tarts, and in Devonshire and Poland are eaten with clotted cream. (*Eng. Bot.*) The berries are very acceptable to children, either eaten by themselves or with milk, or in tarts. The moor-game live upon them in the autumn. The juice stains paper or linen purple. Goats browse upon the plant; sheep are not fond of it; horses and cows refuse it. (*Withering.*) The berries have an astringent quality; and in Arran and the Western Isles are given in diarrheas and dysenteries with good effect. The High-

History, Use, Propagation, Culture,

landers eat them with milk, and make them into tarts and jellies, which last they mix with whisky to give it a relish to strangers.

V. uliginosum grows taller than the common bilberry, and has large globular, black, glaucous fruit. These have less flavor, but abound with a weak acid juice. (Eng. Bot.) In large quantities it occasions giddiness, and a slight head-ache, especially when full grown and quite ripe. (Linn. Succ. and Withering.) Many vintners in France are said to make use of the juice to color their wines red. (Withering.) They furnish an ardent spirit which is highly volatile and intoxicating. The Alpine birds feed upon the fruit, and it is very common in their haunts. (Villars.)

V. Vitis idæa is of very humble growth and almost herbaceous, though evergreen. The berries are red, acid, astringent, and bitter. They are scarcely to be eaten raw, and though made into pies in Derbyshire, where they are called cow-berries, their flavor is far inferior to the cranberry. Their best use is for making a rob or jelly, which is eaten with all kinds of roast meat in Sweden, and is far preferable to that of the red currant as a sauce for venison. It is also an excellent medicine in colds, sore throats, and all irritation of the mouth or fauces. (Smith, Brit. and Eng. Bot.) Linnæus says, that they are sent in large quantities from West Bothnia to Stockholm for pickling, and the same thing is confirmed by Dr. Clarke. Müller was informed that this plant was used for edgings in Norway.

V. tenellum is a very good fruit.

- 5509 Lvs. stalked obl. oval blunt entire beneath resin. Racemes lateral one-sided, Cor. ovate conical 5 angular
- 5510 Fl. branches leafless, Lvs. obl. oval acute at each end ent. young ones downy on both sides, Rac. short scaly
- 5511 Flowering branches leafless, Lvs. obl. acute at each end smooth, Racem. clust. bract. Cor. cylind. Cal. refl.
- 5512 Flowering branches oblong leaf. Lvs. lanc. acute at each end serrul. smooth, Rac. sess. corym. obl. bract. Cor. cylind. contracted at mouth
- 5513 Lvs. sessile cuneate-lanc. serrul. veiny pubes. Clust. sess. Cor. ov. much contracted at mouth, Style exert.
- 5514 Branches angular green, Leaves sess. ovate lanc. mucronate, Fasc. clustered term. sessile, Cor. ovate
- 5515 Flowers racemose, Leaves crenulate ovate smooth
- 5516 Leaves ovate obl. acute serrate flat shining, Racemes terminal erect, Cor. prismatical
- 5517 Creeping very smooth, Leaves stalked oval shining, Clusters axill. sessile few-flowered, Cor. glob. camp.
- 5518 Spread. Lvs. obl. lanc. acute at each end serr. rigid smooth, Racem. term. corymb. Fl. nodd. Cor. open camp.
- 5519 Dwarf, Leaves obovate emarginate serrulate shining above dotted beneath, Cor. cylind. camp.
- 5520 Stem creeping hispid, Leaves roundish oval acute bristly at edge
- 5521 Erect much branched, Leaves evergreen obl. lanc. acute at each end rigid, Cor. open camp. deeply 5-toothed.
- 5522 Leaves very small sessile oval mucron. beneath hairy dotted, Clusters term. and lat. Cor. obl. ovate
- 5523 Dwarf, Leaves obovate crenate toothed smooth, Filam. gland. Stigma cap. Cor. short ovate
- 5524 Leaves ovate stalked, Umbels capitate axillary sessile
- Spikes paniced terminal, Leaves ovate acute
- 5526 Flowers sessile three on the stem, Leaves lanceolate deciduous
- 5527 Flowers sessile axillary, Leaves lanceol. Branches simple
- 5528 Flowers sessile lateral aggregate at the base scaly, Leaves obovate nerved silky
- 5529 Flowers sessile lateral aggregate, Leaves lanceolate obtuse downy beneath
- 5530 Racemes axillary 5-flowered, Leaves lanceolate smooth
- 5531 Pedunc. lateral 2-flowered, Leaves lanceol. ovate
- 5532 Racemes compound erect, Flowers terminal clustered, Leaves oblong
- 5533 Racemes term. paniced, Leaves linear lanceolate cuspidate
- 5534 Head terminal sessile many-flowered, Leaves scattered obl. lanceol. smooth
- 5535 Flowers fascicled term. sessile, Leaves lanceol. naked mucronate
- 5536 Flowers term. subsessile, Leaves opp. obl. lanceol. obtuse narrowed at base glabrous
- 5537 Flowers twin terminal sessile, Leaves elliptic lanceol. smooth
- 5538 Flowers fascicled terminal, Leaves obovate obtuse above very smooth beneath villous

and Miscellaneous Particulars.

908. *Memecylon*. The Greek name of the fruit of the Arbutus. The shrub now so called has a certain degree of resemblance to the Arbutus. Young cuttings plunged in sand in heat and covered with a hand-glass will root freely.

909. *Lagetta*. This plant in Jamaica is called *Lagetto*. Ripened cuttings will root in sand under a hand-glass.

910. *Daphne*. The Greek name of the Laurel. This is a genus of diminutive shrubs, mostly evergreens of great beauty and fragrance in the flower, and with a peculiar velvet texture in the leaf. It is mentioned by Linnaeus as a characteristic of the genus, that the terminating buds of the shoots produce leaves, and the lateral ones flowers. This affords a hint to the cultivator to be sparing of his knife.

*D. Mezereum* (*Mázaryohn* is the Persian name according to Richardson), *Laureole gentille*, Fr., *Kellerhals*, Ger., and *Laureola femina*, Ital., is an old inhabitant of the shrubbery, and deservedly much admired for its precocity and fragrance. It thrives well in loamy soil, and will grow in the shade and even drip of other trees. It is a native of all parts of Europe from Lapland to Sicily, but was first received from Elbing before it was observed to be a native. The roots of *Mezereum* acquire a very large size in proportion to the branches, and have more the character of the fusiform or ramose roots of a herbaceous, than of a ligneous vegetable. They are remarkably hot and acrid, and have long and in most countries been a popular topical

History, Use, Propagation, Culture,

application for the toothach. The whole plant is extremely acrid, especially when fresh, and if retained in the mouth excites great heat and inflammation, particularly of the throat and fauces. The berries when swallowed prove a powerful poison, not only to man, but to many quadrupeds. Both the bark and the berries of Mezereon in different forms have been long used externally in cases of obstinate ulcers and ill-conditioned sores. In France the bark is used as an application to the skin, which, under certain management, produces a serous discharge without blistering, and is thus rendered useful in chronic cases of a local nature, answering the purpose of what is called a perpetual blister, while it occasions less pain and inconvenience. In our own country the Mezereon has been principally employed in syphilitic cases. The branches make a good yellow dye.

D. Laureola is valuable in the shrubbery as thriving under the shade and drip of other trees, and never growing to an unsightly size and figure, and in the nursery as affording stocks for the more rare species. The roots and other parts of the plant possess similar qualities to those of the Mezereon.

911. *Dirca*. From *dirca*, a fountain. A plant which grows in watery places. *Bois de Plomb*, Fr. This shrub grows in hilly swamps in North America: it is in all its parts remarkably tough, and the twigs are in consequence used for rods, and the bark for ropes, baskets, &c. Layers are generally two years in rooting; cuttings do not succeed, and it does not ripen seeds here. Snails, Sweet observes, are particularly fond of this plant.

912. *Gnidia*. One of the names given by the ancients to the *Daphne*. These plants "thrive well in a sandy peat soil, with their pots well drained with broken potsherds: care must be taken not to over water them, or to let them flag for want of water, as their roots are very tender and are easily killed; the tenderest kinds are *G. oppositifolia*, and *G. piniifolia*. (*Bot. Cult.* p. 198.)

5539 The only species. Flowers appearing before the leaves

5540 Leaves scattered 3-cornered, Flowers in umbellate heads, Scales four bearded  
 5541 Leaves scattered 3-quetrous linear acute; floral lin. lanc. shorter than heads, Scales eight beardless  
 5542 Leaves all linear acute, Flowers terminal sessile, Scales four and cor. smooth  
 5543 Leaves scattered lanc. smooth, Flowers capitate surrounded by bractes, Peduncle naked  
 5544 Leaves opp. lanceolate tomentose, Flowers terminal, Scales 4  
 5545 Leaves opp. ovate tomentose, Flowers terminal, Scales 8  
 5546 Leaves ovate oblong imbricated hairy with naked nerves  
 5547 Leaves opp. ovate smooth, Fl. terminal subcapitate

5548 Leaves linear, Flowers axillary sessile 4-cleft

5549 Leaves lin. convex imbricated in 4 rows, Branches downy  
 5550 Leaves fleshy smooth outside, Stems downy  
 5551 Leaves linear smooth, Fl. sessile in terminal filiform silky heads  
 5552 Leaves linear smooth, Heads stalked downy  
 5553 Leaves lin. opposite, Flowers term. solitary, Branches smooth  
 5554 Quite smooth, Leaves oblong acute concave rugose outside, Fl. term. sessile solitary  
 5555 Leaves ovate villous, Flowers lateral solitary  
 5556 Leaves ovate scattered, Flowers capitate, Branches lax cernuous

5557 Heads clustered, Leaves loose  
 5558 Heads solitary woolly, Flowers imbricated in four rows  
 5559 Leaves opp. imbricated 4 ways, Heads smooth  
 5560 Leaves scattered elliptical ovate, Heads woolly  
 5561 Leaves oval sessile very smooth, Fl. capitate woolly

5562 Leaves opposite ovate acute, Racemes one-sided bracteate, Bractes shorter than peduncle, Fl. decandrous  
 5563 Leaves opp. oblong hairy, Racemes numerous terminal one-sided

### DIGYNIA.

5564 Erect shrubby, Leaves linear fleshy

5565 Flowers loosely spiked very minute, Bractes lanceolate membranous

5566 Leaves pinnate, Leaflets obovate crenate smooth

5567 Leaves linear connate, Sepals flat the length of the stem-joints lanceol. acute

### and Miscellaneous Particulars.

913. *Stellera*. So named by Gmelin, in memory of Georg. Wilh. Steller, adjunct of the academy at Petersburg, who collected plants in Kamtschatka, and died in Siberia, in 1746. An inconspicuous plant resembling the next genus and requiring the same culture.

914. *Passerina*. From *passer*, a sparrow. Its seed has an appendage at the end like the beak of a sparrow. Young cuttings root freely under a bell-glass in sand.

915. *Lachnæa*. Derived from *λαχνη*, wool, on account of the woolly heads of flowers.

916. *Combretum*. A name employed by Pliny. The plant of the ancients could have no relation to the plant now called by this name, which is a genus of splendid climbing shrubs, with beautiful branches of flowers which are often crimson or purple, and sometimes white. A number of species are found at Sierra Leone. They are all stove plants.

917. *Galenia*. So named by Linnæus from the famous physician Claudius Galenus, born at Pergamus, 133 years before the Christian æra. A coarse-looking shrub, with the leaves obscurely papillose or bladdery, and the stem round.

918. *Aphananthe*. A name contrived from *α*, privative, *φανω*, to be remarkable, and *ανθος*, a flower: that is to say, a plant which is not remarkable for the beauty of its flowers. A curious little Brazilian weed.

919. *Weinmannia*. In honor of John William Weinmann, a German botanist, who published in 4 vols. folio, his *Phytanthoza Iconographica*, about the middle of the last century. Handsome shrubs, with pinnated leaves.

920. *Mehringia*. So named by Linnæus, from Paul Henry Gerard Moehring, a physician, author of *Hortus Proprius*, 1736. A little inconspicuous weed-like plant. It suits very well for rock-work, or to be grown in small pots.

History, Use, Propagation, Culture,

921. *Polygonum*. From *πολος*, many, and *γωνη*, knee, many joints. These are nearly all common weeds of temperate climates. *P. Bistorta*, being one of the strongest vegetable astringents, might well be applied to the purpose of tanning leather, if it could be procured in sufficient quantity. The young shoots were formerly eaten in herb-puddings in the north of England, where the plant is known by the name of Easter Giant, and about Manchester they are substituted for greens under the name of Patience Dock. (*Curtis, Wähering.*) The root was formerly considered to be alexipharmic and sudorific.

*P. viviparum* is so named on account of the flowers frequently changing into vegetable bulbs. The roots have the same qualities as those of *P. Bistorta*, and are eaten in Sweden and Lapland, Siberia and Tartary.

*P. amphibium* is one of the most difficult weeds to eradicate from recovered alluvial lands, and has no equal in this respect unless *Equisetum*. The roots, which in the water are properly stems, are found to a great depth in such soils; and though by fallowing or otherwise stirring the surface, the leaves may be prevented from showing themselves for several years; yet if the field be allowed to lie a year in grass, the surface will be found abounding with *Polygonum*. Many tracts in Scotland which have been recovered from rivers and estuaries for an unknown series of years still abound with this plant, and as under such circumstances it never advances so far as to flower and seed, the individuals must be the same which formerly were suspended in the water. As an aquatic, it has a gay, showy appearance, when in flower.

*P. Hydropiper* is a powerful diuretic, and will dye woollen cloth of a yellow color.

*P. tinctorium*, and also *chinense* and *aviculare*, are cultivated in China for dyeing cloth of a beautiful blue or green.

TRIGYNIA.

§ 1. *Flowers pentandrous.*

- 5568 Half digyn. Spike ovate, Stipules lacerate, Leaves oblong or lanceolate
- 5569 Flowers trigynous, Leaves lanceolate
- 5570 Flowers half digynous, Cor. 4-cleft unequal, Leaves ovate

§ 2. *Flowers hexandrous.*

- 5571 Flowers digynous, Stipules unarmed, Pedunc. rough, Seeds depressed on each side
- 5572 Flowers half digynous, Leaves lanc. wavy not spotted, Spikes filiform nodding
- 5573 Flowers trigynous, Spikes twigg, Stipules smooth truncate ciliated, Leaves ovate acute smooth
- 5574 Flowers nearly monogynous, Leaves lin. lanceol. flat, Spikes filiform erect, Stem rooting at base
- 5575 Flowers half digynous, Spikes ovate-oblong erect, Pedunc. smooth, Stipules ciliated
- 5576 Flowers digynous, Spikes oblong, Leaves obl. lanceolate pubescent beneath
- 5577 Flowers trigynous, Spikes twigg, Stipules truncate ciliated, Leaves oblong acute smoothish

§ 3. *Flowers heptandrous.*

- 5578 Flowers digynous, Leaves ovate, Stem erect, Stipules hairy hypocateriform

§ 4. *Flowers octandrous.*

\* *Stem twining.*

- 5579 Leaves lanceolate narrowed each way, Stipule lanceol. shorter than the joint. — *TRAGOPYRUM. Bieb.*
- 5580 Flowers axill. Leaves ellipt. lanceol. rough at edge, Nerves of stipules remote
- 5581 Flowers trigynous, Spikes term. leafless, Leaves lanc. lin. Stems angular declinate herbaceous
- 5582 Flowers large axillary, Spike compact, Stem stout sheathed
- 5583 Flowers trigynous axillary, Leaves oval, Stem erect herbaceous
- 5584 Flowers trigynous, Peduncles rough, Leaves ovate stalked, Bractes cordate sessile
- 5585 Leaves sagittate, Stem prickly
- 5586 Leaves hastate, Stem prickly
- 5587 Leaves cordate sagittate, Stem angular, Segm. of cal. obtusely keeled
- 5588 Leaves cordate, Stem smooth, Leaves keeled winged
- 5589 Leaves cordate, Raceme simple axillary, Stem smooth
- 5590 Stem procumbent, Leaves oblong acute veiny fleshy, Stipules ciliated much shorter than the joints
- 5591 Flowers axill. trigynous, Leaves ellipt. lanceol. Sheaths ciliated
- 5592 Flowers trigynous axillary, Leaves lanceolate fleshy veinless, Stipules 2-parted

\* *Stem not twining.*

- 5593 Leaves stalked obovate mucronulate smooth with a crisp revolute edge
- 5594 Stem simple one-spiked, Leaves ovate wavy running down the stalk
- 5595 Stem simple one-spiked, Leaves revolute lanceolate at edge
- 5596 Flowers trigynous racemose, Leaves lanceolate smooth, Stem divaricating spreading smooth
- 5597 Flowers trigynous panicle, Leaves lanceolate wavy rough above pubescent beneath
- 5598 Flowers trigynous racemose-panicled, Leaves linear lanceolate smooth
- 5599 Flowers trigynous racemose-panicled, Leaves linear lanceolate smooth acuminate ciliated at edge
- 5600 Leaves cordate sagittate, Stem unarmed, Seeds toothed
- 5601 Leaves cordate sagittate, Stem unarmed, Seeds truncate at end emarginate winged
- 5602 Leaves cordate sagittate, Stem unarmed, Angles of seeds equal
- 5603 Flowers trigynous racemose-panicled, Leaves ovate lanc. smooth ciliated at edge

5604 Leaves cordate roundish shining

and *Miscellaneous Particulars.*

*P. orientale* is a well known annual, showy, and fit for shrubberies. The seeds were first sent to Europe by Tournefort, who saw it growing in the garden of the monks of the three churches near Mount Ararat. They cultivate this plant there, not only for the beauty of the flowers, but for its medicinal qualities, which are the same with those attributed to our common species. (*Müll. Fig.*) The seeds are farinaceous.

*P.aviculare* is so named from the gratefulness of its seeds to small birds; the English name, knot-grass, from the knottiness of the stem, and because it is eaten by cattle; many such plants having obtained the name of grass, though they bear no similitude to real grasses. Hogs eat it with great avidity, and hence it is known in many countries by the name of hogweed. All other domestic quadrupeds are said to eat it. The seeds are useful for every purpose in which those of buckwheat are employed, but they are much smaller.

*P. Fagopyrum*, (*Fagus*, beech, and *pyros*, corn, its grain is like the mast of beech,) properly beechwheat, *Bled noir* or *Sarrazin*, Fr. Buckwheat is considered a native of Asia and not of Europe, though sometimes found in a seemingly wild state. It will not, however, bear the frosts of our springs or the severity of winter. In China and other countries of the East, it is cultivated as a bread corn. The flower is also used in cookery and bread-making in various parts of Europe, to make cakes and crumpets in England, and as rice or gruel in Germany and Poland. The seed is said to be excellent for horses and poultry; the flowers for bees, and the plant green for soiling cows, cattle, sheep or swine. As an agricultural plant it is valuable, as standing only a short time on the ground; but it produces little straw for manure.

922. *Coccoloba*. From *κακκος*, fruit, and *λαβος*, a lobe; the fruit has three lobes. *C. uvifera* is a common tree in most of the sugar colonies, generally near the sea. It is remarkable for its large leaves, and when of

History, Use, Propagation, Culture.

a considerable size, its wood is valued for cabinet work. The berries are of the size of grapes, reddish brown or purplish without, with a thin pulp, rather astringent, and a large stone within. All the species grow freely in light loamy soil; and ripened cuttings, taken off at the joint, and placed under a hand-glass, in a pot of sand, will root freely: one cutting under a glass is sufficient, as the leaves must not be shortened. (*Bot. Cult.* 41.)

923. *Paullinia*. So named by Linnæus, from Simon Paulli, professor of botany at Copenhagen; author of *Botanicum Quadrupartitum*, 1640, and *Flora Danica*, 1648. *P. polyphylla* affords a well known walking-stick. In the woods of Jamaica it rises with a slender, woody, tough, flexible stalk, and ascends among the bushes to a considerable height. When the wood is ripe it is cut down, barked, and used as riding or walking sticks.

All the species succeed well in a light loamy soil; and large sized cuttings root in sand under a hand-glass.

924. *Seriana*. Named by Schumacher, after one Paul Serjeant. Cuttings root in sand under a hand-glass.

925. *Cardiospermum*. From *cardia*, a heart, and *spereua*, seed, in allusion to its round seeds, which are marked with a spot like a heart. The plant is remarkable for its inflated membranous capsule, from which it is sometimes called balloon vine.

926. *Sapindus*. A syncope of *sapo-indicus*, Indian soap. Its fruit is covered with a pulp, which is used in America for washing linen. *S. Saponaria* bears a berry as large as a cherry, inclosing a nut of a shining black when ripe. These nuts were formerly brought to England for buttons to waistcoats; some of them were tipped with silver, and others with different metals; they were very durable, as they do not wear, and seldom broke. The skin or pulp which surrounds the nut is saponaceous, and is used in America to wash linen; but it is very apt to burn and destroy it, if often used, being of a very acrid nature.

The whole plant, especially the seed-vessel, being pounded and steeped in ponds, rivulets, or creeks, is ob-

- 5605 Leaves entire very broad contracted at base
- 5606 Leaves orbicular pubescent

served to intoxicate and kill the fish. Loureiro celebrates the berries, slightly bruised and steeped in water, as a very excellent soap; and remarks that it is only required to use them with prudence, all abstergents being in some degree corrosive.

927. *Vernu*. So named after the late James Vere, Esq., a gentleman of fortune, who patronized gardening, and had once a fine collection of living plants. The species thrive best in sandy loam, and should be plunged in the bark pit to make them flower. The leaves placed on a pot of mould, or on the tan, will shoot out young plants from the notches of the margin. (*Bot. Cult.* 35.)

928. *Bryophyllum*. From βρύω, to grow, and φύλλον, a leaf. If the leaves are laid upon damp earth their notches push forth roots, whence proceed young plants. This plant requires very little water, and the pot to be well drained: it flowers best plunged in a tan heat; rich loamy soil suits it best.

929. *Paris*. According to some authors, this word is derived from *par*, equal; in allusion to the regularity of the parts of the plant. Few plants are more readily distinguished than this, by the proportion and regularity of all the parts.

The regular number is four, or some aliquot part or multiple of that number. There are, however, sometimes only three leaves, and they are even said to vary from one to seven. The calyx also has sometimes three leaves. The leaves and berries are said to partake of the properties of opium; and the juice of the latter to be useful in inflammations of the eyes. Linnæus says, the root will vomit as well as ipecacuanha, given in a double quantity. It is a suspicious plant, which has nevertheless been used in medicine in a great variety of ways.

930. *Adoxa*. From α, privative, and δόξα, glory — inglorious. This plant is minute, and by no means beautiful, and grows in obscure places.

931. *Elatine*. From ελατη, a fir, in Greek. Its fine leaves have been compared to those of a fir-tree.

5639 Strigose, Leaves lanceolate with spiny teeth, Sepals lanceolate subulate

and *Miscellaneous Particulars.*

travelled at the expence of the king of Denmark into Egypt and Arabia, and died in the latter country of the plague in 1763. Inelegant plants, with the aspect of a nettle.

CLASS IX. — ENNEANDRIA. 9 STAMENS.

ONE of the smallest of the Linnean classes; containing, however, three important genera; the Laurel, famous for the valuable spices it produces, and for the beautiful foliage of its insipid species; the Cashew nut, well known at the tables of the great or luxurious; and the Rhubarb, one of the most valuable of medicines. The class itself is extremely unnatural, and the assemblage of genera most incongruous.

Order 1. MONOGYNIA.  9 Stamens. 1 Style.

934. *Laurus*. Cal. 4-6-parted. Nect. 3 glands, with 2 bristles surrounding the ovary. Anthers opening transversely. Valves hinged to the upper side.

MONOGYNIA.

History, Use, Propagation, Culture,

934. *Laurus*. From the Celtic *blaur* (the *b* is dropped in pronunciation, *laur*), green. The laurel is perpetually green. This genus contains several important spice or drug-bearing trees, besides the poetical laurel and a fruit tree.

*L. Cinnamomum* (*qu.* China Amomum) has a smooth ash-colored bark, a short erect trunk, and wide spreading branches, which form an elegant head. The leaves are of a bright green above, pale beneath, and white veined; the flowers are in panicles, have no shew, and are inodorous, or perhaps somewhat fetid; the fruit is the size of a middling olive, soft, insipid, and of a deep blue; it encloses a nut, the kernel of which germinates soon after it falls, and therefore cannot easily be transported to a distance. The timber is white, and not very solid; the root is thick and branching, and exudes abundance of camphor. The inner bark forms the cinnamon of commerce. There are many varieties, and probably some of them species, especially in the island of Ceylon, but only four are said to be barked. Besides Ceylon, the tree grows plentifully in Malabar, Cochin China, Sumatra, and the Eastern islands. It has been cultivated in the Brazils, the Mauritius, India, Jamaica, and other places. The soil in which it thrives best is nearly pure quartz sand. That of the cinnamon garden near Colombo in Ceylon, was found by Dr. Davy to consist of 98.5 of allicious sand, and of 1.0 only of vegetable matter in 100 parts. "The garden is nearly on a level with the lake of Colombo; its situation is sheltered; the climate is remarkably damp; showers are frequent, and the temperature is high and uncommonly equable." (*Davy's Ceylon*, p. 39.)

The trees that grow in the valleys, in a white sandy soil, are fit to be barked when four or five years old, but those in a wet soil or in shady places, require to be seven or eight years of age. The bark is good for nothing if the tree be older than eighteen years. The tree was formerly propagated by a species of pigeon that ate the fruit and voided the seed; but since Falck, one of the Dutch governors, about the middle of the eighteenth century, raised it from berries sown in his garden, it has been regularly cultivated.

The barking commences early in May, and continues until late in October. Branches of three years old are selected, and topped off with a pruning knife or bill hook. To remove the bark a longitudinal incision is made through it on both sides of the shoot, so that it can be gradually loosened and taken off entire, forming hollow cylinders. The bark in this state, tied up in bundles, is allowed to remain for twenty-four hours, by which a fermentation is produced that facilitates the separation of the epidermis, which, with the green pulpy matter under it is carefully scraped off. The bark now soon dries, contracts, and assumes the quilled form, after which the smaller pieces are put within the larger. The cinnamon, when dry, is tied up in bundles of 30 lbs. weight, and carried to the Government store-house, where the quality is determined by inspection of the bundles. It was formerly chewed for this purpose; and the surgeons who used to be thus employed, had their

935. *Anacardium*. Cal. 5-parted. Petals 5, reflexed. Anthers 9, and one filament barren. Nut reniform, upon a fleshy receptacle.

936. *Cassytha*. Cal. 6-parted. Nect. 3 truncate glands surrounding the ovary. Inner filaments glanduliferous. Drupe 1-seeded.

937. *Eriogonum*. Cal. campanulate, 6-cleft. Nut 1, 3-cornered, covered by the calyx.

Order 2. TRIGYNIA.  9 Stamens. 3 Styles.

938. *Rheum*. Cor. 6-cleft, persistent. Nut 1, 3-cornered.

Order 3. HEXAGYNIA.  9 Stamens. 6 Styles.

939. *Butomus*. Sepals 6. Caps. 6, many-seeded.

### MONOGYNIA.

5640 Leaves 3-nerved ovate-oblong, Nerves vanishing towards the end

5641 Leaves triple-nerved lanceolate

5642 Leaves opp. very long acute at each end triple-nerved veiny across

5643 Leaves triple-nerved lanceolate ovate

5644 Leaves 3-nerved ovate coriaceous, Nerves reaching the end

5645 Leaves ovate acuminate 3-nerved glaucous beneath, Flowers axillary numerous

5646 Leaves lanceolate veiny perennial, Flowers 4-fid dioicous

5647 Leaves triple-nerved opposite

and Miscellaneous Particulars.

mouths so excoriated, as to be unable to continue the process longer than two days together: but tasting is now seldom had recourse to.

Cinnamon bark is astringent, cordial, and tonic. But the principal use of cinnamon is to cover the nauseous state of other remedies. (*Thomson's London Dispensatory*, 354.)

An oil is procured from the leaves and roots of cinnamon; the former is called the oil of cloves, and the latter the oil of camphor: both are powerfully stimulant, and used in cramps of the stomach, flatulent colic, hiccough, toothach, and nervous languor.

According to Sweet *L. Cinnamomum* is the hardest plant of the genus to cultivate in our stoves. "I have scarcely," he says, "ever seen it do well any where but at Messrs. Loddiges," who generally keep their stoves warmer than other gardeners usually do; and the cinnamon likes a warm atmosphere, and very little water in winter. It grows best in a mixture of sandy loam and peat, the pots being well drained with small potsberds. Ripened cuttings soon take root in a pot of sand, plunged under a hand-glass, in a good moist heat. (*Bot. Cult.* 74.)

The plant has regularly flowered and ripened seeds in the hothouse of the Bishop of Winchester for several years past.

*L. Cassia* is also decorticated like the cinnamon, but it is considered of inferior value, on account of containing a greater proportion of mucilage. What are called *Cassia buds*, are not obtained from this tree, but are the hexangular fleshy receptacles of the seed of the *L. Cinnamomum*. *Cassia bark* and buds are used in the same manner as cinnamon bark: the tree also affords an oil of similar use. In our stoves, the *cassia* grows more readily than the cinnamon; the same kind of soil suits it; and cuttings root freely treated in the same manner. (*Bot. Cult.* 74.)

*L. Camphora*, an alteration of the Arabic name, *kâfûr*, is nearly allied to the cinnamon tree. The roots, wood, and leaves of this tree have a very strong odor of camphor; and from the roots and smaller branches it is obtained by distillation. They are cut into chips, which are suspended in a net within a kind of still or iron pot, the bottom of which is covered with water, and an earthen head fitted to it; heat is then applied, and the steam of the boiling water, penetrating the contents of the net, elevates the camphor into the capital, where it concretes on straws, with which this part of the apparatus is lined. Camphor is stimulant, narcotic, and diaphoretic, but its stimulant powers are very transitory, and followed by sedative effects. In moderate doses it operates as a cordial, increasing the heat of the body, and exhilarating, besides softening, and rendering fuller the pulse, and promoting diaphoresis; in large doses it allays irritation and spasm, abates pain, and induces sleep. But in immoderate doses camphor produces vomiting, vertigo, delirium, convulsions, and other

deleterious effects. The greater part of the camphor brought to Europe is obtained in Sumatra from the *Dryobalanops Camphora*. This tree is cut and split, and the camphor which is found concentered in the heart of it is picked out and washed in a ley of soap. *Zea* describes a variety of camphor which is procured in South America from a tree, the botanical characters of which are not yet known, but which is termed *castrita* by the natives. The camphor exudes from the bark in the form of tears. (*Thomson's London Dispensatory*, 356.)

*L. Chloroxylon* has its specific from the color of the wood, *χλωρον*, green, and *ξύλον*, wood; it is esteemed one of the best timber trees in Jamaica, and used on all occasions where strength and durability are required: being both hard and tough, it answers better than any other wood for the cogs of sugar mills.

*L. nobilis*, the *Laurier*, Fr., *Lorbeerbaum*, Ger., *Alloro*, Ital., *Laurel*, Span., the *Laurus* of the Romans, and *Daphne* of the Greeks, was designated *nobilis* by Linnaeus, because it was consecrated to priests, sacrifices, and heroes in the ages of antiquity, and has been celebrated accordingly. To the poet and sculptor it still affords emblems for victorious heroes; and it is also used in cookery and medicine. In the south of Italy it grows to a sufficient height to be considered a tree; but is so prolific in suckers and low shoots as always to have the character of a shrub. It forms a dense and yet broken and picturesque mass of a very fine deep green, inclining to olive, and is abundantly covered with berries, which are dark purple or black, when ripe. Oil is obtained from the latter by boiling water. Both the leaves and the berries have a sweet fragrant odour, and an aromatic, astringent taste; and the oil, which is of a yellowish green color, has a stronger but similar odor and taste. Water distilled from the leaves shews traces of prussic acid; and it is probably on this component that their medicinal and poisonous property depend. Leaves, berries, and oil are narcotic and carminative. (*Thomson's London Dispensatory*, 360.)

*L. indica* grows in the Canary Isles and Virginia. The wood is of a yellow color, not heavy, good for building, but better still for furniture: it is called *Vignatiaco* in the island of Madeira, and is probably what is imported into England under the name of Madeira mahogany. It is hardly to be distinguished from mahogany, except that it is somewhat less brown. (*Hawksu. Voy. ii. p. 5.*)

*L. Persea* (*Persea* is a name under which Theophrastus describes an Egyptian tree not now known,) has a trunk as large as our common apple tree; the bark is smooth, and of an ash color; the branches are very succulent and soft, beset with pretty large oblong smooth leaves, like those of laurel, of a deep green color. The flowers are, for the most part, produced towards the extremities of the branches. The fruit is the size of one of our biggest pears. The pulp of the fruit is covered with a tough skinny coat, and contains a large rugged seed, which is wrapped up in one or two thin membranous covers. This fruit is held in great esteem in the West Indies: the pulp is of a pretty firm consistence, and has a delicate rich flavor; it gains upon the palate of most persons, and becomes soon agreeable even to those who cannot like it at first; but it is so rich and mild, that most people make use of some spice or pungent substance to give it a poignancy; and, for this purpose, some make use of wine, some of sugar, some of lime-juice, but most of pepper and salt. This fruit seems equally agreeable to the horse, the cow, the dog, and the cat, as well as to all sorts of birds; when plentiful, it makes a great part of the delicacies of the negroes. (*Browne.*)

*L. Borbonea* was regarded by Plumier as a genus distinct from *Laurus*, and he applied what is now its specific name, in memory of Gaston Bourbon, son of Henry IV. and uncle of Louis XIV. It is a very common tree in swamps in Carolina, and affords a fine grained wood excellent for cabinets; some of the best resembles watered satin.

*L. Sassafras* (*Sassafras* is an alteration of the Spanish word *Sassafras*, which signifies *Saxifrage*, the virtues of which are attributed by the Spanish Americans to this plant,) has the flowers often imperfect as to the male and female organs, which, before observation was so accurate and scientific as at present, led to the conclusion

- 5648 Leaves veiny lanceolate perennial flat, Branches scarred, Flowers racemose  
 5649 Leaves veiny elliptical acute perennial, Axils of veins villous beneath, Racemes paniced  
 5650 Leaves veiny oblong acute at each end perennial shining, Pedunc. axill. 3-4-flowered  
 5651 Leaves ovate coriaceous transversely veiny perennial, Flowers corymbose  
 5652 Leaves lanceolate perennial, Calyx of fruit berried  
 5653 Leaves oval lanc. perenn. glaucous beneath, Berries globose  
 5654 Branches divaricating flexuose, Leaves oval obtuse smooth at the base beneath bearded, Anth. 4-celled

and Miscellaneous Particulars.

that one plant bore only males and the other only hermaphrodites; it is now found the alleged males are only imperfect hermaphrodites. The wood, root, and bark have a fragrant odor, and a sweetish aromatic taste; their sensible qualities and virtues depend on an essential oil, which can be obtained separate by distilling the chips or the bark with water: it is a stimulating diaphoretic and diuretic, and has been employed in cases of scurvy, chronic rheumatism, gout, and in cutaneous affections; but its effects are very uncertain; and even the diaphoresis which it is supposed to occasion may rather be ascribed to the guaiaic, and other more powerful medicines, with which it is generally combined. (*Thomson's London Dispensatory*, 361.)

The species are well divided into several genera, such as *Laurus*, *Tetranthera*, *Cinnamomum*, and others; but as this division has not been applied to the old species of *Laurus* generally, it has not been practicable to adopt it here.

935. *Anacardium*. From *ana*, in composition, like, and *καρδια*, heart, in allusion to the form of the nut. This is an elegant tree, bearing paniced corymbs of sweet-smelling flowers, succeeded by an edible fruit of the pome kind, of a yellow or red color. This fruit or apple has an agreeable sub-acid flavor, with some degree of astringency. The juice expressed and fermented yields a pleasant wine; and distilled, a spirit is drawn from it, far exceeding arrack or rum, making an admirable punch, and powerfully promoting urine. The dried and broken kernels are occasionally imported for mixing with old Madeira wine, the flavor of which they improve prodigiously. Some planters in the West Indies roast the ripe fruit, or slice one or two into a bowl of punch, to give it a pleasant flavor. The astringency of the juice has recommended it as a very signal remedy in dropsical habits.

The nut protrudes from one end of the apple. (*Long*.) It is of the size and shape of a hare's kidney, but is much larger at the end next the fruit than at the other. The outer shell is of an ash color, and very smooth, under this is another which covers the kernel; between these there is a thick inflammable oil, which is very caustic; this will raise blisters on the skin, and has often been very troublesome to those who have incautiously put the nuts into their mouths to break the shell. This oil has been used with great success in eating off ring-worms, cancerous ulcers, and corns; but it ought to be applied with caution. The kernel when fresh, has a most delicious taste, and abounds with a sweet milky juice. It is an ingredient in puddings, &c. When older it is generally roasted; and in this state is not so proper for costive habits. Ground with cacao it makes an excellent chocolate. When kept too long it becomes shrivelled, and loses its flavor and best qualities. The thick oil of the shell tinges linen of a rusty iron-color, which can hardly be got out; and if any wood be smeared with the oil, it prevents the wood from decaying.

From the body of the tree is procured, by tapping or incision, a milky juice, which will stain linen of a deep black, that cannot be washed out again.

This tree also annually transudes from five to ten or twelve pounds weight of a fine semi-transparent gum, similar to gum arabic, and not inferior to it in virtue or quality, except that it has a slight astringency, which, perhaps, renders it in some respects more valuable. (*Long's Jam*. iii. 725, &c.)

As a stove-plant it grows in light loam or rich mould, and ripe cuttings with their leaves, planted in a pot of sand, and plunged under a hand-glass, will strike root.

936. *Cassytha*. The Greek name of the Cuscutha, which this plant much resembles in habit and characters of analogy. Its affinity, however, is very curious; from a minute analysis of its constituent parts it has been decided by the most learned botanists to be referable to Laurinae.

937. *Eriogonum*. From *εριον*, wool, and *γονον*, a knee. The stem of this plant is very woolly at the joints. The species thrive best in pots, and are principally to be increased by seeds.

938. *Rheum*. This name was ingeniously supposed by Linnæus to have been derived from *ρῆον*, to flow, because the root causes a discharge of bile. It, nevertheless, was formed from *Rha*, the ancient name of the Volga.

*History, Use, Propagation, Culture,*

Ammianus Marcellinus, lib. xii., says, "the *Rha* is a river, on the border of which grows a root, which bears its name, and is much renowned in medicine." The construction of the specific names confirms this; *Rha ponticum*, *Rha barbarum*, whence the name *Rhubarb* was obtained.

*R. Rhaponticum* was thought to be the true rhubarb of druggists, till Dr. Hope of Edinburgh described the *R. palmatum*, some seeds of which he had received from Russia, as of the genuine species. It is not, however, finally settled, whether these species or the *R. compactum* yield the foreign roots, nor does it appear of much consequence, as these three species agree so nearly in their medical properties, that any of them may be used with equal certainty of success. All the rhubarb of commerce, known under the names Turkey or Russian, and East Indian or Chinese, grows on the declivities of the chain of mountains in Tartary which stretches from the Chinese town Sni to the lake Kokonor near Thibet. The soil is light and sandy; and the Bucharians assert that the best grows in the shade on the southern side of the mountains. Rhubarb, however, is also cultivated in China, in the province of Chen-See, where it is called *Hai-houng*. In Tartary, the roots are taken up twice a-year, in spring and in autumn, and after being cleansed and decorticated, and the smaller branches cut off, the body of the root is divided transversely into pieces of a moderate size, which are placed on tables, and turned three or four times a-day, during five or six days. A hole is then bored through each piece, by which it is hung up to dry, exposed to the air and wind, but sheltered from the sun. In about two months, the roots have lost seven parts in eight of their weight, and are fit for the market. In China, the roots are not dug up till winter; and the cultivators, after cleaning, scraping off the bark, and cutting them, dry the slices by frequently turning them on stone slabs heated by a fire underneath; after which, the drying is completed by hanging them up in the air exposed to the greatest heat of the sun. (*Thomson's London Dispensatory*, 471.)

Rhubarb has been cultivated in different parts of Britain with a view to drying the root for medical purposes with the most perfect success; but such is the prejudice in favor of the foreign article, that sufficient de-

*and Miscellaneous Particulars.*

mand was not produced to encourage the cultivator. The only point in which British culture was rather deficient was in the drying, but that a little experience would soon have overcome.

R. *Rhaponticum* and hybridum, indeed any of the species, are or may be cultivated for the petioles of the leaves in a green state, to be used in tarts and pies, as a substitute or along with gooseberries. All that is required is a dry soil well enriched and trenched two, or better, three feet deep. The plants the year after planting may have half their leaves slipped off for the cook, as soon as they arrive at full growth. Keeping the plants from flowering will obviously strengthen the leaves.

Tart rhubarb may be forced either by taking up the roots and planting them in pots, or by covering them with dung where they grow in the open garden, as is done with sea-kale. It may also be blanched, as is done with that vegetable. (See *Encyc. of Gard. art. Rheum.*)

R. *Ribes* is so called from a rob made from its stalks, and called *Rybès of Serapias*.

It is thought that all the supposed species are reducible to *Rhaponticum*, *undulatum*, *palmatum*, and *ribes*. It is certainly very difficult to distinguish the others.

939. *Bulotus*. From *Bul*, an ox, and *τελευω*, to cut; the sharp leaves of the plant cut and cause to bleed the mouths of cattle feeding upon it.

This is the only plant of the class *Enneandria* that grows wild in Britain. It is an elegant aquatic. "The water-Gladiole, or grassie-Rush," says Gerard, "is of all others the fairest and most pleasant to behold, and serveth very well for the decking and trimming up of houses, because of the beautie and braverie thereof."

The corolla varies in different shades of red, or purple mixed with white, and is sometimes entirely white. The stem at bottom and the peduncles at top are often tinged with red. The number three is evidently predominant in the fructification; the corolla being doubly tripetalous, the stamens thrice three, the pistils six, the capsules six, in a hexagon form, the involucre three-leaved.

## CLASS X. — DECANDRIA. 10 STAMENS.

Tats is the last of the Linnean classes in which the stamens are distinct, and bear any determined relation to the other parts of the flower. It is composed of portions of a considerable number of natural orders, of which the most important is Leguminosæ, with which the class usually is made to commence. These are of two kinds: those which are papilionaceous, and those which have a regular expanded flower. The former are remarkable in their kind for bearing distinct stamens combined with a papilionaceous corolla; the greater part are natives of New Holland or the Cape of Good Hope, a very few of the Northern Hemisphere; and all of them ornamental plants. Of those with regular flowers the most beautiful genus is the *Bauhinia*, which, in the latitudes of the tropics, constitutes the most formidable obstacle to the passage of human beings through the woods, which are interlaced in every direction by the climbing or leaning stems of these and other plants commonly called *Lianes*; the most extensive genus is *Cassia*, the species of which are little esteemed as objects of ornament, but of material importance in medicine; the famous Senna of the shops being the produce of at least three species. The *Hæmatoxylon* and *Swietenia*, the one producing Logwood, the other Mahogany, are included in this class, as are the important *Quassia* drug, and the beautiful tribes of *Kalmias*, *Rhododendrons*, and *Andromedas*.

The second and succeeding orders are chiefly occupied by the most important of the genera of the natural order of Caryophyllæ, the whole of which have lately been remodelled and arranged, under the direction of Decandolle, by M. Seringe, an ingenious Swiss botanist. Of this order the most extensive genus is *Silene*, and the most beautiful *Dianthus*, out of which the fine carnations, pinks, and piccotees of the florist have been obtained

Order 1. MONOGYNIA.  10 Stamens. 1 Style.

## § 1. Leguminosæ. Flowers papilionaceous.

940. *Edwardia*. Cal. 5-toothed. Pod 4-winged, many-seeded.  
 941. *Sophora*. Cal. 5-toothed. Pod necklace-shaped, not winged, many-seeded.  
 942. *Ormosia*. Cal. 5-cleft, 2-lipped. Stigmas 2, approximate, obtuse: one on one side. Pod compressed, woody, 1-3-seeded.  
 943. *Anagyris*. Cal. 5-toothed, 2-lipped. Keel of 2 petals, which are larger than the wings, which are longer than the standard. Pod compressed, many-seeded.  
 944. *Thermopsis*. Cal. oblong 3-5-cleft, 2-lipped, convex behind. Petals of equal length. Standard reflexed at edges. Keel obtuse. Stamens persistent. Pod compressed, linear, many-seeded.  
 945. *Virgilia*. Cal. 5-cleft. Petals of equal length; standard not reflexed at edges. Stigma beardless. Pod compressed, oblong, many-seeded.  
 946. *Cyclopia*. Cal. 5-cleft, unequal, pushed inwards at base. Standard with longitudinal wrinkles: wings with a transverse plait. Stamens deciduous. Stigma bearded on one side. Pod compressed, many-seeded.  
 947. *Baptisia*. Cal. half 4-5-cleft, 2-lipped. Petals of equal length. Standard reflexed at edges. Stamens deciduous. Pod ventricose, stalked, many-seeded.  
 948. *Podalyria*. Cal. 5-cleft, unequal, pushed inwards at base. Standard larger than the rest. Stamens persistent, connate at base. Pod ventricose, many-seeded.  
 949. *Chorosenia*. Cal. half 5-cleft, 2-lipped. Keel ventricose, shorter than wings. Style short, hooked. Stigma oblique, obtuse. Pod ventricose, many-seeded.  
 950. *Podolobium*. Cal. 5-cleft, 2-lipped. Keel compressed, the length of the wings, which are equal to the expanded standard. Ovary many-seeded in a single row. Style ascending. Stigma simple. Pod stalked, linear, oblong, moderately ventricose, smooth inside.  
 951. *Oxylobium*. Cal. deeply 5-cleft, rather 2-lipped. Keel compressed, the length of the wings, which are equal to the open standard. Style ascending. Stigma simple. Pod many-seeded, ventricose, ovate, acute.  
 952. *Callistachys*. Cal. 2-lipped. Standard erect, keel and wings drooping. Style incurved. Stigma simple. Pod stalked, woody before ripening, many-celled.  
 953. *Brachysema*. Cal. 5-cleft, but little unequal, with a ventricose tube. Standard shorter than the compressed keel, which is as long as the wings. Ovary with a stalk, surrounded at base by a little sheath. Style filiform long. Pod many-seeded, ventricose.  
 954. *Gompholobium*. Cal. 5-parted, nearly equal. Standard unfurled. Stigma simple. Pod many-seeded, nearly spherical, very obtuse, smooth.  
 955. *Burtonia*. Cal. deeply 5-cleft. Cor. deciduous. Petals nearly equal. Ovary 2-seeded. Style subulate, dilated at base. Stigma blunt, beardless. Pod roundish, moderately inflated. No appendage to the seed.  
 956. *Jacksonia*. Cal. 5-parted, nearly equal. Corolla and stamens deciduous. Ovary 2-seeded. Style subulate, filiform. Stigma simple. Pod moderately inflated, ovate or oblong, with valves downy inside. No appendage to the seed.  
 957. *Viminaria*. Cal. 5-toothed, angular. Style capillary, a little longer than the 2-seeded ovary. Stigma simple. Pod valveless, ovate. No appendage to the seed.  
 958. *Sphaerolobium*. Cal. 5-fid, 2-lipped. Style on one side at the end, with a membranous appendage, on the other beardless. Stigma terminal. Pod spherical.  
 959. *Aotus*. Cal. 5-cleft, 2-lipped. Stamens deciduous. Ovary 2-seeded. Style filiform. Pod 2-valved. No appendage to the seed.  
 960. *Dillwynia*. Cal. 5-cleft, 2-lipped, narrow at base. Petals and stamens deciduous, inserted into the middle of tube of calyx. Standard twice as broad as long, spreading, 2-lobed. Ovary 2-seeded. Style hooked. Stigma capitate. Pod inflated. Seeds with an appendage.  
 961. *Eutaria*. Cal. 2-lipped. Standard a little broader than long. Ovary 2-seeded. Style hooked. Stigma capitate. Pod moderately ventricose. Seed with an appendage. Leaves opposite.  
 962. *Sclerothamnus*. Cal. 5-cleft, 2-lipped, with 2 bractes at base. Keel as long as wings. Ovary 2-seeded, stalked. Style ascending filiform. Stigma simple. Pod ventricose.  
 963. *Gastrolobium*. Cal. 5-cleft, 2-lipped, without bractes. Petals of equal length. Ovary 2-seeded, stalked. Style subulate, ascending. Stigma simple. Pod ventricose. Seeds with an appendage.  
 964. *Euchilus*. Cal. deeply 5-cleft, 2-lipped, the upper lip very large, with 2 bractes at base. Keel as long as wings. Ovary 2-seeded, stalked. Style subulate, ascending. Stigma simple. Pod compressed. Appendage of the seed with the hind lobes entire.  
 965. *Pultenæa*. Cal. 5-cleft with even-sized lips, 2-bracted. Ovary sessile, 2-seeded. Style subulate, ascending. Stigma simple. Appendage of the seed with the hind lobes cut.  
 966. *Daviesia*. Cal. angular without bractes. Keel shorter than standard. Ovary stalked, 2-seeded. Style straight. Stigma simple. Pod compressed, angular, opening with elasticity. Appendage of seed entire behind.  
 967. *Mirbella*. Cal. 5-cleft, 2-lipped. Pod 2-celled, with each suture bent inwards.

968. *Cercis*. Cal. 5-toothed. Pod compressed with the seed-bearing suture winged. Seeds obovate, with a straight embryo.  
 969. *Schotia*. Cal. 5-cleft. Petals 5, inserted on the calyx, and approaching the papilionaceous form. Pod stalked.

§ 2. *Leguminosæ. Flowers nearly regular.*

970. *Bauhinia*. Cal. 5-cleft, deciduous. Petals spreading, oblong, clawed; the upper one more distant; all inserted in the calyx.  
 971. *Azalia*. Cal. tubular, with a 4-cleft deciduous limb. Petals 4, with claws: the upper very large. The upper filaments sterile. Pod many-celled. Seed with an arillus at base.  
 972. *Hymenæa*. Cal. 5-parted. Petals 5, nearly equal. Pod filled with a powdery fecula.  
 973. *Cynometra*. Cal. 4-leaved: the opposite leaves largest. Pod 1-seeded, fleshy.  
 974. *Cassia*. Cal. 5-leaved. Petals 5. The three upper anthers sterile: three lower beaked.  
 975. *Cathartocarpus*. Cal. 5-parted, deciduous. Cor. regular, of 5 petals. The lower filaments bowed. Pod long, round, woody, many-celled. Cells filled with pulp.  
 976. *Parinsonia*. Cal. 5-cleft. Petals 5, ovate, the lowest reniform. Style O. Pod necklace-shaped.  
 977. *Potianana*. Cal. 5-parted. Petals 5, clawed; the upper dissimilar. Stamens very long, all fertile. Pod plano-compressed.  
 978. *Cæsalpinia*. Cal. 5-parted, with the lowest segment largest and vaulted. Petals 5. Stamens woolly at base, all fertile. Pod unarmed. Seeds compressed.  
 979. *Gulandina*. Cal. 5-cleft, the lowest segment largest. Petals inserted in the neck of the calyx, nearly equal. Pod prickly. Seeds stony.  
 980. *Hyperanthera*. Cal. 5-parted. Petals inserted in calyx, unequal. Pod 3-valved, torulose. Seeds winged.  
 981. *Hoffmannseggia*. Cal. 5-parted, persistent. Petals 5, clawed, spreading: the upper broader, glandular at base. Filaments glandular. Stigma clavate. Pod linear, compressed, many-seeded.  
 982. *Adenanthera*. Cal. 5-toothed. Petals 5. Anthers with a globose gland at their extremity. Pod membranous. Seeds lentiform.  
 983. *Cadia*. Cal. 5-cleft. Petals 5, equal, obcordate. Pod many-seeded.  
 984. *Prosopis*. Cal. hemispherical, 4-toothed. Pod many-seeded.  
 985. *Hæmatoxylon*. Cal. 5-parted. Petals 5. Caps. lanceolate, 1-celled, 2-valved; valves navicular.  
 986. *Copaifera*. Cal. O. Petals 4. Pod 1-seeded.

§ 3. *Ovary superior. Stamens united in a tube. Flowers complete.*

987. *Trichilia*. Cal. 4-5-toothed. Petals 4-5, ovate or oblong. Stamens sometimes nearly distinct. Caps. 3-celled, 3-valved, with one or two seeded cells. Seeds with a berried arillus.  
 988. *Melia*. Cal. 5-toothed. Petals 5. Drupe with a five-celled nut.  
 989. *Quinisia*. Cal. urceolate, 4-5-toothed. Petals 4-5, short, silky outside. Stamens with a short tube. Stigma capitate. Caps. coriaceous, 4-5-celled, opening at the end into 4-5-valves.  
 990. *Sweetenia*. Cal. 5-cleft. Petals 5. Caps. 5-celled, woody, opening at base. Seeds imbricated, winged.  
 991. *Ekebergia*. Cal. 4-parted. Petals 4. Nect. a ring surrounding the ovary. Berry 5-seeded.  
 992. *Heynea*. Cal. 5-toothed. Petals 5. Style 1. Ovary 2-celled. Caps. 2-valved, 1-celled, 1-seeded. Seed with an arillus not winged.

§ 4. *Ovary superior. Stamens separate. Flowers complete.*

993. *Guaiacum*. Cal. 5-parted, unequal. Petals 5, equal. Caps. angular, 2-5-celled.  
 994. *Zygophyllum*. Cal. 5-leaved. Petals 5. Nect. 10-leaved, covering the ovary and bearing the stamens. Caps. 5-celled.  
 995. *Fagonia*. Cal. 5-leaved. Petals 5, cordate. Caps. 5-celled, 10-valved; with 1-seeded cells.  
 996. *Tribulus*. Cal. 5-parted. Petals 5, spreading. Style O. Caps. 5, gibbous, spiny, many-seeded.  
 997. *Dictamnus*. Cal. 5-leaved, deciduous. Petals 5, clawed, unequal. Filam. declinate, with glandular dots. Caps. 5, united.  
 998. *Ruta*. Cal. 5-parted. Petals concave. Recept. surrounded by 10 honey-spots. Caps. lobed.  
 999. *Crocea*. Cal. 5-parted. Petals 5, sessile. Stamens flat, subulate, connected by entangled hairs. Anthers united lengthwise to the filaments on their inner side. Style from the base of the ovary. Caps. 5, united. Seeds with an arillus.  
 1000. *Codon*. Cal. 10-parted. Cor. campanulate, 10-cleft. Caps. many-seeded.  
 1001. *Gomphia*. Petals 5. Filaments scarcely any. Anthers long, pyramidal, erect, opening at end by a double pore.  
 1002. *Quassia*. Cal. 5-leaved. Petals 5. Nect. 5-leaved. Drupe 5, distant, 2-valved, 1-seeded, inserted on a fleshy receptacle.  
 1003. *Limonia*. Parts of the flower 4 or 5. Stamens free, twice as numerous as petals, or sometimes as many only. Fruit berried, pulpy, 4-5-celled, with 1-celled seeds.  
 1004. *Glycosmis*. Parts of the flower 5. Stamens with flat subulate filaments, and elliptical anthers. Style short, cylindrical. Ovary 5-celled. Fruit fleshy, 1-2-celled, 1-2-seeded. Coat of the seed membranous.  
 1005. *Murraya*. Parts of the flower 5. Cor. campanulate. Stamens with linear subulate stamens, and roundish anthers. Fruit fleshy, berried, 1-2-celled, 1-2-seeded. Coat of the seed thick, woolly.  
 1006. *Cookia*. Parts of the flower 5. Petals navicular, villous. Stamens with linear distinct filaments, and roundish anthers. Fruit berried, globose, 1-5-celled, with one-seeded cells.  
 1007. *Gærtnera*. Cal. 5-parted. Petals 5 torn. Filaments slightly cohering at base: one longer than the rest. Samara 1-seeded, with four unequal wings.  
 1008. *Monotropæa*. Cal. like a corolla, gibbous at the base. Capsule 5-celled, many-seeded.  
 1009. *Dioneæ*. Cal. 5-leaved. Petals 5. Capsule 1-celled, gibbous, many-seeded.  
 1010. *Garuga*. Cal. campanulate, 5-cleft, bearing the stamens. Petals equal. Stigma 5-lobed. Drupe with 2-5 1-seeded nuts.  
 1011. *Kalmia*. Cal. 5-parted. Cor. hypocrateriform, with a limb having 5 horns beneath. Caps. 5-celled.  
 1012. *Leadm*. Cal. 5-cleft. Cor. flat, 5-parted. Caps. 5-celled, bursting at base.  
 1013. *Rhodora*. Cal. 5-toothed. Petals 3. Stamens declinate. Caps. 5-celled.  
 1014. *Rhododendron*. Cal. 5-parted. Cor. somewhat funnel-shaped. Stamens declinate. Caps. 5-celled.  
 1015. *Epigæa*. Outer calyx 3-leaved, inner 5-parted. Cor. salver-shaped. Caps. 5-celled.  
 1016. *Andromeda*. Cal. 5-parted. Cor. ovate, with a 5-cleft orifice. Caps. 5-celled: valves contrary to the dissepiment.  
 1017. *Enkianthus*. Cal. small, persistent. Cor. campanulate, with a 5-cleft limb. Nectaries 5, at base of corolla. Anthers 2-horned. Capsule 1.  
 1018. *Gualtheria*. Outer calyx 2-leaved: inner 5-cleft, ovate. Nect. with 10 points. Caps. 5-celled, clothed with an inner berried calyx.  
 1019. *Arbutus*. Cal. 5-parted. Cor. ovate, with a 5-cleft orifice; pellicid at base. Berry 5-celled.  
 1020. *Clethra*. Cal. 5-parted. Petals 5. Stigma 3-fid. Caps. 3-celled, 3-valved.  
 1021. *Myllocaryum*. Cal. 5-toothed. Petals 5. Stigma capitate, 3-cornered, sessile. Caps. 3 or 4-winged, 3-celled.  
 1022. *Pyrola*. Cal. 5-parted. Petals 5. Capsule 5-celled, opening at the angles.  
 1023. *Chimaphila*. Cal. 5-parted. Petals 5. Stigma sessile, thick, orbicular, sunk in the ovary. Anthers beaked, opening by a 2-valved cleft. Caps. 5-celled, opening at the angles.

1024. *Inocarpus*. Cal. bifid. Cor. funnel-shaped. Stamens in a double row. Drupe 1-seeded.  
 1025. *Styrax*. Cal. inferior. Cor. funnel-shaped. Drupe 2-seeded.

§ 5. *Ovary inferior. Flowers complete.*

1026. *Jussiaea*. Cal. 4-5-parted. Petals 4-5. Caps. 4-5-celled, oblong, opening at the angles. Seeds numerous, minute.  
 1027. *Getonia*. Cal. 5-leaved, persistent. Filaments alternately broader, 5 in the orifice of the calyx. Seed coated, oblong, crowned by the calyx.  
 1028. *Quisqualis*. Petals 5, inserted on a filiform calyx.  
 1029. *Melastoma*. Cal. 5-cleft, campanulate. Petals 5, inserted in calyx. Berry 5-celled, surrounded by calyx.  
 1030. *Petaloma*. Petals 5, between the segments of the calyx. Berry 1-celled.  
 1031. *Acisanthera*. Cal. ventricose, 5-cleft. Petals 5. Anthers sagittate, versatile. Caps. crowned, 2-celled, many-seeded.

§ 6. *Flowers incomplete, or apetalous.*

1032. *Dais*. Involucre 4-leaved, Cor. 4-5-cleft. Berry 1-seeded.  
 1033. *Bucida*. Cal. 5-toothed, superior. Berry 1-seeded.  
 1034. *Samyda*. Cal. 5-parted, colored. Nect. campanulate, stamen-bearing. Caps. berried inside, 4-valved, 1-celled. Seeds nidulant.

Order 2. DIGYNIA.  10 Stamens. 2 Styles.

1035. *Royena*. Cal. urceolate. Cor. 1-petalous, with a revolute limb. Caps. 1-celled, 4-valved.  
 1036. *Trianthema*. Cal. mucronate under the end. Cor. O. Stam. 5-10. Ovary blunt. Caps. cut round.  
 1037. *Scleranthus*. Cal. 1-leaved. Cor. O. Seeds 2, included in calyx.  
 1038. *Cunonia*. Petals 5. Sepals 5. Capsule 2-celled, acute.  
 1039. *Hydrangea*. Cal. superior, 5-toothed. Petals 5. Caps. 2-celled, 2-beaked, opening by a hole between the beaks.  
 1040. *Chrysosplenium*. Cal. 4-5-cleft, colored. Cor. O. Caps. 2-beaked, 1-celled, many-seeded.  
 1041. *Saxifraga*. Cal. 5-parted. Petals 5. Caps. 2-beaked, 1-celled, many-seeded.  
 1042. *Tiarella*. Cal. 5-parted. Petals 5, inserted in the calyx, entire. Caps. 1-celled, 2-valved; one valve largest.  
 1043. *Mitella*. Cal. 5-cleft. Petals 5, inserted in calyx, pinnatifid. Caps. 1-celled. 2-valved; with equal valves.  
 1044. *Gypsophila*. Cal. 1-leaved, campanulate, angular. Petals 5, ovate, sessile. Caps. globose, 1-celled.  
 1045. *Saponaria*. Cal. 1-leaved, naked. Petals 5, clawed. Caps. 1-celled, oblong.  
 1046. *Dianthus*. Cal. cylindrical, 1-leaved, with scales at the base. Petals 5, clawed. Capsule cylindrical, 1-celled.

MONOGYNIA.

*History, Use, Propagation, Culture*

940. *Edwardsia*. Named after the late Mr. Sydenham Edwards, a celebrated botanical draughtsman. The reputation of the Botanical Magazine has arisen almost wholly from the skill he displayed in the management of the figures of that work. These plants are hardy enough to survive through our winters out of doors, when they are not very severe; but are best protected under a frame, or planted in a conservatory; they generally ripen seeds, by which, or by young cuttings planted under a bell-glass in sand, they may be readily increased. (*Bot. Cult.* 183.)

Order 3. TRIGYNIA.

10 Stamens. 3 Styles.

- 1047. *Cucubalus*. Cal. 1-leaved, inflated. Petals 5, clawed. Berry superior, 1-celled, many-seeded.
- 1048. *Silene*. Cal. 1-leaved, ventricose. Petals 5, clawed. Caps. 3-celled, opening at end, many-seeded.
- 1049. *Stellaria*. Cal. 5-leaved, spreading. Petals 5, 2-parted. Caps. 1-celled, many-seeded.
- 1050. *Arenaria*. Cal. 5-leaved, spreading. Petals 5, entire. Caps. 1-celled, many-seeded.
- 1051. *Cherleria*. Cal. 5-leaved. Nectaries 5, bifid, petal-like. Every other anther sterile. Caps. 3-valved, 3-celled, 3-seeded.
- 1052. *Brunnichia*. Cal. ventricose, 5-cleft. Cor. O. Caps. 3-cornered, 1-celled, 1-seeded.
- 1053. *Garidella*. Cal. 5-leaved, petaloid. Nect. 5, two-lipped, bifid. Caps. 3, united, many-seeded.
- 1054. *Malpighia*. Sepals 5, with two honey pores at base. Petals 5, roundish, clawed. Filaments cohering at base. Drupe 1-celled, with 3 one-celled nuts.
- 1055. *Banisteria*. Cal. 5-parted, with two honey pores outside at the base. Petals roundish, clawed. Filaments cohering at base. Samaræ 3, 1-seeded, with a single wing at end.
- 1056. *Hiraea*. Cal. without glands. Petals 5, with claws. Samaræ 3, surrounded by two opposite wings.

Order 4. PENTAGYNIA.

10 Stamens. 5 Styles.

- 1057. *Cnests*. Petals 5. Capsules 5, one-seeded.
- 1058. *Averrhoa*. Sepals 5. Petals 5, spreading upwards. Stamens inserted in a nectariferous ring: every other one shorter. Apple 5-cornered, 5-celled.
- 1059. *Spondias*. Cal. 5-toothed. Petals 5. Drupe with a 5-celled nut.
- 1060. *Cotyledon*. Cal. 5-cleft. Cor. 1-petalous. Five honey scales at the base of ovary. Caps. 5.
- 1061. *Scdum*. Cal. 5-cleft. Petals 5. Five honey scales at base of ovary. Caps. 5.
- 1062. *Penthorum*. Cal. 5-cleft. Petals O. to 5. Caps. 5-pointed, 5-celled.
- 1063. *Grietum*. Cal. 5-cleft. Petals 5. Filaments persistent. Pericarps 5, one-seeded.
- 1064. *Biophyton*. Sepals 5. Petals 5. Stamens all distinct; the five outer shortest. Styles 5, emarginate at end. Capsule ovate, round, somewhat 5-cornered.
- 1065. *Oxalis*. Sepals 5, distinct or united at base. Petals 5. Stamens united at base, the five outer shortest. Styles 5, pencil-shaped, or capitate at end. Capsule oblong or cylindrical.
- 1066. *Agrostemma*. Cal. 1-leaved, coriaceous. Pet. 5-clawed. Limb obtuse, undivided. Caps. 1-celled.
- 1067. *Lychnis*. Cal. 1-leaved, oblong, smooth. Petals 5-clawed, with a nearly 2-fid limb. Caps. 5-celled.
- 1068. *Cerastium*. Sepals 5. Petals bifid. Capsule 1-celled, opening at end.
- 1069. *Larbræa*. Cal. 5-cleft, urceolate at base. Petals 5, biparted, perigynous. Styles 5. Ovary 1-celled, many-seeded. Capsule 5-valved at end.
- 1070. *Spergula*. Sepals 5. Petals 5, entire. Capsule ovate, 1-celled, 5-valved.

Order 5. DECAGYNIA.

10 Stamens. 10 Styles.

- 1071. *Phytolacca*. Sepals 5. Berry superior, 10-celled, 10-seeded.

MONOGYNIA.

- 5670 Leaflets 13-19 lanceolate oblong
- 5671 Leaflets 8-10 lines long obovate, Pubescence yellowish brown
- 5672 Leaflets 25-41 obovate
  
- 5673 A tree, Leaflets roundish or oval very obtuse at each end as well as the calyx downy
- 5674 A tree, Leaflets oblong ovate acute and pods smooth
- 5675 Herbaceous, Leaflets oblong when full-grown silky above
- 5676 Herbaceous, Leaflets ovate-oblong smoothish

- 5677 Leaflets 9-11 acuminate smooth on each side, Pods downy

and Miscellaneous Particulars.

- 941. *Sophora*. An alteration of the Arabic name *Sophera*. This genus has been much altered from what it formerly was. It now consists chiefly of fine trees, some of which are hardy.
- 942. *Ormosia*. From *ormos*, a necklace, for making which the handsome seeds, red with a black-eye, of the species are well adapted. The kind cultivated in England is exceedingly rare.

History, Use, Propagation, Culture,

943. *Anagyris*. From *ανα*, like, and *γυρος*, a circle. Its pod is curved inwards at its extremity. Small trees native of the South of Europe and North of Africa, and one doubtful species of Nepal. Young cuttings root in sand under a hand-glass.

944. *Thermopsis*. So named from the resemblance of the flower to that of a Lupine. This genus is cultivated with difficulty: it grows best in a light loamy soil, and may be increased by seed; dividing the root is liable to injure the plant, so that it is increased with difficulty by that means. (*Bot. Cult.* 427.)

945. *Virgilia*. A genus dedicated by Lamarck to the poet Virgil, whose *Georgics* contain many things interesting to botanists.

946. *Cyclopia*. Named by Ventenat, from *κυκλος*, a circle, and *πυς*, a foot, in allusion to the replicate circle which is found about the base of the pods.

947. *Baptisia*. So named from *βαπτισμα*, to dye, in allusion to the economical properties of some species. Herbaceous plants of easy cultivation, and as border flowers ornamental.

948. *Podalyria*. Podalyrus was a son of Æsculapius. Small Cape shrubs, with simple silky leaves and purple blossoms. The species may be grown in leaf mould and peat, or peat loam, and rooted by cuttings in sand, or raised from seeds.

949. *Chorozemia*. M. Labillardière originally discovered this plant upon the south-west coast of New

- 5678 Leaves lanceolate acute  
5679 Leaves elliptical obtuse  
5680 Leaves lanceolate shining silky beneath

5681 Leaflets oblong-lanceolate, Stipules lanceolate twice as long as stalk, Pedicels whorled

- 5682 Leaves pinnate, Leaflets with a short point smooth, Racemes long pendulous  
5683 Stamens persistent, Ovaries downy, Leaflets oval obtuse pointless  
5684 Stamens persistent, Ovaries smooth, Base of calyx pushed inwards, Leaflets oval obt. with a little point  
5685 Stam. decid. woolly at base, Ovaries downy, Keel acuminate, Leaflets lanceolate

5686 Leaflets subulate and sepals pointless, Bractes oblong ovate shorter than peduncle, Branchlets smooth

- 5687 Leaves perfoliate entire roundish  
5688 Stem and leaves very hairy, Leaflets oval obtuse, Raceme terminal spiked  
5689 Leaves ternate stalked, Leaflets cuneate lanceolate, Stipules longer than stalk lanceolate  
5690 Leaves ternate stalked, Leaf. ellipt. obl. Stipules deciduous subulate shorter than stalk, Ovaries smooth  
5691 Leaves ternate stalked, Leaf. roundish obovate, Stipules setaceous obovate

- 5692 Leaves oblong obovate on both sides with the calyxes silky, Pedunc. one-fl. as long as leaves  
5693 Leaves oblong obovate on both sides with the calyxes silky, several times longer than the 1-fl. fl-stalk  
5694 Leaves cuneiform emarginate silky, Pedunc. shorter than leaf  
5695 Leaves oval silky on both sides shorter than 2-fl. peduncle, Cal. downy rough  
5696 Lvs. oval and obov. pubes. beneath netted: when full-grown not silky, Cal. vill. with a scarious refl. limb  
5697 Leaves ovate reticulate, Branches hairy angular striated, Peduncles as long as leaves  
5698 Leaves simple ovate downy, Fl. axillary, Peduncles longer than leaf  
5699 Leaves elliptical-lanceolate, Peduncles 1-fl. shorter than leaves, Calyx deeply split  
5700 Leaves villous stalked: upper ovate; lower roundish, Cal. villous with segments as long as wings  
5701 Leaves cordate roundish subsessile very villous, Segments of villous calyx shorter than wings

5702 Leaves pinnatifid-toothed spiny oblong-lanceolate: with an entire point longer than the teeth

5703 Leaves sinuate-toothed spiny oblong obtuse, Bractes below the end of stalk

5704 Leaves entire flat mucronate: lower rhomboid orbicular; the upper elliptical lanceolate

5705 Lvs. opp. spiny toothed 3-lobed with a transverse base, Lateral lobes much shorter than term. toothed one

5706 Leaves lin. lanc. Bractes adhering to top of the footstalk, Corymb. clust. Pods scarcely longer than cal.

5707 Leaves oval. obl. Bractes deciduous below the end of footstalk, Corymb. clust. Pods twice as long as cal.

5708 Leaves ovate cordate hairy, Umb. terminal sessile

5709 Leaves lanceolate acute

5710 Leaves ternate obovate mucronate silky beneath

5711 Leaves ovate flat, Standard oblong obovate

5712 Leaves elliptical wavy mucronate, Standard oblong cordate

and Miscellaneous Particulars.

Holland, at the foot of the mountains, in a loamy soil, near a spot where, after having been tantalized with finding many salt springs, his party had just met with an ample supply of fresh water. This welcome refreshment, of which he speaks feelingly in his book, seems to have suggested a name for this plant, which he had properly determined to constitute a new genus. He called it *Chorozeria*, evidently from *χορος*, a dance or joyous assembly, and *ζημα*, a drink, in allusion to the circumstance just mentioned. (Smith.)

This genus ripens abundance of seeds, from which it may be readily increased, and also by young cuttings in sand under a bell-glass.

950. *Podalobium*. This and the succeeding names ending in *lobium*, refer in that part of their derivation to their pod; this genus is called from *πυρ ποδος*, a foot, the pod being on a stalk. The species may be treated as *Chorozeria*.

951. *Oxylobium*. From *οξυς*, pointed, the pods being pointed. See *Podolobium*.

952. *Callistachys*. From *καλος*, beautiful, and *σχυς*, a spike, in reference to the fine spikes of yellow flowers. These are handsome conservatory shrubs, which grow rapidly and flower freely. They may be raised from seeds or cuttings in sand under a bell-glass.

953. *Brachysema*. From *βραχυς*, short, and *σημα*, a standard. The standard of the flower of the genus is very short. This is a handsome climber, increased by layers, cuttings in sand, or by seeds.

History, Use, Propagation, Culture.

954. *Gompholobium*. The name of this genus alludes to the tumid shape of the legume, which swells from a narrow base upwards; according to the primary signification of *γομφοσ*, a word thence used to signify a club or wedge, or any thing formed upon a similar principle. Delicate plants, difficult to preserve, requiring a large proportion of sand in the peat, and moderate watering. Young cuttings root under a bell-glass in sand.

955. *Burtonia*. A genus defined in the Hortus Kewensis, without an explanation of the origin of the name. This plant, Sweet observes, requires more than ordinary treatment to keep it in good health; an equal mixture of very sandy loam and peat is the best soil for it, and the pots to be well drained with small potsherds, that the water may pass off freely, as nothing is more injurious to it than too much water. Young cuttings are not difficult to root, planted in sand under a bell-glass; it may also be raised from seeds, which are sometimes produced. (*Bot. Cult.* 156.)

956. *Jacksonia*. Named after Mr. Jackson, formerly librarian to Aylmer Bourke Lambert, and an excellent practical botanist, of whom too little is known. Young cuttings will root in sand under a bell-glass, or ripened ones under a hand-glass.

957. *Viminaria*. From *vimen*, a twig. The appearance of the species which have no leaves is that of a bundle of naked twigs.

5713 Leaves term.-Leaf. lin. or obl. lin. an inch and more long, Stem erect, Keel fringed, Cal. in fruit reflexed

5714 Leaves ternate linear mucronate straight, Branches angular smooth

5715 Leaves ternate, Leaf. obovate edged flat, Stipules as long as leafstalk, Cor. length of calyx

5716 Lvs. tern. and quinat. Leaf. linear recurved at edge, somewhat dilated at end, Stem procum. or twining

5717 Leaves ternate linear smooth mucronate, Branches round hairy, Keel hairy

5718 Leaves pinn. Leaf. subulate linear mucronate rough above, Cal. hairy shorter than pod, Keel silky ciliate

5719 Leaves pinn. of many pinn., Leaf. subulate veiny revolute at edge and calyxes smooth, Cor. purple

5720 Leaves ternate, Cal. smooth, Style beyond the middle beardless

5721 Arborescent unarmed, Branches angular, Racemes terminal

5722 Shrubby, Branches spiny 2-3-chotomous spreading angular, Bractes very short

5723 Segments of calyx straight ovate

5724 Flowers racemose, Segments of calyx lanceolate reflexed

5725 Tube of cal. a little shorter than lips, Style included bowed from the base, Cor. yellow

5726 Tube of cal. twice as short as the lips, Cor. red

5727 Cal. silky with appressed hairs, Pods stalked, Seeds dotted rugose, Leaves rough above

5728 Flowers axillary ternate, Leaves subulate mucronate

5729 Corymbs terminal sessile, Leaves subul. rough with dots divaricate twisted, Branches pubescent

5730 Corymbs terminal stalked, Leaves filiform erect smooth, Mucro weak recurved

5731 Leaves short spreading decussate, Fl. capitate, Pedunc. with two bractes, Stigma capitate

5732 Corymbs terminal sessile, Leaves filiform erect, with a weak short point, Branches silky

5733 Leaves acesose horizontal, Branches weak, Heads 3-9-flowered

5734 Leaves lanceolate or lanceolate-obovate, Peduncles axillary twin, Appendages of wings very short

5735 The only species

5736 Lvs. beneath somew. silky retuse, Lobes round. longer than little point, Stalk of pod as long as tube of cal.

5737 The only species

5738 Heads terminal, Leaves obovate oblong flat quite smooth 3 times as long as broad, Point pungent

5739 Heads term. Leaves cuneate orboid, retuse flat smooth scarcely twice as long as broad, Point pungent

5740 Heads term. few-fl. Leaves cuneate truncate bristly pointed recurved at edge rough above villous beneath

5741 Heads term. Leaves linear retuse blunt flat smooth, Bractes a little longer than cal.

5742 Heads term. Leaves obovate mucronate smooth, Stem upright, Calyx and pods hairy

5743 Bractes shorter than 6-8-fl. head, Lvs. lin. with a little point and recurv. edge, Stip. shorter than footstalk

5744 Leaves linear mucronate revolute recurved at end, Stipules solitary 2-nerved with membr. torn sheaths

5745 Heads many-fl. Bractes about as long as cal. Leaves flat linear acute, Stipules biid flat imbricated

5746 Fl. axill. Leaves linear lanceolate mucronate smooth, Stip. imbric. ciliated, Cal. and bractes bearded

5747 Racemes leafy, Leaves linear oblong, above concave, beneath cal. and branchlets pilose

and Miscellaneous Particulars.

958. *Spherolobium*. From *σφαίρα*, a sphere; the pods being nearly spherical. See Jacksonia.

959. *Actis*. From *ἄκτις*, private, and *ἄκτις*, ear, in allusion to the want of the appendages to the calyx in this genus. In *Pultenaea*, to which it is most nearly allied, they are very distinct.

960. *Dillwynia*. Named by Sir James Edward Smith, after Mr. Lewis Weston Dillwyn, whose labors upon Conifers and other parts of British botany are well known. These plants being liable to suffer from wet, the pots must be well drained with sherds and refuse peat siftings. Young cuttings root freely in sand under a bell-glass.

961. *Eutaxia*. From *εὐταξία*, modesty, in allusion to the humble, modest appearance of the plant. Mr. Sweet directs to top the plants frequently when young, otherwise they are apt to run up naked and unsightly.

962. *Sclerothamnus*. From *σκληρός*, hard, and *θάμνος*, a shrub. The species are rigid plants with stiff hard leaves.

963. *Gastrolobium*. From *γάστρις*, the belly; or, in botanical composition, something inflated. The pods of the genus are much swollen.

964. *Euchilus*. From *εὐ*, well, and *χίλος*, a lip; well lipped. The upper lip of the calyx is very large.

965. *Pultenaea*. Named after William Pulteney, M. D., author of a view of the writings of Linnaeus, and

History, Use, Propagation, Culture,

of various other works of merit. These are small New Holland bushes, with numerous yellow flowers, frequently brown on the outside.

966. *Daviesia*. Named after the Rev. Hugh Davies, a Welsh botanist. Plants like furze. The species root best when the cuttings are somewhat ripened and planted in pots of sand, and covered with a hand-glass without bottom heat.

967. *Mirbelia*. In honor of Mr. Mirbel, a distinguished French physiological botanist, whose elucidations of the reticulated structure of vegetables make it proper to consecrate to his merits plants remarkable for their reticulation.

968. *Cercis*. *Kasque* is a name of Theophrastus, supposed to have appertained to the tree now so called. *Gainier* or *Arbre de Judée*, Fr., *Arboid Amor*, Span. Handsome low trees, with singular leaves and fine shewy flowers. These having an agreeable poignancy, and being abundant on the branches, are frequently eaten in salads on the continent, and those of the *C. canadensis* are pickled by the French families in Canada. The wood of both species is finely veined with black and green, and takes a good polish; and the young branches of the Canadian species are said to dye wool of a fine nankeen color. They may be propagated either by layers or seeds: the latter make the best plants. Gerarde, in compliance with the popular notions of his time, says, "this is the tree whereon Judas did hang himself; and not upon the elder tree, as it is said."

969. *Schotia*. So named by Jacquin, in memory of Richard van der Schott, a Dutchman, gardener at Schoenbrunn, and his companion in his travels. This beautiful genus has lately been increased by Burchell, the African traveller. "They require," Sweet observes, "rather more warmth than a common greenhouse, to keep them in good health through the winter. The coldest part of the stove will suit them better; but they should not be plunged in the tan, as they want no bottom heat. A mixture of loam and peat is the best soil for them; and cuttings planted in sand, and plunged in mould (not in tan), under a hand-glass, will strike root." (*Bot. Cult.* 105.)

970. *Bauhinia*. So named by Plumier, in honor of the two famous botanists, John and Caspar Bauhin. The species consist of trees or shrubs, most of them climbing. The leaves are simple, but two-lobed or two-

- 5748 Very smooth, Fl. axill. Leaves oblong linear mucronate flat  
 5749 Heads terminal 2-flowered, Fruit lateral, Leaves subulate linear hairy above concave  
 5750 Heads terminal few-fl. Leaves wedge-shaped at the end dilated 2-lobed above rough beneath silky
- 5751 Leaves linear revolute pungent straight rough, Flowers axillary solitary  
 5752 Branches spiny smooth spreading, Leaves lanceolate or linear, Pedunc. axill. 1-fl. Bractes 8 imbricated  
 5753 Leaves linear oblong flat pointless, Pedunc. axill. twin corymbose many-fl. Calyx regular  
 5754 Branches unarmed, Lvs. long-lanc. with a very short weak point, Corymbs axill. Upper lip of calyx retuse
- 5755 Branches unarmed, Leaves ellipt. or oval veiny attenuated at base, Racemes axillary many-fl.  
 5756 Stem leafless winged, Umbels lateral, Calyx and bractes fringed
- 5757 Leaves lanceolate linear veiny, Ovaries 2-seeded  
 5758 Leaves wedge-shaped at the end dilated-trifid
- 5759 Leaves orbicular cordate  
 5760 Leaves cordate acuminate
- 5761 Leaves 7-10 pairs oval-lanceolate mucronate, Stipules subulate  
 5762 Leaves 8-10 pairs oval obtuse mucronate or not, at the base in front a little swollen  
 5763 Leaves 5 pairs oval acute mucronate, Stipules half-ovate falcate mucronate
- 5764 Stem tendril-bearing, Lobes of leaves attenuated  
 5765 Stem tendril-bearing, Fl. triandr. on outside with stam. at base hairy, Lvs. downy beneath, Lobes rounded  
 5766 Stem prickly  
 5767 Leaves smooth, Lobes divaricate acute 2-nerved, Petals lanceolate  
 5768 Leaves at the base nearly transverse, Lobes lanceolate porrect 3-nerved, Petals lanceolate  
 5769 Leaves cordate, Lobes porrect acute 3-nerved, Petals lanceolate  
 5770 Racemes axill. and term. nodding, Petals linear, Lobes of leaves rounded smooth  
 5771 Cal. 1-leaved bursting, Petals sessile ovate, Lobes of leaves ovate obtuse  
 5772 Leaves cordate downy beneath, Lobes ovate obtuse, Cal. narrowed upwards lengthened  
 5773 Flowers triandrous, Lobes of leaves oval obtuse  
 5774 Leaves cordate, Lobes half orbicular downy  
 5775 Leaves ovate, Lobes acuminate half-ovate spreading  
 5776 Stem prickly, Leaves cordate with porrect 4-nerved lobes
- 5777 Leaves alternate abruptly pinnated, Pod woody, Seeds black with a scarlet arillus

- 5778 Leaflets coriaceous veinless unequal at base, Flowers of panicle stalked  
 5779 Leaves veiny unequal at base, Panicle wavy spreading, Pedunc. many-fl. Pods warted

and Miscellaneous Particulars.

parted, which circumstance gave occasion, it is said, to Plumier to name this genus from the two brothers. They merit a place in the stove, where they are easily cultivated in light loamy soil, and cuttings taken off when the plants are in a growing state, not over ripened, nor yet quite succulent, with their leaves on, will do well in sand under bell-glasses in moist heat. The species rarely flower in this country. In their native woods they are great ornaments of the trees, among which they climb in every direction. The stem of *Bauhinia scandens*, which had twined around a smaller plant, is said to have been the origin of *Esculapius*'s snakes rod, which he brought from India.

971. *Azetta*. Named by Sir J. E. Smith, after Dr. Adam Afzelius, an amiable and excellent Swedish botanist, resident for many years, in the service of the African Company, at the colony of Sierra Leone, and now living at Upsal.

972. *Hymenaea*. A poetical application of this plant, the leaves of which grow in pairs, to Hymen, the god of marriage. *Cowdarit* is a vernacular American name. This tree is abundant in the West Indies, where it grows to a large size, with a spreading head. It has stiff sub-perfoliate leaves obliquely plac'd, and terminal spikes of flowers, which are succeeded by thick, fleshy, brown pods, shaped like those of the garden bean; they are six inches long, and two inches and a half broad, of a purplish brown color, and a ligneous consistence, with a large suture on both edges; they contain three or four roundish compressed seeds, divided by transverse partitions, and inclosed in a whitish substance of fine filaments, as sweet as honey. The Indians eat this substance with great avidity, though it is apt to purge when fresh gathered, but it loses this quality as it grows old.

Between the principal roots of the tree exudes a fine transparent resin, yellowish or red, which is collected in large lumps, is called gum Anime, and makes the finest varnish that is known, superior even to the Chinese lacca: for this latter use it is dissolved in the highest rectified spirits of wine. It burns readily, and with a clear flame, emitting a grateful and fragrant smell, for which reason it is sometimes ordered by way of fumigation in the chambers of persons laboring with asthmas or suffocative catarrhs. Its vapours not only strengthen the head, but all parts of the body affected with cold. Some apply it outwardly, dissolved in oil or spirits of wine, to strengthen the nerves. An oil may be distilled from it, useful in paises, in cramps, and

History, Use, Propagation, Culture.

contractions of the sinews. The solution in spirits has been thought not inferior to Guaiacum in venereal cases. A decoction of the leaves expels flatulency, and gives ease in colicky pains, by gently opening the bowels; and the inward bark is an excellent vermifuge in substance or decoction.

The tree is excellent timber; but it must be very old before it is cut, otherwise the heart will be but small. It is in great request for wheel-work in the sugar-mills, particularly for cogs to the wheels, being extremely hard and tough: it is so heavy, that a foot cube weighs about a hundred pounds, and it will take a fine polish. It is much inhabited by wild honey bees. (*Broune.*)

Besides this locust-tree, there is the American tree of that name, Robinia Pseud-acacia, and the locust-tree of scripture, Ceratonia siliqua.

## 5780 Flowers growing upon the trunk

- 5781 Leaves 1 pair and calyxes smooth, Stipules cordate-lanceolate  
 5782 Leaves 2 pairs obovate, Two subulate glands between the lower pair  
 5783 Leaves 2 pairs ovate oblong acuminate, An obl. gland between the lower pair, Spines obsolete 3-toothed  
 5784 Leaves 2 pairs ovate oblique, An obtuse gland between the lowest, Racemes axill. stalked  
 5785 Leaves 3 pairs : with a gland on the footstalk, Stipules ciliate cordate acuminate  
 5786 Leaves 3 pairs obovate : outer largest, A subulate gland between the lower pair  
 5787 Leaves 3 pairs obovate smooth : the inner roundest with a globose gland between  
 5788 Leaves 3 pairs, Leaflets obtuse elliptical, A gland between the lower leaves  
 5789 Leaves 3 pairs, Leaflets ovate acuminate, A sessile gland between the leaflets  
 5790 Leaves 3 pairs ovate acuminate with soft down on each side  
 5791 Leaves 3 pairs lanceolate subfalcate smooth, A gland between the lowest, Corymbs stalked, Pods cylind.  
 5792 Leaves about 4 pairs ovate, Flowers racemose irregular, Stem arborescent  
 5793 Leaves 3 pairs obovate obtuse beneath very villous outer largest, A gland between lowest, Pods recurved  
 5794 Leaves 3 or 4 pairs obovate the outer largest, A gland between the lower pairs, Pods pendulous rounded  
 5795 Leaves 4 pairs ovate hairy with a subulate gland between the leaflets, Peduncles 4-flowered  
 5796 Leaves 4 pairs obovate pubescent ciliated, A stalked gland between all, Pedunc. 4-fl. Pod jointed  
 5797 Leaves 4 or 5 pairs oblong obtuse : the outer the largest with a gland between every pair  
 5798 Leaves 5 pairs ovate lanceolate rough at edge : outer largest, A gland at foot of leafstalk  
 5799 Leaves 5 pairs oblong acute smooth, A gland at base of footstalk, Branches smooth  
 5800 Leaves 5 pairs elliptical smooth with an obl. gland between the lower, Stip. subul. falcate, Rac. axillary  
 5801 Leaves 5 pairs elliptical smooth, An oblong gland between the lower, Racemes axillary  
 5802 Leaves 5 pairs cordate obtuse, Stalks without glands  
 5803 Leaves 6 pairs obovate smooth, Stalks without glands, Spikes racemose, Pods leafy compressed falc. te  
 5804 Leaves 5 pairs lanceolate equal, Gland above the base of the leafstalks  
 5805 Leaves 6 pairs ovate lanceolate smooth with a gland at the base of the stalk, Pod compressed edged  
 5806 Leaves 8-9 pairs ovate lanceol. hairy with a gland at base of stalk, Racemes many-fl. shorter than leaves  
 5807 Leaves 6 pairs lanceolate acute the outer largest, A gland on leafstalk, Peduncles 2 flowered  
 5808 Leaves 6 pairs obl. smooth : lower smaller with a subulate gland between the lowest, Stalks 2-flowered  
 5809 Leaves 6 pairs ovate acute smooth, with a gland at the base of the stalk, Pod cylindrical hooked  
 5810 Leaves 5-6 pairs ovate acuminate woolly : the outer largest  
 5811 Leaves 6 or 8 pairs lanceolate acute smooth, with a gland on the leafstalk, Pod round smooth  
 5812 Leaves 2 pairs obovate veiny, Stipules lanceolate appressed, Leaflets long equal  
 5813 Leaves 10 pairs oblong obtuse without glands, Racemes long, Bractes ovate tumid imbricated  
 5814 Leaves 6-8 pairs linear obliquely rounded at base above hairy, Panic. axillary, Pod villous  
 5815 Leaves in many pairs with many glands, Stipules subulate  
 5816 Leaves 2 pairs velvety without glands  
 5817 Leaves 5 pairs ovate lanceolate smooth with a gland at the base of the leafstalk  
 5818 Leaves 6-9 pairs lanceolate acuminate smooth, A gland on the leafstalk  
 5819 Leaves 8 pairs ovate-lanceolate, A gland between the lower, Stipules ovate very large  
 5820 Leaves 10 pairs ovate-lanceolate obtuse mucronate smooth, Stalk without gland  
 5821 Leaves 8 pairs ovate-oblong equal, Gland at the base of the leafstalk  
 5822 Leaves 8 pairs oval-oblong : the outer smaller, Leafstalks without glands, Stipules spreading  
 5823 Leaves 7 pairs lanceolate : the outer smallest, A gland at base of leafstalk  
 5824 Leaves 6 pairs oval-obl. obt. hairy : the outer largest, A subulate gland between each pair, Pods linear  
 5825 Leaves 6 pairs oval-obl. smooth obt. A cylindrical gland between the lowest, Footst. with no gland at base  
 5826 Leaves 10 pairs lanceolate with an oblong gland at the base  
 5827 Leaves 10 pairs, Leaflets oblong rounded at each end beneath hoary, No gland on stalk, Pod compressed  
 5828 Leaves 12 pairs obtuse mucronate, Glands many subulate, Stipules reniform bearded  
 5829 Leaves many pairs, Gland of the footstalk stalked, Stipules ensiform  
 5830 Branches hairy, Stipules lanceolate linear with elevated lines, Leaflets cuspidate  
 5831 Leaves 15 pairs, Leaflets with a cartilaginous white edge and a subulate gland between every pair  
 5832 Leaves many pairs linear with an obsolete gland at the base of the leafstalk, Stipules setaceous  
 5833 Leaves many pairs linear mucronate with a gland between the lowest, Pedunc. solitary 1-fl.  
 5834 Leaves many pairs, Flowers pentandrous, Stem erect  
 5835 Leaves many pairs linear, Stem flexuose erect villous. The plant in Bot. Cab. is something else?  
 5836 Leaves many pairs without glands, Stem procumbent

and Miscellaneous Particulars.

973. *Cynometra*. A name contrived to indicate the peculiar form of the pods of this genus, which grow from the old stems and branches of the tree. Large cuttings root best planted in sand, and plunged in heat under a hand-glass.

974. *Cassia*. According to Olaus Celsus, this name is to be traced to the Hebrew, *Ketzioth*, rendered by *Keravay* in the Septuagint, and Latinized by *Cassia*. Cuttings of the species, which do not seed freely, root in pots of sand, in moist heat, and covered by a hand-glass.

Of the trivial names of different species of *Cassia*, that of *Absus* is the name under which it is described by Professor Alpinus, and is supposed to have arisen from a river of Palestine of that name. *Tagera* is a Malabar name, *Sophera*, an Egyptian name, and *Senna*, the Arabic name of the plant — *Senna*.

History, Use, Propagation, Culture,

975. *Cathartocarpus*. From *καθαρτα*, to purge, and *καρπος*, fruit; the fruit of the species being a strong cathartic. The species may be treated as Cassia.

976. *Parkinsonia*. So named by Plumier, in memory of John Parkinson, apothecary, of London, author of *Paradisus Terestris*, 1629, and *Theatrum Botanicum*, 1640. It is a handsome low tree, not unlike the *Laburnum*, and planted in the West Indies near houses, as the latter is in this country.

977. *Poinciana*. So named by Tournefort, in memory of De Poinci, governor of the Antilles, placed by Linnæus among the promoters of botany.

*P. pulcherrima* is a low spiny tree, with an odor, when the leaves are bruised, like savin. It is a native of both Indies, and in Barbadoes is planted in hedges, whence the name of flower-fence, or Spanish carnations, which it is there called. In our stoves they require a strong heat to make them flower well. They are readily increased either by cuttings or seeds.

978. *Cæsalpinia*. So named by Plumier, in honor of Andreas Cæsalius, chief physician to Pope Clement VIII., and the father of systematic arrangement in plants, in his now very scarce work, entitled, *De Plantis, libri sedecim*, Flor. 1583. He died at Rome in 1602. The wood of all the genus may be used in dying. In our stoves the plants are thorny, and, therefore, not being much liked, are seldom suffered to grow large enough to flower freely.

*C. sappan* is a prickly tree, with the heart of the wood red, heavy, and very hard: it dyes a beautiful red, which, however, is said not to stand. It is very durable in sea-water, and exported abundantly by the Chinese for trenails in ship-building, and as a dye.

*C. crista* and *brasiliensis* afford the Brazil wood used in dying, and extensively imported to England from the West Indies. The timber of the last species is elastic, tough, and durable, and takes a fine polish; it is of a beautiful orange-color, full of resin, and yields a fine full tincture by infusion. The best Brazil wood is said to be produced by *Cæsalpinia echinata*. Cuttings, Sweet observes, will not root freely, but will sometimes succeed if taken off in a growing state, but not too young, and plunged in a pot of sand, under a hand-glass, in moist heat. (*Bot. Cult.* 32.)

979. *Guilandina*. Named after Melchior Guilandin, a Prussian traveller in Africa, and demonstrator of Botany at Padua. He died in 1590. The species are all fine trees, with large compound leaves.

980. *Hyperanthera*. From *ὑπερ*, upon, and *ανθηρα*, an anther. The five barren stamens of this

5837 Leaves 5 pairs

5838 Leaves 12 pairs

5839 The only species

5840 Prickly, Calyxes unequal smooth

5841 Unarmed, Calyxes equal downy

5842 Prickly, Leaves doubly in 2 pairs, Leaflets obovate and calyxes smooth, Stam. as long as corolla

5843 Unarmed, Leaflets ovate-oblong, Rachis pubescent, Cal. downy, Stamens shorter than corolla

5844 Prickly, Leaf. obl. oval uneq. sided obt. and cal. smooth, Stamens longer than cor. Upper petal very small

5845 Prickly, Leaflets oval, Racemes simple, Petals ovate shorter than the smooth calyx

5846 Prickly, Leaflets oblong obtuse, Stamens shorter than cor. Pods woolly

5847 First petiole prickly beneath, Leaflets acute and cal. smooth, Pods 1-2-seeded

5848 Stipules spiny, Leaflets oblong retuse, Leafstalks hairy

5849 Prickly, Leaflets oblong obtuse mucronate smooth

5850 Unarmed, Leaflets unevenly bipinnate, Leaflets elliptical obtuse mucronate dotted

5851 The only species

5852 Flowers half decandrous, Leaves about bipinnate, Lower leaflets ternate, Pods 3-cornered

5853 Stem decumbent, Leaves bipinnate ovate glaucous

5854 Leaves decomposed smooth on each side

5855 Leaves decomposed downy beneath

5856 The only species

5857 The only species. Branches spiny, Leaves alternate conjugate

5858 The only species. Leaves abruptly pinnated, Leaflets obovate

5859 The only species

and Miscellaneous Particulars.

genae are surmounted by the five fertile ones. (Vahl.) Cuttings root best under a hand-glass in sand.

