History, Use, Propagation, Culture,

1414. *Euclydium.* From *eu*, well, and *κλυδου*, to shut up, because of the firmly closed seed vessel.  
 1415. *Ochthodium.* So called from *εχθωτης*, warted, in allusion to the surface of the pods.  
 1416. *Anastatica.* Derived from *αναστρεω*, resurrection. This plant has been so called because it has the curious property of recovering its original form, however dry it may be, upon immersion in water. The common people believe that if you put this in water at the time when a woman first experiences the pains of childbirth, it will expand at the precise moment when the infant is brought into the world. Commonly called *Rose of Jericho*. It grows in the arid wastes of Arabia and Palestine, where it is called *kaf margam*, that is to say, Mary's hand.  
 1417. *Cakile.* An Arabic word employed by Serapio. Smooth fleshy annual plants, with pinnatifid leaves, and white or purple flowers. They all grow upon the sandy coasts of the northern hemisphere. *C. maritima* is said by Anguillara to be a powerful cathartic.

- 9132 Silicles even ciliated at edge, Radical leaves lyrate  
 9133 Silicles even ciliated at edge, Stem erect elongated leafy, Leaves sessile oblong remotely toothed [at base  
 9134 Sil. rough on edge and disk with a very fine down, Rad. lvs. obov. cun. acute tooth. Stem somew. nak. hisp.  
 9135 Silicles: rough on the edge and disk with a very fine down, Leaves lanc. serrate, Stem leafy branched hairy  
 9136 Silicles smooth even, Rad. leaves rough with hair oblong narrowed into stalk : cauline linear few entire  
 9137 Silicles smooth even, Leaves rough with hairs, generally radical pinnatifid with 2-3 rem. lobes on each side  
 9138 Sil. smth. even, Lvs. rough with hairs : rad. sin.-tooth. nar. at base ; caul. very few cord. at base  $\frac{1}{2}$  stem-clasp.  
 9139 Silicles smooth rough with elevated dots on the disk, Leaves hairy generally radical oblong  
 9140 Silicles smooth rough with elevated dots on disk, Lvs. mostly radical erect linear lanc. hoary nearly entire

9141 Silicles scabrous with a persistent subulate style, Cauline leaves stalked lanceolate

9142 The only species

9143 The only species

9144 Upper joint of the silicle ensiform

9145 Silicles smooth : upper joint ovate longer than style, Leaves pinnatifid, Lobes toothed cut acute

9146 Silicles downy : upper joint round rugose shorter than style, Leaves blunt toothed ; radical sublyrate

9147 Silicles furrowed smooth, Leaves oblong toothed sinuated

9148 Silique and leaves smooth : upper lanceolate toothed ; lower pinnatifid

9149 Siliques and leaves hairy smooth, Leaves all sinuate pinnatifid

- 9150 Stem branched dif. Lvs. lanc. somew. toothed, Down 2-4-parted, Pedi. shorter than persist. cal. Siliq. rough  
 9151 Stem erect simple, Lvs. obl. cut tooth. Down 3-parted, Pedi. shorter than decid. cal. Siliq. smth. about 4-cor.  
 9152 Stem branched somew. hairy at base, Lvs. ov. acute toothed angul. and siliq. smooth, Pedi. shorter than cal.  
 9153 Stem erect branch. Lvs. obov. ent. Down 2-parted app. Pedi. length of cal. Siliq. round. pub. Style very short  
 9154 Stem erect branched, Lvs. ellipt. blunt ent. nar. at base, Down app. 2-4-parted, Pedicels shorter than cal.  
 9155 Stem erect branched, Lvs. lanc. acute : lower toothed sess. Down stel. Pedi. very short, Pods torulose subul.  
 9156 Stem erect branched, Lvs. obl. blunt nearly ent. Down tom. stel. Pedicels finally as long as cal. Pods pubesc.  
 9157 Stem erect branched, Lower lvs. lyrate stalked blunt, Down app. 2-part. Pedicels length of cal. Pods pubesc.  
 9158 Stem compound erect, Leaves lanceolate linear nearly entire hoary, Pedicels length of cal. Pods hoary

- 9159 Pedicels very long spreading stiff as broad as silique which is thickened at each edge, Petals obl. oblique  
 9160 Pedicels shorter than cal. Petals obovate oblong, Leaves obovate cut-toothed, Stem hispid  
 9161 Pedic. longer than cal. Petals obov. somew. pointed, Lvs. downy : lower lyrate runcinate ; upper lanc. acum.

9162 Pedicels length of cal. Petals obov. Siliq. erect torose smooth not thickened at edge, Lvs. ovate lanc. toothed

- 9163 Pedicels glandular hairy length of cal. Petals obovate, Leaves oblong blunt and stem simple ciliate hispid  
 9164 Pedic. scarcely so long as cal. Petals obovate, Leaves somewhat radical somewhat fleshy lanc. Scape simple

and Miscellaneous Particulars.

1418. *Rapistrum* ; that is to say, resembling *Rapa*. A genus very near *Cakile*, from which it differs in having yellow flowers, and leaves not fleshy, and more or less hairy.

1419. *Chorispora*. From  $\chi\omega\rho\iota\varsigma$ , separately, and  $\sigma\pi\omicron\rho\alpha$ , seed ; each seed being enclosed separately in the pod. This differs from *Raphanus* in having flat decumbent cotyledons, not folded incumbent ones. Little annual plants.

1420. *Malcolmia*. Named after Mr. William Malcolm, an eminent nurseryman in the neighbourhood of London, and a person of some botanical acquirements. *M. maritima* is a common annual, which, sown at different times, or left to sow itself, will be in flower nearly all the year.

1421. *Hesperis*. From  $\eta\sigma\pi\epsilon\rho\iota\varsigma$ , the evening. The flower is more fragrant towards evening than at other periods of the day. *H. matronalis*, in its double varieties, is rather difficult to keep, and requires to be yearly renewed by cuttings. It prefers a strong loamy soil ; and it has been remarked, that it neither thrives in the neighbourhood of London or Paris.

History, Use, Propagation, Culture,

1422. *Sisymbrium*. *Συμβριον* was the name given by the Greeks to some aquatic plant not now recognized. It appears to have had an agreeable smell. Ovid advises that Venus should be propitiated with garlands of myrtle, of roses, and of *Sisymbrium*. *S. officinale* is a celebrated medicinal plant, and esteemed diuretic, detersive, and expectorant, and prescribed in asthma and hoarseness, whence the French call it *Herbe aux chantes*.

1423. *Alliaria*. From *allium*, garlic, in allusion to the smell of the leaves of this plant, for the sake of which it was formerly used in salads.