981. *Hoffmanseggia*. Named by Cavanilles, after John Charles Hoffmansegg, whom he calls a distinguished naturalist. It may be with some propriety be employed to commemorate the merits of the present distinguished Count Hoffmansegg. Cuttings, somewhat ripened, root under a hand-glass in sand.

982. *Adenantha*. From *ἀδνη*, a gland, and *ἀνθή*, an anther. The essential character of the genus is to have each anther tipped with a gland. Large cuttings, with the leaves not shortened, root best in a pot of sand plunged in heat under a hand-glass. (Bot. Culti. 13.)

983. *Cada*. Contrived by Forskahl, from the Arabic name of the plant, — *qadhy*.

984. *Prosois*. One of the names under which Dioscorides described the Arcium Lappa. The present plant has no sort of resemblance to that of the ancients. It is a leguminous plant, and the pods are eaten as a condiment in India.

985. *Hæmatoxylon*. From *αἷμα*, blood, and *ξύλον*, wood, in allusion to the color of an infusion of its wood. The logwood of commerce. This is a crooked stemmed low tree, with pinnate leaves, originally from the Bay of Campechy; the inner bark and wood red, the latter dark and very hard. It makes an excellent fence, the smaller shoots are cut for hoops, and the stems for exportation for dyeing. The gum is a gentle subastrigent. In our stoves it grows well in loam and leaf-mould, kept rather moist, and cuttings root in sand under a hand-glass in heat.

986. *Copaifera*. This tree is so called from bearing the drug Copaiba, which is the name given to the tree itself by the people of Brazil. *Beauve de Copahu*, Fr., *Kopaiba Balsam*, Ger., *Balsamo del Coppaiiba*, Ital. This is a lofty elegant tree, with a handsome branching head, the extreme branches flexuose at the axils, the bark ash-colored, and the leaves pinnate. It grows abundantly in the woods of Tolu, near Carthagena, and of Quito, in Brazil. The copaiba balsam of the shops is procured by wounding or boring these trees to the pith, near the base of the trunk, when it flows abundantly, in the form of a clear colorless liquid, which is thickened, and acquires a yellowish color by age. The operation is performed two or three times in the same year; and from the older trees the best balsam is obtained.

Copaiba balsam is stimulant, diuretic, and gently purgative. It has been recommended in pulmonary complaints, and it certainly affords considerable relief in hæmorrhoidal affections. (Thompson's London Dispensatory, 285.) It may be increased by ripened cuttings in sand under cover.

History, Use, Propagation, Culture.

987. *Trichilia*. From *τριχίλα*, ternary, nearly all the parts of the plant, the leaves, the stigmas, the cells of capsule, the seeds, being produced by threes. *T. glabra* is a tall branching tree, with an unpleasant fetid smell. The species are rarely seen in collections, and seldom, when cultivated, flower.

988. *Melia*. *Melia* was the Greek name of the manna ash, from *μέλι*, honey. This tree has been thought to resemble the ash in its foliage.

*M. azedarach* (*azadarach*, Arab.) grows to a large tree in the south of Spain and Italy, producing long loose bunches of blue flowers, succeeded by pale yellow berries, about the size of a cherry. These berries consist of a pulp, which is poisonous in a high degree, and mixed with grease, will kill dogs, enclosing a nut which is bored and strung as beads by the Catholics.

*M. sempervirens* is considered by some as only a variety of the Azedarach.

989. *Quivivisia*. The tree is called *Bos de Quivi* in the Isle of France.

990. *Swietenia*. So named by Jacquin, in honor of the illustrious Gerard L. B. Von Swieten, archiater to Maria Theresa, Empress of Germany, who at his persuasion founded the botanical garden at Vienna.

*S. mahagoni*. The mahogany tree is a lofty branching tree, with a wide handsome head, the flower of *Melia*, and the fruit of Cedrela, about the size of a turkey's egg. It grows in the warmest parts of America, as in Cuba, Jamaica, Hispaniola, &c. The trees on the Bahama islands are not so large, but are more curiously veined, and are known in Europe as Madeira wood. They generally grow on the solid rock, where there seems to be no earth for their nourishment. Mahogany, like other timber, varies in durability, firmness of grain, and other circumstances, with the soil on which it is grown. The best is furnished from the rocky soils of St. Domingo and the Bahama islands.

*S. febrifuga* is a lofty tree, in general appearance like the Mahogany. The wood is of a dull red color, remarkably hard and heavy; it is reckoned by the natives the most durable wood they know, and on that account is used for all the wood-work in their temples; it is also very serviceable for various other purposes. The bark is internally of a light red color: a decoction of it dyes brown of various shades, according as the cloth has been prepared. Its taste is a bitter and astringent united, and very strong, particularly the bitter; at the same time not any way nauseous or otherwise disagreeable. In India it is used for the cure of intermittents with considerable advantage, and has also been found efficacious in most of the diseases in which the cinchona bark proves serviceable. (*Thompson's London Dispensatory*, 533.)

991. *Ekebergia*. Charles Gustavus Ekeberg was a Danish naturalist, who travelled in Asia from 1770 to 1771. Cuttings to succeed must have their leaves entire, and be planted in sand and covered.

992. *Heynea*. Named after Dr. Benjamin Heyne, a learned German botanist and physician, who travelled many years in India, where he formed a large collection of dried plants.

993. *Guaiacum*. From *guaiaac*, the name given to the tree by the natives of Guiana. *Gijac*, Fr., *Gujakummi*, Ger., *Gujaco*, Ital. This tree rises forty feet high, and is four or five feet in circumference, with many divided knotted branches, greyish bark, and abruptly pinnate leaves. It has blue flowers, which are succeeded by compressed berries of a roundish form. The tree takes many years to arrive at its full growth. The roots run far into the ground perpendicularly, contrary to the usual growth of timber trees in the West Indies, which generally shoot the largest prongs of their roots in a horizontal direction, and are commonly observed to run very near the surface. The bark is thick and smooth, the wood of a dark olive color, and cross grained, the strata running obliquely into one another, in form of an X. It is a valuable timber where

5860 Leaves pinnated smooth, Outer leaflets largest  
5861 Leaflets lanceolate undulate, Flowers with 4 petals

5862 Leaves bipinnate, Leaflets smooth somewhat quinate  
5863 Leaves bipinnate, Leaves cut rugose shining about 9, Petiole rounded at base  
5864 Leaves pinnate

5865 Leaves alternate oval and obovate entire sinuate-toothed or pinnatifid, Pedicels twin axillary 1-flowered

5866 Leaves pinnate in four pairs, Leaflets ovate-lanceolate equal at base, Panicles axillary  
5867 Leaves pinnate in four pairs, Leaflets elliptical roundish emarginate unequal at base, Panicle terminal

5868 The only species, Leaves pinnated with an odd one, Panicles axillary

5869 Leaves pinnated with an odd one in 3 pairs, Pan. axill. on long stalks

5870 Leaflets of 2 or 3 pairs obtuse, Capsules 2-celled

5871 Leaves simple opposite sessile roundish  
5872 Leaves conjugate stalked, Leaflets obovate, Peduncles erect, Calyx smooth  
5873 Leaves conjugate stalked, Leaflets obovate, Flower nodding, Calyx pubescent

5874 Leaves conjugate stalked, Leaflets linear-lanceolate  
5875 Leaves conjugate stalked, Leaflets clavate fleshy with a cobweb surface

and Miscellaneous Particulars.

strength and duration is required, and weight no object. It takes a fine polish, turns well, and is much used for ship blocks. It is one of the most valuable trees of the West Indies; since the timber, the bark, fruit, leaves, and blossom, are all applicable to some useful purpose. The wood yields by incision the peculiar substance called Guaiacum, erroneously termed a gum, of great importance in medicine.

All the parts of this tree possess medicinal qualities; but the wood and the peculiar substance afforded by it are the only parts used: the virtues of the wood depend altogether on the peculiar matter it contains. This is spontaneously exuded from the tree, and is called native gum: it concretes in tears, which are semi-pellucid, and very pure; but the greater part of it is obtained by making incisions into the trunk, or, as it is termed, jaggng the tree. This operation is performed in May; and the juice which flows copiously, is concentered by the sun. It is also obtained by sawing the wood into billets, and boring a hole longitudinally through them; so that, when one end of a billet is laid on a fire, the guaiac melting runs through the hole from the opposite end, and is collected in a calabash. Boiling the chips or rasplings in salt and water also separates the guaiac, which, as it rises to the surface, may be collected by skimming.

Both the wood and the guaiac are stimulant, diaphoretic, diuretic, and purgative. The wood was introduced into Europe by the Spaniards as a remedy for lues venerea in 1506, and gained much celebrity from curing Van Hutten; but it had long before been used for the same purpose by the natives of St. Domingo. It obtained so much reputation, that the exhibition of mercury was discontinued for a considerable length of time, and even in the eighteenth century its specific powers over this disease were maintained by Boerhaave; but frequent disappointments and more correct observations have shown that it possesses no powers of eradicating the venereal virus; and that it is useful only after a successful mercurial course, for repairing the strength and vigor of the system, "and where a thickened state of the ligament, or of the periosteum, remains, or where there are foul indolent ulcers;" (Pearson's Observations, &c. p. 10.) or in suspending the progress of some of the secondary symptoms for a short time, as ulcers of the tonsils, eruptions, and nodes. The decoction of the wood has been found more useful in cutaneous diseases, scrofulous affections of the membranes and ligaments, and in oœna. The guaiac itself is an efficacious remedy in chronic rheumatism and arthritic affections, as well as those diseases for which the decoction of the wood is usually given; and in every respect it may be regarded as the active ingredient of the wood. Its sensible effects are a grateful sense of warmth in the stomach, dryness of the mouth and thirst, with a copious flow of sweat, if the body be kept externally warm, or if the guaiac be united with opium and antimonials: but when the body is freely exposed, instead of producing diaphoresis, it augments considerably the secretion of urine. (Thomson's London Dispensatory, 318.)

Lignum vite in the stove grows freely in loam and peat. "Cuttings," Sweet observes, "are generally supposed to be difficult to root; but I find ripened cuttings, taken off at a joint, root readily, planted thin in a pot of sand, and plunged under a hand-glass in heat. When the cuttings are rooted, which will be easily perceived by their growing at the top, they should be potted off; when great care must be taken not to break off the young roots in taking the sand from them, as they are very small and easily broken. Pot them off in very small pots, and keep them under a close glass or a few days, till they have struck fresh root, when they must be exposed to the air by degrees." (Bot. Cœl. 63.)

584. *Zygophyllum*. From *ζυγος*, a pair, and *φυλλον*, a leaf; all the leaves grow in pairs. *Morgana*, which is the name of one species, is the Syrian name of the plant. These are plants of little ornament, generally with fleshy leaves, and flowers of a yellow or whitish yellow color.

*History, Use, Propagation, Culture,*

995. *Fagonia.* So named by Tournefort, in honor of Mons. Fagon, archiater to Louis XIV, and a great patron of botany. Small prickly plants of no beauty.

996. *Tribulus.* From *tricus*, three, and *balas*, a point, in reference to the points of the capsules. *La Croix du Chenalier*, Fr. The term *Caltrops* is taken from the form of the fruit, which resembles the machines that were formerly cast in the way to obstruct an enemy's cavalry. It is composed of five nuts, united into a subglobular whorl armed with prickles.

T. *terrestris* is a native of most of the hot and temperate parts of the world: it is common about Kingston in Jamaica, where it is called Turkey *Wossom*, and planted in gardens for the sake of its flowers, which have an agreeable smell. The fowls are observed to feed much on them, which is thought both to fatten them and heighten their flavor. In the south of Europe, it is a common weed in arable land, and is troublesome to cattle by the prickly fruit running into their feet. All the species are pretty, though seldom cultivated.

997. *Dictamnus.* An ancient name of what is now supposed to be the *Origanum Dictamnus*. *Fraxinella*, Fr., in allusion to the remarkable similarity which exists between the leaves of the plant and *Fraxinus*, the ash. The whole plant, especially when gently rubbed, emits an odor like that of lemon-peel, but when bruised it has something of a balsamic scent. This fine scent is strongest in the pedicels of the flowers, which are covered with glands of a rusty red color, exuding a viscid juice or resin, which exhales in vapor, and in a dark place may be seen to take fire. The root is used in medicine, and, it is said, with much success, as an opiate and drastic.

998. *Ruta.* This name is nearly the same in all languages. *Purra*, in Greek; *Ruta*, in Latin; *ruiz*, in Runic; *rude*, *ruta*, or *rutu*, in Anglo-Saxon; *rutiza*, in Slavonic; in French and English, *rue*, &c. The root of the word is beyond the ingenuity of etymologists. R. *graveolens* was formerly in much repute as a medicinal plant, and also as emblematical of repentance and grace. In Shakespeare and other old authors, it is called herb of grace, as rosemary is called herb of remembrance. The leaves have a powerful unpleasant odor, and a hot, bitter, nauseous taste. In the recent state they will inflame and blister the skin; but much of this is dissipated in drying. Medicinally, rue is stimulant and antispasmodic, and is supposed to possess emmenagogue powers. It was in high estimation as early as the time of Hippocrates, who frequently ordered it in female complaints. In modern practice, it is chiefly used in hysteria and flatulent colic. (*Thomson's London Dispensatory*, 487.)

999. *Crowea.* So named by the president of the Linnean Society, after his friend James Crowe of Norwich, an excellent British botanist, whose collection of willows we believe still exists. This plant continues in flower the greater part of the year. An equal mixture of sandy loam and peat is the best soil for it, and care must be taken not to over water it, or it will look yellow and unhealthy. It likes an airy situation,

5876 Leaves conjugate stalked, Leaflets obovate, Stem shrubby  
 5877 Leaves conjugate sessile, Leaflets lanceolate oval rough at edge, Stem shrubby  
 5878 Leaves with double leaflets stalked, Leaflets cylindrical fleshy smooth, Petals acuminate

5879 Spiny, Leaflets lanceolate flat smooth  
 5880 Spiny, Leaflets linear convex

5881 Leaflets in 4 pairs: the outer larger, Pericarp 10-seeded blunt  
 5882 Leaflets in 6 pairs nearly equal, Seeds with four horns  
 5883 Leaflets in 8 pairs nearly equal

5884 Leafstalk obscurely edged  
 5885 Leafstalk scarcely edged at all

5886 Leaves supradecomposed, Leaflets oblong terminal obovate, Petals entire  
 5887 Leaves supradecomposed, Leaflets all linear, Petals entire  
 5888 Leaves supradecomposed oblong, Terminal leaflet obovate, Petals toothed  
 5889 Leaves supradecomposed, Lobes oblong cuneate nearly equal, Bractes very small ovate, Petals ciliate  
 5890 Leaves pinnate, Leaves lanceolate attenuate at base serrate crenate, Petals entire  
 5891 Leaves mostly ternate lanceolate pubescent: lateral very short, Cal. and ovaries villous  
 5892 Leaves simple lanceolate smooth, Filaments ciliated, Stem simple herbaceous  
 5893 Leaves in middle ternate linear narrowed at the base entire, Calyx villous  
 5894 Leaves pinnatifid, Segments oblong somewhat stalked: the terminal very large, Petals ciliated  
 5895 Leaves bipinnate with obovate retuse leaflets, Flowers 4-petalous 8-androus

5896 The only species

5897 The only species

5898 Leaves ovate-lanceolate acuminate serrated at end, Cal. as long as cor. Berries ovate  
 5899 Leaves lanceolate entire very obtuse at end, Branches of panicle short angular

5900 Flowers hermaphrodite, Leaves pinnate with an odd one, Leaflets opposite sessile, Stalk jointed winged  
 5901 Flowers monocious, Leaves abruptly pinnated, Leaflets alternate stalked, Stalk naked

and Miscellaneous Particulars.

and not to be crowded amongst other plants. Cuttings strike root freely in sand, under a bell-glass. (*Bot. Cult.* 173.)

1000. *Codon*. From *κωδων*, a bell. The corolla of this plant is globular, and formed like a bell in its upper part. A scarce Cape shrub, of which Thunberg speaks in terms of great delight upon finding a solitary individual growing by the side of a precipice in its native country.

1001. *Gomphia*. From *γομφες*, a club; but the application is not obvious. These are most beautiful tropical bushes, with long spikes of brilliant yellow flowers, and neat serrated shining entire leaves.

1002. *Quassia*. So named by Linnæus, in memory of Quassi, a negro slave of Surinam, who found and discovered to Rolander, a Swede, the wood of *Q. excelsa*, which he had employed with success as a secret remedy in the malignant endemic fevers of Surinam.

*Q. amara* is a lofty tree with strong branches, white light wood, their bark and leaves not unlike those of the common ash. The flowers are in terminal racemes, of a bright red. The root, wood, bark, and indeed all the parts of this tree are intensely bitter. Linnæus says that the wood of the root is a noble remedy, but that the wood of the small branches, which has since been substituted for it, is good for nothing. The wood of both is now thought to be less intensely bitter than the bark, which is at present regarded as the most powerful medicine. *Quassia* has no sensible odor; its taste is that of a pure bitter, more intense and durable than that of almost any other known substance: it imparts its virtues more completely to watery than spirituous menstrea, and its infusions are not blackened by the addition of martial vitriol. It is said that considerable quantities of this drug are used by the brewers instead of hops.

*Q. Simaruba*, or mountain damson, as it is called in Jamaica, is a tall tree with alternate branches, and a smooth grey bark, maculated with yellow spots. The leaves are pinnate; the flowers are male and female on the same axillary panicles, yellowish white; the fruit consists of five smooth, ovate, black, one-celled berries, on a common receptacle, and open spontaneously when ripe.

The official part of this tree is the bark of the root; it is inodorous, and has a bitter, but not disagreeable taste. The pieces are of a very fibrous texture, rough, scaly, warty, and of a full yellow color in the inside when fresh. Alcohol and water take up all its active matters by simple maceration, at a temperature of sixty degrees of Fahrenheit better than at a boiling heat; it is tonic, and has been employed with advantage in intermittent fever, obstinate diarrhoea, dysentery, and dyspeptic affections. (*Thomson's London Dispensatory*, 462.)

The different species of *quassia* flower freely in the stove; are of easy culture in loam and peat, and are increased by ripened cuttings taken off at a joint, and not deprived of their leaves, and planted in a pot of sand under a hand-glass.

History, Use, Propagation, Culture.

1003. *Limonia*. The general denomination of the citron in Arabia is *lymona*, whence limon and lemon, to which fruits this genus is nearly related. L. monophylla is a small thorny tree, with a berry the size of a small nutmeg, very like a lime, and called by the Hindoos wild lime. Ripened cuttings of the species root in sand, under a hand-glass plunged in a moist heat.

1004. *Glycosmis*. From *glykus*, sweet, and *osmōn*, smell; all the parts of the plant, leaves, flowers, fruit, having an agreeable perfume. G. pentaphylla is an elegant fragrant shrub, very common in most uncultivated lands in Coromandel, but chiefly under large trees, where birds have dropped the seeds. It flowers all the year there. The whole plant, when drying in the shade, diffuses a pleasant permanent scent; the flowers are exquisitely fragrant; birds eat the berries greedily.

G. arborea has also very fragrant flowers.

G. citrifolia is a beautiful stove plant, not, indeed, remarkable for the shewiness of its flowers, but most valuable on account of its fruit, which is about the size of a hazel nut, very juicy and sweet, and produced in profusion in our stoves.

1005. *Murraya*. So named by Koenig, in honor of John Andrew Murray, knight of the Swedish order of Vasa, professor of medicine and botany at Gottingen, and an editor of Linnæus's *Systema Vegetabilium*. The species are trees of the smallest size, with dotted pinnated leaves and fragrant white flowers, quite like those of an orange.

1006. *Cookia*. Named by Sonnerat in honor of our celebrated Captain Cook. The fruit is much esteemed in China, where it arrives at the size of a pigeon's egg, growing in bunches, and it is called Wampee. It grows well in light loam, and ripened cuttings with their leaves on root in sand in a moist heat.

1007. *Gærtnera*. In memory of Joseph Gærtner, M. D. F. R. S. Acad. Imp. Petrop. Memb., author of a most excellent work on the fruits and seeds of plants, Stutt. 1788. It is a large climbing woody shrub, cultivated all over the coast of Coromandel, on account of the beauty and fragrance of its flowers. In the stove it requires a good deal of room to flower freely. It is easily increased in sand under a hand-glass. The genus is now referred to the natural order of Malpighiaceæ, among which it is remarkable for its white flowers.

1008. *Monotropa*. From *monos*, one, and *tropos*, to turn: its flowers are all turned one way. It is parasitical and without leaves, of a pale uniform hue, having a simple scaly stem; allied in habit to Orobanche, to some of the Orchis tribe in its peculiarity of scent, which is like that of primrose, or peans in blossom. The root is fibrous, much branched, and somewhat creeping, growing among dead leaves or in half decaying vegetable mould. Sir J. E. Smith says, he could never find it truly parasitical. In Sweden, Linnæus informs us, it is given dry to sheep affected with a cough.

Its natural affinity, which is certainly to the heath, Pyrola, and similar plants, is very singular and unexpected.

5902 Leaves simple, Spines solitary

5903 Leaves pinnate, Leaflets oblong lanceolate crenulate, Spines solitary

5904 Leaves simple and 3-leaved, Leaflets ovate-oblong acuminate, Peduncles axillary shorter than stalk

5905 Leaves pinnate in 2 pairs, Leaflets elliptical entire

5906 Leaves pinnate in 2 pairs, Leaflets oblong obsolete serrate

5907 Leaflets ovate, Peduncles many-fl. corymbose

5908 Leaflets ovate-acuminate, Pedunc. axill. and solitary

5909 Leaves ovate-lanceolate acuminate nearly equal at base

5910 Leaves pinnated, Leaflets ovate-lanceolate

5911 Large cernuous, Scales close together

5912 Flowers smooth lateral octandrous

5913 The only species

5914 The only species

5915 Leaves ovate-elliptical ternate and scattered, Corymbs terminal

5916 Leaves oblong, Corymbs axillary, Bractes linear-lanceolate, Pedunc. and calyx downy with glands

5917 Leaves opposite oblong polished beneath glaucous revolute at edge, Branches 2-edged

β Leaves linear more revolute green beneath

5918 Leaves alternate and opposite ovate-lanceolate and branches hairy, Pedunc. axill. 1-flowered

and Miscellaneous Particulars.

1009. *Dionea*. One of the names of Venus. It is a singular plant in respect of its leaves, which are of an anomalous form, and have a singular motion by which they catch insects, whence the specific name, *muscipula*, a fly-trap. The root is scaly, almost like a bulb, and not prolific in fibres. The leaves have the petiole winged as in the orange; the extreme part, or proper leaf, is the part that operates as a trap. Linnaeus affirms, that when the entrapped insect ceases to struggle and is quiet, the leaf opens and permits it to escape. This does not agree with Ellis's account, for he affirms that the lobes never open again, so long as the animal continues there. He thinks it probable, that a sweet liquor discharged by the red glands tempts the insect to its destruction. He adds, that if a straw or a pin be introduced between the lobes, they will grasp it as fast as if it were an insect. The flowers grow in a corymb resembling an umbel. It is rather difficult to preserve. Sweet finds it "thrive best when planted in a pot of Sphagnum with a little mould at the bottom of the pot, and placed in a pan of water." Shepherd, of the Liverpool botanic garden, finds that leaves of *Dionea* so placed will root and form new plants. In all cases it is necessary that an abundance of fresh cool air should be supplied to the plants.

1010. *Garuga*. *Garugo* is the Telinga name of the plant, which is rare in our stoves, although not of recent introduction.

1011. *Kalmia*. So named by Linnæus in honor of Peter Kalm, professor at Abo in Sweden, author of *Travels in America*. The species are beautiful peat earth shrubs, deserving a place in every American ground. *K. latifolia* is a native of Carolina and other parts of North America, of Pennsylvania, New York, &c. but only in particular places; on rocks, hanging over rivulets, and on the sides of barren hills on the most sterile soil. The noxious qualities of this elegant shrub lessen that esteem which its beauty claims; for though deer feed on its green leaves with impunity, yet when cattle and sheep, by severe winters deprived of better feed, eat the leaves, many die annually. It blossoms in May, and continues in flower a great part of the summer. (*Catesby*.) The flesh of the American partridge is said to be poisonous in the winter from its feeding upon the buds of this plant. But Wilson denies this statement. The Indians use a decoction of the leaves for purposes of self-destruction. A few drops of the tincture poured upon the body of a large and vigorous rattle-snake, killed the reptile in a short time. An ointment made of the powdered leaves has been used with much success in *tenia capitis*, and some other cutaneous affections. (See *Bigelow's Medical Botany*.)

The wood, being very hard, is very useful in smaller works. The Indians are said to make small dishes, spoons, and other domestic utensils out of the roots: these are large, of a soft texture, and easily wrought when green; but when dry become hard and smooth. (*Curtis*.)

*K. angustifolia* is also reputed poisonous to sheep and cattle.

History, Use, Propagation, Culture.

1012. *Ledum*. *Ληδον* was the name applied by the ancients to the plant producing the substance called Ladanum, and now known by the name of *Cistus Ledum*. In foliage the *Ledum* of modern botanists agrees with the plant of the ancients. Pretty American plants, very commonly cultivated for the beauty of their flowers.

1013. *Rhodora*. A name of the same meaning as *Rhododendron*. It is all known in shrubbery as remarkable for its purple flowers appearing on the naked shoots before the leaves come out.

1014. *Rhododendron*. From *ῥόδον*, a rose, and *δένδρον*, a tree, because the flowers resemble in color bunches of roses. Some of the species form beautiful and even splendid ornaments to the shrubbery or American ground; and all of them are interesting and deserving of culture.

*R. ferrugineum* and *hirsutum* abound on the high mountains of Switzerland, Austria, Savoy, Piedmont, Dauphiné, and terminate ligneous vegetation as we ascend, and furnish the shepherds with their only fuel. The grouse are said to eat them; and the white hares sometimes gnaw the bark in hard weather; but animals do not seem to feed on them, except from want of other food; and they are suspected of being in a small degree poisonous. The galls of some small insect are frequent on them.

*R. dauricum* is almost peculiar to the subalpine tracts of eastern Asia; it appears first at the mouth of the river Janisca, and beyond that, especially from the river Uda, in the pine woods, it begins to be common; but about Baikal it is most abundant, and extends through the deserts of the Mongols to China and Tibet: at the Lena it becomes more rare, and beyond that it is much lower, with a more slender flower and narrower leaves. (*Pallas*.)

*R. Camtschaticum* is an elegant evergreen under shrub; it grows abundantly in the peninsula of Kamtschatka and *Bépring's* island in muddy places on the mountains.

*R. caucasicum* is a native of the higher rocks of Caucasus, near the perpetual ice, in the highest range of shrubby vegetation, with *Myrtillus* and *Vitis idæa*.

*R. chrysanthum* is a beautiful evergreen, resembling *R. dauricum*, and like it is a native of the alpine regions of Siberia, where it is a noted remedy for rheumatism. It is cultivated in this country with the

5919 Leaves linear revolute at edge beneath downy

5920 Leaves oblong revolute at edge beneath downy, Flowers about pentandrous

5921 Leaves ovate oblong flat smooth

5922 The only species

5923 Leaves smooth leprous beneath, Corolla funnel-shaped

5924 Leaves elliptical acute ciliated dotted beneath, Corolla funnel-shaped

5925 Leaves smooth dotted naked, Corolla rotate

5926 Leaves ciliate nerved, Corollas rotate, Calyxes leafy

5927 Leaves elliptical acute glandular ciliated naked, Cor. rotate, Petals obtuse

5928 Leaves scabrous rusty with down beneath, Umb. terminal, Cor. rotate, Petals roundish

5929 Leaves oblong scabrous beneath discolored smooth, Umbels terminal, Cor. rotate, Pet. obovate irregular

5930 Leaves oblong smooth beneath dotted with resin, Umbels terminal, Cor. funnel-formed

5931 Leaves oblong glabrous discolored beneath, Umb. terminal, Cor. rotate, Petals roundish

♂ Leaves cuneate-lanceolate flat

♀ Leaves larger oblong-elliptical flattish

5932 Leaves short oval rounded at each end smooth discolored beneath, Sepals elong. obl. Cor. campanulate

5933 Leaves oblong smooth : of the same color on both sides, Corymbs terminal, Cor. campan. rotate

5934 Leaves lanceolate acute silvery beneath, Flowers clustered campanulate, Calyxes woolly

5935 Leaves thin rugose lanceolate smooth subdeciduous

5936 Leaves oval coriaceous glaucous beneath

5937 Leaves cordate ovate entire, Cor. cylindrical

5938 Leaves imbricated subulate smooth, Pedunc. solitary terminal, Cor. globose-campanulate

5939 Pedunc. aggregate on the branches, Cor. ovate cylindrical, Leaves oblong-ovate entire deciduous

5940 Pedunc. aggregate axillary, Cor. globose, Leaves ellipt. entire beneath mealy scaly

5941 Arborescent, Lvs. coriaceous cuneate-lanc. acute entire with downy scales beneath, Fl.-stalks scurfy rusty

5942 Pedunc. aggregate, Cor. ovate transparent, Lvs. altern. broad lanc. obtuse entire cinereous beneath

5943 Pedunc. aggregate, Cor. globose campanulate, Leaves oval subserrate shining

and Miscellaneous Particulars.

greatest difficulty. The leaves have an austere, astringent, bitterish taste, and are stimulant, narcotic, and diaphoretic. When taken, they first increase the arterial action and the heat of the body, producing diaphoresis; and these effects, according to Dr. Home's observations, are followed by a proportional diminution of excitement, the pulse in one case having been reduced thirty-eight beats. It has not been much used in this country. (*Thomson's London Dispensatory*, 477.)

R. maximum grows on rocks and in barren soils, where it continues flowering great part of the year, and is very ornamental.

R. ponticum grows in wet places in beech and alder coppices, on rocky mountains, but not on high alps.

Rhododendrons are commonly propagated by layers, but some sorts produce seeds, and seeds of others are obtained from America. The seeds "should be sown early in spring, in flat pans or pots of peat soil, and very thinly covered: they may then be set in a close frame, or at the front of a hothouse, till they come up, watering them slightly when dry; as soon as they are high enough to be laid hold of, they must be pricked out in other pots, which should be placed in a shady situation; they may stand in a frame a few days till they have taken fresh root, but they must not remain long, or it will spoil them. The small kinds may be propagated freely by cuttings, taken off in the young wood, and planted in sand, under a bell-glass." (*Bot. Cult.* 815.)

1015. *Epigaea*. From *epi*, upon, and *gē*, the earth. The stem grows flat upon the ground, and throws out roots all the length of its branches. A very pretty little American plant with delicate white flowers.

1016. *Andromeda*. Named in allusion to the virgin Andromeda, who, like this plant, was confined in a marsh, and surrounded by monsters of the waters. For an ingenious explanation of this application, see Linnaeus's *Flora Lapponica*. The species are neat little plants, and some of them considerable shrubs and trees. They all require peat earth, and a moist situation; for those of them which do not grow naturally in bogs are mostly inhabitants of alpine regions, where the air is always more moist than on plains.

A. hypnoides has the appearance of a moss, spreads over great tracts of ground in the Lapland alps, and adorns them with its beautiful red flowers. The *Andromeda* is generally increased by layers, but may be also raised from seeds. "These must be very thinly covered, as they are small, and would rot if covered deep:

History, Use, Propagation, Culture,

when about an inch high they should be planted out thinly in other pots, where they will grow strong, and, when large enough, may be planted in the open ground. Spring is the best time to plant them out, as the frost and worms are apt to throw them out of the ground in winter, if planted out in autumn. (*Bot. Cult.* 278.)

1017. *Enkianthus*. From *εγκος*, a pregnant woman, a name given to the plant by Loureiro, because the great colored buds appear as if pregnant with the flowers which afterwards appear. This beautiful genus, as Sweet observes, has generally been considered difficult to propagate: the difficulty is now removed, as ripened cuttings root readily planted in pots of sand, and placed under a hand-glass, without bottom heat. The best soil for it is an equal mixture of sandy loam and peat, and care must be taken not to overwater it when not in a growing state: when it gets pretty large it is one of the most ornamental plants for the greenhouse or conservatory. (*Bot. Cult.* 186.) There are several species confounded under the common name *Enkianthus quinquefolia*.

1018. *Gaultheria*. Named after one Gaulthier, a French physician at Quebec. A small evergreen plant, cultivated in the American border for the sake of its ornamental bright scarlet berries. The species may be increased by dividing at the root, by suckers, layers, or from seeds.

1019. *Arbutus*. An ancient name of this plant, said to be traceable to the Celtic *ar doise*, austere bush, in allusion to the roughness of the fruit. In like manner *Unedo* is said by Pliny to have been so called from *unum edo*, I eat one, because, being found disagreeable, no one could eat a second. *L'Arbousier*, Fr., *Landbeere*,

- 5944 Pedunc. aggregate, Cor. ovate, Leaves alternate lanceolate revolute  
 α Leaves oblong  
 β Leaves lanceolate  
 γ Leaves linear-lanceolate  
 δ Leaves subulate
- 5945 Racemes 1-sided paniced terminal, Leaves lanceolate obovate acute serrulate at end  
 5946 Racemes terminal paniced, Cor. roundish, Leaves ovate entire  
 5947 Raceme compound, Leaves lanceolate subserrulate hairy shining  
 5948 Spikes terminal 1-sided, Leaves membranous smooth oval-lanceolate serrulate acute  
 5949 Raceme compound terminal crowded, Leaves narrow lanceolate rough at edge pilose beneath  
 5950 Leaves lanceolate wavy beneath rusty scaly, Cor. campan. finally of 5 petals, Anthers awned  
 5951 Hispid with pubescence, Leaves obov. lanc. acute serrul. Cor. globose hispid, Anthers awned  
 5952 Panicles terminal, Cor. pubescent, Leaves elliptical acuminate toothletted  
 5953 Racemes term. simple bracted, Cor. cylindrical, Leaves obl.-lanceolate serrated  
 5954 Racemes terminal and axillary 1-sided, Cor. ventricose tubular, Leaves oblong lanc. finely serrated
- 5955 Racemes axillary simple, Cor. oblong, Leaves ovate acute serrulate  
 5956 Racemes axillary simple, Leaves ovate entire shining, Branchlets 3-cornered
- 5957 Racemes axillary simple, Leaves ovate lanceolate acuminate serrate
- 5958 Quite smooth, Leaves obl. ovate acute finely serrulate, Racemes axillary and terminal clustered  
 5959 Peduncles solitary axillary 1-sided Bracts 2, Leaves oval scaly dotted obsolete serrated  
 α Cor. ventricose, Leaves obl. lanceolate  
 β Cor. obl. cylindrical, Leaves oblong oval obtuse  
 γ Very dwarf
- 5960 Pedunc. solitary axillary, Bracts 2, Leaves narrow oblong lanceolate, Corolla oblong oval
- 5961 The only species
- 5962 Leaves oblong obovate mucronate toothed crowded, Stem procumbent
- 5963 Stem arborescent, Leaves oblong lanceolate, Panicles smooth nodding, Berries many-seeded
- 5964 Leaves oblong-lanceolate serrated, Panicles vertical hispid glutinous  
 5965 Stem arborescent, Leaves ovate entire or serrated, Pan. pubescent erect, Berries many-seeded  
 5966 Stems procumbent, Leaves rugose serrated  
 5967 Stems procumbent, Leaves entire  
 5968 Stem much branched, Leaves lanceolate acuminate acutely serrate, Flowers axillary  
 5969 Bark deciduous, Ovary smooth. The same as next?
- 5970 Leaves lanceolate serrated very thin a little wavy

and Miscellaneous Particulars.

Ger., and *Arbuto*, Ital. This genus includes one of the most elegant of hardy shrubs, the *A. unedo*. This evergreen is peculiarly beautiful in October and November, covered at once with blossoms and ripe fruits. It is a native of the south of Europe, and is found also near Killarney in Ireland, where it has probably been brought from Spain or Italy at an early period by the priests. It grows there on limestone rocks, in greater luxuriance than it is often to be met with in the woods of Italy: in both countries the fruit is eaten; and in Spain both a sugar and spirit is extracted from it.

*A. uva ursi*, *La Busserole*, Fr., *Barrenbeere*, Ger., and *Uva d'orzo*, Ital., is abundant in many parts of the continent, especially the alpine regions. It dyes an ash color; tans leather; the berries are food for grouse and other game, and the leaves are used in medicine. The fresh leaves are inodorous, and have a slightly bitter astringent taste, leaving a sweet sensation in the mouth. When properly dried and powdered, they acquire an odour similar to that of hyson tea; but the taste remains the same, the degree of bitterness only being increased. (*Thomson's London Dispensatory*, 163.)

It is used sometimes in calculous complaints and ulcerations of the urinary organs.

The dwarf species of this genus and those of *Rhododendron* and *Andromeda*, are very fit plants for rock work. *A. alpina* thrives best in peat kept moist and shaded. All the species may be increased by seeds, or by budding and inarching on each other: the dwarf kinds root readily by layers.

The *Uva ursi* has been brought into notice in modern times as an efficient remedy in nephritic and even in calculous cases. European practitioners have doubted its powers, but it has found many supporters of respect.

History, Use, Propagation, Culture,

tability in North America. The late professor Barton found the plant of much service in his own case of nephritic paroxysms alternating with gout in the feet. It has also been recommended as a remedy in pulmonary complaints. (See *Bigelow's Med. Botany*.)

1020. *Clethra*. *Κληθρα* was the name given by the Greeks to the Alder, to which, in its leaves, this bears some resemblance. Pretty upright North American plants, with white flowers. One species is a native of Madeira.

1021. *Molocaryum*. From *μύλη*, a mill, and *καρυά*, a kernel or stone; the four wings of the nut may be easily likened to the four sails of a small mill. A North American plant, with the habit of *Andromeda*, or rather of *Clethra*.

1022. *Pyrola*. A diminution of *Pyrus*, to which, in the leaves, this is thought to be similar. A genus of elegant little plants, mostly evergreens. They grow naturally in the shade, and in rocky or very poor soils; in the garden on sand or gravel shaded; and they are increased by seeds or young cuttings, planted under a hand-glass. All the species are powerfully astringent and tonic, and one or more of the American sorts is said to constitute the chief ingredient in the scorbatic draughts of *Whitlaw*.

*P. uniflora*, Sir J. E. Smith says is one of the most curious and elegant of British flowers.

1023. *Chimaphila*. From *χίμα*, winter, and *φίλα*, to love; a sort of translation of the English name winter-green. The species may be treated as *Pyrola*, which they much resemble.

1024. *Inocarpus*. From *ι νος*, fibre, and *καρυά*, fruit. The envelope of the nut is composed of tough interwoven fibres. It is a lofty tree, with alternate subcordate leaves, and flowers in racemes succeeded by by nuts called *Ratta* in Otaheite. The kernel of these, which is kidney-shaped, and about an inch in diameter, is eaten roasted by the inhabitants of the Society and Friendly Isles, the New Hebrides, New Guinea, the Molucca isles, &c. It is sweetish, but less pleasant than the chestnut, harder and less farinaceous. The bark is astringent, and is used in the dysentery. In New Guinea they smear the heads of their arrows with the expressed resinous juice. (*Forst. Escul.*)

1025. *Styrax*. A name altered by the Latins from the Arabic *assthirak*. Pliny says, that the Arabs in his time used the resin to flavor the perfumes of which they are so fond. *S. officinale* is a low tree with slender branches, ovate leaves, flowers in racemes from the sides of the branches, succeeded by ovate globular juiceless drupes, containing one or two angular nuts. From this tree *storax* is obtained in Asiatic Turkey; it issues from incisions made in the bark; and as it was formerly the custom to collect and export it in reeds, it was named *Styrax calamita*. It has a fragrant odour, and a pleasant subacidulous, slightly pungent, and

- 5971 Leaves obovate serrate beneath pubescent, Raceme simple bracted  
 5972 Leaves cuneate obovate acute upwards finely serrated beneath white with down  
 5973 Leaves broad cuneate obovate acute coarsely serrated rough on each side  
 5974 Leaves lanceolate obovate serrated smooth, Panicle narrow bracted  
 5975 Leaves oval acuminate smooth on each side glaucous beneath, Racemes white with down  
 5976 Leaves oblong acuminate serrated smooth, Racemes paniced, Peduncles hairy

5977 Leaves cuneate lanceolate acute, Racemes spiked terminal

- 5978 Stamens ascending, Style declinate, Raceme many-flowered  
 5979 Stamens straight, Style declinate long, Peduncle twisted, Raceme many-flowered  
 5980 Stamens and styles straight, Flowers racemose spreading  
 5981 Raceme 1-sided  
 5982 Stamens and styles straight, Flowers racemose closed, Petals rounded obtuse, Peduncle straight  
 5983 Peduncle 1-flowered

5984 Peduncles 2-flowered  
 5985 Peduncles umbelleted

5986 The only species

- 5987 Leaves ovate beneath villous, Racemes simple shorter than the leaf  
 5988 Leaves obovate villous beneath, Lower peduncles axillary solitary 1-flowered  
 5989 Leaves subsessile oval or obovate beneath powdery, Fl. axill. and term. in threes on short stalks  
 5990 Leaves oblong smooth on each side, Peduncles axillary 1-flowered solitary or twin

- 5991 Root creeping, Stems erect with peduncles and calyxes villous, Lower leaves spatulate upper lanceolate  
 5992 Erect villous, Flowers tetrapetalous octandrous stalked  
 5993 Erect, Flowers tetrapetalous octandrous stalked, Caps. many-valved, Leaves lanceolate  
 5994 Erect smooth, Flowers tetrapetalous octandrous sessile  
 5995 Flowers tetrapetalous octandrous, Stem erect angul. hairy, Leaves oblong hairy

5996 Leaves opposite ovate, Flowers paniced, Bractes lanceolate

and Miscellaneous Particulars.

aromatic taste; is stimulant, and in some degree expectorant. It was formerly much prescribed in asthma, catarrh, phthisis, and menstrual obstructions; but it is now scarcely ever employed, except as an adjunct on account of its fragrance.

Benzoin is obtained from the *S. Benzoin*, by wounding the bark near the origin of the lower branches. The tree is never wounded under six years of age; and cannot sustain these annual incisions above twelve years. (*Thomson's London Dispensatory*, 525.)

As shrubs this genus affords some plants that may be considered pretty and desirable, on account of their small size and free flowering. They grow best in sandy loam, are commonly propagated by layers, and may also be increased by seeds, which they occasionally ripen.

1026. *Jussiaea*. An obscure and most uninteresting genus of plants, selected, not very happily, to commemorate the family of the Jussieus, which has for more than a century and a half been at the head of botanical science. Antoine de Jussieu, born in 1686, and died in 1758, was professor of botany at the Jardin du Roi, and member of the academy of sciences. He published various papers upon exotic plants, and a discourse upon the progress of botany. He also edited the works of Barrelier. Bernard de Jussieu, his brother, born in 1698, died in 1777, was professor at the same garden, and member of the same academy. He also was author of various papers upon plants, a second edition of Tournefort's History of the Plants growing near Paris, and an arrangement of the plants growing in the garden of Trianon, which was published by his nephew. Joseph de Jussieu, a third brother, born in 1704, and died 1779. He was sent to South America by Louis XV., and remained there for six and thirty years. He made many discoveries, and brought home many new plants. Lastly, Antoine Laurent de Jussieu, their nephew, born in 1748, and still living, as demonstrator of botany at the Jardin du Roi, member of the Institute and of every learned body in Europe. He brought, in his *Genera Plantarum*, published in 1789, to a degree of extraordinary perfection, that system, the outlines of which had been traced by the hand of Tournefort, and partially filled up by his uncle Bernard. That system has now superseded, among men of science, all others, and if as yet inapplicable to merely popular purposes, can never be dispensed with in all philosophical investigations.

1027. *Getonia*. A Malabar plant, the meaning of whose name has not been explained. Cuttings root freely in sand, under a hand-glass, and plunged in heat.

History, Use, Propagation, Culture.

1028. *Quisqualis*. A Latin word, expressive of uncertainty. It was given by Rumphius to a tree of Amboyna, because it was subject to variation. It is a fine climbing genus of easy culture. The best soil for the species is a mixture of loam and peat; and cuttings root freely in sand, under a hand-glass. (*Bot. Cult.* 100.)

1029. *Melastoma*. From *μελας*, black, and *σoma*, mouth. Many of the species produce black berries similar to gooseberries, and which stain the mouth black. This is a very numerous genus of shrubs and low trees; the species display great unity of character, and may be considered ornamental. They require but little water in winter, and are easily increased in sand, plunged in a moist heat.

1030. *Petaloma*. From *πεταλον*, a petal, and *λωμα*, an edge. Flowers of which the petals are inserted on the edge of the calyx. A small plant with the leaves, but not flowers, of *Melastoma*.

1031. *Acisanthera*. From *ακτις*, a point, the anthers being pointed. Plants with the habit of *Melastoma*.

- 5997 Leaves ovate  
5998 Leaves subcordate pubescent
- 5999 Leaves ovate-lanc. entire 3-nerved rough, Fl. terminal subcorymbose  
6000 Leaves 3-nerved entire sessile ovate acute villous silky, Racemes brachiate, Stems square  
6001 Leaves 3-nerved without a marginal one entire smooth on each side thin, Racemes term. Fla. sessile  
6002 Leaves entire 3-nerved ovate-lanc. smooth, Margin and nerves hispid beneath, Fl. terminal  
6003 Leaves entire 3-nerved oblong emarginate at base, Raceme erect term. Fl. tetrandrous  
6004 Leaves toothletted 5-nerved ovate-lanceolate, Stem hispid  
6005 Leaves ovate acuminate toothletted 5-nerved, Cymes axillary  
6006 Leaves cordate acumin. 5-nerved serrulate pubescent, Cymes terminal, Sepals roundish, Stamens 5 sterile  
6007 Leaves cordate subcrenate beneath rusty with down, Flowers axillary and lateral solitary sessile  
6008 Leaves ovate lanceolate acuminate 5-nerved pilose somewhat toothletted, Branches bifid, Panic. term.  
6009 Leaves entire 5-nerved subcordate scabrous, Cor. little hairy outside  
6010 Leaves entire 5-nerved lanceolate ovate rough  
6011 Leaves 7-nerved ovate subordinate acuminate ciliated with teeth, Corymb terminal, Flowers 1-sided  
6012 Leaves 3-nerved without ribs ovate-lanceol. acuminate toothletted, Corymbs term. trichotomous powdery  
6013 Leaves 5-nerved obl. lanceol. acute entire hoary beneath, Pedunc. umbelled, Bractes double
- 6014 Leaves 5-nerved entire ovate acute smooth above beneath hoary, Flowers clustered sessile  
6015 Leaves entire 5-nerved ovate-oblong smoothish acuminate smooth at edge  
6016 Leaves 5-nerved nearly entire oblong acuminate smooth beneath yellowish, Racemes cymose  
6017 Leaves lanceolate ciliated entire 3-nerved obtuse at base, Stems square, Flowers terminal solitary  
6018 Leaves cordate oval entire stalked beneath woolly, Petals obovate, Petals bowed at base  
6019 Branches winged, Leaves oval-lanceol. with a long point, Petals obovate pointed, Filam. woolly above  
6020 Leaves oblong elliptical 3-nerved ciliated, Calyx setose at end  
6021 Stamens 12, Leaves ovate-lanceolate 5-nerved, Stems and globose ovaries very hispid
- 6022 Peduncles solitary 1-flowered
- 6023 Leaves 3-nerved ovate crenate opposite
- 6024 Leaves obovate obtuse, Flowers 5-cleft decandrous
- 6025 Spikes elongated, Leaves wedge-shaped smooth
- 6026 Flowers octandrous, Leaves cordate smooth  
6027 Flowers dodecandrous, Leaves ovate downy beneath  
6028 Flowers 12-androus, Leaves ovate oblong serrulate  
6029 Flowers 12-androus clustered, Leaves oblong obtuse serrated pubescent on each side

## DIGYNIA.

- 6030 Leaves ovate roughish  
6031 Leaves cordate oblong downy beneath  
6032 Leaves oblong obovate obtuse smooth  
6033 Leaves lanceolate smooth  
6034 Leaves obovate lanceolate pubescent  
6035 Leaves oblong lanceolate very villous  
6036 Leaves lanceolate acute hairy beneath  
6037 Leaves obovate villous coriaceous, Fl. stalked polyandrous polygynous  
6038 Leaves elliptical, Flowers polyandrous polygynous

## and Miscellaneous Particulars.

1032. *Dass.* A name of unknown application. The plant resembles in its leaves the *Rhus cotinus*, whence its specific name. It may be increased by cuttings of the roots placed in a warm situation.

1033. *Bucida.* From *Bucis*, an ox. The form of the fruit when ripe resembles the horn of such an animal. This tree grows in Jamaica in low swampy lands near the coast; it is remarkable for its slender crooked branches, and the tufted disposition of the leaves: it grows to a considerable size, is reckoned an excellent timber tree, and the bark is greatly esteemed by the tanners.

Well ripened cuttings root in sand, plunged in heat, and covered.

1034. *Samyda.* *Σαμυδα* is the Greek name of the birch, to which this genus may be likened in its leaves. The species are rather tardy in growth, but not difficult to root in sand under a hand-glass.

1035. *Boyena.* So named by Linnæus, in honor of Adrian Van Royen, who with his son David were successively professors of botany at Leyden. It consists of shrubs of little beauty, which are increased by ripened cuttings in sand under a hand-glass. They are chiefly natives of the Cape of Good Hope.

History, Use, Propagation, Culture,

1036. *Trianthema.* From *τρις*, three, and *ανθος*, flower; the flowers growing by threes in the axillæ of the leaves. The species are weeds in their native countries, and of little interest here.

1037. *Scleranthus.* From *σκληρος*, hard, and *ανθος*, a flower; when in seed the envelopes of the flower appear very much indurated. *S. annuus* is common throughout Europe and Siberia on a sandy soil. It flowers about the middle of summer, and sows its seeds very abundantly in autumn, which produce a crop of young plants that generally survive the winter, or, if destroyed, are replaced by another crop arising from those seeds that happen not to vegetate till spring. (*Eng. Bot.*) The Swedes and Germans receive the vapour arising from a decoction of it into their mouths, to cure the tooth-ache. (*Withering.*)

*S. perennis* in several parts of Europe has its roots attacked by the insect *Coccus Polonicus*, *Lin.* which yields a fine crimson dye, and is said likewise to live on *S. annuus* and some *Potentilla*. Sir J. Smith has "never been able to find this insect on these plants in England." (*Flora Brit.* ii. 283.)

These two species are occasionally found in abundance upon barren heathy wastes.

1038. *Cunonia.* In memory of John Christian Cuno, of Amsterdam, who described his own garden in Dutch verse in 1750. This is a handsome tree, with fine shining green foliage, contrasted by numerous dense elongated branches of small milk-white flowers, and twigs of a red color; having the habit of a tropical rather than of a Cape plant. Its colonial name is *Rood Elze* (red alder), although the tree has not in any point of view the least resemblance to the alder of Europe.

1039. *Hydrangea.* From *υδρα*, water, and *γεννησιον*, a vessel. The common garden species, *H. hortensis*, is quite a marsh plant, and to be managed well should have a very copious supply of water in summer. A large plant will consume ten or twelve gallons daily, in warm weather.

*H. quercifolia* is an elegant plant when in leaf; but as it is barely within the limits of ligneous plants, it dies down to the ground on the approach of frost. *H. hortensis* is much valued on account of the great profusion of its very elegant flowers, which are monstrous in the same manner as the *Viburnum opulus*. It has never

6039 Flowers pentandrous monogynous  
6040 Flowers about decandrous digynous

6041 Calyx of fruit spreading  
6042 Calyx of fruit closed

6043 The only certain species

6044 Cymes naked, Leaves oblong ovate acuminate toothed smooth  
6045 Cymes radiate, Leaves cordate toothed  
6046 Leaves ovate acuminate toothed beneath white with down, Serratures mucronate

6047 Cymes radiate, Leaves oblong sinuate-lobed toothed  
6048 Cymes radiate, Leaves elliptical narrowed at each end toothed smooth

6049 Leaves alternate  
6050 Leaves opposite roundish hairy, Stems decumbent

6051 Leaves orbiculate or oval stalked pimpled ciliate cordate at base, Petals round, Sepals mucronate  
6052 Leaves oval retuse obsoletely serrated stalked, Stem naked, Panicle bearded  
6053 Leaves cordate orbicular serrated stalked, Panicle headed  
6054 Leaves radical lingulate with cartilaginous teeth, Stem panicle leafy, Cal. hairy with glands  
6055 Radical leaves rosed straight glaucous supine crenate, Panicle simple  
6056 Leaves radical lingulate with cartilag. teeth, Stem simple racemose leafy, Cal. smooth  
6057 Radical leaves aggreg. lanc. obov. with cartilaginous teeth, Stem leafy clammy, Calyxes glandular  
6058 Leaves rad. lingulate with a cartilaginous repand edge, Stem racemose leafy, Cal. with gland. hairs  
6059 Leaves obl. lanc. hairy toothletted, Stem naked, Peduncles alternate in corymbose heads  
6060 Leaves obl. lanc. smooth repand toothed, Stem naked, Peduncles 1-flowered aggregate  
6061 Smoothish, Leaves oblong-lanc. acute eroded, Stem naked, Panicle oblong  
6062 Leaves roundish toothed with long stalks, Stem naked  
6063 Leaves obovate retuse with cartilaginous crenae, Stem naked panicle  
6064 Leaves cordate oval retuse with cartilaginous crenae, Stem naked panicle  
6065 Leaves reniform toothed, Stem naked panicle  
6066 Leaves cuneiform very obtuse repand, Stem naked panicle  
6067 Very hairy, Lva. elongate spatulate acutely toothed, Stems divaricate dichotomous, Panc. capillary lax  
6068 Leaves roundish toothed hairy, Runners creeping, Two petals long  
6069 Leaves rhomboid toothed variegated hairy, Runners very weak, Petals nearly equal  
6070 Leaves cuneate obovate somewhat toothed shorter than stalk, Stem panicle  
6071 Leaves roundish cuneate crenate in front, Stem naked simple, Flowers clustered racemose

and Miscellaneous Particulars.

been found in a wild state, but is extensively cultivated in the gardens of China and Japan, from whence it was introduced to Kew by Sir Joseph Banks. The flowers are almost always barren; they are naturally of a rose color, but under certain circumstances of culture they become blue. The yellow loam of Hampstead Heath and some other places, and some sorts of peat earth are found to produce this effect; but the cause is not yet ascertained. Dr. Daalen, of Antwerp, finds that turf-ashes, and, still more effectually, those of the Norway spruce, the wood generally used as fuel by him, applied to the roots of Hydrangea, produced the blue color of the petals. (*Neil's Hort. Journ.* 122.) According to Busch, of Petersburg, "the hydrangea will be turned blue by watering the young plant, the summer before, with alum water. Our grey colored earth, under the black moor-earth, has the same effect, being combined with aluminous salt." (*Hort. Trans.* vol. iv. 568.) Sweet recommends a bed of peat, and says, the longer it remains there the bluer will be the flowers.

The hydrangea, to flower freely, must not be allowed more than three or four strong shoots from the same root; it must have abundance of pot room, and plenty of water when in flower. It is a good plan to shift the plants twice or oftener during the early part of the season. If plunged and turned out of the pot into an open border in the end of May, they will flower vigorously, and will even stand the winter around and south of London, and flower yearly, and if well protected in winter very freely and strongly. The flowers are produced from the extremities of the shoots of the current year.

1040. *Chrysosplenium*. From *spores*, gold, and *splen*, the spleen; a figurative name applied to this plant, with reference to its medicinal qualities. It is said to be a powerful cathartic. In the Vosges the plants are used copiously as a salad, under the name of *Cresson de Roche*.

1041. *Saxifraga Saxum-frango*, to break the stone; a name contrived in reference to supposed medicinal qualities which are now forgotten.

An elegant genus of alpine plants, which have long been favorites in gardens. Many of the species are

History, Use, Propagation, Culture,

quite easy to cultivate, and although naturally mountaineers, not incapable of breathing the more impure air of towns and valleys. The greater part known are delicate and difficult to rear: they are regardless of soil, but suffer from mid and humid weather during the winter months. Most of the species are perennial, with either fibrous or granular roots, and a few are annual. Of the latter one species, *S. tridactylites*, is common upon very old walls in England, flowering in the beginning of the spring. The parts of fructification are extremely variable in this genus, and have given rise to the construction of many supposed genera, the constituents of which have the recommendation of agreeing with one another pretty well in habit. The limits, however, of these genera are too obscure, and the gradations by which they are united so obvious, that they have not yet been adopted by men of science generally. Without interfering with that question, the old mode of considering Saxifrage has been here adhered to, as being the most popular and the best under-

- 6072 Leaves obovate crenate subsessile, Stem naked, Flowers headed  
 6073 Leaves serrate, Stem naked branched, Petals acuminate  
 6074 Leaves lanc. mucronate with a cartilaginous ciliated edge, Stem naked few-fl. Cal. obtuse  
 6075 Leaves linear perforated dotted aggregate recurved, Stem many-fl.  
 6076 Leaves lanc. obtuse hairy, Stem naked 2-flowered  
 6077 Leaves ovate opposite imbricated: the upper ciliated  
 6078 Cauline leaves lanc. alternate ciliated, Stems procumbent  
 6079 Cauline leaves lanc. alternate naked unarmed, Stem erect  
 6080 Cauline leaves lin. subul. scattered naked unarmed, Stem decumbent  
 6081 Cauline leaves linear alternate ciliated: radical aggregate  
 6082 Cauline leaves reniform toothed stalked, Stem panicled  
 6083 Cauline leaves reniform lobed, Stem branched, Root granular
- 6084 Cauline leaves palmate stalked, Stem very simple 1-fl. bulbiferous  
 6085 Cauline leaves palmate: the upper floral ovate, Stem simple about 2-flowered  
 6086 Cauline leaves ovate lobed, Stem filiform weak  
 6087 Leaves cuneiform 3-parted with trifid linear segments, Stem simple ascending, Petals lanceolate  
 6088 Radical leaves reniform 5-lobed many-cleft, Cauline linear, Stem nearly naked branched  
 6089 Rad. lvs. reniform pedatifid 7-lobed, Caul. palmate and lin. Stem nearly naked branched, Pet. lin. obov.  
 6090 Smooth, Radical leaves 3-lobed, Lobes many-cut; lateral segments falcate, Stem panicled, Cal. colored  
 6091 Radic. leaves palm. 5-parted, Cauline linear undivided, Stems ascending many-fl.  
 6092 Leaves hairy trifid or 5-fid bearded, Runners procumbent, Stem leafy, Petals obovate rounded  
 6093 Leaves reniform palm. hairy, Stem and flower-stalks filiform  
 6094 Caul. leaves wedge-shaped trifid alternate, Stem erect branched  
 6095 Leaves wedge-shaped, Radic. entire and 3-toothed, Cauline 5-toothed; upper trifid, Pedunc. about 3-fl.  
 6096 Leaves palmate 3-parted, Segments subtrifid, Stem branched ascending  
 6097 Leaves cuneiform palmate 5-fid ciliated longer than the linear petiole, Runners very short tufted  
 6098 Leaves hairy 3 or 5-parted, Lobes elliptical acute, Runners ascending, Petals obovate 3-nerved  
 6099 Leaves hairy palmate 5-cleft and trifid, Stem leafy panicled, Petals roundish  
 6100 Leaves ciliated cuneate trifid nearly 5-cleft, Pedunc. solitary elongate 1-fl.  
 6101 Cauline leaves lin. entire and trifid, Runners procumbent, Stem erect nearly naked  
 6102 Radic. leaves aggregate entire and trifid acute linear, Stem viscid nearly racemose, Petals length of cal.  
 6103 Radic. leaves aggregate membranous lin. lanceolate entire or trifid, Stem nearly naked about 2-fl.
- 6104 Radic. leaves aggr. linear obtuse trifid cut, Stem erect many-fl. Petals twice as long as cal.  
 6105 Leaves imbric. cuneate-palmate ciliated, Petals round, Styles spreading, Stigmas flat woolly  
 6106 Radical leaves aggregate entire and trifid oblong obtuse, Stem filiform about 2-fl, Pet. as long as calyx
- 6107 Leaves cordate acutely lobed toothed, Scape racemose  
 6108 Leaves ovate cordate acute shortly lobed toothed, Raceme filiform spiked  
 6109 Leaves biternate
- 6110 Leaves cordate about 3-lobed toothed, Scape 2-leaved  
 6111 Leaves orbiculate reniform doubly crenate lucid, Scape setaceous lucid  
 6112 Leaves reniform repand ciliated, Scape naked

## 1. Calyxes not scaly.

- 6113 Flowers clustered, Stems simple roughish, Leaves linear fleshy  
 6114 Flowers corymbose, Stem ascending, Leaves lanc. lin. obsolete 3-cornered obt. 1-sided, Stam. exerted  
 6115 Flowers corymbose, Petals rarely submarginate, Leaves linear fleshy smooth flat  
 6116 Flowers corymbose, Branches divaricating, Leaves ovate lanc. smooth at the base cordate amplexicaul.  
 6117 Branches spreading, Flowers panicled small, Pan. much branched, Fl.-stalks viscid  
 6118 Flowers panicled, Panic. much branched polished, Leaves ovate lanc. half stem-clasping  
 6119 Fl. trichotomous panicled, Pedunc. villous viscid, Petals emarginate twice as long as calyx  
 6120 Fl. panicled very minute dioecious, Peduncles smooth filiform divaricating, Leaves lin. lanc. rough  
 6121 Fl. panicled, Panic. divaricating, Branches few-flowered pubescent viscid, Leaves lin. lanc. obtuse  
 6122 Fl. dichotomous, Panic. smooth, Pet. emarg. twice as long as cal. Leaves lanceolate fleshy

## and Miscellaneous Particulars.

stood. The species are subject to great variation in appearance, and to much diversity of opinion among those who profess to be best acquainted with them. A middle course has here been taken, by which the doubtful kinds have been omitted, and those which are recognized, if not defined, satisfactorily, are alone admitted.

1042. *Tiarella*. From *tia*ra, a particular kind of head-dress, a mitre, in allusion to the form of its capsule. Pretty little North American herbaceous plants, related to saxifrage, and easily cultivated in pots of light sandy peat and loam.

1043. *Mitella*. A diminutive of *mitra*, a mitre; so named for the same reason as the last genus, which it altogether resembles in habit and constitution.

1044. *Gypsophila*. From *γυψος*, chalk, and *φίλας*, to love; most of the species delight in chalky districts.

History, Use, Propagation, Culture.

Some of the species are fine border plants, but the greater part are of little beauty, and only grown in botanic gardens.

1045. *Saponaria*. In allusion to its mucilaginous sap, which is said to be fit for supplying the place of soap, *sapo*. *S. officinalis plena* is considered a border flower, but is inconvenient unless kept in pots, from its spreading very much by the roots, which are underground creepers, like those of couch. The leaves form a lather with soap, and take out spots of grease in the same manner. The whole plant is bitter, and was formerly used to cure the itch and the venereal disease.

1046. *Dianthus*. *Διος ωσθός*, the flower of God, or divine flower; so named on account of its pre-eminent beauty. Most of the species of this genus are highly valued, not only for the beauty of their flowers, but also as being evergreens; their foliage during winter being as abundant and vivid as in summer. The fragrance of some of the species is peculiarly grateful, and no plant in this respect surpasses the carnation. *D. barbatus* is an old inhabitant of the flower garden, and was much esteemed in Gerarde's time "for its beauty to deck up the bosom of the beautiful, and garlands and crowns for pleasure." The varieties are numerous, but as the plant has never been treated by florists as a leading flower, they have not been named or improved. A hybrid variety called the Mule, or Fairchild's Sweet-William, is supposed to have been produced from seeds of the

- 6123 Fl. panic. Stem diffuse, Leaves lin. lanc. grassy carinate cæsious  
 6124 Stems panic, few-fl. Stam. shorter than emarginate petals, Leaves linear smooth  
 6125 Petals obovate emarginate campan. Stamens shorter than corolla, Leaves linear somewhat fleshy  
 6126 Stems panicled, Styles longer than emarginate petals, Leaves lin. lanc. smooth  
 6127 Stem dichotomous panicled much branched, Fl. axill. solitary, Leaves lin. flat as long as fl.-stalks

2. *Calyxes supported by 2-4 scarious scales.*

- 6128 Stems numerous erect stiff, Fl. panicled terminal, Leaves linear rigid

- 6129 Flowers fascicled panicled, Cal. rounded villous yellowish, Leaves ovate lanc. acute or not

- 6130 Fl. panicled, Cal. pyramid. 5-ang. smooth, Bractes membranous acute, Leaves ovate lanc. sessile  
 6131 Stem erect, Branches divaric. with clammy hairs, Fl. on long stalks axill. Leaves lanc. linear  
 6132 Stems erect branched, Fl. panic. and corymbose, Cal. slender glandular purple, Lvs. ovate lanc. 1-nerved  
 6133 Stem dichotomous, Branches divaricating, Fl. axill. Cal. hispid round, Leaves linear spatulate  
 6134 Tufted, Stems 2-leaved, Flowers headed with an involucre, Cal. woolly

§ 1. *Flowers capitate or corymbose, sessile or stalked.*

\* *Bractes ovate, blunt.*

- 6135 Scales of calyx ovate pointless longer than tube, Leaves serrulate  
 6136 Like the last, but the flowers nearly solitary

\*\* *Bractes lanceolate, acute, Calyxes villous.*

- 6137 Flowers loosely bundled, Scales lanc. subul. as long as tube, Leaves subulate, Calyxes hairy  
 6138 Flowers densely bundled, Scales ovate subul. as long as tube, Pet. beard. Lvs. subul. pub. rough upright  
 6139 Fls. aggreg. Scales long. than cal. striat. rough, Lvs. lin. short. than joints rough, Stem simple rough upw.

\*\*\* *Bractes ovate or lanceolate, Calyxes smooth.*

- 6140 Flowers aggregate fascicled, Scales ovate subulate as long as tube, Leaves lanceolate  
 6141 Flowers aggregate racemose corymbose, Scales ovate lanceolate finally longer than calyx, Lvs. obl. lanc.  
 6142 Flowers aggregate fascicled, Scales acute ciliated twice as short as tube, Leaves ovate short  
 6143 Fls. subsess. capitate, Scales imbric. mucron. at end spreading a little short. than tube, Lvs. long narrow  
 6144 Glaucous, Fls. sess. capitate, Scales broad ovate with a long awn longer than head, Upper lvs. dilat. at base  
 6145 Dark green, Flowers sessile capitate, Scales ovate very short pointless, Leaves narrow rough  
 § Flowers panicled fastigate and solitary stalked  
 6146 Fl. aggregate, Involucres and scales scarious rufous oblong awned a little shorter than cal.  
 6147 Fl. aggregate sessile and stalked, Scales ovate awned shorter than tube, Leaves linear 3-nerved  
 6148 Like the last, but flowers aggregate headed sessile 3-8  
 6149 Flowers aggregate, Claws of petals very long, Scales mucronulate closely imbricated, Leaves subul. fleshy  
 6150 Flowers aggregate, Claws of pet. as long as cal. Scales mucr. closely imbric. very short, Leaves lanc. obt.  
 6151 Stems aggregate, Scales ovate subulate thrice as short as tube, Leaves lin. lanc. narrowed at each end  
 6152 Flowers aggregate on long stalks, Scales twice as short as tube

§ 2. *Flowers panicled or solitary.*

\* *Petals toothed.*

- 6153 Flowers fascicled, Scales ovate lanceolate shorter than tube, Petals acutely toothed, Lvs. lin. lanc. rough  
 6154 Like the last, but the flowers more numerous, and the leaves linear lanc.  
 6155 Stem panicled somewhat hairy, Fl. sol. Scales ovate acute twice as short as cal. Leaves subul.  
 6156 Flowers fascicled twin, Scales awned as long as calyx, Petals crenate, Stem decumbent, Lvs. anc. obt.  
 6157 Flowers somewhat corymbose, Scales furrowed mucron. twice as short as tube, Stems diffuse smoothish  
 6158 Flowers nearly sol. Scales 6 ovate mucron. much shorter than cal. Pet. crenate, Lvs. subul. rough at edge  
 6159 Stem panicled smooth, Flowers solitary, Scales ovate awned as long as tube, Leaves subulate nerved  
 6160 Stem many-fl. smooth, Scales cuspid. spreading shorter than tube, Pet. downy at orifice, Lvs. lin. roughish  
 6161 Stem panicled, Fl. sol. Scales acuminate appressed, Petals acutely toothed, Leaves subul. lanc.  
 6162 Stem branched, Fl. sol. Scales linear leafy, Petals toothed, Leaves lin. lanc.

and Miscellaneous Particulars.

carnation impregnated by a Sweet-William. *D. caryophyllus* is considered the source whence have sprung the numerous varieties of the carnation, and some think those also of the pink. The pink, however, is more probably derived from some of the smaller growing species, as *plumarius*, *deltoides*, *armeria*, *carthusianorum*, &c.

The carnation is rarely found wild in England, but it may be gathered on the south side of the Swiss Alps. It seems to have been unknown to the ancients, at least in its cultivated state, not being mentioned by Pliny, or sung by any of the Roman poets. It has, however, been cultivated from time immemorial in Europe, and is in the highest favor for its beauty and rich spicy odour. It is the principal florist's flower of Germany and Italy, from which countries the British florists procure their best carnation seed, and also some esteemed varieties.

The varieties of carnation amounted to nearly 400 named sorts in the beginning of the eighteenth century, and the number has not since diminished. They are arranged in three classes; *flakes*, *bizarres*, and *picotees*. *Flakes* have two colors only, and their stripes large, going quite through the leaves; *bizarres*, Fr. (*odd*, irregular) are variegated in irregular spots and stripes, and with no less than three colours; *picotees*, Fr. (*piequettée*, pricked or spotted) have a white ground, spotted or pounced with scarlet, red, purple, or other colors. Of

## History, Use, Propagation, Culture.

each class there are numerous varieties, arranged under the farther subdivisions of scarlet flake, pink flake, purple flake, yellow flake, &c.; scarlet bizarre, crimson bizarre, &c.; and purple picotee, yellow picotee, &c.

Picotees are rather smaller flowers than carnations, and are distinguished by the serrated margins of their petals; the colors are principally yellow and white spotted, and the plants are considered hardier than the other sorts. Whatever colors the flower may be possessed of, they should be perfectly distinct, and disposed in long regular stripes, broadest at the edge of the lamina, and gradually becoming narrower as they approach the unguis, or base of the petal, there terminating in a fine point. Each petal should have a due proportion of white, *i. e.* one half, or nearly so, which should be perfectly clear and free from spots. Bizarres, or such as contain two colors upon a white ground, are esteemed rather preferable to flakes, which have but one, especially when their colors are remarkably rich, and very regularly distributed. Scarlet, purple, and pink are the three colors most predominant in the carnation; the two first are seldom to be met with in the same flower, but the two last are very frequently.

New varieties are procured from seeds, and thousands of seedlings are annually blown by florists and amateurs, sometimes without one being found worth keeping. Established or approved varieties are continued by layering and cuttings, or, as they are commonly called, pipings. The soil in which the carnation thrives best is a rich loam rather sandy than otherwise; the climate should be free from extremes of every kind, for which reason they are commonly grown in pots, and protected by a frame during winter, and covered by an awning while in bloom. Carnations grow exceedingly well in beds of properly prepared soil, over which frames are placed in winter, and an awning of canvass or bunting when the plants are in blossom. Those who are curious in blowing their carnations have a great many nice and curious operations to perform when they come into flower. Such petals as are plain, or run from the proper colors of the variety, are extracted by a particular instrument; the remaining petals are next arranged so as to form a convex imbricated surface; the calyx being slit down or tied up as may be necessary to aid this end. Then the flowerstalks are neatly tied to sticks, and the flower supported in a pendant attitude by means of properly formed brass wires.

6163 Stem branch. upw. closely dichotom. Fl. sol. Bract. with a spread. leafy point, Lvs. lin. subul. 3-nerv. hairy  
 6164 Stem branched, Fl. sol. Scales very short ovate, Petals very broad beardless, Lvs. lin. sub. channelled glauc.

6165 Stem branched or simple, Fl. sol. Scales very short 4 ovate, Pet. broad beardless toothed

6166 Stem dichotomous paniced many-fl. glaucous, Fl. sol. Scales 4 pungent spreading shorter than tube

6167 Fl. sol. subcorymb. Soales ov. lanc. short. than tube, Lvs. lin. lanc. obsol. 3-nerv. smooth, Pet. twice toothed  
 6168 Fl. sol. Scales ovate acute very short, Petals emarginate or nearly entire

6169 Stem branched, Fl. sol. Scales ovate acute very short awned, Pet. lanc. narrow, Leaves subul. roughish

6170 Stem few-fl. Fl. sol. Scales very short mucron. spreading, Tube gibbous, Pet. entire, Lvs. caespitose subul.

6171 Stem decumb. branched, Fl. sol. Scales ovate lanc. acute twin, Upper leaves narr. acute : lower oblong obt.

6172 Like the last, but flowers white. Leaves and stem glaucous

6173 Stem branched, Fl. sol. Scales 6 lanc. appressed, Pet. smooth cuneate obovate, Lvs. lin. acum. channelled

6174 Stems tufted few-fl. Fl. sol. Scales ovate acute short, Leaves subul. spreading downy rough

6175 Stem 1-fl. Scales 2 ovate acute short spreading, Cal. contracted in middle, Lvs. lin. chann. roughish at edge

6176 Stem 1-fl. Scales 4 acute short, Petals bearded doubly serrated, Leaves lin. spreading

6177 Stems tufted about 1-fl. Scales roundish short, Pet. crenate downy, Leaves bluntnish rough at edge

6178 Stem 1-fl. Outer scales as long as tube : inner much shorter, Pet. crenate, Leaves obl. obtuse

6179 Pedunc. biind term. Scales lanc. cusp. erect short. than tube, Pet. cut, Lvs. lin. nerved serrul. rough at edge

6180 Stems about 2-fl. Scales 4 ovate acute twice as short as tube, Petals serrate downy, Leaves linear

6181 Stem about 1-fl. Scales obovate mucronate, Pet. beardless many-cut, Leaves subul. entire smooth nerved

\*\* *Petals fringed.*

6182 Stems ascending about 1-fl. Scales short ovate, Pet. toothed many-cut, Leaves lin. ciliated

6183 Fl. sol. Scales 4 lanc. short, Petals emarginate at the end fringed toothed

6184 Glaucous, Stems 2-3-fl. Teeth blunt, Bractes ovate very short pointed, Leaves lin. rough at edge

6185 Like the last, but the petals bearded at their orifice

6186 Stem pan. few-fl. Fl. sol. Scales ovate acum. Petals equally cut crenate, Leaves glaucous rough at edge

6187 Stems 1-fl. Scales ovate lanceolate acuminate shorter than tube, Pet. beardless, Lvs. subul. rough at edge

6188 Stem branched few-fl. Scales 4 blunt short, Petals beardless dotted, Leaves glaucous linear flaccid

6189 Stems 1-fl. Scales ovate obtuse four times as short as calyxes, Pet. naked, Leaves subul. glauc. ciliated

6190 Stems 1-fl. Scales ovate obtuse, Leaves linear

6191 Stem half-shrubby branched at base 2-fl. Scales 6 lanc. shorter than cal. Leaves subul. rough

6192 Fl. scattered solitary, Scales lanc. lin. spreading a little shorter than tube, Leaves lin. nerved flaccid

6193 Stem paniced few-fl. Fl. sol. Scales subul. straight twice as short as tube, Petals digitate, Lvs. lin. serrul.

6194 Stem panic. many-fl. Fl. fastigate, Scales short ov. mucron. Pet. beyond the middle pinn. many-cut hairy

[at orifice

### TRIGYNIA.

6195 Branches divaricating, Leaves ovate, Cal. campanulate, Pet. distant

and Miscellaneous Particulars.

Behind the petals a circle of card paper is sometimes fixed to keep them in position, and the pot in which the plant grows is placed on a particular description of saucer, by which it is surrounded by water, in order to prevent the approach of ground insects, and especially of the earwig. These and a number of other operations will be found described at length in Maddock's Florist's Directory, and in the Encyclopedia of Gardening. (Sec. 6406.)

The pink, as a florist's flower, is of much less antiquity than the carnation : it is scarcely mentioned by Gerard, and Parkinson has given very few varieties. It was chiefly grown as a border flower till within the last fifty years, since which it has been greatly improved and many fine varieties originated. Being one of the hardiest and least expensive of fine flowers, it is much cultivated by operative mechanics and manufacturers round large towns, and no where to such an extent as about Paisley, by the muslin weavers there.

The varieties of pink most cultivated are chiefly those called pheasant's eyes, which seem to have sprung from *D. plumarius*. Cob pinks are a large sort seemingly intermediate between pinks and picotee carnations; red early pinks are smaller plants than cobs, but larger than pheasant's eyes, and seem to have sprung from cobs and *D. armerius* or *deltoides*. The Paisley growers reckon above three hundred varieties of the pheasant's eyes. To garden pinks in general Wildenow gives the appellation of *D. hortensis*.

The propagation and culture of the pink is the same as that of the carnation, excepting that it is less frequently kept in pots or frames, but planted in beds of fresh loamy soil, and the small side shoots reduced in the autumn in order to throw more strength into those intended to produce flowers the following season. Some cover their pink bed with an awning. Not more than eight or ten flowers are ever allowed to expand on one plant, and these, if they shew a tendency to bursting at the calyx, are to be tied as in carnation culture.

1047. *Cucubatus*. A name signifying a bad subject; an evil weed. According to Miller, the berries of this plant are no less deadly than those of Nightshade.

History, Use, Propagation, Culture,

1048. *Silene*. A poetical name, after the God Silenus, who is represented as always drunk and covered with slaver, as the species of this genus usually are with a viscid secretion. This is a large family of small plants, neither remarkable for use, beauty, or as bad weeds. *S. inflata*, the Cucubalus Behen *L.*, may be used as a substitute for asparagus or green pease, the young shoots having the flavor of both. They ought to be gathered

- § 1. *Tufted, Stems scarcely any, Calyx somewhat inflated, Peduncles 1-flowered.*  
 6196 Smooth, Stems dense, Leaves lin. lanc. Flowers dioecious, Calyx campanulate  
 6197 Stems less dense, Leaves lin. spatulate pubescent, Cal. inflated hairy
- § 2. *Cauliscent, Flowers solitary or panicled, Calyx bladderly inflated.*  
 6198 Pubescent, Leaves large ovate lanc. Fl. in large panicles, Cal. much inflated, Petals fringed  
 6199 Hispid, Leaves ovate lanc. on long stalks wavy, Cal. much inflated, Pet. lacerated crowned  
 6200 Stems erect branched pubescent, Leaves 4 whorled lanc. with long points smooth, Fl. pan. Cal. bladderly  
 6201 Stems branched, Fl. pan. Cal. bladderly ovate, Pet. bifid naked, Styles very long  
 6202 Like the last, but hairy with ovate lanc. leaves  
 6203 Like the last, but creeping with smaller nearly spatulate leaves  
 6204 Smooth branch. Lvs. lanc. : the lower stalk. Fl. pan. Cal. ovate veiny, Pet. with 2 very short lobes crowned  
 6205 Pubescent, Stems very tall branch. Lvs. large lanc. Fl. pan. Cal. ov. netted, Pet. with a claw hairy at base  
 6206 Smooth, Stem erect simple rather leafy, Lvs. lin. scarcely ciliat. Fl. in pan. spikes, Claws of pet. not ciliated  
 6207 Smooth with very leafy branched procumbent stems, Leaves lanc. Fl. axill opp. and terminal, Petals bifid  
 6208 Nearly smooth, Stems little branched, Leaves obovate serrulate-ciliated, Fl. pan. Pet. orbiculate crowned  
 6209 Hoary, Stem erect branched, Leaves lanc. : the upper linear. Fl. few term, Petals 0  
 6210 Stems procumb. diffuse 2-3-chotomous branched, Lvs. small lin. Petals half-bifid with an orbic. crown  
 6211 Nearly smooth, Stems wavy branched leafy, Leaves lin. lanceolate, Petals 2-lobed  
 6212 Smooth, Stem erect, Leaves acute glaucous, Fl. solitary, Pet. lanceolate with a 2-lobed crown

- § 3. *Cauliscent, Flowers spiked in whorls.* [Fl. small dioecious  
 6213 Leaves erect, with a few branches, which are scarcely pubesc. or leafy, Lower lvs. numerous spatul. fleshy,  
 6214 Stem pubesc. branched, Lower leaves large lanc. spatulate : upper lin. long, Fl. panicled with linear petals  
 6215 Hoary, Stems assurgent nearly simple, Leaves spatulate lanc. Cal. spherical 10-stripped  
 6216 Stems erect nearly simple, Lvs. lin. : lower obt. Fl. very numerous and small, Cal. obov. clavate 10-stripped  
 6217 Half-shrubby smooth, Stems much branch. Lvs. lin. lanc. shortly ciliat. numerous, Cal. inf. clav. 10-stripped  
 6218 Stem simple, Lvs. lin. lanc. : lower broader stalk. Cal. clavate cylindr. 10-strip. Pet. 2-part. Stam. very long  
 6219 Smooth, Stems erect simple very leafy, Lvs. lanc. small, Spike dense, Cal. clavate netted, Stam. very long  
 6220 Velvety, Radical leaves cochleate smooth, Cal. tubular 10-stripped, Pet. 2-fid, Stamens very long  
 6221 Pubescent very viscid, Stem simple thick leafy, Leaves large lin. lanc. wavy, Fl. large nodding

- § 4. *Cauliscent, Calyx conoid, at the bottom retracted, with very long teeth.*  
 6222 Pubescent, Leaves linear soft, Cal. short conical  
 6223 Stems pubescent, Leaves lanc. lin. nearly smooth, Cal. long conical  
 6224 Pubescent, Leaves lanceolate wavy : the lower stalked, Fl. large in loose dichotomous panicles

- § 5. *Cauliscent, Flowers spiked, axillary, not opposite, Calyx with 10 stripes.*  
 \* *Calyx cylindrical.*  
 6225 Hairy, Stems branched, Leaves lanc. acute, Cal. ventricose with very long teeth, Petals small crowned  
 6226 Very hairy, Stems much branched, Lower leaves obovate spat. : upper lanc. obtuse, Petals undivided  
 6227 Stems branched, Leaves lin. lanc. Spike 1-sided, Cal. cylindrical with 10 ribs, Teeth long, Pet. 3-toothed  
 6228 Hairy, Stems branched, Lower lvs. spatulate : upper lanc. obtuse, Cal. teeth short, Pet. obov. crowned  
 6229 Hairy, Stems branched, Leaves spatulate, Spike 1-sided few-fl. Cal. very hairy, Pet. obovate crowned  
 6230 Hairy, Stem much branched, Leaves lanc. cusp. Spikes twin dense, Pet. small bifid  
 6231 Stems simple vill. Leaves pub. : lower spatul. : upper lanc. Spike 2-ranked few-fl. Pet. obov. retuse crowned  
 6232 Pubesc. Stems branch. Lvs. lanc. : lower obt. Spike 1-sided. Cal. vill. with short teeth, Pet. roundish crowned  
 6233 Stem branch. hairy below. Lvs. pubesc. with a long fringe at base, Cal. cyl. nearly smooth ribbed and netted  
 6234 Like the last, but flowers few distant, Petals smaller  
 6235 Hairy, Stem branched leafy, Leaves lin. lanc. Flowers terminal, Cal. cylindr. Pet. bifid  
 6236 Hairy, Fl. sessile 1-sided, Cal. cylindr. appressed, Petals small deeply emarginate

- \*\* *Calyx clavate.*  
 6237 Hoary, Stems prostrate branched, Lvs. obovate spatulate ciliated at base, Fl. 1-sided erect, Pet. bifid  
 6238 Stems branch. pubesc. Lvs. scabrous cil. at base : lower spatul. ; upper lanc. Fl. sess. nodding, Pet. 2-parted  
 6239 Pubescent, Lvs. somewhat fleshy : lower spatulate ; upper lanceolate, Cal. long clavate, Petals 2-fid  
 6240 Hairy, Stem erect slender branched, Lvs. lanc. Spikes twin 2-sided, Cal. cylindr. clavate, Pet. bifid  
 6241 Pubesc. Stems branch. Lvs. spatul. obt. Spikes twin 1-sided, Cal. bladderly, Pet. 2-parted with ov. lobes  
 6242 Velvety, Stem procumb. branch. leafy, Lvs. ov. spatul. fleshy, Bract. very small, Pet. with long claws emarg.  
 6243 Smth. Stem erect slender branch. Lvs. lin. scarcely ciliat. : low. ov. Fl. on long stks. Pet. 2-part. with lin. lobes  
 6244 Smooth, Stems usually simple, Lvs. somewhat fleshy lin. lanc. Cal. ov. ventric. Pet. bifid with 4-lob. append.  
 6245 Pubesc. Stems numerous prostrate very leafy at base, Lvs. lin. setaceous ciliated, Ribices of calyx deflexed  
 6246 Pubescent branched supine, Leaves ovate lanc. Fl. axillary pendulous, Petals bifid crowned

- § 6. *Cauliscent, Stems upright, Peduncles filiform, Calyx campanulate or cylindrical.*  
 6247 Tufted, Stems erect slender branched, Lvs. small linear very narrow, Fl. small, Petals short 4-toothed  
 6248 Like the last, but the radical leaves broader, Peduncles long upright  
 6249 Root branched, Stems simple leafy, Lvs. lanc. lin. obt. Fl. large panicled, Petals broad 4-cleft, Seed ciliated  
 6250 Smooth, Stems erect branched, Leaves ovate lanc. Fl. panicled very small, Petals orbiculate

and Miscellaneous Particulars.

when about two inches long, and the more they are blanched the better. Bryant (*Flora Dietetica*) says, its culture would well reward the gardener's trouble. *S. viscosa* is a popular border flower, especially the double variety.

*S. quinquevulnera* was formerly in culture as a border flower, but is now seldom used for that purpose :

History, Use, Propagation, Culture,

being very low and prolific in flowers, it is well adapted for sowing in pots. S. Armeria is one of the annual border flowers of the seed shops.

1049. *Stellaris*. The parts of the flower are stellate. The species are grassy-looking plants of the easiest

- 6251 Smooth, Stems erect branched, Lvs. lanc. acute: lower obt. Petals not opening obovate, Stam. usually 5  
 6252 Pubesc. Stem erect much branched slender, Lower lvs. obl. obt.: upper lanc. narrow, Pet. short erect bifid  
 6253 Nearly smooth, Stem erect branched somewhat leafy, Leaves lanc. acute ciliated, Fl. small panicle  
 6254 Pubescent, Stems branched, Lower leaves ellipt. spatulate: upper lanc. Fl. term. twin, Petals bifid  
 6255 Pubescent, Stems erect branch. straight, Low. lvs. lanc. spat.: up. linear, Fl. loosely panicle, Pet. 2-lobed  
 6256 Stems branched, Leaves lin. spatulate, Fl. term. Cal. cylindr. clavate, Petals 2-fid  
 6257 Smooth, Stems erect branched, Low. lvs. ov. stalked obt.: up. lin. acute, Fl. loosely panic. Cal. ov. clavate  
 6258 Viscid pubesc. Stems erect much branch. Lvs. fleshy: low. spatul.: up. ov. Fl. small, Pet. obcord. crowned  
 6259 Tufted, Stems assurgent, Lvs. lin. acute, Peduncles very long, Cal. long clavate, Petals 2-fid crowned  
 6260 Tufted shortly bristly, Stems assurgent, Leaves lin. with bristly teeth, Fl. small, Petals 2-fid crowned  
 6261 Smth. Stems erect or assurg. somew. branch. leafy at base, Lvs. lanc. lin. acute: low. spat. Pet. 2-part. naked

§ 7. *Cauliscent, Flowers panicle, rarely solitary, Pedicels opposite short, Calyx tubular.*

\* *Flowers nodding, Calyces cylindrical.*

[reflexed

- 6262 Smooth viscid, Stems erect, Lvs. somewhat fleshy lin.-lanc. fringed with fine bristles, Pet. very long 2-part.  
 6263 Pubesc. Stems leafy at base, Radical lvs. spatul.: upper lanc. lin. Pet. 2-parted reflexed with a long crown  
 6264 Like the last, but smooth, less branched, and less leafy, Leaves linear, Petals often green  
 6265 Like the last, but stems flexuose broken down, Petals white above beneath livid green  
 6266 Smooth, Leaves lin. lanc. ciliated at base, Fl. pan. erect, Cal. ventricose cylindr. Petals 2-parted  
 6267 Hairy soft, Stem branch. leafy, Lvs. large ov. acum. Fl. in large nodding panicles, Pet. with very long claws  
 6268 Smooth, Stems erect simple scarcely leafy, Petals 2 parted with filiform lobes [crowned

\*\*\* *Flowers erect, Calyces clavate.*

- 6269 Velvety glutinous upwards, Stem erect branched leafy, Fl. small loosely panicle, Stamens very long  
 6270 Stem short about 2-flowered pubescent, Radic. leaves lanc. lin. acute, Cauline very short, Pet. bifid  
 6271 Creeping pubesc. Root long creeping, Stem erect almost simple, Lvs. lin. grassy acute, Fl. few erect panic.  
 6272 Viscid pubesc. Stem procumb. assurgent branch. Fl. large panic. Cal. large clavate, Pet. broad bifid crowned  
 6273 Scarcely pubesc. Stem upright branched, Lvs. lin. lanc. Fl. panicle erect, Cal. netted, Pet. small emarginate  
 6274 Smoothish viscid, Stem erect, Alternate branches long, Cal. large clavate netted, Petals bifid  
 6275 Visc. pubes. Stems erect branch. Lvs. large, Fl. large panic.: every other stripe of cal. veiny, Teeth very long  
 6276 Pubes. Stems erect branch. Lvs. lanc. obt. Fl. panic.: every other stripe of cal. veiny, Pet. with broad tooth  
 6277 Subtomentose, Stems branch. Lvs. obov. stalked, Fl. term. erect, Pet. obcord. 2-toothed at base [lobes  
 6278 Silky, Stems branched, Lvs. with a long fringe at base, Fl. large term. Pet. 2-parted crowned  
 6279 Stems much branch. scarcely pubesc. Lower lvs. obov. spatul. Lvs. lin. acute, Cal. clavate striped with red  
 6280 Tufted smooth subviscid, Stems branched at base, Lvs. lin. Fl. panic. Cal. netted, Pet. bifid with lanc. lobes

\*\*\* *Flowers erect, Calyces long clavate.*

[at base

- 6281 Smooth viscid. Stems branch. Lvs. lanc. lin. Cal. very long. clav. nett. Pet. obcord. with a tooth on each side  
 6282 Viscid pubescent, Stems procumbent, Leaves lin. long, Cal. long tubular, Petals slightly emarg. crenate  
 6283 Tufted viscid pubesc. Root woody, Stems low assurgent little branched, Cal. long netted, Petals bifid  
 6284 Suffruticose, Stems suberect smooth branched at base, Cal. long cylindr. viscid-villous, Petals 2-lobed  
 6285 Scabrous, Stems bran. Fl. term. in the dichotomies, Cal. long cylin. Pet. 2-part. tooth, on each side at base  
 6286 Pubescent, Root woody, Stems diffuse branched, Leaves soft numerous below, Petals half bifid  
 6287 Tufted viscid pubescent, Stems woody supine branched, Lvs. lin. acute, Petals with narrow diverging lobes  
 6288 Stems erect pub. Lvs. roughish scarcely ciliat. Fl. large pan. Pet. with broad obov. lobes & 2-part. append.  
 6289 Very smooth glaucous, Stems branched, Leaves roundish acuminate, Fl. large, Cal. not striped  
 6290 Pilose pubesc. Stems much branch. Lower lvs. ovate spatul.: up. lin. Fl. in large panic. Pet. 2-lob. naked  
 6291 Pubesc. viscid. Stems erect branch. Branch. spread. Low. lvs. ov. spatul. Cal. long narrow, Pet.  $\frac{1}{2}$  bifid crowned  
 6292 Pubescent, Stems assurgent much branched leafy, Leaves linear acute, Cal. clavate, Petals bifid  
 6293 Stem simple pubescent, Leaves pubescent: lower large rounded stalked, Petals 2-parted crowned  
 6294 Smooth, Stem twiggy, Leaves lin. lanc. radical very long, Cal. very long, Petals 2-parted crowned  
 6295 Smooth clammy, Stem assurgent branch. Lvs. lin. lanc. acute: lower very long, Upper bracts with a broad  
 6296 Silky, Stems erect branch. Lvs. wavy, Calyces long clavate, Pet. 2-part. crowned [membranous margin  
 6297 Viscid pubescent, Lvs. lanceol. Cal. long tubular, Petals lanceolate crowned, Stamens very long  
 6298 Villous viscid, Lvs. lin. lanceol. obt. ciliated, Peduncle 1-fl. spreading in seed, Cal. circularly reflexed at base

§ 8. *Cauliscent, Flowers corymbose, Cal. clavate, 10-stripped.*

- 6299 Tufted roughish, Root thick woody branch. Stems simple slender very leafy at base, Lvs. small lin. acute  
 6300 Viscid, Stem much branch. pubesc. Lvs. round subciliated: the lower on long stalks, Fl. loosely corymb.  
 6301 Very smooth glaucous viscid, Leaves ovate-lanc. Fl. in panicle corymb, Petals obovate crowned  
 6302 Smooth, Stems erect branched, Upper leaves lanceolate: lower linear lanc. Umbel dense, Petals obovate  
 6303 Lower leaves cordate stalked: upper lanc. sessile, Petals twice as long as calyx  
 6304 Stems diffuse dichotomous rooting at base, Lower lvs. ovate stalked cord.: upper sess. Pet. shorter than cal.  
 6305 Stems procumbent with a lateral 1-sided hairy line, Leaves lanc. very tender, Fruit deflexed

and Miscellaneous Particulars.

culture. *S. media* is a well known weed, never found but on rich friable soils in a state of culture: the seeds and flower buds are a favorite food of finches and other small birds.

History, Use, Propagation, Culture.