1424. *Erysimum*. From *ερωσω*, to cure, on account of the salutary effects of this plant in medicine. It is even now reckoned a powerful cure for the sore throat. The plant of the ancients appears to have been our garden cress; for Pliny says the Gauls called his *Erysimum velar*, and the garden cress is to this day called *vilhar* in

9165 Leaves runcinate hairy, Stem hairy, Siliques subulate appressed to the rachis  
 9166 Leaves lanceolate stalked toothed pubescent  
 9167 Leaves smooth glaucous : lower stalked runcinate pinnatifid ; upper linear lanceolate entire  
 9168 Leaves lanc. toothed sessile smooth, Stem branched divaricating, Siliques erect roundish smooth [base  
 9169 Leaves pinnated, Lobes oval oblong blunt sinuate-toothed with rounded recesses, Stem hispid backward at  
 9170 Stem and lvs. smth. : rad. runcin. ; caul. pinnatifid, Lobes and recesses acute, Cal. much spread, Pods rough  
 9171 Stem pods and lvs. smooth : rad. runcin. ; cauline cut or pinnatifid, Lobes and recesses acute, Cal. spreading

9172 Stem and leaves smooth runcinate pinnate, Lobes toothed terminal elongated, Cal. and pods spreading erect  
 9173 Stem villous somewhat hoary, Leaves runcinate pubes. Lobes toothed or ent. acute, Pods nearly erect, Cal. lax

9174 Lower leaves runcin. hispid with toothed lobes : upper pinnated smooth with lin. ent. lobes, Pods spreading  
 9175 Lvs. smth. pinnat. with obl. blunt somewhat tooth. lobes, Pedic. very sh. Pods muric. rough point. with sh. style  
 9176 Leaves bipinnate with oblong linear cut lobes, Pedicels 4 times as long as calyx, Petals smaller than calyx  
 9177 Leaves about 3-pinnate hoary with very small blunt lobes, Stem  $\frac{1}{2}$  shrubby, Petals larger than calyx  
 9178 Lvs. pinnated, Segm. lanc. cut serrated : outer confluent, Petals larger than calyx, Pods shorter than stalk  
 9179 Pedic. axillary very short solitary, Pods erect downy, Leaves sinuate pinnatifid, Stem downy backwards  
 9180 Pedic. about 3 axill. very short, Pods erect smooth, Lvs. sinuate runcin. Lobes acute toothed lowest largest  
 9181 Pedic. very short axill. or naked, Pods and stems erect hispid, Leaves somewhat obl. acutely runcin.-pectin.  
 9182 Leaves lyrate pinnatifid smooth, Stem erect leafy, Pedicels thick shorter than calyx  
 9183 Rad. leaves lyrate : cauline pinnat. Lobes linear ent. term. largest, Pedic. slender almost shorter than alix  
 9184 Leaves linear entire, Branches and pedicels glandular and hairy, Pods glandular

9185 Leaves cordate, Pods prismatical much longer than pedicel

9186 Leaves ovate roundish, Pods lanceolate the length of their stalk

9187 Pods length of style : when young covered by the persistent calyx, Fl. sessile, Leaves linear entire  
 9188 Pods much longer than style when young having a persistent calyx, Fl. subsessile, Leaves linear entire  
 9189 Pods thrice as long as style 2-edged naked, Fl. on short stalks, Leaves oblong lanceolate sinuate toothed  
 9190 Leaves lanc. toothed pubescent with a 3-parted down, Stem branched, Pods lax, Stigma 2-lobed [of pod  
 9191 Lvs. obl. lanc. some tooth. pub with 3-part. down, Stem straight round, Length of style great. than breadth  
 9192 Lower leaves runcinate toothed : upper lanc. undivided, Fl. branches and pods comp. 4-cor. erect spreading

9193 Lvs. lanc. somewhat toothlet, roughish green, Pods erect spread. twice as long as stalk, Stigma small subsessile  
 9194 Leaves linear lanc. repand-toothed, subpubes. Pods spreading, torulose scarcely thicker than short pedicel  
 9195 Lvs. lin. entire and stem cinereous with appressed 2-parted hair, Pods somewhat erect, Stigma stalked emarg.  
 9196 Lvs. lin. ent. or somewhat tooth. somewhat hoary with 2-part. hair, Claws long. than cal. Pods erect, Stig. near sess.  
 9197 Lower lvs. lanc. toothed : upper somewhat linear entire, Petals roundish obovate, Claws longer than calyx  
 9198 Leaves lanceolate toothed narrowed at base, Petals obovate oblong, Pods spreading, Style scarcely any  
 9199 Leaves lin. obl. : lower toothed runcin. and stem pubesc. rough, Pods spreading, Style very short and thick  
 9200 Leaves membranous smoothed : cauline cordate sagittate stem-clasping oblong ; radical stalked ovate

9201 Rad. lvs. obov. : cauline cordate stem-clasping, all blunt smooth glauc. Sides of square stalk without nerves

9202 Pods cuneate pyriform with 4 ribs and a longish style, Leaves lanceolate nearly entire

9203 Pods roundish pyriform with 4 ribs and a longish style, Leaves repand toothed

9204 Pods globose, Leaves oblong serrate toothed bluntly stem-clasping at base, Stem smooth

9205 The only species

9206 Leaves pinnatifid, Lobes oblong toothed or cut, Pods compressed twin netted

9207 Lvs. pinnatifid, Lobes ent. toothed or pinnatifid, Pods somewhat acute compressed with crested rugose valves

and Miscellaneous Particulars.

the Basque tongue, and in other dialects of France *beler* or *veler*. From the seeds of *E. perfoliatum*, a plant not known in this country, oil for lamps is expressed in Japan.

1425. *Camelina*; that is to say, *chamae-linum*, dwarf flax. *C. sativa* is cultivated in many parts of Europe for the seeds, from which oil is obtained. For the method of its culture see Parmentier, in *Roz. Cours d'Agric.*, v. xi. p. 291. *Bosc. Dict. d'Agr.* 3. p. 45. *Galliz. Bot. Agr.* 3. p. 170.

1426. *Nestia*. A name first employed by M. Desvaux, but not explained by him. A genus allied to *Camelina*, but well distinguished by its one-seeded indehiscent siliques.

1427. *Coronopus*. From *κορυφή*, a crown, and *πους*, a foot. The leaves are deeply cut, and resemble the feet of a bird. *Coronopus Ruellii* was formerly gathered and used as a salad, but has long since been deservedly neglected. *C. niloticus* is said, by Delile, to be used in Egypt for the same purpose.

History, Use, Propagation, Culture,

1428. *Lepidium*. From *λεπτε*, a scale. The form of the silicles is that of little scales. *L. pisidium* is used by the natives of the Society Islands for the purpose of catching fish by inebriating them. It was used by the English voyagers as a salad, but it was very pungent. *L. oleraceum* is a powerful antiscorbatic, and is found of great service to the crews of ships visiting New Zealand; it resembles lettuce in taste, and acts as a moderate aperient. *L. sativum*, the common garden cress, is a salad-plant known to every one, and which even the cook can cultivate on moistened cloth or wool in a moist heat. Watering with water, impregnated with muriatic acid gas, or electrifying, will facilitate the germination and development of the seeds.

1429. *Ethionema*. So named by Mr. R. Brown, apparently in allusion to some tawny or sunburnt tinge in the stamens. From *αιθρα*, to scorch, and *νισσα*, a stamen. *Smith*.

1430. *Isatis*. From *ισα*, to render equal. The plant was believed to destroy, by its simple application, all roughness and inequalities of the skin. It was formerly called *glastum*, from the Celtic *glas*, blue, whence *Glastonbury* derived its name. The ancient Britons colored themselves with the blue preparation obtained from this plant, whence they received their appellation, *Briti* being the Celtic word for to paint. The Picts were so named by the Romans for the same reason. On account of the brightness of its manufactured colors the Celts called it *gued* (*guende*, French, at this day), whence the Anglo-Saxons obtained their name of *woad* or *wad*, and the English the word *woad*. *I. tinctoria* is in occasional cultivation for its leaves, from which a dye, as a substitute for indigo, is obtained. The seeds are sown on well prepared land in good heart; fresh broken old pasture land is preferred; and the great object is to have large leaves; for which purpose, as Miller observes, the culture given by the best gardeners to spinage should be imitated, that of sowing on a very rich well pulverised soil, thinning the plants so as they may not touch each other, keeping them perfectly clear of weeds, and frequently stirring the soil between the plants. The culture applied to the turnip in Northumberland would succeed well with woad. The seeds are sown in July, and the plants, when they come up, weeded and thinned; next July, or earlier, the first crop of leaves may be gathered, and two or three others will be ob-

- 9208 Pods cordate somewhat turgid entire at the end exceeded by the style, Leaves stem-clasping lina. toothed  
 9209 Pods elliptical twice as long as stalk, Style filiform, Leaves with acute stem-clasping lanceolate auricles  
 9210 Pods ellipt. smooth shorter than stalk, Style filif. Leaves with blunt stem-clasping obl. bluntly toothed auric.  
 9211 Pods ellipt. ent. somew. downy pointed with style, Cal. somew. persistent, Rad. lvs. pinnat. : caul. lin. ent.  
 9212 Pods orbicular winged, Leaves variously divided and cut, Branches not spiny  
 9213 Pods ovate winged emarginate scaly, Cauline leaves sagittate toothed  
 9214 Pods ovate winged emarginate hairy, Cauline leaves sagittate villous nearly entire  
 9215 Pods oblong winged emarginate about 2-horned smooth, Radical leaves pinnatifid with cut lobes  
 9216 Pods orbic. emarg. shorter than stalk, Flowers with 2-4-stamens, Caul. lvs. lin. lanceol. cut-serrate smooth  
 9217 Pods ovate somewhat emarginate, Leaves subulate entire, Stem  $\frac{1}{2}$  shrubby  
 9218 Pods ovate emarg. spreading shorter than stalk, Leaves smooth : radical pinnatifid, Fls. diandrous apetal.  
 9219 Pods elliptical slightly emarginate, Leaves pinnatifid. Lobes linear, Joints of stem inflated  
 9220 Pods ellipt. slightly emarg. Lower lvs. stalked pinnatifid with multifid lobes : upper cord. amplexicaul entire  
 9221 Pods oval somewhat emarginate, Leaves pinnatifid with oval entire lobes : terminal large roundish  
 9222 Pods oval somew. emarg. approximat. Lower leaves pinnati. with spread. acute lobes, Stem much branched  
 9223 Pods orbicular emarginate, Flowers diandrous, Leaves all pinnately multifid minutely ciliated  
 9224 Pods oblong obovate emarginate, Stigma exserted, Leaves oval-oblong toothed outwardly or entire  
 9225 Pods ovate acutish, Leaves smooth ellipt.-oblong deeply serrated : upper entire somewhat serrated at end  
 9226 Pods ovate pointed with stigma, Lower lvs. stalked lyrate pinnatifid, Lobes cut toothed : term. very large  
 9227 Pods ovate pointed with the stigma, Leaves ovate lanceolate undivided subserrate, lowest on long stalks  
 9228 Pods ovate pointed with stigma, Leaves smooth somew. fleshy entire, Rad. stalked ovate : caul. sess. sagitt.  
 9229 Pods elliptical pointed with stigma, Stems  $\frac{1}{2}$  shrubby, Radical lvs. obov. obl. toothed : cauline linear entire  
 9230 Pods ovate pointed with stigma, Rad. leaves cut or pinnatifid : cauline linear entire, Stem much branched

- 9231 Silicles 2-celled many-seeded obcordate, Valves winged at back and entire, Racemes in fruit lax  
 9232 Silicles 2-celled 2-seeded round emarg. at base and end, Racemes very close, Valves winged at back and ent.  
 9233 Silicles 1-celled 1-seeded not opening emarginate at end, Leaves oval or obovate

- 9234 Silicles round cordate at base with a wide margin pointed with the style  
 9235 Silicles obov. with a broad edge cuneate at base very blunt and emarginate at end, Stem and leaves smooth  
 9236 Silicles oval-oblong blunt at each end with a leafy winged margin 3 times as long as broad  
 9237 Silicles elliptical blunt at each end with a coriaceous winged edge three times as long as broad  
 9238 Silicles obl. cuneate very blunt truncate emarginate narrowed at base, three times as long as broad  
 9239 Silicles cuneate acuminate at base somewhat spatulate at end very blunt three times as long as broad  
 9240 Silicles oblong narrowed at base blunthish at end four times as long as broad [at end  
 9241 Silicles elongate-cuneate downy four times as long as broad and twice as long as the stalk which is obconical

- 9242 Silicles lin. blunt vill. with reversed down eight times as long as broad and three times as long as their stalk

- 9243 The only species

- 9244 Lvs. covered with glaucous pollen somew. fleshy repand or lobed even in their youngest state quite smooth

and Miscellaneous Particulars.

tained during the season. The end of the second year the plants may be ploughed down, as the third year they will run to seed, and yield but small leaves. The leaves are pressed, and the juice treated as in making indigo (see *Indigofera*); but such is the cheapness of the latter article, that no British farmer can afford to raise any sort of substitute.

1431. *Myagrwm*. An ancient plant, so named from its properties of catching flies, which the modern plant does not possess;  $\mu\upsilon\alpha$ , a fly,  $\alpha\gamma\gamma\alpha$ , capture.

1432. *Brassica*. The etymology of this word has been explained with great learning and ingenuity by Vossius, Ray, Dalechamp, and others. It comes, however, from the Celtic *brasic*, which signifies a cabbage. This genus affords the well known pot herbs and roots, and also the oil plant rape, extensively cultivated in agriculture. There is scarcely an instance in the vegetable kingdom of a plant that produces varieties so different in appearance and qualities as the *B. oleracea*; comparing the original plant as it is found on our shores, with wavy sea-green leaves, no appearance of a head, and flowering like wild mustard or charlock, with the red cabbage or cauliflower, the difference is astonishing. A new arrangement of the cultivated species of *Brassica* has been made by Professor Decandolle (*Hort. Trans.* vol. 1., and in his *Reg. Veg.*), whose varieties, or races of *B. oleracea*, are stated above.