1050. *Arenaria*. From *arena*, sand, in which most of the species are found. They are of most difficult discrimination, and are chiefly diminutive weeds found almost exclusively on sandy soils. The flowers vary

- 6306 Hairy, Lvs. cord. ovate stem-clasping, Stem dichotomous, Fl. solitary, Sepals lanc. ac. longer than petals  
 6307 Leaves ovate lanceol. nearly veinless, Pedunc. 1-f. Sepals lanc. acute twice as short as petals  
 6308 Villous viscid, Leaves lin. lanc. Stems dichotomous diffuse, Petals and capsule longer than calyx  
 6309 Lvs. lanc. acum. serrulate roughish : the upper broader and shorter, Pedunc. filiform very long, Pet. 2-fid  
 6310 Stem erect few-fl. Lvs. linear acute entire smoothish, Pedunc. filiform very long, Petals 2-parted  
 6311 Leaves linear smooth at edge, Stems diffuse, Fl. paniced divaricating, Petals the length of calyx  
 6312 Glaucescous, Leaves lin. lanc. smooth at edge, Floral scarious, Petals twice as long as cal. Stem erect weak  
 6313 Leaves ovate-lanceol. entire smooth thick, Sepals ovate-lanceol. much shorter than petals  
 6314 Leaves ovate-obl. Pet. deeply divided shorter than calyx, Caps. ovate oblong longer than calyx  
 6315 Leaves obl. pubescent, Pedunc. 1-f. twin, Pet. larger than cal. Caps. obl. nearly twice as long as sepals  
 6316 Leaves spatulate, Stem erect bifid viscid, Branches alternate, Petals emarginate  
 6317 Leaves linear lanc. obtuse very dense, Pedunc. 1-f. and umbelled, Pet. scarcely longer than calyx  
 6318 Leaves lanc. entire sessile acute, Base and stem pubescent, Fl. axill. solitary  
 6319 Glandular pubescent, Stem procumbent, Leaves ovate fleshy, Petals scarcely longer than calyx cut  
 6320 Very smooth, Leaves linear-lanc. Pedunc. terminal dichotomous bracted, Pet. broad ovate 2-parted

§ 1. *Caps. 3-valved, Leaves linear, with scarious stipules at base.*

- 6321 Smooth, Stem erect, Leaves subulate 1-sided, Petals shorter than calyx

[Calyx

- 6322 Hispid, Stem erect, Branches divaricating, Lvs. setaceous twice as short as joints, Pet. obt. shorter than  
 6323 Stems prostrate hairy, Leaves filiform shorter than the joint, Sepals lanceolate obtuse scarious at edge  
 6324 Like the last, but nearly smooth  
 6325 Stems prostrate, Leaves half cylindrical fleshy as long as joints, Seeds with a membranous wing  
 6326 Pilose subhispid, Leaves filiform longer than joint, Stamens 5, Seeds oboord. compressed, Caps. globose

§ 2. *Leaves grassy, linear, lanceolate or rounded, without stipules, Caps. 3-valved.*

\* *Leaves grassy.*

- 6327 Stems erect simple, Lvs. subul. filiform rough, Panic. trichotomous pubescent lax, Calyxes very obtuse  
 6328 Leaves subulate-filiform serrulate, Stems erect simple, Panicle trichotomous smooth compact  
 6329 Lvs. lin. setaceous ciliated rough, Stems erect rigid simple, Sepals acute scarcely longer than corolla  
 6330 Stems ascending few-fl. pubescent, Lvs. setaceous rigid, Culine straight, Sepals obtuse striated villous  
 6331 Leaves setaceous rigid mucronate striated, Stems paniced few-fl. Sepals lanc. much shorter than corolla

\*\* *Leaves subulate or linear.*

- 6332 Lvs. subulate rigid spiny : lower fascicled ; upper distant, Stems erect firm, Pet. obov. twice as long as cal.  
 6333 Erect smooth many-stemmed, Leaves subulate linear erect, Pan. few-fl. Petals conspicuously striated  
 6334 Leaves subulate tooth-ciliated, Stems ascending 3-6-fl. roughish, Cal. cylindrical, Sepals 3-nerved hairy

- 6335 Like the last, but stems rigid few-fl. Leaves long straight, Pedunc. and calyx viscid hairy  
 6336 Lvs. lin. subul. 3-nerved, Stem paniced, Pedunc. terminal very long twin downy, Pet. obt. emarginate  
 6337 Like the last, but stems 2-4-fl. Leaves narrow recurved  
 6338 Lvs. subulate broadish flat 3-nerved ciliated, Radical clustered, Stems 1-f. Pedunc. very long pubescent  
 6339 Tufted many-stemmed, Leaves subulate obtuse nerved, Stems paniced elongated  
 6340 Erect branched, Leaves linear subulate 3-nerved, Pedunc. twin terminal 1-flowered  
 6341 Leaves subulate, Stems paniced, Sepals ovate  
 6342 Stems filiform rooting very long diffuse, Flowering branches erect few-fl. Lvs. lin. flat acute fascicled  
 6343 Leaves subulate setaceous, Stem branched dichotomous, Sepals subulate striated much longer than petals  
 6344 Stem much branched, Leaves lin. recurved, Sepals with a long point and membranous edge  
 6345 Radical lvs. clustered recurved subul. 1-sided, Stems tufted simple 3-f. Sepals and peduncles hairy gland.  
 6346 Stem much branched, Fl. paniced fastigiate, Leaves setaceous fascicled 1-sided ciliated at base  
 6347 Leaves subulate fascicled setaceous, Stems erect straight simple, Sepals acuminate with 2 lines  
 6348 Leaves setaceous fascicled with 2 stripes, Stems subfruticose dichotomous, Pedunc. term. 1-2-flowered  
 6349 Lvs. setaceous not ciliated at base, Stems tufted prostrate at base, Pedunc. longer than leaf, Sepals awned

- 6350 Procumbent, Leaves linear obt. Peduncles 2 or 3 1-flowered with 2 bractes at base, Sepals without nerves  
 6351 Leaves subulate rigid spiny and flowers whorled, Pedunc. 4-fl. capitate

\*\*\* *Leaves lanceolate, oval or rounded.*

- 6352 Leaves ovate carinate recurved edged imbricated 4 ways, Stems straight downy, Sepals rigid acute keeled  
 6353 Tufted villous, Branches ascending, Leaves lanceolate narrow acute rigid nerved  
 6354 Like the last, but smaller, with creeping and tufted stems, and imbricated leaves  
 6355 Pubescent, Leaves lanc. linear, Barren stems very long procumbent, Pedunc. terminal long 1-flowered  
 6356 Leaves ovate acute sessile regular ciliated and smooth, Sepals lanceolate 3-nerved acute green opaque  
 6357 Pubescent, Lvs. ovate acute stalked, Stems spreading branched elongated, Sepals acute shorter than cor.  
 6358 Leaves oblong acute 3-nerved ciliated imbricated, Stem prostrate, Sepals lanceolate acuminate striped  
 6359 Leaves lanc. acute spreading hard rough, Stem simple short, Sepals ovate acuminate striped  
 6360 Leaves ovate and obovate blistered rugose more or less nerved and ciliated, Stems procumbent  
 6361 Like the last, but leaves pulpy thick and sepals scarcely nerved  
 6362 Stem slender branched, Lvs. ovate acute stalked ciliated nerved, Pedunc. long bent down after flowering

and Miscellaneous Particulars.

considerably in the number of their stamens, more generally falling short of than exceeding the regular number.

History, Use, Propagation, Culture,

1051. *Cherleria*. John Henry Cherler was an assistant of John Bauhin in preparing his *Historia Plantarum*. A little obscure weed.

1052. *Brunnichia*. A catalogue of the books upon natural history was published by one Mr. F. Brunnich, a Danish naturalist, in 1793.

1053. *Garidella*. So named by Tournefort, in honor of Pierre Garidel, M. D., physician at Aix in Provence, author of *Histoire des Plantes qui naissent en Provence*, 1719, with many figures. A plant of little curiosity or beauty. Small inconspicuous plants of the easiest management.

1054. *Malpighia*. So named by Plumier in honor of Marcello Malpighi, professor of medicine at Bologna, author of *Anatome Plantarum*, 1765 and 1769; a celebrated work, the best of its time on the structure of vegetables. The species are handsome evergreen trees and shrubs, some of them fruit-bearing and others climbers. *M. glabra* is grown for its fruit in the West Indies, and the fruit of *M. urens* is also eaten under the name of Barbadoes cherry, but that of both species is much inferior to European cherries. All the species have the under sides of their leaves covered with prickly bristles which when handled run into the fingers. Ripened cuttings root freely in sand under cover.

1055. *Banisteria*. So named by Dr. Houstoun, in memory of the Rev. John Banister, a curious botanist, who lost his life in search after plants in Virginia. The species are chiefly evergreen climbers and twiners; some of them, as *B. fulgens* and *chrysophylla*, have fine shewy foliage as well as beautiful flowers.

6368 Tufted creeping, Leaves ovate shining fleshy ciliated, Pedunc. long 1-f. Flowers cernuous  
 6364 Leaves ovate acute fleshy approximated, Fl. solitary on short stalks, Sepals obl. acute as long as cor.  
 6365 All over pubescent, Leaves lin. lanceol. Stems prostrate much branched, Seeds very minute

6366 Leaves spreading

6367 Leaves cordate sagittate

6368 Petals sessile spreading, Stamens 10-12

6369 Leaves ovate entire smooth, Peduncles umbelled

6370 Leaves ovate entire smooth, Peduncles 1-flowered

6371 Leaves entire oblong acute smooth shining with 2 glands beneath at the base

6372 Leaves entire oblong lanceolate acute smooth with 2 glands at a distance from the base

6373 Leaves ovate nearly entire with hairs on both sides, Fl.-stalks with a truncate gland at top

6374 Leaves ovate elliptical acuminate entire smooth with 2 glands at base

6375 Leaves oblong acuminate entire smooth, Racemes axillary, Fl. monogynous

6376 Leaves elliptical shining hairy beneath, Fl. axillary corymbose

6377 Leaves obl. ovate with decumbent stiff bristles, Peduncles 1-f. aggregate

6378 Leaves lin. lanceol. with decumbent bristles on each side, Peduncles umbelled

6379 Leaves obl. obtuse pubescent, Racemes axillary compound

6380 Leaves ovate entire obtuse downy beneath, Racemes terminal

6381 Leaves ovate downy beneath acute, Flowers yellow spiked

6382 Leaves obovate wedge-shaped entire veinless shining, Raceme terminal

6383 Leaves ovate acute entire smooth on each side, Racemes terminal spiked

6384 Leaves oval acuminate shining, Racemes corymbose terminal

6385 Leaves lanceol. toothed-spiny hispid beneath

6386 Leaves subovate toothed-spiny

6387 Leaves orbicular cordate ciliate toothletted smooth, Petioles with 2 glands

6388 Leaves roundish ovate obtuse smooth, Racemes axillary and terminal, Seeds erect

6389 Leaves ovate oblong acutish towards the end obsolete ciliated beneath shining gold-colored

6390 Leaves ovate-oblong rigid, Racemes terminal

6391 Leaves ovate oblong entire beneath shining, Panicle terminal leafy

6392 Branches 2-edged, Leaves ovate downy beneath, Petioles with 2 glands

6393 Leaves subovate downy beneath, Racemes brachiate, Peduncles umbelled

6394 Leaves downy beneath orbicular cordate, Branches divaricating roundish, Petioles with 2 glands

6395 Leaves subovate, Branches brachiate, Seeds narrower inwards

6396 Leaves simple obovate obtuse pubescent above smooth beneath

6397 Leaves pinnated, Leaflets ovate stalked smooth on each side, Racemes fascicled

### PENTAGYNIA.

6398 Leaves pinnated, Leaflets ovate-lanceolate, Fruit oblong with obtuse angles

6399 Leaflets ovate unequal acuminate, Fruit obl. acute-angled

and Miscellaneous Particulars.

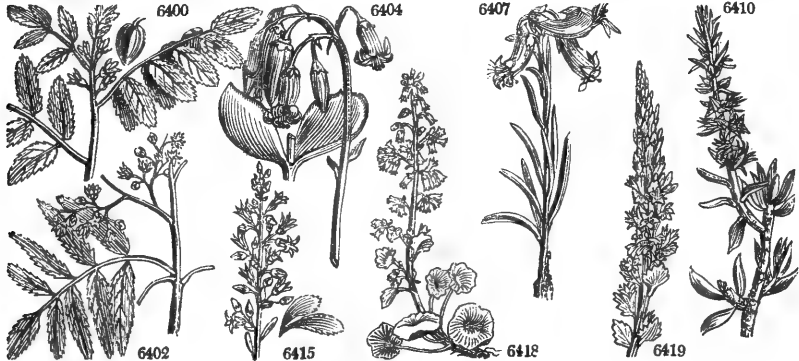

All of them root freely in ripened wood in sand under a hand-glass. In most respects they resemble the last genus.

1056. *Hiræa*. Named after John Nicholas de la Hire, a French physician, who died in 1727. Plants with the appearance of *Banisteria*.

1057. *Cnestis*. From *κνήθη*, to scratch. The capules, covered with hairs, excite a troublesome itching. Fine evergreen stove shrubs.

1058. *Averrhoa*. So named in honor of Ebn Elvelid Ebn Rushad, commonly called Averrhoes, of Corduba in Spain, a famous commentator on Aristotle and Avicenna. He also published Calliget, or the plants used in food, &c. He died at the beginning of the thirteenth century. The specific names are vernacular appellations. The species are evergreen trees, singular for the fruit growing frequently on the trunk itself, below the leaves: the flowers grow in racemes; the fruit is a five-celled pome. A. Bilimbi is a beautiful tree with a green fleshy oblong fruit the thickness of the finger, filled with a grateful acid juice; the substance and seeds not unlike those of cucumber. They make a syrup of the juice, and a conserve of the flowers, which are esteemed excellent in fevers and bilious disorders. A. carambola bears a fruit the size of a hen's egg, with a pulpy subacid juice, used ripe and also pickled green, and employed also in dying, and other economical purposes. The petioles and branches of this tree are said to have a peculiar sensitive quality, of which an account is given by Dr. Bruce in the Philosophical Transactions,

History, Use, Propagation, Culture,

Both species form handsome plants in our stoves ; they grow freely, and ripened cuttings root readily in sand under a hand glass.

1059. Spondias. One of the Greek names of the plum. The plants of this genus bear fruit like plums, which are also called hog plums in the West Indies. These are deciduous fruit-bearing trees, natives or cultivated in both Indies. S. Mombin (the South American name) flowers from the sides of the branches, and is known by its oblong or ovate fruit like a plum, having a luscious thin pulp covering a large fibrous stone. The skin is yellow, purple, or variegated; the pulp is yellow and thin, having a singular but not unpleasant taste, and a sweet smell. The seed scarcely ever ripens, but it is so easily increased by cuttings, that if a branch laden with young fruit be set in the ground, it will grow, and the fruit will soon come to maturity. In St. Domingo they make hedges of the boughs, which flower and bear fruit in a few months. It is also cultivated for the sake of the fruit, though it is not in much esteem in Jamaica.

The flowers of S. Myrobálanus (the Myrobálanus of Dioscorides was an Egyptian or Arabian tree, which

- 6400 Common petiole compressed  
 6401 Common petiole round, Leaves shining acuminate  
 6402 Common petiole round with 6 pairs of leaflets which are serrated and ribbed
- 6403 Leaves orbicular spatulate powdery obtuse with a point, Fl. paniced, Stem erect branched  
 6404 Leaves ovate spatulate obtuse powdery with a point edged with red, Fl. paniced, Stem erect branched  
 6405 Leaves opp. rounded ovate, Flowers corymbose  
 6406 Leaves obl. spatulate obtuse smooth with a point, Fl. paniced, Stem erect branched  
 6407 Leaves semicylindrical scattered, Fl. paniced nodding, Tube curved  
 6408 Leaves ovate spatulate obtuse with a point powdery, Fl. paniced, Stem much branched divaricating  
 6409 Leaves wedge-shaped fascicled, Stem thickened, Branches fleshy conical  
 6410 Leaves obovate acute fleshy, Spike leafy terminal  
 6411 Leaves crossing rounded mucronate glaucous, Fl. paniced pendulous  
 6412 Leaves half orbicular scurfy dotted flat above, Fl. few small sessile  
 6413 Leaves spatulate obtuse naked with a point  
 6414 Leaves glaucous narrow tongue-shaped at the end obtuse mucronate, Fl. cymose, Stem leafy
- 6415 Leaves oval crenate, Stem spiked  
 6416 Leaves oblong nearly round, Flowers fascicled  
 6417 Leaves lanceolate acute fleshy, Spike cylindrical terminal leafless  
 6418 Leaves peltate crenate, Stem nearly simple, Fl. pendulous, Bractes entire
- 6419 Leaves peltate crenate, Stem nearly simple, Flowers erect, Bractes toothed
- 6420 Leaves whorled 4
- 6421 Leaves amplexicaul. cordate ovate obtuse unequally and deeply serrated  
 6422 Leaves amplexicaul. cordate oblong obtusely serrated whitish  
 6423 Leaves flattish serrated, Corymb leafy, Stem erect  
 6424 Leaves flat ovate acute at each end toothed, Flowers in corymbose fascicles  
 6425 Leaves wedge-shaped narrowed at the base subsessile, Stems decumbent, Fl. corymbose  
 6426 Leaves wedge-shaped rhomboid emarginate stalked, Stems branched, Pan. term. divaricating  
 6427 Leaves lanceolate serrated flat, Stem erect, Cyme sessile terminal  
 6428 Leaves roundish obovate flat crenated at end with a cartilaginous muricated edge  
 6429 Leaves flat opposite spatulate toothed  
 6430 Leaves wedge-shaped concave somewhat toothed aggregate, Branches creeping, Cyme terminal  
 6431 Leaves flat cordate toothed stalked, Corymbs terminal  
 6432 Leaves whorled obovate entire smooth, Cyme in three divisions  
 6433 Leaves flattish angular, Fl. lateral subsessile solitary  
 6434 Stems branched, Leaves entire: lower spatulate, Stigmas acute  
 6435 Leaves flat lanceolate, Stem branched, Flowers paniced, Petals acute awned  
 6436 Radical leaves obovate with a long mucronate point, Stem simple, Spike term. long
- 6437 Leaves opposite ovate obtuse fleshy, Stem weak, Fl. scattered  
 6438 Leaves subulate scattered separate at base: the lower recurved  
 6439 Leaves glaucous subulate scattered separate at base, Fl. cymose, Cal. lanceolate  
 6440 Lvs. rounded subulate acute: those of the barren branches glaucous spreading, Branches of cyme recurved  
 6441 Lvs. rounded subulate acute: those of the barren branches glaucous spreading, Branches of cyme compact  
 6442 Leaves subulate in 7 rows glaucous very close distinct at base  
 6443 Leaves subulate scattered separate at base, Fl. in cymes, Petals half as long as lanceolate calyx  
 6444 Leaves subulate scattered separate at base glaucous, Fl. in cymes, Petals twice as long as calyx  
 6445 Leaves subulate spreading in many rows close, Cal. short obtuse  
 6446 Leaves oblong alternate obtuse separate at base, Cyme bifid smooth  
 6447 Leaves flat spatulate ovate acute entire pubescent, Corymb hemispherical

and Miscellaneous Particulars.

bore a perfumed fleshy fruit. Jacquin applied the name to this South American plant, which is nearly similar in properties) come out before the leaves make their appearance, and are succeeded by yellow plums the size of a pigeon's egg, which are eaten by children, and considered excellent food for hogs. It grows by large cuttings as freely as the other. *S. gulcis* is a handsome tree; the pulp of the fruit is firmer than that of the others, and tastes like a Reinette apple. It is cultivated in the Society and Friendly islands, especially in Otaheite; the fruit is of a gold color, hangs in little nodding bunches, and is esteemed both tasteful and wholesome: its flavor resembles that of the pine-apple.

1060. *Cotyledon*. From *κωτύλον*, a vessel or cup. Many of the species of this genus have cup-shaped leaves. The species are succulents of little beauty, and of the easiest culture in light earth and lime rubbish, or in sand and loam.

1061. *Sedum*. From *σέδωρ*, to sit: these plants growing upon the bare rock, look as if sitting upon it. The species are low succulents, some of them pretty, others curious; but none of them remarkable in any way.

History, Use, Propagation, Culture,

They seem destined by nature to clothe rocks and dry arid places, after a certain portion of vegetable soil has been generated by lichens and mosses.

*Oxalis* is the French name of two or three species. *S. album* is said to have the same virtues as used to be attributed to the houseleek, *Sempervivum tectorum*: it is pickled by some in the manner of samphire. *S. acre* is considered antiscorbatic; its juice applied to the skin blisters it, taken inwardly it vomits, and applied externally to gangrenes promotes suppuration.

1062. *Penthorum*. From *πεντα*, five, in allusion to the five-marked angles of the capsules. Succulent North American plants of no beauty whatever.

1063. *Grietum*. A small uninteresting Cape plant, with yellow flowers and hoary leaves like southernwood. Derived from *γριος*, old, in allusion to its hoary aspect.

1064. *Biophytum*. *Βι φωνος*, plant of life, in allusion to the lively irritable nature of the foliage. This genus, the *Oxalis sensitiva* of Jacquin, has been lately divided by M. De Candolle from *Oxalis*, chiefly on

6448 Petals 8, Leaves scattered: the lower rounded; upper depressed

6449 Leaves scattered rounded obtuse, Stem simple, Fl. in umbels with 4 petals

6450 Leaves linear rounded depressed scattered, Cyme open, Petals 4

6451 Leaves oblong obtuse roundish sessile spreading, Cyme branched

6452 Leaves subovate adnate-sessile gibbous nearly erect alternate, Cyme trifid

6453 Leaves subovate adnate-sessile gibbous nearly erect imbricated six ways

6454 Leaves subovate adnate-sessile gibbous alternate, Cyme branched bifid

6455 Stem erect solitary annual, Leaves ovate sessile gibbous alternate, Cyme recurved

6456 Leaves oblong flatish above and peduncles axillary about 1-fl. pubescent, Petals ovate obtuse

6457 Leaves whorled linear, Stem procumbent paniced, Peduncles villous viscid

6458 Stem erect, Flowers corymbose fastigiate

6459 Leaves scattered oblong-cylindrical obtuse, Stems shrubby much branched, Cymes terminal

6460 The only species

6461 Peduncles simple 1-fl. Leaves tripartite multifid linear downy

6462 Peduncles many-fl. at end

§ 1. *Peduncles many-flowered, Stems suffruticose, Cells of ovary usually 1 seeded.*

6463 Stem erect leafy, Umbel 4-fl. the length of leaves, Leaflets entire ovate obtuse

§ 2. *Cauliscent, Leaves palmate 3-foliolate, Leaflets all sessile, obovate.*

6464 Pedunc. 2-3-fl. somewhat longer than leaf-st. Lvs. 2-lobed obov. ciliated, Styles a little longer than inner

6465 Stem hairy, Umb. 5-6-fl. longer than leaves, Lvs. obovate, Styles longer than both stamens [stamens

§ Stem decumbent, Peduncles 2 or 3-flowered

6466 Stem erect, Umbels 2-6-fl. about as long as leaves, Leaf. obov. Styles the length of inner stamens

6467 Stem rooting, Peduncles shorter than leafst. Leaf. obovate, Styles the length of inner stamens

6468 Smoothish, Pedunc. 2-fl. longer than leafst. Leaf. 2-lobed, Styles the length of inner stamens

6469 Stem rooting, Pedunc. 2-fl. the length of leafst. Leaflets obovate, Styles middling

6470 Stem erect, Pedunc. axill. four times as long as leaf at the end corymbose racemose, Leaf. obovate

6471 Stem naked at base, Pedunc. lateral umbell. at end, Leaf. cun. emarg. Styles shorter than outer stamens

§ 3. *Cauliscent, Leaves sessile, 3-leaved, villous, not glandular, Pedunc. axillary, 1-flowered.*

6472 Stem branch. Ped. much long. than lvs. Bractes next cal. Leaf. lin. emarg. Styles long, than inner stam.

6473 Ped. 4 times as long as lvs. Bractes appressed to cal. Leaf. lin. cun. obt. Styles shorter than outer stamens

6474 Stem declined, Branches 1-sided, Leaf. lin.-cuneiform, Peduncles scarcely longer than leaves

6475 Leaf. lin. cun. ret. Ped. much long. than lvs. Bractes remote from cal. Stam. with neither teeth nor glands

6476 Stem much branched, Leaf. lin. cuneate obt. Pedunc. much shorter than lvs. Bractes remote from cal.

6477 Leaf. lin. cuneate, Pedunc. much longer than leaves, Bractes remote from cal. Styles intermediate

6478 Leaf. obl. cuneiform, Pedunc. much longer than leaves, Bractes remote from cal. Styles intermediate

§ 4. *Cauliscent, sparingly leafy, Leaves stalked, 3-5-leaved, Pedunc. axill. 1-flowered.*

6479 Stem short, Leaves on long stalks, Leaf. 3 ovate-rounded, Styles very short

6480 Stem branched, Leaves stalked in fascicled whorls with 3 obovate leaflets, Styles very long

§ 5. *Stemless, Pedunc. 1-2 or many-flowered, Leaves radical, many-leaved, usually 3-leaved.*

6481 Leaf. 3 obovate silky, Umbel longer than leaves, Fl. nodding, Styles intermediate

6482 Leaf. 3 obovate smooth, Umb. 3-9. fl. Styles very short, Fl. nodding

6483 Leaf. 3 obovate 2-lobed smooth, Umb. 2-4-fl. Flowers erect, Styles very short

6484 Leaf. 3 obovate 2-lobed smooth subciliated, Umb. many-fl. Fl. drooping, Styles very short

6485 Petiole flatish, Leaf. 3 obovate pubescent, Umb. 2-fl. Sepals entire, Styles very long

6486 Leaf. 3 obovate smooth subciliate, Umb. 2-5-fl. Sepals 3-toothed at end, Styles very long

6487 Leaf. 3 obovate 2-parted beneath violet, Umbel 2-fl. Styles middling

6488 Smooth, Pedunc. 1-fl. longer than leaf, Leaflets obovate, Root tuberous

and Miscellaneous Particulars.

account of its irritable pinnated foliage, and its stamens being distinct, and five of them only being perfect. It is a very pretty annual, and if well managed so as to acquire, as in China, a stem six or nine inches high, is quite a remarkable object. Cultivated in common earth, and propagated by seeds, which it produces in abundance.

1065. *Oxalis*. The *Oxalis* of the ancients, which was named from *oxys*, sharp, or sour, was a very different plant from this, which is thought to have been the *Oxys* of Pliny. The name employed by Linnaeus has, however, been adopted by his followers, although Clusius, Ray, Plumier, Tournefort, Haller, and others, called the genus *Oxys*.

This is a tribe of pretty little plants, of which most of the species flower freely, but all of them are without their leaves half the year. The root is commonly bulbous; in some species only thick and fleshy; in a few branched: the bulbs consist of fleshy scales, sometimes closely imbricate, sometimes loose and diverging. In a few the subterranean stipe and the terminating fibre of the bulb produce little dog-toothed bulbs, in such

History, Use, Propagation, Culture,

abundance as to fill the whole pot to the very bottom, as in purpurea, cernua, reptatrix. Sometimes the bulb strikes very deep, as in tomentosa; the original bulb near the surface striking a radical fibre downright from its base, which puts out from its side a new bulb, producing the next year's plant, whilst the former perishes. Sometimes fusiform, thick and long fibres spring in a monstrous form from the bulbs, as in glandulosa, and some others. Some of the species have a proper stem (*Caulis*), when it bears all the leaves and peduncles alternately, and not in a terminating umbel: this is either branched or quite simple, and that for the most part inconstantly. Others have a stipe; the leaves and flowers being aggregate together at the end of the stalk; this bears none or very few leaves along it, seldom many. In some species the stipe is always subterranean, as in breviscapa, purpurea, &c.; in others it is always above ground, as in gracilis, versicolor, tenuifolia. Stipes are commonly quite simple; some, however, are branched, the branches terminating in umbels, as in incarnata and polyphylla. Hence the division of the species into caulescent and stipitate. The leaves are not, perhaps, truly sessile in any of the species; they are subsessile in a few, but in most are petioled. They are simple in three species, bipinate in four, digitate in six, in the rest ternate: almost all of them have an acid

§ 6. *Stemless, Leaves simple.*

- 6489 Leaves ellipt obtuse, Scape 1-f. Filam. smooth, Styles middling covered with glandular hairs  
 6490 Leaves obovate retuse, Scape 1-f. Styles very short, Filaments glandular

§ 7. *Stemless, Leaves 2 or 3-leaved, Stalks winged.*

- 6461 Leaf. 2 roundish obovate emarginate wavy at edge, Styles very long and filaments glandular  
 6462 Leaf. 2 ellipt. ovate with a cartilaginous toothletted edge, Filam. glandular  
 6463 Leaf. 2 lanceolate with a cartilaginous toothletted edge, Filam. glandular  
 6464 Leaf. 2-3 with a cartilaginous scabrous edge, Filam. smooth  
 6465 Leaf. 3 obovate emarg. mucronate, Styles and filaments glandular

§ 8. *Stemless, Leaves stalked, 3-leaved, Stalks not winged.*

- 6496 Pubescent, Lateral leaflets obliquely oblong: middle lanceolate, Scares higher than petioles  
 6497 Pubescent, Leaf. obl. obt.: middle cuneate at base, Scares length of petiole  
 6498 Pubescent, Leaf. obl. obt.: middle subcuneate, Scares longer than petiole  
 6499 Pubesc. Leaf. obl. obt. subemarg. Pedunc. longer than petiole with 2 bractes immediately below the cal.  
 6500 Pubescent, Leaf. obl. emarg. Pedunc. length of petiole with 2 bractes immediately below the cal.  
 6501 Pubescent, Leaf. obl. retuse: middle cuneate, Peduncles twice as long as leaves with 2 bractes in middle  
 6502 Subhirsute, Leaf. obov. obl. obt. Pedunc. equal to petiole with 2 bractes in their middle, Styles glandular  
 6503 Subhirsute, Leaf. obov. obl. obt. Ped. longer than petioles with 2 bractes below their middle, Styles hairy  
 6504 Pubesc. Leaf. obl. lateral ovate: midd. cuneate, Pedunc. twice as long as petiole with 2 bractes in midd.  
 6505 Pubesc. Leaf. roundish, Pedunc. as long as pet. with 2 bractes at base, Calyx with clavate hairs at edges  
 6506 Pub. Leaf. roundish, Ped. as long as pet. with 2 bractes below mid. Cal. with simple and glan. hairs mixed  
 6507 Pub. Leaf. round.: mid. cun. at base, Ped. as long as lvs. or long. with 2 bractes below mid. Styles very short

β Flowers large, Leaves red beneath

γ Flowers large, Leaves green on both sides

- 6508 Pubesc. Leaf. roundish, Scares longer than leaf with 2 bractes below the middle  
 6509 Smooth, Leaf. roundish dotted, Stipules dilated acuminate, Bractes alternate  
 6510 Pub. Leaf. obov. roundish, Scares nearly twice as short as pet. with 2 bractes in mid. Styles intermediate  
 6511 Pub. Leaf. obov. roundish, Scares thrice as short as petiole with 2 bractes in mid. Styles very long  
 6512 Densely pubesc. Leaf. obovate, Scape longer than leaves with 2 bractes above middle, Cal. obtuse  
 6513 Woolly, Leaf. obovate, Ca. acute  
 6514 Root toothed creeping, Leaf. obov. downy, Scape longer than leaves, Petals oval obtuse  
 6515 Root toothed creeping, Leaf. obov. downy, Scape longer than leaves, Pet. obl. unequally emarginate  
 6516 Smoothish, Leaflets obovate, Scape longer than the leaves, Styles very short  
 6517 Leaflets obovate smooth, Pedunc. the length of leaves, Styles very short  
 6518 Leaf. obov. 2-lobed, smooth, Pedunc. longer than leaf, Styles intermediate  
 6519 Leaf. obov. 2-lobed smooth, Pedunc. longer than leaf, Styles very long  
 6520 Leaf. cuneate emarg. hairy, Pedunc. the length of petiole, Styles very short, Filam. glandular  
 6521 Leaf. lin. emarg. downy, Pedunc. shorter than petiole with 2 bractes at summit, Styles very long  
 6522 Leaflets linear subcuneate emarginate, Pedunc. as long as petiole, Style intermediate

§ 9. *Leaves 3 or 5-leaved, glandular at end.*

- 6523 Leaflets 3 linear cuneiform emarginate ciliated with many glands beneath  
 6524 Leaflets 3 linear emarginate with 2 glands beneath, Styles and filaments glandular  
 6525 Leaflets 3 linear emarginate with 2 calli at end, Styles very short  
 6526 Leaflets 3 linear emarginate with many glands beneath, Styles very short, Inner filaments glandular  
 6527 Leaflets 3 linear emarginate with 2 glands beneath, Styles intermediate and filaments glandular  
 6528 Leaflets 3 linear entire at end and glandular, Styles very long and inner filaments glandular  
 6529 Leaflets 5 linear at the end nearly entire with 2 callous glands, Styles intermediate

§ 10. *Leaves palmate or peltate, many-leaved, not glandular at end.*

- 6530 Leaflets 7 lanceolate acutish smooth spotted at base, Petioles compressed, Styles very short  
 6531 Leaflets 6-7 smooth linear channelled acute, Styles very short, Filam. glandular  
 6532 Leaflets 7 smooth lin. lanc. obtuse, Cal. appressed, Styles very long and filaments glandular  
 6533 Leaflets 7-9 smooth lin. emarg. Cal. reflexed at end, Styles intermediate  
 6534 Leaflets 9-19 all over downy lanceolate cuneate emarginate

and Miscellaneous Particulars.

taste; whence their names of Oxalis or Oxys, wood Sorrel, &c. The partial stem bearing the flower is a peduncle in the caulescent, a scape in the stipitate species.

Many of the species ripen seeds, from which, or from offsets, they are readily propagated, and grown in light sandy soil: care being taken to give the pots little or no water when the plants are in a dormant state. An excellent work has been written on the genus by Jacquin, in which ninety-six species are described. All that were known in Europe at that time, were cultivated in the Imperial gardens of Schönbrunn with great success, under the immediate inspection of Jacquin, by whom the following directions are given for their management. They are best kept in pots which will hold a good many roots. The earth should be so light and sandy as never to become hard, but always to be soft enough not to resist the point of the finger when pressed upon it; when the flowering time is passed, the pots should be placed aside, where they require neither care nor water; but are well protected from mice. In the beginning of August they should be placed in the open air and moderately watered. About the end of that month, or a little later, the leaves should appear. About the middle of September, earlier or later, according to the weather, they should be placed in a very sunny, airy greenhouse,

History, Use, Propagation, Culture,

when they will flower well. Oxalis monophylla and rostrata will not, however, blossom unless placed in a very hot stove.

O. Acetosella, la petite oseille or surelle, Fr., is used as a salad plant, and is more delicate than the Rumex salads: its acid approaches nearly to that of the juice of lemons, or the acid of tartar, with which it also corresponds in its medical effects, being esteemed refrigerant, antiscorbatic, and diuretic. An infusion of the leaves, or a whey made by boiling the plant in milk, given in ardent fevers, is said to allay inordinate heat, and to quench thirst.

The expressed juice depurated, properly evaporated, and set in a cool place, affords a crystalline acid salt in considerable quantity, which may be used whenever vegetable acids are wanted. It is employed to take iron moulds and ink stains out of linen, and is sold under the name of essential salt of lemons. (Withering.) This salt when genuine, which it seldom is, consists of the vegetable alkali and a peculiar acid, which, according to Bergman, seems more allied to the acid of sugar than that of tartar. What is sold for it in this country, appears sometimes to consist of C. Tart., with the addition of a small quantity of vitriolic acid. For taking out spots in linen, the stained part is dipped in water, sprinkled with a little of the salt powdered, then rubbed on a pewter plate, after which the spot is washed out with warm water. (Curtis, from Neum. Chem. by Lewis.) Twenty pounds of leaves fresh yield six pounds of juice, from which two ounces, two drachms, and one scruple of salt have been obtained. (Lewis.)

1066. Agrostemma. Ayeu sylvana, crown of the field. The beauty of the flowers of the common cockle weed well entitles it to such a distinction. The foreign species are very pretty annuals. A. Githago (git or gith) was the name of certain black and aromatic grains, supposed to have been of Nigella sativa, which were employed by the Romans in cookery. The seeds of the plant Githago are externally similar) is an ornamental weed, and along with corn poppy and blue bottle makes a fine appearance in the fields of the slovenly husbandman, where the soil is dry and gravelly.

- 6535 Hairy, Stem dichotomous, Flowers on long stalks, Leaves linear  
 $\beta$  A slight variety, with longer divisions to the calyx  
 6536 Downy, Stem dichotomous, Peduncles long 1-f. Cal. campanulate ribbed
- 6537 Downy, Flowers in umbellate heads, Cal. cylindr. clavate ribbed  
 6538 Smooth, Stem dichotomous panicled erect, Flowers terminal solitary
- 6539 Smoothish, Flowers fascicled, Cal. cylindr. clavate ribbed, Petals 2-lobed
- 6540 Stems ascending smoothish, Fl. dichotomous fascicled, Cal. camp. 10-ribbed, Pet. torn with an appendage  
 6541 Smooth, Flowers terminal and axillary 1-3, Cal. rounded clavate ribbed, Petals torn  
 6542 Hairy, Fl. 2-3 fastigate, Cal. rounded clavate woolly, Petals 4-cleft  
 6543 Stem viscid about the joints, Limb of petals nearly entire, Leaves linear spatulate
- 6544 Smooth, Stems tufted upright, Fl. in dense capitate umbels, Cal. camp. Petals bifid  
 6545 Fl. solitary, Cal. with ten keels, Petals bifid, linear-lanc. subciliated  
 6546 Fl. dichotomous panicled diceious, Petals  $\frac{3}{4}$ -bifid, Lobes narrow diverg. Caps. round
- 6547 Fl. dichotomous panicled diceious, Petals  $\frac{3}{4}$ -bifid, Lobes broad avoroximating, Caps. conical
- 6548 Smooth glaucous, Stem erect branched or simple, Leaves lanceolate connate obtuse  
 6549 Hairy pale green viscid, Leaves ovate, Petals length of calyx, Fl. longer than fl.-stalk  
 6550 Hairy viscid diffuse, Leaves lanceolate oblong  
 6551 Stem much branched villous, Leaves ovate-lanc. hispid, Flowers numerous in dichotomous panicles  
 6552 Leaves ovate, Flowers panicled, Cal. villous longer than petals, Caps. scarcely longer than sepals  
 6553 Hairy viscid, Flowers pentandrous, Petals emarginate  
 6554 Hairy subviscid, Flower 4-fid 4-androus, Pet. bifid shorter than calyx  
 6555 Leaves linear lanceolate obtuse ciliated at base, Pet. twice as long as calyx  
 6556 Glutinous hairy, Fl. solitary in the dichotomies, Sepals lanc. acute the length of petals, Leaves lanc.  
 6557 Leaves ellipt. naked or hairy, Pan. dichotomous few-fl. with bractes, Caps. oblong recurved  
 6558 Stems prostrate, Leaves ovate acute subciliated smooth, Flowers terminal subcorymbose  
 6559 Leaves sublinear acuminate smooth, Peduncles glandular, Pet. twice as large as calyx  
 $\beta$  Leaves very narrow and smooth  
 6560 Downy, Leaves lanc.-lin. acute, Flowers very large in dichotomous umbels, Pet. crenate and 2-lobed  
 6561 Leaves cordate ovate, Stem clasping, Peduncles in fruit very long deflexed
- 6562 Hairy viscid, Leaves lanceolate, Fl. diceious, Petals thrice as long as calyx  
 6563 Leaves elliptical scabrous, Pedunc. terminal simple subsolitary, Caps. ovate  
 6564 Leaves oblong spatulate hoary, Sepals hoary scarious at edge, Caps. cylindr. longer than calyx  
 6565 Very smooth, Leaves lanc. linear, Pedunc. very long, Caps. acute shorter than corolla

6566 This is the *Cerastium aquaticum* of English botany

and Miscellaneous Particulars.

*A. coronaria* and *flos-jovis* are shewy border flowers, the first generally increased by seeds, and the other by cuttings or division of the plant.

1067. *Lychnis*. From *Lycyris*, a lamp, in allusion to the cottony leaves of some species, which have been used as wicks to lamps. *L. chalcedonica*, *Croix de Malthe*, Fr. and Portug. *Croce de Covatiere*, Ital., and *C. de Jerusalem*, Span., is an old and much esteemed border flower, the double varieties of which require some care in cultivation, to prevent their returning to the single state, and to propagate them by cuttings. *L. fulgens* and *coronata* are also very handsome species. "They do best in a light rich loamy soil, but they must be often taken up and divided, or they dwindle away; the best time of doing this is early in spring. *L. coronata* thrives and flowers abundantly if planted out in the open ground in spring; but it requires to be taken up in autumn and potted, or the severe frosts in winter will kill it, or injure it very much. All may be raised by cuttings planted under hand-glasses, or by seeds, which often ripen in abundance. (*Bot. Cult.* 389.)

*L. viscaria* and *fiosoculi* are more hardy, and grow in common garden soil, and increase abundantly by division: they are both old inhabitants of the flower garden. *L. diurna* and *vespertina* are also border flowers in their double varieties.

1068. *Cerastium*. Derived from *κερας*, a horn, in allusion to the cornute form of the capsule of many species. Most of the annual species, and some of the others, are weeds; a few may be grown in pots or on rock-work, for both of which they seem well adapted. They are very prolific in seeds, and contribute materially to the support of small birds.

1069. *Larbrca*. A genus founded by Aug. St. Hilaire, in the second volume of *Mémoires du Muséum*, upon the *Cerastium aquaticum* of Linnæus. He named it after the Abbé de Larbre, who at the age of 80, published a *Flora of Auvergne*.

History, Use, Propagation, Culture.

1070. *Spergula*. From *spargere*, to scatter, because it scatters its seeds abroad, to the great profit of the farmer in Holland, who obtains from it meadows affording the most delicious butter. *S. arvensis* is a common weed in sandy soils, in Scotland called yarr, and in Norfolk pickpurse. In the Netherlands and in Germany it is sown on corn stubbles, to supply a bite for sheep during winter. It may be sown and reaped in eight weeks, either in autumn or spring. It is said to enrich the milk of cows, so as to make it afford excellent butter; and the mutton fed on it is preferable to that fed on turnips. Hens eat spurry greedily, and it is supposed to make them lay a great number of eggs, whether in hay, or cut green, or pasture. Von Thæer observes, it is the most nourishing, in proportion of its bulk, of all forage, and gives the best flavored milk and butter. It has been recommended to be cultivated in England; but it is not likely that such a plant can ever pay the expense of seed and labour in this country, even on the poorest soil; or at all events, as Professor Martyn observes, we have many better plants for such soils.

1071. *Phytolacca*. From *peru*, a plant, and *lacca*, lac; that is to say, a plant whose fruit gives out a fine red color like lac. The English-American name Poke, applied to one species, is a corruption of Pocan, the name by which it was formerly known in Virginia.

*P. decandra* has large ramose roots, shoots half an inch in diameter, and five or six feet high; the leaves five inches long, and two and a half inches broad, smooth and of a deep green. It grows vigorously in a good deep soil, and furnishes ample supplies of young shoots, which in America and the West Indies are boiled and eaten as spinach. (*Correa de Serra, in Hort. Trans. iv. 446.*)

- 6567 Leaves whorled, Pedunc. in fruit reflexed, Seeds reniform angular rough  
 6568 Leaves whorled, Flowers pentandrous, Seeds depressed winged smooth  
 6569 Leaves opposite subulate smooth : upper fascicled, Cal. not nerved  
 6570 Leaves opposite subulate blunt naked, Pedunc. solitary very long smooth  
 6571 Leaves opposite subulate awned ciliated, Pedunc. very long solitary hairy

## DECAGYNIA.

- 6572 Flowers octandrous octogynous  
 6573 Flowers decandrous pentagynous  
 6574 Flowers dodecandrous octogynous, Leaves ovate obl. with a recurved point  
 6575 Flowers decandrous decagynous  
 6576 Flowers icosandrous decagynous  
 6577 Flowers diceious

*and Miscellaneous Particulars.*

An ounce of the dried root, infused in a pint of wine, and given to the quantity of two spoonfuls, operates kindly as an emetic, and is preferable to most others, as it hardly alters the taste of the wine. In its medicinal properties, the *Phytolacca* approaches nearer to *Ipecacuanha* than to any other vegetable; but it is slower in its effects, and it remains longer in action, although it may be checked by an opiate. Sometimes its operation produces vertigo and stupor. The powder of the leaves possesses the same virtues as the root, but in a weaker degree. It is one of the plants which have had a temporary reputation for the cure of cancer, and some sensible men have been converts to its efficacy. The fermented berries give out a liquor which yields alcohol by distillation. From half a bushel of the berries, six pints of spirits were obtained, sufficiently strong to take fire and burn with readiness. Two ounces of this given to a dog occasioned nausea and drowsiness, with slight spasmodic motions, but no vomiting. Poultry are fond of the berries, but if eaten in large quantities, they give the flesh a disagreeable flavor. The juice stains paper and linen of a beautiful purple color, but it will not last long; if a method could be found of fixing the dye, it might be very useful. The vignerons in Portugal for many years used the juice of the berries of the elder-bush to give a deep color to the Port wines, to which it was thought to communicate a disagreeable taste when mixed in too great a quantity. Complaint of this practice having been made to government, orders were given that the stems of that plant should be cut down and destroyed before they produced berries: but they forgot to include the *Phytolacca* in the proscription, so that the berries of that plant supply the same purpose in a much worse manner.

CLASS XI. — DODECANDRIA. 12 STAMENS.

This is a small incongruous class, containing no extensive genus of importance except Euphorbia. Some botanists have been of opinion that it ought to be cancelled, but it is probable that Linnæus understood the application of his own principles as well as some of his more pretending followers, and it is certain that if the Linnean plan can be made to act successfully, its artificial arrangement must be rigorously observed. Euphorbia and Reseda, which are usually referred hither, should more properly be referred, the former to Monœcia, and the latter to Polygamia.

Order 1. MONOGYNIA.  12 Stamens. 1 Style.

- 1072. *Asarum*. Cal. 3-4-cleft, superior. Cor. O. Capsule coriaceous, crowned.
- 1073. *Bocconia*. Cal. 2-leaved. Cor. O. Style bifid. Caps. 2-valved, 1-seeded.
- 1074. *Bassia*. Sepals 4. Cor. 8-cleft, with an inflated tube. Stamens 16. Drupe 5-seeded.
- 1075. *Blakea*. Sepals 6, inferior, with a superior entire calyx. Petals 6. Caps. 6-celled, many seeded.
- 1076. *Bejaria*. Cal. 7-cleft. Petals 7. Stamens 14. Berry 7-celled, many-seeded.
- 1077. *Agathophyllum*. Petals 6. Calyx truncate. Drupe 1-seeded.
- 1078. *Rhizophora*. Cal. 4-parted. Cor. 4-parted. Stigmas 2. Seed 1 very long, fleshy at base.
- 1079. *Garcinia*. Sepals 4, inferior. Petals 4. Berry 8-seeded, crowned by the peltate stigma.
- 1080. *Grangeria*. Cal. 5-cleft. Petals 5. Stamens 15. Drupe 3-cornered. Nut 3-cornered, bony, 1-seeded.
- 1081. *Halesia*. Cal. 4-toothed, superior. Cor. 4-cleft. Nut quadrangular, 2-seeded.
- 1082. *Decumaria*. Sepals 8-12, superior. Petals 8-12. Caps. 8-celled, many-seeded.
- 1083. *Eurya*. Cal. 5-leaved, with 2 bracts at base. Petals 5. Caps. 5-celled, many-seeded.
- 1084. *Aristotelia*. Sepals 5. Petals 5. Style trifid. Berry 3-celled. Seeds twin.
- 1085. *Canella*. Cal. 3-lobed. Petals 5. Anthers 16, united to an urceolate nectary. Berry 1-celled, 2-4-seeded.
- 1086. *Cratæva*. Petals 4. Cal. 4-cleft. Berry 1-celled, many-seeded.
- 1087. *Triumfetta*. Petals 5. Sepals 5. Capsule hispid, opening in four.
- 1088. *Peganum*. Petals 5. Sepals 5, or O. Capsules 5-celled, 3-valved, many-seeded.
- 1089. *Hudsonia*. Petals 5. Sepals 3, tubular. Stamens 15. Capsules 1-celled, 3-valved, 3-seeded.
- 1090. *Nitraria*. Petals 5, vaulted at end. Cal. 5-cleft. Stamens 15. Drupe 1-seeded.
- 1091. *Portulaca*. Petals 5. Cal. 2-fid. Capsule 1-celled, cut across.
- 1092. *Tainum*. Petals 5. Sepals 2. Capsule 3-6-valved, many-seeded. Leaves without stipules. Seeds not winged.
- 1093. *Anacampteros*. Like *Tainum*, but having stipules and winged seeds.
- 1094. *Lythrum*. Cal. 12-toothed, tubular, unequal at base. Petals 6, inserted in calyx. Caps. 2-celled, many-seeded.
- 1095. *Nesaea*. Like *Lythrum*, but calyx campanulate.
- 1096. *Heimia*. Cal. 12-toothed. Petals 6. Capsule 4-celled.

History, Use, Propagation, Culture,

1072. *Asarum*. An ancient name, said to have been formed from *α*, privative, and *ερα*, bandage, because it was not used in garlands of which the ancients were so fond; in that case it should be *Asarum*. The common name, *Asarabacca*, is Latin, *qs* = the berry of *Asarum*? Little inconspicuous herbaceous plants. The leaves of *A. europæum* are emetic, cathartic, and diuretic; and, perhaps, as Dr. Cullen has remarked, they form the most useful species of emetic stimulants. A proper dose snuffed up the nose for a few successive evenings at

1097. *Cuphea*. Cal. 6-12-toothed, occasionally gibbous at base. Pet. 6, inserted in calyx, or O. Caps. 1-celled, opening on one side longitudinally along with the calyx.  
 1098. *Kleinohia*. Sepals 5. Petals 5. Nect. campanulate, 5-toothed, stamiferous, united to the column of ovary. Ovary stalked. Caps. with 5-angles and 5-cells inflated, cells 1-seeded.

Order 2. DIGYNIA  12 Stamens. 2 Styles.

1099. *Callicoma*. Flowers in round heads. Calyx 4-5-leaved. Corolla O.  
 1100. *Heliocarpus*. Sepals 4. Petals 4. Styles simple. Caps. 2-celled, compressed, radiating on each side longitudinally.  
 1101. *Agrimonia*. Cal. 5-toothed, surrounded by another. Petals 5. Grains 2, in the bottom of the calyx.

Order 3. TRIGYNIA.  12 Stamens. 3 Styles.

1102. *Reseda*. Involucre many-leaved spreading. Hermaphrodite flower central, apetalous, surrounded by several fringed petaloid barren flowers.  
 1103. *Euphorbia*. Involucre 1-leaved, ventricose, regular. Flowers naked, aggregate. Female floret surrounded by many monandrous male florets.  
 1104. *Pedilanthus*. Like Euphorbia, but involucre calceiform.  
 1105. *Visnea*. Cal. 5-leaved, inferior. Petals 5. Stigmas 3. Nut 2-3-celled, half inferior.

Order 4. TETRAGYNIA.  12 Stamens. 4 Styles.

1106. *Caligonum*. Cal. 5-parted. Corolla O. Filaments about 16, united at base. Ovary superior, 4-cornered. Styles 4. Nut with a many winged crust, 1-celled.

Order 5. PENTAGYNIA.  12 Stamens. 5 Styles.

1107. *Glinus*. Sepals 5. Cor. O. Nectary with bifid bristles. Caps. 5-angular, 5-celled, 5-valved, many-seeded.  
 1108. *Blackwellia*. Cal.  $\frac{1}{2}$ -superior, persistent, at the base turbinate, many-parted; with villous ciliated segments. Petals 15. Capsule 1-celled, many-seeded.  
 1109. *Gastonia*. Cal. entire. Petals 5-6. Stam. 10-12: two opposite each petal. Styles 10-12, very small, united at base. Capsules 10-12-celled.

Order 6. DODECAGYNIA.  12 Stamens. 12 Styles.

1110. *Sempervivum*. Cal. 12-parted. Petals 12. Caps. 12, many-seeded.

MONOGYNIA.

6578 Leaves subhastate cordate, Calyx tubular shortly trifid  
 6579 Leaves reniform obtuse twin  
 6580 Leaves reniform mucronate  
 6581 Leaves cordate obtuse smooth stalked

6582 Leaves oblong sinuated  
 6583 Leaves cordate somewhat lobed

History, Use, Propagation, Culture,

lished by Morrison at Oxford, 1764, quarto, and other works. *B. frutescens* is very ornamental in its foliage. The Indian kings, Hernandez tells us, planted it in their gardens, which must have been for its beauty, as it is neither culinary nor medicinal, though the juice is acrid, and used in the West Indies to take off warts.

1074. *Bassia*. So named by Koenig, in honor of Ferdinando Bassi, curator of the botanic garden at Bologna. Tall trees, natives of the hottest parts of the East Indies, with tufted alternate leaves growing only at the end of the shoots. Ripened cuttings root freely in sand.

1075. *Blakea*. So named by Dr. Patrick Browne, after Mr. Martin Blake of Antigua, a great promoter of useful knowledge, and a patron of the doctor's Natural History of Jamaica. This is one of the most beautiful plants of the West Indies. It supports itself for a time by the help of some neighboring shrub or tree, but it grows gradually more robust, and at length acquires a pretty moderate stem, which divides into a thousand weakly declining branches, well supplied with beautiful rosy blossoms on all sides. It cannot display itself to so great advantage in our stoves; but it flowers freely, and thrives well in loam and peat, well supplied with water. Ripe cuttings root in sand in moist heat and covered.

1076. *Bejaria*. So named by Mutis, in honor of Bejar, a Spanish botanist. The original species are natives of New Grenada. That in gardens, which is a native of the southern states of North America, is a beautiful shrub from three to four feet high, with pink flowers of an agreeable scent. It is found upon the banks of swamps and ponds, and requires the protection of a frame or greenhouse.

1077. *Agathophyllum*. From *αγαθος*, good, and *φυλλον*, a leaf. The leaf has a pleasant smell like cloves. In Madagascar, where it is called *Ravenisara*, it forms a large tree with a rufous aromatic bark, and a heavy insipid wood. The leaves are alternate and coriaceous. The dried fruit is very aromatic.

1078. *Rhizophora*. From *ρίζα*, a root, and *φάρα*, to bear, in allusion to the numerous roots which are emitted by the seeds, which vegetate among the branches of the tree while yet adhering to their footstalk. This is the common Mangrove, which covers immense tracts of coast within the tropics, rooting and vegetating even as far as low water mark.

1079. *Garcinia*. So named in honor of Laurent Garcin, M. D., F. R. S., who travelled into the East Indies. *Mangostans* is the Malayan name. This tree bears a fruit, which in the East Indies ranks with that of the pine-apple. It rises with a taper stem, sending out many branches, not unlike a fir-tree, with oval leaves, seven or eight inches long. The flower is like that of a single rose; the fruit round, the size of a middling orange; the shell is like that of the pomegranate, the inside of a rose color, divided by thin partitions, as in oranges, in which the seeds are lodged, surrounded by a soft juicy pulp, of a delicious flavor, partaking of the strawberry and the grape, and is esteemed one of the richest fruits in the world. It is a native of the Molucca islands, whence it has been transplanted to Java and Malacca. The head of the tree is in the form of a parabola, so fine and regular, and the leaves so beautiful, that it is looked upon in Batavia as the tree most proper for adorning a garden, and affording an agreeable shade. It was introduced to England in 1789. According to Dr. Garcin, (*Phil. Trans.*) "it is esteemed the most delicious of the East Indian fruits, and a

- 6584 Leaves lanceolate, Peduncles 1-flowered very long horizontal axillary  
 6585 Leaves elliptical acute, Peduncles 1-flowered nodding terminal
- 6586 Calyxes two, Leaves with three nerves finely striated across beneath
- 6587 Leaves ovate-lanceolate smooth, Flowers terminal in paniced racemes
- 6588 Leaves stalked alternate obovate obtuse coriaceous entire smooth
- 6589 Leaves acute, Fruit subulate-clavate
- 6590 Leaves ovate, Peduncles 1-flowered
- 6591 Leaves alternate stalked ovate entire smooth veiny
- 6592 Leaves ovate acuminate, Veins hairy beneath, Wings of the fruit equal  
 6593 Lvs. obl. ovate obtusely pointed green on both sides very soft beneath, Wings of fruit alternately larger
- 6594 Leaves all ovate, Stem climbing  
 6595 Lower leaves rounded : upper ovate-lanceolate, Stem sarmentose
- 6596 Branches at end pubescent, Leaves cuneate oval, Flowers axillary
- 6597 Leaves opposite evergreen ovate shining serrated
- 6598 Leaves oblong obtuse shining, Racemes terminal

and Miscellaneous Particulars.

great deal of it may be eaten without any inconvenience; it is the only fruit which sick people are allowed to eat without scruple. It is given with safety in almost every disorder; and we are told that Dr. Solander, in the last stage of a putrid fever in Batavia, found himself insensibly recovering by sucking this delicious and refreshing fruit. The pulp has a most happy mixture of the tart and sweet, and is no less salutary than pleasant. It is propagated by ripe cuttings in sand in moist heat. But the plant rarely survives long after its importation.

1080. *Grangeria*. Named after N. Granger, a traveller in Egypt, Persia, &c. who died at Bassora in 1733. His voyage into Egypt was published in 1745. This is a tree the size of an oak, with alternate ovate entire leaves. The flowers are small, in small terminal and axillary racemes.

1081. *Halesia*. So named by Ellis, in honor of the learned and venerable Stephen Hales, D. D., F. R. S., author of *Vegetable Staticks*, 1727. The species are very ornamental shrubs, valuable for blossoming early in the season. The flowers hang in small bunches all along the branches, each bud producing from four to eight or nine; they appear before the leaves, are of a pure snowy whiteness, and last for two or three weeks; they are succeeded by pretty large winged juiceless drupes, hanging likewise in bunches. The leaves of *H. diptera* are six times the size of those of *H. tetraptera*, and the fruit has two large wings and two minute ones. They are propagated by cuttings of the roots.

1082. *Decumaria*. Derived from *decem*, ten, all the parts of fructification answering to the number 10. It is commonly propagated by layers, but will grow by cuttings in sand under a hand-glass.

1083. *Eurya*. A name of Thunberg's, supposed to have been formed from *europs*, broad; its application no one has been able to discover. The *Eurya chinensis* is a little evergreen bush, bearing many whitish flowers on the under side of the branches and hidden by the leaves. It is easily propagated by cuttings.

1084. *Aristotelia*. After the celebrated ancient philosopher and naturalist Aristotle. Macqui is the name of this shrub in Chili. It grows freely in a sheltered situation; but its flowers are of little beauty. They are succeeded by small berries of a purple or black color, slightly acid and eatable: the inhabitants of Chili make a wine from them, which they give in fevers, and for curing the plague. It is increased by layers or ripened cuttings.

1085. *Canella*. A name given by Murray, on account of the resemblance between its wood and the aromatic flavor of *Canella*, Cinnamon. This tree rises very straight, from ten to fifty feet in height. The branches are erect, not spreading, and only at the top of the tree; furnished with petiolated leaves of a dark green color, thick, and shining like those of the laurel, and emitting a similar odor. The flowers, which exhale a powerful aromatic perfume, are small, seldom open, and in bunches. The inner bark of the branches is freed from the cuticle, and dried in the shade. This bark is stimulant, and slightly tonic. It is a useful adjunct to bitters in some cases of dyspepsia and atonic gout; but it is employed chiefly on account of its flavor, and to correct the griping quality of the resinous cathartics. It is said to prove useful in scurvy (*London Dispensatory*, 207.)

History, Use, Propagation, Culture.

1086. *Cratæva*. In honor of Cratævus, a Greek botanist and contemporary of Hippocrates. *C. Tapia*, an American name, produces a fruit about the size of an orange, with a mealy pulp and a strong smell of garlic, which is communicated to the animals that feed on it. All the species prefer a rich loamy soil, and may be increased by cuttings in sand under a hand-glass.

1087. *Triumfetta*. So named by Plumier, in memory of Giov. Battista Triumfetti, prefect of the botanic garden at Rome, author of *Hortus Romanus*, 1681, and other works. *T. semitriloba* has a tough strong bark which serves for ropes and other conveniences of that kind in the inland parts of the West Indies. The whole plant is mucilaginous and emollient. Cuttings root in sand under a hand-glass. All the species are uninteresting weed-like shrubs of tropical countries.

1088. *Peganum*. *Πυγανος* was the Greek name of the rue, which the modern plant resembles. *Harmala* is the Arabic name (*harmel*) of the species so called. The species are of easy culture and propagation in any light soil.

1089. *Hudsonia*. So named by Linnaeus, in honor of William Hudson, apothecary of London, F. R. S., and author of *Flora Anglica*, 1762 and 1778, octavo. It is a heath-like plant which grows in peat soil, and young cuttings are rooted in sand under a bell-glass. It is extremely rare in gardens.

1090. *Nitvaria*. So named by Schreber, who first found it in Siberia near the nitre works, with other saline vegetables. This is a curious thorny shrub, peculiar to the salt deserts of Siberia. Pallas informs us, that the berries, though saltish and insipid, are eaten in the Caspian desert, but in that arid soil they are almost the only luxury. Camels feed on the twigs. Linnaeus had the shrub twenty years before it flowered in Sweden;

6599 Unarmed, Leaves entire, Flowers gynandrous  
 6600 Leaflets ovate acuminate, Petals ovate roundish obtuse with globose ovaries  
 6601 Stem twining, Cor. regular, Petals very long wavy, Peduncles capitate-racemose

6602 Leaves emarginate at base, Flowers without calyx  
 6603 Leaves entire at base undivided  
 6604 Leaves half three lobed, Flowers complete  
 6605 Leaves subcordate ovate entire serrated rather hairy: the floral ones lanceolate, Branches hairy  
 6606 Leaves ovate undivided rarely lobed  
 6607 Leaves rhomboid: the upper lanceolate ovate, Flowers complete  
 6608 Leaves ovate cordate entire unequally serrated acuminate downy glandular at base, Fl. complete  
 6609 Leaves ovate cordate 7-nerved acuminate serrate hairy, Flowers clustered  
 6610 Leaves oblong serrate 5-nerved softly hairy, Fl. terminal clustered

6611 Leaves multifid, Stem herbaceous  
 6612 Leaves oblong acute, Stem herbaceous

6613 Leaves subulate aceroso hairy, Calyx erect pubescent

6614 Leaves entire obtuse

6615 Leaves wedge-shaped fleshy, Fl. sessile, Stem and branches nearly erect  
 6616 Leaves wedge-shaped fleshy, Fl. sessile, Branches prostrate  
 6617 Much branched prostrate, Leaves wedge-shaped minute fleshy, Fl. on long stalks and sessile  
 6618 Leaves subulate alternate hairy at the axilla, Flowers sessile terminal  
 6619 Bractes 4, Flowers 4-fid, Joints of the stem hairy  
 6620 Leaves elliptical fleshy flat, Joints hairy, Flowers sessile terminal  
 6621 Leaves subulate, Cal. hairy, Involucre many-leaved, Flowers about 3, Petals retuse  
 6622 Axils hairy, Leaves obversely oblong, Involucre 8-leaved

6623 Leaves cylindrical fleshy, Corymbs terminal stalked  
 6624 Leaves linear oblong ciliated, Flowers solitary  
 6625 Leaves flat chann. wedge-shaped emarg. mucronate, Raceme simple with a 3-cornered peduncle  
 6626 Leaves flat obovate mucronate, Corymb long, Peduncle 3-cornered  
 6627 Leaves ovate flat, Panicle terminal, Peduncle dichotomous  
 6628 Leaves lanc. ovate sessile opposite, Panicle branched

6629 Leaves ovate difform smooth green, Peduncles round long panicled

6630 Leaves ovate acuminate difform green shining cobwebbed, Raceme simple, Peduncles round long  
 6631 Leaves ovate acuminate difform shining cobwebbed dark-red, Rac. simple, Pedunc. very long  
 6632 Leaves imbricated expanded dark-green cobwebbed rugose above, Threads axillary longer than leaves  
 6633 Leaves lanceolate fleshy convex beneath, Scape leafy short 1-flowered

and Miscellaneous Particulars.

and during ten years having in vain tried to make it flower in the garden at Upsal, he at length succeeded by watering the plant with salt water; it flowered, however, at Gottingen without this assistance. Murray expresses a surprise that it has not been used in its native soil for making soda: but perhaps it does not grow in sufficient quantity, or there may be an ample harvest in that salt region of plants that answer the same purpose.

In this country it thrives in sandy loam with a little salt put round it, and is increased by layers, or cuttings in sand under a hand-glass.

1091. *Portulaca*. An ancient name of unknown origin. The species are succulents of the easiest culture. *P. sativa* and *oleracea* were formerly cultivated as potherbs, salads, for garnishings and pickling, though now little used for any of these purposes.

1092. *Talinum*. One of those names invented by Adanson, which probably were the mere creations of that botanist's erratic brain. This is a succulent genus allied in habits to *Portulaca*, and of the easiest culture.

1398. *Anacampteros*. *Ανακαμπερος* was the name of a plant, to which the ancients attributed the quality of restoring the passion of love, for which purpose it was used in philtres and incantations: from *ανακαμπερος*, to return, and *εως*, love. The species are succulents, and grow freely in a sandy loam mixed with a little lime rubbish, and require but little water. Cuttings root readily, but should be laid to dry a few days before being planted. Leaves taken off close to the plants, and laid to dry a few days, and then planted, will root, and shoot out young plants at their base.

History, Use, Propagation, Culture,

1094. *Lythrum*. From *λυθρον*, black blood, in allusion to the color of the flowers. *L. Salicaria* (willow-like, from *Salix*) although a common British plant, is considered a handsome border flower, and several varieties, differing chiefly in size, are in cultivation. The whole plant is astringent, and has been used in medicine and tanning.

1095. *Nesæa*. Plants formerly referred to *Lythrum*, from which they seem to be satisfactorily distinguished.

1096. *Heimia*. Named by Link, in honor of Dr. Heim, a celebrated Berlin physician. A beautiful stove shrub with fine spikes of yellow flowers.

1097. *Cuphea*. From *κυφος*, curved, in reference to the form of its capsule. Pretty herbaceous or shrubby plants, resembling *Lythrum* in aspect. *C. Melvilla* is a very handsome stove shrub resembling *Bouvardia coccinea*.

1098. *Kleinhofta*. So named by Linnæus, after Kleinhoff, formerly director of the botanic garden in Java. The leaves when bruised smell like violets; the flowers appear the greater part of the year, and the tree is seldom without fruit in all its different stages. Cuttings root in sand under a hand-glass.

1099. *Callicoma*. From *καλος*, beautiful, and *κομη*, hair, in allusion to the tufted yellow heads of flowers, for which the plant is remarkable. Ripened cuttings root in sand under a hand-glass.

1100. *Heliocharpus*. From *ήλιος*, the sun, and *καρπος*, fruit. The valves of its round and elegantly ciliated capsule resemble a little sun surrounded by its rays. Cuttings root in sand under a hand-glass; and Miller found the seeds to vegetate after being kept ten years.

1101. *Agrimonia*. A corruption of the word *Argemone*, by which name the ancients distinguished a plant reputed useful in cataract of the eye, which in Greek was termed *argema*. *A. Eupatoria* was formerly regarded as a remedy of much importance as a tonic and deobstruent; but though still retained in the London *Materia Medica*, is seldom or never prescribed. The root in spring is sweet scented, and the flowers fresh

- 6634 Leaves opp. cordate lanceolate, Flowers spiked 12-androus  
 6635 Leaves opp. lanc. Panicle virgate, Flowers 12-androus 3 together  
 6636 Leaves opp. ovate obl. acute cordate at base closely sessile, Branches 4-winged, Fl. axil. sol. 6-androus  
 6637 Leaves opposite linear, Flowers opp. hexandrous  
 6638 Leaves alternate linear, Flowers hexandrous

6639 Smooth, Leaves opp. subsessile lanceolate entire, Pedunc. axill. opposite, Head 3-flowered

6640 Leaves opp. somewhat downy stalked, Flowers whorled linear

6641 Leaves linear-lanceolate acute, Flowers axillary

6642 Fl. axill. solitary, Leaves ovate-lanceolate scabrous above, Stem erect hispid, Style hairy

6643 Branches decumbent viscous, Leaves ovate lanceolate hispid on short stalks

6644 Fl. axill. sol. Lvs. lanc. hairy, Stem erect hairy, Style smooth, The ♀ long filam. having a tuft of wool longer [than anthers]

6645 Raceme term. Leaves ellipt. and branches pubesc. Stem shrubby, Fl. decandrous

6646 Raceme term. Pedicels scattered, Bractes linear, Leaves ovate stalked pubescent

6647 Leaves small lanceolate, Flowers small solitary terminal, Bush compact

6648 Leaves lanceolate scabrous narrowed at each end, Racemes term. Cal. long bowed, Petals O

6649 A smooth tree, with broad cordate acuminate entire leaves

### DIGYNIA.

6650 The only species

6651 The only species

6652 Fruit hispid, Cauline leaves pinn.-with obl. ovate leaflets, Spikes elevated, Pet. twice as long as calyx

6653 Fruit hispid, Leaves pinnate with obl. leaflets the lower veiny short, Pet. twice as long as calyx

6654 Fruit hispid, Cauline leaves pinnate with obl. leaflets, Spikes subsessile, Petals 3 times as long as calyx

6655 Fruit hispid, Cauline leaves pinnate with many lanceol. leaflets, Petals half as long again as calyx

6656 Spikes virgate, Fruit reflexed turbinate furrowed crowned with hairs

6657 Fruit smooth, Cauline leaves ternate, Stamens usually 8

### TRIGYNIA.

6658 Leaves lanc. entire with a tooth on each side at base, Cal. 4-fid

6659 Leaves lanceolate wavy entire with two glands at base

and Miscellaneous Particulars.

gathered smell like apricots. When the plant is coming into flower it will dye wool a full nankeen color, and gathered in September a darker yellow. It has been used for dressing leather. Sheep and goats eat it, but kine, horses, and swine refuse it.

1102. *Reseda*. From *resedo*, to calm, to appease. The Latins thought it useful as a topical application in external bruises. *R. Luteola*, a diminutive of *lutea*, yellow, is used by dyers, especially in France. (Chaptal's *Chimie appliqué à l'Agriculture*, &c.) It affords a most beautiful yellow dye for cotton, woollen, mohair, silk and linen. Blue cloths are dipped in a decoction of it, in order to become green. The yellow color of the paint called Dutch Pink, is obtained from this plant. The entire plant, when it is about flowering, is pulled up and employed both fresh and dried. Mr. Swayne observes, that it is one of the first plants which grow on the rubbish thrown out of coal pits. It flowers in June and July. The root and bottom leaves are formed from the fallen seeds before winter; and thus it happens in this, as in many other cases, that the wild plant is biennial, whilst the cultivated plant, growing from seeds sown in the spring, is annual. It is an observation of Linnaeus's, that the nodding spike of flowers follows the course of the sun, even when the sky is covered; pointing towards the east in a morning, to the south at noon, westward in the afternoon, and to the north at night.

*R. odorata* is a well known and universal favorite. The flowers are highly odoriferous, and there are very few to whom this odor is offensive. The plant is in great demand in London for rooms and placing in balconies, and forms for these purposes an extensive article of culture among the florists and market gardeners. The plants are in many cases sown and transplanted into pots, three or four plants to a pot four inches in diameter. To obtain plants for blowing from December to February, a sowing should be made in July in the open ground, and the plants potted in September. The crop for March, April, and May, should be sown not later than the twenty-fifth of August, the plants from this sowing will not suffer by exposure to rain, whilst they are young; they must, however, be protected from early frosts, like the winter crop; they are to

History, Use, Propagation, Culture,

be thinned in November, leaving not more than eight or ten plants in each pot; and at the same time, the pots being sunk about three or four inches in some old tan or coal ashes, should be covered with a frame, which it is best to place fronting the west; for then the lights may be left open in the evening, to catch the sun whenever it sets clear. The third, or spring crop, should be sown in pots, not later than the twenty-fifth of February; these must be placed in a frame, on a gentle heat, and as the heat declines the pots must be let down three or four inches into the dung-bed, which will keep the roots moist, and prevent their leaves turning brown, from the heat of the sun, in April and May. The plants thus obtained, will be in perfection by the end of May, and be ready to succeed those raised by the autumnal sowing. (*Risbon in Hort. Trans. ii. 372.*)

R. odorata frutescens, if left to itself, hardly appears a distinct variety, but trained against a wall or to a stick it, and also the common mignonette, may be made to assume a frutescent character. According to Sabine, the tree mignonette is to be propagated from seeds sown in spring; it may also be increased by cuttings, which will readily strike. The young plants should be put singly into small pots, and brought forward by heat, that of a gentle hot-bed being preferable, but they will grow well without artificial heat. As they advance, they must be tied to a stick; taking care to prevent the growth of the smaller side shoots, by pinching them off, but allowing the leaves of the main stem to remain on for a time to support and strengthen it. When they have attained the height of about ten inches or more, according to the fancy of the cultivator, the shoots must be suffered to extend themselves from the top, but must be occasionally stopped at the ends, to force them to form a bushy head, which by the autumn will be eight or nine inches in diameter, and covered with bloom.

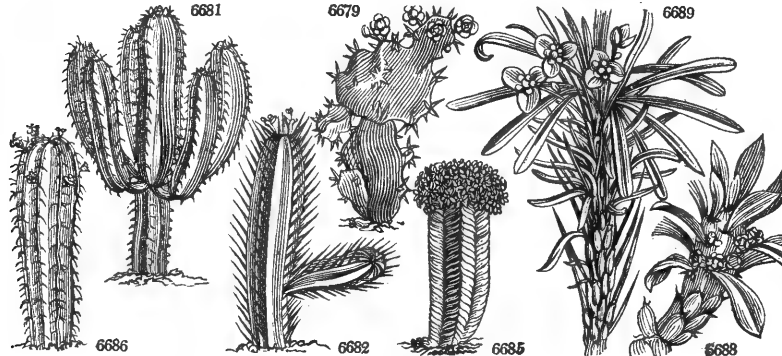

Whilst the plants are attaining their proper size, they should be shifted progressively into larger pots, and may ultimately be left in those of about six inches in diameter at top. (*Hort. Trans. iii. 181.*)

Mr. Lindley's theory of the nature of the inflorescence of this genus being remarkable, and only explained in his *Collectanea Botanica*, which is in few hands, it is here transcribed entire. "The usual idea of the flower of *Rosa* has been, that it is furnished with a calyx of a variable number of divisions, with as many petals, proceeding from their surface certain anomalous appendages, and with an ovary and stamens inserted on a great fleshy body, called nectary by Linnæan botanists, squama by others, and raised to the rank of a distinct organ by M. Mirbel, under the name of Gynophore. To us, however, it has always appeared, that this could by no means be the real structure of the plant, and that by a slight alteration of terms it not only might be much more satisfactorily explained, but its real affinity ascertained with some degree of probability. For even allowing for a moment an analogy between the nectary of this plant and the discus of others, particularly of some *Tiliaceae*, there is still a great difficulty remaining to be overcome in the anomalous structure of the supposed petals, of which we can imagine no probable explanation. We are therefore of opinion, that a much more natural mode of understanding *Rosa* is to consider it as having compound flowers; taking the calyx of authors for an involucreum, their petals for neutral florets, and their nectary for the calyx of a fertile

- 6660 Leaves lanceolate wavy hairy  
 6661 Leaves linear toothed at base, Styles 4  
 6662 Leaves linear entire, Styles 4, Barren florets 2  
 6663 Leaves linear entire, Fl. trigynous, Fruit clavate, Stem twiggly  
 6664 Leaves lanceolate entire, Fruit stellate  
 6665 Nearly related to *R. luteola*, but the leaves are not toothed at base  
 6666 Leaves pinnate recurved at end, Styles 4, Involucre 5-parted spreading, Stem half shrubby  
 6667 Leaves pinnate, Styles 4, Involucres 6-parted  
 6668 Branches above and younger leaves covered with large distinct blisters  
 6669 Leaves pinnate wavy, Styles 3 or 4  
 6670 Leaves bipinnatifid very rough, Flowers spiked  
 6671 Leaves all trifid: segments of the upper leaves linear flat; of the lower lanceol. wavy, Stem quite simple  
 6672 Leaves linear simple or trifid, Stem erect branched, Fruit obovate  
 6673 Leaves all trifid: the lower pinnate  
 6674 Leaves entire and 3-lobed, Involucres 6-parted very large  
 6675 Leaves entire and 3-lobed, Involucres shorter than florets  
 6676 Leaves entire and 3-lobed, Involucres as long as florets

§ 1. *Stem thick, fleshy, naked, or with a few leaves, Flowers dispersed.*  
 \* Prickly.

- 6677 Fleshy prickly compressed channelled inflexed at end, Prickles twin diverging  
 6678 Naked erect prickly triangular jointed, Branches erect somewhat channelled  
 6679 Prickly nearly naked triangular jointed, Branches spreading  
 6680 Naked prickly jointed with 3-cornered expanded branches obsolete marbled with white  
 6681 Prickly naked nearly quadrangular, Prickles twin hooked, Fl. subsessile  
 6682 Prickly naked with 7 angles, Prickles solitary subulate flower-bearing  
 6683 Prickly naked erect with 9 angles, Prickles solitary flower-bearing ascending fuscous, Branches pendulous  
 6684 Prickly half naked, Angles warted with spines between, The young warts leafy  
 6685 Prickly naked with many angles, Prickles solitary subulate  
 6686 Prickly naked with many angles, Prickles twin  
 6687 Prickly naked with numerous simple erect 10-13-angled stems, Prickles dark  
 6688 Prickly half naked, Prickles twin, Angles obliquely warted leafy upwards, Leaves oblong  
 6689 Stem round half naked leafy upwards, Leaves lanc. linear, Peduncle 1-f. at length spiny  
 6690 Prickles twin, Stem rounded or angular, Angles obliquely warted, Leaves nearly oblong  
 6691 Prickles twin horizontal, Stem rounded simple, Leaves oblong spatulate very large

and Miscellaneous Particulars.

floret in the middle. In support of this opinion, we may observe, firstly, that there is a difference in the time of expansion of the neutral florets, and of the stamens of the fertile one; the former being quite open, in very many capituli, before one anther of the latter has burst in a single flower. Secondly, that there is an evident analogy between the appendages of the neutral florets, and the stamens of the perfect florets; inasmuch as in *Reseda odorata* those of the upper sterile florets are of nearly the same number as the real stamens; because in *Reseda alba*, and some others, in which a union of filaments takes place in the perfect floret, there is a corresponding but more complete union of the sterile appendages; and because occasionally, in *Reseda odorata*, stamens are changed into bodies altogether similar to the sterile appendages, and in *Reseda Phyteuma* the same appearance is always assumed by the perfect stamens after the anthers have performed their functions. Thirdly, that there is an equal analogy between the calyx of the neutral florets, and that of the perfect floret; because both have a peculiar glandular margin; the same form; both produce their stamens from their surface; and because the upper edge of the calyx in sterile florets has the same relation to the axis of each particular head, as that of the perfect floret has to the axis of the whole inflorescence. In *Reseda Phyteuma*, which has the margin of its neutral florets rolled back, the same thing occurs in the perfect floret. Fourthly, that there is no instance of the same analogy existing between the discus and petals of other plants. We may also observe, that in *Reseda Phyteuma*, there is a campanulate tube to the calyx, into the upper edge of which the stamens are inserted.

"To determine the affinity of *Reseda* to other orders, will not be so easy as to explain its structure. One cannot avoid remarking the resemblance between its calyx and the squama of *Amentaceæ* and *Ulmaceæ*. *Ficoideæ*, *Grossellaceæ* and *Cacti*, on account of placentation and structure of seed, may be supposed to have a certain relation to it: as may *Chenopodeæ* with regard to inflorescence, absence of petals, and habit. But we are disposed to believe its real place in the system is in the neighbourhood of *Euphorbiaceæ*, where we have placed it in *Flora Scotica*. They agree with it in having the same sort of aggregation of flowers, similar habit, no corolla, and ternary division of ovarium. The insertion of their ovula is the same, as is also the direction of the radicle. They differ, however, firstly, in the presence of albumen; which yet is not entirely absorbed in *Reseda* till the seed is perfectly ripe, and which exists even after that time in the seed of *R. alba*, where it is fleshy as in *Euphorbiaceæ*. Secondly, in their solitary seeds; in which respect *Resedaceæ* may be supposed to bear the same relation to *Euphorbiaceæ* as *Campanulaceæ* do to *Compositæ*; or as some sections of *Rubiaceæ* to the others. In *R. suffruticulosa* the ovules appeared to be reduced to a single row, and the same is said to obtain in *Ochradenus*. Thirdly, in elastic dehiscence of capsule; but as this is not universal in *Euphorbiaceæ*, it is not, strictly speaking, an objection of importance." (*Lindley's Coll. Bot.*)

1103. *Euphorbia*. *Euphorbus* was physician to Juba, king of Mauritania, and first used this plant in medicine. This is a genus of grotesque and curious plants, few of them of either beauty or use, and most of

History, Use, Propagation, Culture,

the annuals poisonous weeds. One species (*E. edulis*), not yet introduced, is said to be used as a pot-herb in Cochín China; one (*E. punicea*) is a very splendid plant, and the *E. officinarum*, and one or two other species gathered along with it, are used in medicine. They are all milky, mostly herbaceous, several however shrubby, upright for the most part, very few of them creeping; some are leafless, but most of them are leafy. Stems angular or tubercled, or more frequently cylindric or columnar; unarmed, or in the angular sorts resembling the upright Cactuses, and armed with prickles, which are either solitary or in pairs, placed in a single row on the top of the ridges. Such as have leaves have them simple, most frequently alternate and naked; in some sorts, however, they are opposite, and are then commonly attended with stipules, and in a few they are placed by threes in whorls. Peduncles in the leafless sorts naked, bearing from one to three flowers; in the leafy ones axillary, but more frequently from two to five or more in a terminating umbel; each some-

- 6692 Prickly elliptical obtuse furrowed, Prickles subsolitary, Peduncles 3-flowered  
 6693 Warts very large green downy at end, Spines about 4 strong black at end  
 6694 Simple rounded obovate with warts woody at end [than the rest  
 6695 Columnar, Warts small numerous with many small spines between, Two spines in each cluster longer  
 \*\* Unarmed.

- 6696 Unarmed globose with many angles  
 6697 Unarmed imbricated, Warts with one leaf, Flowers somewhat stalked, Divisions palmate  
 6698 Stem closely tessellated with warts upwards thickly branched  
 6699 Unarmed imbricated with warts bearing a linear leaf  
 6700 Unarmed with round procumbent branches, Warts 4-cornered  
 6701 Unarmed imbricated, Warts with a roundish leaflet, Fl. term. solitary sessile with palmate segments  
 6702 Unarmed imbricated, Warts with a lanceolate leaflet, Fl. stalked with entire segments  
 6703 Unarmed imbricated capitate, Warts rhomboid with lanceolate stalked leaves, Segm. of flower entire  
 6704 Unarmed half naked shrubby filiform flaccid, Leaves alternate  
 6705 Warts large imbricated hooked at end: the upper having an oval leaflet at length withering  
 6706 Unarmed warted, Warts with a deciduous leaf, Pedunc. solitary or 3 terminal 1-flowered  
 6707 Unarmed naked leafless branched, Branches square, Fl. solitary terminal  
 6708 Unarmed shrubby upright, Head terminal, Leaves lanceolate smooth glaucous  
 6709 Unarmed half naked shrubby filiform erect, Branches spreading regularly clustered

§ 2. *Stem uniform, shrubby, upright, Flowers scattered or aggregate, not in umbels.*

- 6710 Unarmed, Leaves lanceolate clustered entire, Umbel terminal sessile, Invol. connate colored  
 6711 Unarmed shrubby upright, Umbel 5-fid term. Invol. oblong, Leaves lanc. smooth  
 6712 Unarmed shrubby, Leaves oblong alternate distichous, Bractes persistent  
 6713 Unarmed shrubby naked, Branches rounded effuse dependent jointed  
 6714 Umbel multifid dichotomous, Invol. subcordate: the first 3-leaved  
 6715 Unarmed, Leaves panduriform ovate, Fl. term. suberect, Invol. colored  
 6716 Villous, Leaves with long stalks alternate broadly ovate repand-toothed, Stem erect striated  
 6717 Leaves opp. minute stalked obovate entire, Two glands on the stem at the base of petioles  
 6718 Unarmed shrubby, Leaves ovate entire, Cyme axillary naked  
 6719 Leaves opp. subcordate stalked emarginate entire, Stem shrubby  
 6720 Stalks whorled longer than the orbicular leaf, Fl. solitary, Stem unarmed naked  
 6721 Leaves scattered lanceolate acute smooth, Pedunc. dichotomous, Caps. muricate  
 6722 Unarmed shrubby, Leaves scattered lanc. mucron. Fl. solitary term. with a 3-leaved invol. Caps. muricate  
 6723 Leaves oval entire wavy edged with white, Caps. smooth, Stem hairy  
 6724 Dichotomous, Leaves ovate serrate acute villous, Fl. solitary, Upper dichotomies cymose

§ 3. *Dichotomous, herbaceous, Flowers solitary or aggregate, not umbelled.*

- 6725 Unarmed branched, Leaves subcordate entire shorter than their stalk, Fl. solitary  
 6726 Dwarf hairy, Leaves opp. oval toothed, Flowers clustered at the end of branches  
 6727 Dichotomous, Leaves serrate oval-obl. smooth, Corymbs terminal, Branches divaricate  
 6728 Dichotomous, Leaves ovate obl. acute at each end smooth stalked entire, Capsules smooth  
 6729 Dichotomous, Leaves oval obsol. serrated, Pedunc. axill. 3-flowered, Stems diffuse smooth  
 6730 Dichotomous diffuse, Lvs. obov. oblique somewhat cord. at base toothletted at end, Pedunc. 1-fl. axillary  
 6731 Dichotomous, Leaves serrate oblong hairy, Fl. axill. solitary, Branches spreading  
 6732 Dichotomous, Leaves ovate hairy stalked entire, Pedunc. axill. 1-fl. Caps. smooth  
 6733 Dichotomous, Leaves serrate oval oblong, Pedunc. 2-headed axillary, Stem erect  
 6734 Dichotomous, Leaves subcrenate linear, Fl. fascicled term. Stem erect  
 6735 Dichotomous, Leaves serrate oval-obl. Heads axill. clustered subsessile, Stems procumbent  
 6736 Dichotomous, Leaves crenulate roundish smooth, Fl. solitary axill. Stems procumbent  
 6737 Dichotomous, Leaves entire half cordate, Fl. solitary axillary, Stems procumbent  
 6738 Leaves opp. entire lanceolate obtuse, Fl. solitary axillary, Stems procumbent  
 6739 Dichotomous, Leaves entire lanceolate, Peduncles axillary 1-fl. as long as leaves, Stem erect  
 6740 Branches alternate dichotomous channelled filiform, Leaves ovate stalked pubescent

§ 4. *Flowers umbelled with an involucre.*

\* *Umbel trifid.*

- 6741 Dichotomous, Invol. ovate, Leaves entire obovate stalked  
 6742 Dichotomous, Invol. subcordate mucronate, Leaves lanceol. obtuse  
 6743 Dichotomous, Invol. lanceolate, Leaves linear

*and Miscellaneous Particulars.*

times in a many-flowered head, but more often dichotomous, trichotomous, or even tetrachotomous, with single flowers between the divisions at the base and in the forkings; having bractes in number the same with the peduncles, forming a sort of involucre. The juice of every species of Spurge is so acrid that it corrodes and ulcerates the body wherever it is applied; so that it is seldom used internally. Externally it is dropped on warts or corns to remove them, and in the hollow of a decayed tooth, to remove the pain by destroying the nerve, or it is rubbed behind the ears to give relief in the tooth-ache by blistering.

*E. officinarum*, and also *antiquorum* and *canariensis*, furnish the Euphorbium of the *Materia Medica*. In the lower regions of Mount Atlas, the inhabitants collect the concreted gum resin, which they call *Surbinne*, in September. It is obtained by making slight incisions in the branches of the plant with a knife, from which a milk-like juice exudes, and forms into tears of an oblong or roundish form. The quantity yielded is so

History, Use, Propagation, Culture,

considerable, that the plants are cut once only in four years; the supply then obtained being sufficient for that space of time for all Europe. The recent juice is so corrosive as to erode the skin wherever it touches; and the people who gather the gum are obliged to tie a cloth over their mouth and nostrils, to protect them from the acrid dust of the withered branches, which induces the most violent sneezing. It is inodorous; and, when first chewed, has little taste, but it soon gives a very acrid burning impression to the tongue, palate, and throat, which is very permanent, and almost insupportable. Euphorbium possesses powerful cathartic, emetic, errhine, and rubeefacient properties. It has been given as a hydragogue in dropsies; but, owing to the violence of its effects, its internal use is now exploded: neither as an errhine can it be used alone, for it occasions so

 6751 Umbel 4-fid bifid, Invol. reniform: the first obovate  
 6752 Umbel 4 or 5-fid twice dichotomous, First invol. oblong: upper rhomboid-roundish, Leaves lin. lanceol.  
 6753 Umbel 5-cleft bifid, Invol. ovate, Leaves linear erect  
 6754 Umbel 5-cleft simple, Invol. ovate: first 3-leaved, Leaves oblong entire  
 6755 Umbel 5-cleft bifid, Upper leaves rounded obovate serrulate mucronate: lower lanc. reflexed  
 6756 Umbel 5-cleft bifid, Invol. ovate toothletted, Leaves entire lanc. oblong villous beneath  
 6757 Umbel 5-cleft bifid, Invol. subovate toothletted, Leaves lanc. obtuse, Caps. warted hairy  
 6758 Umbel 5-cleft bifid, Rays nodding, Invol. ovate entire, Leaves lanc. acute, Caps. warted smooth  
 6759 Umbel 5-cleft bifid, Invol. ovate mucronate, Leaves lanc.: the lower involute imbricated downwards  
 6760 Umbel 5-cleft dichotomous, Invol. subcordate concave, Leaves lin. lanc. acute smooth spreading  
 6761 Umbel 5-cleft bifid, Invol. cordate reniform, Leaves imbricated upwards

- 6762 Branches filiform, Leaves numerous linear oblong retuse. Rib mucronate, Fl. solitary terminal  
 6763 Umbel 5-cleft dichotomous, Leaves and invol. linear lanceolate acute  
 6764 Umbel 5-cleft dichotomous, Invol. ovate lanceolate mucronate, Lower leaves setaceous  
 6765 Umbel 5-cleft dichotomous, Invol. cordate acute, Leaves lin. lanceolate: the upper broadest  
 6766 Umbel multifid double, Invol. subcordate, Leaves linear  
 6767 Umbel multifid clustered, Invol. subcordate, Leaves numerous close very narrow  
 6768 Umbel multifid dichotomous, Invol. half orbicular cordate, Sterile branches many, Lvs. lin. lanc. obtuse  
 6769 Umbel 5-cleft bifid, Invol. cordate mucronate, Leaves oblong  
 6770 Umbel 5-cleft bifid, Invol. half orbic. cordate submucronate, Leaves linear imbricated backwards  
 6771 Umbel 5-cleft bifid dichotomous, Invol. obovate, Leaves cuneiform serrate smooth, Caps. smooth  
 6772 Umbel 5-cleft trifid dichotomous, Invol. 2-leaved reniform, Leaves amplexicaul. cordate serrate  
 6773 Umbel multifid bifid, Invol. orbicular, Leaves linear lanc. villous  
 6774 Umbel 5-cleft trifid, Invol. oval acuminate colored, Caps. smooth, Leaves glaucous beneath  
 6775 Umbel 5-cleft trifid, Invol. ovate, Leaves lanc. serrulate villous, Caps. warted  
 6776 Umbel 5-cleft trifid dichotomous, Invol. and leaves oblong obtuse, Divisions of invol. white  
 6777 Umbel 4-fid bifid, Invol. obovate, Leaves spatulate lanc. entire reflexed, Stem half shrubby branched  
 6778 Umbel 5-cleft trifid dichotomous, Invol. ovate, Leaves lanceolate, Caps. woolly  
 6779 Naked smooth, Umbel 5-cleft bifid, Leaves sessile lanceolate veiny on each side  
 6780 Umbel 5-cleft trifid bifid, Invol. ovate entire, Leaves lanc. hairy subserulate at end  
 6781 Umbel 5-cleft 4-fid dichotomous, Invol. roundish acute, Leaves lanceolate  
 6782 Umbel 5-cleft 3-fid dichotomous, Invol. with a hairy keel, Leaves serrate lanceolate, Caps. warted

- 6783 Umbel 5-cleft 3-fid dichotomous, Invol. lanceolate, Leaves lanc. toothed pubescent, Caps. smooth warted  
 6784 Umbel multifid bifid, Invol. subcordate 2-horned, Barren branches with 1-shaped leaves  
 6785 Umbel 5-fid bifid, Invol. perfoliate cordate acute, Leaves lanc. entire  
 6786 Leaves lanc. obtuse, Umbel 5-fid dichotomous, Invol. ovate obtuse 2-horned  
 6787 Umbel 5-fid bifid, Leaves spatulate lanc. mucronate coriaceous serrulate, Invol. ovate, Caps. smooth  
 6788 Leaves obversely obl. Invol. oblong and ovate serrulate at end, Umbel 5-fid dichotomous. Caps. keeled twice  
 6789 Leaves linear with long points entire smooth, Umbel 5-fid bifid, Invol. lanceolate, Leaves 2-horned  
 6790 Umbel trifid dichotomous, Leaves serrate somewhat hairy: lower spatulate; upper and invol. spatulate  
 6791 Upper branches hairy, Leaves smooth lanceolate, Caps. warted, Invol. cordate  
 6792 Umbel sub-5-fid bifid, Caul. leaves and invol. cordate lanceolate obtuse toothletted, Invol. reniform  
 6793 Leaves lanceolate, Umbel 5-fid, Invol. oval obtuse, Caps. rammentaceous hairy

\*\*\* Umbel 6-many-fid.

- 6794 Umbel multifid dichotomous, Invol. roundish entire, Branches none  
 6795 Umbel multifid dichotomous, Invol. subcordate, Branches sterile, Leaves setaceous, Cauline lanceolate  
 6796 Umbel multifid bifid, Invol. subtriangular, Leaves sessile erect, Caps. rough  
 6797 Umbel 8-fid bifid, Invol. subovate, Leaves spatulate spreading fleshy mucronate rough at edge  
 6798 Umbel dichotomous bifid, Invol. roundish mucronate, Leaves obovate imbricate serrulate  
 6799 Umbel 5-fid bifid, Invol. cordate roundish entire, Leaves lanceolate mucronate coriaceous

and Miscellaneous Particulars.

much inflammation as to produce hæmorrhage from the nostrils, and swells the integuments of the head. When properly diluted, however, with starch or any other inert powder, and cautiously used, it is an effectual and excellent erethic in lethargy, deafness, palsy, amaurosis, and similar cases. (*London Dispensatory*, 298.)

E. *Lathris* has seeds about the size and color of caper buds, and in Paris is sometimes substituted for that pickle. Eaten in any quantity they must prove highly deleterious.

E. *helioscopia* has a peculiarly acrid milky juice, which is often applied by country people to eat off warts; but should be used with caution where the parts are tender. According to Linnaeus, sheep eat it, and are purged by it, and their flesh acquires a bad taste; but this is not the case with cows.

History, Use, Propagation, Culture,

Many of the stove species of this genus are succulents, and will thrive the better if a little lime rubbish be added to their sandy loam. They are somewhat difficult to strike. Sweet says, "The way I have succeeded best, is to stick them in the tan amongst the pots in a good heat, and not cover them with any glass." (*Bot. Cult.* 55.)

The inflorescence of this genus is not now considered to consist of twelve stamens surrounding an ovary; but almost as in *Reseda*, of a number of monandrous naked male florets surrounding a naked female floret. This manner of understanding *Euphorbia* was first indicated by Jussieu, and afterwards correctly explained by Mr. Brown.

1104. *Pedilanthus*. From *παιδιλον*, a slipper, and *ανθος*, a flower, in allusion to the form of the involucre. A genus resembling *Euphorbia* in properties and appearance.

1105. *Visnea*. This seems to be a blunder of the younger Linnæus for *Visnea*, which now is the name of a distinct genus, which see. Ripened cuttings root freely in sand.