The *colza* of the Dutch he makes a distinct species (*B. campestris*), and also the turnip (*B. rapa*); the rape (*B. napus*), and the summer rape of the Germans (*B. præcox*).

In Hungary, in the territory of Alba, the *B. elongata* is cultivated for its oil, for which purpose it is said to be better adapted than any other species.

The culture of all the *Brassica* tribe is so universally known that it would be a waste of space in a work of this sort to enlarge on it. They all prefer a loamy soil, well enriched with manure; and manures of the strongest kind, as nightsoil, offals from the shambles, blood, &c. are not found so powerful for common cabbage or cauliflower. The turnip prefers a lighter soil than the cabbage tribe, but it must be well manured, and if the

History, Use, Propagation, Culture,

manure be well fermented, so much the better for the garden turnip; in the fields, where it is buried in rows or drills, more littersy dung will succeed.

The field culture of the turnip is become an important part of the agriculture of light soils; the best mode is by drills, as in Berwickshire and Northumberland, where are produced crops of treble the weight of those grown in the broad-cast manner in Norfolk. In the latter county a crop weighs from five to fifteen tons per acre; in Northumberland from twenty-five to thirty tons; and in Ayrshire as many as sixty tons have been raised on the statute acre. (*Encyc. of Agric.*)

The cabbage has been tried as a field plant; but, though it has been said by Sinclair (*Hortus Gram. Wob.*) to produce more nutritive matter than either turnips or field beet, professional farmers have not found it to answer. Of all the Brassica tribe it may be observed, that they attain to much the greatest perfection in temperate climates, such as those of Britain and Holland. Without constant and liberal supplies of water, they are small in size, and rigid or stringy in texture. In France and in Italy, and warm climates, it is only the cauliflower and broccoli that attain a large size; and that, in Italy at least, is during the coldest months of the year, and aided by liberal waterings. But in Tarragona the cauliflower is said to reach the enormous weight of 40 lbs.

1433. *Sinapis*. In Greek *σινάπις*, said to be derived from *nap*, the Celtic designation of all plants resembling the turnip or cabbage. Our English word *mustard*, and the French *mustarde*, are modernizations of *mustum ardens*, hot must; the sweet must of new wine being one of the ingredients of the French mustard for the table. The seeds of all the species are hot, acrid, and will afford an oil by expression, and a powder or meal by drying and grinding, which might serve as the condiment mustard. *S. nigra* is more particularly adapted for the latter purpose, though it is often mixed with the seeds of *S. alba* and *arvensis*, and often with those of the

Garden Varieties.

9245 Lvs. fleshy with glaucous bloom : the lower when young somew. hispid or ciliat. lyrate toothed ; the others [cordate amplexicaul acum.

- 9246 Rad. leaves lyrate without glauc. bloom rough ; cauline cut : upper entire
- 9247 Lvs. smooth cesiosus : radical lyrate ; cauline pinnatifid and cren. cord. ; upper lanc. stem-clasping
- 9248 Lvs. smooth cesiosus : radic. and lower cauline lyrate ; upper cord. lanc. stem-clasping cren. Pods erect
- 9249 Lvs. oval nectansifire : floral amplexicaul lanc. Cal. longer than the claw of the petals
- 9250 Radic. leaves fleshy smooth toothed, Scapes naked, Style slender distinct from silique
- 9251 Leaves smooth : lower stalked obl. somewhat toothed ; upper linear lanc. few
- 9252 Leaves smooth somewhat fleshy glauc. pinnated with linear distant somewhat toothed lobes
- 9253 Leaves runcinate somewhat smooth, Lobes unequal bluntly sinuated, Stem hispid at base
- 9254 Leaves stalked : lower sinuate pinnatifid hispid ; upper smooth toothed, Stem smooth
- 9255 Rad. leaves stalked lyrate pinnatifid somewhat hispid : cauline few with entire acute lobes

- 9256 Pods smooth about 4-cornered pressed to the peduncles, Lower lvs. lyrate : upper lanc. entire  
β Pods turgid veiny diverging with a conical striated beak
- 9257 Smooth, Lvs. stalked lyrate pinnatifid with acute lobes, Petiole not auricled at base
- 9278 Smooth, Lvs. ovate lanc. undivided acutely toothed, Pods erect torose with a subulate style
- 9259 Smooth, Lower leaves ovate lanc. coarsely serrated : upper lanc. entire, Branches fascicled
- 9260 At the base and nerves hairy, Lvs. blunt cut pinnatifid, Lobes toothed, Pods erect pointed with the style
- 9261 Smooth, Caul. lvs. cord. amplexicaul obl. entire : lower lyrate pinnatifid toothed, Pods spreading with a [conical beak
- 9262 Lvs. pubesc. villous lyrate pinnatifid, Terminal lobe large ovate, Pod hairy
- 9263 Pods smooth with many angles torulose three times as long as their slender two-edged beak, Stem and lvs. [hairy
- 9264 Pods hairy backwards about 4-cornered torulose shorter than the slender beak
- 9265 Pods smooth round with smooth valves twice as long as the conical beak
- 9266 Pods smooth ovate-oblong, Valves smooth scarcely longer than conical beak
- 9267 Pods smooth appressed to the raceme somew. torose, Stem branch. rough at base, Lvs. lyrate rough
- 9268 Pods downy appressed to raceme somew. torose, Stem bran. rough at base, Lvs. lyrate pinn. hispid on nerves
- 9269 Pods hispid spreading a little narrower than the ensiform beak, Lvs. lyrate and stem nearly smooth
- 9270 Pods hispid spreading a little narrower than the ensiform beak, Lvs. lyrate rough, Stem hispid backwards
- 9271 Pods suberect torulose shorter than the ensiform beak, Lvs. pinnat. Lobes narr. cut-toothed or pinnatifid
- 9272 Beak compressed very rough longer than the hispid pod, Lvs. lyrate repand angular smooth
- 9273 Calyx bisaccate, Lvs. coriaceous : lower oblong lanc. narrowed at base somewhat toothed

9274 Pods about 4-cornered, Cauline leaves cordate amplexicaul entire

- 9275 Pods pendulous stalked, Cauline leaves oblong hispid coarsely cut-toothed
- 9276 Pods pendulous sessile, Leaves obovate coarsely toothed hispid
- 9277 Pods sessile nearly erect, Style ensiform, Leaves sessile runcinate lyrate toothed

and Miscellaneous Particulars.

Brassica and Raphanus genera. Both *S. alba* and *nigra* are grown as small salads to be eaten with cress ; they are sown as thick as the seeds will lie, in pots or boxes, or in the area of forcing-houses, in the winter season, and forced, or in beds in the open air, and cut as soon as the seed leaf is fully expanded. For flower of mustard, or for the seed for oil or medical purposes, both white and black sorts are sown in the fields in rich well pulverized soil, in March or April, and kept free of weeds. The crop ripens in July and August, and is either threshed immediately or stacked like other grain. It is like other oleiferous seeds, exhausting for the soil, and such seeds as drop and are buried, will retain their vegetative qualities for an unknown length of time ; so that where mustard has once been grown, it will come up occasionally for a century or more afterwards.