- 6800 Umbel multifid 3-fid bifid, Invol. ovate, Leaves lanceolate, Branches barren
- 6801 Umbel multifid bifid, Invol. broadly cord. Leaves obl. emarg. smooth, Stem branched, Capsules warted
- 6802 Umbel 6-fid dichotomous, Invol. oval, Leaves entire, Branches none, Capsules warted
- 6803 Umbel multifid dichotomous, Invol. reniform cordate, Leaves lanceolate villous
- 6804 Umbel multifid dichotomous, Invol. perfoliate orbiculate, Leaves obtuse
- 6805 Umbel multifid bifid, Invol. perfoliate emarginate, Leaves lanceolate entire
- 6806 Leaves linear lanceolate entire close together, Capsules smooth
- 6807 Umbel multifid bifid, Cauline leaves and involucre cordate oblong rough at edge subserrulate
- 6808 Umbel multifid trifid, Invol. roundish, Leaves lanc. attenuated, Stem simple, Caps. smooth
- 6809 Umb. 5-fid 3-fid dichotomous, Leaves lanceolate hairy serrulate at end, Capsules smooth
- 6810 Leaves lanceolate entire smooth, Caps. warted smooth, otherwise like *E. palustris*
- 6811 Leaves entire lanceolate villous, Umb. multifid, Inv. reniform cordate

- 6812 Leaves ovate acuminate
- 6813 Leaves ovate acuminate keeled beneath

6814 The only species

*TETRAGYNIA.*

6815 Fruit winged, Wings membranous crisp toothed

*PENTAGYNIA.*

6816 Stem hairy, Leaves obovate

6817 Leaves ovate obtuse usually entire, Fl. terminal paniced

6818 Leaves palmate, Stem aculeate

*DODECAGYNIA.*

6819 Stem arborescent smooth branched, Leaves cuneiform smoothish ciliated, Ciliæ spreading smooth

- 6820 Stem shrubby, Leaves orbicular-spatulate villous, Nectaries nearly square truncate
- 6821 Stem shrubby, Leaves cuneiform viscid ciliated, Ciliæ cartilaginous appressed
- 6822 Stem shrubby, Leaves orbicular-spatul. glutinous at edge with globose glands and cuneiform trunc. necta.
- 6823 Leaves obovate acute smooth with a cartilaginous edge, Cymes clustered
- 6824 Stem with dense spreading bristles, Leaves curved with longitudinal green spots beneath
- 6825 Leaves closely packed together in a broad flat disk
- 6826 Suckers spreading lateral, Leaves ovate mucronate warted, Branches of cyme bifid
- 6827 Leaves obovate gibbous beneath villous, Necta. 2-lobed
- 6828 Leaves spatulate cuneiform obtuse villous, Necta. palmate
- 6829 Stem pubescent, Leaves spatulate scattered
- 6830 Leaves ciliated, Suckers spreading, Necta. cuneiform with a swelling
- 6831 Margins of leaves serrate toothed, Offsets spreading
- 6832 Leaves entire obovate smooth stalked, Cymes spreading, Pedunc. and calyx hairy
- 6833 Leaves stem and petals hairy at end
- 6834 Leaves ciliated, Offsets short round nearly sessile, Petals 6 fringed

and Miscellaneous Particulars.

1106. *Calligonum*. From *καλος*, beautiful, and *γων*, a knee or joint. This plant produces, instead of leaves, curious greenish excrescences disposed in joints, which give it a remarkable appearance.

1107. *Glinus*. A name employed by Theophrastus to designate a kind of maple. This plant is, however, more like a purslane.

1108. *Blackwellia*. Named after Elizabeth Blackwell, who published an Herbari in 1735, containing figures of between two and three hundred plants, drawn and engraved by herself. Curious stove plants with pretty foliage, but inconspicuous spikes of whitish green flowers.

1109. *Gastonia*. Named by Commerson after Gaston de Bourbon, son of Henry IV. In the Isle de Bourbon it is called *Bois d'éponge*.

1110. *Sempervivum*. From *semper vivere*, to live for ever, in allusion to the tenacity of life common to plants of the genus. This is a succulent genus, some species of which are ornamental or singular, and others

*History, Use, Propagation, Culture,*

curious. *S. tectorum*, common on the roofs of buildings, is used by country people as an application to burns, inflammations, and ulcers, alone, in a bruised state, or mixed with cream. Linnæus informs us, that house-

CLASS XII. — ICOSANDRIA. STAMENS many, perigynous, or inserted into the Calyx.

To gardeners this is one of the most interesting of the Linnæan classes, containing a greater proportion than any other of objects which come within their observation and management. It also consists of genera for the most part naturally allied; and comprises not only the most remarkable portion of Ficoideæ, all Cacti, and the chief of the Myrtaceæ, but almost every genus of the beautiful and hardy tribes of Rosaceæ. Its characters are well defined, and depend upon the insertion of a number of distinct stamens, exceeding twenty, into the inner surface of the calyx; modifications of which organ are here found to be of more than ordinary importance in characterising the genera.

The genera are extremely natural, and have been all studied with unusual attention. Some difference of opinion exists among botanists as to the limits which ought to be assigned to them, and great diversity of nomenclature has thence arisen. "But," as has been observed by a modern author, "in a class so strictly natural as this is, greater difficulty is always to be expected in finding characters for genera, than in those of which our knowledge is more imperfect, and whose series of individuals may therefore be considered less complete." In the apple and pear tribe, Pomaceæ, where the greatest difficulty is thought to exist, we adopt Mr. Lindley's arrangement, as published in the Transactions of the Linnæan Society, which we find admitted by all botanists of authority.

But if it is difficult to ascertain the definite limits of the genera of Icosandria, it is yet more perplexing to arrive at a satisfactory conclusion respecting the species of which the genera are constituted. Having all been, as long as gardens have existed, the objects of cultivation, it has happened that many individuals have, under the action of domestication, wandered so far from their original types, as to have acquired new characters for themselves, of so peculiar a kind as to have rendered it impossible at the present day to refer them with certainty to the source from which they originally sprung. To remedy this confusion, which has been thus increasing for ages, some persons have thought it necessary to distinguish the species by such artificial characters as they are now found to possess, without reference to any changes the genera may have undergone; but it has been found that no facilities of discrimination have been gained by multiplying distinctions in consideration of differences which are neither permanent or remarkable, nor connected with natural habit, but purely artificial. To others it has appeared proper to endeavour to reduce the aberrant forms which now exist to those from which, upon mature consideration, they may be presumed to have been derived, and to simplify the arrangement and discrimination of the species by confining them within their primitive limits. As we think the latter to be the most simple principles of arrangement, and as they are certainly the most philosophical, we shall here follow those authors who have adopted them.

It is usual in this class to distinguish the orders with two and three styles from that with five: but the different species vary so much in the same genus in this respect, that we have only separated the genera into those with one style, Monogynia; with two, three, or five styles, Di-Pentagynia; and with many styles, Polygynia.

Order 1. MONOGYNIA.  Many perigynous Stamens. 1 Style.

§ 1. Ovary inferior.

1111. *Cactus*. Cal. imbricated. Petals numerous, in many rows: the inner the largest. Stigma many-cleft. Berry many-seeded.

1112. *Rhipsalis*. Cal. 3-4 parted, very short. Teeth acuminate, membranous, very fine. Berry 1-celled, pelucid. Seeds 12, in the centre.

1113. *Bartonia*. Cal. 5-cleft. Petals many. Caps. cylindrical, 1-celled at the end with 3-5 lid-like valves. Plantas 3-5, parietal, bearing seeds in a double row.

- 6835 Leaves ciliated, Offsets globose  
 6836 Leaves entire, Offsets spreading  
 6837 Leaves with entangled hairs, Offsets round  
 6838 Leaves rounded clavate clustered, Pedunc. naked 1-fl. Nects. obcordate

and Miscellaneous Particulars.

leek is a preservative to the coverings of houses in Smoland. It may easily be made to cover the whole roof of a building, whether of tiles, thatch, or wood, by sticking the offsets on with a little earth or cow dung.

1114. *Philadelphus*. Cal. 4-5-parted. Petals 4-5. Style 4-cleft. Caps. half-superior, 4-5-celled, many-seeded. Seeds with an arillus.  
 1115. *Leptospermum*. Cal. persistent at base, 5-cleft, half-superior. Petals 5, clawed, round, longer than stamens. Stigma capitate. Caps. depressed, 4-5-celled. Seeds angular, slender.  
 1116. *Fabricia*. Cal. 5-cleft, half-superior. Petals 5, sessile. Stigma capitate. Capsule many-celled. Seeds winged.  
 1117. *Metrosideros*. Cal. 5-cleft, half-superior. Petals 5. Stamens very long, separate. Stigma simple. Caps. 3-4-celled.  
 1118. *Psidium*. Cal. 5-cleft. Petals 5. Berry soft, pulpy, many-seeded. Cotyledons leafy, very small. Radicle very large, arcuate. Testa bony.  
 1119. *Eugenia*. Cal. 4-5-parted, superior. Petals 4-5. Fruit fleshy, 1-celled, 1-seeded. Cotyledons half-cylindrical. Radicle very small. Testa membranous.  
 1120. *Caryophyllus*. Cal. funnel-form. Fruit dry, 1 or 2-celled. Otherwise like *Eugenia*.  
 1121. *Myrtus*. Cal. 5-cleft. Petals 5. Berry 2 or 3-celled, many-seeded. Radicle and cotyledons distinct.  
 1122. *Catyptranthus*. Cal. truncate, before flowering covered with an hemispherical deciduous lid. Cor. O. Berry 1-celled, 4-seeded.  
 1123. *Pimenta*. Cal. 5-fid. Petals 5. Ovary 2-celled. Ovules solitary, appense. Style straight. Stigma somewhat capitate.  
 1124. *Olymnia*. Cal. 5-cleft. Petals 5. Stigma hooked. Berry 1-celled. Seeds angular. Embryo conferruminate.  
 1125. *Stravadium*. Cal. 4-cleft. Petals 4. Fruit 4-cornered, 1-seeded. Flowers in terminal racemes. Leaves alternate.  
 1126. *Eucalyptus*. Cal. truncate, covered with an entire deciduous lid. Cor. O. Capsule 4-celled, opening at end, many-seeded.  
 1127. *Punica*. Cal. 5-cleft. Petals 5. Berry many-celled, many-seeded. Seeds berried, Placenta parietal.
- § 2. *Ovary superior*.
1128. *Amygdalus*. Cal. 5-cleft. Petals 5. Drupe with a nut perforated on its surface.  
 1129. *Prunus*. Cal. 5-cleft. Petals 5. Drupe with a hard smooth nut.  
 1130. *Chrysobalanus*. Cal. 5-cleft. Petals 5. Drupe with a 5-furrowed, 5-valved nut.

## Order 2. DI-PENTAGYNIA.

Many perigynous Stamens. 2 to 5 Styles.

§ 1. *Ovary inferior*

1131. *Mespilus*. Cal. 5-parted, with leafy divisions. Disk arge, honey-bearing. Styles smooth. Apple turbinate, open, 5-celled, with a bony putamen.  
 1132. *Crataegus*. Cal. 5-toothed. Petals spreading, orbicular. Ovary 2-5-celled. Styles smooth. Apple fleshy, oblong, closed by the teeth of the cal., or by the thickened disk. Putamen bony.  
 1133. *Pyrus*. Cal. 5-toothed. Petals roundish. Apple closed, 5-celled, with a cartilaginous putamen. Cells 2-seeded. Testa cartilaginous.  
 1134. *Cydonia*. Cal. 5-parted, with leafy divisions. Apple closed, many-seeded. Testa mucilaginous.  
 1135. *Photinia*. Cal. 5-toothed. Petals reflexed. Ovary half-superior, villous, 2-celled. Styles 2, smooth. Pericarp 2-celled, included in the fleshy calyx. Testa cartilaginous.  
 1136. *Raphiotepis*. Cal. with a funnel-shaped deciduous limb. Filaments filiform. Ovary 2-celled. Apple closed by the thickened discus, with a papery putamen. Seeds gibbous.  
 1137. *Eriobotrya*. Cal. woolly, bluntly 5-toothed. Petals bearded. Stamens erect, the length of teeth. Styles 5, filiform, included, hairy. Apple closed, 3-5-celled. Chalaza none. Radicle included between the bases of cotyledons.  
 1138. *Amelanchier*. Cal. 5-toothed. Petals lanceolate. Ovary 10-celled. Ovules solitary. Apple 3-5-celled, with a cartilaginous putamen.

1139. *Cotoneaster*. Flowers polygamous. Cal. turbinate, bluntly 5-toothed. Petals short, erect. Stamens length of teeth. Styles smooth, shorter than stamens. Achenopses parietal, included in calyx.

§ 2. *Ovary superior.*

1140. *Waldsteinia*. Cal. 10-cleft; the alternate segments smaller. Petals 5. Styles clavate, deciduous. Grains 2, obovate.

1141. *Spiraea*. Cal. spreading, 5-cleft. Petals 5. Caps. 1-celled, 2-valved, opening inwards, 1-3-seeded.

1142. *Gillenia*. Cal. infundibuliform, 5-toothed. Petals 5. Stamens very short. Capsule 5-celled.

1143. *Sesuvium*. Cal. 5-parted, colored. Petals O. Caps. ovate, 3-celled, cut round, many-seeded.

1144. *Aizoon*. Cal. 5-parted. Pet. O. Caps. 5-celled, 5-valved.

Order 3. POLYGYNIA.

Stamens many; perigynous. Styles many.

1145. *Tetragonia*. Cal. 3-5-parted. Petals O. Drupe inferior, with a 3-8-celled nut.

1146. *Mesembryanthemum*. Cal. 5-cleft. Petals many, linear. Capsule turbinate, fleshy, inferior, many-seeded.

1147. *Hymenogyne*. Styles about 12, united in a delicate tube. Caps. 1-celled, many-seeded. Otherwise like *Mesembryanthemum*.

History, Use, Propagation, Culture,

1111. *Cactus*. A name under which Theophrastus describes a spiny plant, an article of food, which grew in Sicily. This genus consists of succulent plants, permanent in duration, singular and various in structure; generally without leaves, and having the stem or branches jointed; for the most part armed with spines in bundles, with which, in many species, bristles are intermixed. These bundles of spines are placed on the top of the tubercles in the smaller melon thistle, which is tubercled all over, and produces its flowers between the tubercles. In the great melon thistle the spines are ranged in a single row on the ridge of the ribs. These are of an ovate or globular form. The torch thistle, on the contrary, are slender, rise up high, are jointed and branched; many of them are almost cylindrical, with from five to ten shallow ribs; some, however, are square or three cornered. The structure of the creeping *Cereuses* is the same with these, except that the stems are weak and cannot support themselves; they therefore seek support from trees, and throw out roots from the stem, like ivy. In the Indian figs the branches are jointed, and flatted like the sole of a shoe; the bundles of spines or bristles are scattered over the surface, and the flowers are produced from the edge of the extreme branches. In the *Phyllanthus* the branches are thinner, they are indented along the edge, and the flowers come out singly from the indentures. This seldom has any spines. *Perekia* has a round stalk with leafy branches; the leaves alternate, flat, and thick; the prickles are large and stiff, and come out in bundles on the stalk and branches, chiefly at the axilla; the flowers are produced several together from the axilla also. In this and the Indian figs the flowers are pitcher-shaped; in the other species they are subcylindrical and longer; in *Phyllanthus* very long. The fruit in some of the sorts is small, like currants; but in most it is larger, and shaped like a fig, whence their name of Indian fig.

*C. melocactus*, the great melon thistle or Turk's cap, appears like a large fleshy green melon, with deep ribs, set all over with strong sharp thorns. When it is cut through the middle, the inside is found to be a soft, green, fleshy substance, very full of moisture. The flowers and fruit are produced in circles round the upper part of the cap. Some of those which have been brought to England, have been more than a yard in circumference, and two feet and half high including the cap. But in the West Indies there are plants near twice as large. Linnæus observes, that this plant resembles a hedge-hog in its form and spines; and on the top has a discoid, convex, villous body, from which the flowers proceed.

1148. *Rosa*. Cal. urceolate, 5-cleft, fleshy, contracted at orifice. Petals 5. Grains bony, hairy, included in the fleshy tube of calyx.
1149. *Rubus*. Cal. 5-cleft. Petals 5. Berry composed of many cohering fleshy grains. Receptacle nearly dry.
1150. *Dalibarda*. Cal. 5-cleft. Petals 5. Berry dry. Styles 5, long, deciduous.
1151. *Fragaria*. Cal. 10-cleft. Pet. 5. Grains inserted upon a fleshy deciduous receptacle.
1152. *Comarum*. Cal. 10-cleft. Petals 5, less than calyx. Receptacle ovate, spongy, persistent.
1153. *Potentilla*. Cal. 10-cleft. Petals 5. Grains rugose, roundish, naked, fixed to a small dry receptacle.
1154. *Tormentilla*. Like *Potentilla*, but cal. 8-cleft. Petals 4.
1155. *Geum*. Cal. 10-cleft. Sepals unequal. Petals 5. Grains generally with a jointed awn.
1156. *Kerria*. Cal. 5-cleft. Pet. 5, orbicular. Ovaries 5-8, smooth, globose. Ovules solitary. Styles filiform. Capsules globose.
1157. *Calycanthus*. Stamens unequal, deciduous; the 12 outer fertile. Grains many.
1158. *Chimonanthus*. Stamens equal, persistent; the 5 outer fertile, in maturity closing the orifice of the calyx by their united bases.
1159. *Dryas*. Cal. simple, 8-cleft. Petals 8. Grains with a hairy tail.
1160. *Coluria*. Like *Sieversia*, but the style jointed with the top of ovarium and deciduous, and the achenia angular, included in the long turbinate tube of the calyx.
1161. *Sieversia*. Cal. 10-cleft. Petals 5. Stamens indefinite. Ovaries indefinite, with an ascending ovule. Styles terminal, continuous. Achenia awned with the persistent style. Embryo erect.

## MONOGYNIA.

- 6839 Roundish covered with ovate bearded tubercles
- 6840 Simple clavate, Tubercles ovate with woolly spines at end, Wool shorter than spines
- 6841 Roundish depressed with ten angles
- 6842 Proliferous, Warts small cylindrical, Spines fine whitish the lowest like hairs
- 6843 Roundish multiplex, Warts cylindrical bearded above furrowed proliferous
- 6844 Roundish deeply 16-angled, Angles with a remarkable swelling below each parcel of spines
- 6845 Warts large very green downy at end, Spines about 4 strong expanded
- 6846 Simple rounded obovate, Warts woolly at end with more than 20 spines
- 6847 Columnar, Warts small very numerous with little spines between, 2 in each parcel much longer than rest
- 6848 Roundish with about 14 angles
- 6849 Roundish with 15 angles, Spines broad recurved numerous
- 6850 Oblong with many angles, Angles and spines middle-sized straight
- 6851 Oblong with about 20 angles, Rays of spines capillary long
- 6852 Depressed spheroidal with about 21 angles, Rays of spines variable the lowest very broad flat deflexed
- 6853 Rounded bright green with 14 angles, Ribs straight with long thick white spines

## and Miscellaneous Particulars.

*C. melocactus*, *mammillaris*, and *proliferus*, by many thought to be but one species, grow upon the steep sides of rocks in the hottest parts of America, where they seem to be thrust out of the apertures, having little or no earth to support them: their roots shooting down into the fissures of the rocks to a considerable depth, so that it is troublesome to get the plants up. As they delight in such rocky places, they seldom live long when transplanted into a better soil. In times of great drought the cattle repair to the barren rocks where these plants grow, rip them up with their horns, tear off the outside skin, and greedily devour all the fleshy moist part. The fruit is frequently eaten by the inhabitants of the West Indies. It is about three quarters of an inch in length, of a taper form, drawing to a point at the bottom, but blunt at the top: the taste is an agreeable acid.

*C. repandus* has a fruit about the size and shape of a Bergamot pear, having many soft spines on the skin; the outside is a pale yellow, the inside very white, full of pulp, having a great number of small black seeds lodged in it. It frequently flowers in July, and in warm seasons will perfect its fruit, which has very little flavor in this country, but is frequently served up at table in the West India islands.

The fruit of *lanuginosus* and *peruvianus* are also occasionally eaten where they are natives.

*C. grandiflorus* and *flagelliformis* have flowers remarkable for their beauty and sweetness. *C. grandiflorus*, when arrived to a sufficient strength, will produce many exceeding large, beautiful, sweet scented flowers, like most of this kind, of very short duration, scarcely continuing six hours full blown: nor do the flowers ever open again when once closed. They begin to open between seven and eight of the clock in the evening, are fully blown by eleven, and by three or four in the morning they fade, and hang down quite decayed; but during their short continuance, there is scarcely any flower of greater beauty, or that makes a more magnificent appearance; for the calyx of the flower, when open, is near a foot diameter; the inside of which, being of a splendid yellow color, appears like the rays of a bright star; the outside is of a dark brown; the petals being of a pure white, add to the lustre; the vast number of recurved stamens surrounding the style in the centre of the flower make a fine appearance: add to all this the fine scent of the flower, which perfumes the air to a considerable distance. There is scarce any plant which deserves a place in the hothouse so much as this, especially as it may be trained against the wall, where it will not take up any room. The usual season of its

History, Use, Propagation, Culture,

flowering is in July, and when the plants are large, many flowers will open the same night, and there will be a succession of them for several nights together. Sometimes six, eight, or ten flowers open at the same time on one plant, making a most magnificent appearance by candle-light: but none of them are succeeded here by any appearance of fruit.

*C. flagelliformis* produces a greater number of flowers than the foregoing sort: they come out in May, and sometimes earlier, when the season is warm. The petals are of a fine pink color both within and without; they are not so numerous, and the tube of the flower is longer than that of the other. These flowers keep open three or four days, provided the weather, or the place where the plants stand, be not too warm; and during their continuance they make a fine appearance. This sort has very slender trailing branches, which require a support: they are not jointed, nor do they extend so far as those of the other sort. Fruit sometimes succeeds the flowers, but seldom ripens.

*C. triangularis*, the strawberry pear, *Poirer de Chardon*, Fr., bears the best flavored fruit of any of the sorts; it is slightly acid, and at the same time sweet, pleasant, and cooling; in Martinique and other West India islands it is much esteemed.

*C. opuntia*, native of the country of the Opuntians, whose chief town was Opus, in the vicinity of Phœcis, though like the others a native of America, is now found growing wild on the sides of the roads between Rome and Naples and other parts of Italy, and even in the Valais. Gerarde says, it was brought from Virginia into England, and Collinson had it from Newfoundland. It was fruited in Scotland in a stove by

- 6854 Erect with deep furrows long with 6 distant angles  
 6855 Erect with deep furrows long with about 8 obtuse angles  
 6856 Erect with deep furrows long with 4 compressed angles  
 6857 Erect with deep furrows long slightly quadrangular with toothed angles  
 6858 Erect with deep furrows long jointed with about 5 angles  
 6859 Erect slender with shallow furrows jointed with 9 angles, Joints ovate, Spines as long as wool  
 6860 Erect slender with shallow furrows jointed with 9 angles not glaucous, Spines white; a variety of the last  
 6861 Erect slender with shallow furrows long with 9 obsolete angles, Spines shorter than wool  
 6862 Erect slender with shallow furrows long with 8 compressed wavy angles, Spines longer than wool  
 6863 Erect slender with shallow furrows, Branches jointed few bluntly triangular  
 6864 Erect slender with shallow furrows, Scarcely ang. Surface covered with variously imbric. lobed divisions  
 6865 Erect slender with shallow furrows black with numerous brown spines longer than the wool  
 6866 Erect slender with shallow furrows weak cylindrical, Surface covered with netted crossing furrows  
 6867 Erect rounded below long elegant with about 9 angles, Spines snow-white weak, Wool very short  
 6868 Erect with 18 close obtuse angles with bristly yellowish spines longer than the wool  
 6869 Erect with deep furrows oblong with 7 angles  
 6870 Creeping triangular rooting  
 6871 Decumbent rooting 3-cornered, Spines fasciated divaricating seven two or three lines long  
 6872 Creeping rooting 3-cornered with scarcely channelled angles, Spines 5-7 in stellate fascicles  
 6873 Creeping rooting with about 5 angles  
 6874 Creeping 5-cornered with subulate spines longer than the wool  
 6875 Creeping rooting hispid with 10 angles  
 6876 Creeping with 3 or 4 angles which are scarcely channelled, Spines 5-7 in stellate parcels  
 6877 Erect, Joints broadly ovate-oblong, Spines subulate very long blackish  
 6878 Erect, Joints broadly ovate-oblong, Spines subulate long yellow  
 6879 Erect, Joints oblong and lanceolate, Spines of various shapes brownish black  
 6880 Joints oblong and ovate, Spines of various shapes yellow, Fl. numerous solitary  
 6881 Stem rounded, Branches ovate compressed flat, Spines solitary or 3 together subulate strong  
 6882 Joints cuneate obovate decumbent, Spines variously shaped yellow  
 6883 Erect, Joints obovate roundish glaucous, Stigma 6-lobed  
 6884 Creeping prostrate, Joints ovate, Spines even numerous hair-shaped  
 6885 Erect, Joints ovate elliptical, Spines even numerous short  
 6886 Joints ovate oblong very thick, Spines unequal
- 6887 Jointed proliferous, Joints oval, Warts with a cluster of spines the length of the wool  
 6888 Joints ovate oblong unarmed  
 6889 Erect, Joints lanceolate-oblong, Clusters of spines fuscous weak with one strong white spine  
 6890 Erect, Joints oblong or oval, Spines numerous variable brown; one very long straw-colored  
 6891 Jointed proliferous, Joints ovate oblong with strong white spines longer than wool  
 6892 Nearly erect, Joints lanceolate with even short spines, Leaves 3 lines long  
 6893 Branches oblong with short soft hairs, Spines small  
 6894 Branches oblong scarcely spiny  
 6895 Joints very long slender compressed, Spines very long slender clustered white  
 6896 Joints oblong with numerous stiff spines of which one is very long and white at base  
 6897 Joints brittle cylindrical ventricose compressed much divaricating  
 6898 Joints brittle compressed short, Spines numerous variable white erect  
 6899 Jointed proliferous, Joints lanceolate-glaucous, Spines bristly longer than wool  
 6900 Joints brittle linear-lanceolate divaricating, Spines unequal  
 6901 Proliferous smooth branched ensiform compressed serrated with a central woody rib  
 6902 Branches ensiform compressed obovate with spreading teeth, Spines few setaceous longer than wool

and Miscellaneous Particulars.

Justice, in 1750, and recently by Braddick, near London, in the open air. This active horticulturist, having eaten with pleasure of the prickly pear in Virginia, was desirous of cultivating it here. He recollected that the plant in its wild state delighted in a dry soil, amongst rocks, near the skirts of the sunny sides of the forests; and having heard that it would stand the open air in this country, he planted it in the compost described below, placed in a sheltered situation open to the sun. "The first plant that I turned out has lived in the open ground of this country for six or seven years, during which period it has endured one exceeding hard winter, and several trying springs; and in all, except the two first years, it has never failed to ripen its fruit and seeds, so that it may be now considered decidedly acclimated. The compost used by me for growing the Cactus Opuntia, is the following: one half is carbonate of lime, for which lime-rubbish from old buildings will answer; the remaining half consists of equal portions of London clay and peat-earth, having the acid neutralised by barilla: these are intimately blended and sifted. One square yard of this compost I conceive to be sufficient for one plant, which must be placed in the middle of a small artificial hillock, raised eighteen inches above the surface of the ground, which ground should be rendered perfectly dry, if not naturally so, by under-draining. Neither the leaves, flowers, nor fruit should ever be suffered to touch the ground, but they should as constantly as they are produced be kept from the earth by placing stones, pebbles, flints, or bricks under them, in imitation of artificial rock-work." (*Hort. Trans.* ii. 238.)

C. *Ficus indica* is very common in Jamaica, and on it feed the wild sort of cochineal insect. The fruit is large and of a deep purple color, and when eaten dyes the urine of a bloody color.

History, Use, Propagation, Culture,

*C. tuna* (yn the Arabic name for fig) is used as a hedge plant in Spain, South America, and the West Indies. When the island of St. Christopher was to be divided between the English and the French, three rows of the tuna were planted by common consent between the boundaries. (Sloane.) Sir J. E. Smith informs us, that the stamens of the flower are very irritable; and that if a feather be drawn through them, in two or three seconds they begin to lie down gently on one side, and in a short time become recumbent at the bottom of the flower.

*C. cochiniifera* is the species on which the cochineal insect chiefly feeds. The insect feeds on other succulent plants besides those of the *Cactus* genus, but this species is cultivated because least annoying by its prickles. It produces an edible fruit larger than that of *C. opuntia*. On the top of the fruit there grows a red flower: this when the fruit is ripe, falls down on the top of it, and covers it so that no rain or dew can wet the inside. A day or two after the flower being scorched up by the heat of the sun, the fruit opens wide, and the inside appears full of small red insects. The Indians, when they perceive the fruit open, spread a large linen cloth, and then with sticks shake the plant, to disturb the insect, so that they take wing to be gone, but keep hovering over the plant, till by the heat they fall down dead on the cloth, where the Indians let them remain two or three days till they are dry. The cochineal plants are called by the Spaniards *Toona*. They are planted in the country about Guatimala, Chiapa, and Guaxaca, in the kingdom of Mexico.

The difference, in point of goodness, observable in the cochineal, is entirely owing to the plant it feeds upon. The prickly pear (*C. tuna*) so abundant in Jamaica, is covered with the insects, but not having their proper food, they are in general diminutive, and have very little red tincture in their bodies. The delicate red colored juice of the fruit is the natural food of the insect. The exuvia and animal salts of the insect are, from the minuteness of its parts, inseparable from the essential principles of the dye, and must diminish the brilliancy of the color: and this has put some persons upon inspissating the juice of the fruit itself. The ripe fruit is said to check fluxes by its mild restraining; it is also a powerful diuretic, and sometimes imparts a tinge to the urine.

*C. pereskia*, so called from the generic name of Plumier, who made this species a distinct genus, in memory of N. F. Peiresk, of Aix, whose name, as Tournefort says, is his only monument, has fruit about the size of a walnut, having tufts of small leaves on it, and within a whitish mucilaginous pulp.

In our stoves, according to Sweet, "sandy loam, or loam mixed with a little brick rubbish, is the best soil for all the *Cacti*: the pots should be as small as the plants will allow, and well drained with potsherds. They

- 6903 Branched, Joints short oblong truncated  
 6904 Leaves elliptical fleshy, Spines about  $\frac{1}{2}$  an inch long, Buds little woolly  
 6905 Spines numerous variable strong, Leaves lanc. oblong with a strong rib beneath  
 6906 Leaves elliptical fleshy, Spines  $\frac{1}{2}$  an inch long, Buds very woolly

 6919 Leaves lin.-lanc. obtuse nerveless, Cal. smooth with membranous naked teeth  
 6920 Leaves lanc. lin. acute 3-nerved, Cal. silky villous, with membr. colored naked teeth  
 6921 Leaves oblong or oval mucr. pubescent on each side obsolete 3-nerved, Branches villous, Cal. very vil.  
 6922 Leaves lanc. oblong hairy oblique reflexed at end  
 6923 Leaves oval lanceolate, Young shoots colored, Flowers large, Teeth of calyx colored  
 6924 Leaves obovate nerveless, Branches and calyxes hairy with membranous colored teeth  
 6925 Leaves ovate lanceolate short three nerved, Fl. sol. sessile, Cal. entire persistent  
 6926 Leaves subulate pungent, Branches hairy, Calyxes and teeth villous  
 6927 Branches flexuose, Flowers sessile fasciated, Cal. hairy  
 6928 Leaves lin.-lanc. pungent, Branches silky, Cal. smooth with membranous colored naked teeth  
 6929 Leaves lin.-lanc. pungent, Branches hairy, Cal. smooth with membranous col. pubescent teeth  
 6930 Leaves oblanc. densely dotted, Fl. sol. terminal, Sepals deciduous  
 6931 Leaves acicular rigid fasciated, Flowers solitary, Teeth of calyx colored  
 6932 Leaves linear recurved at end, Cal. smoothish, Teeth leafy lanc. naked, Stamens longer than cor.  
 6933 Leaves lanceolate obovate opp. Teeth of calyx round  
 6934 Leaves obovate altern. glaucous, Teeth of calyx triangular

and Miscellaneous Particulars.

require very little water. The best way to flower them is to expose them to the air all the summer, which makes them get plump and throws them into flower-bud. Most of the species are fine flowers. Cuttings, after they are taken off, should be left to dry a few weeks till they are shrivelled, then potted, and they will root immediately. (*Bot. Cult.* 31.)

112. *Rhipsalis*. From  $\rho\upsilon\lambda\alpha\varsigma$ , a willow branch, in allusion to the flexible decumbent branches of the genus. Curious, branched, jointed, leafless, prostrate plants. Culture as in Cactus.

113. *Bartonia*. Named by Pursh, in honor of Dr. B. S. Barton of Philadelphia, an American botanist. Beautiful plants, with alternate pinnatifid rough glaucous leaves, and large white flowers, which open during the night, and spread a most agreeable odor. Very rare, if they yet exist, in collections.

114. *Philadelphus*. A name used by Athenæus for a tree which is now unknown. Bauhin applied it to this genus. The species are free flowerers, well adapted for the shrubbery. The native country of *P. coronarius* is not known; it is generally referred to the south of Europe, but it has only been found twice in Italy, and then in situations where it might have been planted. The flowers have the appearance and odor of those of the orange, but the odor in near contact is much more powerful. Seeds are seldom produced in this country. The leaves taste like fresh cucumbers. *P. grandiflorus* is a very showy plant. All the species grow freely in common soil, and are increased by layers.

115. *Leptospermum*. From  $\lambda\epsilon\pi\tau\omicron\varsigma$ , slender, and  $\sigma\pi\epsilon\rho\mu$ , seed, in allusion to the extreme tenuity of the seeds. Pretty New Holland plants. *L. scoparium* grows commonly in dry places near the shores in New Zealand, and the underwood in Adventure Bay, Van Dieman's Land, chiefly consists of this shrub. The leaves were used by Captain Cook's ships' crews as tea, whence they named it the tea plant. The leaves have a very agreeable bitter flavor, with a pleasant smell, when fresh; but lose something of both, when dry. If the infusion was made strong, it proved emetic to some, in the same manner as green tea. It was also used with spruce leaves, in equal quantity, to correct their astringency in brewing beer from them; and they rendered the beer exceedingly palatable.

Young cuttings of all the species will root readily in sand, under a bell-glass: the species may also be raised from seeds; but plants from cuttings are best, as they flower young, and the seedlings do not flower till they attain a considerable size. (*Bot. Cult.* 214.)

116. *Fabricia*. Dedicated by Gartner to John Christian Fabricius, the famous Entomologist. The species

History, Use, Propagation, Culture,

requiring to grow to a good size before they produce flowers are well adapted for a conservatory: the culture and propagation as in *Leptospermum*.

1117. *Metrosideros*. From *metros*, the heart of a tree, and *sidneon*, iron, in allusion to the hardness of the wood. One species (*M. vera*) is called Iron wood. The Chinese make their rudders and anchors of it; and among the Japanese it is so scarce and valuable that it is only allowed to be manufactured in the service of their king. The bark is used as a remedy for fluor albus and diarrhoea, being mixed with Pinang, and a small quantity of cloves and nutmegs. This is a genus distinguished at eight by the peculiar character of the shrubs of Australasia, with both sides of the leaf alike. *M. hispidia*, *lanceolata*, and *speciosa*, are beautiful plants, but not free flowerers. They are rather difficult to strike. Sweet recommends "ripened wood planted under a bell-glass in sand."

1118. *Psidium*. One of the Greek names of the Pomegranate. In English it is called *Guava*, a corruption of the American name *Guayaba*. Most of the species are cultivated in the tropics for their fruit, which also ripens freely in this country, though it is of little merit. *P. pyriferum* bears fruit the size of a hen's egg, yellowish, with a peculiar smell. The rind is brittle and fleshy; pulp rather firm, full of bony seeds, flesh colored, sweet, aromatic, and pleasant. In the West Indies it is eaten with avidity, not only by the natives, but by Europeans: with those who are not accustomed to it, the Guava is apt to occasion a slight flux; but Jacquin affirms, that when he has been thirsty on a journey he has eaten of it to satiety without suffering any harm. It is eaten raw in the dessert, but the seeds are scarcely separable. It is also preserved with sugar. *P. pomiferum* has fruit like a pomegranate, which is seldom eaten, though eatable, and being astringent is counted strengthening for the stomach. *P. Cattleianum* is reckoned one of the best of the Guavas; the fruit is of a fine deep claret color, and the pulp in consistence and flavor bears a considerable resemblance to the strawberry.

All the species are of easy culture in light and rather rich loam, and are increased readily by seeds, layers, or cuttings in sand under a hand-glass.

- 6935 Leaves opposite cordate at base stem-clasping, Branches calyxes and peduncles hispid  
 6936 Leaves opposite stalked ovate lanceolate, Panicle brachiate, Pedic. umbellal  
 6937 Leaves opposite stalked lin.-lanc. acuminate oblique, Panicle brachiate decomposed  
 6938 Leaves opposite ovate netted veiny beneath pubescent, Heads lateral stalked and bracts downy  
 6939 Leaves opposite lin.-lanc. naked, Pedunc. axillary umbellal, Bracts lanc. smooth  
 6940 Leaves alternate lanceolate 3-nerved, Fl. racemose clustered terminal smooth  
 6941 Leaves scattered linear channelled acute rigid, Fl. lateral clustered sessile  
 6942 Leaves alternate lin. filiform rigid mucronate channelled rough, Fl. clustered sessile  
 6943 Leaves alternate linear-lanceolate, Fl. clustered lateral pubescent  
 6944 Leaves alternate lanceolate narrowed at each end mucronate, Fl. lateral clustered sessile smooth  
 6945 Leaves alternate lanceolate mucronate, Fl. lateral clustered sessile pubescent  
 6946 Leaves scattered lanceolate veiny glandular mucronate, Caps. downy at end  
 6947 Leaves ovate-lanceolate acuminate quite smooth, Cymes stalked many-flowered  
 6948 Very like *M. lanceolata*, but the blossoms appear more copiously  
 6949 Leaves alternate lin.-lanceolate with a long acute point  
 6950 Leaves lin.-lanceolate with a long point dotted rough

- 6951 Leaves elliptical pubescent beneath, Peduncles 1-flowered  
 6952 Leaves oblong lanceolate pubescent beneath, Peduncles 3-flowered  
 6953 Leaves oblong acuminate smooth, Peduncles 1-flowered  
 6954 Leaves sessile cordate rounded smooth on each side, Pedunc. 1-fl. clustered  
 6955 Leaves oblong acuminate crenulate shining, Peduncles many-fl.  
 6956 Leaves ovate oblong acute sub-crenate, pubescent above rugose beneath, Branches reclinate  
 6957 Leaves obovate smooth coriaceous, Fruit purple

- 6958 Leaves entire oblong, Peduncles 4-fl. lateral  
 6959 Leaves entire lanceolate, Pedunc. 4-fl. terminal  
 6960 Leaves entire ovate-lanceolate, Ped. many-fl. axillary shorter than petiole  
 6961 Leaves elliptical, Pedunc. trichotomous lateral and terminal, Stamens much longer than petals

- 6962 Leaves entire oblong acuminate obtuse flat, Pedunc. axill. many-fl. the length of petioles  
 6963 Leaves entire roundish ovate obtuse, Pedunc. axill. many-fl. trichotomous the length of leaves  
 6964 Leaves entire oblong-lanceolate acuminate, Pedunc. axillary many-fl. racemose shorter than leaf  
 6965 Leaves entire elliptical acuminate, Pedunc. panic. axill. and terminal, Fruit globose  
 6966 Leaves entire lanceolate narrowed at base obtuse veinless, Pedunc. 1-fl. solitary terminal  
 6967 Leaves entire ovate-lanceolate, Pedunc. 1-flowered solitary lateral  
 6968 Leaves entire oblong acuminate coriaceous not dotted, Pedunc. 1-fl. filiform  
 6969 Leaves entire ovate oblong acuminate netted with veins, Pedunc. 1-fl. about 3 in fruit nodding

6970 The only species

- 6971 Flowers solitary, Involucre 2-leaved  
 α Leaves ovate longer than the peduncles  
 β Leaves ovate with round berries

and Miscellaneous Particulars.

1119. *Eugenia*. In honor of Prince Eugene of Savoy, who was a protector and encourager of botany, and possessed a botanic garden. Some of the species bear edible fruits: that of *E. malaccensis* is ovate, an inch and a half in diameter, flesh smelling like the rose, agreeable to the taste, and wholesome. It is generally cultivated between the tropics. *E. Jambos* bears smaller fruit, edible, but not so much esteemed; it is nevertheless excellent, resembling in appearance and flavor a Brussels apricot, and produced in great abundance in the stove. All the species grow freely in two-thirds loam and one-third peat, and flower abundantly when the plants are of a good size. Ripened cuttings strike root freely in sand under a hand-glass.

1120. *Caryophyllus*. The Arabs, who have been acquainted from all antiquity with the clove, called it *qarunfel*, which the Greeks altered into *Caryophyllon*. *Girofiter*, Fr. The fruit is thought to bear some resemblance to a nail, and hence is called clove, *clou*, Fr., *Chiode*, Ital., *Clavo*, Span., *Naghel*, Ger. and Dutch. The whole tree is aromatic, and the fruit or clove is considered as one of the hottest and most acrid substances of the aromatic class, and as such is often used, not only internally, but externally, as a stimulant; as in paralytic cases for example, in which the oil of cloves has been administered to advantage: it is also made use of in the tooth ache, in which it often succeeds in suddenly abating and subduing the pain. A tincture of cloves in rectified spirit is kept in the shops, as well as the essential oil, which latter is perhaps seldom free from sophistication. For culinary purposes, the uses of cloves are innumerable. The Dutch, who had for a long time the monopoly of the spice trade, prevented while they could the tree from being removed from the Moluccas and other islands, where it grows naturally; but the French now cultivate it in Cayenne and St. Domingo. There are a few specimens in the British gardens. It grows freely in loam and peat, and ripened cuttings are not difficult to root in sand, in moist heat under a hand-glass.

1121. *Myrtus*. From *μύρτος*, perfume. *Mugros* of the Greeks. *Le Myrte*, Fr., *Myrtle*, Ger., *Myrtus*, Dutch, *Mirto*, Ital. and Span., *Myrta*, Portug., *Myrtler*, Dan. and *Myrten*, Swed. The common myrtle is a well known popular shrub, which has been in English gardens for an unknown length of time; evidently from

History, Use, Propagation, Culture,

what Gerarde and Evelyn say, before the invention of greenhouses, and probably in that case preserved by covering or housing in rooms. It was a great favorite among the ancients, for its elegance, and its evergreen sweet leaves. It was sacred to Venus, either on this account, or perhaps because it flourishes most in the neighbourhood of the sea. Myrtle-wreaths adorned the brows of bloodless victors, and were the symbol of authority for magistrates at Athens. Both branches and berries were put into wine, and the latter were used in the cookery of the ancients. The myrtle was also one of their medicinal plants. All parts of it are astringent, but it is discarded from modern practice.

*M. coriacea*, sometimes called wild cinnamon, is a most elegant tree, with a handsome ash-colored straight trunk, and pyramidal head. It grows slowly, and flowers late twice a year. In old trees, the bark becomes white, and hangs down in shreds which have an aromatic quality. The timber is red, very hard, and used in mill-work. The berries, which are the size of peas, and of an agreeable aromatic smell and taste, are used in culinary purposes.

1122. *Calyptanthus*. From *καλυπτρον*, a lid, and *ανθος*, a flower, in allusion to the peculiar manner in which the segments of the calyx, being grown together, fall off.

*Zuzygium*, is so called from *συζυγος*, coupled, in allusion to the manner in which the branches and leaves are united by pairs. *C. Jambolana*, frequently called the Java plum, bears a black esculent berry. Cuttings of this genus, Sweet observes, "do not strike freely; ripened ones strike best in sand under a bell-glass; but the plants root best from layers." (*Bot. Cult.* 34.)

1123. *Pimenta*. A genus readily distinguishable from *Myrtus* by the structure of its ovary. It is a handsome tree, common in the hilly parts of the north side of Jamaica. The flowers are without shew, and are succeeded by spherical purple berries crowned with a persistent calyx; they are called Jamaica pepper or all-spice, from their taste being thought to resemble a composition of all other spices. The berries are gathered before being ripe, and are carefully dried on mats or terraced floors in the shade. In ten or twelve

- γ Leaves ovate-lanceolate acute

and Miscellaneous Particulars.

days they become wrinkled, dry, and of a dark brown color, and are then packed in bags or casks for sale. Some kiln-dry them by which the same object is sooner effected. The berries have an agreeable aromatic substringent taste, resembling that of a mixture of cinnamon, cloves, and nutmegs, with the warm pungent taste of the cloves; qualities which reside chiefly in the cortical part of the dried berry, and are better extracted by a watery infusion, than by spirit or distillation. They are much used in the kitchen, and also by the druggists to cover the disagreeable taste of other remedies, or to give them warmth. An oil is obtained by distillation which is said to be nearly equal to that of oil of cloves, and sometimes substituted for it.

1124. *Olynthia*. So named from *αλυθα*, a little fig or berry. A genus separated from *Myrtus* on account of the singular manner in which all the parts of the seed are consolidated. A small stove plant common in collections.

1125. *Stravadium*. The Malabar name of this plant is *Tsjera samstravadi*, from which *Stravadium* has been contrived. A fine tree with racemose flowers, and large, four-cornered, oblong fruit. A delicate stove plant rarely seen.

1126. *Eucalyptus*. From *eu*, well, and *καλυπτω*, to cover as with a lid; a name, therefore, with the same meaning as *Calyptranthes*, No. 1122. This genus consists of the loftiest timber trees of New Holland. Botanists knowing them principally from dried specimens, their respective heights cannot be stated correctly. They are all of the tallest habit, and soon grow beyond the limits of our stoves. In Van Dieman's Island a manufactory has been established for the preparation of extract of tannin from the bark of various species of *Eucalyptus*. A considerable quantity of the substance has been imported into England recently, and it is said to have been found by the tanners to be twice as powerful in its operation as oak-bark.

*E. resinifera* produces a gum resin something like the Kino of druggists (obtained from a species of *Pterocarpus*), and for all medical purposes full as efficacious.

All the species, Sweet observes, "are fine plants for a large conservatory, as they grow very fast, and are

History, Use, Propagation, Culture.

generally well clothed with beautiful foliage; they will also flower freely, when of a moderate size. The best soil for them is a mixture of loam and peat; and cuttings of them may be struck in sand under a bell-glass; but they are not so free to root, as most of this natural order are. (*Bot. Cult.* 189.)

1127. *Punica*. This fruit was called by the ancients *Malum Punicum*, Carthaginian apple; because, as Pliny tells us, the tree was first known to grow in the vicinity of Carthage. Hence has the term *Punica* been constructed. *P. nana* has very small fruit and flowers, and is used in the West Indies as a hedge-plant, as *P. Granatum* (from *granum*, grain, on account of the numerous grains of its fruit) is in the south of France and in Italy. The latter, in its wild state, is a thorny bush not unlike our hawthorn: the flowers have a fine appearance, and the fruit is very ornamental. It will produce fruit, trained against a south wall, in many parts of England; and under a glass-case, or against a fluted wall, it is probable, the fruit might be as highly flavored as that imported from Genoa and Leghorn. The flowers come out at the ends of the branches, singly, or three or four together; and, therefore, in pruning, care must be had to bring into action only the strongest buds. For this purpose, all the weak shoots should be cut out, and the stronger ones shortened, so as to produce bearing-shoots over the whole tree. The best soil is a rich strong loam.

The double-flowering varieties are to be treated in the same manner, and are highly ornamental.

1128. *Amygdalus*. The Greek name of the almond. The species are fruit-trees, or ornamental trees and shrubs, both much esteemed for the gay color and early appearance of their flowers. *A. Persica*, the peach and nectarine, bears the most exquisitely delicious of European fruits; it is more gratifying to the palate by its mass of juicy pulp than the grape, and more delicate than the melon. Some, however, prefer the grape and melon to the peach and nectarine; but the most delicate of taste consider the latter as surpassed only by the pine-apple. The varieties of peach and nectarine are numerous, and by raising from seed might easily be rendered innumerable. The best varieties have been raised in France, at Montreuil, a village of peach growers for the Paris market. Some good varieties have been raised in England by Mr. Knight, and other members of the Horticultural Society. The peach, to attain its proper flavor, must be protected by glass during the spring and earlier summer months, and exposed to the direct influence of the weather during the ripening process. Ripened under glass, unless very liberal supplies of air are given, the flavor will be very inferior. Mr. Knight considers that the direct rays of the sun (without the intervention of glass) are of great advantage to the proper ripening, and essential to the coloring of the peach.

Linnaeus divides the *A. Persica* into two varieties; that with downy fruit, or the peach, and that with smooth fruit, or the nectarine. There are various instances on record (*Hort. Trans.* vol. i. p. 103.) of both fruits growing on the same tree, even on the same branch; and one case has occurred of a single fruit partaking of the nature of both. The French consider them as one fruit, arranging them in four divisions; the *pêches*, or free-stone peaches, the flesh of whose fruit separates readily from the skin and the stone; the *pêches lisses*, or free-stone nectarines, or free-stone smooth peaches; the *pavies*, or cling-stone peaches, whose flesh is firm, and adheres

- 7002 Lid hemispherical obtuse, Cal. angular, Umb. panicled terminal  
 7003 Lid very long and cornute, Heads lateral solitary, Style persistent 3-4-fid at base, Leaves lin. lanceolate  
 7004 Leaves lanceolate subfalcate acuminate subovate at base oblique netted with veins beneath  
 7005 Leaves lanceol. unequal at base, on one side rounded with an incurved point, Branches axillary many-f.  
 7006 Leaves lanceolate with a long point at the base subovate oblique with parallel nerves beneath  
 7007 Leaves lanceol. with a short point wavy with parallel nerves beneath and a marginal nerve on both sides  
 7008 Leaves obl. unequal at base attenuated somewhat falcate with axillary 3-f. peduncles and sessile flowers  
 7009 Leaves lanceolate stalked, Pedunc. short axillary 6-12-flowered  
 7010 Leaves amplexicaul. with a short point glaucous beneath  
 7011 Leaves lanc. attenuated with a filiform point netted with veins beneath  
 7012 Leaves acute reticulated, the nerves united at the margin  
 7013 Leaves falcate at end, those on the branchlets small clustered  
 7014 Leaves linear narrowed at base obtuse veiny with nerves united on this side the edge  
 7015 Leaves 6 lines long and 1½ broad with the lateral parallel nerves united on this side the edge  
 7016 Leaves stalked cordate obtuse with nerves downy beneath, Branches and peduncles strigose  
 7017 Leaves amplexicaul. lanceolate with a long point glaucous beneath

- 7018 Leaves linear, Stem shrubby  
 7019 Leaves lanceolate, Stem arborescent

7020 Leaves with all the serratures acute, Flowers sessile solitary

7021 Lower serratures of the leaves glandular, Flowers scssile in pairs

- 7022 Leaves ovate attenuate at base simply and finely serrate  
 7023 Leaves oblong lanceolate serrate downy beneath  
 7024 Leaves lanceolate entire silvery perennial shorter than footstalk  
 7025 Leaves lanceolate doubly serrated

and Miscellaneous Particulars.

both to the skin and stone; and the *brignons*, or nectarines, or cling-stone smooth peaches. *Knight. (Hort. Trans. iii. 1.)*

The double-blossomed peach is one of the most ornamental of spring-flowering trees; its blossoms appear about three weeks later than those of the common peach.

*A. communis* and *amara*, and especially the former, are employed as ornamental trees in front of shrubberies, and in suburban gardens. In the south of France, Italy, Spain, and different parts of the Levant, they are cultivated for their fruit. In France they have above a dozen species or varieties, besides a hybrid called the almond-peach. (See *Duhamel*.) The common and bitter almond are only to be distinguished by the taste of the kernels of their fruit. The Jordan almonds, which come from Malaga, are the best sweet almonds brought to England; the bitter come chiefly from Magadore. The bitter cuticle of almonds is taken off by immersion in boiling water. The almond eaten as food is not very digestible, and requires to be well masticated.

Robertson (*Hort. Trans. iii. 382.*) and various botanists consider the peach and almond as one species.

Four distinguished and ingenious attempts have been made to class the varieties of peaches and nectarines by the leaf and flower as well as the fruit: the first is by Poiteau, in the *Bon Jardinier*; the next by Count Lelieur, in his *Pomone Française*; the third by Robertson, nurseryman, of Kilkenny, whose arrangement is founded on the glands of the leaves; and the fourth, and most important, by Mr. George Lindley, in the fifth volume of the Horticultural Society's Transactions. The latter writer has, in a peculiarly distinct manner, arranged no fewer than 155 sorts of peaches and nectarines in well defined divisions or sections.

The bitter almond contains less fixed oil, than the sweet almond, and a portion of prussic acid or hydrocyanic acid, upon which its narcotic power is supposed to depend. This variety is said to operate as a poison on dogs and some other animals, but not generally on the human species. The distilled water exerts an action not less deleterious than that of laurel water on the human frame. It produces vertigo, head-ache, tinnitis aurium, dizziness of sight, and vomiting, when taken to the extent of thirty drops only; and a drachm of it has killed a stout dog. When a large doze is taken, death almost instantly follows. In order to counteract its poisonous effects recourse is had to diffusibles, as brandy and ammonia; or three or four spoonfuls of oil of turpentine may be given at intervals of half an hour. The fixed oil, which both varieties of the almond yield by expression in large quantity, is insipid and inodorous when heat has not been employed.

Sweet almonds are used more as food than as medicine, but they afford little nourishment. Heartburn is said to be relieved by eating six or eight of them decorticated. When triturated with water, milky mixtures or emulsions are formed; and they are also used in pharmacy for assisting, by trituration, the combination of substances, such as camphor and the resins with water. Bitter almonds are scarcely ever used medicinally. (*London Dispensatory*, 151.)

*A. nana* and *pumila* are very ornamental shrubs, both in their double and single varieties.

History, Use, Propagation, Culture,

1199. *Prunus*. The origin of this name is wholly unknown. The Greeks called it *περουν*, and the Latins *prunus*. From this genus has been obtained the principal characters of that section of the natural order Rosacea, which is called Amygdaleæ or Prunaceæ, and which is curiously and chemically known by the presence of Prussic acid all in the species, and in all their parts.

*P. Padus* (a name of Theophrastus), the bird-cherry, is an ornamental tree, by its purple bark, leafy bunches of white flowers, and berries successively green, red, and black. It is common in the native woods of Scotland and Sweden, and in both countries the berries are infused in spirits in order to give them an agreeable flavor. The fruit is nauseous to the taste, though greedily eaten by birds. The bark is used by the Finlanders to cure venereal complaints, and also with success by regular practitioners in Stockholm for the same purpose. (*Stockholm Acts*.) The tree is very leafy, and dislikes a wet soil; but bears lopping as copsewood. The wood is beautifully veined, and used for cabinet work in France, as is that of *P. virginiana* in America.

*P. rubra* greatly resembles *P. Padus*. *P. caroliniana* is an imperfect evergreen.

*P. Lauro-cerasus* is one of our most popular evergreens. It was first brought from Constantinople to Holland in 1576; the first we read of in England was one at Highgate, in the garden of Mr. James Cole, a merchant of London, who, as Parkinson informs us, used to cover it in winter with a blanket. In less than half a century afterwards (1688), Ray informs us, the laurel was common in English gardens. It is now as universal in shrubberies as the rose. The kernel-like flavor of the fresh leaves has led to their use in flavoring custards and other culinary preparations; but as these leaves are poisonous, they ought to be used with caution. To brute animals the effect of the distilled water of laurel leaves is almost instant death; and two women in Dublin, and Sir T. Boughton in England, have been poisoned by it.

*P. lusitana* is a most beautiful evergreen shrub, nearly as universal as the lauro-cerasus. It was brought to England from Portugal, but does not appear to be a native of that country; probably of Madeira or some other islands possessed by the Portuguese in the sixteenth or seventeenth centuries.

*P. Mahaleb* (*Mahaleb* the Arabic name) flowers profusely, and disperses an odor resembling that of Clematis for a considerable distance around. Its fruit is round, shining black, and so hard that it has been bored for beads by the catholics. The wood is perfumed and used by the French in cabinet-work, especially in the village of St. Lucie, near Commercy, whence, among the French, the plant has obtained the name of *Bois de St. Lucie*.

*P. Cerasus*, the cultivated cherry, is by some considered a distinct species, and by others only a variety of *P. avium*, the cean or wild black cherry. Lucullus is said to have first introduced the cultivated cherry to Italy, in 73 A. C. from a town in Pontus in Asia, called *Cerasus*, whence its specific name, and it was introduced to Britain 120 years afterwards. Many suppose that the cherries introduced by the Romans into Britain were lost, and that they were re-introduced in the time of Henry VIII. by Richard Haines, the fruiterer to that monarch. But though we have no proof that cherries were in England at the time of the Norman conquest, or for some centuries after it; yet Warton has proved, by a quotation from Lidgate, a poet who wrote about

- 7026 Flowers racemose, Racemes pendulous, Lvs. decid. doubly serrat. somewhat rugose, Petioles with 2 glands  
 β Serratures of leaves less, Racemes more erect
- 7027 Flowers racemose, Racemes erect, Leaves deciduous doubly toothed smooth, Stalks with 4 glands
- 7028 Flowers in loose racemes, Lvs. decid. simply serrated: lower serratures glandular, Rib beard. towards base
- 7029 Flowers in lateral racemes, Leaves without glands oblong acuminate entire smooth on each side
- 7030 Flowers racemose, Racemes lateral, Leaves evergreen without glands oblong acuminate entire
- 7031 Flowers racemose, Leaves evergreen ovate-lanceolate serrated without glands
- 7032 Flowers racemose, Leaves evergreen with two glands at back
- 7033 Flowers corymbose terminal, Leaves ovate
- 7034 Umbels sessile aggregate few-flowered, Cal. acute, Branches virgate round, Leaves narrow lanceolate
- 7035 Umbels sessile aggregate few-fl. Sepals lanc. Stipules setaceous compound, Lvs. obl. oval suddenly pointed
- 7036 Umbels sessile, Leaves obovate obtuse smooth with glandular serratures
- 7037 Umbels somewhat stalked, Leaves ovate-lanceolate smooth folded together
- 7038 Leaves obovate acuminate flat serrated, Racemes pubescent
- 7039 Flowers racemose, Calyxes serrated, Leaves ovate serrated glandular at base
- 7040 Umbel sessile, Leaves ovate-lanceolate pubescent beneath folded together
- 7041 Umbel subsessile aggregate many-fl. at length panicle, Leaves obl. lanceolate serrated smooth
- 7042 Umbel sessile solitary few-fl. Leaves deciduous ovate acuminate finely serrated, Petioles with 2 glands
- 7043 Peduncles solitary, Leaves ovate acuminate smooth, Branches unarmed
- 7044 Fl. lateral clustered, Leaves doubly serrated roundish acute
- 7045 Peduncles subsolitary, Leaves lanceolate ovate convolute, Branches not spiny
- 7046 Peduncles twin, Leaves ovate villous beneath convolute, Branches spiny
- 7047 Peduncles solitary, Leaves elliptical smooth, Fruit pendulous, Branches nearly unarmed
- 7048 Umbel sessile clustered few-fl. Cal. obtuse, Branches angular prostrate, Lvs. can. lanc. glaucous beneath
- 7049 Buds clustered 2-fl. Ped. very short, Cal. smooth, Leaves oblong acum. serrulate, Branches spiny
- 7050 Pedunc. subsolitary, Leaves obovate-oblong acuminate doubly serrated
- 7051 Peduncles solitary, Leaves obovate obl. beneath glaucous serrated entire at base
- 7052 Peduncles solitary, Leaves ellipt. lanceolate pubescent beneath, Branches spiny
- 7053 Peduncles twin, Leaves ovate cut serrate without glands beneath white, Stem prostrate
- 7054 Flowers corymbose, Ped. elongated, Leaves oval oblong eroded membranous smooth
- 7055 Umbels sessile aggregate few-fl. Leaves ovate ellipt. acute smooth on each side with 2 glands at base
- 7056 Flowers sessile, Leaves subordinate

and Miscellaneous Particulars.

or before 1415, that the hawkers in London were wont to expose cherries for sale in the same manner as is now done early in the season. The tree is now very generally cultivated both as a wall and standard fruit, and has been forced for upwards of two centuries.

The Romans had eight varieties of cherry: in the British gardens are upwards of forty sorts. The French divide their cherries into *griottes*, or tender-fleshed; *bigarreaux*, or hard-fleshed; and *guignes*, or small fruits. The fruit of many varieties is somewhat heart-shaped, hence the very general cognomen; why some sorts are called dukes is not so obvious. The Morello cherry is very distinct from the other varieties, bearing almost exclusively on the preceding year's wood, and the pulp of the fruit having the consistence and flavor of the Morel, whence the name. Cherries are grafted or budded on seedlings from cherry-stones, or better from seedlings of the wild cherry. For dwarfing, they are worked on the bird cherry or perfumed cherry: the latter is preferred in Holland.

Cherry trees are very ornamental in shrubberies and woods, and valuable as encouraging the different species of thrush. The gum of cherry trees is eatable, and equal to that of gum arabic; the wood is hard and tough, and used by the turner and cabinet maker.

*Frumus Pesado*, Cerasus, the Chinese cherry, is of recent introduction, and most valuable on account of its bearing an excellent fruit, and producing it abundantly in a forcing-house.

*P. avium*, the gean, *guigne*, Fr., attains a large size, and its timber is of considerable value: the black corone cherry is supposed to be an improved variety of it, as are the different geans.

*P. domestica* is generally considered the original of the plum tree, *Prune*, Fr., *Pflaumen*, Ger., and *Prugno*, Ital. Many, however, conjecture that *P. insititia*, spinosa, and domestica, are the same species. There are several sorts of plums found wild in Britain, independently of the sloe, such as the bulcæ, damson, muscle, and winesour. The plum is said to love a lofty exposure, and to be favorable to the growth of grass under it. The bark dyes yellow, the wood is used in turnery, and the dried fruit or prune is formed into electuaries and gentle purgatives. Prunes were originally brought from Damascus, whence their name of damask, but are now chiefly imported from France.

There are a great many varieties of the plum in France, and in British gardens nearly a hundred sorts. By far the best dessert plum is the greengage, *Reine Claude*, Fr., *Regina Claudio*, Ital. It is well known throughout Europe, and perfectly distinct from every other variety. The damson is the best baking plum, and the winesour the best for sweetmeats. Plums are generally grafted or budded on muscle or damson stocks.

*Frumus Armeniaca*, *Abricot*, Fr., *Abricosenbaum*, Ger., *Albicocco*, Ital., *Albarcoque*, Portug. is a fruit tree next in esteem to the peach. From its trivial name, it is generally supposed to have originated in Armenia, but Regnier and Siedler assign it a parallel between the Niger and the Atlas; and Pallas states it to be a native of the whole of the Caucasus; the mountains there, to the top, being covered with it, Thunberg describes it as a very large, spreading, branchy tree in Japan. Grossier says, that it covers the barren mountains to the west of Pekin, that the Chinese have a great many varieties of the tree double-

History, Use, Propagation, Culture,

blossomed, which they plant on little mounts for ornament, and dwarfs in pots for their apartments. It appears from Turner's Herbal, that the apricot was cultivated here in 1562; and in Hackluyt's Remembrancer, 1582, it is affirmed, that the apricot was procured out of Italy by Wolfe, a French priest, gardener to Henry VIII. The fruit seems to have been known in Italy in the time of Dioscorides, under the name of *Præcocia*, probably, as Regnier supposes, from the Arabic, *Berkock*; whence the Tuscan, *Bacchoe* or *Albicocco*, and the English *Apricock*; or, as Professor Martyn observes, a tree when first introduced, might have been called a *præcox*, or early fruit; and gardeners, taking the article *a* for the first syllable of the word, might easily have corrupted it to *apricocks*. The orthography seems to have been finally changed to *apricot* about the end of the last century.

There are fifteen or twenty excellent varieties of apricot, besides the peach apricot, a large fruit supposed to be a hybrid between a peach and an apricot. The trees are generally budded on plum stocks, and always trained against walls. Apricots do not force freely.

1130. *Chrysohalanus*. From χρυσος, gold, and ἄλανος, an acorn; in allusion to the size, color, and form of its fruit. C. Icaëco (the West Indian name) bears flowers and fruit not unlike the plum, which is sold in the markets of the West Indies, and eaten both raw and preserved. Both species grow well in a sandy loam. Large cuttings root best, taken off at a joint, and planted thinly in a pot of sand, without having their leaves injured, and a hand-glass placed over them. (*Bot. Cult.* 39.)

1131. *Mespilus*. In Greek μεσπύλη, from μέσος, half, and πύλος, bullet; the fruit resembling half a bullet or round ball. In French it is called *nefle*, from the Celtic *naff*, which also signifies truncate. M. Germanica, bears a turbinate berry, which is eaten raw in a state of incipient decay. It is little cultivated, but one or two trees are generally introduced in shrubberies or in complete orchards. There are one or two varieties besides the wild sort; what is called the Dutch medlar is reckoned the best. It is grafted on seedlings of the

7085 Unarmed, Lvs. obovate obl. acuminate serrated smooth beneath, Rachis glandular above, Cal. smooth

## and Miscellaneous Particulars.

wild medlar, or on any other species of the same genus: often on the common thorn. The other species bears fruit similar to *M. germanica*, but more dry.

1132. *Crataegus*. From *καρτος*, force, on account of the extreme hardness of the wood of the original *Crataegus*, which appears to be what is now called *Pyrus aria*, the beam-tree. This is a very ornamental genus of small hardy trees, valuable for the neatness of their foliage, the earliness of their flowers in spring, and the rich colors of their berries in autumn.

*C. oxyacantha*, *αξυρ*, *αξυρδα*, sharp-spine, is the best hedge plant in Europe, and also furnishes some highly ornamental varieties, especially the double-blossomed and scarlet-blossomed.

The fruit of *C. odoratissima* is very agreeable. That of the Azarole (*al z'aroadr* Arabic, according to Castel and John de Souza) is much esteemed in the South of Europe. In this country it rarely arrives at perfection.

1133. *Pyrus*. From the Celtic *peren*, the Anglo-Saxons made *pere*, the English, *pear*, the French, *poire*, and the Latins, *pyrus*, or for the fruit, *pyrum*. From the Celtic word *api*, which also signified a fruit resembling an apple, the Greeks obtained *απις*, the English, *apple*, the Germans, *apfel*. To this day the French distinguish a tribe of small fruited apples by the name *api*.

*P. malus*, *Pomme*, Fr., *Apfel*, Ger., and *Pomo*, Ital., is the most popular of British fruits. None can be brought to so high a degree of perfection with so little trouble; and of no other are there so many excellent varieties in general cultivation, calculated for almost every soil, situation, and climate, which our islands afford. Very good apples are grown in the Highlands and Orkneys, and even in the Shetland isles, (*Caled. Hort. Mem.* vol. ii.) as well as in Devonshire and Cornwall; some sorts are ripe in the beginning of July, and others, which ripen later, will keep till June. Unlike other fruits, those which ripen latest are the best.

The tree attains a great age, is in general very prolific, and the timber is valuable for the turner, millwright

History, Use, Propagation, Culture,

and cabinet maker. The Romans had twenty-two varieties, and there are now several hundreds in Britain and France, and some excellent sorts from America. They are usually divided into dessert, baking, and cyder fruits; the first high flavored, the second such as fall or become mellow in baking or boiling, and the third austere, and generally fruits of small size. Besides this division, apples are classed as pippins or seedlings, pearmain or somewhat pear-shaped fruits, rennets or queens, specked fruits, calvilles or white-skinned fruits, russets or brown fruits, codlings or falling fruits, and burknots, which grow readily by cuttings. Most sorts of apple form ugly trees as standards, but are otherwise very ornamental in shrubberies from their blossoms. The crabs, and especially the varieties obtained from the Siberian crab, form much the handsomest heads, and have also more brilliant blossoms. The apple may be propagated by layers, and many sorts by cuttings; but the usual mode is by grafting on crab-stocks, and for dwarfing on stocks of the paradise apple.

*P. communis*, Poirier, Fr., *Birnbaum*, Ger., and *Pero*, Ital., is a fruit-tree next in popularity and value to the apple tree. It is a greatly superior dessert fruit, but not so valuable for culinary purposes and the press. There are fewer good sorts of pears, in proportion to the number of current varieties, than of apples; but a few, as the Jargonelles, Bergamots, Beurrees, Chaumontelles, &c. are most exquisite dessert fruits, and are much easier of digestion than the apple. It arrives in greater perfection in France and the north of Italy than in England. The Chaumontelles of Guernsey are in high repute, as are the St. Germain's and other sorts of Picardy, and the Beurrees of Milan. The Romans had thirty-six varieties, and there are many hundreds in the French and British nurseries, most of them good for little. Professor Van Mons, of Brussels, and M. Duquessie, of Mons, fruited about 8000 seedling pears, from which they obtained nearly 800 sorts worth cultivating. (Nesill's Hort. Tour.) The var. eties are divided into dessert and baking fruits; and also into melting or butter pears, *beurrees*, Fr., breaking pears, *crevers*, Fr., and perry, *poirée*, Fr., fruits. The tree is grafted on seedlings of the same species, and for dwarfing and precocity on the quince. It is a much handsomer upright growing tree than the apple, more durable, and its wood hard and valuable for the turner and millwright; but its blossoms being white, are less shewy than those of the apple.

*P. domestica*, and the other species of service are very ornamental trees; their leaves are mostly white

- 7086 Leaves ovate serrated, Pedunc. corymbose  
 7087 Leaves serrated downy beneath, Flowers corymbose  
 7088 Leaves lin. lanc. hoary white with down beneath, Fl. axillary solitary subsessile  
 7089 Leaves ovate stalked entire silky beneath, Flowers corymbose  
 7090 Umbel sessile, Leaves ovate oblong acuminate serrated smooth, Claws shorter than cal. Styles smooth  
 7091 Umbel sessile, Leaves oval oblong serrated smooth, Claws longer than cal. Styles woolly at base  
 7092 Umbel sessile, Pedunc. pubescent, Styles woolly at base, Leaves ovate acuminate  
 7093 Leaves equally serrulate, Pedunc. clustered, Apples like berries, Cal. deciduous  
 7094 Leaves cordate cut-serrate angular smooth, Pedunc. corymbose  
 7095 Leaves lanc. oblong shining tooth-serrated narrowed at base entire, Pedunc. corymbose  
 7096 Leaves roundish ovate cut serrate hoary beneath, Flowers corymbose  
 7097 Leaves ovate lanceolate cut-lobed toothed beneath snow-white, Flowers corymbose  
 7098 Leaves pubescent beneath pinnated with the last pinna very large pinnatifid and simple  
 7099 Leaves half pinnated downy beneath
- 7100 Leaves pinnated villous beneath  
 7101 Leaves pinnated smooth on both sides  
 7102 Leaves pinnated, Leaflets acute almost equally serrated and common petiole smooth  
 7103 Lvs. pinnated, Leaflets acuminate unequally cut serrated and common petiole smooth, Serratures bristly [mucronate]  
 7104 Leaves oval acutely serrated smooth, Fl. in corymbose heads  
 7105 Leaves ovate oblong entire somewhat downy, Peduncle simple downy corymbose  
 7106 Leaves oblong cuneate at base unequally and doubly serrated hoary beneath, Fl. corymbose  
 7107 Leaves oval serrated, Fl. solitary dioecious, Pet. linear the length of calyx
- 7108 Leaves downy deciduous  
 7109 Leaves smooth shining evergreen
- 7110 Leaves smooth deciduous
- 7111 Leaves oblong acute serrulate, Pedicels longer than calyx
- 7112 Leaves oblong lanc. distantly toothed, Pedicels shorter than calyx  
 7113 Leaves lanceolate distantly serrated, Panicle hairy
- 7114 Raceme imbricated with persistent foliaceous bractes, Petals roundish  
 7115 Leaves ovate lanceolate acuminate at each end, Pet. lanc. Stamens upright shorter than calyx  
 7116 Leaves long lanceolate, Stamens spreading longer than the calyx  
 7117 Leaves linear lanceolate, Sepals subulate much longer than stamens, Panicle contracted
- 7118 Leaves lanceolate serrated

and Miscellaneous Particulars.

underneath, and they are generally profusely covered with blossoms and fruit. Of *P. domestica* there are two varieties, the pear and apple-shaped, cultivated in some parts of France and near Genoa for their fruits. Those like the medlar and quince are not eaten till in a state of incipient decay. There are but few of the true service in English gardens, but the *P. hybrida* and *pinnatifida* are common, and their fruit, which resembles that of the mountain ash, is sometimes made use of.

*P. aucuparia* and *Americana* are handsome trees for shrubberies, the former very popular in suburban gardens.

1134. *Cydonia*. So called from being native of the ancient town Cydon in the Island of Crete; or perhaps it may be a corruption of *malus-cotonea*, by which the Latins designate the fruit. *C. vulgaris* is a deformed low tree, sometimes cultivated for its fruit, which is a pome with a persisting calyx like the medlar. It is used as a marmalade for flavoring apple-tarts. It prefers moist loam, and is raised by layers. It is most in use, however, as a stock for the pear. *C. japonica* is a beautiful low bush, remarkable for the brilliancy of its blossoms, which vary from the richest scarlet to the most delicate bluish color. It is hardy, and well adapted for single plants, upon grass, or for forming ornamental hedges in flower gardens.

1135. *Photinia*. So named, we believe, from *φωσ φωτος*, light, in allusion to the lucid surface of the leaves of the species. *P. serrulata* and *arbutifolia* are elegant shrubs, and nearly hardy. The latter succeeds perfectly against a south wall.

1136. *Raphiolepis*. From *ραφίς*, a needle, and *λεπίς*, a scale, in allusion to the numerous, subulate, persistent bractes, which are mixed among the racemes of flowers. Pretty Chinese small shrubs, formerly known under the collective name of *Crataegus indica*.

1137. *Eriobotrya*. From *ερίον*, wool, and *κόρυς*, a bunch of grapes, in allusion to the wooliness of its raceme. This genus is excellently characterized by the structure of its seed, of which the radicle is retracted within the cotyledons, not exerted as in all the other genera of Pomaceae. *E. japonica* produces an agreeable fruit about the size of a gooseberry, of a fine yellow color, and, according to Sir Joseph Banks, as good as the mango. To ripen it with flavor, it requires the temperature of the stove, and comes into use in March. It may be grafted on any species of the genus, or on the hawthorn.

History, Use, Propagation, Culture.

1138. *Amelanchier*. According to Cusius, *Amelanchier* is the old Savoy name of the plant. It has been adopted by Mr. Lindley as the title of a small group of plants nearly related to *Pyrus*, but curiously distinguished by the 10-cells of the ovary.

1139. *Cotoneaster*. Named in allusion to the cottony nature of the fruit and young branches of the most common species. Small inconspicuous bushes, with solitary pink flowers almost hidden among the leaves.

1140. *Waldsteinia*. Named by Willdenow, in honor of Franz de Waldstein, a distinguished German botanist. Plants with the aspect of *Potentilla* or rather *Geum*.

1141. *Spiræa*. *Sarica*, signifies a cord. *Spiræon* is Pliny's name for a plant the blossoms of which are used in garlands. That plant is thought to have been the *Viburnum Lantana*. This genus affords some orna-

7119 Leaves roundish elliptical acute pubescent beneath, Sepals smooth, Germen villous  
 7120 Leaves oblong elliptical cuspidate smooth, Sepals smooth, Germen pubescent  
 7121 Leaves roundish elliptical acute smooth, Petals obovate, Sepals and germen pubescent

7122 Leaves ovate rounded at base, Cal. and pedunc. naked  
 7123 Leaves elliptical obtuse at each end, Cal. and pedunc. woolly  
 7124 Leaves ovate acuminate a little hairy on each side, Cal. and pedunc. naked  
 7125 Leaves ovate attenuate at base, Cal. and pedunc. woolly

7126 Leaves radical stalked 5-lobed

7127 Leaves lanceolate entire sessile, Racemes compound

7128 Leaves oblong serrated smooth, Racemes decomound

7129 Leaves ovate elliptical acute at each end smooth coarsely serrated, Racemes spreading paniced

7130 Leaves lanceolate unequally serrate downy beneath, Flowers doubly racemose

7131 Leaves linear-lanceolate toothlitted smooth, Corymbs lateral

7132 Leaves obovate entire, Umbels sessile

7133 Leaves obovate cut-toothed at end, Corymbs stalked

7134 Leaves ovate lanceolate doubly toothed, Corymbs stalked

7135 Leaves broad ovate cut-serrate smooth, Corymbs terminal compound leafy

7136 Leaves obovate acute toothed at end 3-nerved, Corymbs close stalked

7137 Leaves oblong lanceolate serrated at end and entire, Corymbs stalked

7138 Leaves roundish bluntly lobed toothed, Umbels stalked

7139 Leaves obovate obtuse 3-lobed, Umbels lateral sessile

7140 Leaves obovate obtuse at the end bluntly and unequally 3-nerved, Corymbs axillary sessile

7141 Leaves ovate 3-lobed serrated, Corymbs stalked

7142 Leaves pinnated, Leaflets even serrated, Flowers paniced

7143 Leaves ovate acute smooth serrated stalked glaucous beneath, Cymes pubescent

7144 Leaves oblong bluntly and irregularly serrated, Flowers in dense corymbs

7145 Leaves obovate obtuse forwards doubly serrated smooth, Corymbs terminal compound, Flowers capitata

7146 Leaves supra-decompound, Spikes paniced, Flowers diiccious

7147 Leaves pinnated, Leaflets even serrated, Flowers corymbose

7148 Leaves pinnated downy beneath, The end lobe larger and 3-lobed; the side ones undivided

7149 Leaves pinnated smooth, The end lobe 7-lobed; the lateral 3-lobed, Corymbs proliferous

7150 Stipules linear entire, Calyx tubular campanulate

7151 Stipules leafy ovate cut-toothed, Calyx campanulate

7152 Leaves spatulate oblong, Joints of stem tumid, Fl. stalked

7153 Flowers sessile, Leaves linear oblong flat

7154 Leaves linear lanc. revolute at edge, Fl. terminal sessile

7155 Leaves lin. spatulate, Joints of stem equal, Fl. stalked

7156 Leaves lanc. spatulate, Joints of stem creeping filiform, Fl. stalked

7157 Leaves cuneiform ovate, Flowers sessile

7158 Leaves roundish cuneiform pilose, Fl. sessile, Cal. hairy

7159 Leaves lanceolate, Flowers sessile apetalous

7160 Leaves lanceolate, Flowers paniced

and Miscellaneous Particulars.

mental shrubs, free flowerers, and of easy culture; as *S. salicifolia*, *hypericifolia*, *tomentosa*, &c. The herbaceous species, especially *filipendula*, *ulmaria*, and *aruncus*, are also very ornamental.

1142. *Gallenia*. A genus well divided by Monch from *Spiraea*, from which it differs in so many respects as to make it astonishing that the species should ever have been referred to that genus, even by the most unreasonable advocate of the exploded doctrines of synthetical botany. Pretty North American plants with lobed discolored leaves, and white flowers.

1143. *Securinum*. Meaning of the name unknown. Inelegant plants with the habit of purslane.

1144. *Azoon*. From *αει*, always, and *ζωον*, alive, always alive, or evergreen. A name given by the Greeks to the *Sempervivum*. This is an uninteresting genus, only known among the curious.

History, Use, Propagation, Culture,

1145. *Tetragonia*. From *τετρας*, quaternary, and *γωνια*, an angle, in allusion to the four angles of the body pericarpium. The species are succulent trailers of no beauty, but possibly all fit to be used, like *Chenopodium*, as a spinage. *T. expansa* has been so used by Captain Cook when visiting New Zealand, and lately introduced for the same purpose in British gardens; as a summer spinage, it is as valuable as the orache, or perhaps more so. Every gardener knows the plague that attends the frequent sowing of common spinage through the the warm season of the year; without that trouble it is impossible to have it good, and with the utmost care it cannot always be obtained exactly as it ought to be, (particularly when the weather is hot and dry,) from the rapidity with which the young plants run to seed. The New Zealand spinage, if watered, grows freely, and produces leaves of the greatest succulency in the hottest weather. Anderson, one of its earliest cultivators, had only nine plants, from which, he says, "I have been enabled to send in a gathering for the kitchen every other day since the middle of June, so that I consider a bed with about twenty plants quite sufficient to give a daily supply, if required, for a large table."

- 7161 Herbaceous, Leaves ovate rhomboid, Fruit with 4 horns  
 7162 Frosted, Leaves ovate sessile, Fruit not horned  
 7163 Shrubby, Leaves linear, Fruit winged  
 7164 Shrubby frosted, Leaves obovate, Fruit winged  
 7165 Procrumbent, Leaves sessile lanceolate decumbent, Wings of fruit 8 alternately smaller  
 7166 Smooth herbaceous erect, Lower leaves ovate: upper lanceolate smooth, Fl. racemose  
 7167 Smooth herbaceous, Leaves ovate stalked, Fruit winged  
 7168 Herbaceous, Leaves rhomboid ovate, Fruit ubinate  
 7169 Leaves alternate linear revolute at edge with a dorsal line above  
 7170 Leaves alternate frosted obovate with winged decumbent stalks

§ 1. Stem none or very short, Root perennial, Leaves large.

- 7171 Whitish polished unarmd, Flower with a long tube  
 7172 Smooth rather glaucous with branched confluent spots, Ovary exerted  
 7173 Smooth green with great confluent branched spots, Ovary included  
 7174 Glaucous, Spots branched confluent, Ovary included  
 7175 Green, Spots confluent wart-like, Ovary included  
 7176 Pyriform glaucous retuse at end, Spots generally distinct green and obsolete  
 7177 Very depressed and rather glaucous, Spots nearly distinct, Ovary exerted  
 7178 Somewhat hoary and pubescent much depressed  
 7179 Nearly globose pale green berry-shaped with little dark scarcely confluent spots  
 7180 Glaucous smooth, Ends of the leaves unequally distinct flat above  
 7181 Leaves about 4 broadly ovate or parabolic half rounded expanded  
 7182 Leaves 6-8 oblong-ovate half round erect  
 7183 Green, Leaves unequally half rounded acinaciform obtuse  
 7184 Whitish, Leaves equally half rounded very blunt  
 7185 Stemless, Leaves rounded very smooth  
 7186 Leaves perfect about 4 clavate 3-cornered very thick glaucous with many large dots
- 7187 Leaves hoary at the base half rounded and thin upwards gibbous and keeled  
 7188 Stemless, Leaves entire half round green marbled at the end keeled 3-cornered  
 7189 Stemless, Lvs. glaucous towards the end and the bractes incurved and toothed, Pedunc. length of leaves  
 7190 Leaves glaucous, Marginal fringes numerous very deep  
 7191 Nearly seml. Lvs. glauc. towards end entire or with large teeth, Bractes entire, Pedun. longer than leaves  
 7192 Stemless smooth whitish, Lvs. half round entire at end keeled 3-cornered little thickened with a recurved  
 7193 Stemless very smooth white, Leaves thick subulate 3-cornered obtuse with a point [point  
 7194 Green stemless, Leaves cordate ovate expanded marbled with white and with a deep fringe  
 7195 Stemless glaucous, Leaves deeply tooth-fringed obsolete dotted with a cartilaginous keel at end  
 7196 Stemless green with clear spots, Leaves 3-cornered towards the end with a shortly toothed fringe  
 7197 Nearly stemless glaucous, Leaves with 3 rows of toothed fringe and small dots  
 7198 Leaves exactly hatchet-shaped, The old stem nearly six inches high and erect  
 7199 Leaves keeled 3-cornered green, Scape strong paniced 2-edged  
 7200 Leaves erect incurved keeled upwards long glaucous rugose with large dots  
 7201 Leaves very glaucous triquetrous compressed at the end with a dilated keel which is often toothletted

- 7202 Leaves obt. dotted with gibbous pustules at the base in the inside, Stem strong short decumbent branch.  
 7203 Stemless, Leaves connate dotted half round at the end triquet. reflexed acute. Fl. sessile, Cal. cylin. 6-fid  
 7204 Nearly stemless, Leaves hoary glaucous obtuse towards the end with a few spots, Cal. 4-fid  
 7205 Nearly stemless, Leaves glaucous very blunt with many dots, Cal. 2-4-fid  
 7206 Nearly stemless branched, Leaves subul. elong. dott. very glauc. Bractes 4 crossing shorter than scape  
 7207 Stemless, Leaves subulate elongated acute glauc. much dott. Bractes 2 longer than scape  
 7208 Like the last, but leaves half cylindr. connate warted outside  
 7209 Leaves obl. at the base inside with elevated pustules, Old stem three inches long decumbent  
 7210 Leaves papulose iced, the first pisiform, the next half round, the stem much branched corky

and Miscellaneous Particulars.

The seed should be sown in the latter end of March in a pot, which must be placed in a melon-frame; the seedling plants, while small, should be set out singly in small pots, and kept under the shelter of a cold frame, until about the twentieth of May, when the mildness of the season will probably allow of their being planted out, without risk of being killed by frost. The plants must be put out three feet apart in very rich soil. In five or six weeks from the planting, their branches will have grown sufficiently to allow the gathering of the leaves for use. In dry seasons, the plants will probably require a good supply of water. They put forth their branches vigorously as soon as they have taken to the ground, and extend before the end of the season three feet on each side.

1145. *Mesembryanthemum*. From *uservu2610*, the mid-day: on account of the flowers usually expanding at that time: the termination *anthemum*, which signifies flowering, is, to say the least of it, superfluous. The species of this extensive genus are singular, yet beautiful, and some even splendid plants. Their leaves are of odd shapes, and the habits of most of the sorts slovenly and insignificant, though some are grotesque; but the

History, Use, Propagation, Culture,

flowers make ample amends by their profusion, the brilliancy of their colors, and the length of time the species continue in flower. Few are annual, fewer biennial, many are perennial, but most are shrubby,

- 7211 First leaves connate spheroidal, next half round subulate very long recurved green  
 7212 Leaves sloping graver-shaped very broad thickest on one edge at the base inside pimpled, Fl. sessile  
 7213 Nearly steml. Lvs. tongue-shaped thick; one convex blunt at end, the other with a long keel, Fl. stlkd. frag.  
 7214 Leaves obliquely tongue-shaped pale green very soft, the younger ciliated pubesc. hooked inwards at end  
 7215 Nearly stemless, Lvs. tongue-shaped sloping 4-inches long, 1-broad cultrate, Pedunc. an inch long  
 7216 Nearly stemless, Lvs. distichous tongue-shaped at the edge and end cultrate, Fl. stalked  
 7217 Leaves long very green and polished, Pedunc. longer than calyx, Caps. small depressed  
 7218 Leaves broad tongue-shaped ascending obtuse green longer than peduncles  
 7219 Leaves tongue-shaped ascending 5-6-in. long, 3-11-lines broad, with large pimples at the base inside  
 7220 Leaves long tongue-shaped shining thinner, Flowers subsessile, Caps. large depressed

7221 Leaves unequally tongue-shaped thick green partially keeled, Caps. little elevated subsessile

7222 Leaves tongue-shaped obtuse thick often sloping and a little hollowed, Caps. large conical subsessile

7223 Prostrate, Lvs. narr. tongue-shaped obt. recurved depressed variously bent inwards at end, Caps. depressed

7224 Leaves lin. tongue-shaped half cylindr. very soft cruciate, Old stem three inches long

7225 Leaves bifarious obliquely crossed half round obt. very thick yellowish green incurv. Old stem 6 in. high

7226 Stemless, Lvs.  $\frac{3}{4}$  cylin. subul. variously obliquely hooked blunt with broad smooth spots at base, Caps. flat  
 [half included]

7227 Lvs. crossing suberect or spreading half round subulate acute soft often pustulate at base, Ovary exerted

7228 Stemless, Leaves green deformed the upper longest [stalked]

7229 Leaves linear linguiform half cylindrical very long

7230 Lvs. obliquely cruciate long variously obliquely deformed with one or more obscure teeth, Old stem 3-6-in.

7231 Lvs.  $\frac{3}{4}$  cylin. thick soft with two large opp. fleshy teeth beyond the midd. at the end variously and obliquely  
 [deformed]

7232 Lvs. very narr. tongue-shap.  $\frac{3}{4}$  round towards end oblique with 1 or 2 obsolete teeth, Old stem branch. 6 in.

7233 Nearly stemless, Leaves yellowish green spreading ovate half cylindrical rarely keeled at end

7234 Stem weak two or three inches long, Lvs. obl.  $\frac{3}{4}$ -cylindr. upwards 3-cornered yellowish green

7235 Stem weak two or three inches long, Leaves half-cylindr. 3-cornered or subovate very green

7236 Leaves downy hoary or silky smooth

7237 Leaves subulate glaucous at the base above flat, Styles 8

7238 Leaves obsubulate thick obtuse green

7239 Leaves 3-cornered cylindr. subglaucous dotted 3 inches long, The old stem 3 inches closely branched

7240 Lvs. 4 in. long green roundish or cylindr. : the younger polished  $\frac{3}{4}$  round very green the old stems 6 in.

7241 Leaves 3-cornered rounded very thick green dotted two inches long [polished]

7242 Leaves 3-cornered blunt with three rows of teeth at end, The old stem branched half shrubby

7242 Leaves half round subulate incurved with clear spots, Spots obsolete not wrinkled

7244 Leaves half round subulate incurved with clear spots, Spots large numerous with a white head

7245 Leaves half round subulate incurved with clear spots, Spots nearly middle sized with a little white point

$\frac{1}{2}$  2. Cluster-leaved. Stem about a foot high decumbent perennial, Leaves in capitate clusters, Flowers polygamous, Calyx 5-leaved.

7246 Lvs. capit. closely clustered  $\frac{3}{4}$  cylindr. 3-cornered elong. recurv. somewhat glaucous, Stems roundish white

7247 Lvs. capitate closely clustered long 3-cornered half cylindr. glaucous or green, Stems angular red

7248 Lvs. somewhat clustered long  $\frac{3}{4}$ -cylindr 3-cornered minutely wrinkled, Stems prostrate with distant joints

7249 Leaves clust. longish broad erect half cylindr. 3-cornered shining, Joints close, Styles 12

and Miscellaneous Particulars.

especially towards the base. Leaves mostly opposite, seldom alternate, thick, or succulent, of various forms. Flowers solitary, axillary, or extra-axillary, but more frequently terminating. The fruit is some-

times shaped like a fig. Linnaeus arranged the species from the color of the flower; Haworth chiefly from the leaves.

7250 Leaves clust. 3-cornered  $\frac{1}{2}$  cylindr. very long glaucous incurved, Stems scarcely angular, Joints distant

7251 Leaves in pairs coriuculate Incurved  $\frac{1}{2}$  cylindr. 3-cornered glaucous, Stems flexuose procumbent

7252 Leaves exactly cylindr. three inches long acute green, Styles 20

7253 Leaves glaucous about a foot long 3-cornered, Angles dilated with a broad furrow, Stem simple

7254 Leaves somewhat glaucous 6-7 inches long 3-cornered, Old stem simple

7255 Leaves green 3-4 inches long 3-cornered, Old stem two inches high simple erect

7256 Leaves dagger-shaped long glittering, Stem shrubby perennial

7257 Leaves glauc. about a span long bluntly 3-cornered channelled or half round, Root large tuberous fleshy

§ 3. *Trailers. Stems prostrate or creeping, angular, Calyx 5-leaved, Flowers polygynous, Leaves connate at base acutely 3-cornered.*

7258 Branches long slender spreading, Lvs. equilateral 3-corn. green hooked a little outwards at end, Fl. 3 or 2

7259 Lvs. equilateral 3-corn. glauc. much dotted straight at end lon. than joints, Edges not serr. Stems firm proc.

7260 Lvs. conn. comp. 3-corn. very green warts often short. than joints, Edges finely tooth. Branches very sen.

7261 Runners  $\frac{1}{2}$  foot long slender rooting, Lvs. clustered compressed 3-corn. bright green not rough at edge

7262 Leaves long equilateral 3-cornered straight roughish at edge, Stem firm procumbent

7263 Leaves compressed 3-cornered large recurved serrulate very rough, Old stems firm decumbent [decum.

7264 Lvs. bright green clust. thick comp. 3-corn. acinacif. dott. lon. than joints with rough edges, Stems short

7265 Lvs. comp. 3-corn. acinacif. glauc. not serrated and scarcely cartilaginous at edge generally lon. than joints

7266 Lvs. comp. 3-corn. greenish rugose the edges with cartilaginous serratures generally shorter than joints

7267 Leaves acinaciform, Edges curled wavy rough

7268 Leaves acinaciform polished glaucous with entire cartilaginous edges

7269 Leaves acinaciform with the edges and keel rough and red

7270 Leaves compressed 3-cornered acinaciform and equilateral, Every edge roughish

7271 Old leaves equilateral 3-cornered green incurved three inches long blistered inside at base, Keel serrulate

7272 Leaves about two inches sharply 3-cornered, the old ones comp. with their keel upwards serrulate burnt

7273 Young lvs. incurved equilateral 3-cornered soft glauc. with a cartilaginous smoothish white edge, Styles 7

7274 Leaves acinaciform or compressed 3-cornered glauc. with a pink smooth cartilag. edge, Stems prostrate

7275 Leaves not equilateral 3-cornered greenish, Stems prostrate, Pedunc. terminal solitary winged, Styles 8

7276 Leaves equilateral 3-cornered greenish, Edges smooth cartilaginous, Stems weak prostrate

7277 Lvs. comp. 3-corn. acinacif. smooth dotted green, in the inside at the base blistered, Keel roughish at edge

7278 Leaves clustered 3-cornered acute glaucous with large rough pellucid dots, Stems filiform very weak

7279 Leaves glaucous dotted 3-cornered incurved smooth

7280 Leaves 3-cornered not dotted smooth very green half cylindrical at base

7281 Leaves clustered obsoletely 3-cornered clavate obtuse green with a little point

§ 4. *Perfoliate. Leaves connate sheathing generally three-cornered upwards, usually hooked at end, Calyx 5-leaved.*

7282 Leaves 3-cornered compressed green prickly at end, Stem 2-edged decumbent

7283 Leaves erect white smooth 3-cornered thick sheathing beyond their middle with a cartilaginous edge

7284 Leaves 3-cornered subacinaciform white at edge, Keel dilated

7285 Leaves beaked connate half round subulate recurved dotted green, Stems prostrate branched knotty

7286 Leaves white thick hard dotted usually with about three spines beneath, Branches few

7287 Leaves whitish thick dotted recurved at end usually with one spine beneath, Branches many

7288 Leaves greenish with two spines beneath at the end

7289 Branches simple slender upright hard, Lvs. 3-cornered dotted white with 1-4 teeth at the back upwards

7290 Leaves quite entire very green smooth thick hooked backwards at the end

7291 Leaves acute-angled 3-cornered acum. incurved recurved green rough at edge

7292 Erect, Lvs. usually close recurved smooth green with the angles roughish above, Sheath often sharp

7293 Erect roughish, Lvs. about an inch long spreading straight recurv. at end, Sheaths green smooth, Angles [rough upwards

and Miscellaneous Particulars.