If the seeds, Dr. Cullen observes, be taken fresh from the plant and ground, the powder has little pungency, but is very bitter ; by steeping in vinegar, however, the essential oil is cooled, and the powder becomes extremely pungent. In moistening mustard-powder for the table, it may be remarked, that it makes the best appearance when rich milk is used ; but the mixture in this case does not keep good for more than two days. The seeds of both the black and white mustard are often used in an entire state medicinally. Half or a quarter of a wine glass of mustard seeds, swallowed fasting, about five in the morning, is the most powerful tonic and strengthener of the digestive organs which is known.

1434. *Moricandia*. Named by Decandolle, after his friend Stephen Moricand, author of the *Flora Veneta*, and an excellent Italian botanist. *M. hesperidiflora* is a favourite food of the camel, notwithstanding its intense acidity.

1435. *Diplotaxis*. From διπλος, double, and ταξις, arrangement, on account of the double rows of seeds in each cell.

History, Use, Propagation, Culture,

1436. *Eruca*. The meaning of this word is involved in obscurity. According to Isidore, of Seville, a learned Spaniard, who died in 636, and left a book of etymologies, *cruca* is an alteration of *urica*, derived from *uro*, to burn. From *cruca*, the Italians formed *ruchetta*, the French *rocketta*, and the English *rocket*. *E. sativa* is very pungent in the foliage, and is used as a salad in the South of Europe for its aphrodisiacal powers:

"Excitat ad venerem tardos *Eruca maritios*."

1437. *Vella*. Latinized from *valer*, the Gallic name of the cress. A pretty low shrub, with beautiful yellow flowers appearing in the early spring. It is hardy enough to live through the winter in a dry warm south border.

1438. *Carrichtera*. An unexplained name, first used by Adanson. A small annual plant, with pinnated leaves, and long erect racemes opposite to the leaves. Flowers small, pale yellow.

1439. *Succowia*. In honor of Professor Suckow, a learned botanist of Heidelberg. An annual, with the habit of the last, from which it differs in its subulate style and solitary seeds.

1440. *Zilla*. The Egyptian name of the plant, which is a large glabrous herb, with round white branches and oblong toothed leaves, which are boiled and eaten by the Arabs like those of cabbage.

1441. *Calepina*. A name used by Adanson, the meaning of which is unknown. This plant has been transferred by one author or another to almost every genus of Siliculose, but appears to be really akin to *Crambe* only, from which it differs in its sessile and purely unilocular silicle, in its stamens having no teeth, and in the outer petals being larger than the others.

1442. *Crambe*. One of the names applied by the Greeks to the cabbage, and especially to the marine cabbage. *C. maritima* grows on sandy shores in the west of England, and there the common people have from time immemorial been in the practice of watching when the shoots and leafstalks begin to push up the sand

- 9278 Pods sess. nearly erect, Style roundish 1-2-seed. Lvs. pinnatif. with cut lobes and lin. sinuate toothed segm.  
 9279 Pods somewhat stalked erect, Style filif. short without seeds, Upper lvs. entire lower pinnatifid compound  
 9280 Pods sess. erect, Style short somew. filif. Rad. lvs. toothed or lyrate smooth, Stems nearly naked ascending  
 9281 Pods sess. erect, Style short somew. filif. Rad. lvs. runcinate toothed hispid, Stems naked erect  
 9282 Pods sess. erect, Style short somew. filif. Rad. lvs. lyrate very blunt smooth, Stems naked decumbent  
 9283 Pods sess. erect narrowed at base, Style short conical, Rad. lvs. pinnatifid thickish with entire lobes  
 9284 Lvs. lyrate pinnated with toothed acute lobes, Stem hirsute, Pedicels shorter than deciduous calyx  
 9285 Lvs. pinnatifid, Lobes acute nearly entire, Stem hirsute, Calyx persistent somewhat bladderly  
 9286 The only species  
 9287 The only species  
 9288 The only species  
 9289 The only species  
 9290 The only species  
 9291 Long filaments forked, Pod blunt, Leaves roundish sinuated wavy toothed glauc. and stem quite smooth  
 9292 Long filaments forked, Pod blunt, Leaves pinnatifid with obl. acute toothed lobes, Stem smooth  
 9293 Long filaments forked, Pod blunt smooth, Leaves pinnatifid toothed rough, Stem smooth [smoothish  
 9294 Long filam. forked, Pod blunt, Rad. lvs. decomposed, Pinnae cut toothed: younger rough; old and stem  
 9295 Long filam. forked, Pod blunt rugose, Lvs. pinnated with obl. lin. toothed lobes and stem rough  
 9296 Long filam. forked, Pod nearly blunt, Lvs. stalked toothed: lower cord.; upper ov. and stem nearly smooth  
 9297 Long filam. toothed, Pod blunt, Lvs. lyrate rough, Terminal lobe cord. orbicular  
 9298 Long filam. scarcely toothed, Pod blunt, Lvs. pinnate-lyrate hairy, Terminal lobe ovate  
 9299 Long filam. toothed on one side, Pod mucronate, Lvs. lyrate pinnatifid toothed hoary  
 9300 Filam. not toothed, Pod mucronate, Lvs. ov. toothed unequal and somew. auricled at base and stem hispid  
 9301 Pods round torose acuminate scarcely longer than stalk  
 9302 Pods depressed acuminate decumbent longer than the whole plant  
 9303 Pods 1-celled jointed striated 3-8-seeded longer than the style, Lvs. simply lyrate  
 9304 Pods 1-celled jointed substriated 2-6-seeded longer than the subulate style, Lvs. interruptedly lyrate  
 9305 Pods 1-celled jointed striated 2-6-seeded, Style conical shorter than the last joint, Lvs. interruptedly lyrate

and Miscellaneous Particulars.

and gravel, in March and April; when they cut them off under ground, as is done in gathering asparagus, and boil them as greens. About the middle of the last century the plant was first introduced into gardens, grown on deep sandy soil, and blanched either by sand, ashes, litter, or by covering with flower pots, earthen pots made on purpose, or any opaque cover. It is now almost as universal in good gardens as asparagus, and like it is forced either by taking up the roots and planting them on a hotbed, or in the border of a forcing house, or by covering or surrounding them with litter in the open garden. Before covering a bed with warm litter, each plant or stool of plants is covered with an earthenware blanching pot, or a wicker case, to keep off the dung from the young shoots, and to ensure their being blanched. No plant is so easily forced; and, unlike asparagus, it yields produce the first spring after raising from seed.

C. tataria is called by the Hungarians *Tatar-Kenger* or Tartarian bread, and its root, stripped of the bark and sliced, is eaten with oil, vinegar, and salt. The boiled root is sweet, and eaten by children. The young shoots are boiled like those of sea kail, and have an excellent taste, but are stringy, which they would not be if well cultivated, which the plant appears to deserve.

1443. *Raphanus*. From *βρα*, quickly, and *ραφειναι*, to appear, on account of the rapidity of its germination and arriving at perfection. *R. sativus* is a well known salad root, requiring a deep sandy soil to attain a large size. There are several varieties both of the spindle-shaped and globular rooted kinds, and a very distinct sort known as the black or Spanish radish. In the Horticultural Transactions, sixteen varieties are mentioned besides subvarieties, arranged as spring, summer, turnip, autumn, and winter radishes. They are all of easy culture, and the spring, summer, and turnip sorts force well on hot-beds, or on dung-beds covered with mats.

*R. caudatus*, or tree radish, is remarkable for the length of its pod, which is greater than the whole height of the plant. The young leaves of *R. Landra* are eaten by the inhabitants of Insubria as salad.

History, Use, Propagation, Culture,

1444. *Bunias*. From *Cucac*, a hill, because the plants grow upon exposed open situations. Linn.  
 1445. *Erucaria*. See *Eruca*, No. 1437. Plants with the habit of *Cakile*.  
 1446. *Heliophila*. From *ήλιος*, the sun, and *φίλος*, to love; a plant loving heat. All the species grow upon dry hot plains at the Cape of Good Hope. These are mostly beautiful annual or perennial plants.

- 9306 Pods 4-cornered : angles crested, Radical leaves runcinate  
 9307 Pods 4-cornered : angles crested, Leaves all lanceolate  
 9308 Pods ovate 2-celled not crested somewhat warted

- 9309 Pod style-bearing, Lvs. pinnated, Lobes linear : of the lower pinnatifid ; of the upper entire  
 9310 Stigma sessile, Beak longer than pod, Lvs. pinnated thick, Lobes linear

- 9311 Smooth, Pods rounded narrowed at each end, Leaves linear subulate  
 9312 Smooth, Pods moniliform, Lower lvs. opp. : upper altern. cord. stem-clasping obl. entire  
 9313 Smooth, Pods moniliform pendulous, Lvs. pinnated in 3-5-pairs, Lobes linear entire  
 9314 Hispid, Pods linear, Lvs. hairy either linear entire or trifid at end and cuneate at base  
 9315 Hispid, Pods linear, Lvs. oval entire or here and there coarsely cut-toothed  
 9316 Smooth, Pods linear, Leaves pinnated, Lobes and rachis linear entire  
 9317 Downy, Pods linear spreading, Lvs. pinnated or bipinnated : lobes filiform  
 9318 Velvety, Pods linear nodding, Lvs. pinnated somewhat fleshy : lobes subfiliform furrowed above  
 9319 Smooth, Pods linear erect or pendulous, Lvs. fleshy half round  
 9320 Pods linear compressed velvety, Style thick conical smooth, Leaves oblong  
 9321 Pods compressed stalked, Leaves linear lanceolate

9322 The only species

- 9323 Polyandrous hairy, Lvs. 5-7 cuneiform rough, Racemes term. Pods filiform  
 9324 Flowers dodecandrous, Leaves quinate and ternate  
 9325 Flowers dodecandrous, Leaves ternate  
 9326 Flowers gynandrous, Leaves quinate, Stem unarmed  
 9327 Flowers hexandrous, Leaves 7, Stem unarmed  
 9328 Flowers hexandrous, Leaves 7-5, Stem spiny  
 9329 Flowers hexandrous, Leaves quinate viscid, Stem spiny

- 9330 Prickly hexandrous, Leaves quinate and ternate : floral simple, Stigma dilated  
 9331 Flowers hexandrous, Leaves ternate and solitary, Leaflets lanc. lin. entire  
 9332 Unarmed, Lvs. 5 : lower and floral 3 ; upper sessile ovate, Pod smooth as long as its stalk  
 9333 Flowers hexandrous, Leaves ternate, Leaflets oval lanceolate  
 9334 Flowers hexandrous, Leaves ternate lanceolate blunt, Pods fusiform viscid  
 9335 Flowers hexandrous, Leaves simple ovate-lanceolate stalked  
 9336 Flowers hexandrous, Leaves simple lanceolate stalked, Stems procumbent  
 9337 Unarmed pubescent, Leaves 5-7 : floral simple cordate, Pod the length of the stalk

and Miscellaneous Particulars.

1447. *Subularia*. From *subula*, an awl, on account of the form of the leaves. A curious little aquatic, not of common occurrence.

1448. *Cleome*. A name employed by Octavius Horatius, a Latin physician, who lived in the fourth century, to designate a plant resembling *Sinapis*, and growing in humid places. It appears to have had no relation to the modern plant.

## CLASS XVI. — MONADELPHIA.

This class is distinctly characterized by the filaments being united together throughout the whole or a part of their length; and for the most part consists of plants belonging to the natural orders of Malvaceæ and Geraniaceæ. Of the former, the major part are of little moment, consisting, in a great measure, of weeds or worthless shrubs of various parts of the world. Among them, however, are some plants both of interest and ornament, especially the beautiful *Astrapeæ*, and the various species of *Bombax* and *Hibiscus*. The *Gossypium*, so important as producing the material of cotton, and the *Adansonia* or *Baobab* tree of Africa, remarkable for its immense size and use as an article of food, are found in this class. The *Geranium*, *Camellia* and *Passion* flower are also genera of much beauty; the latter yielding the well known West Indian fruit called the *Granadilla*. The common *Tamarind*, with which this class commences, would more properly be placed in the next, and the succeeding genera of *Paterosnia*, *Tigridia*, *Ferraria*, and *Galaxia*, are in every respect, except the union of their filaments, referable to the third class.

## Order 1. TRIANDRIA.

Stamens 3.

1449. *Tamarindus*. Petals 3, ascending. Three filaments longer than the others and fertile. Legumen 1-3-celled, pulpy inside.  
 1450. *Paterosnia*. Cor. tubular. Limb 6-parted, with 3 small segments. Caps. 3-celled, inferior.  
 1451. *Ferraria*. Spatha 2-leaved. Cal. O. Petals 6, wavy, curled. Filaments united at base. Style 1. Caps. 3-celled, inferior.  
 1452. *Tigridia*. Spatha 2-leaved. Cal. O. Petals 6, the 3 outer large. Filaments united into a very long tube.  
 1453. *Galaxia*. Spatha 1-leaved. Cal. O. Corolla monopetalous, 6-cleft, with a long tube. Style 1. Capsule 3-celled, inferior.

## Order 2. PENTANDRIA.

Stamens 5.