Most of the species are so hardy, that on dry rock-work, in a sheltered part of the garden, they will endure ordinary winters. Every thing, however, depends on keeping them dry. Among the hardy sorts may be reckoned

History, Use, Propagation, Culture,

M. hispidum, striatum, barbatum, crassifolium, glaucum, uncinatum, corniculatum, &c. Hardy, and yet showy sorts, are M. inclaudens, aurantium, perfoliatum, deltoides, barbatum, &c. These will grow and

- 7294 Leaves half an inch long smooth suberect, Keel not serrulate, Stem three feet high and branches erect  
 7295 Lvs. about three lines long horiz. and sheaths smooth, Keel rough at end, Branches very stiff and spread.  
 7296 Lvs. 3 lines long and more spreading thin and sheaths rough at edge, Branches filiform decumbent  
 7297 Lvs. somewhat compressed 3-cornered glauc. about one inch long, Branches many erect, Cal. turbinate

7298 Leaves somewhat compressed 3-cornered glaucous and the branchlets spreading

7299 Leaves distant roundish somewhat glaucous roughish with dots, Sheaths tumid at end

7300 Leaves remote greenish smooth about an inch and half long recurved at end, Sheaths tumid at end

7301 Leaves somewhat glaucous smooth clustered obtuse an inch long with a recurved point

7302 Leaves connate incurve-recurved blunt, Keel roughish at end with a sheathing line at base

§ 5. *Delta-leaved. Leaves more or less deltoid or hatchet formed. Flowers pink.*

7303 Leaves subulate 3-cornered dotted with the keel serrated backward

7304 Leaves glaucous compressed 3-cornered gladiate, Keel cartilaginous torn, Petals much longer than calyx

7305 Lvs. clust. not dotted glauc. shortly falcate gladiate, Angles cartilag. Petals much shorter than calyx

7306 Lvs. clust. compressed 3-cornered shortly acinaciform glauc. entire dotted with a cartilaginous edge

7307 Leaves distinct clust. equilaterally 3-corn. shortly acinaciform green dotted with a cartilaginous edge

7308 Lvs. subdelt. smooth very green with a gibb. entire keel, Pet. not closing: the inner imbricate very short

7309 Leaves clustered glaucous long 3-cornered deltoid, The sides not toothed, Keel entire

7310 Leaves clust. very glauc. 3-corn. deltoid toothed in three rows, Keel of the bractes and sepals entire

7311 Leaves clust. deltoid with the bractes and sepals 3-cornered glaucous toothed in three rows

7312 Leaves 3-corn. acuminate awned green blistered inside at the base, Branches much clustered

7313 Leaves obl. ovate acute glaucous 3-corn. with a little white point at end

7314 Leaves connate at base oblong ovate half round not pointed, the winter leaves joined almost to the end

7315 Leaves acute equilaterally 3-corn. cymbiform grey obsoletely dotted with a downy fringe and recurv. point

§ 6. *Triquetrous. Leaves more or less 3-cornered distinct. Cal. 5-leaved. Styles 5.*

7316 Leaves large clustered much compressed 3-corn. incurved very glaucous, Stem woody erect bushy

7317 Leaves small much clust. somewhat connate compressed 3-corn. closely incurved, Branches clustered

7318 Leaves minute distinctly compressed 3-cornered falcate, Branches numerous filiform

7319 Leaves much compressed 3-corn. very glauc. attenuate at each end incurved, Branches much clustered

7320 Leaves compressed 3-corn. very glaucous attenuate at each end acinaciform, Stem erect

7321 Leaves 3-corn. clust. robust incurved very glaucous, Stem erect much branched

7322 Leaves much clustered thick acinaciform falcate with large spots glaucous

7323 Lvs. bluntly 3-corn. comp. glauc. incurv. atten. at each end, Pedunc. and branches erect filiform comp.

7324 Lvs. clustered falcate inflexed from 3-cornered half round compressed subglaucous smooth

7325 Leaves subtriquetrous green shining warted very rough, Sepals ovate acuminate, Petals crenate at end

7326 Leaves subtriquetrous glaucescent warted very rough, Sepals ovate-acuminate, Petals two toothed at end

7327 Leaves subtriquetrous very glaucous rough, Sepals and petals distant reflexed, Stamens clust. Bark white

7328 Erect woody, Leaves lin. obsoletely 3-corn. smoothish glauc. white imbricated at the ends of old branches

7329 Leaves subtriquetrous glauc. roughish attenuated downwards, Stems clust. deflexed, Pet. very numerous

7330 Leaves subtriquetrous glauc. attenuated upwards smooth, Keel roughish, Branches distant filiform

7331 Leaves small glauc. 3-corn. rough, Branches bushy clust. The young bark brown, Flowers panicled

7332 Leaves small often longer than the joints but inwards by pairs glauc. 3-corn. obtuse smooth

7333 Leaves much clust. strong incurved-recurved clavate compressed dotted glaucous, Branches bushy

7334 Leaves compressed bluntly 3-corn. roughish with dots glaucous, Sepals like spines spreading

7335 Leaves subglaucous subtriquetrous rough, Calyxes spiny, Petals deeply emarginate

7336 Leaves distinct remote subrecurved triquetrous much comp. dotted glauc. Keel gibbous above middle

7337 Leaves distinct distant triquetrous compressed acute subglaucous dotted, Branches twiggy

7338 Leaves green, Bractes 4 broadly ovate keeled embracing the calyx, Pet. white at base, Branches fuscous

7339 Branches decumbent 2-edged brown, Leaves acinacif. 3-corn. with sides membranous downwards, Dots [large pellucid elevated

and Miscellaneous Particulars.

flower vigorously if planted in a bed in the open air and protected during winter, or if planted in a common pit, and matted over during frost.

History, Use, Propagation, Culture,

M. nodiflorum grows wild in Italy and Egypt, and in the latter country is burnt for potash, which it produces in excellent quality.

- 7340 Leaves glauc. slender roughish, Bractes ovate acute almost surrounding the calyx, Branches very slender [straight]
- 7341 Leaves glaucous, Bractes broad ovate, Branchlets clustered, Stem hoary
- 7342 Leaves glauc. equilateral 3-corn. very rough, Bractes ovate acute embracing the peduncles upwards
- 7343 Leaves 6-12 lines long half erect glauc. with little pellucid rough dots
- 7344 Leaves compressed 3-corn. longish bluish-green with rough pellucid dots, Keel usually onetoothed
- 7345 Low, Leaves green sparkling in the sun and branches very dense, Flower-stems decumbent
- 7346 Lowish, Lvs. glauc. 3-corner. and branches very close, Fl.-stems ascending or erect, Styles obovate twice [as short as stamens]
- 7347 Leaves green sparkling in the sun and branches close, Flower-stems erect
- 7348 Lvs. close compressed 3-cornered very green, Ped. longer than bract, Flowers spreading flat in the sun
- 7349 Leaves compressed 3-cornered glaucous, Branches stout, Pedunc. clavate, Corolla incurved
- 7350 Leaves cylindrical 3-cornered, Petals orange, Styles dark purple
- 7351 Lvs. cymbiform pale-green with large dots, Branches few 2-edged hoary
- 7352 Lvs. very glauc. 3-corn. compressed, Sepals obl. ovate, Pet. deep orange imbricated, Styles purple outside
- 7353 Lvs. acutely 3-corn. much compressed glauc. roughish, Sepals ovate cordate, Pet. sulphur, Styles yellow
- 7354 Leaves 3-cornered obtuse expanded glaucous with large spots, Stem much branched woody stiff erect
- 7355 Leaves 3-cornered spreading cymbiform glaucous, Stems branched, Branches filiform nearly erect close
- 7356 Lvs. distinct 3-corn. ovate granular 3 lines long, Flowers yellow opening in the evening, Stems expanded
- 7357 Leaves spreading turgid 3-cornered hoary bluntly dotted at edge, Branches clustered 2-edged decumbent
- § 7. *Slender, Leaves distinct, dotted, rounded, without warts, Flowers opening in the morning, red, orange, or yellow.*
- 7358 Lvs. rounded 3-corn. somewhat compressed obt. glauc. Pedunc. smooth at base, Sepals obt. nearly equal
- 7359 Leaves 3-cornered acute green, Pedunc. and cal. unequal rough, Petals yellow inside
- 7360 Leaves about 3-cornered very green, Pedunc. in fruit clavate, Sepals very unequal, Branches loose
- 7361 Leaves half round subcompressed subulate green smooth longer than joints, Stems erect or procumbent
- 7362 Lvs. 3-corn. compressed glauc. rough, Sepals unequal, Petals changing from yellow to pink, Stems effuse
- 7363 Branches and lvs. cylindrical subul. spiniform erect recurved at end, Pedunc. and keels of bractes rough
- 7364 Lvs. distant expanded at base incurv. half round subul. Branch. firm suberect roughish angul. compressed
- 7365 Lvs. 3-cornered subulate incurved below hooked at end, Branches filiform compressed wavy decumbent
- 7366 Leaves clustered half cylindrical acuminate much recurved at end, Branches erect very close
- 7367 Tufted, Leaves clustered half cylindrical acuminate with filiform very weak creeping stems
- 7368 Leaves rounded 3-cornered dotted distinct, Spines branched
- 7369 Leaves long rounded 3-cornered subulate incurved glaucous edged at base
- 7370 Leaves rounded incurved smooth thickest in middle glaucous, Stem straight branched
- 7371 Flowers terminal 5, Two sepals deeply divided
- 7372 Leaves subulate rounded 3-cornered acute somewhat incurved very glaucous, Bark chestnut-colored
- 7373 Leaves clustered cylindrical obtuse arcuate glaucous smooth
- 7374 Leaves connate at base very close and glaucous 3-cornered cylindrical soapy, Flowers afternoon
- 7375 Leaves clustered 3-cornered half cylindrical mealy obtuse shorter than joint soapy, Sepals very unequal

§ 8. *Warted, Leaves and branches almost always more or less warted, Root biennial or annual.*

- 7376 Leaves large ovate acute wavy frosted with three nerves beneath, Root biennial
- 7377 Leaves large altern. ovate much wavy, as are the stems and cal., bespangled with ice drops, Root annual
- 7378 Leaves oblong pinnatifid pimpled, Petals minute yellow
- 7379 Leaves flat spatulate and stems pimpled, Branches divaricating, Fl. sessile
- 7380 Leaves amplexicaul. spatulate keeled, Pimples conical rough, Petals very minute
- 7381 Leaves opp. and altern. ovate spatulate wavy pimpled, Branches and calyxes angular, Fl. afternoon
- 7382 Leaves altern. lanceolate bluntnish pimpled, Calyxes stalked crystalline
- 7383 Leaves stalked cordate ovate, Stems procumbent spreading, Cal. 4-cleft 2-horned
- 7384 Leaves broad lanceolate flattish smooth ciliated distinct, Stem peduncle and ovaries hairy
- 7385 Leaves opp. lanc. acute subciliate, Pedunc. solitary subterminal very long hairy, Sepals lanceolate
- 7386 Lvs. lin.-lanc. ciliated, Stems branched effuse, Pedunc. bractes and cal. shorter than flower woolly villous
- 7387 Leaves lin.-lanc. scarcely spatulate and calyx ciliated, Sepals linear thick or turgid, Pedunc. scabrous
- 7388 Leaves spatulate flat smooth, Pedunc. very long, Cal. flat at base angular
- 7389 Leaves opp. spatulate blunt rough, Pimples oblong, Sepals oblong blunt contracted in middle

and Miscellaneous Particulars.

M. crystallinum is a popular hothouse annual, which does well in the open air in the summer season.  
 M. umbellatum forms one of the handsomest shrubs of the genus, standing without support with a stout

History, Use, Propagation, Culture,

stem, two or three feet high, with terminating white flowers, which open, when the sun shines, from seven or eight in the morning to two or three in the afternoon, and smell like those of the hawthorn. The fruit of M. edule is eaten by the Hottentots and Dutch inhabitants of the Cape, and is called Hottentots' figs.

7390 Leaves linear inflexed channelled blunt rough, Pedunc. and calyx jewelled with crystals

- 7391 Leaves pubescent connate not dotted, Stem hairy [of leaves  
7392 Leaves filiform half round distinct, Pimples ovate, Fl. lateral sessile: the terminal surrounded by a pair  
7393 Leaves amplexicaul. distinct linear flat above pimples longer than joints, Fl stalked  
7394 Leaves alternate roundish obtuse paired at base  
7395 Leaves opp. connate half round, Stipules membranous reflexed torn fringe-like  
7396 Leaves half round papulose distinct, Fl. sessile axill. Cal. 4-cleft  
7397 Leaves alternate lanceolate flat not dotted, Stems lax simple, Cal. 5-cornered  
7398 Leaves flattish lanceolate not dotted spreading distinct opp. and altern. remote  
7399 Leaves lanc. acuminate keeled fleshy bluntly 3-cornered channelled, Pedunc. very thick  
7400 Leaves flattish oblong ovate papulose clustered connate, Cal. 3-leaved 2-horned  
7401 Leaves amplexicaul. glaucous distinct obl. lanc. inflexed concave, Sepals ovate obl. longer than cor.  
7402 Leaves lorate long channelled inflexed blunt very glaucous convex beneath, Sepals obtuse as long as cor.  
7403 Lvs. lorate obl. blunt glauc. livid channelled dotted papulose keeled, Stems branched rounded decumbent  
7404 Leaves lorate acuminate green smooth, Stem very short and thick  
7405 Leaves lanc. elliptical crystalline when dead having only the nerves remaining, Stems procumbent

- 7406 Leaves connate ovate papulose, Branches erect clustered  
7407 Leaves lanc. lin. somewhat channelled convex beneath, Fl. solitary terminal [acute  
7408 Lvs. clustered papulose erect somewhat imbricate subul. half round, Fl. ternate cymose, Sepals digitiform  
7409 Leaves half round not dotted recurved distinct close, Cal. terminal finger-shaped  
7410 Lvs. close flexuose recurved very green half round, Sepals finger-shaped, Stems flexuose shining slender  
7411 Leaves acuminate green, Sepals 2 much elongated  
7412 Leaves close linear subulate half round pale green deeply channelled, Sepals acute  
7413 Leaves close flexuose reflex subulate half round glaucous, Sepals equal 3 membranes on each side  
7414 Leaves distinct roundish pimples, Stem erect, Branchlets 1-flowered  
7415 Leaves opposite amplexicaul. distichous oblong-lanceolate acute bluntly keeled, Pimples minute  
7416 Leaves lanc. linear keeled not dotted distinct, Flowers stalked, Two sepals very long

- 7417 Lvs. subulate half round acute remote, Fl. term. dichotomous, Sepals very unequal, Branches sometimes  
7418 Branches round granular closely dotted [rush-formed  
7419 Leaves very slender 1-sided effuse, Leaves erect linear very fine  
7420 Branches procumbent knotted at the base, Spines of the leaves very long  
7421 Leaves close half round channelled, Stem and branches erect thick  
7422 Leaves lin. round obtuse narrowed at each end, Old stem strumose at base, Branches effuse  
7423 Branches filiform weak long prostrate, Old roots strumose above, Leaves lin. furrowed longer than joints  
7424 Leaves lin. half round with shining pimples, Stems procumbent filiform  
7425 Leaves half round pimples hairy, Cal. hairy, Stem thick, Branches diffuse knotty  
7426 Leaves half round blunt channelled spreading iced, Branches diffuse weak cinereous  
7427 Beautifully pimples all over, Leaves half round, Branches knotty slender, Fl. small dichotomous  
7428 Stems and leaves cylindrical pimples, Branches dichotomous  
7429 Leaves expanded compressed 3-cornered somewhat hoary soft recurved at end mucronate  
7430 Leaves half round somewhat triquetrous glaucous, Fl. 3-chorotomous testaceous, Stem erect shrubby  
7431 Leaves subtriquetrous compressed minutely pimples recurved at end, Old root tuberous large  
7432 Leaves remote obsolete cylindrical glaucous, Fl. 2 ternate cymose, Bark white

- 7433 Leaves remote subcylindrical glaucous exactly half erect, Fl. ternate, Bark cinereous  
7434 Leaves half round, Pedunc. terminal aggregate clavate cymose  
7435 Leaves remote half cylindrical glaucous exactly horizontal, Fl. ternate  
7436 Leaves half cylindrical subul. subacute incurved sparkling, Sepals and petals obtuse, Cor. funnel-shaped  
7437 Leaves half cylindrical obtuse subrecurved much sparkling, Sepals and petals subacute  
7438 Leaves expanded remote blunt compressed subcylindrical, Stems very rough spotted  
7439 Leaves half round narrowed at each end sparkling incurved erect variously bent, Branches filiform  
7440 Leaves distant cylindrical blunt small shining pimples: one of each pair deflexed, Branches hard suberect  
7441 Leaves graniform expanded bluntly 3-cornered papulose shining, Branches hard rough erect  
7442 Leaves cylindrical blunt spreading short, Branches numerous diffuse filiform  
7443 Leaves expanded very short or globose cylindrical, Branches numerous filiform divaricating decumbent  
7444 Leaves cylindrical 3-cornered obtuse with white dots, Calyx 6-cleft  
7445 Leaves cylindr. very blunt and cal. smooth obconical green pimples sparkling, Stamens longer than styles

- 7446 Leaves close cylindrical blunt with crystalline pimples, Cal. turbinate hairy, Stamens length of styles  
7447 Leaves cylindrical incurved crystalline hoary blunt sparkling, Branches long weak procumbent  
7448 Lvs. subcylindr. incurv. pimpl. obt. Cal. hemispheric. pimpl. hairy cluster. Branch. numerous spreading

and Miscellaneous Particulars.

Mr. Haworth's arrangement of the genus, which is the only intelligible one, is here followed. Respecting the general culture of the genus, Sweet observes, "the dwarf kinds require but little water, and to be grown in small pots in a very sandy or gravelly soil. The species should be kept quite dry when in a dormant state;

History, Use, Propagation, Culture,

but when growing freely, and at the flowering season, they require a moderate supply of water. The stronger and more woody kinds may be planted in a richer soil; but the poorer the soil is, the dwarfer they will grow, and the more abundantly they will flower; they also require more water than the dwarf kinds, particularly at the flowering season, but need very little in winter. A good dry frame is sufficient to preserve them through the winter, with the covering of mats in frosty weather. Cuttings of any of them strike root readily, planted in pots of earth, and kept dry till they begin to wither; when they may have a little water, and they will root very soon. (*Bot. Cult.* 224.)

1147. *Hymenogyne.* From *ὑμην*, a membrane, and *γυν*, a woman, or, in botanical language, a style, in allusion to the cohesion of the styles into a membranous tube. An artificial division of *Mesembryanthemum*.

1148. *Rosa.* From *rhos*, signifying red in Armorican, whence *ῥόδον*, Greek, and *rosa*, Latin. The rose has been a favorite flower from time immemorial among the civilized nations of Europe and Asia. The shrub varies in size in different species, from one foot to six or eight, and the colors are red, white, yellow, purple, striped; simple, or in almost numberless shades and mixtures; the flowers are single, semi-double, and double. The odour is universally grateful. It is cultivated in every garden, from that of the most humble cottager upwards; some species, as *R. centifolia*, *damascena*, &c. are also cultivated by commercial gardeners on a large scale for distilling rose water, and for making attar, or essential oil of roses. Six pounds of rose leaves will impregnate by distillation a gallon of water strongly with their odor; but a hundred pounds affords scarcely half an ounce of attar. The rose is also used in medicine. Botanists are not agreed as to the number of

- 7449 Lvs. subcylindr. incurved pimpled obt. hoary, Cal. hemispheric. pimpled numerous, Stamens longer than  
 7450 Leaves cylindrical fine, Two sepals leafy much longer than the others [styles  
 7451 Erect, Leaves subulate half cylindrical, Cal. woolly, Stamens the length of styles  
 7452 Slender, Lvs. half cylindr. blunt or half round, Cal. hairy at base, Pedunc. long and branches decumbent  
 7453 Branches, leaves, peduncles, and calyxes hispid  
 7454 Leaves obl. ovate subtriquetrous gibbous, Sepals very unequal filiform ragged hispid the length of petals  
 7455 Leaves close depressed cylindrical hispid all over, Old root tuberous  
 7456 Proccumbent, Leaves remote suboblong exactly half erect with 5 rays at end, Cal. 5-cleft very irregular  
 7457 Erect decumbent, Leaves remote nearly oblong horizontal flat above with 6 rays at end, Cal. 5-cleft equal  
 7458 Lvs. tufted hoary thick half round pimpl. rough with many rays at end ciliated at base, Cal. 6-8-fid hairy  
 7459 Densely tufted, Leaves half round papulose rough with many rays at end, Cal. 6-cleft very hairy  
 7460 Branches villous, Leaves horizontal, Root tuberous  
 7461 Branches erect decumbent hairy, Leaves with about 10 rays at end, Calyx with a black beard  
 7462 Leaves on long stalks spatulate lanceolate green

## and Miscellaneous Particulars.

original species of this genus : some regard all the European species as originated from one source ; others, and especially the moderns, divide them into species, subspecies, and varieties. The most scientific work which has appeared in England on roses is the *Rosarum Monographia* of Mr. Lindley, 1819, in which above a hundred species or subspecies are described, and some of them figured ; Miss Lawrence has published ninety plates of *A Collection of Roses from Nature*, 1810. In France, Guillemeau has published *Histoire Naturelle de la Rose*, 1800 ; and Redouté and Thory are engaged in a splendid work, in folio, entitled *Les Roses*, containing plates of all the known species and varieties of this flower. Thory has published a separate tract on their culture, entitled *Prodrome de la Monographie du Genre Rosier*, &c. 1820 ; Pronville, a *Nomenclature Raisonnée*, in 1818 ; and Vibert, *Observations*, &c., in 1820. A copious and intelligent account of the Scotch roses has been given by Mr. Sabine (*Hort. Tyans.* iv. 231.), and some hundreds of new varieties have flowered from seedling plants in the Hammersmith nursery, and will soon be found in the sale catalogues.

Species and varieties. The lists of the London and Paris nurseries contain upwards of 500 names : that of Calvert and Co., Englishmen, who have established a nursery at Bonne Nouvelle near Rouen, enumerates near 900 sorts. The greater part of these have been raised, within the last thirty years, from seed on the continent, where it ripens better than in this country. A number of varieties have also been raised in Britain, especially of the *R. spinosissima*, or Scotch rose, of which above 300 varieties are procurable in the Glasgow nursery. New varieties are raised in France and Italy annually ; Villaresi, royal gardener at Monza, has raised upwards of fifty varieties of *Rosa indica* ; not one of which has, as far as we know, reached this

History, Use, Propagation, Culture,

country. Some of them are quite black, others shaped like a ranunculus, and many of them highly odoriferous. The most remarkable only are here arranged under the species to which they are referable.

A modern invention, of Dutch origin, in the culture of roses, is that of forming standards, by budding on stocks of any of the hardy woody growing sorts, as the dog rose, R. canina, or the tree rose, R. villosa. They are budded at different distances from the ground, according to taste and the purposes in view, and form, after a few years, handsome round heads, which flower freely, and preserve the variety a longer time than in plants raised from cuttings or layers. They are particularly valuable for shrubberies and lawns, where the culture at the root required by dwarf roses could not be given, and if omitted would occasion the degeneracy of the variety.

New varieties of the rose are obtained from seed; but the usual mode of propagation is by layers. All will grow by cuttings, and some, as the sempervirens, freely; but that mode is seldom resorted to. For preserving delicate varieties, the best mode seems decidedly that of budding on hardier sorts.

No species of rose, wild or cultivated, thrives well in or very near large towns, on account of the smoke and confined air. The yellow and Austrian roses (R. lutea and R. bicolor) are difficult to flower in any situation, but seldom or never blow in the suburbs of London: even the monthly rose does not thrive so well there as at some miles distance in the country. Roses are generally planted in the front of shrubberies, and in borders; they are also planted by themselves in rose gardens or rosaries, in groups on lawn, either with common edgings, or with edgings of wire, in imitation of basket-work. These last are called baskets of roses; the ground enclosed in the basket-margin is made convex, so as to present a greater surface to the eye, and increase the illusion; the shoots of the stronger sorts are layered or kept down by pegs till they strike roots

and Miscellaneous Particulars.

into the ground, so that the points of the shoots furnished with buds appear only above the soil, which is sometimes covered with moss or small shells. Under this treatment, the whole surface of the basket becomes, in two or three years, covered with rose-buds and leaves of one or of various sorts. Where one of the larger free-growing sorts is employed, as the moss, or any of the Provence varieties, one plant may be trained so as to cover a surface of many square yards. Where different sorts are introduced in the same basket, they should be as much as possible assimilated in size of leaves and flowers and habits of growth, and as different as possible in the colors of their flowers. By mixing small-flowered with large showy sorts, the beauty of the former is lost without adding to the effect of the latter.

In rosaries, commonly, but one plant of a sort is introduced, and the varieties which most resemble each other are placed together, by which their distinctions are better seen. Particular compartments are often devoted to one species, as the Scotch, Chinese, yellow, burnet-leaved, &c. which has an excellent effect; sometimes a piece of rock-work in the centre is covered with the creeping roses, and on other occasions these are trained to trellis-work, which forms a fence or hedge of roses round the whole. In this hedge, standard roses are sometimes introduced at regular distances; a grove of standards is also frequently formed in the centre of the rosary, and sometimes they are introduced here and there in the beds.

Standard roses, however, have certainly the best effect in flower borders, or when completely detached on a lawn: their sameness of form, and that form being compact and lumpy, prevents them from grouping well, either among themselves or with other objects. Their beauty consists in their singularity as rose plants, and in their flowers; and, therefore, to display these beauties to the best advantage, they require to be seen singly, or in succession. This is the case where they occur as single objects on a lawn, or in the centre, and here and

*History, Use, Propagation, Culture,*

there among groups of flowers; or in lines or avenues, along flower walks. In the gardens of the Grand Trianon, they are planted profusely in large masses, like plantations of trees and shrubs, and there much of their individual beauty is lost, and no good general effect produced.

Most species of the rose, in their wild state, grow in sandy and rather poor soil, except such as are natives of woods, where the soil is richer, and comparatively moist. But all the cultivated roses, and especially the double-flowering kinds, require a rich loamy soil, inclining to clay rather than sand; and they require also, like most double flowers, plenty of moisture when in a growing state.

To produce strong flowers, roses require some attention to pruning; old wood should be yearly cut out, and the young shoots thinned and shortened according to their strength, and whether number or magnitude of flowers be wanted. Those sorts which throw up numerous suckers should be taken up every three or four years, reduced, and replanted; and most sorts, excepting the standards, will be improved by the practice, provided attention be paid to remove a part of the old soil, and replace it by new. The points of the shoots

and Miscellaneous Particulars.

of the more delicate sorts of roses, are very apt to die when pruning is performed in winter or spring; to avoid the consequences of this evil, many give a second pruning in June, or do not prune the tender sorts at all till the beginning of that month. A very good time for performing the operation, is immediately after the bloom is over; cutting out old exhausted wood, shortening shoots which have flowered to a good bud accompanied with a healthy leaf, but leaving such shoots as are still in a growing state untouched till October. Where very large roses are wanted, all the buds but that on the extreme point of each shoot should be pinched off as soon as they make their appearance, and the plant liberally supplied with water. To lessen evaporation, and keep up a constant moisture at the roots of their roses, the Paris gardeners generally mulch them with half-rotten stable-dung, or partially rotten leaves.

The earliest flowering rose is the monthly, which, in mild seasons, and planted against a wall, will sometimes flower in the beginning of April; the roses next in succession are the cinnamon, which flowers in May; the damask in the end of May or beginning of June; the blush, York and Lancaster, Provins, and Dutch

History, Use, Propagation, Culture,

hundred-leaved, in June, July, and August. The Virginia and musk roses are the latest European sorts; they flower in September, and in shaded situations will sometimes continue in bloom till the middle of October; but the earliest rose (the monthly) is also the latest, and generally continues flowering till interrupted by frost. The earliest sorts may be materially forwarded by being planted against a south wall; and if portable sashes are placed before them, and the wall is either flued and heated by fires, or a lining of dung placed behind, the plants may be brought to flower in February or March. The monthly rose being protected by glass in autumn, or aided by artificial heat, may be continued in bloom till Christmas. A very

♂ Flowers single, Roots creeping  
 7496 Dwarf, Arms nearly equal, Leaflets rigid ovate acute finely serrate, Sepals ovate

Div. VII. VILLOSÆ. *Lindl.* p. 72.

7497 Tube of calyx turbinate  
 7498 Leaflets ellipt. obtuse, Fruit very large with close stiff prickles, Sepals viscid hispid

7499 Leaflets ovate nearly acute, Fruit hispid or naked

♂ Root-shoots upright, Sepals nearly simple

♂ Dwarf sessious, Leaflets narrow, Flowers very red

7500 Leaflets oblong glaucous naked above simply serrate, Sepals reflexed, Fruit unarmed

*Garden Varieties.*

♂ Prickles nearly equal or none, Sepals deciduous

♂ Branches of the inflorescence very prickly, Fruit long

♂ Branches weak flexuose, Leaflets acute at each end, Sepals very long and narrow

♂ Prickles much hooked nearly equal, Leaflets less glandular than usual, Sepals deciduous

7504 Branches glandular, Leaves frosted on each side: the upper somewhat whorled

7505 Branches hairy, Leaflets hoary roundish viscid

Div. IX. CANINÆ. *Lindl.* p. 97.

7506 Leaflets soft ovate, Ovaries 50-60

7507 Leaflets rigid ovate, Ovaries 20-30

♂ Leaflets more or less hairy beneath, Sepals and peduncles hispid

♂ Leaflets hairy on both sides, Sepals and peduncles smooth

7508 Prickles small distant, Leaflets ovate and branches glauc. opaque discolored, Ovaries 20-30

♂ Dwarf with setæ upon the branches

7509 Leaflets ellipt. acuminate smooth crenate serrate glaucous beneath, Ovaries 40-50

*Garden Varieties, referable either to Rosa indica or R. semperflorens.*

♂ Fruit ovate, Flowers very fragrant

♂ A little bush, smaller in every respect

♂ Leaves lanceolate, Branches nearly unarmed

7510 Leaflets ovate-lanceolate crenate serrate, Ovaries 15, Petals entire

7511 Dwarf, Leaflets ovate acute finely serrated, Petals acuminate, Ovaries 7-8

7512 Leaflets finely serrate shining, Cal. mucricated with very dense prickles, Sep. short broad acute apiculate

Div. X. SYSTYLE. *Lindl.* p. 111.

7513 Root-shoots assurgent, Prickles very strong hooked

♂ Stem lower, when in flower erect many-flowered, Branches with a few setæ

7514 Root-shoots flagelliform, Prickles unequal falcate, Leaflets glaucous beneath

♂ Root-shoots thicker and shorter, when in fl. erect many-fl. Branches with a few scat. setæ, Styles distinct

and Miscellaneous Particulars.

common mode of obtaining late roses, and one of the greatest antiquity, is by cutting all the flower shoots off when the buds begin to appear, or by rubbing off all the rudiments of shoots, of every kind, early in spring; a second crop is in consequence produced, which will not be in a state to bloom before the autumn.

The best roses for forcing are the common and moss Provence; the Indian sorts force well, or rather, in stoves, continue in bloom all the year; but the commoner varieties of these not being fragrant, they are in less repute than the European roses. Rose plants should be a year in pots previously to the autumn when it is intended to force them; they should be planted in pots of six or eight inches diameter, in rich loam, and

History, Use, Propagation, Culture,

plunged in an open airy situation; their flower buds pinched off as they appear; and the plants put early into a state of rest, by excluding the sun and rain, and not a free circulation of air.

All the species of roes are very liable to the attacks of insects, especially of the aphides; some, and especially the briar and Scotch rose, are attacked by the *Cynips rosa*, which, by puncturing the bark, occasions the production of rose-galls, and of those mossy tufts often seen on wild roses, which were known formerly under the name of Bedeguar, and used in medicine. Under cover tobacco smoke will prove an effectual remedy for the aphides; but the larvæ of many others, and especially of tipula and the tenthredinidæ, which occasion the wrapping up and shrivelling of the leaves, can only be removed by washing with lime-water or hand picking.

1149. *Rubus.* From the Celtic *rub*, which signifies red. Many of the species are only biennial woody plants, producing suckers or stolones from the roots, which ripen and drop their leaves one year, and resume their

- 7515 Root-shoots climbing, Prickles nearly equal falcate, Leaves evergreen  
 β Leaves nearly deciduous  
 7516 Branchlets peduncles and calyx downy, Leaflets soft lanceolate rugose, Stipules pectinate  
 7517 Branchlets lanceolate, Leaflets and calyxes downy glandular, Stipules entire [acuminate  
 7518 Branchlets nearly naked, Leaflets ellip. acum. glauc. beneath with connivent serratures, Sepals comp. [pisiform  
 β Flowers double  
 γ Leaflets ovate lanceolate, Petals acute, Pedicels and calyxes glandular  
 δ Stem arborescent  
 ε Stem branched, Leaflets ovate-obl. acuminate rugose, Petals large obcordate  
 ζ Stem erect, Flowers double pink  
 7519 Branchlets not downy, Leaflets ovate lanc. with diverging serratures, Stipules entire, Sepals ovate, Fruit  
 β Leaflets smooth on each side

Div. XI. BANKSIANÆ.

- 7520 Stipules setaceous deciduous, Petioles and rib prickly, Fruit muricate  
 7521 Branches and fruit unarmed

\* Shrubby.

- 7522 Leaves quinate pinnate and ternate green on each side, Stem and petioles prickly, Fl. solitary  
 7523 Leaves quinate pinnate and ternate rugose smooth on each side, Stem petioles and pedunc. prickly, Raceme  
 7524 Leaves quinate pinnate and ternate white beneath, Leaf. rhomboid lined [terminal  
 7525 Leaves three white beneath, Stem prickly, Petioles round  
 7526 Lvs. pinnate, Stem round, Leaf. 5-7 obl. plicate serr. white beneath, Pan. cymose, Pet. shorter than calyx  
 7527 Branches pet. and ped. downy, Leaf. 3-5 cuneate obovate unequally toothed upwards, Racemes term. pan.  
 7528 Smoothish, Leaf. 10-5-3 lanceolate naked on each side finely serrated, Stem unarmed, Bractes lanceolate  
 7529 Leaves 3 naked, Stems and petioles very hispid, Bristles stiff  
 7530 Leaves ternate nearly naked: the lateral 2-lobed, Stem prickly round  
 7531 Stem erect roundish, Prickles many close, Leaf. 5 pubesc. beneath, the lateral sessile, Cal. of fl. reflexed  
 7532 Stem angular furrowed, Leaf. 5 obtuse shining and even above, hoary beneath, Pan. decomp. hoary  
 7533 Stem with small straight prickles, Leaf. 3 and 5 obl. acum. doubly and finely serr. pubes. beneath, Fl. pan.  
 7534 Stems square hoary, Leaf. 3 obov. round. unequally and finely cut-tooth. hoary beneath, Pan. small hoary  
 7535 Stem aculeate, Leaf. 3-5 unequal ovate acum. serr. with fine white down beneath, Fl. panicle  
 7536 Stem densely prickly and strigose, Leaf. 5 lanc. acum. serrul. smooth, Pedunc. axill. few-flowered  
 7537 Lvs. 3-5 cut-serr. downy beneath, Stem petioles and leaves pubesc. with recurved prickles, Pan. diffuse  
 7538 Stem decum. very prick. Leaf. 3 subcord. ov. doub. acute. cren. smooth prick. beneath, Branches very red  
 7539 Differs from R. corylifolius in having the upper shoots and peduncles covered with short hairs  
 7540 Differs from the last in having the leaves covered all over beneath with soft hairs  
 7541 Unarmed, Branches lvs. beneath and calyxes downy with brown hairs, Lvs. 3-lobed, Fl. sol. on short stalks  
 7542 Stem suberect angular prickly smooth, Leaf. 5 cordate ovate cusp. pubes. beneath, Pan. simple  
 7543 Stem angl. furrowed, Leaf. 5 orbicular cusp. hoary beneath, Pan. comp. divaricating, Cal. prickly at base  
 7544 Stem suberect angular smooth, Leaf. 5 ovate shining pubes. beneath, Panicle prickly  
 7545 Leaves 3 obovate downy and soft on each side, Fl. panicle  
 7546 Leaves tern. Leaf. roundish ovate acum. mucronate serr. Stem pet. ped. and cal. prickly and glandular  
 7547 Lvs. 5-3 hairy, Leaf. ov. acum. unequally serr. Stem decum. and pet. prickly and gland. Ped. unarm. gland.  
 7548 Lvs. 3-5-nate, Leaf. pinn. Stem pet. and ped. with recurved prickles  
 7549 Procumbent, Stipules subulate, Lvs. 3-5 digitate, Leaf. ovate obl. smoothish serrate, Pedicels solitary  
 7550 Leaves 5 ellipt. acum. finely serrate villous on each side, Stem and petioles prickly  
 7551 Unarmed hispid, Leaf. 3 or pinnate quinate ovate blunt at base white beneath: the odd one cordate  
 7552 Lvs. 3-nate smooth unequal serr.: interm. ov.-cuneate at base; lat. rhomb. Stem round proc. and pet. prick.  
 7553 Lvs. ternate, Leaf. ovate acute unequally serrate downy beneath, Stem pet. and ped. unarmed  
 7554 Leaves simple palmate, Stem unarmed many-leaved many-flowered  
 7555 Leaves pinnate about 7 hairy beneath: the upper ternate, Stem ascending with small straight prickles

and Miscellaneous Particulars.

foliage, produce blossom shoots, flower, and fruit, and die the next. The common raspberry and bramble are examples.

R. idæus is a native fruit, greatly improved by cultivation; it has a grateful subacid taste, and like the strawberry, is one of the few fruits that does not undergo the acetous fermentation in the stomach. There are red and yellow varieties, and one very excellent sort that bears twice a-year, in July and September. The raspberry requires a soft rich moist soil, and if a plant stands singly or a single row is planted by itself, the situation should be gently shaded. Where a plantation is made of several rows together it may be placed in the open garden, as the plants will shade one another to a sufficient degree. Frequent renewal is necessary to prevent the stools getting large and matted when they send up only weak suckers. No more suckers should be left at the stools than are intended to bear the following year, unless young plants are wanted; and if very

History, Use, Propagation, Culture,

large fruit is the object, no suckers should be left at all: on the contrary, when the strongest suckers are wanted, the fruit-bearing shoots should be cut down.

*R. occidentalis* is a showy plant for large shrubberies. The fruit of *R. cæsius* is blue, edible, and it continues till frost. *R. corylifolius* and *fruticosus* are both common in our hedges; the shoots of the latter are much tougher than those of the former, and are preferred by thatchers for binding their roofs, and by straw-hive and mat makers. The berries, eaten at the moment they are ripe, are cooling and grateful; a little before, they are coarse and astringent; and a little after, disagreeably flavored or putrid. They are sometimes made into pies; but great care is requisite in gathering the fruit, for one berry of the last sort will spoil a whole pie. The double-flowering variety is considered very ornamental.

The fruit of *R. arcticus* and *chamaemorus* is eaten in the north of Scotland and Sweden. In the latter country, Dr. Clarke informs us, it is much prized in soups, sauces, and for making vinegar; and Dr. Clarke was cured of a bilious fever by eating great quantities. The plant is rather difficult to preserve in gardens, but by raising successive generations from the seed it might perhaps be subjected to the same culture as the cranberry. The fruit of *R. pauciflorus*, the Nepal raspberry, is very agreeable.

1150. *Dalibarda.* Denis Dalibard was a French botanist, who published, in 1749, a catalogue of the plants in the neighbourhood of Paris. Small plants, resembling the little species of Rubus.

- 7556 Leaves simple cordate somewhat lobed downy beneath, Stem prickly decumbent  
 7557 Branches round villous, Lvs. cordate obl. 5-lobed: the middle lobe elongated, Stip. and bractes pectinate  
 7558 Leaves 3-5 downy beneath, Stem peduncles and petioles with recurved prickles

## \*\* Herbaceous.

- 7559 Leaves tern. naked, Runners creeping herbaceous, Panic few-flowered  
 7560 Leaves tern. naked, Leaf. rhomboid acute cut serrate: the odd one stalked, Flowers about 3  
 7561 Stem unarmed 1-flowered, Leaves tern. smooth finely serrate, Pet. obl. entire, Styles approximating  
 7562 Leaves ternate, Stem unarmed 1-flowered  
 7563 Leaves simple lobed, Stem unarmed 1-flowered

7564 Leaves simple cordate crenate, Peduncles 1-flowered

7565 Leaves ternate, Leaf. cuneate serrate-cut, Tube of cal. obconical

7566 Cal. of fruit reflexed, Pubescence of petioles spreading, of the peduncles appressed

7567 Leaves simple

7568 Cal. of fruit erect, Pubescence of pedunc. erect, of petioles much spreading, Leaves downy on each side

7569 Cal. of fruit reflexed, Pubescence of pedunc. and petioles much spreading

7570 Large, Leaves broad oval, Pedic. long recurved pendulous, Recept. much excavated globose villous

7571 Cal. of fruit spreading, Pubescence of petioles erect, of peduncles appressed, Leaves smoothish above

7572 Cal. of fruit erect, Pubescence of peduncles and petioles erect, Lvs. smoothish above

7573 Cal. of fruit erect, Pubescence of peduncles and petioles much spreading, Lvs. vilous on each side

7574 Outer sepals larger than the rest obovate 3-toothed

7575 Leaves pinn. Petals smaller than calyx

7576 Leaves tern. Petals larger than calyx

7577 Leaves pinnate, Leaf. lin. obl. flat, Petioles long, Branches 1-2-fl.

7578 Leaves pinnate, Leaf. lin. obl. revolute at edge, Petioles short, Corymbs terminal

7579 Leaves interruptedly pinnate silky, Leaflets finely serrate, Stem creeping, Pedunc. 1-fl.

7580 Leaves ternate stalked, Leaf. obovate cut serrate white with down beneath, Sepals ellipt. Pet. obcordate

7581 Rad. lvs. quinate cauline tern. Leaf. cuneate obl. serrate, Stipules large adnate entire

7582 Leaves pinnate white with down beneath, Leaf. serrate, Stem shrubby

7583 All over silky, Lvs. interruptedly pinn. Fl. dichoto. corymb. Sepals ov. acute, Stem erect nearly simple

7584 Lvs. interruptedly pinn. with spread hairs, Leaf. lanc. cut toothed, Stip. cut, Pet. obcord. larger than cal.

7585 Lvs. bipinnatifid in many pairs downy on each side: segments parallel approximating, Stem decumbent

7586 Lvs. bipinnatifid in four pairs smooth above downy beneath: segments distant, Stem decumbent

7587 Leaves pinnate: the outer largest, Runners creeping

7588 Rad. leaves subpinn. cauline tern. Leaf. lanc. unequally coarsely serrate hairy on each side

7589 Leaves pinnate alternate, Leaf. 5 ovate crenate, Stem erect

7590 Leaves pinnate nearly equal, Leaf. oblong suboboid: the outer confluent

7591 Leaves pinnate, Leaf. roundish toothed equal, Stem erect

7592 Leaves pinnate upper ternate, Leaf. deeply toothed, Stem erect pubescent

7593 Leaves pinnate, Leaf. oblong deeply toothed, Stem decumbent dichotomous, Pedun. axill. solitary

7594 Leaf. 7-5 lanceolate coarsely toothed, Petals obcordate larger than calyx, Stem erect

7595 Leaf. 5 cuneiform cut downy beneath, Stem erect

7596 Radic. leaves 5-nate, Cauline ternate, Stem nearly erect much branched

7597 Lvs. 5-nate with adpressed hairs: of the branches ternate, Leaf. obl. cuneate deeply toothed, Stem ascend.

## and Miscellaneous Particulars.

1151. *Fragaria*. From *fragrans*, in allusion to the perfumed fruit. *Fraisier*, Fr., *Erdbeere*, Ger., and *Tragoto*, Ital. This is a genus of fruit-bearing herbaceous plants, of which there are few in the vegetable kingdom, and none to equal the strawberry in wholesomeness and excellence. This fruit is universally grateful, alone, or with sugar, cream or wine; and has the property, so valuable for acid stomachs, of not undergoing the acetous fermentation. Besides the species or subspecies enumerated, there are upwards of sixty mongrel varieties or different names, some of which, recently produced from seed, are of great excellence. The strawberry is not only a valuable and easily cultivated out-door fruit, but forces well, and with a little trouble in choosing a succession of sorts, they may be had at the dessert every month in the year, though during the three winter months they are without flavor.

In cultivating the strawberry an open situation and rich loamy soil, rather strong, is required for most varieties; and from their large mass of foliage and flowers, they must, till the fruit is set, have copious supplies of water. The row culture is most convenient, and frequent renewal insures vigorous plants and large fruit.

1152. *Comarum*. A name given by the Greeks to the *Arbutus*. The *Comarum* of the moderns produces a fruit not unlike that of the *Arbutus*.

1153. *Potentilla*. In allusion to its supposed *potential* virtues in medicine. These, however, appear to con-

History, Use, Propagation, Culture,

sist of nothing beyond a slight vulnerary quality. P. fruticosa and floribunda are shewy shrubs. P. asnerina is remarkable for the silvery whiteness of its foliage, which is eaten by geese, as the roots were once by the country people in some places. All the species are pretty, and deserving cultivation.

1154. *Tormentilla*. From *tormina*, the dysentery, which this plant was formerly employed for curing. T. erecta was once a plant of some importance in economy and medicine. The roots are still used in most of the Western Isles of Scotland and in the Orkneys for tanning leather, for which they are superior even to oak-bark. They are first boiled in water, and the leather is then steeped in the cold liquor. In the islands of Tirey and Col, the inhabitants have destroyed so much ground by digging them up, that they have been prohibited the use of them. They are also used for dyeing of a red color. And Mr. Young informs us, that many swine are reared with them on the mountains of Killarney.

In the London Materia Medica it is employed in intermittents, and as a local application in the form of gargle and lotion, in ulcerations of the tongue and mouth, against spongy gums, and as an application to fetid ill conditioned sores; but it is seldom used. (*London Dispensatory*, 538.)

1155. *Geum*. From *γεωμ*, to taste well. The roots of G. urbanum have a mildly astringent aromatic taste, somewhat like that of cloves, whence this plant has the name of Caryophyllata. They should be gathered in dry warm situations, for in shady moist places they have little virtue. Gathered in the spring, and put fresh into ale, they give it a pleasant flavor, and prevent its turning sour. Infused in wine, it is esteemed a good

- 7598 Leaf. 5-7 cuneiform cut pilose, Stem erect hairy
- 7599 Leaf. 7 sessile seated upon a dilated stipule
- 7600 Rad. lvs. 5-7 lin. cuneiform toothed, Petals retuse the length of calyx, Stems filiform decumbent hairy
- 7601 Leaves 5-nate obovate toothed pubescent, Pet. obcord. larger than calyx, Stems declinate
- 7602 Rad. lvs. 5-nate, Leaf. cuneif. ciliate 5-toothed at end, Caul. 3-nate subsess. Pet. obcord. larger than calyx
- 7603 Rad. lvs. 5-nate oblong toothed : upper 3-parted, Cor. larger than calyx, Stem ascending
- 7604 Leaves 5-nate with connivent serratures at end, Stems filiform procumbent, Recept. hairy
- 7605 Leaves 5-nate with connivent serratures at end, Stems many-fl. decumbent, Recept. hairy, Pet. obovate
- 7606 Leaves 5-nate with connivent serratures at end, Stems many-fl. decumbent, Recept. hairy, Pet. roundish
- 7607 Leaves 5-nate silky on each side, Leaf. obovate bluntly toothed at end, Pet. length of cal. Recept. woolly
- 7608 Leaves subtern. downy with 3 connivent teeth, Stems 1-fl. Recept. woolly
- 7609 Leaves 5-nate, Stem creeping, Pedunc. 1-flowered
- 7610 Leaves 5-nate obovate coarsely serr. Stip. cut bifid, Pedunc. 1-fl. axill. Stem producing runners
- 7611 Rad. lvs. subpinnate : cauline ternate, Leaf. lanc. unequally and coarsely serrated with spreading hairs on
- 7612 Leaves ternate, Stem branched erect, Peduncles with a knee at base [each side
- 7613 Leaves ternate cut downy beneath, Stem ascending
- 7614 Leaves ternate, Stem dichotomous, Pedunc. axillary
- 7615 Leaves ternate cuneiform 3-fid at end
- 7616 Leaves ternate toothed hairy on both sides, Stem decumbent longer than leaves

- 7617 Stem creeping, Leaves stalked
- 7618 Stem nearly erect, Leaves sessile

- 7619 Fl. erect, Awns hooked naked, Caul. lvs. pinn. Leaf. and stipules split, Petals longer than calyx
- 7620 Fl. erect, Lvs. pinn. Leaf. nearly equal irregularly cut toothed, Stip. ovate nearly entire, Pet. oval length of
- 7621 Fl. erect, Rad. lvs. pinn. : cauline tern. upper simple, Lower stip. cut, Pet. length of calyx [calyx
- 7622 Fl. erect, Awns hooked naked, Caul. lvs. tern. : upper lanc. Petals shorter than calyx
- 7623 Fl. erect, Awns hooked naked hairy at end, Rad. lvs. lyrate pinnate : terminal pinnate cordate
- 7624 Fl. erect, Awns hooked naked, Caul. lvs. tern. : radical lyrate pinnate
- 7625 Fl. nodd. Pet. length of cal. Awns hooked naked, Grains hairy, Rad. lvs. lyrate pinn. : cauline ternate
- 7626 Fl. nodd. Pet. length of cal. Awns feathery twisted in the middle
- 7627 Fl. nodd. Cal. leafy longer than the polypetalous corolla
- 7628 Fl. nodd. Pet. longer than cal. Awns hairy twisted at base, Rad. lvs. lyrate pinnate : cauline simple trifid

7629 The only species

- 7630 Leaves oblong downy beneath
- 7631 Leaves lanceolate smooth on each side glaucous beneath
- 7632 Sepals lanc. Lvs. obl. acute by degrees somewhat rugose smooth and green on each side, Branches very [straight and erect

7633 The only species. Fl. small very fragrant pale yellow appearing in the winter

7634 Leaves toothed

and Miscellaneous Particulars.

stomachic ; but in water, Haller affirms it to have been attended with bad effects, when given in malignant fevers, producing delirium. Chewed in the mouth, the roots take off from a disagreeable breath.

1156. *Kerria*. So named after Mr. William Ker, a botanical collector, who was sent some years since to China, whence he sent many curious plants. The plant named after him is the common *Corchorus japonica* of the gardens.

1157. *Calycanthus*. From *καλυξ*, and *ανθος*, a flower ; the calyx being colored and similar to petals, which are not present in the genus. Small North American shrubs, with chocolate-colored blossoms. The flowers of *C. floridus* have an agreeable scent like those of allspice, and is so called in Carolina.

1158. *Chimonanthus*. From *χιμων*, winter, and *ανθος*, a flower, in allusion to the period of the year when its blossoms are produced. *C. fragrans* is highly odoriferous, and though hardy, deserves a place in the front border of a conservatory, on account of the odor it disperses early in spring.

1159. *Dryas*. A name poetically applied to this little plant, from the resemblance of its leaves to those of the oak, which was sacred to the Dryads. This is a delicate evergreen plant, and with its snow-white blossoms is a great ornament to alpine heights. The stalk and branches are woody and perennial, lying flat upon the ground, and spreading wide about the root in tufts.

It requires some care to preserve it in gardens, and grows better in a shaded bed of peat than in pots.

History, Use, Propagation, Culture.

1160. *Coluria*. From *κολυρος*, deprived of the tail; or, as we usually say in English, bob-tailed. Distinguished by Mr. Brown from *Geum*, principally on account of the deciduous nature of the style or tail of the grains.

CLASS XIII. — POLYANDRIA. STAMENS many, hypogynous, or inserted under the Ovary.

This class agrees with the last in having hermaphrodite flowers, with an indefinite number of stamens, which neither cohere in any part of their length, nor are distributed in distinct parcels; but it is distinguished by the stamens being inserted distinctly from the floral envelopes, immediately under the ovary, into what has been called the *receptacle* by Linnæus and his followers; *torus*, by Mr. Salisbury; and *thalamus*, by some other botanists. The class consists of the greater part of several extensive natural orders, such as Ranunculaceæ, Magnoliaceæ, Cistaceæ, &c.; and, like the last, is replete with subjects of interest to gardeners and florists. The various kinds of Clematis form the most valuable portion of the hardy climbing plants of the verandah. The brilliant varieties of the ranunculus and anemone constitute the most attractive part of the flower garden. *Pæonia*, well known for the richness of its coloring, and the robustness of its constitution, is the ornament of every cottage; and the noble varieties of Magnolia, the pride of the North American forest, are the finest exotics of the shrubbery. *Nymphaea* and *Nelumbium* are beautiful genera of aquatic plants. *Annona*, or the custard apple, is one of the most important of the fruit trees of tropical countries; and the celebrated water vine of Sierra Leone is a species of *Tetracera*. Nor must *Sarracenia*, with its curious pitcher-like leaves; *Papaver*, from which opium is extracted; *Cimicifuga*, whence is obtained the antidote to the dangerous bite of the rattle-snake; *Bixa*, or the arnotta tree, from the fruit of which the coloring matter for the red cheese of England is procured; nor *Hepatica*, with its modest beauties, be omitted.

The commencement of M. Decandolle's laborious *Systema Vegetabilium* has included nearly every thing contained in the class, and is followed in the discrimination of the species, as being the best authority which can be taken.

Order 1. MONOGYNIA.

Stamens many, hypogynous. Style 1.

1162. *Capparis*. Cal. 4-leaved, coriaceous, deciduous. Petals 4. Stamens long. Stigma capitate. Berry with a rind, 1-celled, stalked, subglobose, or like a pod.

1163. *Marcgraavia*. Cal. 6-leaved, imbricated. Corolla monopetalous, calyptriformis. Berry many-celled, many-seeded. Style 0.

1164. *Actæa*. Cal. 4-leaved, deciduous. Petals 4. Berry 1-celled. Seeds half orbicular.

1165. *Sanguinaria*. Cal. 2-leaved. Petals 8. Pod ovate, 1-celled.

1166. *Podophyllum*. Cal. 3-leaved. Petals 9. Berry 1-celled, crowned with the stigma.

1167. *Chelidonium*. Cal. 2-leaved. Petals 4. Pod 1-celled, linear. Dissepiment 0. Seeds several, crested.

1168. *Romeria*. Petals 4. Caps. long, 2-3.4-valved; the valves opening from the vertex to the base. Seeds reniform, scurfy, without a glandular crest.

1169. *Glaucium*. Cal. 2-leaved. Petals 4. Pod 2-celled, linear, 2-3-valved. Seeds several, dotted.

1170. *Papaver*. Cal. 2-leaved. Petals 4. Capsule 1-celled, opening by pores under the persistent stigma.

1171. *Meconopsis*. Petals 4. Style short. Stigmas 4-6, radiating, convex, distinct. Capsule opening with 4-6 valves.

1172. *Argemone*. Cal. 3-leaved. Petals 6. Capsule half valved.

1173. *Sarracenia*. Cal. double, 3-5-leaved. Petals 5. Caps. 5-celled. Style with a clypeate stigma.

1174. *Nymphaea*. Sepals at the base of the discus. Petals and stamens connected with the whole of the discus, which covers the carpella.

1175. *Limncharis*. Sepals 3. Petals 3, very delicate, withering. Plant monocotyledonous.

7635 Stem about 2-flowered, Awns straight naked, Cal. of fruit erect, Lvs. pinnate toothed

7636 Leaves pinnate : the outer leaflet very large round, lower smaller by degrees

7637 Leaves pinnate cut, Runners creeping

and Miscellaneous Particulars.

1161. *Siewersia*. Named by Willdenow, after M. Sievers, a well known Russian botanical collector. Plants resembling *Geum* in habit.

1176. *Nuphar*. Sepals, petals, and stamens inserted at the base of the discus.  
 1177. *Euryale*. Sepals, petals, and stamens united with the discus, which covers the carpella.  
 1178. *Bixa*. Cal. 5-toothed. Petals 10. Capsule hispid, 2-valved.  
 1179. *Proclia*. Cal. 3-leaved, besides two extra leaves at base. Cor. O. Berry 5-angled, many-seeded.  
 1180. *Sloanea*. Cal. 1-leaved, 5-9-fid. Cor. O. Anthers united to filaments beneath the end. Caps. echinate, 3-6-celled, 3-6-valved. Seeds 2, with a berried arillus.  
 1181. *Apeiba*. Cal. 5-leaved. Petals 5. Caps. echinate, many-celled.  
 1182. *Sparmannia*. Cal. 4-leaved. Petals 4. Filaments cohering at base, torulose. Capsule echinate, 5-angled, 5-celled. Cells 2-seeded.  
 1183. *Entelea*. Sepals 4-5. Petals 4. Stamens indefinite, uniform. Anthers roundish, incumbent. Stigma denticulate. Caps. roundish, echinate, 6-celled, half 6-valved, many-seeded.  
 1184. *Muntingia*. Cal. 5-parted. Petals 5. Berry 5-celled, 1-5-many-seeded.  
 1185. *Grewia*. Cal. 5-leaved, coriaceous, colored inside. Petals 5. Scales 5. Ovary usually stalked. Drupe 4-lobed, 4-celled. Nut 1-2-seeded.  
 1186. *Tilia*. Cal. 5-parted. Petals 5. Capsule coriaceous, globose, 5-celled, 4-valved, opening at base, 1-seeded.  
 1187. *Corchorus*. Cal. 5-leaved, deciduous. Petals 5. Style scarcely any. Stigma 1-3. Capsule pod-shaped, 2-celled, 2-5-valved, many-seeded.  
 1188. *Grias*. Cal. 4-cleft. Petals 4. Stigma sessile, cruciate. Drupe with an 8-furrowed nut.  
 1189. *Calophyllum*. Cal. 4-leaved, colored. Petals 4. Drupe globose.  
 1190. *Mammea*. Cal. 2-leaved. Petals 4. Berry very large, 4-seeded.  
 1191. *Ochna*. Cal. 5-leaved. Petals 5. Berries 1-seeded, with a large roundish receptacle.  
 1192. *Elaeocarpus*. Cal. 5-leaved. Petals 5, torn. Anthers 2-valved at end. Drupe with a curly nut.  
 1193. *Alangium*. Cal. 6-10-toothed, superior. Petals 6-10, linear. Berry coated, 1-3-seeded.  
 1194. *Mentzelia*. Cal. 5-leaved. Petals 5. Capsule inferior, cylindrical, many-seeded.  
 1195. *Lagerstromia*. Cal. 6-cleft, campanulate. Petals 6. Stamens many, of which the six outer are thickest. Caps. 4-6-celled, many-seeded.  
 1196. *Egla*. Cal. 1-leaved, 5-lobed. Petals 5, spreading. Style short, thick. Berry coated, turbinate, globose, finally woody, with 12-16 cells.  
 1197. *Cistus*. Cal. 5-leaved, with two small leaflets. Petals 5. Caps. 5-celled; the valves bearing the dissepiments in the middle.  
 1198. *Helianthemum*. Divisions of the calyx often unequal: the two outer the smallest. Caps. 1-celled, 3-valved, with the dissepiment in the middle of the valves.

Order 2. DI-TRIGYNIA.

Stamens many, hypogynous. Styles 2-3.

1199. *Bauera*. Cal. 7-9-leaved, persistent. Petals 7-9, deciduous. Caps. inflated, 2-celled, many-seeded.  
 1200. *Fothergilla*. Cal. truncate, entire. Cor. O. Filaments very long, clavate. Ovary bifid. Caps. 2-celled, 2-horned. Seeds solitary, bony.  
 1201. *Curatella*. Cal. 5-leaved. Petals 4. Styles 2. Caps. 2-parted. Cells 2-seeded.  
 1202. *Peonia*. Cal. 5-leaved. Petals 5. Style O. Caps. many-seeded, like a pod.  
 1203. *Hibbertia*. Stamens distinct, filiform, equal. Anthers oval, oblong. Ovaries 1-15. Styles filiform, inflexed. Carpella membranous, generally 1-2-seeded.  
 1204. *Delphinium*. Cal. O. Petals 5. Nectary bifid, cornute behind. Siliques 3-1.  
 1205. *Aconitum*. Cal. O. Petals 5; the upper vaulted. Nectaries 2, hooded, stalked, recurved. Siliques 3-5.  
 1206. *Trachytella*. Carpella 1-2, berried, many-seeded; otherwise Tetracera.

Order 3. PENTAGYNIA.

Stamens many, hypogynous. Styles 5.

1207. *Cimicifuga*. Cal. 4-leaved. Cor. with four urceolate nectaries. Caps. 4. Seeds scaly.  
 1208. *Aquilegia*. Cal. O. Petals 5. Nectaries 5, horned between the petals. Caps. 5, distinct.

1209. *Nigella*. Cal. O. Petals 5. Nectaries 5, trifid between the corolla.  
 1210. *Reaumuria*. Cal. 5-leaved. Petals reflexed, 5. Caps. 5-celled, 5-valved, many-seeded. Seeds woolly.  
 1211. *Colbertia*. Ten stamens much longer than the others. Carpella 5, united? Stigma capitate. Seeds several in each cell, reniform, inclosed in a pellicul pulp.  
 1215. *Illicium*. Cal. 6-leaved. Petals 27. Caps. many, placed in a circle, 2-valved, 1-seeded.  
 1216. *Liriodendron*. Cal. 3-leaved. Petals 6. Samarae imbricated in a cone. Caps. 1-2-seeded, not opening, attenuated.  
 1217. *Magnolia*. Cal. 5-leaved. Petals 6-9. Caps. 2-valved, 1-seeded, imbricated in a cone. Seeds pendulous.  
 1218. *Michelia*. Cal. 3-leaved. Petals 15. Berries many, 4-seeded.  
 1219. *Uvaria*. Cal. 3-leaved. Petals 6. Berries numerous, pendulous, 4-seeded.  
 1220. *Annona*. Sepals 3, united at base, concave, cordate, acute. Petals 6, thick; the interior thicker or none. Anthers subsessile, with a dilated angular end. Berry pulpy, many-celled towards the outside.  
 1221. *Artabotrys*. Cal. 3-parted. Petals 6. Stamens hypogynous. Ovaries distinct, 2-seeded. Berries 2-seeded. Seeds collateral erect, without arillus.  
 1222. *Guatteria*. Sepals 3, united at base, ovate, subcordate, acute. Petals 6, ovate or obovate. Berries dry, coriaceous, ovate or subglobose, stalked, 1-seeded.  
 1223. *Asimina*. Cal. 3-parted. Petals 6, spreading, ovate-oblong; the inner smallest. Anthers subsessile. Berries usually 3, sessile. Seeds several.

Order 4. POLYGYNIA.  Styles many. Stamens many, hypogynous.

1213. *Nelumbium*. Cal. 4-5-leaved. Petals many. Fruit turbinate, in a truncate discus, with several 1-seeded hollows. Nuts ovate, crowned with the persistent style.  
 1214. *Dillenia*. Cal. 5-leaved. Petals 5. Capsules many-seeded, connate, replete with pulp.  
 1215. *Illicium*. Cal. 6-leaved. Petals 27. Caps. many, placed in a circle, 2-valved, 1-seeded.  
 1216. *Liriodendron*. Cal. 3-leaved. Petals 6. Samarae imbricated in a cone. Caps. 1-2-seeded, not opening, attenuated.  
 1217. *Magnolia*. Cal. 5-leaved. Petals 6-9. Caps. 2-valved, 1-seeded, imbricated in a cone. Seeds pendulous.  
 1218. *Michelia*. Cal. 3-leaved. Petals 15. Berries many, 4-seeded.  
 1219. *Uvaria*. Cal. 3-leaved. Petals 6. Berries numerous, pendulous, 4-seeded.  
 1220. *Annona*. Sepals 3, united at base, concave, cordate, acute. Petals 6, thick; the interior thicker or none. Anthers subsessile, with a dilated angular end. Berry pulpy, many-celled towards the outside.  
 1221. *Artabotrys*. Cal. 3-parted. Petals 6. Stamens hypogynous. Ovaries distinct, 2-seeded. Berries 2-seeded. Seeds collateral erect, without arillus.  
 1222. *Guatteria*. Sepals 3, united at base, ovate, subcordate, acute. Petals 6, ovate or obovate. Berries dry, coriaceous, ovate or subglobose, stalked, 1-seeded.  
 1223. *Asimina*. Cal. 3-parted. Petals 6, spreading, ovate-oblong; the inner smallest. Anthers subsessile. Berries usually 3, sessile. Seeds several.

History, Use, Propagation, Culture,

1162. *Capparis*. From its Arabic name *Kabar*, from which the Greeks made *καπαρις*. *Caprier*, Fr., *Capriolo*, Ital. and *Kapernstrauch*, Ger. This is a genus of low shrubs, some of which produce berries and others pods. *C. spinosa* has the habit of the common bramble; it grows in similar situations in the south of Europe, and especially on rocks and ruins. The chief supply of caper buds is from Sicily; but the plant is cultivated in the neighbourhood of Toulon in orchards, in the intervals between fig and olive trees, and in the neighbourhood of Paris, where it is trained on low walls, and the shoots during winter laid down and covered with soil to protect them from the frost. In this country it is generally treated as a stove plant; though it has stood the winter in the open air in some situations, and by raising from the seed for several generations might probably be naturalized. A plant stood near a century against the wall of the garden of Camden House, Kensington; it produced many flowers annually, though the young shoots were frequently killed to the stump during winter.

As a pickle, the flower buds of the caper are in great esteem throughout Europe. In Italy, the unripe fruit is prepared in the same way as the flower buds; both are highly acrid and burning to the taste. In the isles of the Mediterranean, and near Toulon, the flower buds of the caper are gathered just before they begin to expand, which forms a daily occupation during six months, when the plants are in a flowering state. As the buds are gathered they are thrown into a cask among as much salt and vinegar as is sufficient to cover

1224. *Xylopia*. Cal. 3-5-lobed. Petals 6; the exterior largest. Stamens usually inserted in a globose receptacle. Berries 2-15, on short stalks, compressed, frequently dry and opening. Seeds shining.
1225. *Hepatica*. Invol. 3-leaved, 1-flowered, resembling a calyx, entire. Sepals petaloid, 6-9, arranged in 2 or 3 rows. Ovaries many. Grains without an awn.
1226. *Anemone*. Invol. 3-leaved, distant from the flower, cut. Sepals 5-15, petaloid. Petals O.
1227. *Clematis*. Invol. O, or like a calyx under the flower. Sepals 4-8, colored. Petals O, or shorter than the sepals. Grains terminating in a feathery awn.
1228. *Naravelia*. Petals 6-12, longer than calyx. Grains seated on a thick hollow stalk.
1229. *Thalictrum*. Invol. O. Petals O. Grains dry, not awned, sometimes stalked, sometimes with a longitudinal furrow.
1230. *Adonis*. Sepals 5, appressed. Petals 5-15, with a naked claw. Grains many, 1-seeded, spiked, ovate, pointed with the persistent hardened style.
1231. *Knoultonia*. Sepals 5. Petals 5-15, with a naked claw. Ovaries upon a globose receptacle. Grains 1-seeded, berried, with a deciduous style.
1232. *Ficaria*. Sepals 3, deciduous. Petals 9, with a honey-pore at base. Grains obtuse.
1233. *Ranunculus*. Sepals 5, not deciduous. Petals 5, rarely 10, with a honey-scale at base. Grains pointed.
1234. *Trollius*. Sepals colored, 5-10-15, deciduous, petaloid. Capsules many, subcylindrical, many-seeded.
1235. *Isopyrum*. Sepals 5, deciduous. Petals 5, equal, tubular, 2-lipped. Ovaries 2-20. Capsules compressed, membranous, many-seeded. Seeds minute, dotted.
1236. *Eranthis*. Involucre under the flower, cut into many divisions. Sepals 5-8, colored, oblong, deciduous. Petals 6-8, tubular. Capsules stalked. Seeds globose.
1237. *Helleborus*. Sepals 5, persistent, roundish, obtuse, large, usually green. Petals 8-10, tubular, nectariferous. Stigmas orbicular. Capsules coriaceous.
1238. *Conia*. Sepals 5-6, colored, petaloid, deciduous. Petals small, cucullate. Stamens 20-25. Caps. 6-10, on long stalks, membranous, 4-6-seeded.
1239. *Caltha*. Sepals 5, colored, round. Petals O. Stamens many. Capsule spreading, 1-celled, many-seeded.
1240. *Hydropeltis*. Sepals 3-4. Petals 3-4. Ovaries 6-18. Seeds in a pendulous ovate globose capsule.
1241. *Hydrastis*. Sepals 3, ovate. Petals O. Cariopsides berried, many in a head, terminated by the style, 1-celled, 1-2-seeded.

MONOGYNIA.

- 7638 Pedunc. 1-fl. solitary, Stipules spiny, Leaves roundish obtuse smooth, Caps. oval
- 7639 Pedunc. many-fl. Leaves obl. obt. emarginate downy beneath, Cor. campanulate
- 7640 Pedunc. umbelled, Leaves clustered in parcels
- 7641 Pedunc. 1-fl. solitary, Stipules spiny, Leaves roundish ovate acute smooth, Capsules oval
- 7642 Leaves linear lanceolate dilated downwards obtuse at each end smooth, Fruit round torulose
- 7643 Pedunc. racemose, Leaves linear
- 7644 Pedunc. racemose, Leaves perennial oblong, Cal. and pedunc. downy, Fl. octandrous
- 7645 Pedunc. many-fl. terminal, Leaves elliptical blunt smooth, Glands axillary, Fruit cylindrical torulose
- 7646 Pedunc. many-fl. Leaves obl. lanceolate acute dotted with scales beneath
- 7647 Pedunc. umbelled, Leaves persistent lanceolate downy beneath, Flowers octandrous

7648 Leaves ovate-oblong acuminate veiny

and Miscellaneous Particulars.

them, and as the supply of capers is increased more vinegar is added. When the caper season closes, the casks are emptied, and the buds sorted according to their size and color, the smallest and greenest being reckoned the best, and put into small casks of fresh vinegar for commerce. They will in this state keep fit for use for five or six years. It is said to be a common practice to put filings of copper in the first pickle to save vinegar, and give the buds a green color. The best capers are called nonpareilles, and the second best capucines. (*N. Cours complet d'Agr.*; art. *Coprier*.)

Most of the species are very showy when in flower: *C. cynophallophora* has large petals, and stamens upwards of four inches long.ripe cuttings of all the species grow readily in sand.

1163. *Marcgravia*. In memory of George Marcgraa, of Leibstadt, author of a voyage to Brazil in 1648. A sub-parasitical creeping shrub: at first it is radicate like some ferns, but as it advances, the stem becomes shrubby, adhering still by its fibres to the trunk of some tree, to the top of which it frequently runs, at length dividing into several subdivided loose pendulous branches, commonly terminated by flowering umbels. It is frequent in the cool wooded mountains of Jamaica, and, according to Browne, appears in such various forms, that it has been mistaken for different plants in the different stages of its growth. It grows freely in British stoves, and cuttings root in sand under a glass. The genus is remarkable for the transformation of part of the bractæe into fistular bodies, resembling the pitchers of some other plants.

History, Use, Propagation, Culture.

1164. *Actea*. *Άκτση* was the Greek name of the elder, which this plant resembles in foliage and fruit. Weed-like plants seldom seen in gardens. The berries of *A. spicata* are poisonous, and with alum yield a black dye. The tubers of *A. racemosa* are called snake root, and much used in North America by self-practitioners, and as an antidote against poison and the bite of the rattle snake.

1165. *Sanguinaria*. From *sanguis*, blood. All parts of the plant or being wounded discharge a blood-colored fluid. This is a singular and very delicate looking plant. It has a tuberous fleshy root with red fibres and a reddish juice: from each bud of the root there springs only a single fig-like glaucous leaf, with a one-flowered scape; the flower has no smell, and is very fugacious. It abounds in the woods of Canada, and in the back settlements, where the Indians stain themselves with its red juice.

1166. *Podophyllum*. From *πους*, ποδος, a foot, and *φυλλον*, a leaf; in allusion to the long firm stalk on which the leaves are placed. Low neat herbaceous plants, with white flowers hidden by the overshadowing broad leaves.

1167. *Chelidonium*. From *χελιδων*, the swallow, because it was thought to flower with the arrival of that bird, and to perish with its departure. The English word celandine appears to be a corruption of chelidonium. The juice of *C. majus* is of an orange color and very acrimonious. It cures tetters and ringworms. Diluted with milk it consumes white opaque spots on the eyes. It destroys warts, and cures the itch. There is no doubt but a medicine of such activity will one day be converted to more important purposes. (*Withering*.) The root, according to Loureiro, is extremely bitter, and greatly esteemed among the natives of Cochin-China, for a variety of uses in medicine.

1168. *Römeria*. Named after J. J. Römer, professor of botany at Landshut, and the collaborator of Schultze in an edition of the Species Plantarum of Willdenow. He died in 1820. A genus intermediate between *Chelidonium*, *Glaucium*, and *Papaver*.

1169. *Glaucium*. All the parts of the species appear covered with a glaucous bloom. Handsome sea-coast plants. *G. luteum* has large and numerous flowers, which, although of short duration, succeed one another in great abundance during most part of the summer, make a fine contrast with the sea-green dew-bespangled leaves, and are a great ornament to our sandy shores. The whole plant abounds in a yellow juice, is fetid, and of a poisonous quality, and said to occasion madness.

1170. *Papaver*. Said by De Theis to have been so called from the Celtic *papa*, which signifies *pop*, or the soft food given to children, in which the seeds were formerly boiled to make the infants sleep. Opium is derived from *σως*, juice; it is supposed to have been the *Nepenthes* of Homer. *Rhœas*, the name of one of the species, is from *ρῖον*, to flow or fall, in allusion to the quickly perishable nature of the flowers. The poppy produces a great quantity of seeds, for which reason Cybele, the mother of the gods, is represented crowned with poppy-heads as a symbol of fecundity.

The species of this genus are all showy, with large, brilliant, but fugacious flowers. They are all easy of culture in almost any soil; and one species affords that singular medicine opium. *P. rhœas* is one of the commonest weeds among corn on gravelly soils; but in its double and semidouble variegated varieties, it is also one of the handsomest of garden annuals. The capsules, as in *P. somniferum*, contain a milky juice of a narcotic quality: an extract from them has been successfully employed as a sedative; and some foreign practitioners are said to prefer this extract to opium.

*P. somniferum*, although it is found growing wild in the southern parts of Europe, and even in England, yet there is every reason for thinking that its seed must have been carried to these parts from Asia. It was very early cultivated in Greece, perhaps at first solely for the sake of its seed, which was used as food. It is extensively cultivated in most of the states of Europe in the present age, not only on account of the opium,

7649 Berries roundish, Petals length of stamens, Raceme ovate, Leaves 2-3 ternate  
 7650 Berries ovate-oblong, Petals shorter than stamens, Raceme ovate, Leaves bi-triternate

7651 The only species

7652 Stem erect 2-leaved 1-flowered, Fruit ovate

7653 Peduncles umbelled, Leaves pinnated with roundish toothed lobed segments, Petals elliptical entire

7654 Peduncles umbelled, Leaves pinnated with finely cut segments, Petals serrated or cut

7655 Pods 3-4-valved erect with rigid bristles at end

7656 Stem smooth, Cauline leaves repand, Pod warted roughish

7657 Stem smooth, Cauline leaves roundish sinuated, Pods rough, Flowers subsessile

7658 Stem hairy, Cauline leaves pinnatifid cut, Pod bristly

7659 Caps. subglobose torose hispid, Stem leafy many-flowered

7660 Caps. olate hispid, Stem leafy many-flowered

7661 Caps. hispid, Scape 1-fl. naked hispid, Leaves bipinnate

7662 Caps. hispid, Scape 1-fl. naked hispid, Leaves simple pinnate sinuated

and Miscellaneous Particulars.

for which it is reared in Turkey, Persia, and India, but also on account of the capsules, and of the bland oil obtained from the seeds. All the parts of the poppy contain a white, opaque, narcotic juice; but it abounds more in the capsules: hence these are the only officinal parts of the plant, and for them chiefly is the plant cultivated in this country. They are gathered as they ripen; and as this happens at different times, there are annually three or four gatherings. They are brought to market in bags, each containing about 3000 capsules, and sold to the druggists. The London market is chiefly supplied from Mitcham in Surrey.

The milky juice of the poppy, in its more perfect state, which is the case in warm climates only, is extracted by incisions made in the capsules, and inspissated; and in this state forms the opium of commerce. The mode of obtaining it appears to have been nearly the same in the time of Dioscorides as is at this day adopted. The plants, during their growth, are carefully watered and manured, the watering being more profuse as the period of flowering approaches, and until the capsules are half grown, when it is discontinued, and the collection of the opium commences. At sunset, longitudinal incisions are made upon each half-ripe capsule, passing from below upwards, and not penetrating to the internal cavity. The night dews favor the exudation of the juice, which is collected in the morning by women and children, who scrape it from off the wounds with a small iron scoop, and deposit the whole in an earthen pot, where it is worked by wooden spatules in the sunshine, until it attains a considerable degree of thickness. It is then formed by the hand into cakes, which are laid in earthen basins to be further exsiccated, when it is covered over with poppy or tobacco leaves. Such is the mode followed in India, and according to Kampfer's account, nearly the same is practised in Persia; and when the juice is drawn in a similar manner in this country and inspissated, it has all the characters of pure opium.

Opium is brought to this country in chests from Turkey and India. The Turkey opium is in flat pieces, covered with leaves. East Indian opium is in round masses, covered with the petals of the poppy in successive layers, to the thickness nearly of one-fourth of an inch. Mr. Kerr relates, that at Bahar, it is frequently adulterated with cow-dung, the extract of the poppy procured by boiling, and various other substances. In Malava it is mixed with oil of sesamum, which is often one half of the mass; ashes and the dried leaves of the plant are also used. It is also adulterated with the aqueous extract of the capsules, the extracts of *Chelidonium glaucum*, *Lactuca virosa*, and *Glycyrrhiza glabra*, and sometimes with gum arabic, tragacanth, aloes, and many other articles.

Poppy heads or capsules possess anodyne properties; they are chiefly employed, boiled in water, as fomentations to inflamed and ulcerated surfaces; and a syrup, prepared with the inspissated decoction, is used as an anodyne for children, and to allay the tickling cough in chronic catarrh and phthisis.

Opium operates as a powerful and very diffusible stimulus, but its primary operation is followed by narcotic and sedative effects in a degree much greater than could be expected from the previous excitement it induces. It acts directly on the nervous system, and when taken into the stomach destroys irritability, and allays pain in the most distant parts of the body, independent of the circulation, and without inducing any change on the composition of the blood. As the principle, therefore, on which opium acts is the same over all the body, the topical application of it is capable of producing similar effects, only in a diminished degree, to those resulting from it when it is taken into the stomach.

In moderate doses, opium increases the fulness, the force, and the frequency of the pulse, augments the heat of the body, quickens respiration, and invigorates both the corporeal and mental functions, exhilarating even to intoxication; but by degrees these effects are succeeded by languor, lassitude, and sleep; and in many instances headach, sickness, thirst, tremors, and other symptoms of debility such as follow the excessive use

History, Use, Propagation, Culture,

of ardent spirits, supervene. In very large doses the primary excitement is scarcely apparent, but the pulse seems to be at once diminished, drowsiness and stupor immediately come on, and are followed by delirium, sighing, deep and stertorous breathing, cold sweats, convulsions, apoplexy, and death. The appearances on dissection are those which indicate the previous existence of violent inflammation of the stomach and bowels; but notwithstanding the symptoms of apoplexy which an overdose, when it proves fatal, occasions, no particular appearance of an inflammatory state or fulness of the vessels of the brain are perceived.

The Turks call opium *afioni*; and in the *teriakhana*, or opium shops of Constantinople, they take it in graduated doses from ten grains to one hundred grains in a day. It is mixed with rich syrup and the inspissated juices of fruit, to render it more palatable and less intoxicating; and is taken with a spoon, or made up into small lozenges stamped with the words, Mash Allah, literally, "The work of God." The Tartar couriers, who travel great distances, and with astonishing rapidity, take nothing else to support them during their journeys. (*Dallaway's Constantinople*, quarto, 78.) There is, however, some reason for supposing that the Mash Allah, or Maslach of the Turks, contains other narcotics, as those of hemp and of lolium, as well as opium.

The use of opium for the purpose of exhilarating the spirits has long been known in Turkey, Syria, and China; and of late years it has been unfortunately adopted by many, particularly females, in this country. Russell says, that in Syria, when combined with spices and aromatics, he has known it taken to the amount of three drachms in twenty-four hours. Its habitual use cannot be too much reprobated. It impairs the digestive organs, consequently the vigour of the whole body, and destroys also gradually the mental energies. The effects of opium on those addicted to its use, says Russell, are at first obstinate costiveness, succeeded by diarrhoea and flatulence, with the loss of appetite and a sottish appearance. The memories of those who take it soon fail, they become prematurely old, and then sink into the grave, objects of scorn and pity. Mustapha Shatour, an opium eater in Smyrna, took daily three drachms of crude opium. The visible effects at the time, were the sparkling of his eyes, and great exhilaration of spirits. He found the desire of increasing his dose growing upon him. He seemed twenty years older than he really was; his complexion was very sallow, his legs small, his gums eaten away, and the teeth laid bare to the sockets. He could not rise without first swallowing half a drachm of opium. (*Phil. Trans.* xix. 289.)

When opium has been taken in an overdose, the first thing to be done for counteracting its bad effect, is the exhibition of a powerful emetic; and for this purpose sulphate of zinc, or sulphate of copper dissolved in water, should be immediately swallowed, and the vomiting kept up for a considerable time, and urged by irritation of the fauces. Large draughts of vinegar and water, or other acidulated fluids, should afterwards be frequently taken; and the powers of the habit supported by brandy, coffee, and cordials. The sufferer should be kept awake, and, if possible, in continued gentle motion. Currie recommends the affusion of warm water at 106 degrees or 108 degrees for removing the drowsiness. (*London Dispensary*, 426.)

Medical men have of late sought to discover the sedative principle of opium, and have found it in the extractive, from which a crystallized salt called morphia is obtained. Some foreign physicians, and Mr.

 7683 Leaves peltate finely toothed, beneath downy without spots

and Miscellaneous Particulars.

Thomson, the author of *The London Dispensatory*, have found that a quarter of a grain of the acetate of morphia produces the most beneficial effects that can be expected from an anodyne, allaying pain, and procuring sleep without in any degree affecting the central functions. (*London Dispensatory*, 420.)

A variety of *P. somniferum*, known as the black poppy, from the color of its seeds, is cultivated for these to some extent; they are called maw seed, and generally stained of a light blue color.

*P. Rheas* (*cellette*, Fr.) and also *somniferum* are cultivated in Flanders and Germany for their seeds, which are bruised for an oil used in cookery as a substitute for that of olives. In Poland and some parts of Russia, the seeds are used as a seasoning to soups, gruels, and porridge.

Professor Martyn, in his edition of *Miller's Dictionary*, has collected a body of facts, which clearly prove that opium may be produced to any extent in Britain, and of equal quality to that procured from abroad; the value of labor in this country, however, does not admit of such a thing. We have seen samples of opium made in the south of England quite equal to that of foreign growth, but we understood that the labor of collecting it was greater than could be afforded for its market price.

*P. cambricum* is admired for its yellow petals, and *orientale* and *bracteatum* are very splendid plants.  
 1171. *Meconopsis*. From *μικρον*, a poppy, and *opsis*, resemblance. A genus of herbaceous shade-loving plants, just intermediate between *Papaver* and *Argemone*. The flowers are yellow.

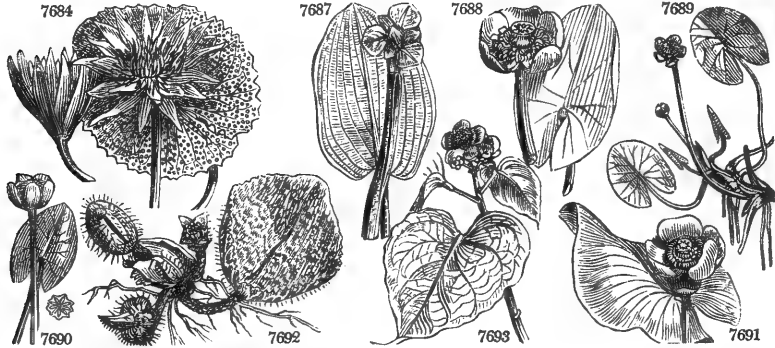

1172. *Argemone*. From *argema*, the name by which the cataract of the eye was known, and which was thought to be cured by this plant. *A. mexicana* is a troublesome weed in the West Indies, with a fig-like fruit, armed with prickles, and thence, by the Spaniards, called *Figo del inferno*. The whole plant abounds with a milky glutinous juice, which turns in the air to a fine bright yellow, and when reduced to consistence is not distinguishable from gamboge. In very small doses it is probably of equal efficacy, given in dropsies, jaundice, and cutaneous eruptions. It is esteemed very detestive, and generally used in diseases of the eyes: but the infusion is looked upon as a sudorific and resolutive, which may be used with success on many occasions. The seeds are said to be a much stronger narcotic than opium.

1173. *Sarracenia*. So named by Tournefort in honor of Dr. Sarrasin, a French physician of rank residing in Quebec, who sent this genus to him from Canada: it is called side-saddle flower from the resemblance of the stigma to a woman's pillion. These plants are remarkable for the singular form of the leaves, which are tubular and hold water, and some species have lids or covers, which it is alleged shrink and close over the mouth of the tube in dry weather, so as to prevent the exhalation of the water. In great drought birds and other animals resort to them. They grow in bogs in Carolina and Virginia, and in British gardens thrive very well in pots with turfy peat at the bottom, and the upper part filled with sphagnum, or water-moss, in which the plants must be set, and then placed in pans of water; they succeed best in frames in a shady situation. (*Bot. Cult.* 417.)

1174. *Nymphaea*. The *Nymph*, or Naiad of the streams. The species are beautiful aquatics, especially *N. alba*, which has a large flower filled with petals, so as almost to appear double: it raises itself out of the water and expands about seven o'clock in the morning, and closes again, reposing upon the surface, about

History, Use, Propagation, Culture,

four in the afternoon. The roots have an astringent bitter taste; they are used in Ireland, in the Highlands of Scotland, in the island of Jura, &c. to dye a dark brown or chestnut color. Swine are said to eat it, goats not to be fond of it, kine and horses to refuse it. The flowers, the herb, and the root were formerly used in medicine, but are all now obsolete.

*N. lotus* resembles our common white species very much in the form of the flower and leaves, but the latter are toothed about the edge. It is native of the hot parts of the East Indies, Africa, and America. It is very common in ponds, lakes, and rivers in Jamaica; and grows in vast quantities in the plains of Lower Egypt near Cairo, during the time they are under water. It flowers there about the middle of September, and ripens towards the end of October. The Arabians call it *Nuphar*. The ancient Egyptians made a bread of the seed of the *Lotus* dried and ground.

All the species grow well in large pots of water with a few inches of rich soil at the bottom: they are propagated by dividing the root, and some sorts which produce bulbs are increased by offsets from these. Mr. Kent, of Clapton, who cultivated exotic aquatics to great perfection, found that the bulbous rooted *Nymphaeas*, if checked in their growth for want of water, from cold, or excessive heat, were apt to form bulbs at the roots and cease growing for the season. Hence the necessity of a regular and powerful moist heat to make them flower freely.

1175. *Limnocharis*. From *λίμνη*, a marsh, and *χαρίς*, dear, so called because the species are marsh plants. They have beautiful umbels of yellow flowers, and are very easily cultivated in a stove. They are increased by seeds.

1176. *Nuphar*. The Arabic name is *naufar*, according to Forskahl. The species are shewy plants closely resembling *Nymphaea*. *N. lutea* is a native of most parts of Europe, and also of America. Linnaeus states, that swine are fond both of the leaves and root; that goats are not fond of it; and that kine, sheep, and horses refuse it: also that crickets are driven out of houses by the smoke in burning it, and that both they and cock-roaches are destroyed by the roots rubbed or bruised with milk. Ray observes, that the flowers smell like brandy.

1177. *Euryale*. From *εὐρύαλος*, broad, in allusion to the enormous broad floating leaves of the plant. A noble aquatic, easily cultivated in a good stove.

1178. *Bixa*. The American name of the tree. The drug called Terra Orellana, or Orleans, Roucou or Arnotto, is prepared from the red pulp which covers the seeds of this plant. By maceration in hot water, the seeds are separated from the pulp, the latter is then made into balls or cakes, which when dry are fit for use. Arnotto of a good quality is of the color of fire, bright within, soft to the touch, and dissolves entirely in water. It is reputed to be cooling and cordial, and is much used by the Spaniards in their chocolate and soups, both to heighten the flavor and to give them an agreeable color. It is esteemed good in bloody fluxes

7684 Leaves peltate at the edge and within the fissure sinuate toothed blistered smooth on each side [end  
 7685 Leaves peltate nearly entire not dotted smooth on each side 2-lobed at base, Anthers with appendages at  
 7686 Leaves cordate entire, Lobes divaricating acute, Calyx acute 4-leaved longer than the acute petals

7687 Leaves oblong very blunt at each end, Flowers in umbels

7688 Leaves cordate entire, Lobes approximating, Cal. 5-leaved longer than petals

7689 Sepals 5, Stigma cut with 8-10 rays, Leaves cordate a little out of the water, Petioles roundish

7690 Sepals 5, Stigma lobed with 10 rays, Lvs. obl. cord. dott. sub-pubesc. Petioles at base  $\frac{1}{2}$  round, at end nearly

7691 Leaves cordate entire half erect, Lobes divaricating, Cal. 6-leaved longer than petals [3-cornered

7602 Petioles and calyxes covered over with stiff prickles, Leaves sometimes 3 feet across

7693 Leaves smooth on each side

7694 Leaves cordate ovate toothed, Peduncles terminal racemose

7695 Leaves ovate, Stipules cordate triangular serrated

7696 Leaves cordate lanceol. serrate hirsute beneath, Capsules bristly

7697 Leaves obl. subcordate serrulate hoary beneath, Caps. bristly

7698 Leaves obl. subcordate entire pubescent beneath, Caps. muricated

7699 Leaves obl. obovate acuminate entire smooth, Petals obtuse, Caps. scabrous

7700 The only species

7701 The only species

7702 Leaves serrated oblong oblique

and Miscellaneous Particulars.

and disorders of the kidneys. Mixed with lemon-juice and a gum, it makes the crimson paint with which the Indians adorn their persons. It was formerly used by dyers to form the color called aurora; but at present it is not held in much estimation as a dye, though it still maintains its ground with painters. Arnotto is well known to be the drug which is used for dying cheese in Gloucestershire, under the name of cheese-coloring. It is used in Holland for coloring their butter. The bark makes good ropes for the common plantation uses in the West Indies; and pieces of the wood are used by the Indians to procure fire by friction.

1179. *Prockia*. A name of unknown meaning. American or Isle of France plants with alternate entire or toothed leaves, and yellow flowers, which are occasionally unisexual.

1180. *Sloanea*. Named by Plumier, in memory of the famous Sir Hans Sloane, Bart., physician to the king, and president to the Royal Society; author of the Natural History of Jamaica, and founder of Chelsea garden and hospital. The leaves are like those of the chesnut; the flowers very large, and the fruit as big as a tennis ball, armed all over with strong spines, and divided regularly into four cells, each containing one small chesnut. It grows freely in our stoves, and ripened cuttings root in sand under a hand-glass.

1181. *Apeiba*. The vernacular name of the plant in Guiana. Tibourbou and Petoumo are vernacular names among the Caribs. The species grow freely in light loamy soil. Cuttings must be well ripened, and the glass they are put under should have a little air given it occasionally, or they will damp off. The best way of flowering it, is to cut a ring round the bark of a large branch, which stagnates it and throws it into flower. (*Bot. Cult.* 20.)

1182. *Sparmannia*. In memory of Anders or Andrew Sparman, a Swede, fellow of the Academy of Sciences at Stockholm, who travelled into China, the Cape of Good Hope, and the islands of the South Sea. His travels were published in London, 1785, quarto, and there are many descriptions by him in the Philosophical and other transactions. It is a beautiful shrub with snowy white petals, and singular nectaries. It grows freely in loam and peat, and cuttings root in sand under a hand-glass.

1183. *Eutelea*. From *εὐτάλης*, perfect. So named by Mr. Brown, because all its filaments are fertile; by which character, among others, it is distinguished from *Sparmannia*. A fine New Zealand plant, discovered originally by the botanists with Sir Joseph Banks in Cook's second voyage.

1184. *Muntingia*. Named by Plumier, after Abraham Munting, professor of botany at Groeningen, died in 1682. *Catobura* is an American name. The flowers resemble those of the bramble, and the fruit cherries. It grows in Jamaica on calcareous subalpine hills, flowering in spring; and in St. Domingo in the wet parts of woods, flowering in August and September. In our stoves it grows freely in light loam, and cuttings root in sand under a hand-glass.

History, Use, Propagation, Culture,

1185. *Grewia*. So named by Linnaeus, in honor of Nehemiah Grew, M. D., F. R. S., famous for his work on the Anatomy of Vegetables. The species are shrubs with elm-looking leaves, generally deciduous, and of no great beauty. Cuttings root in sand under a hand-glass in heat. Some of the kinds produce a sort of berry which is esteemed by the natives of the country where they grow.

1186. *Tilia*. A name the meaning of which is unexplained. *Tilleul*, Fr., *Linden*, Ger., and *Tiglio*, Ital. The species are graceful trees with highly odoriferous flowers, all the soft parts abounding in mucilage.

*T. intermedia* is wild in Sweden, and will in some degree bear the smoke of London. It is a favorite avenue tree in Holland and Germany, and at Evelyn's suggestions (*Sylva*) was a good deal employed in this way in England. He describes some enormous lime trees in Switzerland, Germany, and Hungary, and speaks of its esteem in these countries, and by the Romans. "It is a shameful negligence," he says, "that we are no better provided of nurseries, for a tree so choice and universally acceptable;" for in his time they sent into Holland and Flanders, to our excessive cost, whilst our own woods spontaneously produce them, and though of somewhat a smaller leaf, yet altogether as good, apt to be civilized, and made more florid.

Lime-tree wood is turned into light bowls and dishes, and into boxes for the apothecaries. With the twigs they make baskets and cradles. Formerly the bark was used for writing tablets. Shoemakers make dressers of the plank to cut leather on. The truncheons make a far better coal for gunpowder than that of alder itself, and also scriblets for painters' first draughts. The wood is soft, light, and smooth, close grained, and not subject to the worm. The most elegant use to which it is applied is for carving. Many of Gibbon's beautiful works in lime-tree are dispersed about the kingdom in our churches and palaces; as in the choir of St. Paul's, the Duke of Devonshire's at Chatsworth, Trinity College Library at Cambridge, &c. Evelyn first recommended him to King Charles II. The sap inspissated affords a quantity of sugar. Roucher remarks, that the timber is stronger and lighter than any sort of willow; and makes a proper lining for rooms, and when painted will last long.

In Lincolnshire, in the forest of Dean, and in various parts of the borders of South Wales they make ropes of the bark. This, by maceration, separates into thin rough layers, and is used for making the mats used by gardeners, and called in the north of Europe bast. They form a considerable part of the exports from Russia. This quality in the bark, and a great degree of viscosity in the whole tree, evince its acknowledged affinity to the mallow tribe.

- 7703 Leaves lanc. ovate soft, Cal. very hairy, Pedunc. 3-flowered  
 7704 Leaves cordate ovate oblong crenated scabrous, Pedic. axillary 3-flowered, Fruit of 4 pieces  
 7705 Leaves ovate obl. acum. smooth nearly entire, Fl. terminal panicle  
 7706 Leaves roundish ovate blunt toothed smooth, Peduncles solitary 3-flowered  
 7707 Leaves ovate crenate rough on each side, Peduncles axillary 3-flowered  
 7708 Leaves ovate crenate rough thickish, Pedunc. 2-6-fl. axill. and term. Fruit pilose  
 7709 Leaves cordate roundish hoary beneath, Peduncles axillary about 4, longer than petiole  
 7710 Leaves cordate roundish smooth on each side, Peduncles shorter than petiole  
 \* *Petals naked.*  
 7711 Lvs. cord. uneq. at base, Petioles and suckers hairy, Axill. of veins beneath beard. Fruit globose smooth  
 7712 Lvs. cord. acum. ser. smth. twice as long as stalks, Axill. of veins beard. ben. Fr. membr. obl. deform. 2-seed.  
 7713 Lvs. cord. round. acum. finely serr. smth. scarcely longer than stks. Ax. of veins ben. beard. Fr. round very  
 7714 Lvs. cord. round. acum. finely serr. a little downy ben. Fr. turb. woody with prominent ribs [thin & brittle  
 \*\* *Petals with a scale at base.*  
 7715 Lvs. deeply cord. abruptly acum. finely serrated coriaceous smooth, Pet. trunc. at end cren. Fruit ov. ribbed  
 7716 Lvs. trunc. at base subcord. oblique dent. serr. pubescent beneath, Pet. emarginate, Fruit globose smooth  
 β Leaves thin deeply and rarely cut  
 7717 Lvs. cord. subacum. unequal at base serrated snow-white beneath smooth above, Fruit round with 5 ribs  
 7718 Lvs. ov. downy beneath, at base either cordate or obliquely or equally truncate, Fruit round with 5 ribs  
 7719 Caps. obl. ventricose, Lowest serratures of leaves setaceous  
 7720 Caps. 3-celled 3-valved 3-cornered, Angles bifid scabrous, Leaves obl. Lowest serratures setaceous  
 7721 Caps. obl. 3-celled 3-valved 6-furrowed 6-pointed, Leaves cordate, Lowest serratures setaceous  
 7722 Caps. prismatical cuneate acutangular 3-toothed, Lvs. ovate with about 1 seta at the base, Petioles hispid  
 7723 Caps. roundish depressed rugose, Lowest serratures of leaves setaceous  
 7724 Caps. roundish woolly, Leaves ovate obtuse downy equally serrated  
 7725 Caps. linear compressed 2-valved, Leaves lanceolate equally serrate

7726 Leaves 3 feet long obovate, Flowers growing out of the stem and old branches

7727 Leaves oval  
 7728 Leaves ovate obtuse

7729 Leaves very blunt striated, Peduncles short, Berries 4-seeded

and Miscellaneous Particulars.