1454. *Waltheria*. Cal. 5-fid, with a lateral deciduous 3-leaved involucre. Petals 5. Style 1. Stigma penceiled. Caps. 1-celled, 2-valved, 1-seeded.  
 1455. *Hermannia*. Cal. nearly naked, campanulate, 5-fid. Pet. 5. Stamens 5. Filaments united at base, lanceolate, frequently winged. Styles 5, cohering in one. Caps. 5-celled, 5-valved, many-seeded.  
 1456. *Melochia*. Cal. 5-fid, naked, or with 1-3 bractæ. Petals 5, spreading. Stam. 5, monadelphous at base. Styles 5. Caps. 5-celled. Seeds 1-2 in each cell.  
 1457. *Methania*. Cal. 5-parted, persistent, with a 3-leaved involucre on one side. Pet. 5. Stam. 10, alternately sterile: the fertile ones bearing from 1-2 anthers each.  
 1458. *Ochroma*. Cal. double, outer 3-leaved. Petals 5. Anthers anfractuose. Capsule 5-celled, many-seeded. Seeds involved in wool.  
 1459. *Passiflora*. Cal. 5-parted, colored. Petals 5 or 0, inserted in the calyx. Crown of many filiform rays. Fruit stalked, fleshy.  
 1460. *Erodium*. Cal. 5-leaved. Petals 5. Scales 5, alternate, with filaments and honey glands at the base of the stamens. Cocci 5, 1-seeded, awned, at the base of a rostrate receptacle.

## Order 3. HEPTANDRIA.

Stamens 7.

1461. *Pelargonium*. Cal. 5-parted, the upper segment ending in a nectariferous tube running down the peduncle. Cor. 5-petalous, irregular.

## Order 4. OCTANDRIA.

Stamens 8.

1462. *Aitonía*. Cal. 4-parted. Cor. 4 petals. Style 1. Berry dry, quadrangular, 1-celled, many-seeded.

## Order 5. DECANDRIA.

Stamens 10.

1463. *Geranium*. Cal. 5-leaved. Petals 5, regular. Glands 5, honey-bearing, united to the base of the longer filaments. Cocci 5, 1-seeded, awned, at the base of a beaked receptacle.

## Order 6. DODECANDRIA.

Stamens 12.

1464. *Brounea*. Cal. tubular, bifid. Cor. double: outer 5-fid; inner of 5 petals. Legumen 1-celled.  
 1465. *Monsonia*. Sepals 5. Pet. 5. Stamens 15, united; their cup 5-fid. Style 5-fid. Cocci 5, 1-seeded awned, at the base of a beaked receptacle.  
 1466. *Helicteres*. Cal. tubular, obliquely 5-fid. Petals 5. Germen on a long stalk. Style about 5-fid. Caps. 5, 1-celled, many-seeded, spirally twisted.  
 1467. *Dombeya*. Cal. double, outer 3-leaved, deciduous. Petals 5. Stamens 20, of which 5 are sterile. Style 5-fid. Caps. 5, united, 1-celled, 1-many-seeded.  
 1468. *Pentapetes*. Cal. double, outer 3-leaved, deciduous. Petals 5. Stamens 20, of which 5 are barren. Style obsoletely 5-toothed. Caps. 5-celled, many-seeded, with contrary dissepiments.  
 1469. *Astrapeæ*. Flowers umbellate, with an involucre. Involucre many-leaved, unequal. Cal. simple, 5-leaved, with 1 bract. Petals 5, convolute-closed. Stamens 25, united into a tube bearing the corolla: 5-sterile.  
 1470. *Pterospermum*. Cal. simple, 5-parted. Petals 5. Stamens 20, of which 5 are sterile. Style cylindrical, Stigma thickish, Caps. woody, 5-celled. Seeds winged.

## Order 7. POLYANDRIA.

Stamens indefinite in number.

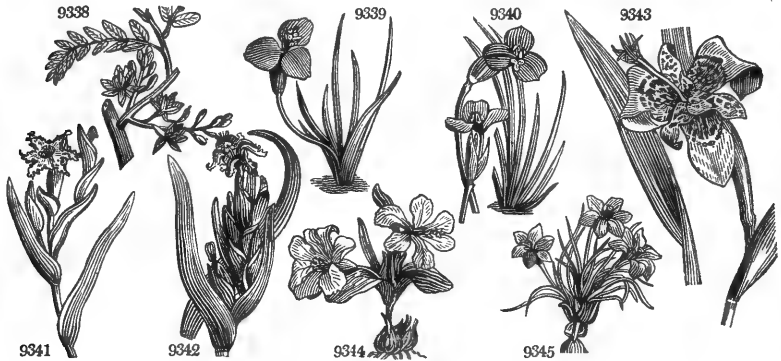

1471. *Malope*. Cal. double, outer 3-leaved. Capsules heaped without order, 1-seeded.  
 1472. *Muhua*. Cal. double, outer 3-leaved. Capsules many, 1-seeded.  
 1473. *Kitaibelia*. Cal. double, outer 7-9-fid. Caps. clustered in a 5-lobed head, 1-seeded.  
 1474. *Althæa*. Cal. double, outer 6-9-fid. Capsules many, 1-seeded.  
 1475. *Lavatera*. Cal. double, outer 3-fid. Capsules many, 1-seeded.  
 1476. *Malachra*. Common calyx 3-leaved, many-flowered, large. Caps. 5, 1-seeded.  
 1477. *Urena*. Cal. double, outer 5-fid. Capsule 5-celled, 5-partible, with close 1-seeded cells.  
 1478. *Pavonia*. Cal. double, outer many-leaved. Stigmas 10. Capsules 5, 2-valved, 1-seeded.  
 1479. *Achania*. Cal. double, outer many-leaved. Cor. convolute, closed. Stigmas 10. Berry 5 celled, 5-seeded.  
 1480. *Hibiscus*. Cal. double, outer many-leaved. Stigmas 5. Capsule 5-celled, many-seeded.  
 1481. *Gossypium*. Cal. double, outer 3-fid. Caps. 5-celled. Seeds enwrapped in wool.  
 1482. *Redoutea*. Cal. 5-parted, surrounded by a 10-12-leaved involucre. Stigmas 3. Capsules 3-celled, 3-valved, many-seeded, with three placentas alternate with the valves, and bearing on each side woolly seeds.  
 1483. *Palavia*. Cal. naked, 5-fid. Capsules many, 1-seeded, united in a head without order.  
 1484. *Cristaria*. Cal. naked, 5-fid. Fruit orbicular, depressed, covered with a skin, and consisting of several carpella, 2-winged in the centre, and many-seeded.  
 1485. *Anoda*. Cal. naked, 5-fid. Lobes acuminate, much spreading in fruit. Caps. hemispherical beneath, depressed and stellate above, many-celled, with 1-celled, 1-seeded divisions.  
 1486. *Periptera*. Cal. naked, 5-fid. Petals erect, spirally twisted in the tube, at length distinct. Capsule stellate, many-celled, with 1-seeded cells.  
 1487. *Sida*. Cal. simple, angular. Style many-parted. Capsules several, 1 or 3-seeded.  
 1488. *Lagunæa*. Cal. simple, 5-fid. Style 5-fid. Capsule 5-celled, with contrary dissepiments.  
 1489. *Ruizia*. Cal. double, outer 3-leaved. Styles 10. Caps. 10, 1-celled, 2-seeded, closely cohering.  
 1490. *Carolinea*. Cal. simple, subtruncate. Filaments branched. Style very long. Stigmas 6. Caps. woody, 1-celled, many-seeded.  
 1491. *Adansonia*. Cal. simple, deciduous. Style very long. Stigmas many. Caps. woody, 10-celled, many-seeded, with a farinaceous pulp.  
 1492. *Bombax*. Cal. 5-fid. Stamens 5, or many. Caps. woody, 5-celled, 5-valved. Seeds woolly. Receptacle 5-cornered.  
 1493. *Myrodia*. Cal. naked, tubular, 4-5-toothed, bursting laterally. Petals oblong, linear. Stamens with a long column. Anthers 10-15. Capsule drupaceous, 2-3-celled, with 1-seeded cells.  
 1494. *Gordonia*. Cal. simple. Style 5-cornered, with a 5-fid stigma. Caps. 5-celled. Seeds twin, with a leafy wing.  
 1495. *Stuartia*. Cal. simple, rotate. Petals 5. Styles 5, united or distinct. Caps. 5-celled, 5-valved. Seeds solitary or twin.  
 1496. *Camellia*. Cal. imbricated, many-leaved, the inner leaflets largest.  
 1497. *Barringtonia*. Cal. 2-leaved, superior. Petals 4. Drupe dry, large, quadrangular, with a 4-celled ut.  
 1498. *Gustavia*. Cal. 4-6-fid. Petals 4-6. Berry dry, 4-5-celled.  
 1499. *Careya*. Cal. superior, 4-fid. Petals 4. Berry many-seeded. Seeds nestling in pulp.