The honey made from the flowers of the lime tree is reckoned the finest in the world. Near Kowno in Lithuania, there are large forests chiefly of this tree, and probably a distinct variety or species. The honey produced in these forests sells at more than double the price of any other, and is used exclusively in medicine and for mixing with liquours. (*Encyc. of Agric. ; Poland and Hungary.*)

1187. *Corchorus Korymbos*, the Greek name of a culinary vegetable, supposed to be the same as that now known as *C. olitorius*. *C. olitorius* is sown in great plenty about Aleppo as a pot herb, the Jews boiling the leaves to eat with their meat, whence in French it is called *Maune-de-Juif*. The other species are weeds.

1188. *Grias*. From *γριας*, to eat. The fruit is eaten in the West Indies under the name of the Anchovy pear. The uprightness of the growth and the largeness of the leaves give this tree a very elegant appearance. The fruit is about the size of an alligator's egg, and much like it in shape, only a little more acute at one end, and of a brown russet color. It is frequent in many parts of Jamaica, and grows generally in low moist bottoms or shallow water, where the fruit is pickled and eaten in the same manner with the East Indian mango, which it exactly resembles in taste. It grows in a loamy soil, and large cuttings, Sweet observes, succeed best in the same soil under a hand-glass in heat.

1189. *Calophyllum*. From *καλος*, beautiful, and *φυλλον*, a leaf, on account of its large beautifully veined leaves. *C. inophyllum* (*isives*, fibre, because the middle nerve of the leaf seems to ramify into a multitude of fibres) is a very large tree, with leaves like a water lily, snow-white fragrant flowers, and fruit like a walnut. The trunk when wounded exudes a viscid yellowish juice, frequently hardening to a gum. It is common in Malabar, in sandy soils, and bears fruit twice a year, in March and September, frequently to the age of three hundred years. An oil is expressed from the nuts to burn in lamps, to assuage pains, and to make ointments. The bark and gum is also used for medical purposes. In Java, &c. they plant this tree about their houses, for the elegance of the shade and the sweetness of the flowers.

*C. Calaba* (the name among the Caribs) branches from the ground upwards, and is therefore well adapted for tree hedges. It has a green fruit not unlike our cornelian cherry, which is eaten by the natives, and an oil is expressed from it for lamps. Both species grow freely in a light loamy soil, and ripe cuttings are readily struck in sand under a glass and plunged in heat. (*Sweet.*)

1190. *Mammea*. An alteration of its American name, *Mamey*. The name having some resemblance to the Latin word *mamma*, a teat, Linnæus attributed the derivation to that word, on account of the large fleshy pointed nature of its fruit. *Abricot-sauvage*, Fr. A handsome tree with a spreading elegant head, like those

History, Use, Propagation, Culture,

of *Magnolia grandiflora*, and odoriferous white flowers on peduncles. The fruit is roundish, with a leathery rind, inclosing one thinner, containing a firm bright yellow pulp, having a pleasant singular taste, and a sweet aromatic smell; but the skin and seeds are very bitter and resinous. It is eaten raw alone, or cut in slices with wine or sugar, or preserved in sugar. In Martinico they distil the flowers with spirit, and make a liquor which they call Eau orsèle.

Some horticulturists are now attempting its culture in our stoves as a fruit tree. It grows freely in sandy loam, and ripened cuttings, with the leaves not shortened, root in sand under a hand-glass in heat. (Sweet.)

1191. *Ochna*. The Greek name of the wild pear tree, to which the genus so distinguished by Linnaeus has no kind of resemblance. The species are pretty free-flowering plants, with shining serrated leaves, and long racemes of beautiful yellow flowers. They grow freely in loam and peat, and cuttings root readily in sand under a hand-glass.

1192. *Elæocarpus*. From *elaia*, the olive, and *καρπος*, fruit, in allusion to the shape of its fruit. The stones cleaned from the pulp, and set in gold, are formed into necklaces. The species thrive in loam and peat, and cuttings root in sand under a hand-glass.

1193. *Alangium*. So denominated by Lamarck, from a slight alteration of one of its Malabar names, *Alangi*. It grows in light sandy soil, and cuttings root in sand under a hand-glass in moist heat. (Sweet.)

1194. *Mentzelia*. Named after Christian Mentzel, a Prussian, physician to the Elector of Brandenburg; he died in 1701. Curious plants related to *Loasa*.

1195. *Lagerstrœmia*. So named by Linnaeus from Magnus Lagerstroem, of Gottenburgh, director of the Swedish East India Company, who procured many curiosities from China, and gave them to the public. L. regine is a very handsome shrub; the flowers are in panicles, a span long, pale rose-colored in the morning, growing deeper through the day, and becoming purple in the evening. According to Sweet, this species is rather difficult to preserve through the winter; it requires a good heat, and but little water in winter; if it happens to have too much wet, it is a great chance if it survives: in summer it grows very fast, and requires plenty of room and water. Cuttings of both kinds root readily in sand, under a hand-glass. (Bot. Cult. 73.)

1196. *Ægle*. *Αιγλή* was one of the Hesperides. Correa de Serra named the genus *Ægle* from the fruit having some resemblance to the orange. Sweet observes, that this plant likes a rich loamy soil. The wood

7730 Stigma capitate, Petals 8-10, Leaves obovate very blunt serrated  
7731 Flowers solitary, Leaves ovate acutely toothed, Sepals ovate

7732 Leaves lanceolate ellipt. serrated, Racemes axillary  
7733 Leaves obl. lanc. serrated netted, Racemes axillary clustered, Drupes blue

7734 Petals 10, Branches spiny

7735 Stem branched, Peduncles axillary, Petals crenate obtuse  
7736 Stem branched, Peduncles axillary solitary, Petals acuminate, Fruit reflexed

7737 Petals crisp, Panicle terminal, Leaves roundish ovate acute smooth  
7738 Petals wavy, Panicle terminal, Leaves oblong smooth

7739 Middle leaflet stalked, Fruit with 12 cells

7740 Leaves subsessile connate at base lin. lanc. smooth above downy beneath, Caps. 10-celled

7741 Leaves lin. lanc. sessile 3-nerved villous on each side, Pedunc. cymose 1-sided  
7742 Leaves on short stalks ovate lanceolate acum. wavy at edge: the upper hairy, Cymes hirsute  
7743 Lvs. sessile obl. obt. hirsute, Pedunc. short 1-f. or cymose, Caps. small in a large hairy pyramidal calyx  
7744 Leaves roundish ovate rugose tomentose hairy stalked, Pedunc. 1-f. 1-3 together, Calyx villous  
7745 Leaves stalked cordate acuminate smooth, Fl. cymose, Pedunc. with long bractes  
7746 Leaves stalked cordate ovate acuminate fringed at edge rugose and a little glutinous on each side  
7747 Leaves sessile linear oblong acute wavy at edge 3-nerved at base, Sepals villous with long points  
7748 Lvs. lanc. acute 3-nerv. hairy reticul. beneath stalked, Stalks sheathing the stem with their connate bases  
7749 Leaves sessile linear lanceolate waved crisp 3-nerved rugose pubescent, Fl. sessile umbelled  
7750 Leaves stalked ovate blunt rugose downy beneath, Pedunc. long hoary 1-flowered  
7751 Leaves stalked ovate lanc. 3-nerved smooth above downy beneath, Petioles dilated and united at base  
7752 Lvs. ovate lanc. on short stalks sheathing at base revolute at edge, Pedunc. hirsute leafy 1-flowered  
7753 Leaves spatulate toment. rugose 3-nerved sessile subconnate: the upper narrower, Pedunc. 1-flowered  
7754 Leaves obl. lanc. acuminate at each end rugose, Stalks short hairy sheathing, Pedunc. short 1-2-3  
7755 Leaves spatulate ovate downy hairy narrowed into a short stalk wavy at edge, Pedunc. short 1-flowered  
7756 Leaves sessile obl. ellipt. hoary downy about 3-nerved, Fl. 3-8 in terminal umbels, Outer sepals largest  
7757 Lvs. conn. obl. lanc. nerv. above smooth and shin. beneath silky, Fl. in corymb. cymes, Ped. and cal. vill.

and Miscellaneous Particulars.

requires to be ripened before the cuttings are taken off; then to be planted in a pot of sand without shortening the leaves, and to be plunged under a hand-glass in heat.

1197. *Cistus*. *Karree*, in Greek; derived from *κυσ*, a box, or capsule. The capsules of the genus are remarkable. All these words have been formed from the Anglo Saxon, *cyst*, which signifies a hollow vessel.

The species are for the most part shewy and free-flowering plants; the colors brilliant, and the petals very fugacious. In gardens they are rather difficult to keep in a neat shape, getting naked below, and often dying wholly or in part during severe winters. They succeed best in glass cases, which can be entirely removed in summer, or in a dry soil under a warm wall.

*C. villosus* has a strong woody stem, the flowers are produced at the ends of the branches, four or five together, almost in form of an umbel, but it rarely happens that more than one is open at the same time. The petals are large, purple, and spread open like a rose; they are but of short duration, generally falling off the same day they expand; but there is a succession of fresh flowers every day for a considerable time in May and June; generally again in September and October, if the autumn be favorable, and even in the winter if the plants be protected from frosts.

*C. ledon* and *ladaniferus* produce the gum ladanum, but not in such quantities as *C. creticus*. The resin, which is secreted from the leaves and other parts of the shrub, is scraped off by means of a kind of rake, to which numerous leathern thongs are appended instead of teeth. This instrument being drawn backwards and forwards over the plant from time to time, collects the resin. The chief use of this gum in modern practice is in fumigations, its fragrant smell having made it a constant ingredient in such preparations.

*C. ladaniferus* is the most popular species for warm situations in ornamental scenery. "Most of the species," Sweet observes, "will survive through the winter in the open air, if the weather be not too severe; but it is safest to keep some of all the kinds in pots, that they may be sheltered from severe frosts; and they can be turned out in the borders in spring, when they will thrive and flower well. They will succeed in any common soil, or a mixture of loam and peat will suit them very well. They may be increased by layers; or young cuttings, as soon as ripened, taken off at a joint, and planted under a hand-glass, will root readily: they may be also raised from seeds, which are produced in abundance." (*Bot. Cult.* 168.)

History, Use, Propagation, Culture,

1198. *Helianthemum*. From  $\eta\lambda\lambda\iota\omicron\varsigma$ , the sun, and  $\alpha\upsilon\tau\omicron\varsigma$ , flower, in allusion to the bright golden radiance of the blossoms. This is a showy free-flowering genus of little trailing plants, mostly ligneous, and well adapted for rock-work. A number of them answer best kept in pots, and sheltered by frames during winter; but some are quite hardy, and none are more ornamental than the *H. vulgare*, and its varieties with orange, yellow, straw-colored, red, and double flowers. It is one of the handsomest plants in cultivation for rock-work. All the species are of easy culture in light soil, and cuttings root freely under a hand-glass.

1199. *Bauera*. Named after Francis and Ferdinand Bauer, German botanical draughtsmen of the highest

- 7758 Stem nearly smooth, Lvs. sess. lin. revol. at edge brownish green above hoary beneath, Fl. sol. Sep. shining  
 7759 Young shoots visc. with downy hairs, Lvs. sess. lin. obl. viscid downy beneath, Fl. in term. umb. Sep. villous  
 7760 Branches hairy rough hoary, Lvs. sess. atten. at base green above ash-colored beneath, Ped. shorter than  
 7761 Leaves sessile hoary ovate-lanc. Pedunc. panic. hairy, Sepals 3 acute hairy [Leaves, Cal. hairy  
 7762 Branches villous, Leaves obov. lanc. hoary, Pedunc. and cal. villous, Sepals 3  
 7763 Branches white with scales, Leaves broad ovate blunt wavy at base silvery on each side, Cal. hairy  
 7764 Branches white with scales upwards, Lvs. stalked ovate-obl. Pedunc. long brached panic. Sepals 5 scaly  
 7765 Branches hairy, Lvs. obl. lanc. acute hairy pale beneath, Pedunc. hairy l-f. Capsule shorter than calyx  
 7766 Stems nearly simple, Radical leaves stalked ov. obl. 3-nerved hairy, Ped. panic. few, Cal. smooth shining  
 7767 Stem hairy, Leaves sess. obl. lin. 3-nerved villous, Racemes lax without bractes, Ped. filiform naked  
 7768 Stem nearly smooth, Lvs. obl. ellipt. tooth. Fl. opp. with stipules, Ped. erect smooth shorter than calyx  
 7769 Lvs. on short stalks lin. obl. narr. rev. at edge, Stip. lin. subulate, Pedunc. filif. pubescent, Calyx inflated  
 7770 Branches hairy, Leaves obov. obl. acute toothletted, Stip. lin. obl. Pedunc. and cal. hairy  
 7771 Leaves obl. 3-5-nerved rough with short stellate hairs, Racemes long pubescent cinereous few-flowered  
 7772 Branches hoary, Leaves stalked opp. and alternate blunt glauc. Stipules subulate, Raceme term. erect  
 7773 Stem tortuose, Leaves altern. lin. rough at edge subinvolute, Pedunc. sol. l-f. Caps naked  
 7774 Leaves setaceous glaucous nearly smooth, Stip. filiform long, Pedunc. racemose, Calyx hairy  
 7775 Branches villous, Leaves lin. obl. pubesc. Stip. lin. subul. mucron. erect, Pedunc. racemose glutinous  
 7776 Branches villous glutinous, Leaves lin. vill. glut. ash-colored, Stipules long lax, Pedunc. and cal. villous  
 7777 Leaves stalked ovate hairy on each side, Racemes short term. Pet. scarcely larger than calyx  
 7778 Leaves lanc. ellipt. blunt green on each side, Racemes simple few-fl. Cal. subglobose ovate  
 7779 Branches simple long, Leaves pilose hispid; lower ovate; upper lanc. Racemes simple hairy hoary  
 7780 Leaves oblong hairy green above hoary beneath, Racemes simple, Pedic. and cal. hoary  
 7781 Leaves with stipules stalked ovate cordate, Racemes simple solitary few-flowered terminal  
 7782 Branches silvery with scales, Leaves stalked obl. blunt silvery with small stipules, Cal. scaly  
 7783 Branches ascend. hoary, Leaves downy glaucous: the lower round; upper ellipt. Stip. and bractes green  
 7784 Leaves lanc. ovate hoary beneath green above, Calyx furrowed with elevated hairy nerves  
 7785 Leaves obl. ellipt. hoary beneath deep green shining above, Calyx hoary: its nerves with a few hairs  
 7786 Leaves scarcely revol. at edge hoary beneath, green and hairy above: lower round; upper obl. Rac. lax
- 7787 Lower leaves round: upper obl. lin. hairy green beneath, Racemes and calyxes hairy  
 7788 Leaves obov. obl. somewhat hairy, Racemes few-fl. term. Pet. narrow lanceolate  
 7789 Leaves ovate-obl. keeled sessile, Peduncles long branched panicled, Stipules O  
 7790 Stipules O, Leaves lanc. hoary hairy beneath, Pedunc. long 2-leaved and racemose, Calyxes hairy  
 7791 Leaves opp. lanc. 3-nerved hairy viscid, Radical obovate, Racemes without bractes, Petals serrated  
 7792 Leaves obovate obl. revolute at edge downy hoary beneath, Calyxes very hirsute white  
 7793 Leaves obl. linear glaucous above hoary beneath, Cal. hoary minutely pubescent, Branches hoary  
 7794 Leaves lin. obl. revolute at edge hoary on each side, Calyxes very hirsute white  
 7795 Leaves lin. very short pubescent opp. Stip. mucronate erect, Pedunc. villous few-flowered  
 7796 Leaves oblong lin. revolute at edge the younger hoary on each side, Calyxes glaucous, Sepals ciliated  
 7797 Leaves short stalked lin. oblong hispid above, Racemes lax, Calyx with deciduous hairs  
 7798 Leaves flat ovate obl. acute smooth above beneath finely downy, Cal. striated smoothish  
 7799 Leaves obl. ovate obt. flat beneath hoary above smooth green, Cal. striated smooth shining  
 7800 Leaves stalked obl. lin. downy beneath glaucous above, Cal. shortly hairy striated glaucous obtuse  
 7801 Leaves linear hoary on each side setose at end, Stipules subulate, Cal. hairy nerved striated  
 7802 Upper leaves flat obl. hairy, Stipules ciliated longer than stalk, Fl. large, Calyxes hairy  
 7803 Leaves ovate lanc. a little downy on each side, Stipules linear, Ped. and cal. pilose hirsute  
 7804 Leaves downy hoary beneath glaucous above revolute at edge, Calyxes yellowish glaucous  
 7805 Leaves narrow lanc. flat with stellate pubescence on each side, Raceme terminal few-flowered

## DIGYNIA.

7806 The only species

- 7807 Leaves cuneate obovate upwards crenate toothed  
 7808 Leaves ovate-oblong cordate at base, upwards crenate toothed  
 7809 Leaves ovate acute nearly entire  
 7810 Leaves oblong acute crenate-toothed upwards, green beneath

## and Miscellaneous Particulars.

celebrity. Nothing comparable to their works has ever appeared from any other hand. The species is a hardy free-flowering plant, of easy culture in sandy loam and peat, and cuttings root in the same soil under a glass.

1200. *Fothergilla*. In memory of John Fothergill, M. D., an eminent physician and patron of botany, who cultivated a variety of the most curious plants in his garden near London. The species are dwarf deciduous shrubs, of easy culture in light soil or peat, and generally increased by layers.

History, Use, Propagation, Culture.

1201. *Curatella*. From *curatus*, worked; a name given by Aublet to the genus, because the leaves, which have a rough surface, are used in Guyana for polishing bows, sabres, and other weapons. A small tree with rough leaves, which grows well in sandy loam; cuttings root in sand under a glass.

1202. *Pæonia*. The physician Pæon was the first to use this in medicine. The Greek legend adds, that he used it to cure Pluto of a wound inflicted by Hercules. The species are magnificent flowering plants, especially *P. officinalis* and *moutan*, with their numerous varieties. *P. moutan* and its different varieties are hardy enough to bear our winters in the open air; but they do not flower in such perfection as when planted out in a conservatory, or in a pit where they may be protected from the severe frost under glass: they will thrive well in any rich light soil; and ripened cuttings, slipped off, and planted in the ground, in a shady place, without cover, will root freely. (*Bot. Cult.* 234.)

*P. edulis* has a more slender stem than the common Pæony. The Daurians and Mongols boil the root in

7811 Leaves ovate subrepand toothletted rough

7812 Segments of leaves ovate obl. glaucous beneath

7813 Capsules smooth recurved, Segm. of leaves smooth shining 3-parted with ovate lanceolate lobes

7814 Capsules downy erect, Segm. of leaves glaucous beneath smooth somewhat lobed with blunt obovate lobes

7815 Capsules downy, Segm. of leaves ovate entire smooth

7816 Capsules downy nearly straight, Segments of leaves unequally cut smooth, Lobes ovate-lanceolate

7817 Caps. downy erect, Segm. of leaves 3-parted cut and entire ovate-lanc. flat hairy beneath

7818 Leaves somewhat shining blistered coriaceous glaucous and downy beneath, Ovaries woolly spreading

7819 Caps. downy straight, Segm. of leaves many-parted blunt somewhat wavy glaucous beneath hairy

7820 Caps. downy straight, Segm. of leaves oval-lanc. flat lobed imbricated beneath casious hairy

7821 Caps. downy arcuate spreading, Segm. of lvs. 3-lobed and pinnatifid decurrent ovate-obl. flat hairy beneath

7822 Caps. pubescent spreading, Segm. of leaves 3-parted oblong blunt hairy beneath

7823 Caps. somewhat pilose nearly erect, Segm. of leaves 3-5-parted villous beneath, Lobes obl. entire

7824 Caps. 5 smooth depressed blunt, Segm. of leaves smooth pinnated, Lobes lanc. acuminate

7825 Caps. pubescent, Segments of leaves smooth many-parted, Lobes linear

7826 Caps. downy spreading, Segm. of leaves smooth many parted, Lobes linear

### TRIGYNIA.

7827 Leaves obovate lanc. nearly entire mucronate pubescent beneath, Flowers sessile, Stem twining

7828 Leaves roundish crenate toothed, Fl. stalked opp. to the leaves, Stems procumbent

7829 Leaves obl. acum. smooth with awned serratures, Fl. stalked trigynous

7830 Like *D. grandiflorum*, from which it differs in having a more rigid stem, and a later time for flowering

7831 Stem erect velvety, Lvs. 3-5-part. Lobes pinnatifid, Racemes lax, Spur straight pubesc. shorter than cal.

7832 Stem suberect smth. with spread. branches, Fls. few loosely racem. Ped. long. than bractes, Caps. smooth

7833 Petioles not dilated at base, Lvs. cun. at base 5-7-lob. Lobes cut acute, Raceme lax branch. Calyxes smooth

7834 Stem erect smoothish nearly simple, Branches much covered with fls. Ped. length of bractes, Caps. pubesc.

7835 Stem erect branch. subpub. Lvs. pedate multifid, Ped. very long, Spur incurv. at end horiz. divid. upwards

7836 Stem erect much branch. Lvs. smooth rigid: low. multifid, Branc. and bractes lin. ent. Rac. lax. Pet. stalk.

7837 Leaves palmate many-parted, Lobes linear distant, Pedicels longer than bract, Pet. shorter than calyx

### and Miscellaneous Particulars.

their broth, and grind the seeds and put them into their tea. *P. officinalis* was by old authors said to be of two sorts, male and female, the flowers of the former being smaller and lighter colored than those of the latter. These distinctions, however, were not indicative of sexual difference, the peony being hermaphrodite, but merely of stronger and weaker growing varieties, according to the practice of the age. Now they are laid aside, the varieties reduced to seven or eight, of which a full account is given in the Horticultural Transactions (vol. ii. 273.). Of these, the double red, the most common, when introduced at Antwerp about the end of the sixteenth century, sold for twelve crowns a root. A useful account of the species and varieties has been published by Messrs. Anderson and Sabine, in the transactions of the Linnean Society.

1203. *Hibbertia*. Named after George Hibbert, Esq. who was once a distinguished English collector of plants. Twining or trailing plants of New Holland, with bright yellow flowers.

1204. *Delphinium*. From  $\delta\epsilon\lambda\phi\iota\nu$ , a dolphin, on account of the resemblance between the nectary of the

History, Use, Propagation, Culture,

plant and the imaginary figures of the dolphin. The species are shewy annuals or perennials, valuable as border flowers. The leaves are generally much divided, and the flowers in terminal spikes, blue, purple, or red; never yellow or any shade of that color.

D. consolida, (from *consolidare*, to unite; it being formerly reputed as a most powerful vulnerary,) *Pied d'Alouette*, Fr., *Rittersporn*, Ger., is a shewy annual, with blue, pink, purple, and white flowers, and semi-double and double. D. Ajacis, so called because some traces may be perceived in the flower of what may be likened to the letters AIA, is by some considered as only a variety of this species; both are universally grown as border annuals. D. elatum is well adapted for shrubberies. All the species are of the easiest culture. The species are extremely difficult to distinguish from each other, and are probably in many cases mere varieties.

1205. *Aconitum*. So called from growing about Acona, a town of Bithynia. The species are robust free-flowering plants of some beauty and consequence. The stems rise from two to six feet in height, upright, strong, furnished with many digitate or palmate leaves, and terminated by panicles or loose spikes of blue or yellow flowers.

A. Napellus, from *napus*, a turnip, its grumous roots resembling little turnips, is a well known poisonous plant. Linnaeus says, that it is fatal to kine and goats, especially when they come fresh to it, and are not acquainted with the plant; but that it does no injury to horses, who eat it only when dry. He also relates (from the Stockholm Acts) that an ignorant surgeon prescribed the leaves, and on the patient refusing to take them, he took them himself and died. The ancients, who were acquainted with chemical poisons, regarded the Aconite as the most violent of all poisons. Some persons, only by taking in the effluvia of the herb in full flower by the nostrils, have been seized with swooning fits, and have lost their sight for two or three days.

 7845 Pet. scar. dilat. at base, Lvs. 3-5-part. multif. with lin. lobes, Rac. straight, Pet. beard. at end : low. very vill.  
 7846 Pet. scar. dilat. at base, Lvs. 3-7-lob. Lobes obl. ac. cut pinnatifid : up. 3-part. Caps. nett. at keel and edge cil.  
 7847 Pet. smth. but scar. sheath. at base, Lvs. 5-par. Lobes 3-5-fid lin. Pet. sh. than cal. Caps. refl. from their base  
 7848 Petioles not dilat. at base, Leaves concave beyond the middle trifid, Lobes cuneiform cut acuminate at end  
 7849 Petio. not dilat. at base, Lvs. 5-lob. with cut lobes, Stem flexu. and petioles hairy, Bractes lin. Caps. smooth  
 7850 Petioles sheathing at base, Lvs. many-par. with lin. subul. segm. Fl. pubesc. Spur acute longer than flowers  
 7851 Pet. not dilat. at base, Lvs. 3-7-lob. with obl. ac. cut pinnat. lobes, Rac. lax branch. Bractes and ovaries pub.  
 7852 Petioles sheathing at base, Lvs. many-parted in lin. lobes, Rac. long, Spur straight blunt longer than pedicel  
 7853 Spur very short, Bracteoles inserted at base of pedicel, Petioles hairy, Pedicels twice as long as flower  
 7854 Spur scarcely shorter than cal. Bracteoles inserted at base of pedicel, Petioles pubesc. Pedic. scarcely longer  
 7855 Spur nearly as long as calyx, Bractes inserted in the middle of pedicel, Petioles hairy [than flower

7856 Pan. divaricating, Branches tortuose, Helmet conical half circular, Spur short thick spiral [at end  
 7857 Fl. spiked or panic. numerous, Lvs. deeply 3-5-lobed with cuneate trifid lobes, Spur slender straight curv.  
 7858 Helmet conical cylindrical. Spur slender spirally twisted, Lip divaricating, Lvs. palm. 3-5-lob. beyond middle  
 7859 Veiny smooth, Pan. smoothish with ascend. branches, Bag of hoods very large ventric. Spur thick subinvol.  
 7860 Pan. divaricating very smooth, Branches tortuose, Spur thick somewhat spiral, Lobes of leaves rhomboid  
 7861 Fls. panic. Sep. and pet. persist. Bag of hoods scarcely any, Spur thick spiral, Lvs. multif. with lin. ac. segm.  
 7862 All over densely pubesc. Lvs. very large palmate 3-5-lobed beyond middle pubesc. Helmet conical cylindr.  
 7863 Like Anthera, but flowers smoothish variegated with a low subconical helmet [compressed  
 7864 Like Lycoctonum, but flowers paniced, Stem peduncles and flowers villous, Ovaries smooth or hairy  
 7865 Ovaries 4-5, Helmet conical with a long claw, Rac. lax simple, Lvs. 3-5-parted with trifid toothed lobes  
 7866 Pan. lax, Helmet conical elongated abruptly mucronate in front, Spur thick spiral, Ovaries 3-5

7867 Pan. lax, Branches 1-4-f. Spur thick long abruptly kneed, Bags of hoods inflated, Ovaries 3-5 smooth  
 7868 Ovaries 3 smooth, Raceme lax corymbose, Ped. smooth, Helmet very convex subconical  
 7869 Pan. lax, Helmet exactly conical, Spur very thick blunt very short, Bag of the hoods very large  
 7870 Fl. panic. Helmet conical, Spur thick blunt very short. Lvs. deeply lobed with narrow diverging segments  
 7871 Stem very short, Low. lvs. few on long stalks 5-part. with palm. segm. Hoods hook. blunt, Ovaries 3 villous  
 7872 Ovaries 3 smooth, Raceme cylindrical. long, Leaves divided down to petiole with linear acute furrowed lobes  
 7873 Ovaries 3 smooth, Rac. cylindr. long very compact, Pedicels smooth shorter than bractes, Lvs. subpedate  
 7874 Stem twining with spreading hairs, Petioles ciliated, Leaves 3-5-parted with pinnatifid lobes, Ovaries 5-7  
 7875 Pan. lax, Branches diverging, Helmet exactly conical, Leaves 3-lobed with entire lobes, Ovaries villous

PENTAGYNIA.

7876 Leaves very rough toothed

and Miscellaneous Particulars.

But the root is unquestionably the most powerful part of the plant. Matthiolus relates, that a criminal was put to death by taking one dram of it. Dodonæus gives us an instance, recent in his time, of five persons at Antwerp, who ate the root by mistake, and all died. Dr. Turner also mentions, that some Frenchmen at the same place, eating the shoots of this plant for those of masterwort, all died in the course of two days, except two players, who quickly evacuated all that they had taken by vomit. We have an account, in the Philosophical Transactions, of a man who was poisoned, in the year 1732, by eating some of this plant in a salad, instead of celery. Dr. Willis also, in his work De Anima Brutorum, gives an instance of a man who died in a few hours, by eating the tender leaves of this plant also in a salad. He was seized with all the symptoms of mania. The Aconite, thus invested with terrors, has, however, been so far subdued, as to become a powerful remedy in some of the most troublesome disorders incident to the human frame. Baron Stoerck led the way by administering it in violent pains of the side and joints, in glandulous scirrh, tumours, ulcerous tubercles of the breast, &c. to the quantity of from ten to thirty grains in a dose, of an extract, the method of making which he describes.

Willdenow and the Dublin College consider that the plant used by Stoerck was the *A. neomontanum*, in which opinion Mr. Thomson agrees in his London Dispensatory.

All the species are poisonous in a high degree. The limits of the species are extremely obscure, and in a very unsettled state; Decandolle in his *Systema*, increased the number at that time known, but in his *Prodromus* many of the species of the *Systema* are considered mere varieties. Dr. Reichenbach has, however, multiplied the species prodigiously, but with little reason.

1206. *Trachytella*. From *τραχυτητα*, roughness. These are climbing shrubs with racemose white flowers, and hard rough leaves, which are used in China for polishing metals and hard wood.

History, Use, Propagation, Culture,

1207. *Cimicifuga*. From *cimex*, a bug, and *fugo*, to drive away, indicating certain virtues a species is supposed to possess. The *C. serpentaria* is used with success by the native practitioners in North America, for curing the dangerous bite of the rattlesnake. Tall, leafy herbaceous plants, with the appearance of *Actæa*.

1208. *Aquilegia*. From *aquila*, an eagle; the inverted spurs of the flower have been likened to the talons of a bird of prey. The species are smooth-leaved, handsome-flowered plants. *A. vulgaris* is an old inhabitant of the flower border: the whole plant has been recommended to be used medicinally, but it belongs to a suspicious natural order, and Linneus affirms, that children have lost their lives by it. *A. alpina* is the handsomest species.

1209. *Nigella*. From *niger*, black, because of the color of the seeds, which are the part of the plant known in cookery. The species are curious or neat little plants, with fine cut leaves like fennel. *N. damascena* and *sativa* are sown as hardy annual flowers; and on the continent, the leaves and seeds of the latter species and *N. arvensis*, are used in cookery instead of more expensive aromatics. They are also said to be extensively used in the adulteration of pepper.

1210. *Reaumuria*. So named by Hasselquist, in honor of René A. F. de Reaumur, author of several entomological works; *Histoire des Insectes*, &c. He died in 1757. A small caesious plant, bearing an abundance of bright lilac flowers.

1211. *Colbertia*. Named by Mr. Salisbury after the famous Colbert, a patron of the Paris garden, who destroyed with his own hands the vines which had been planted therein in lieu of more curious objects. A fine plant, with leaves like those of *Dillenia speciosa*.

1212. *Tetracera*. From *τετρα*, four, and *κερας*, a horn, because of its four capsules recurved like as many horns. Shrubs or small trees, which are often climbers with alternate stalked naked leaves, often rough above. The flowers are paniced or racemose. The leaves are remarkable as an exemplification of that mode of nervation which M. Decandolle calls feather-nerving.

1213. *Nelumbium*. This is called in Ceylon *Nelumbo*. Sir James Smith proposed to call the genus by the more classical name of *Cyanus*, but it has been remarked, that it remains to be proved that the holy *κλυμνος*, was this plant. *N. speciosum* is a native both of the East and West Indies, China, Cochinchina, and Japan,

7877 Monogynous, Racemes very long, Caps. dry dehiscent, Leaves biternate with serrate or cut segments

7878 Ovaries 4 subsessile very vill. Racemes paniced, Lvs. ternate or biternate, Segm. ovate-lanc. cut toothed

7879 Ovaries 2-3 smooth sessile, Racemes paniced, Leaves biternate, Segments cordate at base

7880 Ovaries 12-15 in a roundish head, Racemes dichotomous paniced, Leaves palmate

7881 Spurs incurved, Caps. vill. Stem few or 1-fl. Lvs. covered with viscid down, Styles not longer than stamens

7882 Spurs incurved, Caps. villous, Stem leafy many-fl. Leaves nearly smooth, Styles not longer than stamens

7883 Spurs incurved twice as short as petals, Upper part of the plant and capsules covered with glandular hairs

7884 Spurs straight longer than limb, Stam. as long as petals, Styles long, Petals oval obl. shorter than petals

7885 Spurs straight longer than very blunt limb, Styles scarcely longer than stamens and petals, Sepals acute the length of petals

7886 Spurs straight somewhat incurved at end twice as short as limb of petals, Stem 2-3-fl. leafy, Lvs. finely cut

7887 Spurs straight, Styles and stamens exserted, Sepals acute a little longer than petals, Segm. of leaves 3-parted

7888 Spurs straight as long as limb, Styles and stamens as long as sepals, Sepals the length of petals

7889 Anthers blunt, Caps. 5 smooth 2-cell. united as far as end into an ovate globose one, Fls. in a leafy involucre

7890 Anthers blunt, Flowers in an involucre, Sepals erect conniving

7891 Anthers blunt, Caps. muricate, Stem erect hairy, Flowers naked

7892 Anthers pointed, Styles 5-7 revolute, Capsules and stem smooth, Branches diverging

7893 Anthers pointed, Styles 8-10 erect, Caps. smooth 1-nerved at back, Stem erect smooth, Branches erect

7894 Caps. 5-10 smooth erect, Styles straight

7895 A low shrub, with narrow glaucous leaves

7896 Leaves smooth 10-nerved 1-1½ foot long 6 inches broad

7897 Lvs. oval-obl. blunt or nearly acute smooth roughish above somewhat toothed at end, Pedunc. paniced [pubescent]

### POLYGYNIA.

7898 Petals many, Anthers lengthened beyond the cells into a clavate appendage

β Inner petals scarcely smaller than the outer, blunt

7899 Petals many, Anthers lengthened beyond the cells into a linear appendage

and Miscellaneous Particulars.

Persia, and some parts of the Russian empire. Thunberg informs us, that it is considered as a sacred plant in Japan, and pleasing to their deities, and that the images of their idols were often drawn sitting on its large leaves. The long stalks are there eaten among other potherbs. Loureiro relates, that it abounds in muddy marshes in India and China, and is cultivated in large handsome pots in the gardens and houses of the mandarins; that there is a variety with the flower of a pure white, and another with a very beautiful luxuriant flower, having about one hundred large petals, white or rose-colored. Both root and seeds are esculent, sapid and wholesome. In China it is called Lien-wha, and the seeds and slices of the hairy root, with the kernels of apricots and walnuts, and alternate layers of ice, were frequently presented to the British ambassador and his suite at breakfasts given by some of the principal mandarins. The Chinese have always held this plant in such high value, that at length they regarded it as sacred. That character, however, has not limited it to merely ornamental purposes; for the roots are not only served up in summer with ice, but they are also laid up in salt and vinegar for the winter. The seeds are somewhat of the size and form of an acorn, and of a taste more delicate than that of almonds. The ponds are generally covered with it, and exhibit a very beautiful appearance, when it is in flower; and the flowers are no less fragrant than handsome.

Sir George Staunton remarks, that the leaf, besides its common uses, has, from its structure, growing entirely round the stalk, the advantage of defending the flower and fruit arising from its centre from contact with the water, which might injure them. He also remarks, that the stem never fails to ascend in the water from whatever depth, unless in case of a sudden inundation, until it attains the surface, when its leaf expands, rests, and swims upon it, and sometimes rises above it. This plant bears the rigorous cold of the Pekin winter, though it is reared with difficulty in European stoves. It often grows spontaneously in China, and is propagated in the open air with ease both by the seed and root. The Chinese distinguish many varieties of it.

From the root of the Nelumbo, Sir George Staunton says, the Egyptians are supposed to have prepared their Colocasia, but the plant is now no longer found in that country; from which circumstance some naturalists infer, that it never was indigenous there, but cultivated by the inhabitants with extreme care. The ancient Romans made repeated efforts to raise it among them, from seeds brought out of Egypt; and the

History, Use, Propagation, Culture,

modern attempts to cultivate it in Europe, though with the assistance of artificial heat, seldom have succeeded.

Dr. Patrick Browne is of opinion that the ancients confounded two plants under the name of Lotus or Egyptian bean, and that under these titles they described the upper parts of the Nymphaea Nelumbo, and the roots of the lesser Colocasia, now commonly called *coccos* in Jamaica, Arum Colocasia. (*Jam.* 243. 332.)

In our stoves the Nelumbium should be grown in a tub or large pot, in a rich loamy soil, and requires a strong heat to flower in perfection. The pot or tub should be kept full of water all the time the plants are growing, but may be allowed to get dry when the flowering season is over. The plants may be increased by dividing at the root, but it is obtained more readily from seeds, which vegetate freely. (*Bot. Cult.* 83.)

Kent of Clapton says, that the seeds will keep forty years, vegetate freely, and flower the first year. (*Hort. Trans.* iii. 36.)

1214. *Dillenia*. So named by Linnæus, in honor of John James Dillenius, the famous professor of botany at Oxford, author of *Historia Muscorum*, *Hortus Elthamensis*, &c. The species are beautiful trees, with large leathery leaves, and axillary or terminating flowers often also large. They thrive best in a light loamy soil. Ripened cuttings, not deprived of their leaves, strike root freely, in a pot of sand plunged under a hand-glass in heat. Good seeds sometimes arrive from India, when the sooner they are sown the better; placed in a moderate hot-bed frame, they will succeed well. (*Bot. Cult.* 50.)

1215. *Illicium*. From *illicio*, to attract, on account of its agreeable perfume. *I. floridanum* has very fragrant leaves, and capsules having a strong smell of anise when rubbed. This species, and more especially anisatum are so sweet. In Japan they place bundles and garlands of the aniseed-tree in their temples before their idols, and on the tombs of their friends. They also use the powdered bark as incense to their idols. A branch put into the decoction of *Tetracton hispidum* is supposed to increase the virulence of that poison. The bark, finely powdered, is used by the public watchmen to make a chronometer or instrument for measuring the hours, by slowly sparkling at certain intervals in a box, in order to direct when the public bells are to sound.

Ripened cuttings will root in sand, but the plant is most readily increased by layers.

1216. *Liriodendron*. From *λειρον*, a lily, and *δενδρον*, a tree. The flowers, which may be likened to a lily or tulip, grow upon one of the loftiest trees of the forest. A smooth tree, not less admired for its fiddle-shaped leaves, than its tulip-like flowers, which are produced at the end of the branches; they are composed of six petals, three without and three within, which form a sort of bell-shaped flower, whence the inhabitants of North America gave it the title of tulip. These petals are marked with green, yellow, and red spots, making a fine appearance when the trees are well charged with flowers. When the flowers drop the germ swells, and forms a kind of cone, but it does not ripen in England.

The timber is used in America for canoes, but is unfit for boards or planks, as it contracts and expands more than the wood of any other tree.

The tulip tree is now very common in Europe; in the south of France and Italy, it is frequent in public avenues, and flowers when twenty or thirty feet high, and of six or seven years growth. In Britain it requires a

7900 Leaves elliptic oblong simply serrated, Peduncles 1-flowered

7901 Petals 27-30 purple: outer oblong; inner lanceolate

7902 Petals 9-12 yellowish ovate roundish

7903 Leaves truncate at end with two broad opposite stipules

7904 Leaves evergreen oval-obl. coriaceous shining above ferruginous beneath, Flowers erect with 9-12 petals

7905 Leaves elliptical blunt glaucous beneath, Flowers with 9-12 contracted petals which are ovate concave

7906 Like the last, but leaves evergreen elliptical acute at each end

7907 Lvs. deciduous obovate abruptly acuminate the younger pubescent, Flowers naked erect with 6-9 petals

7908 Lvs. deciduous obov. acute netted nearly smooth, Fls. erect, Sepals 3, Petals 6 obovate, Styles very short

7909 Lvs. decid. obov. point. at each end, younger downy ben., old ones smooth, Fls. erect, Sep. 3, Pet. 6, Styles [very short]

7910 Leaves evergreen smooth netted ellipt. acuminate at each end subglaucous, Flowers cernuous

7911 Leaves evergreen elliptic obl.: the old smooth; younger and branches fuscous downy, Flowers erect

7912 Lvs. deciduous heart-shaped subovate acute, above smooth, beneath somewhat tomentose, Pet. 6-9. obl.

7913 Leaves deciduous oval acuminate pubescent beneath, Petals 6-9

7914 Leaves deciduous lanc. much spreading, younger downy beneath, Petals 9-12, the outer hanging down

7915 Lvs. deciduous very large obl. obov. subcuneate cordate at base, beneath whitish glaucous, Pet. 6-9 ovate

7916 Lvs. decid. smooth spatulate obov. subcord. at base, Auricles blunt close, Sep. 3 much spread, Pet. 9 oblong

7917 Lvs. decid. smth spatul. obov. subcord. at base, of same color on both sides, Auric. spread, Pet. 9 lanc. acum.

and Miscellaneous Particulars.

greater age, though ringing might probably be successfully applied to throwing this and other ornamental trees into a flowering state. There are many fine old trees round London, in the parishes of Fulham, Walham-green, Kew, &c., and a very fine one even so far north as Pitcaithly wells in Fifeshire.

1217. *Magnolia*. In honor of Pierre Magnol, professor of medicine, and prefect of the botanic garden at Montpellier; author of *Botanicum Monspeliense*, 1676, and other works. The species are chiefly large trees with large leaves, and axillary flowers, also very large and highly odorous.

*M. grandiflora* is the noblest species; the leaves, which are persistent, are nine or ten inches long, and not unlike those of a common laurel. The flowers are produced at the ends of the branches: they are very large, and composed of eight or ten petals, narrow at their base, but broad, rounded, and a little waved at their extremities; they spread open very wide, are of a pure white color, and have an agreeable scent.

The variety *g. elliptica* or Exmouth (having been raised from the seed of an old tree in Sir John Collington's garden of that place) flowers earliest and most freely: it is also the hardiest.

*M. glauca* is deciduous. In America it is known by the names of *white laurel*, *swamp sassafras*, and *beaver tree*. It has the last name, because the root is eaten as a great dainty by beavers; and this animal is caught by means of it. Kalm says, these trees may be discovered by the scent of the blossoms at the distance of three quarters of a mile, if the wind be favorable. It is beyond description pleasant to travel in the woods at the flowering season, especially in the evening. They retain their flowers for three weeks, and even longer. The berries also look very handsome when they are ripe, being of a rich red color, and hanging in bunches on slender threads. They cure coughs and other pectoral diseases by putting these berries into brandy, and giving a draught of the liquor every morning. The wood is made use of for joiners' planes. Dillenius remarks, that the flowers never open in a morning, that the calyx falls off at the second opening of the flower, but that the petals dry on, and that the scent resembles that of the lily of the valley, with a mixture of aromatic.

*M. conspicua* is much valued as a free flowerer, and on account of the early appearance of its white odoriferous blossoms. *Yulan* is the vernacular name in Japan.

*M. acuminata* bears a fruit about three inches long, like a small cucumber, and is thence called cucumber tree in America.

*M. tripetala* has leaves twelve or fifteen inches long and five or six inches wide, narrowing to a point at each extremity, and placed at the ends of the branches in a circular manner like an umbrella, whence its name. The flowers are composed of ten, eleven, or twelve large oblong white petals; the wood is soft and spongy, and the leaves drop off earlier than in the other deciduous sorts.

The different species, Sweet observes, are generally increased by layers or seeds: when the layers are first taken off they should be potted in a mixture of loam and peat, and placed in a close frame till they have taken fresh root. None of the leaves should be taken off or shortened, nor any shoots be cut off, or their tops shortened, as they will not succeed so well; for the more branches and leaves are on them, the sooner they will strike fresh root. Most cultivators cut off many of the leaves and shoots of layers, when they are first taken off, thinking the roots will not have so much to nourish, which is the very reason

History, Use, Propagation, Culture,

they often lose great part of their crop; layers of any kind of shrub whatever, when first taken off, should not have a single leaf taken off till they have made fresh root: supposing their tops flag ever so much, as long as there is life it will draw up the sap, and help the plant to root afresh. The Chinese kinds are often inarched or budded on *M. obovata*, which takes readily. (*Bot. Cult.* 306.)

1218. *Michelia*. Named by Linnæus, in honor of Pietro Antonio Micheli, of Florence, author of *Nova Plantarum Genera*, Flor. 1729, fol. A lofty tree, with fragrant flowers, and fruit edible, but not agreeable. In our stoves it grows well in light loam, and cuttings root in sand under a glass and plunged in heat.

1219. *Uvaria*. The fruit grows in bunches like a small bunch of grapes, whence it has been called *Uvaria* from *Uva*. The berries are considered a specific for gonorrhœa, and are used under the name of *cubeba*. These are trees or shrubs with erect or trailing stems, and 1-4-flowered axillary peduncles.

1220. *Anona*. This is called by the Malays, *manoa*, and at Banda, *menona*, which it is presumed that the Europeans have corrupted into *Anona*. As the word signifies in Latin food, it has been adopted by Linnæus in this sense, because of the habitual use made of the fruit by the Americans. The species are for the most part fruit trees, with soft pulpy subacid berries, sometimes as large as an orange, but generally more like a plum.

*A. muricata* is common in every savannah of Jamaica, flowering in the spring. The large succulent fruit is agreeable to new-comers and over-heated habits; but it is so common, and so much in use among the negroes, that it is now hardly ever used among the better sort of people. The smell and taste of the fruit, flowers, and whole plant, resemble very much those of black currants.

*A. tripetala* is a large tree with large bright green leaves. The fruit is oblong, scaly on the outside, and of a dark purple color when ripe; the flesh is soft and sweet, and has many brown seeds intermixed with it which are very smooth and shining. It is esteemed by the Peruvians as one of their most delicate sorts.

*A. palustris* grows wild in soft marshy places in Jamaica, and bears a fine sweet-scented fruit, of no disagreeable flavour; but it is said to be a strong narcotic, and is not eaten on that account. It is called alligator apple. The wood of this tree is so very soft, even after it is dried, that it is frequently used by the country people instead of corks, to stop up their jugs and calabashes; whence it has now universally obtained the name of cork-wood in Jamaica. (*Browne*.)

To bear fruit in our stoves, these trees require a rich loamy soil, rather moist, and to be trained on a wall or trellis close under the glass. Ringing would also be useful. They are propagated by ripened cuttings, of a good size, with their leaves on, planted in sand, and plunged in heat.

7918 Leaves lanceolate smooth

7919 Leaves lanc. acuminate, Pedunc. lateral solitary 1-flowered

7920 Leaves ovate lanceolate smooth somewhat shining, Pedunc. solitary 1-flowered

7921 Leaves ovate lanceolate not dotted very finely silky beneath, Outer petal downy outside

7922 Leaves lanceolate smooth with pellucid dots, Outer petals smooth

7923 Leaves obl. acute somewhat downy above, silky and rufous beneath, Flowers on short stalks

7924 Leaves obl. lanc. acute smooth somewhat dotted, Outer petals obl. somewhat closed

7925 Leaves ovate obl. coriaceous very smooth, Fl. solitary stalked

7926 Leaves ovate lanc. smooth, Pedunc. opposite the leaves 2-flowered

7927 Leaves obl. lanc. acuminate smooth shining

7928 Leaves oval acuminate cordate covered beneath, as on the branches, with brown down

7929 Leaves ovate acuminate very smooth nearly sessile, Pedunc. axillary 1-flowered

7930 Leaves obl. cuneate acuminate, Branches quite smooth

7931 Leaves cuneate obovate mucronate beneath, as on the branches, rufous with down

7932 Leaves obl. linear long-cuneate, Branches quite smooth

7933 Leaves lanc. acuminate strigose beneath bearded at end

7934 Leaves obl. ovate smooth, Pedunc. 1-f. solitary

7935 Leaves cordate 3-lobed, Lobes entire

and Miscellaneous Particulars.

1221. *Artabotrys*. This name was suggested by the curious grapple or tendril belonging to the peduncle, by which the growing fruit is conveniently suspended on the nearest support. A beautiful Chinese plant, cultivated as an ornamental covering to walls, as well as on account of the fragrance of the blossom, which diffuses an odor like that proceeding from the finer kinds of ripe fruit. The genus is intermediate, between *Kadsura* and *Gutteria*.

1222. *Guatteria*. Named by the authors of the Flora Peruviana, after John Baptist Guatterri, an Italian professor of botany at Parma. *G. virgata* is one of the best timber trees in Jamaica for strength and elasticity; it is imported under the name of lance-wood, and much used by coachmakers for shafts to light carriages.

1223. *Asimina*. A name coined by Adanson, without any meaning. Shrubs with deciduous, oblong, often cuneate leaves, and axillary flowers, which often appear before the leaves. The species are natives of shady woods in the more southern provinces of North America.

1224. *Xylopia*. Named by syncope from *ξύλον πικρόν*, bitter wood, in allusion to the properties of the wood. Fruit-bearing trees, but not in much esteem as such. *X. glabra* is the most useful species. The wood, bark, and berries have an agreeable bitter taste, not unlike that of the orange seed. The wild pigeons feed much upon the latter, and owe that delicate bitterish flavor, so peculiar to them in the season, wholly to this part of their food. Fresh gathered from the tree, they are agreeable to the palate and grateful to the stomach. The bark is also richly impregnated with this juice as well as the wood, and both yield a very agreeable bitter in the mouth while fresh; but that delicacy diminishes greatly after they are dried. The wood is easily wrought, and esteemed a good timber where it is not much exposed to the weather. The bitter quality of this tree is communicated with great facility. A handful of the shavings immersed in water and instantly taken out again, will render it of a very bitter taste. Sugar sent over in hogsheds made of this wood was so bitter that no person would purchase it. Bedsteads and presses made of it, are proof against cockroaches and other insects. Carpenters who work the wood, perceive a bitter taste in their mouths and throats. A decoction of it is said to be of service in cholics, and to create appetite.

1225. *Hepatica*. From *ἥπατις*, of or relating to the liver. The three lobes of the leaves have been compared to the three lobes of the liver. A great favorite of the flower border, both as being evergreen in its foliage, and for its abundant blossoms and great variety of colors and shades.

History, Use, Propagation, Culture.

1296. *Anemone*. From *ανεμος*, wind, because the greater part of the species grow in elevated places much exposed to the wind. The species are showy flowering plants, and *A. coronaria* and *hortensis* are well known florists' flowers, valued for their hardy nature, and also because they will flower at almost any season, according to the time the roots are kept out of the ground, and the season when they are replanted. The prevailing colors are red, white, and blue, and semidouble flowers are in nearly as much repute as double ones. Many new varieties have been raised from seed; but they are not named by the florists, as in the case of tulips and pinks. The roots of anemones are solid flattened masses like those of ginger, and like them are multiplied by division. A root which has remained in the soil two or three years, if it has room to extend, attains a great breadth, but is still only one root; and hence the mode of sale is by weight, and the roots are divided when planted.

The soil preferred by the anemone is a fresh loam, rather heavy or light. The usual time of planting is the end of October, covering the roots three inches; but to have an early bloom they may be planted in the beginning of September, and to have a bloom every month in the year, plant every month. The finer sorts

- 7936 Leaves ternate with multifid segments and linear mucronate lobes, Sep. 6 oval close  
 7937 Leaves 3-parted with cuneate cut-toothed lobes, Invol. sessile obl. entire or cut, Sepals 10-12 oblong  
 7938 Leaves cordate roundish bluntly 3.5-lobed toothed, Invol. sessile trifid, Sepals 10-12 oblong  
 7939 Leaves ternate with cut-toothed ciliated segments, Invol. on short stalks 3 cut, Sepals 6 round  
 7940 Leaves ternate or quinate, Segments cut-toothed at the end, Invol. stalked similar, Sepals 5 obovate  
 7941 Lvs. biternate with a branch. stalk, Segm. many-part. with lin. lobes, Inv. shortly stalk. multifid, Sep. obl.  
 7942 Leaves ternate or quinate, Segm. cut-toothed at end, Invol. stalked similar, Sepals 6 elliptical  
 7943 Leaves 3-parted with cuneate cut-toothed lobes, Invol. sessile oblong entire or a little cut, Sep. very acute  
 7944 Leaves ternate with trifid acuminate cut-toothed segments, Invol. stalked similar, Sepals 5 elliptical  
 7945 Invol. leaves on short stalks three cut with linear cut-toothed segments, Sepals 5-6 oval-oblong.  
 7946 Leaves 3-parted with cut-toothed acuminate lobes, Invol. sessile similar, Sepals 5 elliptical, Fruit hairy  
 7947 Leaves 3-parted with cut-toothed oblong lobes, Invol. sessile similar, Sepals 5 elliptical, Fruit smooth  
 7948 Leaves all stalked ternate with ovate lanc. acute-toothed segments, Sepals 5 elliptical obtuse  
 7949 Leaves ternate with trifid cut-toothed lanc. acute segments, Invol. stalked similar, Sepals 6 elliptical  
 7950 Leaves 3-ternate with a branched stalk, Sepals 12-14 oblong obtuse, Leaves of invol. stalked  
 7951 Radical lvs. 3-5 cut with subtrifid cut-toothed segments, Invol. stalk. 3-parted toothed, Sep. 5-6 elliptical  
 7952 Radical leaves villous palmate 3.5-parted with cut-toothed lobes, Lobes lin. acute, Fl. umbelled  
 7953 Flowers umbelled, Floral leaves stalked biternate forming a sort of involucre  
 7954 Leaves biternate with a branched petiole, Segm. pinnated cut serrate, Sepals 6 spreading  
 7955 Leaves pinnated with multifid segments, Lobes linear, Flowers pendulous, Sepals 6 erect reflexed at end  
 7956 Like the last, but the flower larger and paler, and the lobes of the pinnæ broader and awned  
 7957 Leaves pinnated with multifid segments, Lobes linear, Flower somewhat nodding, Sepals 6 spreading  
 7958 Leaves pinnated very villous with 3-parted segments, Lobes lanc. lin. acum. Fl. erect, Sep. 6 oval lanceol.  
 7959 Leaves pinnated with cuneate lanceolate trifid smooth high segments, Fl. erect, Invol. very villous  
 7960 Leaves pinnated villous beneath, Segm. pinnatifid, Lobes cut oblong, Fl. suberucous, Sep. 6 spreading  
 7961 Leaves pinnate coming after the flowers, Segm. 3-parted, Lobes toothed cut at end, Fl. erect spreading  
 7962 Leaves biternate rigid smooth, Segm. cuneiform toothed at end  
 7963 Pedunc. 1-fl. longer than leaf, Lvs. biternate, Segm. ovate-lanc. acum. serrate, Pet. subspatulate obtuse  
 7964 Pedunc. 1-fl. the length of leaf, Leaves biternate with obl. lanc. acumin. segments, Pet. emarginate at end  
 7965 Pedunc. 1-fl. Leaves whorled in fours ternate, Segm. stalked cordate lanc. entire, Petals acute  
 7966 Leaves pinnate, Segm. glaucous smooth cuneiform lobed, Lobes entire blunt, Pedunc. trifid  
 7967 Fl. panicled, Leaves ternate, Segm. ovate lanc. acumin. nearly entire smooth 5-nerved at base  
 7968 Leaves pinnated, Segm. ovate lanc. entire, Pedunc. few-fl. longer than leaf, Ovaries about 4, Tails almost  
 7969 Pedunc. 1-fl. with an involucre, Leaves ovate subcordate toothed fascicled [naked  
 7970 Pedunc. 1-fl. longer than leaf, Leaves tern. decomposed, Segm. ovate acute entire, Sepals much pointed  
 7971 Pedunc. 1-fl. longer than leaf, Leaves entire or ternate decomp. Lobes or segm. entire, Sepals obovate  
 7972 Pedunc. 1-fl. Sep. connivent thick reflexed at end acuminate, Lvs. smooth with ent. or 3-lob. ov. acute segm.  
 7973 Pedunc. 1-fl. Sep. connivent, Lvs. coriaceous netted nerved smooth with stalked 3-lobed or entire segments  
 7974 Pedunc. 1-fl. Sep. acum. wavy at edge thin, Lvs. smooth thin decomposed with stalked ov. or obl. segm.  
 7975 Pedunc. 1-fl. shorter than leaf, Leaves entire 3-lobed very acute, Sepals conniving at base spreading at end  
 7976 Pedunc. 1-fl. with an involucre under the leaf, Leaves ternate with stalked ternate cut-toothed segments  
 7977 Leaves pinnate with glaucous smooth wedge-shaped 3-lobed segments, Lobes toothed acuminate  
 7978 Fl. panicled dioecious, Leaves ternate, Segm. cordate acute coarsely toothed and lobed  
 7979 Fl. panicled dioecious, Lvs. tern. Segm. smooth ovate cordate acuminate 3-nerved ent. Pedicels pubescent  
 7980 Fl. panic. dioec. Sep. 4, Lvs. tern. Segm. ovate subcord. acute coarsely toothed 3-nerv. Anth. awned at end  
 7981 Ped. 3-1-fl. or 3-fid or panic. long. than lvs. Lvs. tern. or pinn. Segm. ovate coarsely toothed, Fl.-buds globose

and Miscellaneous Particulars.

require protection from violent storms and excessive light and heat; but many varieties do exceedingly well in borders. A very severe winter will destroy the roots if the surface is not mulched; but the anemone is considerably harder than the ranunculus. *Anemone pulsatilla* is common in borders. The roots are mostly tuberous, and when taken up should not be long kept out of ground. Like most tuberous plants, they thrive best in a sandy loam.

127. *Clematis*. From *κλημα*, a tendril; the climbing habit of this genus is well known. The species are mostly climbing shrubs of rapid growth, free-flowerers, very ornamental, and some are highly odoriferous. *C. florida*, *viticella*, and *flammula* are admired species. The plants formerly called *Atragene*, do now properly united to *Clematis*, are shewy climbers, especially *C. austriaca*, which grows and flowers freely. Any common garden soil will suit them, and they are readily increased by layers; or young cuttings, planted under a common hand-glass, will root freely. Seeds are often ripened in abundance, by which any quantity may be raised; they are best sown in pans, or wide-mouthed pots, and placed in a shady situation, where they will

History, Use, Propagation, Culture,

remain some time before they come up; they may then be potted off, or planted out in the ground, when they will require to be shaded a little if the weather be warm, till they have taken fresh root. (*Bot. Cult.* 281.)

1228. *Naravelia*. An alteration of *narawael*, the name by which the plant is known in Ceylon. A plant with the habit of *Clematis*, but bearing leaves of only one opposite many-nerved pair, like *Lathyrus*.

1229. *Thalictrum*. This name is said to be derived from *θαλλω*, to grow green; fr. on the bright color of the young shoots. The species are vigorous growing plants, with ramose roots and smooth finely divided leaves; they grow in any soil and situation, and *T. tuberosum*, *cornuti*, and *aquilegifolium*, are reckoned handsome ornaments in a border or shrubbery.

1230. *Adonis*. The plant which sprang from the blood of Adonis when wounded by the boar. Handsome border flowers, especially *A. vernalis* and *autumnalis*, and of the easiest culture in any common soil.

- 7982 Leaves pinnate with smooth subglaucescous ovate cut-toothed 3-lobed segments  
 7983 Lvs. pinn. Segm. ovate-lanc. cut-toothed acuminate truncate cordate at base, Pedunc. shorter than leaf  
 7984 Leaves pinnate, Segments smooth entire or 3-lobed round oval oblong or linear rather acute  
 α Segments nearly round  
 β Segments oval or oblong lanceolate  
 γ Segments linear  
 7985 Leaves pinnate with stalked ovate-lanc. entire segments  
 7986 Pedunc. 1-fl. Sepals 6-8 blunt, Leaves pinnate, Segm. lanc. lin. acute or 3-lobed, Stems erect  
 7987 Pedunc. 1-fl. Fl. suberect, Leaves entire ovate; young ones silky  
 7988 Pedunc. 1-fl. Fl. nodding, Leaves entire ovate lanc. smooth

7989 The only species

- 7990 Stem simple almost naked, Raceme simple terminal, Fl. nodding, Segm. smooth  
 7991 Stem simple naked at base: leafy in middle; paniced at end, Lvs. pubescent viscid, Segm. blunt toothed  
 7992 Fl. loosely corymbose or subsolitary, Invol. none, Bract subsessile  
 7993 Fl. dioecious, Filam. clavate at end, Pericarp obl. sessile striated, Segm. of leaves bluntly 3-lobed  
 7994 Fl. dioecious, Fil. filiform, Segm. of leaves roundish cordate bluntly lobed smooth  
 7995 Stem round without bloom, Fl. paniced erect, Segm. of leaves smooth ovate or subcordate subtrifid  
 7996 Stem round without bloom, Fl. loosely panic. Segm. of leaves smooth glauc. ben. Peric. obliq. round. at base  
 7997 Stem round without bloom, Fl. loosely paniced, Segm. of lvs. obl. cuneiform sharply trifid: upper entire  
 7998 St. round cover. with a glauc. bloom, Fl. loose. pan. cern. Segm. of lvs. roundish tooth. at end, glauc. beneath  
 7999 Stem round upright, Fl. cernu. in a very large spreading panic. Segm. of lvs. smooth cuneif. trifid acute  
 8000 St. erect round striat. green, Pan. ere-t. comp. Fl. clust. Segm. of lvs. ov. subcord. coarsely cren. shin. above  
 8001 Stem roundish, Fl. panic. cernuous, Segm. of lvs. smooth ov. cuneate trifid, Lobes acute entire or finely cut  
 8002 Stem round, Fl. paniced cernuous, Petioles stem-clasping winged  
 8003 Stem simple covered with scattered leaves paniced at end, Stem downy viscid  
 8004 Fl. dioecious or monœc. Filam. filif. colored, Segm. of lvs. roundish coarsely tooth. smooth glauc. beneath  
 8005 Stem upright round somewhat furrowed, Root fibrous, Panic. multiple erect, Segm. of lvs. lin. lanc. entire  
 8006 St. branch. round somew. furrow. Root fibr. Pan. multiple erect, Segm. of lvs. lin. lanc. entire. cuneate at base  
 8007 Stem branch. erect somewhat furrowed, Root fibr. Pan. multiple erect, Segm. of lvs. cuneiform trifid acute  
 8008 St. branch. erect somew. furrow. Root fibr. Pan. multiple erect, Segm. of rad. lvs. cuneif. trif. Caul. obl. lin.  
 8009 Stem erect round striat. glauc. Pan. multip. erect close, Seg. of lvs. subcord. ov. bluntly trifid glauc. beneath  
 8010 Leaves simple 5-lobed serrated  
 8011 Stem erect simple angular, Root creeping, Panic. erect racemose few-flowered, Segm. of leaves linear  
 8012 Stipules ovate, two at the base of the ramifications of the petiole, Panic. corymb. Fruit 3-cornered  
 8013 Stem round upright somewhat furrowed, Root creeping, Panic. erect, Segm. of lvs. lin. very narrow entire  
 8014 Stipules O, Fl. loosely corymbose racemose, Fruit 3-cornered pendulous  
 8015 Stem round nearly naked, Fl. corymb. Filam. dilated at end, Segm. of lvs. smooth ovate entire or 3-lobed

- 8016 Cal. hispid at base, Pet. flat obl. blunt, Fruit netted in a long lax spike  
 8017 Cal. smooth, Pet. conc. conniving scarcely longer than cal. Fruit netted in an ovate head  
 8018 Cal. hispid at base, Pet. flat acute longer than cal. Flower large, Fruit in a cylindrical head  
 8019 Lower leaves abortive, Upper sessile, Fruit velvety, Pet. 10-12 oblong somewhat toothed  
 8020 Cal. smooth distinct at base, Pet. flat obl. twice as long as cal. Fruit smooth in an oblong head  
 8021 Rad. leaves on long stalks, Stalks trifid, Fruit smooth, Pet. 8-10 obl. cuneate entire

- 8022 Umb. supradecomound much spreading  
 8023 Umb. simple few-flowered

8024 Root grumous, Stem leafy, Leaves cordate

and Miscellaneous Particulars.

1231. *Knoulttonia*. Named after Thomas Knowlton, once the curator of the botanic garden at Eltham. The species grow freely in loam and peat, and are increased by dividing at the root, and by seeds.

1232. *Ficaria*. So named because the grumous roots bear tubercles like little figs. A common wood plant, remarkable for its shining leaves and bright yellow flowers. The young leaves are sometimes used as greens in Sweden, and the roots were formerly applied in poultices to piles in England, probably from their resemblance to that disease. These roots or tubercles lie near the surface, and are sometimes laid bare by the rains, and in this state have induced the ignorant, under the influence of superstition, to fancy that it rained wheat. The plant is injurious in moist grass lands, but is effectually destroyed by a dressing of coal or wood ashes.

History, Use, Propagation, Culture,

1933. *Ranunculus*. Said to be so called from *rana*, a frog, because the species inhabit humid places frequented by that reptile. *Renoncule*, Fr., *Ranunkel*, Ger., and *Ranuncolo*, Ital. Some of the species are weeds, one or two border flowers, and *R. asiaticus* is one of our most esteemed florists' flowers. Some of the species are tuberous and others bulbous rooted, but the most part are tuberous. *R. sceleratus* is one of the most virulent of our native plants. Bruised and applied to the skin it soon raises a blister, and makes a sore by no means easy to heal. Strolling beggars have been said to use it for that purpose, in order to excite compassion. When chewed, it inflames the tongue; and when taken into the stomach, it produces violent effects. It is suspected to have proved poisonous to sheep.

*R. acontifolius* is a handsome plant, with branching stems, deep green leaves, and pure white flowers; the double variety is an old and much admired border flower.

Of *R. asiaticus* the varieties raised from seed are endless. Maddock, in the end of the last century, had nearly eight hundred, all with proper names, and ranged as purple, gray, crimson, red, rosy, orange, yellow, white, olive, coffee, striped, spotted, &c. No plant is more prolific in new varieties from seeds; no two plants, as Maddock observes, producing flowers alike, or the same as the original. Established sorts are propagated by offsets, which generally flower the first year: rare sorts may be multiplied by dividing the crown of the tuber with a sharp penknife into as many parts as there are buds: these will not flower till the second year, but will diminish the risk of losing a very rare variety.

The *ranunculus* prefers a fresh loamy soil, rather than otherwise inclined to clay: it should be well manured; and it is customary, in forming the beds, to place a stratum of well rotted cow-dung six or nine inches below the surface, which both retains moisture and supplies nourishment. The roots may either be planted in November or earlier, in which case, to prevent their being destroyed by the frost, they should be mulched, or they need not be planted till March. The former mode gives much the strongest bloom, as the roots, when kept in air all the winter, are apt to be over dried, and kept in sand they sometimes get mouldy: and in this and similar cases, the progress of vegetation from the planting to the blossoming period, is more rapid than is natural to the species. *Ranunculus* roots will retain their vegetative properties two and sometimes three years; a thing not common among bulbs and tubers, unless preserved dormant in an ice cold room.

*R. bulbosus* has a solid white bulb about the size of that of the common *Crocus*. The flowers are some-

- 8025 Leaves smooth lin. lanc. : lower stalked, Stem declinate solid rooting at base, Fruit smooth  
 8026 Leaves lin. entire smooth, Stem creeping and rooting at every joint  
 8027 Leaves lanc. subserrate sessile half stem-clasping, Stem erect smooth  
 8028 Rad. leaves stalked oval-obl. Fl. sess. opposite the leaves, Fruit granular scarcely crowned with the style  
 8029 Leaves lanc. or lin. entire, Stem erect very smooth, Scales of the petals tubular  
 8030 Rad. leaves stalked subcordate ovate-roundish : cauline sessile ovate-lanc. Pedunc. hirsute  
 8031 Leaves oval-lanceolate acuminate stem-clasping, Scape and peduncles smooth  
 8032 All the leaves radical-stalked ovate toothed, Scapes naked 1-flowered  
 8033 Leaves smooth reniform crenate, Floral cut, Stem 2-3-fl. smooth  
 8034 Lvs. woolly 3-lobed with trifid toothed cuneate lobes : upper 3-parted with entire lin. lobes, Cal. reflexed  
 8035 Leaves cuneiform irregularly cut at the end, Stem smooth branched many-fl. Cal. appressed  
 8036 Lower leaves stalked cordate blunt : upper obl. sessile, Stem erect hollow, Fruit granular  
 8037 Rad. lvs. stalked oval or subcord. 3-5-tooth. at end, Runners from neck of plant, Scapes naked 1-fl. erect  
 8038 Lvs. very smooth many-parted, Lobes obl. Scapes many 1-fl. with appressed hairs, Cal. spreading smooth  
 8039 Covered with soft hairs, Rad. lvs. stalk. cord. orbic. somewhat cut-tooth. Stem branched, Cal. appressed  
 8040 Lvs. smooth : radic. stalked reniform crenate ; caul. in linear lobes, Cal. pubescent shorter than petals  
 8041 Leaves smooth : radic. stalked cordate generally 3-parted or lobed, Calyx pubescent shorter than petals  
 8042 Lvs. smooth : radic. stalk. cordate-roundish crenate some 3-parted or cut, Cal. smooth longer than petals  
 8043 Lvs. smooth : radic. stalk. 3-part. Lobes 3-lob. bluntly cut, Cal. smooth, Fruit very small in an obl. spike  
 8044 Lvs. palm. 3-7-parted cut-toothed : upper sessile with lin. lanc. lobes, Stem branch. many-fl. Cal. appressed

- β Radic. leaves 5-7-lobed with acuminate lobes, Bractes lin. entire  
 8045 Leaves smooth : radic. stalked 3-parted or pedate ; upper linear, Stem erect few-fl. Calyx appressed  
 8046 Lvs. silky : first ent. lin. lanc. ; rest 3-part. with entire or 3-part. lobes, Stem many-fl. Cal. somewhat reflexed  
 8047 Leaves tern. or bitern. Segm. toothed or cut trifid, Stem erect simple or branched, Fruit in a cylindr. spike  
 8048 Rad. lvs. stalked villous 3 cut : first ovate toothed or 3-lobed, Stem erect 1-2-fl. Cal. spreading subreflexed  
 8049 Leaves pinnate with 3-lobed cut multifid lobes, Stem about 1-fl. Cal. smooth, Pet. 8-10  
 8050 Radical leaves stalked palmate 3-parted with trifid blunt thick lobes, Calyx very hirsute  
 8051 Leaves smooth : radical stalked 5-fid with entire ovate lobes, Calyx very hirsute twice as short as petals  
 8052 Rad. lvs. smooth 3-parted round with trifid blunt segments : cauline sess. linear-lobed, Cal. nearly smooth  
 8053 Leaves round 3-lobed, Lobes blunt crenate at end, Stem about 1-fl. Cal. smooth, Pet. obcord. or 3-lobed  
 8054 Stem and petioles cover. with stiff hairs, Lvs. 3-fid with stalk. acutely 3-lob. segm. Cal. reflex. Style smooth  
 8055 Rad. lvs. stalked 3-cut with trifid cut segm., of which the middle one is stalked, Stem erect, Cal. reflexed  
 8056 Lvs. 3-lob. with blunt cut lobes, of which the mid. is stalk. Cal. red. Grains with a single row of minute warts  
 8057 Stem and petioles with soft hairs at base, Lvs. smooth, trif. with 3-lob. ac. cut segm. Cal. smooth spreading  
 8058 Lvs. pinnate 3-fid with cuneate 3-lobed cut segm. Runners creeping, Cal. erect, Grains with an acute point  
 8059 Lvs. 3-5-lob. with lin. divisions, Stem erect and petioles with spreading hairs, Pedunc. furrowed, Cal. hairy  
 8060 Lvs. pubesc. or smooth, Lobes cut-tooth. acute : upper lin. Stem many-fl. pubesc. Cal. vill. Grains mucron.

## and Miscellaneous Particulars.

times double, but not so frequently as *R. acris*. It is distinguished from *R. repens*, with which it has been confounded by some authors, by its roots, by its never throwing out runners, and by its reflexed calyx : this last character arises from its particular structure, the lower half being thin and almost transparent, and therefore not having a sufficient degree of solidity to support itself upright. It is the second flower which, next to the Dandelion, covers the meadows with dazzling yellow. Like most of the Crow-foots, it possesses the property of inflaming and blistering the skin ; particularly the root, which is said to raise blisters with less pain and more safety than Spanish flies ; hence these roots have been applied for that purpose, particularly to the joints in cases of the gout. According to Hoffman, beggars make use of them to blister their skins, with a view of exciting compassion. The juice of the herb is said to be more acrid than that of *R. sceleratus*, and if applied to the nostrils, it provokes sneezing. The roots, on being kept, lose their stimulating quality, and are even eatable when boiled. Hogs are fond of them, and frequently dig them up. The herb is too acrid to be eaten unmix'd by cattle ; accordingly the flowering-stalks are left to perfect the seed in pastures : some of it, however, is consumed, and it is not improbable that this and other pungent plants, mix'd with the grasses, may act as a powerful stimulus to some animals, as salt does to others. It abounds in dry pastures, and flowers in May. Besides the name of round-rooted or bulbous Crow-foot, it is called by the common people butter-flower, butter-cups, king-cups, gold-cups ; and it is the cuckoo-buds of yellow hue, of Shakspeare. *R. repens*, hirsutus, and acris, however, are all confounded with this under one name by the vulgar.

*R. repens* is an obnoxious plant in every description of gardening and agriculture. From the great variety of soil and situation in which it is found, it assumes many varieties ; by a river's side, or in marshes, it will grow three or four feet high, with a stem nearly as large as the human thumb ; in barren gravelly fields it is entirely procumbent, with a stem not larger than a small wheat-straw ; but in all states it retains the character of the creeping stem, and it does not lose it in cultivation. Its principal time of flowering is in June, but it may be found in blossom during most of the ensuing summer months in meadows and pastures, under hedges, in shady waste places, church-yards, and gardens. The qualities of this and bulbosus are similar : both blister the skin, and are very acrid in taste. Like *R. acris* and bulbosus, it is sometimes found double, but more rarely.

*R. acris* is supposed to possess the blistering property in a considerable degree, whence Linnæus gave it the

History, Use, Propagation, Culture

name of acris. Curtis says, that even pulling up the plant, and carrying it to some little distance, has produced a considerable inflammation in the palm of the hand: that cattle, in general, will not eat it; yet that sometimes, when they are turned hungry into a new field of grass, or have but a small spot to range in, they will feed on it, and hence their mouths have become sore and blistered. According to Linnaeus, sheep and goats eat it; but kine, horses, and swine refuse it. When made into hay it loses its acrid quality, but then it seems to be too stalky and hard to afford much nourishment: if it be of any use it must be to correct, by its warmth, the insipidity of the grasses. In many pastures the flowering stems are left standing in vast abundance to disseminate their seeds: before they do that, they might easily be cut down with the scythe, or pulled up by women and children after a shower, which would more effectually destroy the plants; they should be gathered into heaps and burnt. It flowers in June and July, and is confounded vulgarly with the repens and bulbosus, under the name of butter-flower or butter-cups, under a notion that the yellow color of butter is owing to these plants. It is the richness and exuberance of the pasture that communicates this color, and not these flowers, which the cattle seldom or ever touch. It is frequent in gardens with a double flower, among other herbaceous perennials, under the name of yellow bachelor's buttons.

R. aquatilis produces flowers which are sometimes very large, and make a handsome show in ponds and ditches: the curious variety in the floating and immersed leaves, occasioned by the depth and velocity of the stream, adds to the beauty of this common aquatic plant. Dr. Pulteney (*Linn. Trans.* vol. 5. p. 19.) contradicts the assertions of its deleterious qualities, and proves that it is not merely innocuous, but nutritive to cattle, and capable of being converted to useful purposes in agricultural economy. In the neighbourhood of Ringwood, on the borders of the Avon, some of the cottagers support their cows, and even horses, almost wholly by this plant. A man collects a quantity every morning, and brings it in a boat to the edge of the water, from which the cows eat it with great avidity, insomuch that they stint them, and allow only about twenty-five or thirty pounds to each cow daily. One man kept five cows and one horse so much on this plant with the little which the heath afforded, that they had not consumed more than half a ton of hay throughout the whole year, none being used except when the river is frozen over. Hogs also are fed with this plant, and improve so well on it, that it is not necessary to give them any other sustenance till they are put up to fatten. This property of water-crowfoot is the more remarkable, as all the species have been deemed acrimonious, and some of them are, without doubt, highly so. It is probable this species is rendered inert as a poison by growing in the water; although it must be confessed, that in other instances moisture heightens the deleterious property of vegetables, especially in the umbelliferous tribe.

- 8061 Leaves trifid silky, Lobes broad toothed cut, Stem and petiole with reflexed hairs, Grains hooked  
 8062 A small variety of *R. hirsutus*, with a dwarf 1-flowered stem

 8081 Radical leaves pedate smooth : cauline subsessile palmate, Sepals roundish ovate green  
 8082 Radical leaves palmate downy beneath, Segm. cuneate at base 3-5-lobed at end, Sepals roundish colored  
 8083 Radical leaves palmate downy beneath, Segm. obl. undivided serrate at end, Sepals ovate obl. acute green  
 8084 Radical leaves very smooth pedate : cauline subsessile palmate, Sepals roundish green  
 8085 Stem many-fl. leafy, Leaves pedate very smooth with obl. linear segments  
 8086 Stem many-fl. leafy, Leaves 3 cut smooth glaucous beneath, Segments ovate-lanceolate

8087 Leaves trifid with obovate toothed blunt 3-lobed segments, Scape 1-flowered

and Miscellaneous Particulars.

This remark of Dr. Pulteney's is the more important, as in the Swedish experiments the *R. aquatilis* is recorded as the only one rejected by all the species of domestic cattle ; of the common sorts, there is no doubt but that *R. Flammula*, *bulbosus*, *acris*, *sceleratus*, and *arvensis* are acrimonious. Before the introduction of *Cantharides* they were used as vesicatories, and are said to act with less pain than flies, without any effect on the urinary passages ; but their action is related to be uncertain, and they are accused of frequently leaving ill-conditioned ulcers.

The acrimony, even of the most virulent, is wholly dissipated in drying ; so that in form of hay they appear to be harmless. It is also expelled in decoction ; accordingly, the shepherds of Morlachia boil the *R. sceleratus* and eat it ; and both *R. auricomus* and *repens* are said to be wholly inoffensive, and are ranked by some authors among oleraceous plants.

The *Ranunculi* give out their acrimony wholly in distillation. The distilled water of *R. sceleratus* is intensely acrimonious ; and when cold deposits crystals, which are scarcely soluble in any menstruum, and are of an inflammable nature.

1234. *Trollius*. A name given to this plant by Conrad Gesner. It is derived from *trol* or *trolen*, an old German word, signifying something round, in allusion to the form of the flowers. The species are showy flowers for the general border, and of the easiest possible culture.

1235. *Isopyrum*. A name given by the Greeks to a plant resembling *Nigella*, the seeds of which had the same taste. These are small herbaceous plants related to *Nigella*, but with the habit of *Thalictrum*.

1236. *Eranthis*. From *ερα*, the earth, and *ανθη*, flower, because the bright yellow blossoms seem to lie upon the earth. A pretty little tuberous rooted plant, valuable for the early period at which it flowers.

1237. *Helleborus*. From *ηλη*, to cause death, and *βοτα*, food. The dangerous qualities of *Hellebore* are well known. Leathery leaved plants, most of which are evergreen, and flower in winter and early in spring. *H. niger* and fetidus have long been in use in popular medicine, especially the latter, as a vermifuge and cathartic. They are both admitted in the London *Materia Medica*, but being violent poisons, require caution in their application. *H. fetidus*, from its deep green and finely divided leaves, forms a most ornamental evergreen bush for the shrubbery.

1238. *Coptis*. From *κοπτε*, to cut, in reference to the numerous divisions of the leaves. Small plants, with the habit of *Trientalis*.

History, Use, Propagation, Culture,

1239. *Caltha*. A syncope of *καλαδος*, a goblet, in allusion to the form of the corolla, which may be likened to a golden cup. The flower-buds of *C. palustris*, gathered before they expand, are said to be a good substitute for capers. The juice of the petals boiled with alum dyes paper yellow. The whole plant is acrid, and not eaten by cows, unless in case of extreme hunger.

CLASS XIV. — DIDYNAMIA. 4 STAMENS, of which two are shorter than the others.

This class, which, as its name applies, depends upon the presence of four stamens in the corolla, two of them being longer than the others, is, with the exception of Syngenesia and Gynandria, the most natural and best defined of all Linnæus's great groups, or, as he named them, classes. It is divided into two orders, called Gymnospermia and Angiospermia.

Gymnospermia contains all the genera with what are popularly but erroneously called by the Linnæan school of botany, naked seeds. It answers to the natural order of Labiatae of Jussieu's method, with the exception of some genera which are excluded on account of having only two stamens, and are found in Diandria. Nearly all the class consists of herbaceous plants, those which are called shrubs being for the most part herbaceous plants, whose stems, from the mildness of the climate in which they grow, become perennial. The most remarkable plants are the rosemary, hyssop, balm, thyme, mint, and marjoram, for the kitchen or laboratory; and the various species of Teucrium, Lavandula, Phlomis, and Dracocephalum, for the flower garden.

In Angiospermia are included the genera with numerous, or rarely a few, seeds, enclosed in a simple pericarpium. These would be combined in a manner not altogether unnatural, if some of the genera were excluded. For instance, the beautiful Linnæa, the emblem of the most highly gifted naturalist the world has ever produced, belongs to Caprifoliaceæ, and stands alone in point of natural affinity; the same may be said of Melianthus. The greater part of Scrophulariaceæ, all Melampyraceæ and Orobanchæ, and nearly the whole of Verbenacæ and Gesneriæ are found here. A considerable portion of Acanthaceæ also occupy a station in this order. Among these are many genera of much beauty, but few of interest as useful plants. Among the ornamental families every one will recognize the Bignonia, with its elegant orange or yellow trumpet flowers, and frequently twining stem; the Jacaranda, with its fern-like umbrageous foliage and magnificent diadem of blue; the Acanthus, consecrated to sculpture; in another, the noble Clerodendrum, the pride of the Japanese; and the modest Eyebrights (*Euphrasia*) of our English meadows. In one part of the class we have the Vervain, surrounded by its mystic moonlight charms; in another, the Antirrhinum tribe, remarkable for the grotesque resemblance of its blossoms to the snouts of animals; and close behind it, imperial Pedicularis, proudly rearing her heraldic honours among the snows and deserts of the frozen north. These are succeeded by a long line of forms, principally European, and of various degrees of beauty. Among the useful plants, *Digitalis*, used in medicine, and *Sesamum* as oil seed, are all which can be particularized.

Order I. GYMNOSPERMIA.

Pericarpium divided into four lobes resembling naked seeds.

- 1242. *Ajuga*. Upper lip of cor. very minute, 2-toothed. Stamens longer than upper lip.
- 1243. *Anisomeles*. Calyx tubular, 10-striated, 5-cleft. Upper lip of corolla small, entire; lower trifid, with the middle segment 2-lobed. Stamens exerted, ascending. Anthers of the short stamens 2-celled, with close cells; of the longer halved or dissimilar. Seeds smooth.
- 1244. *Teucrium*. Upper lip of cor. none, 2-parted beyond the base. Stamens exerted.
- 1245. *Westringia*. Cal. campanulate, 5-toothed. Corolla subrotate, with the upper segment bifid. Two of the anthers barren.
- 1246. *Satureja*. Cal. tubular, striated. Segments of corolla nearly equal. Stamens distant.

8088 Stem creeping, Leaves triangular cordate serrate crenate

8089 Stem erect, Leaves cordate roundish crenate with round auricles

8090 An aquatic floating plant, covered all over with viscid slime, Roots fibrous

8091 The only species. A small plant with simple stems and a few 3-5-parted leaves

and Miscellaneous Particulars.

1240. *Hydropeltis*. From ὑδωρ, water, and πέλτρον, a buckler; that is to say, a water-plant, with a leaf like a round shield. A curious little floater, with the aspect of *Hydrocharis*.

1241. *Hydrastis*. From ὑδωρ, water, in reference to the humid places wherein it grows. The root of this plant is yellow, bitter, pungent, and tonic.

1247. *Thymra*. Cal. subcylindrica, 2-lipped, with a villous furrowed line on each side. Segm. of cor. flat. Style half bifid.

1248. *Hyssopus*. Lower lip of cor. 3-parted, with the intermediate segm. subcrenate. Stamens straight, distant.

1249. *Nepeta*. Cal. dry, striated. Cor. with a longish tube; the middle segments of lower lip crenate. Orifice reflexed at edge. Stamens approximating.

1250. *Elsholtzia*. Cal. tubular, 5-toothed. Upper lip of corolla 4-toothed; lower longer, undivided, somewhat crenulate. Stamens distant.

1251. *Lavandula*. Cal. ovate, somewhat toothed, supported by a bractea. Corolla resuplicate. Stamens within the tube.

1252. *Sideritis*. Cal. 5-fid. Cor. ringent or subregular: the upper lip bifid, lower 3-parted. Stamens within the tube. The short stigma wrapping over the other.

1253. *Bystropogon*. Cal. with 5 subulate teeth, closed at the orifice with hairs. Upper lip of cor. bifid; lower trifid. Stamens distant.

1254. *Mentha*. Cor. nearly equal, 4-fid, with the broadest segment emarginate. Stamens erect, distant.

1255. *Perilla*. Cal. with the upper segment very short. Stamens distant. Styles 2, united.

1256. *Hyptis*. Cal. 5-toothed, increasing in size. Corolla ringent: the upper lip bifid; the lower 3-parted, with the intermediate segment shaped like a little bag. Stamens inserted in the swollen part of the tube, and declinate.

1257. *Horminum*. Cal. 2-lipped, awned, smooth in the orifice; when past flower, having its upper teeth crossing each other. Upper lip of corolla 2-lobed; lower 3-lobed, with nearly equal segments. Leaves radical. Scape nearly naked.

1258. *Glechoma*. Cal. 5-fid. Each pair of anthers forming by their union the figure of a cross.

1259. *Lamium*. Upper lip of corolla entire, vaulted; lower 2-lobed; the orifice toothed at the edge on both sides.

1260. *Galeopsis*. Upper lip of corolla somewhat crenate, vaulted; lower 2-toothed above.

1261. *Galeobdolon*. Cal. 5-fid, unequal, awned. Upper lip of corolla vaulted, entire; lower trifid, with acute segments. Anthers smooth.

1262. *Betonica*. Calyx awned. Upper lip of cor. ascending, flattish. Tube cylindrical.

1263. *Stachys*. Upper lip of cor. vaulted; lower reflexed at edges, intermediate larger and emarginate. Stamens after flowering reflexed towards the sides.

1264. *Zizania*. Cal. 5-parted, with subulate very long equal segments. Segments of lower lip of cor. reflexed; intermediate folded together and emarginate. Stamens after flowering reflexed towards the sides. Grain one.

1265. *Ballota*. Cal. hypocrateriform, 5-toothed, 10-lined. Upper lip of cor. crenate concave. Grains ovate 3-cornered.

1266. *Marrubium*. Cal. hypocrateriform, rigid, 10 lined. Upper lip of cor. bifid, linear, straight.

1267. *Leonurus*. Cal. 5-angled, 5-toothed. Upper lip of cor. villous, flat, entire; lower 3-parted, with the middle segment undivided. Anthers covered, with shining spots.

1268. *Phlomis*. Calyx 5-angled, 5-toothed. Helmet compressed, keeled, emarginate. Seeds bearded at end.

1269. *Leucas*. Cal. tubular, 10-striated, 8-10-toothed, with an orifice, either equal or oblique. Corolla ringent. Helmet concave, entire, bearded; lower lip 3-fid, with the middle segment largest. Anthers twin, beardless, with divaricating lobes. Stigma 2-lipped, with the upper segment very short.

1270. *Leonotis*. Differs from the last in having an elongated helmet, and the lower lip small and withering: the middle segment scarcely larger than the others.

1271. *Moluccella*. Cal. campanulate, enlarged, wider than corolla, spiny.

1272. *Clinopodium*. Invol. of many bristles beneath the whorl. Corolla 2-lipped. Upper lip of corolla flat, orbicordate, straight.

1273. *Pycnanthemum*. Involucre of many bractes beneath the little heads. Cal. tubular, striated. Upper lip of corolla nearly entire; lower trifid. Stamens nearly equal.
1274. *Origanum*. Cone 4-cornered, spiked, collecting the calyxes. Upper lip of corolla erect, flat; lower 3-parted, with nearly equal segments.
1275. *Thymus*. Orifice of bilabiate calyx closed with hairs. Upper limb of corolla flat, emarginate.
1276. *Acymos*. Cal. 2-lipped, furrowed, hispid, gibbous at base, villous at orifice. Cor. ringent, inflated at orifice, with the upper lip erect, emarginate; the lower 3-parted, spreading: intermediate segm. concave. All the stamens fertile.
1277. *Calamintha*. Cal. after flowering closed by hairs. Orifice of cor. inflated. Upper lip emarginate; lower 3-parted, with the intermediate segment entire, submarginate or crenulate.
1278. *Melissa*. Cal. dry, flattish above, with the upper lip somewhat fastigiate. Upper lip of cor. somewhat vaulted, 2-fid: lower less, with middle lobe cordate.
1279. *Dracocephalum*. Cor. inflated at orifice, with the upper lip concave.
1280. *Melittis*. Cal. smooth, campanulate, blunt, oblique at orifice. Upper lip of cor. flat; lower crenate. Anthers cruciate.
1281. *Ocymum*. Cal. with the upper lip orbicular; lower 4-fid. Corolla resupinate, with one lip 4-cleft, the other undivided. Exterior filaments having a process at their base.
1282. *Plectranthus*. Upper lip of cal. largest. Corolla resupinate, ringent, with the tube gibbous upwards, or spurred.
1283. *Trichostema*. Upper lip of cor. falcate, Stamens very long.
1284. *Prostanthera*. Calyx 2-lipped, in fruit closed. Tube striated, lips undivided, blunt. Corolla ringent, with a half bifid helmet: middle segment of lower lip large, 2-lobed. Anthers spurred beneath.
1285. *Scutellaria*. Cal. entire, after flowering closed with a lid. Tube of the corolla elongated.
1286. *Franella*. Upper lip of calyx dilated. Filaments forked, upon one point bearing their anthers. Stigma bifid.
1287. *Cleonia*. Filaments forked, upon one point bearing their anthers. Stigma bifid.
1288. *Prasium*. Cal. campanulate, 2-lipped. Upper lip of cor. vaulted; lower trifid, with the middle segm. largest cordate. Grains berried.
1289. *Phryma*. Cal. 2-lipped, 5-toothed. Grain only one.

## Order 2. ANGIOSPERMIA.

Seeds several, enclosed in an undivided pericarpium.

## I. Ovary inferior, or nearly inferior.

1290. *Gesneria*. Cal. 5-fid. Corolla incurved and recurved. Capsule 2-celled.
1291. *Gloxinia*. Cal. 5-leaved. Cor. campanulate, with an oblique limb. Filaments with the rudiment of a fifth inserted upon the receptacle.
1292. *Linnaea*. Cal. double: of the fruit 2-leaved; of the flower 5-parted. Cor. campanulate. Berry dry, 3-celled.

## II. Ovary superior, polypetalous.

1293. *Melianthus*. Cal. 5-leaved, with the lower leaflet gibbous. Petals 4, with the nectary below the lowest. Capsule 4-celled.

## III. Ovary superior, monopetalous.

## A. Filaments 5, the upper only rudimentary.

1294. *Bignonia*. Cal. 5-fid, cup-shaped. Cor. campanulate, 5-fid, ventricose beneath. Pod 2-celled. Seeds with membranous wings.
1295. *Jacuranda*. Cal. 5-toothed. Cor. tubular at base, with a dilated throat, and a 5-lobed unequal limb. Fifth filament sterile, long, villous at end. Stigma with two lips. Capsule large, round, woody, with the edge dividing into two valves.
1296. *Secamum*. Cal. 5-parted. Cor. campanulate 5-fid, with the lower lobe largest. Stigma lanceolate. Capsule 2-celled, the cells divided in two by the inflexed edges of the valves.
1297. *Pentstemon*. Cal. 5-leaved. Cor. 2-lipped, ventricose. Fifth filament longer than the rest, and bearded at its upper end. Capsule compressed, 2-celled, 2-valved. Seeds numerous, subglobose.
1298. *Chelone*. Cal. 5-parted, with two bractes. Cor. ringent, ventricose. Fifth filament shorter than the others. Caps. 2-celled, 2-valved. Seeds numerous, with a membranous edge.
1299. *Tourretia*. Cal. 2-lipped. Corolla ringent: the upper lip galeate, large; lower 2-toothed, very small. Nectary annular, 4-lobed. Stigma truncate. Capsule 4-celled. Dissepiments with 4 wings. Seeds cordate.
1300. *Martynia*. Cal. 5-fid. Cor. ringent. Capsule woody, coated, with a hooked beak, 4-celled, 2-valved.

## B. Filaments 4. Capsule many-seeded, opening with elasticity. Seeds large, flat.

## \* Calyx bifid.

1301. *Acanthus*. Cal. 4-parted: the two lateral inner segments short; the two outer long, with 3 bractes, of which the middle one is toothed, spiny. Cor. labiate, having the orifice closed with hairs. Lower lip very large, 3-lobed. Anthers villous. Stigma bifid. Caps. ovate, with 1-2-seeded cells.

## \*\* Calyx 4-fid.

1302. *Barleria*. Cal. 4-parted. Stamens 2, much smaller than the others. Capsule with 4 angles, 2-celled, 2-valved, elastic, without claws. Seeds 2.

## \*\*\* Calyx 5-fid.

1303. *Phaylopsis*. Calyx unequal, with a large dorsal segment. Cells of the ovary 2-seeded, with the segments of the dissepiment spontaneously dividing in two. Otherwise like *Blechnum*.
1304. *Ruellia*. Cal. 5-parted, generally with two bractes. Corolla campanulate, with a 5-lobed limb. Stamens in pairs. Capsule narrowed to each end. Teeth opening elastically. Seeds not many.
1305. *Blechnum*. Cal. 5-parted, equal. Cor. funnel-shaped. Capsule about 2-celled, 2-valved: the segments of the crosswise dissepiment finally becoming loose. Seeds many, with hooks.
1306. *Aphelandra*. Cal. 5-parted, unequal. Cal. 2-lipped. Anthers 1-celled. Capsule 2-celled, 2-valved, with a dissepiment crosswise. Seeds with hooks.
1307. *Crossandra*. Cal. 5-parted, unequal. Cor. 1-lipped. Stamens included. Anthers 1-celled. Capsule 2-celled, 2-valved, with a dissepiment crosswise. Seeds with hooks.

## \*\*\*\* Calyx multifid.

1308. *Thunbergia*. Cal. double: outer 2-leaved; inner about 12-toothed. Cor. campanulate. Capsule beaked, 2-celled.

## C. Filaments 4. Capsule, drupa, or berry few seeded. Seeds erect.

## \* Calyx bifid.

1309. *Hebenstreitia*. Cal. spathaceous, opening lengthwise beneath. Cor. tubular, unequal, with one upper 4-fid lip. Stamens projecting from the lower cleft of the corolla. Caps. 2-seeded.

\*\* *Calyx 4-fid.*

1310. *Hosta*. Cal. obsoletely 2-lipped, 4-toothed. Corolla ringent, with the middle segment of the lower lip large, emarginate. Drupe with a 4-celled, 4-seeded nut.  
 1311. *Gmelina*. Cal. about 4-toothed. Cor. 4-fid, campanulate. Two of the anthers 2-parted, 2-simple. Drupe baccate. Putamen bony, 4-celled. Cells 1-seeded, the lower sterile.  
 1312. *Lantana*. Flowers capitate. Cal. obsoletely 4-toothed. Limb of corolla 4-fid, with an open orifice. Stigma hooked backwards. Drupes heaped, with a 2-celled smooth nut.  
 1313. *Aloysia*. Calyx deeply 4-cleft. Corolla tubular, 4-lobed. Stigma emarginate. Stamens 4, perfect. Seeds two.  
 1314. *Lippia*. Flowers capitate. Cal. 4-toothed, roundish, erect, compressed, membranous. Corolla 4-fid, funnel-shaped. Drupe dry, 1-seeded, thin, covered by the calyx. Nuts two, 1-seeded.  
 1315. *Melampyrum*. Capsule 2-celled. Seeds 2, gibbous, polished.

\*\*\* *Calyx 5-fid.*

1516. *Selago*. Cal. 5-fid. Tube of corolla filiform. Limb nearly equal. Capsule simple or 2-lobed, each lobe with a seed.  
 1317. *Vicia*. Cal. 5-toothed. Limb of cor. 5-6-fid. Drupe 1-seeded, with a 4-celled nut.  
 1318. *Cornus*. Cal. 5-toothed. Stamens longer than corolla. Style very long. Berry 1-seeded.  
 1319. *Zapania*. Flowers capitate. Cal. 5-toothed. Cor. 6-fid. Stigma peltate, capitate, oblique. Fruit covered, bladdery, enclosing two seeds.  
 1320. *Prina*. Cal. inflated, 5-toothed. Cor. a little longer than the tube of calyx, contracted at orifice. Drupe covered by the calyx. Nuts two, 2-celled, 2-seeded. Stamens 2-4.  
 1321. *Spielmannia*. Cal. 5-fid. Limb of cor. 5-fid, the orifice closed by hairs. Stigma hooked. Drupe with a 2-celled warted nut.  
 1322. *Verbena*. Cal. 5-fid. Cor. funnel-shaped, with an incurved tube, and an unequal 5-fid limb. Stamens 4, fertile. Fruit bladdery, covered, withering. Seeds 4.  
 1323. *Avicennia*. Cal. 5-parted. Cor. 2-lipped: the upper lip square. Caps. coriaceous, rhomboid, 1-seeded. Seed germinating within the capsule.  
 1324. *Caldasia*. Cal. tubular, 5-toothed. Cor. hypocrateriform, nearly equal. Filaments inserted in top of tube. Caps. 3-celled, 3-seeded. 3-valved. Seeds elliptical.  
 1325. *Clerodendrum*. Cal. 5-fid, campanulate. Corolla with a filiform tube and a 5-parted equal limb. Stamens very long, projecting from between the segments of corolla. Drupe 4-seeded, with a 1-celled nut.  
 1326. *Volkameria*. Cal. 5-fid. Cor. with 1-sided segments. Drupe 2-seeded. Nuts 2-celled, with 1-seeded cells.  
 1327. *Holmskioldia*. Cal. colored, very large, campanulate, spreading, with a nearly entire limb a little shorter than the ringent corolla.  
 1328. *Petræa*. Cal. 5-parted, very large, colored. Corolla rotate. Caps. 2-celled, 2-seeded in the bottom of the calyx. Seeds solitary.  
 1329. *Citharexylum*. Cal. 5-toothed, campanulate. Corolla funnel-shaped, rotate. Segments villous, above equal. Drupe 2-seeded. Nuts 2-celled.  
 1330. *Duranta*. Cal. 5-fid, superior. Drupe 4-seeded, covered by the calyx. Nut 4-2-celled, 2-seeded.  
 1331. *Pedañum*. Cal. 5-parted. Cor. tubular, ringent, with a 5-cleft limb. Filaments hairy at base. Anthers in pairs, forming a cross. Nut corky, with spiny angles. Seeds 2, with an arillus.  
 1332. *Myoporum*. Cal. 5-parted. Corolla campanulate, with a spreading nearly equal 5-parted limb. Drupe 1-2-seeded, with 2-celled nuts.  
 1333. *Stenochilus*. Cal. 5-parted. Cor. ringent: the upper lip erect, half 4-cleft: lower undivided, narrow, deflexed. Stamens didynamous, exserted. Ovary 4-celled, with 1-seeded cells. Stigma blunt, undivided. Drupe berried, 4-celled. Seeds solitary.  
 1334. *Bontia*. Cal. 5-parted. Cor. 2-lipped, with an oblong tube: the lower lip 3-parted, revolute. Drupe ovate, 1-seeded, oblique at end.

D. Filaments 4. Capsule or berry many-seeded. Seeds small, attached to a central receptacle.

\* *Calyx bifid.*

1335. *Orobanchæ*. Cal. of 2-lobed lateral leaflets. Corolla ringent. Capsule 1-celled, 2-valved, many-seeded. Gland at the base of the ovary.  
 1336. *Crescentia*. Cal. 2-parted, equal. Corolla gibbous. Berry stalked, 1-celled, many-seeded. Seeds immersed in pulp.  
 1337. *Castilleja*. Cal. spathaceous; the upper lip bifid, lower none. Cor. 2-lipped: the lower lip very short, trifid, with 2 glands between the segments. Caps. 2-celled.

\*\* *Calyx trifid.*

1338. *Halleria*. Cal. 3 or 5-leaved. Cor. 4-fid, somewhat inflated. Berry 2-celled, many-seeded

\*\*\* *Calyx 4-fid.*

1339. *Lathræa*. Cal. 4-fid. A depressed gland at the base of the suture of the ovary. Capsule 1-celled.  
 1340. *Rhinanthus*. Cal. 4-fid, ventricose. Cor. ringent, with the upper lip generally compressed. Capsule 2-celled, blunt, compressed.  
 1341. *Bartsia*. Cal. 4-lobed, emarginate, colored. Cor. smaller than the calyx: the upper lip longest. Capsule 2-celled. Seeds angular.  
 1342. *Euphrasia*. Cal. cylindrical, 4-fid. Corolla 2-lipped: the upper lip bifid; the lower 3-lobed, with bifid lobes. Lower anthers with spiny lobes.

\*\*\*\* *Calyx 5-fid.*

1343. *Antirrhinum*. Cal. 5-leaved. Cor. not spurred, gibbous at base: the upper lip bifid, reflexed; lower trifid, closed by the prominent palate. Caps. oblique at base, without valves, opening at the end by three pores.  
 1344. *Linaria*. Cal. 5-parted, with the two lower segments remote. Cor. spurred, ringent: the orifice closed by the prominent palate. Caps. ovate 2-valved, opening at the end into 3-5-segments.  
 1345. *Anarrhinum*. Cal. 5-leaved. Cor. prominent at base, honey bearing: lower lip flat, without a prominent palate. Caps. 2-celled, many-valved.  
 1346. *Nemesia*. Cal. 5-parted. Cor. spurred, with a prominent palate. Caps. compressed, truncate, opening lengthwise in the middle, 2-celled, 2-valved. Seeds numerous, linear.  
 1347. *Mauandya*. Cal. 5-parted. Cor. campanulate, unequal. Filaments callous at base. Caps. 2, united, half 5-valved at end.  
 1348. *Gerardia*. Cal. 5-fid. Cor. 2-lipped, the lower lip 3-parted, with emarginate lobes: the middle 2-parted. Capsule 3-celled, splitting.  
 1349. *Pedicularis*. Cal. 5-fid. Cor. ringent. Capsule 2-celled, mucronate, oblique. Seeds truncated. Leaves multifid.  
 1350. *Erinus*. Cal. 5-leaved. Cor. with a 5-fid, equal limb. Lobes emarginate: the upper lip very short, reflexed. Caps. 2-celled.  
 1351. *Mimulus*. Cal. prismatical, 5-toothed. Cor. ringent, with the upper lip folded back at the sides. Stigma thick. Capsule 2-celled, many-seeded.

1352. *Hornemannia*. Cal. tubular, 5-toothed, plaited. Cor. with the upper lip emarginate: lower 3-lobed. Seeds minute, scurfy.  
 1353. *Maxus*. Cal. large, campanulate, spreading. Cor. ringent, with a pimpled throat. Anthers connected. Stigma spatulate. Caps. 2-celled, many-seeded.  
 1354. *Isoptaxis*. Like *Digitalis*, but corolla campanulate, with the upper segment as long as the lip, and incumbent upon it before expansion.  
 1355. *Digitalis*. Cal. 5-parted. Corolla campanulate, ventricose, 5-fid. Capsule ovate 2-celled.  
 1356. *Scrophularia*. Cal. 5-fid. Cor. subglobose, resupinate. Caps. 2-celled.  
 1357. *Vandellia*. Cal. 4-fid. Cor. ringent. Two outer filaments from the disk of the lip of cor. Anthers united in pairs. Caps. 1-celled, many-seeded.  
 1358. *Sibthorpia*. Cal. 5-parted. Cor. 5-parted, equal. Stamens in remote pairs. Caps. orbicular, compressed, 2-celled, with a transverse dissepiment.  
 1359. *Limosella*. Cal. 5-fid. Cor. 5-fid, equal. Stamens approximating in pairs. Caps. 1-celled, 2-valved, many-seeded.  
 1360. *Brouallia*. Cal. 5-toothed. Cor. closed by the prominent orifice. Two of the anthers larger than the others. Caps. 1-celled.  
 1361. *Stemodia*. Cal. 5-parted. Cor. 2-lipped. Stamens 4: each filament bifid, and bearing two anthers. Capsule 2-celled.  
 1362. *Trevirana*. Cal. 5-leaved. Cor. declinate funnel-shaped. Limb flat, 5-parted, nearly equal. Caps. half 2-celled.  
 1363. *Columnnea*. Cal. 5-parted, spreading. Corolla ringent: the upper lip 3-parted, with the intermediate segment arched, above the base gibbous. Capsule berried, 1-2-celled.  
 1364. *Russelia*. Cal. 5-leaved. Cor. 2-lipped, with a hairy throat: upper lip broader, emarginate, lower trifid, with linear segments. Stigma globose. Caps. 1-celled, 2-valved, many seeded.  
 1365. *Dodartia*. Cal. campanulate, angular, 5-toothed. Lower lip of cor. broad, 3-fid. Stigma bifid. Caps. globose, 2-celled, covered by the calyx.

GYMNOSPERMIA.

History, Use, Propagation, Culture,

1242. *Ajuga*. Said to be an alteration of *abigo*, to expel or drive away. The Latins attributed emmenagogue qualities to a plant called *ajuga*, which is believed to be our *Teucrium chamæpitys*. Handsome flowering plants. A. reptans is vulgarly reputed vulnerary, cooling, and gently astringent. It is commonly called *bugle*, which appears to be a corruption of *bugula*, a contracted diminutive of *buglossum*, which the plant resembles in medical qualities.  
 1243. *Anisomeles*. So named by Mr. Brown, from *a*, privative, *isos*, equal, and *μελος*, a member. Tropical downy herbaceous plants. Their leaves are crenated, flowers grow in whorls supported by minute bractes; the calyces are glandular, and the corolla of all the species purple.  
 1244. *Teucrium*. Teucer, the Trojan prince, is said by Pliny to have been the first to employ this plant

1366. *Lindernia*. Cal. 5-parted. Cor. ringent : upper lip very short. Two lower stamens with a terminal tooth and lateral anther. Capsule 1-celled.
1367. *Herpestis*. Cal. 5-parted, unequal : 2 inner sepals smaller, covered by the others. Cor. tubular, somewhat 2-lipped. Stamens included. Lobes of anthers spreading. Stigma emarginate.
1368. *Capriaria*. Cal. 5-parted. Cor. campanulate, 5-fid, acute. Caps. 2-valved, 2-celled, many-seeded.
1369. *Buchnera*. Cal. absolutely 5-toothed. Limb of corolla 5-fid, equal, with cordate lobes. Capsule 2-celled.
1370. *Manulea*. Cal. 5-parted. Cor. funnel-shaped. Limb 5-parted, with subulate segments ; the four upper large, connected. Caps. 2-celled, many-seeded.
1371. *Angelonia*. Cal. 5-parted, nearly equal. Cor. irregular, spreading, 2-lipped, with a short tube, and arched orifice : upper lip 2-parted ; lower much larger, 3-parted, with the middle segment slipper-shaped at base.
1372. *Schizanthus*. Cor. irregular : the upper lip 5-fid ; lower 3-parted. Two filaments sterile. Capsule 2-celled.
1373. *Besleria*. Cal. 5-parted. Cor. tubular, gibbous on each side, with a 5-lobed unequal limb. Berry roundish, 1-celled, many-seeded. Seeds nidulant.
1374. *Teedia*. Cal. 5-parted. Cor. hypocrateriform, 5-fid, blunt. Style short, persistent. Berry 2-celled, many-seeded.
1375. *Bransfelsia*. Cal. 5-toothed, small. Tube of cor. very long, with a flat 5-lobed limb. Capsule berried, 1-celled, many-seeded, with a very large receptacle.
1376. *Celsia*. Cal. 5-parted. Cor. rotate. Filaments bearded. Capsule 2-celled.
1377. *Alonsoa*. Cal. 5-parted. Cor. subrotate, resupinate, 5-fid, with the upper segment largest. Stamens declinate. Filaments smooth. Anthers approximating, similar. Capsule 2-celled.
1378. *Anthocercis*. Cal. 5-fid. Cor. campanulate, regular. Rudiment of a 5th filament. Stigma capitate. Caps. 2-celled, 2-valved, many-seeded. The inflexed edges of valves inserted in the placenta.

\*\*\*\*\* *Calyx multifid.*

1379. *Cymbaria*. Cal. 10-toothed. Upper lip of cor. bifid, lower trifid. Capsule cordate, 2-celled.

GYMNOSPERMIA.

- 8092 Leaves ovate, Cor. pubescent resupinate  
 8093 Four-cornered pyramidal villous, Radical leaves very large  
 8094 Stem simple, Cauline leaves as long as radical leaves  
 8095 Radical leaves smaller than cauline leaves  
 8096 Stolones creeping
- 8097 Leaves trifid, Fl. axillary solitary shorter than leaf, Stem diffuse  
 8098 Leaves linear toothed forwards, Flowers axillary solitary  
 8099 Leaves stalked subcordate ovate acuminate acutely crenate hairy, Thyrses axillary stalked
- 8100 Bractes filiform, Leaves lanceolate entire downwards  
 8101 Leaves ovate subcordate crenate, Whorls many-fl. Bractes linear, Calyx hairy, Glands inconspicuous
- 8102 Leaves multifid, Flowers lateral solitary  
 8103 Leaves multifid linear, Raceme compound, Pedicels short  
 8104 Leaves multifid, Whorls halved  
 8105 Leaves trifid or 5-fid filiform, Flower stalked solitary opposite, Stem decumbent  
 8106 Leaves lanceolate trifid, Pedunc. axillary 3-flowered  
 8107 Leaves lanceolate entire white beneath, Flowers solitary  
 8108 Leaves entire rhomboid acute villous downy beneath, Flowers solitary  
 8109 Leaves quite entire ovate acute stalked downy beneath, Flowers racemose one-sided  
 8110 Leaves oval toothed forwards, floral entire stalked, Whorls racemose, Stem much branched  
 8111 Leaves ovate toothed forwards, floral entire sessile, Whorls racemose, Stems branched

and Miscellaneous Particulars.

medicinally. Under-shrubs or herbs of little beauty ; but several of them aromatic. The leaves and younger branches of *T. marum* (*Mar*, Arabic, signifying bitter), when recent, on being rubbed between the fingers, emit a volatile aromatic smell, which readily excites sneezing, but to the taste they are bitterish, accompanied with a sensation of heat and acrimony. Cats are very fond of these plants, and where there are few will destroy them.

*T. scorodonia* (*σκαροδον*, garlic, the smell of which this plant possesses) in Jersey is used as a substitute for hops, and the beer is said sooner to become clear than when hops are made use of. Withering found on trial that it gave too much color to the liquor.

*T. scordium*, also from *σκαροδον*, garlic, was once in high esteem for destroying worms and for fomentations

History, Use, Propagation, Culture,

Sheep and goats are said to eat this plant: horses, cows, and swine to refuse it. If cows, compelled by hunger, eat it, their milk gets a garlic flavor.

T. chamædrya, is said to have cured Charles V. of the gout, by a vinous decoction taken for sixty successive days. It is commonly called Gernander, which seems to be a corruption of the word Chamædryx, for the French call it *germandrée*, an evident alteration of *gamandré*, under which name it first appeared in the very rare *Herbier de Mayence*, printed in 1485.

1245. *Westringia*. Named by Sir J. E. Smith, in honor of Dr. John Peter Westring, physician to the king of Sweden, and author of several learned papers on the Lichen tribe. A genus of New Holland plants, chiefly from the colder parts of that country, and having the appearance of our Rosemary.

- 8112 Leaves ovate-oblong villous nearly entire, Flowers axillary solitary sessile  
 8113 Leaves ovate serrate smooth, Pedunc. sol. 3-flowered; intermediate sessile, Bractes linear lanceolate  
 8114 Leaves lanceolate repand-serrate rectangular at base, Fl. racemose one-sided, Calyx 2-lipped  
 8115 Leaves lanceolate crenate rugose, Flower racemose one-sided, Calyx 2-lipped  
 8116 Leaves ovate serrate, Raceme spiked round sessile terminal  
 8117 Leaves cuncate serrate cut smooth narrowed into the stalk, Flower solitary stalked  
 8118 Leaves ovate-lanceolate serrate hoary beneath, Stem erect round terminal, Whorls 6-leaved  
 8119 Leaves ovate unequally serrate, Racemes terminal, Bractes shorter than flower-stalk  
 8120 Leaves oblong acuminate unequally serrate pubescent, Spikes sessile terminal, Cal. inflated villous  
 8121 Leaves cordate oblong obtuse, Stem brachiata dichotomous, Spikes very long terminal sessile spiral  
 8122 Leaves cordate toothed acuminate, Racemes lateral nodding  
 8123 Leaves cordate subpubescent toothed stalked, Racemes axillary one-sided, Stem erect herbaceous  
 8124 Leaves lanceolate crenate tomentose hoary beneath, Racemes terminal, Flower stem brachiata  
 8125 Leaves cuneiform lanc. serrated villous, Racemes axillary and terminal, Cor. resupinate  
 8126 Leaves ovate rugose cut crenate hoary, Stems erect, Racemes straight one-sided  
 8127 Leaves oblong sessile toothed nearly naked, Fl. axillary stalked in pairs, Stem diffuse pubescent  
 8128 Leaves cuneiform ovate cut crenate stalked, Fl. ternary, Stems procumbent somewhat hairy  
 8129 Leaves elliptical crenate, Fl. lateral solitary, Lip of cor. woolly outside, Leaves various in form  
 8130 Leaves ovate cut serrate smooth, Whorls halved, Stems erect smooth  
 8131 Leaves ovate crenate: floral entire, Whorls halved racemose, Stem bearded in two rows  
 8132 Corymbs terminal, Cal. with acute unarmed teeth, Leaves lanceolate entire downy beneath  
 8133 Corymbs terminal, Cal. with acute mucronate teeth, Lvs. linear entire revolute at edge downy beneath  
 8134 Heads terminal few-flowered, Leaves stalked ovate blunt downy beneath, Stem procumbent  
 8135 Corymbs terminal, Leaves cuneiform orbicular crenate hairy  
 8136 Corymbs terminal hairy, Leaves ovate serrate and stems densely woolly at the ends yellow and shining  
 8137 Heads roundish stalked, Leaves lanceolate blunt crenate revolute at edge downy, Stem decumbent  
 8138 Heads roundish, and leaves, which are linear lanceolate crenate forwards, tomentose yellow at end  
 8139 Fl. solitary clustered, Leaves linear revolute crenate, Calyxes woolly  
 8140 Heads roundish lax, Leaves lanceolate crenate forwards downy hoary, Stem woolly corymbose  
 8141 Heads stalked, Leaves lanceolate crenate tomentose, Stem erect  
 8142 Heads roundish, Leaves linear revolute crenate forwards close and stem densely woolly  
 8143 Heads terminal sessile, Leaves linear revol. at edge packed in four close rows, Stem procumbent downy  
 8144 Spiny, Upper lip of calyx ovate, Corolla resupinate, Peduncles twin  
 8145 Leaves entire ovate acute stalked revolute at edge pubescent downy beneath, Fl. racemose
- 8146 Leaves beneath and calyxes silvery, Teeth half as long again as tube  
 8147 Leaves beneath and calyxes ash-colored opaque, Teeth half as short as tube
- 8148 Whorls fastigiate, Leaves linear lanceolate rough  
 8149 Lvs. acute revolute at edge pubescent, Pedunc. axillary many-fl. Bractes much shorter than calyx  
 8150 Whorls roundish hispid, Leaves obovate oblong acuminate veinless dotted hispid  
 8151 Pedunc. axillary 2-6-flowered, Bractes shorter than calyx, Leaves ovate hispid veiny beneath  
 8152 Pedunc. axillary cymose one-sided, Sepals acuminate mucronate, Leaves lin. lanc. entire mucronate  
 8153 Stem erect branched with spreading hairs, Upper leaves hairy acute, Ped. 1-flowered axillary  
 8154 Ped. axill. cymose one-sided, Sepals blunt unarmed, Lvs. roundish ovate atten. at base toothed bluntnish  
 8155 Pedunc. axillary cymose, Leaves lanceolate entire, Stem brachiata  
 8156 Flowers spiked, Leaves keeled dotted ciliated  
 8157 Fl. axillary 3 subsessile, Bractes linear, Leaves oblong entire attenuate at base smooth hispid beneath
- 8158 Flowers spiked, Bractes heaped linear ciliate  
 8159 Flowers whorled, Leaves linear lanceolate entire

- 8160 Fl. whorled racemose 1-sided, Middle lobe of cor. 2-lobed entire, Leaves lanceolate, Teeth of calyx erect  
 8161 Fl. whorled racemose 1-sided, Midd. lobe of cor. 2-lobed entire, Lvs. lin. lanc. Teeth of cal. spreading uneq.  
 8162 Pedunc. axillary cymose, Cor. resupinate, Middle lobe crenate, Leaves oblong cordate toothed  
 8163 Spikes whorled cylind. Midd. lobe of cor. crenate, Style shorter than cor. Lvs. subcord. ov. acum. sharply  
 8164 Spikes whorl. cylind. Midd. lobe of cor. crenate, Style longer than cor. Lvs. cord.-ov. acum. bluntly tooth.

and Miscellaneous Particulars.

1246. *Satureja*. The Arabs call all labiate plants by the collective name of *ss'atar*, according to Bochart. Forskahl says, they call the wild Thyme *ss'atar*. *S. montana* and *hortensis* have been cultivated as culinary aromatics from time immemorial, and much more formerly than now, when almost all European species are superseded by those of the East Indies.

1247. *Thymbra*. A name of uncertain origin. The ancients gave it to a plant analogous to Thyme. Possibly it may have been so called after the name of a place. Thymbraea, a town in Lydia, was the spot where the famous battle was fought between Cyrus and Croesus, in which the fate of the latter was decided.

1248. *Hyssopus*. Latinized from the Hebrew name *ezob*. The Arabic name *axxof*, is evidently the same.

History, Use, Propagation, Culture,

Vide John de Souza, p. 106. The plant to which this name was given is involved in uncertainty. It appears to have been one of the smallest plants, whence some have inferred that "the Hyssop which groweth out of the wall" is a kind of moss. It officinally, a neat little evergreen tuft, and most ornamental and fragrant when in flower, was once in considerable repute as a popular medicine, but is now almost out of use.

1949. *Nepeta*. Said by Linnaeus to be derived from *Nepes*, a town of Tuscany, mentioned by Pliny. *N. cataria* is called catmint, because cats are very fond of it, especially when it is withered, when they will roll themselves on it, tear it to pieces, and chew it with great pleasure. Ray observes, that plants which he transplanted from the fields into his garden were always destroyed by the cats, unless he protected them with thorns till they had taken good root and came into flower; but that they never meddled with plants raised from seed. Miller has confirmed this by his own experience; having frequently set a plant from another part of the garden within two feet of others which came up from seeds, when the former was torn in pieces and destroyed by the cats, whilst the latter remained unharmed. The true reason of this difference is assigned by Ray; that the cat is fond of it in a languid withering state, or when the peculiar scent of the plant is excited by being handled or bruised in gathering or transplanting. Hence the English vulgar saying,

- 8165 Flowers spiked, Whorls somewhat stalked, Leaves stalked cordate tooth-serrated
- 8166 Corymbs stalked spiked, Leaves lanceolate rugose tomentose bluntly serrated
- 8167 Spike whorled interrupted, Leaves cordate toothed rugose waved crisp stalked hoary
- 8168 Cymes stalked many-flowered, Leaves lanceolate oblong cordate naked, Lateral lobes of cor. reflexed
- 8169 Cymes stalked many-fl. hairy, Lvs. oblong cordate villous subsessile, Lateral lobes of cor. reflexed
- 8170 Cymes stalked many-fl. pilose, Leaves cordate stalked naked subsessile, Lateral lobes of cor. spreading
- 8171 Cymes remote stalked 1-sided few-fl. Lvs. cordate blunt crenate glandular beneath: floral all sessile
- 8172 Cymes stalk. 1-sid: lower rem. Lvs. cord. blunt cren. rug. downy without glands: floral generally stalked
- 8173 Cymes stalked many-flowered, Leaves stalked oblong subsordate crenate downy
- 8174 Flowers panicled, Leaves lanceolate serrate sessile naked
- 8175 Cymes stalked, Leaves cordate oblong lanceolate deeply serrate downy
- 8176 Leaves cordate oblong serrated, Bractes linear, Whorls 8-12-flowered incurved nearly 1-sided
- 8177 Racemes whorled naked, Leaves cordate oblong sessile naked
- 8178 Flowers sessile in whorled spikes, Bractes lan. longer than calyx pubesc. Leaves stalked villous beneath
- 8179 Cymes stalked racemose, Leaves obl. cordate serrate beneath hoary and rugose with veins
- 8180 Leaves cordate oblong crenate stalked, Stem smooth angular, Flowers whorled capitate clustered
- 8181 Fl. sessile in whorled spikes, Bractes lin. the length of calyx, Leaves stalked
- 8182 Fl. sessile in whorled spikes, Whorls distant capitate, Bractes lanc. length of cal. Leaves stalked entire
- 8183 Leaves sessile lanceolate in approximated whorls, Bractes ovate with netted veins [at end
- 8184 Cymes stalked many-fl. Tube of cor. filiform curved, Leaves ovate cordate blunt stalked serr. pubescent
- 8185 Cymes stalked few-fl. racemose, Leaves ovate cordate blunt stalked toothed pubescent
- 8186 Spikes term. Bractes obl. acum. nerved with colored lines, Lvs. cord. pubesc. Lateral lobes of cor. reflexed
- 8187 Spikes term, Bractes ov. nerved rugose subsarciose, Lvs. obl. cord. villous, Lateral lobes of cor. spreading
- 8188 Flowers spiked, Leaves pinnatifid entire
- 8189 Flowers spiked, Lateral lobes of cor. spreading, Leaves pinnatifid with lin. nearly equal segments

- 8190 Stems prostrate, Leaves ovate subserrate, Spikes terminal, Calyx scarious at end
- 8191 Spikes solitary unilateral erect, Bractes veiny

- 8192 Leaves sessile lin. lanc. revolute at edge, Spike interrupted naked

- 8193 Leaves sessile lin. downy revolute at edge, Spike contracted comose subsessile, Bractes 3-lobed
- 8194 Leaves sessile lin. rugose villous revolute at edge, Spike comose, Bractes undivided
- 8195 Leaves sessile linear pectinate-pinnate, Spike contracted comose
- 8196 Lvs. stalked pinnate, Leaflets cuneate, Spike imbricated
- 8197 Lvs. stalked hoary, Leaf. pinnatifid crosswise, Spike simple 4-corn. spiral, Bractes ovate nerved villous
- 8198 Lvs. stalked pinnate nearly smooth, Leaf. pinnatifid crosswise, Spike branched interrupted 4-cornered
- 8199 Lvs. stalked ovate cordate serrate fleshy, Spike 4-cornered, Calyxes recurved

- 8200 Shrubby villous, Lvs. cordate oblong acute stalked, Spikes whorled before flowering nodding
- 8201 Shrubby downy, Lvs. ovate lanc. cordate narrowed at end white beneath, Whorls about 8-fl. remote
- 8202 Herbaceous without bractes, Cal. larger than cor. spiny, Upper lip trifid
- 8203 Herbaceous without bractes villous, Stem diffuse, Segm. of calyx nearly equal spiny
- 8204 Herbaceous decumbent without bractes, Leaves spatulate toothed at end, Cal. spiny, Upper lip ovate
- 8205 Half-shrubby woolly, Leaves lanc. nearly entire, Fl. in whorled spikes, Bractes cordate acute downy
- 8206 Half-shrubby villous, Lvs. lanc. cren. Fl. in whorled spikes, Bractes cord. acum. reticulated with nerves
- 8207 Herbac. pilose-hispid, Upper lvs. lanc. amplexicaul. toothlfted, Bractes cord. acum. netted hairy at edge
- 8208 Half-shrubby downy, Lvs. linear lanceolate nearly entire, Flowers and bractes toothed
- 8209 Hirsute, Lvs. lanc. spiny toothed, Bractes round. cord. shorter than cal. with spiny teeth, Whorls distant
- 8210 Hirsute, Lvs. lanc. spiny toothed, Bractes cord. acum. longer than cal. with spiny teeth, Whorls close
- 8211 Lvs. lanc. smooth entire, Bractes cord. toothed-spiny, Calyxes equal
- 8212 Leaves lanc. toothed smooth above, downy beneath, Bractes ovate toothed spiny, Calyxes equal

and Miscellaneous Particulars.

"If you set it  
The cats will eat it;  
If you sow it  
The cats will not know it."

1250 *Elsholtzia*. Named by Willdenow, in memory of a Prussian botanist, John Sigismund Elsholtz, who lived in the middle of the seventeenth century. Inconspicuous hardy herbaceous plants of little merit.

1251 *Lavandula*. From *lavare*, to wash. The use of the distilled water of this plant is well known. The flowers of *L. spica* have an agreeable fragrant odour, and warm bitterish taste. Alcohol extracts their virtues completely, and elevates in distillation all their odorous parts; water acts less completely. The oil, however, on which their virtues depend, is obtained separate in distillation with water; in the proportion, according to Lewis, of one ounce of oil from sixty ounces of the flowers. Lavender is stimulant and tonic. The oil extracted by alcohol enters into several compositions. The dried leaves in powder were used formerly as a sternutatory; but they are now neglected. The flowers are cut in dry weather, when they begin to blow. (*London Dispensatory*, 862.)

1252 *Sideritis*. From *sidros*, iron. A name given by the Greeks to a plant by which they were cured all

History, Use, Propagation, Culture,

wounds by sword. The plants of the moderns do not possess any such properties. Their flowers, however, have frequently a ferruginous color.

1253. *Bystropogon*. A name elegantly contrived by L'Heritier, from *βου*, to close, and *πυρον*, a beard, in allusion to the throat of the corolla being closed by hairs.

1254. *Mentha*. *Μινθα* or *μινθη*, in old Greek. The poets feign that Mintha was a daughter of Cocytus, transformed into the plant which bears her name; an allegorical description of the terrible effects ascribed to their plant by the ancients. *M. viridis* not being so hot to the taste as peppermint, and having a more agreeable flavor than most of the others, is generally preferred for culinary and some medicinal purposes. The leaves or tops are used in spring salads, and eaten dried as sauce with lamb and in soups.

The medical preparations of spearmint are more pleasant than those of peppermint, but perhaps less efficacious. This herb, as do the other sorts, contains much essential oil, but of an odor less agreeable than that of lavender or marjoram: it is therefore less employed as a cephalic; but it acts very powerfully on parts to which it is immediately applied, and therefore considerably on the stomach. It acts especially as an antispasmodic, and therefore relieves pains and choleric arising from spasm. It will also stop vomiting dependent on the same cause; but if it arise from an inflammatory irritation in the stomach itself, or in other parts of the body, it aggravates the disease. The infusion of mint in warm water agrees better with the stomach than the distilled water. The official preparations are an essential oil, a conserve, a simple water, and a spirit. The conserve is very grateful, and the distilled waters both simple and spirituous, are generally thought pleasant.

8213 Leaves lanc. toothed blunt pilose, Bractes toothed spiny, Stems hirsute decumbent  
 8214 Hirsute, Lvs. obl. cuneate toothed wavy downy beneath, Bractes round with spiny teeth, Whorls distant  
 8215 Shrubby downy, Lvs. cord. obl. crenate stalked downy on each side, Upper lip of cor. ovate entire  
 8216 Like *hyasopifolia*, but leaves smooth on each side somewhat toothed lanceolate blunt

8217 Panicle dichotomous, Cal. feathery, Leaves ovate subserrate downy beneath  
 8218 Panicle dichotomous, Cal. feathery, Leaves ovate entire very white beneath  
 8219 Panicle dichotomous, Flowers capitate, Leaves ovate crenate most villous beneath  
 8220 Panicle dichotomous, Flowers capitate, Leaves ovate toothed smooth dotted

8221 Spikes oblong, Leaves oblong serrated hairy sessile, Stamens longer than cor.  
 8222 Spikes cylindr. interrupted, Leaves ovate-obl. subsessile remotely serrate and calyxes smooth  
 8223 Hoary, Spikes oblong interrupted, Leaves roundish rugose crenate sessile

8224 Spikes obl. Leaves sessile oval finely and equally serrate acum. hoary beneath, Stamens as long as cor.  
 8225 Spikes obl. Lvs. ovate stalked serr. hoary beneath, Calyxes and peduncles hirsute, Stem much branched  
 8226 Leaves stalked subcordate slightly pubescent, Spikes middle sized [somewhat hairy  
 8227 Spikes cylindr. interrupted, Lvs. lanc. subsess. cun. at base finely serrated smth. on each side, Teeth of cal.  
 8228 Spks. obl. Lvs. obl. comp. blunt. serrat. ses. hoary and downy on each side, Cal. and ped. vill. Stem much br.  
 8229 Spikes obl. blunt interrupted at base, Lvs. ov.-obl. acute serrat. stalked smooth, Cal. quite smooth at base  
 8230 Flowers racemose whorled, Leaves stalked ovate lanc. serrated smooth  
 8231 Spikes capitate, Leaves cordate cut-toothed wavy sessile, Stamens length of corolla [hirsute  
 8232 Spikes cylindr. interrupt. Lvs. ov. obl. subsess. cuspid. ser. waved complicate hoary on each side, Cal. and ped.  
 8233 Spikes cylindr. Lvs. ovate obl. subsess. cuspidate serr. wavy complicate hoary on each side  
 8234 Flowers in heads, Lvs. ellipt. blunt serrated smooth stalked, Stamens shorter than corolla

[at base  
 8235 Spikes cylindr. interrupted, Lvs. ovate lanc. stalked finely serr. entire at base, Ped. hirsute, Cal. smooth  
 8236 Spikes obl. interrupt. at base, Lvs. obl. lanc. subsess. remotely and finely serrat. entire at base hoary beneath  
 8237 Spikes cylindr. contracted, Leaves obl. subcor. subsess. equally serrated hoary beneath, Cal. and ped. hirsute  
 8238 Spks. cylindr. interrupt. at base, Lvs. ov. obl. subsess. finely and unequally serr. hoary, Cal. and ped. hirsute  
 8239 Spikes cylindr. interrupted, Lvs. ovate-ellipt. rounded at end serrated subsessile hoary beneath

[calyx villous  
 8240 Spks. cylindr. interrupt. at base, Lvs. lin. lanc. nearly entire complicate sess. hoary on each side, Ped. and  
 8241 Flowers whorled, Lvs. ovate stalked serrated entire at base smooth, Teeth of calyx hairy  
 8242 Fls. whorl. Lvs. ov.-lanc. narrowed at each end, Cal. tubular obl. hairy, Hairs of pedicels spreading, of stems  
 8243 Low pubesc. Fl. whorled, Lvs. stalked with resinous dots acute at each end, Stamens exerted [deflexed  
 8244 Flowers capitate or whorled, Lvs. stalked ovate, Calyx hairy on each side, Pedicels hispid backwards  
 8245 Whorls spiked oblong, Leaves lanceolate entire downy  
 8246 Fl. whorled, Lvs. ovate stalked serrate hairy, Cal. hairy, Ped. smooth, Stem erect  
 8247 Flowers whorled, Lvs. ovate acutish serrated, Stamens longer than corolla  
 8248 Spikes cylindr. interrupted at base, Lvs. ovate stalked serrate beneath hairy, Cal. and peduncle hirsute  
 8249 Flowers whorled, Lvs. lanc. subsess. Stem much branched erect, Cal. at base and pedicels very smooth  
 8250 Flowers whorled, Lvs. ovate stalked serrate hairy, Cal. and peduncles hirsute, Stem much branched

8251 Flowers whorled, Lvs. ovate, Stem much branched spreading, Calyxes and pedicels smooth at base  
 8252 Flowers whorled, Lvs. lanc. serrate stalked hairy, Stam. as long as corolla  
 8253 Flowers whorled, Lvs. ov. subsess. cuspidate serr. wavy nearly smooth, Pedunc. and calyx smooth at base  
 8254 Flowers whorled, Lvs. ovate, Stem prostrate, Pedicels and cal. downy on each side, Teeth ciliated  
 8255 Flowers whorled, Lvs. lanc. nearly entire sessile smooth, Bractes palmate

and Miscellaneous Particulars.

Lewis observes, that mint is said to prevent the coagulation of milk; and hence it has been recommended to be used with milk diets, and even in cataplasms and fomentations for resolving coagulated milk in the breasts: upon experiment, the curd of milk, digested in a strong infusion of mint, could not be perceived to be any otherwise affected than by common water; but milk, in which mint leaves were set to macerate, did not coagulate near so soon as an equal quantity of the same milk kept by itself. Dry mint digested in rectified spirits of wine, gives out a tincture which appears by day-light of a fine dark green, but by candle-light of a bright red color. The fact is, that a small quantity of this tincture is green, either by day-light or candle-light, but a large quantity seems impervious to common day-light; however, when held between the eye and a candle, or between the eye and the sun, it appears red; so that if put into a flat bottle it appears green, but when viewed edgewise red.

For medicinal use peppermint is generally cut just as the flowers appear; but for obtaining the essential oil, the flowering plant is preferred. It should be cut in very dry weather. (*London Dispensatory*, 384.)

*M. piperita* has a more penetrating smell than any of the other species, and a much stronger taste, pungent and glowing like pepper, sinking as it were into the tongue, and followed by a sensation of coldness. Its stomachic, anti-spasmodic and carminative qualities render it useful in flatulent colics, hysterical affections, retchings, and other dyspeptic symptoms, acting as a cordial, and often producing immediate relief. The official preparations are an essential oil, a simple water, and a spirit. The essence of peppermint is an elegant medicine, and seems to be the rectified oil dissolved in spirits of wine.

<sup>46</sup> The cultivators of the plant observe, that to keep up its quality, the roots must be transplanted every three

History, Use, Propagation, Culture,

years, otherwise it degenerates into the flavor of spearmint." (*Linnean Transactions*, v. 176.) If the plant be cut in wet weather it changes to black, and is little worth. (*London Dispensatory*, 385.)

M. pulegium (from *pulex*, a louse, which animal it was thought to drive away) smells like spearmint, but less fragrant; the taste aromatic and pungent, with a slight flavor of camphor. These qualities reside in a very volatile essential oil, which rises in distillation with water. It was formerly regarded as emmenagogue, expectorant, and diaphoretic, and was in repute for promoting the uterine evacuation, and relieving hysteria, whooping-cough, asthma; but it is now justly considered of no value, and seldom used in regular practice. (*London Dispensatory*, 386.)

1255. *Perilla*. A name the meaning of which has not been explained. An annual plant with a strong balmy fragrance.

1256. *Hyptis*. From *hyrtos*, reversed, because the corolla seems inverted, both as to its form and as to the insertion of stamens. Plants with densely whorled flowers, all natives of the western parts of the world, within, or nearly so, the limits of the tropics.

1257. *Horminum*. From *orgeon*, to excite, in allusion to its stimulant qualities. The Horminum of the ancients was reputed aphrodisiac.

1258. *Glechoma*. Γληχων was a sort of Thyme among the Greeks. Small trailing herbs. The leaves of *G. hederacea* are often deformed with red hairy tumours, which are the galls of the Cynips *Glechoma*. Before

8256 Leaves ovate serrate, Bractes long leafy

8257 Heads stalked in an involucre, Invol. lanc. the length of flowers, Leaves ovate toothed  
 8258 Heads stalked in an involucre, Invol. lanc. longer than flowers, Leaves oblong toothed narrowed at base  
 8259 Heads opp. few-fl. without bractes, Pedunc. shorter than joints, Leaves cord. doubly serrate; upper oval  
 8260 Flowers in spiked 1-sided panicles on a two-parted peduncle, Leaves ovate  
 8261 Flowers in stalked capitate cymes, Leaves of invol. 2 longer than calyx in fruit, Leaves oblong  
 8262 Leaves ovate subcordate attenuate acutely crenate pubesc. spiked whorled terminal, Cal. 5-toothed  
 8263 Flowers capitate, Invol. filiform hispid shorter than calyx of fruit, Lower leaves cordate  
 8264 Heads on a short peduncle, Leaves of invol. oblong lanc. Cal. pubescent not closed with hairs

8265 Stem leafy, Leaves ovate oblong crenate, Bractes cordate, acuminate, Cal. pungent

8266 Smooth, Segment of calyx ovate acute  
 8267 Hirsute, Segment of calyx lanceolate cuspidate

8268 Leaves cord. unequally finely serr. Orifice of cor. inflated, Lower lip 3-toothed on each side, Cal. colored  
 8269 Leaves cord. rugose, Stem smooth, Cal. smooth the length of tube of corolla  
 8270 Leaves cord. acute rugose and stems hairy, Whorls many-flowered, Tooth of orifice solitary setaceous  
 8271 Leaves cord. concave somewhat hoary, Orifice of cor. inflated, Tube straight with two teeth on each side  
 8272 Leaves cord. acuminate, Whorls 10-flowered  
 8273 Leaves cord. acuminate serrate stalked, Whorls 20-flowered  
 8274 Smooth, Leaves cordate crenate: floral subsessile, Teeth of calyx as long as cor.  
 8275 Leaves stalked somewhat toothed: lower cordate; upper ovate  
 8276 Leaves stalked cordate blunt toothed; upper close together, Stem naked below  
     β Leaves cut-toothed  
 8277 Floral leaves sessile amplexicaul cut; radical lobed  
 8278 Leaves many-parted

8279 Joints of stem equal, All the whorls remote, Leaves lanceolate  
 8280 Joints of stem equal, Leaves ovate lanceolate serrate villous, Helmet crenate cut  
 8281 Joints of stem thickened upwards, Upper whorls contiguous, Cal. pungent, Cor. little longer than calyx  
 8282 Stem hispid, Joints thickened upwards, Cor. thrice as long as calyx, Helmet ventricose

8283 All the leaves ovate, Involucre 4-leaved

8284 Spike interrupted, Helmet entire, Middle segm. of lower lip emarg. Cal. smoothish  
 8285 Spike oblong, Helmet entire, Middle segm. of lower lip crenate wavy, Cal. hairy, Bractes ciliated  
 8286 Spike interrupted, Helmet bifid, Middle segm. of lower lip crenate, Tube downy incurved  
 8287 Spike entire, Middle segm. of lower lip entire  
 8288 Spike leafy at base, Helmet bifid  
 8289 Spike leafy at base, Helmet entire  
 8290 Spike leafy interrupted, Calyx villous at edge, Teeth subulate, Helmet obovate

and Miscellaneous Particulars.

the use of hops, the leaves were put in ale, and being bitter, aromatic, and having a peculiar and very strong smell, were much used in popular medicine. It is now, however, seldom used.

1259. *Lamium*. *Lamium* was a celebrated marine monster; the flowers of this genus have a considerable resemblance to the grotesque figure of some beast. *L. orvala* is the only species admitted into the garden. The others are mostly ugly weeds. *L. album*, *Ortie blanche*, Fr., *Taube Nessel*, Ger., and *Ortica mortia* or *bianca*, Ital., has a disagreeable smell when bruised, and though no cattle whatever will touch it, yet Linnæus says, the leaves are eaten in Sweden as a pot herb in spring.

1260. *Galeopsis*. From *γαλεος*, a weasel, and *opsis*, appearance. The flower has a grotesque figure, and may be likened to the form of a weasel, or, indeed, of any thing else.

1261. *Galeobdolon*. A word with the same meaning as *Galeopsis*, which see.

1262. *Betonica*. In Celtic botany is called *Bentonic*; wherefore it appears, that Pliny gave too much way to conjecture, when he wrote that *Betonica* or *Vetonica* was so called from the *Vetones*, a people who dwelt at the foot of the Pyrenees. *B. officinalis* was formerly much used in medicine, but it is discarded from modern practice. When fresh it intoxicates. The leaves when dry excite sneezing. Sheep eat it, but goats refuse it. The roots are bitter and very nauseous; in a small dose they vomit and purge violently. This plant dyes wool of a very fine dark yellow color.

History, Use, Propagation, Culture,

1263. *Stachys*. From *gaxx*, a spike; the flowers of all the species grow in spikes. They are for the most part strong smelling weeds.

1264. *Zietenia*. A genus divided by Gleditsch from *Stachys*, on account of the different structure of the corolla, and the single grain. It is a plant with lanceolate entire lineate leaves, the lower of which are connate, and purple blossoms.

- 8291 Whorls 6-flowered, Leaves cordate stalked  
 8292 Leaves ovate obl. acum. serrated hairy above with soft down beneath, Segm. of cal. linear mucronate  
 8293 Whorls spiked 6-f. Tube of cal. shorter than spread. teeth, Helm. of cor. emarg. Lvs. ov. serr. with soft down  
 8294 Small, Stems much branched diffuse, Leaves cordate crenate, Cal. campanulate spiny  
 8295 Whorls about 6-flowered, Leaves linear lanceolate  $\frac{1}{2}$  stem-clasping sessile  
 8296 Whorls 6-flowered, Leaves ovate cordate crenate, Petioles dilated  
 8297 Leaves cordate cren. pubescent, Whorls 4-6-flowered, Stem erect smooth simple  
 8298 Whorls many-fl. approximated, Bractes filiform, Leaves cordate toothed, Stem decumbent villous  
 8299 Hoary, Whorls many-fl. Leaves ovate, Serratures imbricated, Stem woolly  
 8300 Whorls many-fl. Calyxes subpungent, Leaves oblong subcordate crenate, Stem woolly  
 8301 Whorls many-fl. Leaves woolly oblong, Stems procumbent at base and rooting  
 8302 Whorls 10-fl. Calyxes unarmed, Leaves cordate: floral ovate entire sessile, Stem hairy  
 8303 Whorls 6-fl. Leaves oblong cordate stalked, Stem hollow  
 8304 Whorls 2-f. Leaves linear naked: lower pinnatifid-toothed  
 8305 Like *S. germanica*, but downy not woolly, Leaves narrower, Calyxes long spiny  
 8306 Whorls many-fl. Leaves cordate thin, Serratures cartilaginous at end, Lips of cor. flat  
 8307 Whorls spiked 6-flowered, Bractes cordate, Leaves cordate stalked blunt crenate toothed  
 8308 Leaves ovate crenate pubescent: upper entire, Whorls 6-f. Cal. hairy with filiform segments  
 8309 Whorls spiked, Lvs. oblong attenuated at base serrated hairy: lower blunt, Cal. mucronate spiny  
 8310 Erect pubescent, Leaves cord. ov. toothed: above smooth; beneath white with down, Whorls about 6-f.  
 8311 Whorls a little spiked hairy 6-f. Cal. spiny, Leaves oblong serrate blunt, Helmet bifid  
 8312 Hairy, Whorls 30-flowered, Calyx pungent, Stem hairy  
 8313 Smooth much branched, Branches spiny, Pedunc. axillary solitary 1-fl. with two bractes  
 8314 Hoary, Branches brachiate terminated by a spine, Flowers axillary in threes  
 8315 Leaves downy ovate lanceolate: floral shorter than the whorl  
 8316 Whorls 6-flowered, Radical leaves oval crenate: upper ovate entire, Cor. twice as long as calyx  
 8317 Leaves obliquely cordate rugose crenate blunt hairy; Bractes entire shorter than calyx  
 8318 Leaves cordate ellipt. the lower on long stalks, Stems and spinulose calyxes covered with wool  
 8319 Whorls 2-flowered, Leaves cordate deeply serrated rugose, Tube of cor. curved  
 8320 Whorls 6-flowered, Stems prostrate, Upper lip of cor. bifid spreading reflexed, Lvs. broad cord. crenate  
 8321 Hoary, Whorls 6-f. Leaves linear lanceolate narrowed at base downy rugose serrated, Calyxes pointless  
 8322 Whorls 6-f. Calyxes rather pungent, Lvs. cuneate lanceolate blunt serrate at end sessile, Stem decum.  
 8323 Whorls subspiked, Leaves cordate ellipt. crenate rough, Stems ascending  
 8324 Whorls 6-f. Leaves ovate lanc. rugose 3-nerved stalked, Stem erect  
 8325 Small, Whorls 6-f. Leaves blunt nearly naked, Corolla the length of calyx, Stem weak  
 8326 Whorls many-fl. spiked, Upper lip bifid, with acute divisions, Leaves broad cordate rugose hairy  
 8327 Whorls 8-flowered, Leaves lanceolate cordate crenate rugose, Stem very hairy

8328 Whorls 6-flowered very hairy, Leaves lanceolate entire ned

- 8329 Leaves cordate undivided serrated, Cal. acuminate  
 8330 Leaves cordate undivided serrated, Cal. subtruncate  
 8331 Leaves palmate toothed, Stem woolly

8332 Leaves whorled halved 2-parted half-spiked

- 8333 Leaves cuneiform 5-toothed plaited, Whorls without involucrem  
 8334 Leaves elliptical obtuse crenate downy rugose, Calyxes and bractes lanceolate  
 8335 Leaves oblong hoary rugose toothed; the teeth towards the end largest, Cal. with small subulate teeth  
 8336 Leaves lanceolate hoary rugose toothed at end, Cal. with setaceous teeth, Stem branched divaricating  
 8337 Leaves ovate hoary bluntly toothed rugose, Cal. with subulate teeth, Stem branched at base  
 8338 Leaves roundish subcordate crenate rugose, Cal. with straight villous setaceous teeth.  
 8339 Leaves cordate roundish emarginate crenate, Calyx 10-toothed spiny  
 8340 Leaves roundish ovate toothed rugose, Teeth of calyx 10 setaceous hooked  
 8341 Leaves cordate crenate downy green above, Teeth of calyx mucronate recurved  
 8342 Leaves cordate ovate crenate, Teeth of cal. 10 spreading lanceolate, Bractes subulate  
 8343 Leaves roundish cordate unequally crenate, Limb of calyx spreading, Teeth ovate mucronate  
 8344 Leaves cordate roundish, crenate somewhat toothed, Teeth of calyx 10 unarmed  
 8345 Leaves ovate greenish deeply crenate, Teeth of calyx subulate smooth spreading  
 8346 Leaves cordate ovate crenate, Limb of calyx spreading, Teeth ovate mucronate, Bractes oblong  
 8347 Hoary, Limb of calyx flat villous, Leaves cordate concave, Stem shrubby  
 8348 Limb of calyx longer than tube membranous, Larger angles rounded

and Miscellaneous Particulars.

1265. *Ballota*. So named on account of its offensive odor, from *βαλλω*, to reject.  
 1266. *Marrubium*. According to Linnaeus is derived from an ancient town of Italy called *Maria-urbs*, situated on the borders of the Fucine lake. *M. vulgare* dried, has an aromatic odor, which, however, is soon lost by keeping, and a bitter taste. Both water and alcohol extract its virtues. It is tonic, diuretic, and laxative; was formerly much used in pulmonary affections, and is still a popular remedy for asthma and obsti-

History, Use, Propagation, Culture,

nate coughs. It loosens the belly when taken in large doses, and was consequently recommended in jaundice, cachexies, menstrual obstructions, and hysteria; but its powers are not found by modern practitioners equal to the account ancients gave of them, and therefore it is very seldom prescribed. (*London Dispensatory*, 379.)

1267. *Leonurus*. From *λεων*, a lion, and *ουρα*, tail. The spikes of flowers have been compared to the tuft which grows on the end of the lion's tail. *L. Cardiaca* was formerly used in medicine, but is now neglected. Tall herbaceous plants with cut leaves and whorls of flowers, of which the corolla is woolly.

1268. *Phlomis*. *Φλομης* was the Greek name of the Mullein, and so called from *φλοξ*, fire, because the thick cottony leaves were used as wicks for lamps. At this day, *P. Lychnitis* is so called, because the dried leaves, which are cottony and russet colored, are used in Spain for wicks. Fine shewy small shrubs or herbaceous plants, with corolla covered with down, and usually of a brownish yellow color.

1269. *Leucas*. A name used by Burmann, neglected by Linnæus and others, and restored by Mr. Brown; derived from *λευκος*, white, in reference to the usual color of the flowers, which are covered all over with a thick covering of wool.

1270. *Leonotis*. From *λεων*, a lion, and *οτις*, an ear. A fanciful name applied to the fine scarlet-flowering

8349 Leaves cordate 3-lobed or 5-lobed cut toothed wavy, Cor. larger than pungent calyx  
 8350 Leaves cuneiform ovate 3-lobed toothed, Cor. larger than pungent calyx, Middle lobe of lower lip acute  
 8351 Leaves 3-parted cut, Calyxes villous  
 8352 Leaves 3-parted multifid linear somewhat blunt  
 8353 Lvs. obl. toothed, Cor. scarcely longer than somewhat pungent calyx, Middle lobe of lower lip roundish  
 8354 Leaves about 5-lobed, Lobes blunt toothed at end, Cal. sessile spiny

8355 Leaves oblong blunt rugose and branches downy; floral ovate-lanceolate, Bractes ovate acuminate  
 8356 Leaves elliptical blunt woolly rugose, Branches woolly, Bractes obovate twice as short as calyx  
 8357 Bractes lanceolate acute pungent, Cal. 5-cornered acuminate, Leaves densely woolly beneath  
 8358 Bractes lanceolate blunt unarmed, Cal. truncated pointless, Leaves woolly on each side  
 8359 Lvs. downy on each side: rad. cord. sagitt.; cauline obl. Whorls without bractes, Cal. with obl. acute teeth  
 8360 Leaves lanceolate downy: floral ovate, Bractes setaceous woolly length of bluntly toothed calyx  
 8361 Stem hairy, Lvs. cordate crenate downy beneath, Bractes 3-parted subulate mucronate as long as calyx  
 8362 Lvs. ovate obl. serrate hairy beneath, Teeth of calyx lanc. subulate erect, Bractes subul. and stem hairy  
 8363 Radical leaves cordate pubescent; floral lanceolate, Bractes linear subulate villous, Stem pubescent  
 8364 Radical leaves cordate rough; floral oblong lanceolate, Bractes subulate hispid, Stem smooth  
 8365 Leaves alternately pinnate, Leaflets lacinate, Calyx woolly  
 8366 Leaves stalked obl. lanc. serr. at end, rough above downy beneath, Teeth of calyx subulate spreading  
 8367 Leaves cordate crenate downy beneath, Bractes ovate-lanceolate mucronate  
 8368 Like *P. fruticosa*, but the lower leaves are cordate stalked, Upper ovate

8369 Leaves lanceolate serrate, Heads terminal, Calyxes with 8 teeth  
 8370 Leaves obl. toothed pubes. beneath, Whorls many-fl. globose, Cal. incurv. 8-toothed, upper tooth longest  
 8371 Leaves ovate serrated hoary, Invol. subulate, Cal. obliquely truncate membranous 9-toothed  
 8372 Invol. linear, Cal. 1-lipped oblique, Leaves ovate hairy  
 8373 Lvs. lanc. smooth serrated at end, Stem 4-cornered rough, Whorls many-fl. Lip of cor. undivided

8374 Leaves cordate acute serrated somewhat downy, Calyx 7-toothed awned; upper tooth largest  
 8375 Leaves lanceolate serrate, Calyxes 10-cornered 10-toothed unarmed  
 8376 Leaves small ovate blunt somewhat downy crenate, Cal. 7-toothed awned  
 8377 Leaves stalked ovate cordate acuminate cut-toothed, Cal. velvety 10-toothed

8378 Cal. 2-lipp. upper lip lanc. mucron. longest, lower round. 7-tooth. Teeth spiny, Lvs. stalk. ov. deeply tooth.  
 8379 Cal. campanulate 5-toothed, Teeth equal pointless, Leaves stalked roundish ovate toothed  
 8380 Cal. funnel-shaped 5-toothed: teeth equal mucronate, Leaves sessile wedge-shaped oblong toothed

8381 Heads whorled, Bractes setaceous hispid, Leaves hairy above remotely toothed, Stem simple  
 8382 Heads terminal, Bractes setaceous hispid, Leaves smooth above nearly entire

8383 Leaves oblong-ovate acute subserrate hoary, Heads compound, Bractes setaceous, Stamens exerted  
 8384 Leaves lanceolate ovate subserrate on short stalks somewhat hoary, Heads sessile, Bractes awned  
 8385 Stem much branched rather rough, Leaves linear 3-nerved entire, Heads terminal fascicled

8386 Stem much branched roughish, Lv. lin. lanceolate veiny entire, Heads terminal fascicled corymbose

8387 Leaves concave downy, Spikes naked  
 8388 Lower leaves downy, Spikes nodding  
 8389 Leaves all smooth, Spikes nodding  
 8390 Spikes 4-cornered, Bractes roundish very large  
 8391 Spikes aggregate long prismatic upright, Bractes membranous twice as long as calyx

and Miscellaneous Particulars.

plants, known at the Cape by the name of lion's tail. They require a good greenhouse and plenty of air to secure their appearing in perfection. In places badly ventilated their leaves acquire a yellow color, and are apt to fall off.

1271. *Motucella*. Brought from the Moluccas. Plants remarkable for the enlarged calyx in which the flower is seated.

1272. *Clinopodium*. From  $\alpha\lambda\eta\eta$ , bed, and  $\pi\upsilon\sigma$ , a foot. The tufted close whorls of flowers have been compared to the caster of a bed's foot.

1273. *Pycnanthemum*. From  $\pi\upsilon\kappa\alpha\upsilon\sigma$ , dense, and  $\alpha\upsilon\delta\omicron\varsigma$ , a flower. The blossoms are in a close head. A North American genus of plants, some of which, as *P. verticillatum* and *incanum*, are occasionally seen in gardens.

1274. *Origanum*. From  $\omicron\omicron\epsilon\sigma$ , a mountain, and  $\gamma\alpha\upsilon\epsilon\sigma$ , joy. These plants, with their pretty spikes of bracted flowers and agreeable perfume, may indeed be called the joy of the places where they grow naturally. *O. vulgare* is an aromatic and ornamental plant, growing wild in thickets and hedges, chiefly in a calcareous soil. The dried leaves used instead of tea, are said to be exceeding grateful; they are also used in fomentations: the essential oil is so acrid, that it may be considered as a caustic, and is much used with that intention by

History, Use, Propagation, Culture,

farriers; a little cotton moistened with it, and put into the hollow of an aching tooth, frequently relieves the pain. The country people use the tops to dye woollen cloth purple. It also dyes linen of a reddish brown color. For this purpose the linen is first macerated in alum water and dried; it is then soaked for two days in a decoction of the bark of the crab-tree; it is then wrung out of this, boiled in a ley of ashes, and then suffered to boil in the decoction. According to the Swedish experiments, goats and sheep eat it, horses are not fond of it, and kine refuse it.

O. onites and marjorana are culinary aromatics; the latter being principally in use under the name of knotted marjoram, from the flower coming in whorls at the joints. O. vulgare and marjorana are both retained in the *Materia Medica* as tonics and stomachics, though scarcely ever used. In quack medicines, the leaves dried and powdered form an ingredient in cephalic snuff. Marjorana is so called from *marjamic* (*māryamyich*), its Arabic name, according to Forskahl, p. 59.

1275. *Thymus*. From *θυμος*, courage, on account of its balsamic smell, which revives the spirits of animals. *T. serpyllum*, from *σέρπω*, to creep, is fragrant, and yields an essential oil that is very heating. It has the same sensible qualities as garden thyme, but the flavor is milder, and rather more grateful. Its essential oil is both smaller in quantity and less acrid, and its spirituous extract comes greatly short of the penetrating warmth and pungency of the other. It is a common notion that the flesh of sheep that feed upon aromatic plants, particularly wild thyme, is superior in flavor to other mutton. The truth is, that sheep do not crop

- 8392 Leaves ovate acute serrated, Spikes clustered in umbels  
 8393 Spikes on long stalks aggregate, Bractes the length of calyx  
 8394 Spikes roundish panicled clustered, Bractes longer than calyx ovate colored  
 8395 Spikes oblong aggregate hairy, Leaves cordate downy  
 8396 Leaves stalked ovate pubesc. Spikes clustered prismatical, Bractes imbricate ovate smooth ciliated at edge  
 8397 Leaves stalked ovate acute subserrate hairy, Spikes prismatical, Bractes dense ovate acute  
 8398 Leaves subsessile ovate acute subserrate hairy, Spikes oblong bluntish  
 8399 Spikes roundish thin compact stalked, Leaves stalked ellipt. blunt smoothish  
 8400 Spikes roundish several clustered stalked, Leaves stalked ellipt. blunt downy

- 8401 Flowers capitate, Stems decumbent, Leaves flat blunt ciliated at base  
 8402 Flowers capitate, Stems creeping hairy, Leaves blunt villous  
 8403 Leaves ovate smooth with the smell of common balm  
 8404 Flowers capitate, Stems procumbent, Leaves cuneate linear ciliated at base  
 8405 Erect, Leaves revolute ovate, Flowers in whorled spikes  
 8406 Leaves oblong more ciliated than in *T. serpyllum*, Cor. with a more obscure spot in the orifice  
 8407 Stem shrubby, Flowers in whorled spikes, Lvs. linear lanc. bluish flat about 3-nerved ciliated at base  
 8408 Erect, Leaves revolute linear-lanc. hairy, Head few-flowered axillary stalked  
 8409 Flowers capitate, Stems creeping, Leaves linear nerved and furrowed beneath, Bractes ovate  
 8410 Fl. whorled somew. spiked, Ped. 1-f. Stem shrubby erect, Lvs. ellipt. entire acute smooth shining above  
 8411 Flowers in whorled spikes, Cal. woolly with very long setaceous segments  
 8412 Flowers in whorled spikes, Spikes oblique, Ped. 1-f. Lvs. ov. obtuse very entire and calyxes nearly naked  
 8413 Flowers in whorled heads, Stems filiform, Leaves roundish flat hairy nerved ciliate at base  
 8414 Flowers in whorled spikes, Cal. woolly with setaceous teeth, Lvs. ellipt. entire downy on each side  
 8415 Flowers in whorled spikes, Stem erect, Lvs. linear very blunt nerveless revolute at edge ciliated at base  
 8416 Pedun. about 3-f. axillary, Lvs. ovate blunt nerved entire sess. Cor. twice as long as calyx, Stem villous  
 8417 Heads laxly imbricated, Bractes broad ovate colored not dotted, Leaves linear entire  
 8418 Heads imbricated large, Bractes toothed, Leaves setaceous hairy  
 8419 Flowers whorled, Stem half-shrubby erect, Leaves hispid acuminate  
 8420 Flowers axillary subsolitary stalked, Leaves cordate acute entire, Stems filiform

8421 Stem erect branched at base, Leaves ovate acute serrated forwards, Whorls 6-flowered

- 8422 Hirsute villous larger than the last, Stem much branched, Leaves ovate  
 8423 Whorls 6-f. Leaves nearly blunt roundish concave subserrated  
 8424 Nearly smooth, Whorls 6-10-f. Leaves ovate subserrate, Stem ascending  
 8425 Fls. whorled, Pedunc. 1-flow. Stem branched spreading, Leaves roundish acute subserrate at end hairy

8426 Pedun. axill. 3-4-f. Bractes lanc. sessile, Leaves ovate acute finely serrated  
 8427 Leaves rhomboid oval obsolete toothed upwards, Whorls somewhat stalked about 10-f. shorter than leaf

- 8428 Stem weak, Pedun. axill. many-f. dichotomous, Lvs. ovate blunt serrated hairy dotted  
 8429 Pedunc. axill. many-f. in dichotomous corymbs, Lvs. ovate blunt subserrate smoothish  
 8430 Leaves ovate somewhat toothed glaucous, Pedunc. axill. dichotomous, Segm. of calyx equal  
 8431 Racemes terminal, Peduncles solitary very short  
 8432 Branches thin twiggy, Leaves downy beneath

- 8433 Villous, Leaves cordate crenate-toothed, Branches axillary elongated flowering  
 8434 Whorls halved subsessile, Bractes oblong stalked, Leaves ovate acute serrated

and Miscellaneous Particulars.

these aromatic plants, unless now and then by accident, or when they are first turned on hungry to downs, heaths, or commons; but the soil and situations favorable to aromatic plants produce a short sweet pasturage best adapted to feeding sheep, whom nature designed for mountains, and not for turnip grounds and rich meadows. The attachment of bees to this and other aromatic plants is well known.

Few plants are subject to more varieties than wild thyme. In its most natural state, on dry exposed downs, it is small and procumbent; but when it grows among furze or other plants, it runs up with a slender stalk to a foot or more in height. It differs also very much in the smoothness or hairiness of its leaves. The flowers are sometimes larger than ordinary, and of a paler purple color, or even white.

*T. vulgaris* has the aromatic qualities common to lavender, sage, rosemary, and other Verticillatae. It yields a species of camphor in distillation with water. In Spain they infuse it in the pickle with which they preserve their olives. Before the oriental spices were common, it was much used in cookery.

1276. *Acynos*. The Greek name of a balsamic plant, which probably was related to *Thymus*. This genus was included in *Thymus* by Linnæus.

1277. *Calamintha*. From *καλος*, beautiful, and *μινθη*, mint. An ancient Greek name of a plant supposed to chase away serpents.

1278. *Melissa*. This is the Greek name of the bee, from *μελι*, honey, which is sought by bees in these flowers with avidity, as indeed it is in all the plants of the order. The recent plant has the agreeable odor of

History, Use, Propagation, Culture,

lemons, which is lost in drying, and an austere, slightly aromatic taste. In distillation with water, it yields a small portion of a yellow essential oil, on which its odor depends. It is stomachic and diuretic, and was formerly prized as a corroborant in hypochondriacal and nervous affections; but it is now used only in the form of tea, as a grateful diluent in fevers. For medicinal use the herb should be cut before it flowers, as it is then more odorous. (*London Dispensatory*, 383.)

1279. *Dracocephalum*. From *δρακων*, a dragon, and *κεφαλη*, a head. A name applied in the same sense as *Lamium*, *Galeopsis*, &c. See those genera. Most of the species are plants of ornament, and cultivated as such in the gardens of the curious. *D. canariense* smells of citron, especially when rubbed between the fingers. Sown on a hot-bed early in spring, it may be planted out in the borders like other tender annuals. *D. austriacum* is a handsome plant for a flower border.

- 8435 Smooth, Flowers spiked close, Leaves linear lanceolate serrated  
 8436 Flowers spiked remote, Leaves obovate lanceolate toothletted upwards  
 8437 Spikes short 4-cornered, Corolla variegated, Leaves oblong toothletted upwards  
 8438 Flowers spiked, Leaves ternate oblong  
 8439 Fl. somewhat spiked, Lvs. roundish cuneiform sinuate-toothed, Upper lip of cal. undivided mucronate  
 8440 Fl. somewhat spiked, Leaves lanceolate remotely mucronate toothed, Bractes lin. lanc. toothed spiny  
 8441 Fls. spiked, Lvs. sessile linear mucronate, Cauline 3-5-parted at base, Stem branched somewhat villous  
 8442 Flowers spiked, Leaves and bractes lanceolate undivided pointless, Stem nearly simple smooth  
 8443 Fls. whorled, Lvs. obl. blunt toothed stalked, Bractes lanc. entire, Upper lip of cal. ellipt. blunt undivided  
 8444 Fls. whorled, Rad. lvs. cord. ov.; cauline sessile roundish wedge-shaped acutely toothed, Teeth of cal. equal  
 8445 Flowers whorled, Whorls stalked bifid one-sided, Leaves lanc. cordate acum. serrated smooth  
 8446 Flowers whorled, Bractes lanceolate deeply toothed dotted beneath, Lower serratures subciliated
- 8447 Flowers whorled, Bractes oblong ciliated, Cal. striated pubescent, Tube of cor. longer than calyx  
 8448 Flowers whorled, Bractes orbicular serrate ciliate  
 8449 Stem erect, Leaves linear lanceolate blunt entire at edge rough, Two upper teeth of calyx largest  
 8450 Leaves broad-lanceolate finely serrated entire at base, Lower teeth of calyx longest  
 8451 Flowers in spiked heads, Leaves roundish pinnatifid crenate downy on each side  
 8452 Flowers whorled, Bractes oblong ovate entire, Cor. twice as long as calyx nodding  
 8453 Flowers whorled, Bractes oblong entire, Cor. scarcely larger than calyx

8454 Leaves opposite ovate toothed, Calyx 3-lobed hairy

8455 Cal. 4-lobed smooth, Cor. yellowish white, Segment of lower lip violet in the middle

- 8456 Flowers in paniced fascicles, Stem much branched  
 8457 Racemes paniced, Leaves ovate oblong cuneate at base acutely serrated hoary beneath  
 8458 Racemes paniced, Leaves ovate cuneate at base bluntly serrated, Veins hairy above rough beneath  
 8459 Stamens toothless, every other one bearded at base  
 8460 Stem  $\frac{1}{2}$  shrubby, Leaves lanceolate ovate subtomentose, Racemes rounded  
 8461 Stem shrubby, Leaves ovate serrate, Stamens very long  
 8462 Leaves ovate smooth, Calyxes ciliated  
 8463 Leaves ovate entire  
 8464 Leaves somewhat oblong blunt serrated wavy, Stem hairy, Bractes cordate  
 8465 Leaves ovate oblong, Foot-stalks, bractes and calyxes ciliated  
 8466 Leaves sublanceolate acuminate subserrate, Racemes rounded, Stem nearly herbaceous  
 8467 Leaves ovate-oblong serrated, Bractes cordate reflexed concave, Spikes filiform  
 8468 Cor. 4-fid, Racemes leafless nodding at end  
 8469 Leaves linear lanceolate serrate [than calyx  
 8470 Lvs. broad ovate acum. at each end serr. Bractes shorter than cal. winged at edge, Cor. scarcely longer  
 8471 Leaves ovate cordate acute serrated rugose, Recesses closed, Bractes roundish wedge-shaped  
 8472 Leaves ovate, Flowers aggregate, Footstalks lateral  
 8473 Downy, Lvs. ovate lanceolate crenate stalked, Whorls terminal racemose, Corolla the length of calyx  
 8474 Leaves oblong elliptical serrated hoary on long stalks, Stamens twice as long as corolla  
 8475 Like *Ocimum polystachyon*, but not having a musky scent as that has

- 8476 Nectary spurred, Racemes compound, Pedunc. 3-parted, Stem shrubby polished  
 8477 Nectary gibbous, Racemes leafless, Stem nearly equal  
 8478 Nectary gibbous, Racemes compound, Pedunc. 1-flowered whorled, Stem half shrubby nearly smooth  
 8479 Cor. falcate, Flower-stalks branched

- 8480 Nectary gibbous, Flowers spiked, Stem herbaceous hairy rufous dotted  
 8481 Flowers whorled sessile, Lower lip of calyx 4-parted, Bractes cordate acuminate  
 8482 Stem 6-angled, Leaves ternate stalked ovate crenate rugose, Roots tuberous  
 8483 Leaves stalked cordate crenate hairy, Bractes nearly equal to flower ovate

and Miscellaneous Particulars.

1280. *Melittis*. A name with the same meaning as *Melissa*.

1281. *Ocimum*. Said by Mathiolus to be derived from  $\xi\omega\sigma$ , to smell, on account of the powerful scent of the plants. *O. gratissimum* is cultivated in China for culinary purposes. *O. Basilicum* ( $\beta\alpha\sigma\iota\lambda\iota\kappa\omicron\varsigma$ , royal) and *minimum*, are culinary aromatics much used in French cookery. There are several varieties of the *basilicum*, which with some other species were formerly used in medicine, but are now neglected.

1282. *Plectranthus*. From  $\pi\lambda\eta\kappa\tau\epsilon\omicron\nu$ , a cock's spur, and  $\alpha\theta\upsilon\sigma$ , a flower; the corolla of the original species of the genus being terminated by a spur-like appendage. Half-shrubby plants with purple flowers, all natives of hot climates.

History, Use, Propagation, Culture,

1283. *Trichostema*. From *θηξ* *τηξ*, hair, and *σθημα*, a stamen, because its long slender stamens resemble hairs.

1284. *Prostanthera*. Named in allusion to the spurs of the anthers, the word being derived from *προσθηνη*, an appendage, and *ανθηρα*, the anther. Strong smelling shrubs, natives of New Holland. Flowers either racemose or terminal.

1285. *Scutellaria*. From *scutella*, a small vessel, on account of the figure of the calyx, which is not unlike a cup with its handle. The calyx inverted, presents the figure of a helmet with visor raised.

1286. *Prunella*. A barbarous name softened down by Linnæus from the Brunella of some authors, and so called from the German *die Bräune*, a disorder in the jaws and throat, which this plant is said to cure. Herbaceous plants common by way-sides all over Europe.

8484 Stamens very long exserted, Leaves linear  
8485 Stamens short included

8486 Leaves lanceolate tooth-serrated smooth, Racemes panicle, Corolla hairy

8487 Leaves cut downy beneath, Spikes rounded 4-cornered  
8488 Leaves cordate cut crenate pubescent on each side shorter than footstalk, Spikes short 4-cornered  
8489 Leaves subcordate serrate rugose opaque, Spikes 1-sided, Bractes ovate  
8490 Leaves cordate cut serrate crenated, Spikes imbricated rounded 4-cornered, Bractes twice as short as fl.  
8491 Leaves cordate cut serrate acute smooth, Spikes imbricated rounded 4-cornered, Bractes length of flower  
8492 Much branched, Leaves smooth with a scabrous keel, Racemes lateral leafy  
8493 Hairy, Leaves ovate rhomboid crenate, Flowers subracemose  
8494 Leaves cordate lanceolate crenate, Flowers axillary  
8495 Leaves cordate ovate nearly entire, Flowers axillary  
8496 Leaves quite entire, lower hastate, upper sagittate, Flowers axillary  
8497 Branched very smooth, Leaves stalked linear lanceolate acute entire, Racemes loose leafy, Cal. blunt  
8498 Simple densely pubes. Lvs. subsess. obl. or linear blunt entire attenuated at base, Racemes loosish leafy  
8499 Branched tall pubescent, Leaves ovate acuminate serrate on short stalks, Racemes usually panicle  
8500 Leaves cordate ovate crenate, Flowers solitary axillary, Each lip of cor. trifid  
8501 Leaves cordate serrate, Spikes elongated 1-sided, Bractes stalked ovate longer than calyx  
8502 Leaves oblong cordate serrate pubes. Spikes elongated 1-sided, Bractes stalked ovate shorter than calyx  
8503 Leaves cordate oblong acuminate serrate, Spikes nearly naked  
8504 Villous, Leaves cordate blunt and bluntly serrated, Spikes imbricated, Bractes setaceous  
8505 Subvillous, Leaves ovate entire all alike, Flowers axillary  
8506 Related to *S. albidra* from which it differs in being much less hairy, and in its more slender flower  
8507 Lvs. cord. cren. serrate bluntnish villous, Spikes long 1-sided hispid, Bractes stalked ovate longer than cal.

8508 Lvs. stalked obl. ovate somew. toothed, Upper lip of cor. trunc. with 3 awns, Stem ascending, Spike round

8509 Leaves broad ovate toothed, Stem much branched, Spikes ovate  
8510 Lvs. stalked ovate lanc. toothed at base, Lips of cal. equal: upper truncate with 3 awns, Stem ascending  
8511 Leaves sessile lanceolate entire rough, Stem erect  
8512 Leaves stalked oblong ovate toothed at base, Upper lip of cor. trifid, Stem ascending  
8513 Small, Stem nearly simple villous, Leaves pinnatifid lower oblong, Cor. pale yellow  
8514 Leaves entire and sinuate toothed rugose hairy, Upper lip of cor. truncate slightly 3-toothed  
8515 Upper leaves linear-lanceolate: lower sinuate toothed somewhat hairy

8516 Bractes laciniate

8517 Leaves ovate oblong serrated  
8518 Leaves ovate with a double crenature on each side

8519 Leaves stalked ovate serrated, Spikes terminal long

### ANGIOSPERMIA.

8520 Leaves lanceolate ovate serrated somewhat stalked terminal, Pedunc. 3-f. shorter than leaves  
8521 Leaves ovate lanceolate crenate hairy, Peduncles lateral very long bearing corymbs  
8522 All vill. Branches rounded, Lvs. opp. obl. ovate cren. Ped. 2-4 axill. 1-f. aggregate, Cor. clavate cylind.  
8523 All pubes. Lvs. opp. ovate ellipt. cord. at base serr. cren. Panicle numer. opp. spread. dist. Ped. corymb.  
8524 All pubes. Lvs. oval lanc. velvety above, Panicle leafy, Fl. with a campan. inflated orifice, Limb oblique  
8525 Leaves opposite ovate crenulate tomentose, Flowers axillary 2-3 together downy

8526 Leaves oblong cordate crenate rugose, Stem spotted  
8527 Leaves hoary ellipt. or oblong crenate, Pedunc. erect longer than flower, Sepals angular acuminate

and Miscellaneous Particulars.

1287. *Cleonia*. An ancient Greek name employed by Theophrastus, *lib. 7. cap. 4.*: the *Cleoniaeum* of Pliny. This is an annual plant six or eight inches high, and nearly related to *Prunella*, from which some eminent French botanists do not distinguish it.

1288. *Prasium*. The Greek name of the horehound, which this plant resembles in some respects.

1289. *Phryma*. A Linnæan name, the meaning of which is unknown.

1290. *Gesneria*. In honor of Conrad Gesner, of Zurich, the famous botanist and natural historian, called the German Pliny. Very fine herbaceous or half-shrubby plants, some of which are remarkable for the brilliancy of their colors.

1291. *Gloxinia*. In memory of Ben. Petr. Gloxin, of Colmar, author of *Observationes Botanicae*, Argent,

History, Use, Propagation, Culture.

1785, quarto. Handsome low herbaceous plants, with fine showy flowers. The *Gloxinia speciosa* is a favorite in every hothouse, on account of the beauty of its rich purple blossoms.

1292. *Linnaea*. So named by Gronovius, in honor of the celebrated Carl von Linné, the reformer of natural history, and the father of the modern physical sciences. His works are not less numerous than important; it is to be wished that such another man, with equal talent, industry, and judgment, could be found at the present day, to rescue the science of natural history from the confusion to which it is fast approaching.

1293. *Melianthus*. From *melis*, honey, and *anthos*, flower. A shrub, native of the Cape of Good Hope, the blossoms of which are a great attraction to bees. Both the known species are common in collections, but seldom flower.

1294. *Bigonia*. In memory of Abbé Bignon, librarian to Louis XIV., born 1662, died in 1743. He was the friend and patron of most of the learned men of his time, and especially of Tournefort, by whom this truly noble genus was named. The species are trees or shrubs, inhabitants of hot climates: the leaves are opposite, pinnate, ternate, or conjugate: the flowers in panicles, large, and handsome, of various colors, red, blue, yellow, or white, and eminently beautiful. The stove sorts grow freely in loam and peat, and young cuttings root in sand under a hand-glass. The hardy species grow in any soil, but will not flower well unless the situation be warm. They are increased by cuttings of the roots, by layers, or by young cuttings on gentle heat under a hand-glass or frame. B. radicans is a well known and much admired species, capable of living in the open air in this country against a wall.

1295. *Jacaranda*. The name of the tree in Brazil. Two kinds remarkable for the goodness of their wood, are described by Piso. Those in the gardens are lofty stove plants with fern-like, elegant leaves, and panicles of beautiful blue flowers. They grow with facility, but flower seldom.

8528 The only species

8529 Stipules solitary adhering to stalk, Leaves smooth  
8530 Stipules twin distinct, Leaves hoary beneath

8531 Leaves conjugate cirrhose, Leaflets ovate acuminate, Peduncles axillary 1-flowered.  
8532 Leaves conjugate cirrhose, Leaflets ovate-lanceolate, Pedunc. 2-flowered, Pods linear

8533 Leaves conjugate, Leaflets elliptical entire coriaceous, Pedunc. 5-flowered axillary, Calyx entire  
8534 Lvs. conjugate obl. smooth, Racemes term. Branches dichotomous, Corollas very soft and downy outside  
8535 Leaves conjugate cordate ovate, Flowers racemose, Calyx with a double limb  
8536 Leaves conjugate cirrhose : lower ternate, Leaflets ovate cord. acuminate, Racem. axill. Stem mucronated  
8537 Leaves conjugate quite smooth, Tendrils longer than petiole trifid at end hooked  
8538 Leaves conjugate cirrhose, Leaflets cordate lanceolate, Lower leaves simple  
8539 Leaves conjugate cirrhose, Leaflets cordate ovate downy beneath  
8540 Leaves conjugate cirrhose, Leaflets elliptical blunt, Flowers racemose, Pedunc. 3-fl. Calyxes toothed  
8541 Leaves conjugate cordate ovate smooth, Lower racemes leafy, Limb of calyx leafy entire  
8542 Leaflets 9-lanceolate subserate dotted beneath, Corollas ventricose bearded in the orifice  
8543 Lvs. conjugate cirrhose, Leaf. obl. acute at each end, Corymb trifid term. Ped. petioles and branches rough  
8544 Climbing, Lvs. smooth upper conjugate cirrhose obl. ovate acumin. Peduncles corymbose many-flowered  
8545 Lower leaves ternate, upper conjugate, Petioles dichotomous cirrhose, Fruit echinate  
8546 Leaves ternate smooth, Leaflets ovate acuminate, Stem shrubby erect  
8547 Leaves digitate, Leaflets entire obovate  
8548 Leaves digitate, Leaflets lanceolate acuminate entire smooth, Flowers terminal solitary  
8549 Lvs. pinnate, Leaflets ovate acuminate toothed, Corymb terminal, Tube of cor. thrice as long as calyx

8550 Leaves pinnate, Leaflets ovate acuminate toothed, Panicle terminal, Tube of cor. the length of calyx  
8551 Leaves pinnate, Leaflets oblong lanceolate serrate, Raceme simple terminal, Stem erect  
8552 Leaves pinnate with an odd one, Leaflets ovate entire pubescent, Corollas bearded half pentandrous  
8553 Leaves pinnate with an odd one, Leaflets ovate hirsute, Cal. 1-leaved spathaceous, Cor. hypocrateriform

8554 Leaves pinnate of four pair, Leaflets elliptical generally entire, Racemes compound  
8555 Leaves bipinnate, Leaflets oblong lanceolate acuminate, Fl. pentandrous, Calyx tubular, Cor. 5-fid  
8556 Leaves bipinnate, Leaflets oblong obtuse, Panicle terminal, Peduncles with bractes, Pods oblong blunt  
8557 Leaves simple linear acuminate, Flowers terminal subumbellate, Stem erect

8558 Leaves bipinnate, Leaflets lanceolate acute, Panicle terminal, Peduncle naked, Pods long emarginate  
8559 Leaves bipinnate oblong villous oval oblong mucronate, Panicle large lax branched, Corollas silky

8560 Leaves ovate oblong entire

8561 Leaves ovate lanceolate : lower 3-lobed ; upper undivided, Stem erect

8562 Stem smooth, Sterile filament bearded upwards, Leaves lanceolate acuminate all finely serrate

8563 Leaves polished ovate-oblong amplexicaul finely toothletted, lower entire, Flowers paniced

8564 Leaves serrulate lanceolate oblong sessile downy obscurely toothed narrow, Flowers paniced

and Miscellaneous Particulars.

1296. *Sesamum*. From the Arabic word *semsem*. Forskahl, p. 68. These plants were introduced into Jamaica by the Jews, and are now cultivated in most parts of the island. They are called *vunglo* or oil-plant. The seeds are frequently used in broths by many of the Europeans, but the Jews make them chiefly into cakes. Many of the oriental nations look upon the seed as a hearty wholesome food, and express an oil from them, not unlike, or inferior to, the oil of almonds. It has been also manufactured for salad oil in this country, but without much success.

*S. orientale* is frequently cultivated in the Levant, and also in Africa, as a pulse: the seeds have been introduced in Carolina by the African negroes. An oil is extracted from the seeds which will keep many years, and not acquire any rancid smell or taste, but in two years become quite mild, so that when the warm taste of the seed, which is in the oil when first drawn, is worn off, it is used as salad oil, and for all the purposes of sweet oil.

The seeds are also used by the negroes for food: they parch them over the fire, then mix them with water, and stew other ingredients with them. A pudding is made with them, in the same manner as with millet or rice.

In Japan, China and Cochinchina, where they have no butter, they use the oil for frying fish, and in dressing other dishes; as a varnish; and medicinally as a resolvent and emollient. Nine pounds of the seed yield upwards of two pounds of neat oil.

1297. *Pentstemon*. From *πεντα*, five, and *σταμον*, a stamen, because of the four perfect and one imperfect stamen of the genus. Beautiful herbaceous plants, deserving a place in every garden.

History, Use, Propagation, Culture,

1298. *Chelone*. *Xelovm* signifies a tortoise, to the back of which the helmet of the present genus has been fancifully compared. The species are handsome border flowers, of easy culture in loamy soil, or loam and a little peat.

1299. *Tourrettia*. Named in honor of Marc Antoine Louis Claud la Tourrette, to whom some of Rousseau's Letters on Botany are addressed. A singular climbing annual plant, producing its flowers sparingly from the tips of the branches. Seldom preserved long in a garden, as it produces seed very sparingly.

1300. *Martynia*. In honor of John Martyn, F. R. S., professor of botany at Cambridge, author of *Historia Plantarum Rariorum*, and many other works: died in January, 1768. His son is the editor of the last edition of Miller's Dictionary. Handsome tropical annuals, remarkable for the size of their flowers compared with their leaves.

1301. *Acanthus*. From *ακανθα*, a spine: many of the kinds are very spiny. The species are generally large, with a single herbaceous stalk, and great pinnatifid leaves. The flowers are produced in terminating spikes. Some of the species are shrubby and thorny, with undivided leaves, toothed, and having a thorn at the end of the teeth.

*A. mollis* was formerly used in medicine under the name of *Branca ursina*: the root abounds in mucilage, and may be substituted for those of the marsh mallow. Virgil has two very different plants under the name of *Acanthus*: one a tree, supposed to be the *Mimosa nilotica*, which produces the gum Arabic; the other an

8565 Stem pubescent, Sterile filament bearded from the end to the middle  
 8566 Leaves oblong acute subhirsute, Flowers racemose, Leaves of calyx linear very hairy  
 8567 Stem smooth long linear entire, Flowers in racemose panicles, Leaves of calyx smooth  
 8568 Stem and lvs. smooth, Lvs. subamplex. ovate obl. ent. Barren flam. naked clav. Sepals roundish acuminate  
 8569 Very smooth, Lvs. subamplexicaul. ov. obl. ent. upper roundish, Barren flam. with a short beard at end  
 8570 Leaves ovate lanc. subserrulate smooth, Fl. fascicled axillary and terminal, Cor. equal 5-cleft spreading

8571 Leaves stalked lanceolate serrate : upper opposite  
 8572 Leaves lanceolate oblique stalked opposite finely serrated at edge  
 8573 Smooth much branched, Leaves stalked cordate ovate serrated, Spikes terminal dense  
 8574 Leaves opposite connate lanceolate entire, Lower lip of corolla bearded

8575 The only species. Leaves pinnated cut cirrhose

8576 Stem branched, Leaves opposite cordate toothed, Flowers diandrous  
 8577 Stem branched, Leaves opposite 5-toothed  
 8578 Stem branched, Leaves alternate cordate entire  
 8579 Stem simple, Leaves roundish repand, Tube of cor. at base gibbous flattened

8580 Leaves sinuated unarmed  
 8581 Leaves sinuated unarmed glabrous shining green  
 8582 Leaves pinnated spiny  
 8583 Leaves lacinate pinnatifid blistered spiny, Spines white  
 8584 Leaves repand spiny-toothed, Stem shrubby prickly

8585 Spines of whorls 6, Leaves ensiform very long rough  
 8586 Spines axillary pedate in fours, Leaves quite entire lanceolate ovate  
 8587 Spines axillary opposite solitary, Leaves roundish entire  
 8588 Unarmed, Leaves lanceolate, Flowers axillary solitary sessile  
 8589 Leaves ovate lanceolate rough, Flowers capitate terminal, Bractæe ciliate  
 8590 Leaves oblong entire, Two lateral leaves of calyx ciliated wider than the rest; two linear acute  
 8591 Unarmed, Leaves lanceolate hairy entire, Fl. aggregate terminal tubular, Bractes very narrow setose  
 8592 Unarmed, Leaves ovate silky, Bractes cordate scarious, Corollas very long

8593 Leaves lanceolate on long stalks, Flowers in terminal and axillary heads, Cor. small

8594 Leaves sessile oblong entire acute at each end villous, Fl. 3-subsessile, Stem ascending  
 8595 Leaves stalked ovate entire, Peduncles 3-flowered very short, Stem erect  
 8596 Subvillous, Stem dwarf branched erect, Leaves ovate concave entire  
 8597 Leaves stalked ovate very blunt entire pubescent, Flowers 3 subsessile, Stem erect divaricating  
 8598 Lvs. stalked obl. ovate ciliated somewhat toothed, Pedunc. very short about 3-fl. Stem very villous erect  
 8599 Leaves stalked oblong blunt attenuated at base somewhat toothed, Pedunc. 3-fl. shorter than leaf  
 8600 Leaves entire, Peduncles dichotomous lateral, Calyxes sessile, with the upper segment largest  
 8601 Leaves cuneate ovate crenated, Peduncles 3-parted, Stem simple  
 8602 Flowers twin sessile  
 8603 Leaves stalked entire ovate downy, Pedunc. axillary alternate few-flow. very long

and Miscellaneous Particulars.

herb, supposed to be this plant. Pliny mentions an *Acanthus* which covered part of his lawn, which some conjecture to be a moss, a thing very improbable in a climate and situation where the musci are seldom seen even in winter.

The leaf of *Acanthus mollis* is supposed to have furnished the ancients with the elegant *Acanthus* leaf of their architecture.

1302. *Barleria*. In honor of the Rev. James Barrelier, a Dominican, and M. D. of Paris, who travelled from France into Spain and Italy, and died aged sixty-eight, 1673; author of *Icones*, 1714, Paris, folio, a useful work, containing, even at the present day, figures of many things which are to be found nowhere else. The species flower freely and are of easy culture: loam and peat, with a little rotten dung mixed with it, is the best soil for them. Cuttings root freely; they strike best from the young wood, under a hand-glass, in the same kind of soil as the plants grow in. (*Bot. Cult.* 21.)

1303. *Phyloopsis*. Named by Willdenow, from *φωλος*, vile or contemptible, and *οψις*, aspect. Tropical weeds.

1304. *Ruellia*. In honor of John Ruelle, a native of Soissons, the physician of Francis I. He published a work *De Natura Plantarum*, in 1536, and *Commentaries upon Dioscorides*, in 1516. The species are pretty plants, free flowers, and of the easiest culture and propagation.

History, Use, Propagation, Culture,

1305. *Blechnum*. Βληχον, was the Greek name of a plant resembling Marjoram. This genus has also the flowers in a dense bracted spike. It has been separated from *Justicia* by Jussieu.

1306. *Aphelandra*. From ἀφελανης, simple, and ανη, a male, on account of the single cell of the anthers.

1307. *Crossandra*. From κροσος, a fringe, and ανη, a man; or, in botanical language, an anther, alluding to the fringed anthers. A fine showy shrub with large orange flowers.

1308. *Thunbergia*. In honor of Charles Peter Thunberg, M. D., knight of the order of Vasa, professor of botany in the university of Upsal, member of several learned societies; author of *Travels into Europe, Africa and Asia*; *Flor. Japonica*, &c. Handsome climbing flowers with a fragrant odor.

1309. *Hebenstreitia*. John Ernest Hebenstreit, was a professor of botany in the university of Leipsig, and published, in 1728, a dissertation upon plants. Small Cape undershrubs, occasionally cultivated for the sake of their neat foliage and simple modest flowers. They require an airy greenhouse, and are easily propagated from cuttings.

1310. *Hosta*. After Dr. Nicholas Thomas Host, the author of the superb *Gramina Austriaca*, in four volumes, folio, and other important works. Smith thinks the genus the same as Linnaeus's *Cornutia pyramidata*.

- 8604 Leaves stalked ovate acuminate wavy crenate, Fascicles axillary on long stalks
- 8605 Leaves ovate somewhat toothletted ciliated at edge on long stalks, Flowers solitary axillary sessue
- 8606 Leaves oblong entire, Flowers solitary sessile, Stem procumbent
- 8607 Leaves entire ovate subpubescent, Flowers solitary axillary, Stem erect
- 8608 Leaves ovate lanceolate entire stalked smooth, Fl. solitary axillary sessile, Branches warted
- 8609 Leaves ovate lanceolate acuminate, Peduncles long 2-flowered
- 8610 Leaves stalked oblong wavy, Heads axillary sessile, Stem erect
- 8611 Stem erect hairy, Leaves stalked ovate acuminate repand toothed hairy, Spike whorled

8612 Leaves ovate elliptical somewhat toothed, Spikes 4-cornered, Bractes ovate downy

8613 The only species

8614 The only species

8615 Leaves cordate acuminate somewhat angular at base, Stem climbing

8616 Leaves angular cordate, Inner calyx none, Anthers bearded spurred

8617 Leaves linear toothed, Bractes oval linear hairy

8618 Leaves sessile oblong lanceolate blunt serrated hairy at base, Bractes ciliated

8619 Leaves linear toothed, Spikes smooth

8620 Leaves linear quite entire

8621 Leaves linear toothed, Calyxes 3-valved ciliated

8622 Leaves linear toothed at end, Bractes ovate villous, Stem herbaceous

8623 Leaves lanceolate oblong serrated pilose, Bractes entire ciliated hispid

8624 Leaves cordate somewhat fleshy sessile

8625 Corymbs axillary trichotomous

8626 Spines opposite, Leaves ovate entire

8627 Leaves obovate subtrifid and simple, Prickles nearly straight, those of the stem alternate

8628 Leaves opp. ovate acute hairy, Stem prickly downwards, Heads round, Bractes lanceolate

8629 Leaves 3 or 4-ellipt. rugose above villous beneath, Stem unarmed, Spikes oblong imbricated

8630 Leaves opposite, Stem unarmed, Spikes oblong

8631 Leaves opp. oblong lanc. acute, Stem unarmed, Heads roundish, Bractes ovate-lanceolate and squarrose

8632 Lvs. opp. ov. acute serr. rugose rough hairy ben. Stem nearly unarm. rough, Heads obl. Bractes ovate acute

8633 Leaves opposite, Stem unarmed branched, Flowers in leafless capitate umbels

8634 Leaves opp. or in 3s rhomboid ovate blunt rugose downy, Stem unarmed, Heads squarrose, Bractes ovate

8635 Leaves opposite oval rugose, Stem unarmed, Heads squarrose, Bractes oblong, Pedunc. longer than leaf

8636 Lvs. opp. or in 3s ellipt. rugose, Stem unarmed, Heads squarrose with lanc. bractes, Ped. shorter than leaf

8637 Leaves opp. ovate obl. villous soft, Stem prickly, Spikes hemispherical, Bractes half as short as tube

8638 Lvs. opp. ovate ellipt. rough, Stem prickly, Spikes hemispherical, Bractes half as short as tube lanc. acute

8639 Leaves ovate lanceolate acuminate crenulate, Stem prickly, Head hemispherical, Bractes linear

8640 Leaves ovate subcordate softish beneath, Stem prickly, Bractes of heads linear cuneiform

8641 Lvs. ovate rugose crenate blunt downy running down the foot-stalk, Head depressed shorter than leaf

8642 Leaves opposite ovate rough above hoary beneath, Heads conical, Bractes squarrose ovate acute nerved

8643 Leaves narrowed from an ovate base sessile serrate pubescent, Bractes lanceolate concave

8644 Leaves ovate narrowed into the stalk acuminate acutely crenate pubescent, Outer bractes cordate

8645 Leaves linear lanceolate ternate, Stem shrubby

and Miscellaneous Particulars.

A small shrub rising to the height of four feet. Leaves opposite, ovate, acuminate, somewhat toothed, smooth. Flowers blue, in axillary corymbs, which are shorter than the leaves; they are dotted all over with minute white glandular spots.

1311. *Gmelina*. In honor of John George Gmelin, a German naturalist, professor of medicine and botany at Tubingen, who travelled in Siberia and Kamtschatka, by order of the Empress Anne of Russia. His *Flora Sibirica*, in four quarto volumes, is a book of continual reference. These are fine arborecent Indian plants with beautiful flowers, which are seldom produced in this country. They require the utmost heat of the stove.

1312. *Lantana*. One of the ancient names of the *Viburnum*, which this resembles a little in foliage. The species are rapid growers and free-flowerers, and readily increased by cuttings. They form small bushes with pink, yellow, orange, or changeable heads of flowers, and a peculiar aromatic odor.

1313. *Aloysia*. Named by Don Antonio Palau, professor of botany at Madrid, and author of an excellent translation of the Linnaeus's *Species Plantarum* into Spanish, after her majesty Maria Louisa, queen of Spain, and mother of the reigning king, Ferdinand.

History, Use, Propagation, Culture.

A deciduous under shrub with a most agreeable odor of citrons, and of the easiest culture in any soil. In Jersey and Guernsey, it stands the winter in warm situations.

1314. *Lippia*. Named in honor of Augustine Lippi, a French physician, born in Paris of an Italian family. He accompanied the ill-fated embassy of Lenoir Durole to the king of Abyssinia, in the beginning of the eighteenth century, and was assassinated along with the ambassador at Sennaar. His merits entitled him to a more interesting genus than this, which consists of obscure weedy shrubs of South America.

1315. *Melampyrum*. From *melas*, black, and *arvos*, wheat. Its grain resembles a grain of wheat, and gives a singularly black color to bread in which it is mixed. Smooth narrow-leaved weeds, not uncommon in corn fields and copses. *M. pratense* is considered nutritive, and was formerly cultivated by the Dutch and Flemish in the manner of Spurrey.

1316. *Selago*. This has nothing beyond its name in common with the Selago of the ancients; nor is it possible to imagine what induced Linnaeus to apply it to the present plants, which are pretty half-shrubby Cape plants, with beautiful corymbs or spikes of flowers. Hardy greenhouse plants, propagated with facility by cuttings.

1317. *Vitex*. An ancient name applied to some plant of the osier tribe. *V. Agnus Castus* is an autumn shrub, with whorled spikes of blue and white flowers from seven to fifteen inches long. The dried leaves have a powerfully aromatic odor. The seeds, from the time of Dioscorides and Pliny, have been highly celebrated for securing chastity; hence the absurd official name of the shrub, *Agnus castus*; *αγνος*, in Greek, being the same with *castus* in Latin: and hence the Athenian matrons, in the sacred rites of Ceres, used to strew their

8646 Leaves oblong acute serrate rough above pubescent beneath, Heads globose, Bractes obl. lowest longest

8647 Spikes quadrangular, Bractes cordate compact toothletted imbricated  
8648 Spikes conical lax, Bractes toothed setaceous colored, Teeth of calyx rough, Corolla closed  
8649 Flowers axillary 1-sided, Corollas closed, Leaves lanceolate; floral hastate  
8650 Flowers axillary 1-sided, Corollas gaping, All the leaves lanceolate

8651 Leaves linear acute entire reflexed rigid fleshy smooth, Spikes terminal  
8652 Leaves linear smooth, Spikes terminal, Branches diffuse  
8653 Leaves linear serrate toothed subciliated fleshy, Spikes corymbose  
8654 Spikes terminal, Bractes and calyxes keeled rough, Leaves linear smooth reflexed at edge  
8655 Leaves sessile linear lanceolate acute entire smooth, Spikes terminal solitary  
8656 Spikes corymbose, Leaves linear toothletted  
8657 Corymb multiplex, Leaves obovate smooth serrated  
8658 Leaves obovate entire shining, Spikes rounded terminal, Stem shrubby  
8659 Stem diffuse pubescent upwards, Lvs. lanceolate blunt finely serrate smooth, Spikes terminal subsolitary  
8660 Lvs. rounded with a furrow on each side acutish somewhat toothed smooth fleshy, Spikes term. aggregate  
8661 Spikes come-like ovate terminal, Leaves scattered linear, Stem shrubby  
8662 Spikes terminal, Leaves filiform fascicled smooth  
8663 Leaves filiform fascicled smooth, Panicle compound

8664 Leaves simple ovate  
8665 Leaves ternate entire, Panicle whorled, Berry 3-seeded  
8666 Leaves digitate 7 or 5 lanceolate nearly entire, Spikes whorled paniced

8667 Leaves digitate 5, Leaflets cut-pinnatifid, Spikes somewhat whorled  
8668 Leaves digitate 5, Leaflets stalked oblong entire, Panicle dichotomous, Berry 1-seeded  
8669 Leaves quinate and ternate serrate, Flowers in paniced racemes.  
8670 Lvs. ternate and quinate, Leaf. lanc. acum. ent. beneath white with down, Branches of pan. dichotom.  
8671 Leaves ternate and quinate, Leaflets ovate acute entire hoary beneath, Panicle with a straight rachis

8672 Panicle terminal naked elongated

8673 Spikes ovate, Leaves lanceolate serrated plaited, Stem fruticose  
8674 Spikes roundish conical, Leaves cuneiform toothed, Stem creeping

8675 Spikes lax, Cal. of fruit reflexed roundish didymous hispid

8676 Spikes filiform very long, Cal. of fruit reflexed hispid, Tube of corolla spiral

8677 The only species

8678 Spikes fascicled, Leaves oblong lanceolate stem-clasping, Stem very tall trichotomous at end  
8679 Spikes long acuminate, Leaves hastate  
8680 Spikes filiform paniced, Leaves lanceolate coarsely serrated

and Miscellaneous Particulars.

couches with the leaves. Hence also it has had the affected name of Piper eunuchorum and monachorum. The seeds of the chaste-tree are, however, so far from being thought antiaphrodisiac, that writers of later times have ascribed to them an opposite quality; their aromatic pungency seems to favor this opinion, and Bergius states them to be carminative and emmenagogue. (*Woodville.*)

The fruit of *V. trifolia* is reputed in the eastern countries to be warm, discutient, nervine, cephalic, and emmenagogue; and to be of service in paralysis, weakness, and pains of the limbs. It is in great use among the Indian practitioners, both internally and externally. The plant has a bitter taste, and a strong somewhat aromatic smell.

1318. *Cornutia*. So named after Jacques Cornut, a French physician, who travelled into Canada, and published an account of the plants of that country in 1635. *Cornutia pyramidata* is a shrub with square branches, elliptical ovate entire hoary leaves, and naked pyramidal terminal branches of flowers.

1319. *Zapania*. Named by Scopoli, after Paul Anthony Zappa, an Italian botanist.

1320. *Priva*. A genus of small *Verbena*-like herbaceous plants, with little blue flowers. The derivation of the name is unknown.

1321. *Spielmannia*. In honor of James Reinhold Spielmann, professor of medicine and botany at Strasburg, author of *Prodromus Floræ Argentoratensis*; *Pharmacopœia Generalis*, &c. A shrub of easy culture in any light soil, and cuttings root freely under a glass.

1322. *Verbena*. Said by De Theis, to be derived from *ferfaen*, its name in Celtic. A genus of weedy plants,

History, Use, Propagation, Culture,

with the exception of *Verbena Aubletia* and *Lamberti*. *V. officinalis* was held sacred among the ancients, and used in making leagnes by ambassadors, sacrificial rites, incantations, &c.; and by the moderns as an amulet, and for medical purposes: it is now, however, entirely out of use.

1323. *Avicennia*. Named after Abu Vali Ibn Tsin, commonly called *Avicennes*, a Persian physician, born in 980, died in 1036. His Rules of Medicine were formerly the text-book of physicians, and have occupied the learning and time of many commentators.

1324. *Caldasia*. Named by Willdenow in compliment to Don Josef Caldas, an eminent botanist, native of Popayan, in New Grenada.

1325. *Clerodendrum*. From *κλῆρος*, accident, and *δένδρον*, a tree, in allusion to the various effects in medicine by its various species. *Clerodendrum fortunatum* is useful, *C. calamitosum* and *infortunatum*, dangerous. The species grow freely in light rich soil, composed of half loam, one-fourth of rotten dung, and one-fourth peat. They require a large pot to flower freely, and cuttings root readily under a hand-glass: the younger the shoots the better. The handsomest species are *C. paniculatum* and *C. squamatum*. (*Bot. Cult.* 41.)

*C. inermis* is hardy enough to live in the open air against a wall, but it must have the protection of a mat in winter.

1326. *Volkameria*. Named after John Christopher Volkamer, a German botanist, who died in 1730. John

- 8681 Spikes filiform, Leaves linear lanceolate subserrate  
 8682 Spikes filiform, Leaves lanceolate serrate bluish subsessile  
 8683 Spikes filiform panicked, Leaves ovate serrate acute stalked  
 8684 Hoary, Spikes cylindrical upright, Leaves ovate serrate subsessile, Stem erect round  
 8685 Spikes solitary stalked, Leaves trifid cut  
 8686 Decumbent hirsute, Leaves cut, Flowers spiked, Bractes linear very long squarrose  
 8687 Spikes lax solitary, Stem hispid decumbent rooting, Leaves oblong cut-toothed entire at end  
 8688 Spikes filiform, Leaves multifid cut, Stems numerous  
 8689 Spikes filiform panicked, Leaves multifid cut, Stem subsolitary  
 8690 Spikes filiform solitary, Leaves bipinnatifid  
 8691 Hirsute, Spikes filiform solitary, Leaves serrate cut, Calyxes twice as long as fruit

8692 Leaves oblong blunt downy beneath

8693 The only species

8694 Leaves subcordate tooth-serrate pubesc. with 2 glands at base, Corymb terminal hemispherical compact

8695 Somewhat downy, Leaves cordate toothed, Cal. large 5-cornered viscid, Segm. of cor. on one side

8696 Leaves subcordate entire, Cor. thrice as long as tube of calyx, Limb bilabiate

8697 Leaves lanceolate quite entire

8698 Leaves cordate obscurely angular, Panicles of branches dichotomous smooth

8699 Leaves 5-lobed toothleted smooth, Panicle brachiate, Axille woolly

8700 Leaves lobed and undivided broad ovate entire, Panicle trichotomous

8701 Leaves elliptical acute entire and calyxes downy, The calyx in fruit thickened colored, Corymbs clustered

8702 Leaves oblong lanceolate entire, Petioles peduncles and calyx hairy

8703 Leaves lanc. or lin. lanc. entire quite smooth, Corymbs axill. and term. Cal. 5-toothed and pedunc. smooth

8704 Leaves ovate entire shining, Petioles peduncles and calyxes smooth

8705 Leaves whorled long lanceolate entire smooth, Corymbs axillary few-flowered, Corollas very long

8706 Leaves broad-ovate acuminate serrate subsessile downy beneath, Cal. 5-toothed, Cor. labiate

8707 Leaves ovate entire toothed and angular, Peduncles axillary about 2-flowered

8708 Leaves ovate blunt downy beneath ribbed rugose, Corymb trichotomous

8709 Leaves oblong acute entire, Spines from the rudiments of petioles

8710 Leaves obovate entire retuse shining, Peduncles axillary about 1-flowered

8711 Unarmed, Leaves cordate ovate acute toothed, Racemes 1-sided

8712 Leaves stalked cordate crenate smooth

8713 Leaves ovate, Flowers thirsoid

8714 Branches round, Leaves oblong acuminate entire, Racemes pendulous, Calyxes toothed

8715 Branches round, Leaves elliptical emarginate blunt entire, Racemes erect, Calyxes somewhat toothed

8716 Branches square, Leaves obovate pubescent beneath somewhat toothed at end, Racemes nodding

8717 Branches bluntly 4-cornered, Leaves ovate obl. toothed upwards pubesc. beneath Fl. bracteate pendulous

8718 Branches square, Leaves ovate acuminate entire, Racemes nodding

8719 Calyxes in fruit twisted, Leaves obovate oblong

8720 Calyxes in fruit erect, Leaves oblong lanceolate acuminate

8721 Spiny, Leaves 9 lines long 3 lines broad subserrate attenuated at each end, Teeth of cal. short subciliated

and Miscellaneous Particulars.

George Volkamer, his brother, born 1616, died in 1693, wrote many academical dissertations, and a Flora of Nuremberg, which was not published till after his death. The species are ornamental plants with the habit of the last genus.

1327. *Holmskioldia*. A Theodore Holmskiold, a Dane, published some obscure works upon Cryptogamous plants. A handsome herbaceous stove plant, remarkable for the large calyxes of a bright red color.

1328. *Petrea*. So called by Houstoun, in honor of Robert James Lord Petre, born in 1710, died in 1742. The famous Peter Collinson, in a letter to Linnæus, speaks of his death as the greatest loss that botany or gardening ever felt in this island. A climbing plant with blue flowers.

1329. *Citharexylum*. From *κίθαρα*, a lyre (hence guitar), and *ξύλον*, wood. This tree produces a wood which in America is very useful for carpenters' work. It is very hard, and has been supposed applicable to making musical instruments, a mistake which arose thus; *C. melanocardium* is called by the French *fiddle*, from its faithfulness or durability in building; the English have corrupted the name to fiddle-wood, as if it were used for making musical instruments, which is a mistake. (Müller.)

Cuttings root in sand under a hand-glass.  
 1330. *Duranta*. After Castor Durantes, physician to Pope Sixtus V., author of Herbarium, 1584, died in 1590. The species grow and flower freely in loam and peat, and cuttings root in sand under a hand-glass.

History, Use, Propagation, Culture,

1331. *Pedalium*. Πεδάλιον, a Greek word signifying a nail or point. This plant produces a hard and nut-like fruit with four sharp points or horns.

1332. *Myoporum*. From μύω, to shut up, and πορος, a pore; the spots which cover the leaves being, as it were, pores closed with some semi-transparent substance.

1333. *Stenochilus*. From στενος, narrow, and χυλος, a lip; the narrow lip distinguishing this genus from some of its kindred. Very pretty New Holland small shrubs, with fine red flowers.

1334. *Bontia*. James Bont or Bontius was a Dutch physician, born at Batavia, published in 1658, a natural history of the East Indies, in the manner of Piso. A South American plant, with the appearance of a Daphne. The leaves are alternate, fleshy, and crenated, and the flowers axillary.

1335. *Orobanche*. So called from ορος, a vetch, or other leguminous plant, and ωρχις, to strangle, in allusion to the well known effect of these parasites in destroying the plants upon which they grow. The species are fleshy herbs of a russet color, fastening themselves to the roots of other plants, and chiefly to Leguminosæ. The root is tuberous, imbricate with scales, and sends out fibres into the soil; the stem is without leaves, scaly, and generally simple: the flowers are in terminating spikes. The whole plant is acid and astringent, and rejected by all animals, excepting the minute tribes of Cimices and Thripsos.

O. major adheres to the root of broom, furze, and clover, and is particularly destructive to the latter, especially in Flanders, where in some places it deters the farmer altogether from the culture of clover. It has a large, thick, fleshy, oval, scaly root, sometimes bulbous, and sending out fibres which are very brittle. The bulb adheres to the woody roots of furze or broom, and the fleshy root of clover, and the fibres clasp round them.

O. elatior is commonly found adhering to the roots of *Centaurea scabiosa* and *Trifolium pratense*. It does

8722 Leaves truncate, Flowers with a strong smell of musk

8723 Leaves elliptical bluntish mucronate and branches smooth, Sepals lanc. very acute, Orifice of cor. villous  
 8724 Leaves broadish lanc. acumin. very acute and branches smooth, Sepals ovate lanc. Limb of cor. bearded  
 8725 Lva. lin. bluntish sometimes toothed at end with the branches glandular, Peduncles occasionally 2-parted  
 8726 Leaves lanceolate acute serrated and branches warted with glands  
 8727 Leaves elliptical acute serrated reflexed and branches viscid with glands  
 8728 Leaves lanc. toothed at end entire at base, Drupes compressed shorter than calyx, Stem prostrate  
 8729 Leaves lanceolate at base with recurved teeth, Stems diffuse glandular, Peduncles solitary  
 8730 Leaves serrate cordate sessile

8731 Leaves lanceolate or elliptical entire sometimes toothed at end, Branches downy, Stem diffuse  
 8732 Stem silky, Leaves spatulate lanceolate much shorter than flower, Stamens a little protruded

8733 Leaves alternate, Peduncles 1-flowered

8734 Stem simple, Cor. 4-fid infat. Stam. naked downw. Stigma 2-lobed, Lobes distant, Style pubesc. upwards  
 8735 Stem simple, Cor. 4-fid, Stamens hairy downwards, Stigma obcordate, Style smooth upwards  
 8736 Stem simple, Cor. 4-fid, Stamens hairy downwards, Stigma retuse, Style smooth upwards  
 8737 Stem simple, Corolla tubular, Segm. of lip blunt equal, Stamens fringed on one side at base  
 8738 Stem nearly simple, Cor. 5-fid, Bractes 3, Calyx tubular half 4-cleft  
 8739 Stem branched, Cor. 5-fid, Bractes 3, Calyx short deeply half 4-cleft

8740 Leaves cuneate lanceolate close together  
 8741 Leaves ovate subcoriaceous separate, Fruit ovate acuminate

8742 Leaves at end palmate-cut, Flowers sessile

8743 Leaves ovate acuminate serrate, Corollas 2-lipped, Calyx 3-leaved, Stamens exserted

8744 Stem quite simple, Corollas pendulous with the lower lip trifid

8745 Upper lip of corolla emarginate 2-toothed, Middle segment of lower lip very short  
 8746 Upper lip of corolla compressed shorter, Calyxes villous  
 8747 Lower lip of cor. longer than upper, Middle segm. blunt longer than lateral, Cal. vill. Lva. deeply toothed

8748 Leaves alternate linear 2-toothed on each side  
 8749 Leaves alternate lanceolate entire, Floral oval toothed  
 8750 Upper leaves alternate serrated, Flowers distant lateral  
 8751 Leaves linear lanceolate serrated, Segm. of lower lip of corolla blunt  
 8752 Leaves opposite cordate bluntly serrated

and Miscellaneous Particulars.

not appear among clover till the second year. On the borders of corn-fields it is found on *Centaurea scabiosa* and *nigra*, *Scabiosa arvensis*, &c.

*O. minor* also adheres to common red clover and to *Hypocheris radicata*. *O. ramosa* is found on *Galeopsis tetrahit*. Any of the species may be removed to the garden and planted by the whin or broom.

1336. *Crescentia*. In memory of Pietro Crescenti, of Bologna, author of various agricultural works in the thirteenth century. The fruits after the inside has been scooped out, are dried by the natives of the countries where they grow, and serve for containing water or other fluids.

1337. *Castilleja*. Named after one Castillejo, a Spanish botanist and friend of Mutis. Some of the species of this genus which have not yet been introduced, are very beautiful plants, and would amply repay a collector for his trouble in procuring them.

1338. *Halleria*. After the famous Albert Haller, author of *Stirpes Helveticæ*, and other considerable works on botany and medicine. A pretty stove plant, with long branches of red flowers. Surely so eminent an investigator of alpine vegetation as Haller was, should have had an alpine genus consecrated to him.

1339. *Lathræa*. *ÆSquios*, concealed. The plant is only found in the most hidden recesses of the grove. A curious humble parasite without leaves, in the room of which it is covered with abundance of white fleshy scales.

1340. *Rhinanthus*. From *ῥίς*, a nose, and *ἄνθος*, a flower; because of its ringent corolla compressed, at the upper lip so as to resemble the snout of some animal.

1341. *Berula*. Named by Linnaeus, in honor of his beloved friend John Batsch, M. D., of whom he gives an interesting and melancholy account in his *Flora Suecica*. Curious herbaceous plants of very difficult cultivation.

History, Use, Propagation, Culture.

1342. *Euphrasia*. An abridgment of *Euphrosine*, the name of a woman, expressing joy or pleasure. This has been so called from the joyful effects of *E. officinalis* in disorders of the eyes, but it is now thought to be injurious rather than otherwise. Lightfoot states, that the Scotch Highlanders make an infusion of it in milk, and anoint the patient's eyes with a feather dipped in it.

1343. *Antirrhinum*. From *anti*, similar, and *rho*, a nose, because the flowers of most of the species bear a perfect resemblance to the snout of some animal. *A. majus* and its varieties are popular border flowers of the easiest culture in any dry soil; the other species are also pretty little plants.

1344. *Linaria*. The plant out of flower is very similar to *Linum*, Flax. The species are for the most part pretty annual plants; and some of them, as *L. Cymbalaria*, well adapted for growing in pots or for rock-work.

- 8753 Leaves ovate bluntly toothed, Segm. of lower lip of corolla emarginate  
 8754 Leaves linear serrated: upper entire, Lateral segments of lower lip of corolla toothletted  
 8755 Leaves ovate toothed palmate, Flowers spiked, Cor. tubular, Segm. of lower lip blunt  
 8756 Leaves lanceolate opposite, Flowers racemose, Sepals glandular hairy ovate blunt

- 8757 Leaves linear lanceolate ternate, Flowers racemose, Sepals glandular hairy lanceolate acute  
 8758 Leaves lanceolate: upper alternate, Flowers subsessile, Calyxes longer than corolla  
 8759 Leaves opposite cordate unequally crenate somewhat lobed hairy, Stems procumbent  
 8760 Leaves opposite ovate downy, Stems procumbent

- 8761 Leaves cordate 5-lobed alternate smooth, Stems procumbent  
 8762 Small, Leaves reniform repand very hairy alternate, Stems procumbent  
 8763 Leaves hastate alternate, Stems procumbent  
 8764 Leaves hairy alternate roundish ovate, lower obsolete toothed: upper subsessile entire, Stem procumb.  
 8765 Leaves hastate alternate, Stems spreading, Petioles occasionally producing tendrils  
 8766 Leaves hastate alternate, Stem erect much branched, Peduncles stiff  
 8767 Leaves ternate ovate blunt 3-nerved rough at edge, Spike terminal, Flowers stalked  
 8768 Leaves ternate ovate lanceolate 3-nerved, Spike terminal, Flowers sessile  
 8769 Lvs. whorled lanc. 3-nerved, Stems decumbent, Raceme terminal few-flowered, Cor. very large stalked  
 8770 Leaves linear lanceolate: lower opposite; upper alternate, Racemes lax, Helmet erect 2-parted  
 8771 Leaves 4 linear lanceolate, Flower-stem erect spiked  
 8772 Leaves linear lanceolate: lower ternate, Stem erect spiked  
 8773 Root creeping, Leaves linear close: lower 4, Calyx as long as capsule  
 8774 Leaves subulate channelled fleshy: lower 3, Stem paniced and corolla quite smooth  
 8775 Leaves linear smooth: lower 4, Stem erect paniced, Flowers in capitate spikes  
 8776 Leaves linear lanceolate: lower about 4 smooth, Flowers capitate, Calyxes hairy, Stem nearly simple  
 8777 Leaves linear scattered: lower opposite, Spur subulate, Flowers subsessile  
 8778 Leaves about 4 linear, Stem diffuse, Flowers racemose, Spur straight  
 8779 Leaves nearly linear: lower in fours, Calyxes pilose viscid, Fl. racemose, Spur straight, Stem erect  
 8780 Leaves nearly linear: lower in fours, Calyxes pilose viscid, Fl. racemose, Spur recurved, Stem erect  
 8781 Cauline leaves linear alternate: radical ovate lanceolate 3-5, Flowers corymbose  
 8782 Cauline leaves linear alternate: radical lanceolate 4, Cal. villous close to stem  
 8783 Leaves 5 linear fleshy, Flowers capitate  
 8784 Leaves linear channelled scattered upon the rootshoots in 5s, Calyx hairy, Pedunc. shorter than bractes  
 8785 Leaves 4 subulate fleshy, Stems erect, Flowers spiked  
 8786 Leaves 4 linear lanceolate glaucous, Stem diffuse, Flowers racemose, Spur straight  
 8787 Leaves all opposite villous, Stem simple, Flowers opposite lateral  
 8788 Leaves obovate opposite: floral alternate, Stem ascending pubescent, Spur straight  
 8789 Leaves mostly alternate lanceolate blunt, Stem much branched diffuse  
 8790 Leaves somewhat stem-clasping lanceolate scattered, Bractes longer than calyx, Stem  $\frac{1}{2}$  shrubby  
 8791 Leaves lanceolate hairy alternate, Flowers spiked: upper sepal very large  
 8792 Leaves alternate linear-subulate somewhat fleshy, Stem erect simple, Spike term. stalked  
 8793 Leaves lanceolate acuminate, Panicle twiggy flexuose  
 8794 Leaves linear alternate, Stem paniced twiggy, Flowers racemose  
 8795 Leaves lanceolate linear close, Stem erect, Spikes terminal sessile, Flowers imbricated  
 8796 Leaves alternate linear remote smooth, Flowers racemose, Stem simple, Runners procumbent  
 8797 Leaves linear lanceolate alternate, Flowers racemose, Cal. longer than cor. Stem erect

8798 Very smooth, Radical leaves obovate lanceolate blunt serrate: cauline divided entire

- 8799 Leaves ovate serrated stalked, Peduncles axillary 1-flowered  
 8800 Leaves 4 linear lanceolate acute about 3-nerved smooth, Flowers racemose terminal with bractes  
 8801 Leaves oblong serrated, Stem erect herbaceous, Capsules 2-horned spreading

and Miscellaneous Particulars.

*L. triphylla* is a popular border annual. *L. triornithophora* is remarkable for the form of its flowers, which resemble three little birds seated in the spur.

*L. vulgaris* is a very shewy plant, but also a bad weed in sandy pastures.

1345. *Anarrhinum*. Named by Desfontaines, from  $\alpha$ , privative, and  $\rho\upsilon$ , nose, in contradistinction to *Antirrhinum*, because the plants of this genus have not the snout-like flowers of the latter. Plants resembling *Linaria* in habit.

1346. *Nemesia*. A name used by Dioscorides to designate a kind of *Antirrhinum*, to which genus this is nearly related.

History, Use, Propagation, Culture.

1347. *Maurandya*. Named in honor of the lady of Dr. Maurandy, the botanical professor at Carthage. An elegant greenhouse plant, native of Mexico, and flowering for months together in the summer.

1348. *Gerardia*. In honor of John Gerard, our old English botanist, author of the *Herbal*, 1597, folio, and a great cultivator of exotic plants, of which he published a catalogue in 1596. These are handsome North American herbaceous plants, of such very difficult culture, that few persons have seen them in gardens. They deserve any pains which may be necessary to their successful cultivation.

1349. *Pedicularis*; of which the English word *lousewort* is a translation and explanation. The term lousewort is applied from a supposition that sheep which feed much on the plant become lousy; probably because the plants grow in very bad pastures, which may occasion the sheep to be in bad condition and to breed vermin. The species have their leaves very much cut, and that in a very regular manner. Their flowers are red, white, or yellow, and the mixture or shades of these three colors sometimes give the corolla the colour of fire. They grow in general at a considerable elevation; namely, more than a thousand toises above the level of the sea.

*P. scæptrum Carolinum* was so named by Rudbeck, in honor of Charles XII. It abounds in the north of Sweden and Lapland, where it was greatly admired by the traveller Dr. Clarke, who sent seeds of it to the Cambridge botanic garden, but they never came to any thing. The flowers grow in long whorled spikes, and

8802 Orifice of corolla perivious  
8803 Orifice of corolla closed

8804 Leaves linear pinnatifid, Stem somewhat branching  
8805 Stem oppositely much branched, Leaves linear, Flowers axillary opposite subsessile  
8806 Branches panicled, Leaves linear, Peduncles axillary opposite longer than flower  
8807 Pubescent, Stems nearly simple, Leaves subsessile lanceolate entire or toothed : lower pinnatifid cut  
8808 Smooth, Stem panicled, Leaves stalked pinnatifid, Flowers axillary opposite stalked

8809 Stem branched, Lvs. pinnat. Pinnæ pinnatif. cut, Cal. inflated ovate 2-parted crest. Helmet blunt truncate  
8810 Low tufted, Stem branch. at base, Lvs. pinnat. Pinnæ acute. cut, Cal. obl. inf. smooth uneq. 5-cleft crested  
8811 Stem branched, Leaves pinnatifid toothed, Cal. tubular 2-parted truncate, Helmet 2-toothed  
8812 Stem somewhat branched, Leaves pinnated, Pinnæ in 4s acutely pinnatifid, Helmet acute 2-toothed  
8813 Stem nearly simple, Leaves lanc. toothed crenate, Cal. 2-fid truncate, Helmet acute  
8814 Stem simple, Leaves pinnatifid, Pinnæ repand crenulate, Cal. 5-fid crested, Cor. closed  
8815 Stem simple, Lvs. deeply pinnatifid, Pinnæ lanc. pinnatifid toothed, Spike compact leafy  
8816 Stem simple, Cauline leaves deeply pinnatifid, Pinnæ lanc. acuminate pinnatifid toothed, Spike leafy  
8817 Stem simple, Spike somewhat leafy, Helmet setaceous 2-toothed, Cal. truncate downwards  
8818 Stem simple, Leaves deeply pinnatifid, Pinnæ unequally toothed linear-lanc. Calyxes villous 5-cleft  
8819 Stem simple, Cauline lvs. deeply pinnatifid, Pinnæ lin. lanc. doubly toothed, Cal. round smooth 5-toothed  
8820 Stem simple, Cauline leaves pinnatifid in fours, Pinnæ oblong blunt toothed, Spike capitate, Cal. hairy  
8821 Stem simple, Lvs. pinnated, Pinnæ imbricated ovate blunt doubly toothed, Cal. 5-toothed, Helmet blunt  
8822 Stem simple, Lvs. pinnated, Pinnæ deeply pinnatifid tooth. Cal. 5-fid smooth. crested, Helmet uncinatè  
8823 Stem simple, Lvs. pinn. Pinnæ lanc. pinnatifid confluent at end, Spike capitate naked [acum. emargi.  
8824 Stem simple, Lvs. pinnate, Pinnæ pinnatifid somewhat toothed, Spike leafy, Helmet two-toothed

8825 Leaves caspitose spatulate deeply serrated smoothish, Peduncles terminal subcorymbose  
8826 Smaller branched villous, Leaves bluntly serrated, Flowers racemose  
8827 Leaves lanceolate oblong toothed, Segm. of limb entire  
8828 Leaves lanceolate smooth serrated at end, Stem herbaceous, Segm. of limb bifid

8829 Leaves lanceolate acuminate smooth sessile, Pedunc. longer than flower  
8830 Leaves oblong bluntyish clammy sessile, Peduncles shorter than flower  
8831 Procumb. Stem round rooting hairy, Lvs. cord.-ovate toothed 5-nerved, Pedunc. shorter than petioles  
8832 Leaves ovate stalked, Stem square winged  
8833 Leaves roundish ovate nerved; lower stalked, Stem creeping

8834 Leaves obovate entire at base, Calyxes spreading and peduncles smooth

8835 Raceme lax longer than the few-leaved stem, Calyxes pubescent in fruit increased in size

8836 Segments of cor. acute

8837 Segments of corolla blunt, Raceme comose

and Miscellaneous Particulars.

each represents a lion couchant. All the species are extremely difficult to keep in gardens. According to Sweet, they succeed best in peat soil and moist situations; the more tender species must be grown in pots in the same kind of soil, and should be protected under frames in severe weather: the best way of increasing them is by seed. (*Bot. Cult.* 404.)

1350. *Erinus*. A name under which Dioscorides describes an aquatic plant with a white flower, black seeds, and a milky stem. From the last circumstance it has derived its name; *ερεινος* signifying a wild fig tree. The plant of the ancients had no resemblance to that called *Erinus* by the moderns. Beautiful little alpine herbaceous plants, well adapted to rock-work in warm damp situations.

1351. *Mimulus*. From *μῦθος*, an ape. The flower seeds in front resemble the face of a grinning monkey. The species are showy plants of the easiest culture in almost any soil or situation.

1352. *Hornemannia*. Named after Professor Hornemann, of Copenhagen, an eminent botanist, and the present editor of the *Flora Danica*. Little, inconspicuous, but curious annual plants.

1352. *Maxus*. From *μαζος*, a teat, on account of the little protuberances which close the mouth of the corolla. East Indian herbaceous plants, not unlike some kinds of *Antirrhinum*.

1354. *Isoplexis*. From *ισος*, equal, and *πλεξις*, segment, in allusion to the equal-sized divisions of the corolla.

- 8838 Lvs. obl. rugose crenate, Sepals ovate obl. Segm. of cor. transverse acute, Pedunc. straight as long calyx

 8854 Lvs. lanc. toothed smooth, Raceme 1-sided, Cor. smooth : segm. ov. bearded, Lower bractes longer than  
 8855 Lvs. cordate oblong flat crenate not downy, Raceme 1-sided, Cor. smooth, Segm. very blunt  
 8856 Half shrubby, Leaves linear lanc. entire smooth, Corollas ventricose  
 8857 Leaves cordate serrate acute rounded at base, Stem with blunt angles  
 8858 Leaves cordate 3-nerved, Stem with blunt angles  
 8859 Leaves cordate stalked decurrent blunt, Stem with membranous angles, Racemes terminal  
 8860 Lvs. ovate cord. smooth cut serrate with appendages at base, Petioles dilated, Racemes term. compound  
 8861 Lvs. obl. cord. hairy beneath doubly toothed with an appendage at base, Petioles equal, Racemes terminal  
 8862 Leaves cordate doubly serrate pubescent, Panicles terminal trichotomous with leaves between  
 8863 Lvs. obl. lanc. cord. doubly serrated smooth, Panicles racemose terminal 3-chotomous, Stem  $\frac{1}{2}$  shrubby  
 8864 Leaves cordate obl. toothed : teeth entire those at base deepest  
 8865 Leaves obl. lanc. deeply cordate finely and doubly serrated smooth, Pan. racem. term. Ped. 3-chotomous  
 8866 Lower lvs. tern. cord. cren. toothed ; upper entire, Fl. racemose panicled, Bractes ovate lanc. entire at end  
 8867 Leaves cordate 3-nerved pubesc. on each side, Petioles ciliated, Pedunc. and bracts with glandular hairs  
 8868 Leaves lanceolate serrated stalked : cauline in 3s ; and the branches opposite  
 8869 Lvs. lanc. narrowed at each end deeply unequally and doubly toothed smooth, Racemes terminal  
 8870 Lvs. somew. fleshy : upper sessile toothed smooth recurved at end, Pan. racem. Pedunc. bifid many-flow.  
 8871 Lvs. cord. doubly toothed : lower teeth bent backwards, Raceme terminal compound, Ped. 2-3-fl. altern.  
 8872 Leaves cordate pubescent doubly serrated, Panic. axillary dichotomous, Bractes ovate serrate  
 8873 Leaves cordate smooth doubly serrated, Panic. axillary dichotomous, Capsules acuminate  
 8874 Leaves smooth : lower ternate pinnate blunt ; upper simple, Pedunc. about 3-fl. axillary  
 8875 Leaves interruptedly pinnate cordate unequal, Raceme terminal, Pedunc. axillary twin dichotomous  
 8876 Lvs. obl. cord. lobed at edge naked as long as pet. Rac. term. comp. Branch. and ped. with glandular hairs  
 8877 Lvs. interruptedly pinnate oblong subcordate unequal at base, Panicle terminal, Pedunc. dichotomous  
 8878 Leaves pinnated, Leaflets oblong cut toothed, Panicle terminal, Peduncles dichotomous  
 8879 Leaves smooth : lower interruptedly pinnate ; upper ternate, Leaflets oblong, Flowers axillary  
 8880 Leaves pinnated, Raceme terminal naked, Peduncles bifid, Calyxes scariosus  
 8881 Lower leaves bipinnate somewhat fleshy very smooth, Racemes bipartite  
 8882 Stems woody at base, Leaves bipinnatifid pubescent, Racemes long, Pedicels short villous  
 8883 Leaves bipinnate, Pinnae acutely cut toothed, Panicle terminal, Peduncle dichotomous  
 8884 Lvs. smooth : rad. bipinnat. caul. pinnate, Panicle leafy, Ped. dichotomous, Lat. seg. of lower lip emargin.  
 8885 Leaves cordate lined shining, Pedunc. axillary 2-flowered, Stem hexangular

8886 Leaves roundish subsessile

and Miscellaneous Particulars.

full extent of which the system can admit, the pulse intermits, and vertigo, indistinct vision, and nausea, with vomiting or purging, occur ; and if, after these indications, the quantity be still increased, or if any considerable portion of the recent herb be inconsiderately swallowed, it produces delirium, hicough, cold sweats, convulsions, syncope, and death. (*London Dispensatory*, 287.)

1356. *Scrophularia*. So named from the roots having a resemblance to *scrophulous* tumours, which they were, by the peculiar mode of induction of the dark ages, therefore supposed to cure. *S. nodosa* has the name of figwort from its knobbed roots : it has a rank smell like elder, and a bitter taste ; swine that have the scab are cured by washing them with a decoction of the leaves. Wasps resort greatly to the flowers. Goats eat the plant ; but cows, horses, sheep and swine refuse it.  
 The same observations apply to *S. aquatica*, which in French is called *Herbe du Siege*, because at the celebrated siege of Rochelle by Cardinal Richelieu in 1628, the garrison was reduced to the necessity of supporting life upon the roots of the plant.

1357. *Vandellia*. Louis Vandelli, a Portuguese, was professor of botany in the garden of Coimbra. He published in 1788, an essay on the plants of Portugal and Brazil, a work which is little known, on account of its extreme rarity.

History, Use, Propagation, Culture,

1358. *Sibthorpia*. In honor of Humphry Sibthorp, M. D., professor of botany at Oxford, who travelled into Greece, for the purpose of collecting materials for a classical Flora Græca, in which he succeeded even beyond his own hopes. After his death the publication of his materials was confided to Sir James Edward Smith, under whose care the work has reached to five hundred figures in folio, of the most magnificent kind; five hundred more have yet to be published. A little trailing plant.

1359. *Limosella*. From *limus*, mud. The plant grows by the edge of puddles and in muddy places.

1360. *Browallia*. Named by Linnæus, in honor of John Browallius, bishop of Aboa, who defended the sexual system against Siegesbeck, in a book entitled *Examen epicriseos, &c.*, Aboa, 1739, octavo. Handsome plants with blue flowers, often cultivated as tender annuals.

1361. *Stemodia*. From *stemon*, a stamen, and *dia*, double. Each of the stamens supports two anthers.

1362. *Trevirana*. Named after Dr. Treviranus, a German botanist. This beautiful plant, which is commonly called *Cyrilla pulchella*, is one of the prettiest of the old inhabitants of the stove.

1363. *Columnæa*. In honor of Fabio Columna, or Fabio Colonna, of the noble family of Colonna in Italy, born in 1567. He published his *Phytobazanos* in 1592, and his *Ephrasis* in 1606, both works of high reputation in their day. One species, *C. scandens*, is common in hothouses, where it is cultivated for the neatness of its foliage and the beauty of its scarlet blossoms.

- 8887 Leaves reniform subpeltate crenate
- 8888 Leaves lanceolate spatulate, Scapes shorter than leaf
- 8889 Peduncles 1-flowered  
8890 Peduncles 1 many-flowered
- 8891 Leaves opposite and ternate stalked  
8892 Leaves opposite and ternate stem-clasping
- 8893 Leaves ternate ovate hairy
- 8894 Leaves ovate acute entire subvillous, Sepals entire and corollas pubescent, Upper lip undivided  
8895 Leaves ovate acuminate serrate hairy above, Sepals toothletted and corollas hairy  
8896 Leaves 3 subsessile oblong acutely crenate pubescent, Cor. hairy, Galea dilated reflexed
- 8897 Leaves ovate acuminate stalked, Raceme terminal whorled, Peduncles cymose
- 8898 Leaves linear smooth entire, Stem nearly naked
- 8899 Leaves oblong ovate entire 3-nerved sessile, Pedunc. axillary 1 flowered, Stem procumbent
- 8900 Leaves oblong entire, Peduncles longer than leaf, Stem declinate  
8901 Very smooth, Leaves cuneate oblong upwards obsolete crenate, Pedunc. nearly as long as leaf  
8902 Stem erect, Leaves lanceolate acute doubly serrated smooth, Flowers whorled
- 8903 Leaves ovate serrated alternate, Flowers twin  
8904 Hairy, Leaves alternate rhomboid cuneiform cut serrate, Flowers twin, Sepals linear  
8905 Leaves opposite linear entire, Racemes compound terminal  
8906 Leaves opposite ovate-oblong entire wavy: upper subcordate whorled, Racemes spiked  
8907 Pubescent, Leaves opposite and ternate ovate serrate stalked, Pedunc. axillary shorter than petiole
- 8908 Leaves toothed lanceolate 3-nerved
- 8909 Leaves opposite ovate jagged, Flowers somewhat umbelled terminal  
8910 Leaves linear toothed villous, Cal. hairy, Branches subfastigiata
- 8911 Upper leaves opposite sessile tooth-sinuated, Flowers solitary on long stalks  
8912 Leaves opp. lin. lanc. acute at each end toothletted, Raceme terminal, Stamens exserted  
8913 Leaves lanc. toothed villous, Racemes of flowers remote  
8914 Leaves obovate crenate downy, Stem decumbent  
8915 Leaves obl. serrated hairy, Stem nearly leafless, Flowers alternate remote  
8916 Leaves ovate toothed silky beneath dotted with silver, Flowers axillary stalked  
8917 Leaves wedge-shaped serrated pubescent, Segm. of cor. with very long points  
8918 Leaves opp. stalked oblong blunt tooth-serrated when old smooth, Segm. of cor. rounded

and Miscellaneous Particulars.

1364. *Russelia*. In honor of Alexander Russel, M. D. F. R. S., born in Scotland; died 1768; author of the natural history of Aleppo, London, 1756. His brother Patrick, published a second edition in 1794, and a work on serpents in 1796, folio.

1365. *Dodartia*, by Tournefort, after M. Dodart, member of the academy of sciences at Paris; and an eminent physician. An ugly, leafless, almost flowerless plant, of much rarity and little beauty.

1366. *Lindernia*. Named after Francis Lindern, an obscure Swiss botanist. Pyxidaria is so called from *πυξίς*, the box, which it resembles in foliage.

1367. *Herpestis*. From *ἕρπης*, any thing which creeps. An exotic genus of herbs, with opposite leaves and axillary flowers, each of whose stalks bears a pair of bractæ. *Herpestis Monnieri* is a beautiful aquatic.

1368. *Capraria*. So named from *capra*, a goat, the leaves being much liked by that animal.

1369. *Buchnera*. Named after John Godfrey Buchner, a German botanist, who published in 1743, his Observations upon the Plants of Saxony. Small Cape shrubs of little interest or beauty. Their leaves are generally small, and their flowers white.

1370. *Manulea*. Derived from *manus*, the hand. The five divisions of the flower, in some species, from their form and relative position, resemble an open hand. Handsome Cape shrubs of humble growth. They are rare in collections, but deserving of being very generally cultivated.

History, Use, Propagation, Culture,

1371. *Angelonia*. *Angelon* is the name of the plant among the Spanish colonists of Caraccas, where it grows. A very beautiful stove herbaceous plant, with large light-blue flowers.

1372. *Schizanthus*. From *σχίζω*, to cut, and *ανθος*, a flower, in allusion to the numerous divisions of the beautiful purple and yellow flowers. Tender annual plants, with finely cut pale green leaves, and terminal panicles of elegant flowers.

1373. *Besleria*. After Basil Besler, an apothecary at Nuremberg, joint editor with Jungermann, of a sumptuous work entitled *Hortus Eysicctensis*, 1613. The garden belonged to Bishop Conrad, of Eichstedt, and the plates were engraved at his expense.

1374. *Tecdia*. So named by Persoon, but the meaning is unknown. Pretty herbaceous plants, with bright purple flowers and dark berries.

1375. *Brunfelsia*. In memory of Otho Brunfels, of Mentz, a Carthusian monk, and afterwards a physician, author of *Figures of Plants* in 1530. He died in 1534. The species are handsome tropical shrubs, with neat foliage and shewy white or purple flowers. Cuttings with a little ripened wood strike root freely in heat.

8919 The only species

8920 The only species

8921 Peduncles branched, Leaves ovate

8922 Peduncles simple clustered, Leaves ovate-lanceolate serrated

8923 Peduncles simple solitary, Calyxes serrated, Cor. smooth with a serrulated limb

8924 Leaves obl. ovate rugose crenate decurrent down the petiole, Cal. serrulate colored

8925 Peduncles simple solitary, Calyxes colored serrated, Cor. hairy with an entire limb, Leaves ovate

8926 Leaves opp. obl. finely serrulate smooth

8927 Leaves downy

8928 Leaves ovate-lanceolate narrowed at each end, Tube of cor. curved, Limb wavy

8929 Leaves obovate acuminate longer than petiole, Tube of cor. straight, Limb entire

8930 Leaves and leafstalks deeply stained with purple

8931 Cauline leaves bipinnate

8932 Rad. leaves lyrate: upper oblong, Pedicels longer than bractes, Sepals linear entire

8933 Radical leaves lyrate: upper ovate, Bractes longer than pedicels, Sepals linear oblong entire

8934 Radical leaves lyrate: floral cordate half stem-clasping, Peduncles as long as flower

8935 Radical leaves lyrate: upper oblong, Flowers subsessile the length of bractes, Cal. ovate serrated

8936 Somewhat downy, Leaves lanceolate, Flowers axillary solitary

8637 All over wool, Leaves oval oblong blunt crenate, Stamens bearded with capitate hairs

8938 Leaves ovate lanceolate deeply serrated

8939 Leaves ovate acute cut serrated

8940 Leaves ternate remotely toothletted

8941 Leaves ovate acute serrated, Stem winged at angles

8942 Leaves obovate smooth, Segments of cor. length of tube

8943 Leaves obovate dotted with glands downy

8944 Flowers large yellow spotted

and Miscellaneous Particulars.

1376. *Celsia*. In honor of Olaus Celsius, D. D., surnamed the northern Pliny, professor of the oriental languages in the university of Upsal. His Hierobotanicon, or History of the Plants of Scripture, appeared in 1745. There was also another Swedish botanist called Magnus Nicolaus Celsus, who died in 1679. Besides these moderns, the name is rendered familiar to classical scholars by the recollection of the famous Aurelius Cornelius Celsus, who wrote upon agriculture and medicine, and whose purity of style procured him the name of the Cicero of medicine.

1377. *Alonsoa*. Named by the authors of the Flora Peruviana, after Zanoni Alonso, at the time of the publication of that work, Spanish secretary for the kingdom of Santa Fé, and a great patron of objects connected with natural history. Sir James Smith considers the genus the same as *Hemimeris*.

1378. *Anthocercis*. From *ανθος*, a flower, and *κρημις*, a ray, the narrow divisions of the corolla spreading in a radiant manner, like the spokes of a wheel.

1379. *Cymbaria*. From *κυβητης*, a boat, in allusion to the shape of the fruit. A small pubescent hoary plant, native of mountainous rocky places in Siberia.

CLASS XV. — TETRADYNAMIA. STAMENS 6, of which four are longer than the rest.

This class consists, with the exception of *Cleome*, entirely of the natural order Crucifera, and has lately been the subject of the most acute and successful investigation of many botanists of celebrity. Our countryman, Mr. Brown, led the way to the improvements which have been made in the genera, in the second edition of the *Hortus Kewensis*, in which, discarding the uncertain and unnatural characters derived from variations in the floral envelopes, he took a new course, and by indicating with great precision the curious modifications of the seeds and seed-vessels, led the way to an entirely new arrangement of the class. The principles thus developed have been adopted by M. Decandolle, whose learned treatise upon Cruciferae is here followed without variation.

The difference between the genera with a long pod (*Siliquosæ*), and those with a short one (*Siliiculosæ*), has given rise to two orders in the Linnean system. But these are not only ambiguous, but interfere so much with a distribution of the genera according to their natural affinities, that they have been rejected here, and the divisions of M. Decandolle, depending upon variation in the relative position of the various parts of the seed, have been substituted.

The plants of this class have always been celebrated for their antiscorbutic qualities. These seem to reside in an acrid, oily, volatile principle, not yet determined by chemists, and varying in the degree of abundance in which it is found in different species. It is particularly abundant in the seeds of mustard and garden rocket, in the roots of the horse radish, and in the foliage of the *Lepidium latifolium*, which, administered inwardly, act powerfully upon the gastric organs, or, applied externally, inflame the skin and operate nearly as severely as blisters. A slighter degree of acrimony is found in the foliage of the scurvy grass, the roots of the garden radish, &c.; and these, therefore, operate more gently, and perhaps more safely, when eaten, scarcely at all when applied outwardly. Whatever the degree of acrimony may be in these plants, they all appear, when eaten, to produce some specific action upon the digestive organs, and thence upon scorbutic humours; for which reason, the horse radish, water-cress, radishes, and even cabbages are eminently antiscorbutic. They are also admitted by physicians as diuretic, siagogues, and diaphoretic. It is only when the acrid principle is diffused over a considerable quantity of fleshy and watery substance, that cruciferous plants become eatable, as in the leaves and stems of cabbages and sea-kail, and in the roots of radishes and turnips. Even in these plants, the proportion of acrid principle is much diminished by exclusion from light. Plants of this class are also remarkable for containing a larger quantity of azote than most vegetables; for which reason ammonia is generally evolved in their fermentation or putrefaction: to which circumstance it is possible that the two remarkable phenomena are to be attributed, viz.; that cruciferous plants contain a greater portion of nutritive matter than most herbaceous plants; and that they require either a very rich soil manured with animal substances, or at least a situation near the habitations of men. The embryos of all these plants are filled with oil, and the seeds of *Camelina sativa*, *Brassica campestris*, some species of Rocket, &c. are cultivated in many parts of Europe for the sake of their expressed oil, which is used either for culinary purposes or for lamps.

Cruciferous plants are chiefly natives of temperate climates, those which are found within the tropics being in all cases mountain plants, and are nearly all cultivable in the open air; they are mostly found in open sandy plains; some on the tops of the highest mountains at the utmost limits of vegetation. Nine hundred species are now described, of which not more than twenty-two are to be found in the works of Hippocrates, Theophrastus, Dioscorides, or Pliny.

A. *Cotyledons four, spirally twisted. Petals 4, cruciate.*

1380. *Schiaopetalon*. Petals pinnatifid.

B. *Cotyledons two. Petals 4, cruciate.*

1. *Cotyledons flat, accumbent. Radicle lateral. Seeds compressed.* (O=) PLEURORHIZÆ, Dec.

\* *Silicle opening; with a linear dissepiment more or less wide than seeds. Seeds oval, compressed; often margined. Cotyledons flat, accumbent, parallel with the dissepiment.* ARABIDÆ, Dec.

1381. *Mathiola*. Silicle roundish. Stigmas connivent, thickened or cornute at back. Calyx bisaccate at base.

1382. *Cheiranthus*. Silicle round or compressed. Stigmas 2-lobed or capitate. Calyx bisaccate at base.

1383. *Nasturtium*. Silicle roundish, shortened or declinate. Stigma nearly 2-lobed. Calyx equal at base, spreading.

1384. *Leptocarpea*. Silicle roundish, very slender. Stigmas sessile, 2-lobed. Calyx spreading, equal.

1385. *Notoceras*. Silicle 4-cornered, 2-edged, the valves elongated at end into a horn or mucro.

1386. *Barbarea*. Silicle 4-cornered, 2-edged, the valves not elongated at end. Calyx equal at base.

1387. *Braya*. Silicle oblong, subcylindrical, with flattish valves and a sessile stigma. Seeds few, ovate. Calyx equal at base.

1388. *Parrya*. Silicle linear with veiny valves. Seeds in two rows, with a loose wrinkled skin. Stigmas approximating. Filaments not toothed.

1389. *Turritis*. Silicle linear with flat valves. Seeds in two rows in each cell.

1390. *Arabis*. Silicle linear with flat valves, 1-nerved in the middle. Seeds in one row in each cell.

1391. *Macropodium*. Silicle pedicellate, linear, with flat valves, 1-nerved in middle.

1392. *Cardamine*. Silicle linear with flat nerveless valves, often opening with elasticity. Funicles of the hilum slender.

1393. *Pteroneuron*. Silicle lanceolate with flat nerveless valves, often opening with elasticity: placentas with winged nerves. Funicles dilated.

1394. *Dentaria*. Silicle lanceolate with flat nerveless valves, often opening with elasticity: placentas not winged. Funicles dilated.

\*\* *Silicle opening lengthwise, with a broad oval membranous dissepiment, and flat or concave valves. Seeds compressed, frequently margined. Cotyledons flat, accumbent, parallel with the dissepiment.* ALYSSINÆ, Dec.

1395. *Lunaria*. Silicle pedicellate, elliptical or lanceolate with flat valves. Funicles long, adhering to the dissepiment. Calyx somewhat bisaccate. Petals nearly entire. Stamens not toothed.

1396. *Ricotia*. Silicle sessile, oblong, when ripe losing its dissepiment and becoming 1-celled: valves flat. Calyx with two prominences at base. Petals emarginate. Stamens not toothed.

1397. *Parsetia*. Silicle sessile, oval or orbicular, with flat valves. Seeds winged. Calyx bisaccate at base. Petals entire.

1398. *Berteroa*. Silicle sessile, elliptical or obovate, with flat or concave valves. Calyx equal at base. Petals 2-parted. The small stamens toothed.

1399. *Aubrieta*. Silicle oblong with convex valves. Seeds not edged. Calyx bisaccate at base. Petals entire. Smaller stamens toothed.

1400. *Vesicaria*. Silicle globose inflated with hemispherical valves. Seeds more than 8. Petals entire.

1401. *Alyssum*. Silicle orbicular or elliptical, with valves flat or convex in centre. Seeds 2-4 in each cell. Calyx equal at base. Petals entire. Some the stamens toothed.

1402. *Clypeola*. Silicle orbicular, 1-celled, 1-seeded, with flat valves. Calyx equal. Petals entire. Stamens toothed.

1403. *Peltaria*. Silicle orbicular, 1-celled, 1-4-seeded, with flat valves. Seeds two in each cell: funicles adhering to the dissepiment.

1404. *Petrocallis*. Silicle sessile, oval, with flattish valves. Seeds two in each cell: funicles adhering to the dissepiment.

1405. *Draba*. Silicle sessile, oval or oblong, with flat or convex valves. Seeds many, not edged. Calyx equal. Petals entire. All the stamens without teeth.

1406. *Erophila*. Silicle oval or oblong, with flat valves. Seeds many, not edged. Calyx equal. Petals 2-parted. Stamens without teeth.

1407. *Cochlearia*. Silicle sessile, ovate-globose or oblong, with ventricose valves. Seeds many, not edged. Petals entire. Stamens without teeth.

\*\*\* *Silicle opening, with a very narrow dissepiment, and keeled navicular valves. Seeds oval, sometimes margined. Cotyledons flat, accumbent, contrary to the dissepiment.* THLASPIDÆ, Dec.

† Cells of silicle 2-many-seeded.

1408. *Thlaspi*. Silicle emarginate at end, with navicular valves, winged at back. Cells two, many-seeded.

1409. *Capsella*. Silicle triangular, cuneate at base, with navicular valves, not winged. Cells many-seeded.

1410. *Hutchinsia*. Silicle elliptical, with navicular valves, not winged. Cells 2-seeded, rarely many-seeded.

1411. *Teesdalia*. Silicle oval, emarginate at end, with navicular valves and 2-seeded cells. Stamens having a scale inside at their base.

†† Cells of silicle 1-seeded.

1412. *Iberis*. Two outer petals largest. Silicle compressed, truncate, emarginate.

1413. *Biscutella*. Silicle flat, bicusate, with the cells laterally united to the axis. Style long, persistent. Embryo inverted.

\*\*\*\* *Silicle not opening, with concave indistinct valves, and sometimes with scarcely any trace of a dissepiment. Seeds oval, very few. Cotyledons flat, accumbent, parallel with dissepiment.* EUCLIDIÆ, Dec.

1414. *Euclidium*. Silicle drupaceous, ovate, with manifest sutures. Style subulate. Cells 1-seeded.

1415. *Ochthodium*. Silicle coriaceous, subglobose. Stigma sessile. Dissepiment thick. Cells 1-seeded.

\*\*\*\*\* *Silicle opening lengthwise, with concave valves, bearing internally transverse horizontal dissepiments separating the seeds. Seeds not margined. Cotyledons flat, accumbent, parallel with the dissepiment.* ANASTATICÆ, Dec.

1416. *Anastatica*. Silicle ventricose, with valves bearing an appendage outside at the end.

\*\*\*\*\* *Silique or silicle separating across into 1-2-celled, 1-2-seeded joints. Seeds not edged. Cotyledons flat, accumbent, parallel with the dissepiment when there is any.* CAKILINÆ, Dec.

1417. *Cakile*. Silicle 2-jointed, compressed: the upper joint ensiform. Seeds solitary in the cells: upper erect; lower pendulous.

1418. *Rapistrum*. Silicle 2-jointed: the upper joint ovate, rugose. Seeds solitary in the cells: upper erect, lower pendulous.

1419. *Chorispora*. Silique roundish, with many equal joints. Seeds all pendulous.

2. *Cotyledons flat, incumbent. Radicle dorsal. Seeds ovate, not margined.* (O||) NOTORHIZÆ, Dec.

\* *Silicle 2-celled, opening lengthwise, with concave or keeled valves. Seeds ovate or oblong, not margined. Cotyledons flat, incumbent, contrary to the dissepiment.* SISYMBRIÆ, Dec.

1420. *Malcomia*. Silique roundish. Stigma simple much pointed.

1421. *Hesperis*. Silique roundish, or about 4-cornered. Stigmas 2, erect, conniving. Calyx bisaccate at base.

1422. *Sisymbrium*. Silique roundish, sessile upon the torus. Stigmas 2, somewhat distinct or connate in a head. Calyx equal at base.

1423. *Alliaria*. Silique roundish, 4-cornered, with prominent nerves. Calyx lax.

1424. *Erysimum*. Silique 4-cornered. Calyx closed.

\*\* *Silicle with concave valves, and with a dissepiment elliptical in its greatest diameter. Seeds ovate. Cotyledons flat, incumbent, contrary to dissepiment.* CAMELINÆ, Dec.

1425. *Camelina*. Silicle obovate or subglobose, with ventricose valves and many-seeded cells. Style filiform.

1426. *Neslia*. Silicle subglobose, with concave valves, 1-celled, 1-seeded, indehiscent.

\*\*\* *Silicle with a very narrow dissepiment, and with keeled or very convex valves. Seeds solitary or few in the cells, ovate, not margined. Cotyledons flat, incumbent, parallel with the dissepiment.* LEPIDINÆ, Dec.

1427. *Coronopus*. Silicle ovate. Valves ventricose or subcarinate, scarcely dehiscent, 1-seeded.

1428. *Lepidium*. Silicle ovate or subordate, with carinate or rarely ventricose valves, opening with 1-seeded cells.

1429. *Eithionema*. Silicle oval, generally emarginate, with navicular valves, and 1-2-seeded cells. Larger stamens either united or toothed.

\*\*\*\* *Silicle with indistinct or indehiscent keeled valves, 1-celled, 1-seeded, with an obliterated dissepiment. Seeds ovate, oblong. Cotyledons flat, incumbent, apparently in the same direction as the dissepiment should be.* ISATIDÆ, Dec.

1430. *Isatis*. Silicle elliptical, flat, 1-celled, 1-seeded, with carinate navicular valves, which are scarcely dehiscent.

1431. *Myagrum*. Silicle compressed, almost cuneate, with two empty hollows at end, and at base 1-celled, 1-seeded.

3. *Cotyledons incumbent, folded together, or plaited lengthwise through their middle, and enwrapping the radicle. Style generally enlarged, with a cell and seed at its base. Seeds generally globose, never margined.* (O>>) ORTHOPLUCEÆ, Dec.

\* *Silique with valves opening lengthwise, and a linear dissepiment. Cotyledons folded together.* BRASSICÆ, Dec.

1432. *Brassica*. Silique roundish. Style small, short, obtuse. Seeds in one row. Calyx closed.

1433. *Sinapis*. Silique roundish, with nerved valves. Style small, short, acute. Seeds in one row. Calyx spreading.

1434. *Moricandia*. Silique 4-cornered, somewhat 2-edged. Seeds in two rows. Calyx bisaccate at base.

1435. *Diplotaxis*. Silique compressed, linear. Seeds in two rows. Calyx equal at base.

1436. *Eruca*. Silique roundish. Style large, ensiform or conical. Seeds in one row. Calyx equal at base.

\*\* *Silicle with concave valves, opening lengthwise, with an elliptical dissepiment. Cotyledons folded together.* VELLER, Dec.

- 1437. *Vella*. Larger stamens connate. Style ovate, flat, at the end of a tongue-shaped silicle.
- 1438. *Carrichera*. Stamens all free. Style ovate, flat, foliaceous.
- 1439. *Succowia*. Stamens all free. Style slender, conical. Valves of the silicle echinate.

\*\*\* *Silicle indehiscent, ovate or globose, 1-celled, 1-seeded, with indistinct valves. Seeds globose. Cotyledons folded together.* ZILLER, Dec.

- 1440. *Zilla*. Silicle 2-celled. Cells 1-seeded.
- 1441. *Colepina*. Silicle 1-celled, 1-seed. Seed pendulous. Outer petals rather the largest.

\*\*\*\* *Silicle or silique dividing across into one or few-seeded joints or cells. Seeds globose. Cotyledons folded together.* RAPHAËLE, Dec.

- 1442. *Crambe*. Silicle with two joints, of which the lower is abortive, the upper globose 1-seeded.

History, Use, Propagation, Culture,

1380. *Schizopetalon*. A curious genus of Chilean plants, with pinnatifid petals, whence the name has been formed, from *σχίζω*, to divide. A plant of difficult cultivation. It is raised from seeds, which it produces sparingly, and only in a well-aired cool greenhouse.

1381. *Mathiola*. Named after Peter Andrew Matthioli, an Italian physician, born in 1500, died in 1577. He was first physician to Ferdinand of Austria, and author of a laborious commentary upon Dioscorides. Herbs, or rarely shrubs, nearly all covered with a white stellate soft down. *M. incana*, *annua*, *græca*, and *fenestralis* are popular border flowers, especially the first; the leaves of all the species, and also of *Cheiranthus*, and many other plants of this class, may be used as potherbs or salads.

1382. *Cheiranthus*. So called from the Arabic *kheiry*, the name of a plant with red sweet-scented flowers. Herbs, or occasionally shrubs, with entire or toothed leaves, and flowers of various colors. *C. Cheiri* is a

1443. *Raphanus*. Siliques transversely many-celled or dividing into several joints.  
 4. *Cotyledons incumbent, linear, spirally or rather circinnately twisted.* (O|||) SPIROLOBEE, Dec.  
 1444. *Bunias*. Silicle nucamentaceous, indehiscent, 2-4-celled. Cotyledons twisted spirally.  
 1445. *Erucaria*. Siliques lomentaceous, 2-jointed; the lower joint having two cells, the upper being ensiform. Cotyledons replicate, somewhat spiral.  
 5. *Cotyledons incumbent, linear, with two legs, or a double plait, that is to say, plaited twice crosswise. Seeds depressed.* (O|||) DIPLECOLOBEE, Dec.  
 1446. *Heliofita*. Siliques elongate or rarely oblong or oval. Dissepiment linear or oval. Valves flat, or in the long siliques somewhat convex. Calyx equal at base.  
 1447. *Subularia*. Silicle oval. Dissepiment elliptical. Valves convex. Cells many-seeded. Stigma sessile.  
 C. *Cotyledons 2. Petals 4, not cruciate. Thalamus large, hemispherical or elongated. Stamens 4-6-00.*  
 1448. *Cleome*. A honey gland at each division of the calyx, except the lowest. Calyx 4-leaved. Petals ascending.

8945 Stem weak cesious, Petals pinnatifid quickly perishable

8946 Stem shrubby at base erect branched, Leaves lanceolate entire hoary, Pods subcylind. without glands

- 8947 Stem herbaceous erect branched, Leaves lanceolate blunt hoary, Pods subcylindrical without glands  
 8948 Stem half shrubby erect branched, Leaves lanceolate smooth, Pods somewhat compressed without glands  
 8949 Stem herbaceous erect branched, Leaves lanceolate smooth, Pods somewhat compressed without glands  
 8950 Stem  $\frac{1}{2}$  shrubby erect simple, Leaves close obovate downy, Pods downy without glands broadest at base  
 8951 Stem somewhat erect herbaceous branch. Lvs. obl. downy; lower sinuated, Pods comp. velvety and gland.  
 8952 Stem erect branched, Leaves downy or pubescent toothed or pinnatifid, Pods compressed downy  
 $\beta$  Pods twice as short as  $\alpha$   
 8953 Stem erect nearly simple naked, Leaves linear blunt hoary entire, Flowers subsessile, Pods compressed  
 8954 Stem  $\frac{1}{2}$  shrubby at base branched erect, Leaves downy linear entire or toothed, Fl. subsess. Pods roundish  
 8955 Stem suberect branched, Leaves sinuate pinnatifid, Pods with three acute nearly equal points  
 8956 Stem suberect branched, Leaves downy lanceolate repand toothed, Fl. sessile, Middle point of pod longest

8957 Leaves lanc. entire, Hairs 2-parted appressed or none, Pods linear, Stigmas with recurved lobes

8958 Lvs. obl. lanc. somew. toothed, Hairs 2-parted or none, Stem decum. branch. Pet obov. Pods erect pointed

8959 Leaves linear entire somewhat silky, Stem half shrubby

8960 Leaves linear-lanceolate acuminate finely serrated downy with 2-parted hairs, Stem shrubby branched

8961 Leaves linear-lanceolate acuminate entire downy with appressed 2-parted hairs, Stem shrubby branched

8962 Leaves lin. lanc. entire roughish, Stem shrubby branched, Pods compressed, Pedic. half as short as calyx

8963 Leaves linear entire rough clustered, Stem shrubby branched, Pods roundish 3 times as long as calyx

- 8964 Leaves pinnatifid, Segments ovate subcordate repand  
 8965 Leaves pinnatifid, Segments lanceolate serrate or cut  
 8966 Leaves pinnated-lobed, lobes confluent toothed smooth, Root fusiform, Petals as long as calyx  
 8967 Downy, Rad. lvs. toothed backwards, cauline sagittate oblong blunt, Stems erect branched from the base  
 8968 Radical leaves stalked obovate toothed or lyrate : upper pinnatifid, Lobes linear entire

and Miscellaneous Particulars.

popular flower of long standing, admired for its various colors and agreeable odor. Being an acrid and hardy evergreen, it is sometimes sown in pastures, along with parsley, thyme, &c. as a preventative of the rot in sheep.

1383. *Nasturtium*, is said to have been so called from the effect its acrimony produces upon the muscles of the nose; *nasus tortus* signifying a convulsed nose. *Pliny*. *N. officinale* is a well known popular salad, gathered wild in most parts where it is found, and since 1808, cultivated to a considerable extent in the neighbourhood of London. A running stream of clear water is essential to its cultivation; in the bed of this stream the plants are inserted in rows in the direction of the current, and all that is necessary is to take up and replant occasionally, and to keep up the plants free of mud or any accumulation of extraneous matters, and to see that other plants, especially the *Sium nodiflorum*, a poisonous plant resembling the water-cress, do

History, Use, Propagation, Culture,

not find their way into the plantation. Near Rickmansworth, in Hertfordshire, there is a fine stream of water on a chalky bottom, in which one cultivator grows five acres, and sends a supply to London every day in the year, Sundays excepted. There are also large plantations at Uxbridge, Gravesend, and other places.

Some market-gardeners, who can command a small stream of water, grow the water-cress in beds sunk about a foot in a retentive soil, with a very gentle slope from one end to the other. Along the bottom of this bed, which may be of any convenient length and breadth, chalk or gravel is deposited, and the plants are inserted about six inches distance every way. Then, according to the slope and length of the bed, dams are made six inches high across it, at intervals; so that when these dams are full, the water may rise not less than three inches on all the plants included in each. The water, being turned on, will circulate from dam to dam; and the plants, if not allowed to run to flower, will afford abundance of young tops in all but the winter months. A stream of water no larger than what will fill a pipe of an inch bore, will, if not absorbed by the soil, suffice to irrigate in this way an eighth of an acre. As some of the plants are apt to rot off in winter, the plantation should be laid dry two or three times a year, and all weeds and decayed parts removed, and vacancies filled up. Cress grown in this way, however, is far inferior to that grown in a living stream flowing over gravel or chalk.

The water-cress has lately been cultivated in the neighbourhood of Paris, and also near Edinburgh.

1384. *Leptocarpea*. From *λεπτος*, slender, and *καρπον*, fruit. A genus distinguished from *Sisymbrium* by its accumbent cotyledons.

- 8969 Radical leaves stalked obovate or lyrate, Cauline amplexicaul pinnatifid, Lobes linear entire  
 8970 Leaves obl. lanc. pinnatifid or serrated, Root fibrous, Petals larger than calyx, Siliques ellipsoid  
 8971 Leaves obovate cuneate toothed at end, Pods roundish subtergoid, Bractes a little shorter than pods  
 8972 Lvs. smooth : rad. stalked pinnatif. ; caul. stem-clasping cut serr. Pods roundish, Pedic. bracteate very short  
 8973 Lvs. ovate lanc. toothed backwards acuminate at each end smooth, Pods roundish 4 times as long as stalk

8974 The only species. Leaves stalked pinnatifid sublyrate with cut toothed acuminate lobes

- 8975 Pods 2-horned, Petals equal, Leaves entire, Hairs strigose fixed by their middle 2-parted appr. scattered  
 8976 Pods 2-horned, Petals unequal, Leaves ent. Hairs strigose fixed by their middle 2-parted very numerous

- 8977 Lower leaves lyrate : terminal lobe roundish ; upper obovate toothed  
 8978 Lower leaves lyrate : terminal lobe ovate ; upper pinnatifid with linear oblong entire lobes  
 8979 Radical and lower leaves pinnatifid-lyrate : lateral lobes ovate ; terminal cordate entire  
 8980 Lower leaves toothed lyrate : lateral lobes dentiform ; terminal very large subcordate, upper ovate

8981 Leaves linear narrowed at base smooth acute

8982 Pods lin.-oblong, Anthers oval, Leaves entire, Peduncles smooth

8983 Rad. leaves toothed hairy : cauline stem-clasping entire smooth, Pods erect 6 times as long as stalk

- 8984 Cauline lvs. cord. stem-clasping rough with 3-parted down, Pedicels shorter than cal. Stigma somew. emarg.  
 8985 Leaves many-toothed villous with branched hair lanc. acute : rad. somew. stalked ; caul. cord. stem-clasp.  
 8986 Leaves few-toothed hoary with branched hairs : rad. obov. oblong ; cauline cordate sagitt. stem-clasping

- 8987 Lvs. pubesc. with minute stellate down : rad. obl. stalked sinuate toothed ; cauline sagittate lanceol. entire  
 8988 Lvs. somew. toothed rough with branch. hair : lower oval narr. into a stalk ; cauline bluntly cord.-auricled  
 8989 Lvs. somew. toothed rough with branch. hair : lower oval narr. into a stalk ; cauline acutely cord.-auricled  
 8990 Lvs. acutely toothed lanc. stem-clasping wavy rough with branching hairs : rad. narrowed into the stalk  
 8991 Lvs. somew. toothed rough : rad. ovate or obl. narrowed into the stalk ; cauline lanceol. sagittate cordate  
 8992 Lvs. toothed rough with generally branched hairs : radical obov. obl. narr. into the stalk ; caul. ovate lanc.  
 8993 Lvs. smooth : radical ovate-oblong somewhat toothed narrowed at base ; cauline sessile ovate serrated

- 8994 Leaves hairy with branched pubescence : radical spatulate bluntly toothed ; cauline ovate acutely toothed  
 8995 Leaves rough with scattered bifid down : radical obov. toothed ; cauline obl. nearly entire, Raceme erect  
 8996 Leaves somewhat toothed smooth ciliated : radical subsessile oval oblong ; cauline oblong, Raceme erect  
 8997 All the lvs. sessile somew. toothed hoary with branched hairs : radical obov. obl. ; cauline obl. Rac. erect  
 8998 Leaves hairy somewhat toothed : radical stalked ovate oblong, Stem branched, Pods ascending  
 8999 Leaves nearly entire rough with branched hairs : radical and caul. oval narrowed at base, Raceme lax  
 9000 Lvs. pubesc. coarsely toothed ; rad. spatulate lanc. narrowed into the stalk ; caul. lanc. Pods pubescent  
 9001 Leaves oblong acute sessile entire smooth, Stems strigose, Runners creeping, Pods spreading  
 9002 Leaves nearly smooth : radical cut ; cauline oblong linear entire, Stem generally branched  
 9003 Rad. leaves lyrate pinnatifid smooth or ciliated : cauline linear, Stem hispid at base somewhat branched  
 9004 Lvs. vill. with forked down : rad. lyrate pinnat. ; caul. cut toothed, Stem branched hisp. with simple hairs

and Miscellaneous Particulars.

1385. *Notoceras*. From *voros*, the back, and *zigas*, a horn. The structure of the pod of this genus is intermediate between *Erysimum* and *Capsella*. The species are small annuals, with very minute flowers, which are sometimes apetalous.

1386. *Barbarea*. A name used by Dodoens, because the plant had been called the herb of St. Barbara by some preceding botanists. *B. vulgaris* is sometimes cultivated as a spring salad, but is much less delicate than the common cress, and has nothing in flavor to recommend it. *B. præcox*, the American or Bellesie cress of gardeners, is preferred to the other, and cultivated in a number of gardens.

1387. *Braya*. A curious little plant, with the habit of *Arabis cærulea*. Leaves are linear, racemes terminal, flowers purple. The genus is not completely known ; but it appears to be intermediate between *Siliculosæ* and *Siliculosæ* ; related to *Draba* on one hand, and *Arabis* on the other. It is a native of the Carinthian alps, where it was found by Dr. Hoppe, who named it after Count Bray, a German nobleman.

1388. *Parrya*. Named by Mr. R. Brown, after Captain Edward Parry, the commander of the British expeditions to discover the north-west passage round America. It was found upon Melville island, and once was raised from seeds brought home by some of the officers, but it never flowered, and is now lost.

1389. *Turrilis*. From *turris*, a tower ; the leaves and seeds giving the stem a pyramidal form. This genus is principally distinguished from *Arabis* by its seeds being in two rows, and by its habit.

1390. *Arabis*. Native of *Arabia*, according to De Theis ; but this is a forced explanation, and scarcely the true root of the word. Distinguished from all the neighbouring genera by its linear compressed siliques, and flat valves.

History, Use, Propagation, Culture,

1391. *Macropodium*. So named because the pod is elevated above the receptacle upon a stalk; *μακρος*, long, and *πους*, a foot or stalk. A genus differing from *Arabis* chiefly in its stalked pod, and its calyx being a little thickened at the base. A little, smooth, erect, simple herb, with ovate, lanceolate, acuminate leaves, and white flowers.

1392. *Cardamine*. From *καρδια*, the heart, and *δυναμις*, to strengthen, in allusion to its supposed stomachic qualities. The leaves of *C. pratensis* were formerly used in salads. *C. impatiens* is so named from the sudden bursting of the seed pods, being ripe and pressed between the fingers. *C. pratensis* frequently has double flowers. *C. hirsuta* and, it is said, other species, produce young plants from the leaves. All that is necessary is to lay the leaf on a moist grassy surface, or on moss kept moist. The plant propagates itself extensively in this way in moist soils.

1393. *Pteroncuron*. From *πτερον*, a wing, and *νευρον*, a nerve, in allusion to the winged nerves of the pods, by which it is distinguished from *Dentaria* and *Cardamine*.

9005 Lower lvs. stalked lyrate : terminal lobe ovate ; upper lanceolate cut. Stem branched weak softly villous  
 9006 Leaves all stalked ovate-acumin. coarsely toothed velvety with very fine down, Pedic. and pods spreading  
 9007 Lvs. stem-clasping acum. somewhat toothed pubescent, Pedicels length of calyx, Pods 1-sided decurved  
 9008 Leaves stem-clasping toothed oblong dilated and cordate at base, Stem furrowed hispid, Pods pendulous  
 9009 Cauline leaves linear sessile smooth : lower somewhat toothed ; radical obovate, Pods erect  
 9010 Cauline leaves sessile oblong lanceolate acuminate somewhat toothed, Pods pendulous falcate [stalk  
 9011 Lvs. roughish nearly ent. : rad. obov. ; caul. ov. or obl. Rac. nodding, Pods erect 3 times as long as their  
 9012 Lvs. smooth nearly entire : rad. obovate ; cauline ovate, Raceme erect, Pods 4 times as long as their stalk  
 9013 Leaves smooth nearly entire : rad. oblong obovate ; cauline few oblong, Raceme nodding, Pods. erect  
 9014 Lvs. hoary with stellated down obl. sinuate toothed : rad. stalked ; caul. sess. Pods 8 times as long as their  
 9015 Leaves stem-clasping shining [stalk

9016 Leaves ovate lanceolate acuminate subserrate, Raceme terminal long

9017 Lvs. smooth stalked cordate roundish subsinuate toothed, Stem erect, Pods erect twice as long as stalk  
 9018 Leaves smooth thickish : radical stalked ovate entire ; cauline few entire or 3-lobed, Pods erect  
 9019 Leaves smooth membranous radical : radical undivided ; lower cauline 3-fid, upper 5-lobed, Pods erect  
 9020 Leaves smooth 3-fid, Segments stalked ovate acuminate toothed, Pods spreading  
 9021 Lvs. smoothish 3-fid, Segm. sess. rhomb. roundish tooth. Scape naked, Lower branches root-like creeping  
 9022 Leaves above downy trifid, Segments somewhat stalked ovate lanceolate crenate, Stem ascending  
 9023 Radical leaves stalked ovate subcordate : cauline pinnatifid with oblong entire lobes, Root granular  
 9024 Leaves pinnatifid, Segments of radical roundish ; of cauline toothed angular, Stem rooting at base  
 9025 Lvs. pinnatifid, Segm. ovate nearly entire : term. round. 3-lobed, Runners creeping, Stem ascend. pubesc.  
 9026 Lvs. pinnatifid, Segm. of rad. roundish : of cauline linear or lanc. entire, Style very short, Stigma capitate

9027 Leaves pinnatifid or lyrate, Lobes oval angular toothed blunt, Stem erect, Petals oblong linear  
 9028 Leaves pinnatifid, Segm. of radical roundish mucronate stalked, of the upper oblong subsess. Petals obl.  
 9029 Leaves pinnatifid, Lobes sessile obl. linear entire the lowest distant from the stem, Petals oblong linear  
 9030 Leaves pinnatifid, Segm. oval oblong somewhat toothed, lowest close to the stem acute stipule-like  
 9031 Leaves pinnatifid smooth, Segm. 3-7 roundish toothed angular, Pods erect a little longer than stalk,  
 9033 Leaves pinnatifid nearly smooth, Segm. stalked ovate toothed lower pinnatifid, Segm. 3-4

9033 Segm. of leaves somewhat stalked roundish tooth-lobed nearly equal

9034 Leaves 3 whorled stalked trifid, Segm. oval lanceolate acuminate serrated, Stamens length of petals  
 9035 Leaves 1-2 alternately shortly stalked 3-fid, Segm. ovate lanceolate coarsely and unequally serrate lobed  
 9036 Leaves many alternate stalked trifid, Segm. broad oval cut toothed, Axillæ without glands  
 9037 Leaves many alternate stalked trifid, Segm. ovate-lanceolate remotely toothed, Axillæ with glands  
 9038 Caul. lvs. many alternate stalked palmate 5-lobed, Segm. oblong lanceolate acuminate coarsely serrated  
 9039 Cauline leaves alternate stalked pinnatifid, Segm. oblong acuminate serrate toothed  
 9040 Cauline leaves alternate pinnatifid : upper undivided mostly bearing bulbs in the axillæ

9041 Pods lanceolate narrowed at each end

9042 Pods elliptical blunt at each end

9043 Leaves sub-bipinnatifid, Lobes oblong sinuate angular

9044 Stem shrubby erect, Leaves linear with close hairs  
 9045 Stem half-shrubby at base erect, Leaves lanceolate downy  
 9046 Stems half-shrubby ascending, Leaves oblong obovate stalked and pods hoary with down  
 9047 Stems herbaceous erect, Leaves oblong repand, Pods velvety with short down, Stigma capitate

and Miscellaneous Particulars.

1394. *Dentaria*. From *dens*, a tooth ; its roots are furnished with projecting angles, which resemble the molar teeth of quadrupeds. Plants with broad palmate or pinnate leaves, and shewy white, yellowish, or purple flowers. The dried root of *D. diphylla* is used instead of mustard by the Americans, under the name of *pepper root*.

1395. *Lunaria*. Derived from *luna*, the moon, in allusion to the broad round silvery silicles. Large hairy plants, with alternate or opposite cordate leaves, and large lilac flowers.

1396. *Ricotia*. A word, the meaning of which is no where explained. It was probably formed after some obscure botanist. Small weak branched annual plants, with variously lobed foliage, and pale lilac flowers.

1397. *Farsetia*. In memory of Philip Farseti, a noble Venetian, celebrated for his botanical erudition. A small genus, with hoary entire leaves, and yellow or dirty-white flowers.

History, Use, Propagation, Culture,

1398. *Berteroa*. Named after Charles Joseph Bertero, a pupil of Balbis, and a friend of M. Decandolle, who speaks in high terms of his merits. A genus distinguished from its allies by its bifid petals and peculiar habit.

1399. *Aubrietia*. Named by Adanson, after Aubriet, the famous French botanical draughtsman. A genus very distinct in habit, and sufficiently different from *Berteroa* in its entire petals, and from *Alyssum* in its bisaccate calyx and oblong fruit.

1400. *Vesicaria*. From *vesica*, a blister or bladder. The silicles of this genus are inflated like small bladders. This is a genus which combines species with bisaccate and an equal calyx, with entire and toothed stamens, with edged or not edged seeds, and with a deciduous or persistent calyx. It will, therefore, require division hereafter.

1401. *Alyssum*. From *a*, privative, and *λωσσω*, rage; the *Alyssum* passed among the ancients for a plant which possessed the properties of allaying anger. The *αλωσσω* of Dioscorides is referred by Sprengel to *A. alpestre*. The species are shewy plants, of easy culture. *A. saxatile* is very ornamental early in the season.

- 9048 Silicles pubescent somewhat ventricose
- 9049 Silicles compressed flat elliptical smooth
- 9050 Silicles flat elliptical downy
- 9051 Pedicels longer than calyx

- 9052 Calyx bisaccate, Leaves oblong entire smooth ; lower ciliate subspatulate
- 9053 Calyx equal somewhat spreading and leaves velvety oblong entire or sinuate toothed, Stem herbaceous
- 9054 Calyx deciduous, Leaves oblong entire or repand wavy hoary with down

- 9055 Stems  $\frac{1}{2}$  shrubby at base subcorymbose, Leaves lanc. entire downy, Pods obov. orb. 2-seeded, Seeds edged
- 9056 Stems  $\frac{1}{2}$  shrubby at base panic. Leaves lanc. nearly entire velvety, Pods roundish 2-4-seeded, Seeds edged
- 9057 Stems  $\frac{1}{2}$  shrubby at base hoary with stellate down, Lvs. obl. spatul. silvery beneath, Pods ovate roundish
- 9058 Stems  $\frac{1}{2}$  shrubby at base hoary with stellate down, Leaves obl. obov. silvery beneath, Pods elliptical
- 9059 Stems  $\frac{1}{2}$  shrubby at base hoary with stellate down, Leaves obl. nearly acute whitish beneath, Pods ovate
- 9060 Stems  $\frac{1}{2}$  shrubby at base twisted diffuse hoary, Leaves hoary sublanceolate, Racemes corymbose
- 9061 Stems  $\frac{1}{2}$  shrubby at base diffuse hoary, Leaves obovate hoary, Racemes simple, Pods ovate oblong
- 9062 Stems diffuse pubescent, Leaves hoary : lower obovate ; upper oblong, Racemes simple
- 9063 Stem erect, Flowering branches panic. Lvs. lanceol. downy, Pods roundish elliptic. little longer than style
- 9064 Stem erect, Leaves lanceolate, Pods hirsute in long racemes twice as long as style
- 9065 Stems diffuse, Leaves lanceolate or somewhat linear hairy, Pods roundish rough 6 times as long as style
- 9066 Stems diffuse, Leaves linear lanceolate hoary, Cal. persistent, Pods four times as long as style
- 9067 Stems diffuse, Leaves linear lanceolate hoary, Pods roundish emarginate smooth
- 9068 Stem erect, Leaves velvety oblong sinuated : upper linear, Cal. spreading, Petals bifid
- 9069 Stems half shrubby at base procumbent, Leaves lin. lanceol. acute somewhat hoary, Pods oval woolly
- 9070 Stems half shrubby at base somewhat erect, Rad. lvs. obl.-lanc. acute silvery : caul. few lin. Pods woolly
- 9071 Stems  $\frac{1}{2}$  shrubby ascend. Lvs. obl. obt. narrowed at base scaly, Pods roundish smooth twice as long as style
- 9072 Stem shrubby, Branches and old peduncles spiny, Leaves obl. linear silvery, Pods round smooth

9073 Stems diffuse or ascending

9074 Cauline leaves sagittate stem-clasping, Pods flat smooth

9075 Leaves sessile 3-5-fid at end cuneate at base

- 9076 Scapes naked smooth, Leaves rigid linear lanceolate keeled ciliated, Stamens as long as petals
- 9077 Scapes naked smooth, Leaves long linear keeled ciliated, Stamens scarcely as long as calyx
- 9078 Scapes naked smooth, Leaves linear keeled rigid ciliated, Style as broad as hairy pod but twice as short
- 9079 Scapes naked downy, Leaves lanceolate flat hairy, Hairs branched, Pods oblong, Style very short
- 9080 Scapes downy with 2 toothletted leaves, Rad. leaves obl. nearly entire downy, Pods smooth
- 9081 Scapes naked or 1-leaved downy, Leaves lanc. hairy nearly entire, Pods lanceol. pubescent
- 9082 Scapes 1-leaved pubescent, Leaves ovate obl. with a short starry down, Pedicels downy, Pods oblong
- 9083 Stem leafy branched velvety with starry down, Leaves ovate toothed, Pod obl. smooth somewhat twisted
- 9084 Stem leafy branched velvety with starry down, Leaves obl. somewhat toothed, Pods obl. pubescent
- 9085 Stem branched leafy downy, Leaves ovate toothed downy, Pods ellipt. obl. many-seeded (32-36) velvety
- 9086 Stem branched leafy downy, Lvs. ovate toothed subcord. stem-clasping somewhat hairy, Pods smooth few-seeded (12-16)

9087 Pods elliptical shorter than stalk, Scapes 5-15-flowered

and Miscellaneous Particulars.

1402. *Clypeola*. From *clypeus*, a buckler, in allusion to the form of its silicle. A little annual plant, hoary, with stellate pubescence.

1403. *Pellaria*. A name with the same meaning and application as the last; *πέλαρη* signifies in Greek a small buckler.

1404. *Petrocallis*. From *πέτρας*, a rock, and *καλλος*, beautiful, in allusion to the rocky places where it grows, and which it enlivens with its elegant tufts of rose-colored flowers.

1405. *Draba*. From *δραβη*, acrid, biting, according to Linnæus. Little annual or perennial plants, found, for the most part, in the cold mountainous countries of Europe ; a few are also found in America. Some of the species have siliques, others silicles.

1406. *Erophila*. A genus divided from *Draba*, on account of its bifid petals ; and deriving its name from *ἔρος*, the spring, and *φιλία*, to love, in allusion to the time of the year when it appears.

History, Use, Propagation, Culture,

1407. *Cochlearia*. From *cochlear*, a spoon. The leaves are hollowed and concave like the bowl of a spoon. The annual species were formerly used as spring salads and antiscorbutics, but are now generally neglected.

*C. armoracia*, the horse radish, is cultivated as a condiment to roast beef. It is called upon the continent *Cran*, *Cran de Bretagne*, *Raifort*, *Reeredyck*, &c. &c. Two excellent modes of cultivating it have lately been described in the Horticultural Transactions, by Knight, a nurseryman, and Judd, a gardener. Both agree in trenching the soil to a considerable depth, and putting the manure at the bottom of the trench; but Knight plants the sets on the surface, and calculates on the root that strikes down to the dung for produce. Judd, on the other hand, makes holes quite to the bottom of his trenched soil, and in each drops a set, filling up the hole with wood ashes, rotten tan, or sand, calculating for produce on the shoot made from the set at the bottom of the hole, up through the sand or ashes to the surface. Judd's mode is the most ingenious, and appears the best, but either will do extremely well. A moist soil increases the bitter and alkaline flavor of this and all the Cruciferae.

Common scurvy-grass has powerful medical properties, as antiscorbutic and sialagogue, and stimulating the digestive organs. For ample details respecting its qualities, consult *Wier Cochli. Descr.* lib. 1., Basilæa. 1567. *Mæhlenroch Cochli. Cur.*, Lipsiæ, 1674. *Murr. App. Med.* 2. p. 420, &c.

9088 Pods lentiform smooth, Rad. leaves obl. toothed hairy; cauline linear oblong  
 9089 Pods ellipsoid, Rad. leaves obl. crenate; cauline long lanceolate toothed or cut, Root large fleshy  
 9090 Pods ellipsoid, Rad. lvs. obl. crenate; cauline lanc. toothed, Teeth cartilaginous, Root fleshy, Sepals erect  
 9091 Pods roundish, Cauline leaves cordate sagittate stem-clasping acuminate entire  
 9092 Pods ovate roundish with netted veins twice as short as stalk, Rad. leaves stalked ovate entire; caul. obl.  
 9093 Pods ovate globose twice as short as stalk, Rad. leaves stalked cordate; cauline ovate toothed angular  
 9094 Pods ovate the length of stalk, Rad. leaves stalked reniform entire; cauline scarcely any  
 9095 Silicles ellipsoid the length of pedicel, Leaves all stalked subdeltoïd  
 9096 Silicles roundish emarginate, Pedicels and petioles radical long, Leaves ovate rounded entire

9097 Radical leaves on long stalks cordate repand-toothed; cauline ovate cordate on short stalks  
 9098 Rad. lvs. somewhat stalked obovate-obl.; cauline oblong at the base hastate stem-clasp. with acute auricles  
 9099 Leaves oblong toothed, Stems erect, Silicles obovate orbicular shorter than pedicel  
 9100 Lvs. obl. tooth. blunt: lower stalked; upper sagit. stem-clasp. with acute auricles, Silicles subov. ventricose  
 9101 Lvs. somew. tooth.: rad. stalk.; caul. cord. stem-clasp. Stem branch. Pet. length of cal. Silicles obcordate  
 9102 Lvs. somew. fleshy ent.: rad. obov. stalk.; caul. obl. sagitt. stem-clasp. Pet. larg. than cal. Silic. obc. 4-seeded  
 9103 Lvs. nearly entire: rad. ovate stalked; caul. obl. stem-clasp. Pet. as long as cal. Silic. obcord. 8-12-seeded

9104 Radical leaves pinnatifid, Silicles obcordate

[twice as short as silicle

9105 Lvs. somew. fleshy entire: lower stalk. obov.; caul. ovate obl. somewhat stem-clasp. Stam. petals and style  
 9106 Lvs. somew. fleshy: lower stalk obov. obl. entire; caul. obl. Stamens petals and style about length of silicle  
 9107 Lvs. pinnated smooth, Pet. twice as long as decid. cal. Silicles acute at each end, Style very short exserted  
 9108 Lvs. pinnated, smooth, Pet. scarcely longer than calyx, Silicles blunt at each end 4-seeded, Stigmas sessile

9109 Petals unequal: outer largest

9110 Petals equal

9111 Shrubby, Lvs. cuneate or spatul. blunt ent. smooth, Flowers corymbose, Silicles truncate subemarg. at end  
 9112 Shrubby, Leaves cuneiform obtuse somewhat toothed at end a little ciliated, Flowers corymbose  
 9113 Shrubby, Leaves linear entire somewhat fleshy rather acute smooth or ciliated, Flowers corymbose  
 9114 Shrubby, Leaves ciliated blunt linear spatulate; lower somewhat toothed at end, Flowers corymbose  
 9115 Shrubby, Lvs. obl. blunt narrowed at base smooth, Fla. in long racemes, Silic. emarg. with a narrow recess  
 9116 Herbaceous, Lvs. lanc. acute somew. toothed, Fls. corym. becoming racem. Silic. obcord. narrowly emarg.  
 9117 Herbaceous, Lvs. lanc. blunt smooth entire or the rad. somew. toothed, Fls. finally racem. Silic. ovate trun.  
 9118 Herbaceous smooth, Leaves pinnatifid, Racemes corymbose but little elongated after flowering [style  
 9119 Herb. smooth, Lvs. lin. tooth. ciliat. at base dilat. at end, Silic. round. Lobes of end acute spread. short. than  
 9120 Herbaceous smooth, Leaves lanc. acuminate: lower serrate; upper entire, Silicles umb. acutely 2-lobed  
 9121 Herbaceous smooth, Leaves linear entire: radical somewhat toothed, Silicles corymbose 2-toothed  
 9122 Herb. smoothish, Lvs. lin. entire ciliated at base, Silic. corymb. emargin. with blunt lobes as long as styles  
 9123 Herb. smoothish, Leaves ciliat. somew. fleshy: lower spatul. 2-tooth. at end; upp. lin. Silic. corymb. emarg.  
 9124 Herb. smoothish, Lvs. stalked spat. blunt toothed and ent. ciliat. Corymbs somew. umbel. Cal. hairy at back  
 9125 Herbaceous smooth, Lvs. round. spatul. ent. rather fleshy, Silic. corymbo. emarg. with a broad blunt recess  
 9126 Half-shrubby at base pub. Lvs. rather fleshy cren.: lower ob. narr. at base; up. obl. lin. Sil. somew. corymb.  
 [emarginate  
 9127 Cal. bluntly 2-spurred, Silicles smooth rough with elevated dots in centre, Lobes of end meeting over style  
 9128 Cal. bluntly 2-spurred, Silicles smooth even, Lobes at the end somewhat meeting over the style  
 9129 Cal. acutely 2-spur. Silic. smooth with elevat. rough points on disk, not overhang. style at end, Stem hispid  
 9130 Silicles hispid on each disk, Radical leaves lyrate  
 9131 Silicles smooth even, Radical leaves lyrate

and Miscellaneous Particulars.

1408. *Thlaspi*. From  $\theta\lambda\alpha\sigma\sigma$ , to compress. The *Thlaspi*, says Pliny, bears seeds like the lentil, and compressed, whence its name. *T. arvense*, when rubbed, has the smell of garlic.

1409. *Capsella*. A diminutive of *capsula*. This, which is the common shepherd's-purse, has been separated from *Thlaspi* on account of its valves not being winged at back.

1410. *Hutchinsia*. Named after Miss Hutchins, to whom Sir James Smith was indebted for many communications of submarine algae during the progress of his English Botany.

1411. *Teesdalia*. Named after Mr. Robert Teesdale, author of a Catalogue of the Plants growing about Castle Howard, in the North Riding of Yorkshire, published in the Transactions of the Linnean Society. Small annual smooth herbs, with revolute leaves, and simple scapes of small white flowers.

1412. *Iberis*. From the country called *Iberia*, now Spain. Most of the species grow in such countries. They are generally pretty plants, and some of them are commonly cultivated in gardens as hardy annuals, under the name of Candy-tuft; a name which was originally applied to the *I. umbellata* only, which was first discovered in Candia, and called *Thlaspi Candia* by Lobel and Dodoneus.

1413. *Biscutella*. From *bis scutella*, a double shield, in allusion to the form of its seed-vessel when bursting. Small annual or perennial hispid plants, with small bright yellow flowers. The species are nearly related to each other, and difficult to distinguish.