History, Use, Propagation, Culture,

1449. *Tamarindus*. Latinized from the Arabic name *Tamer-hindy*, or Indian date. This tree is a native of the East and West Indies, of Arabia, and Egypt. It is a large beautiful spreading tree. The leaves are abruptly pinnate, composed of sixteen or eighteen pairs of sessile leaflets, half an inch only in length, and one sixth of an inch broad, of a bright green color, downy, oblong, entire, and obtuse: the flowers are in loose bunches of five or six, which come out from the sides of the branches: the calyx is of a straw yellow color, and deciduous: the petals also yellowish, and beautifully variegated with red veins; ovate, concave, acute, indented, and plaited at the edge; and the filaments purplish, bearing incumbent brownish anthers: the pods are thick, compressed, and of a dull brown color when ripe: those from the West Indies from two to five inches long, with two, three, or four seeds: those from the East Indies are twice as long, and contain five, six, or seven seeds: the seeds in both are flat, angular, shining, and lodged in a dark pulpy matter.

In the West Indies, the pods are gathered in June, July, and August, when fully ripe; and the fruit being freed from the shelly fragments, is placed in layers in a cask, and boiling syrup poured over it, till the cask is filled; the syrup pervades every part quite down to the bottom; and when cool the cask is headed for sale. (*Long's Jamaica*, iii. 729.) The East India tamarinds are darker colored and drier, and are said to be preserved without sugar. Tamarinds are inodorous, and have an agreeable acid sweetish taste. The acid taste chiefly depends on the citric acid, the quantity of that being greater than of the other. The pulp is refrigerant, and gently laxative. The simple infusion of the pulp in warm water, or a whey made by boiling it in milk, forms a very grateful refrigerant beverage, which is advantageously used in febrile diseases. The dose of the simple fruit required to act upon the bowels is so large, that it is seldom given alone as a purgative, but is generally combined with cassia or manna, the action of which it augments, or with such of the neutral purgative salts as are not decomposed by it; which is the case with those that have potash for their base, and are therefore incompatible in mixtures with this fruit. (*Thompson's London Dispensatory*, 534.)

The plants thrive in loam and peat, and root under a glass in sand. They form handsome objects, but in our stoves are seldom allowed sufficient room to flower. Miller says, he had several plants twenty years old, and upwards, of fifteen feet high, which never had shewed blossoms.

## TRIANDRIA.

9338 The only species

9339 Stigma deflexed, Scape and spathes silky, Leaves ensiform straight striated

9340 Stigma deflexed, Scape and spathes smooth shining, Keel of leaves woolly at base

9341 Stem branched, Leaves equitant ensiform equal wavy; inner twice as narrow as the outer

9342 Stem simple, Leaves equitant ensiform; lower narrow

9343 Stem simple wavy, Leaves ensiform nerved, Petals flat; inner small panduriform

9344 Almost stemless, Leaves oblong, Spathe 1-valved 1-flowered

9345 Almost stemless, Leaves linear filiform dilated at base, Spathe 1-valved 1-flowered

## PENTANDRIA.

9346 Leaves oval plicate acutely and unequally toothed downy, Heads stalked

9347 Leaves oval plicate bluntly toothed downy, Heads sessile

9348 Leaves lanceolate oblong blunt plicate toothed downy, Heads sessile

9349 Leaves ovate mucronate serrate and stem quite smooth, Heads stalked, Calyxes ciliated

9350 Leaves ovate downy plicate crenate, Lower stipules ovate; upper broad lanceolate, Cal. angular

9351 Lvs. downy hairy ovate subcord. rugose denticulate, Stipules ovate acute, Cal. in fl. cylind. finally inflated

9352 Leaves oval unequally crenate subpubescent, Stipules ovate acute often cut, Stem glandular pubescent

9353 Leaves whitish downy round ovate crenate, Stipules lanceolate subulate, Cal. campanulate spreading

9354 Leaves hispid-vilous roundish-ovate blunt toothed, Stipules subovate acuminate, Cal. angular

9355 Leaves downy hispid rugose oblong blunt entire subsessile, Stipules long lanceolate subulate, Fls. naked

9356 Lvs. downy hispid somew. rugose obl. very blunt a little toothed at end with short stalks, Stip. lanc. subul.

## and Miscellaneous Particulars.

1450. *Patersonia*. Named after Colonel William Paterson, a gentleman whose remarks on the Cape of Good Hope, New Holland, and Norfolk Island, have been of much service to botany. Handsome plants, which grow readily in loam and peat, and are increased like other herbaceous vegetables.

1451. *Ferraria*. Named after Jean Baptiste Ferrari, an Italian botanist, author of a work on the culture of flowers, published in 1633, &c. According to Sweet, "a mixture of sandy loam and peat is the best soil for the species, and they should be kept without water, after they have done growing, till they begin to grow again, when they may be planted in fresh pots and regularly watered: they are increased by offsets from the bulbs, or by seeds." (*Bot. Cult.* 192.)

1452. *Tigrida*. In allusion to the spotted flowers, which are marked something like the skin of a tiger. Splendid plants, and tolerably hardy. They do best when planted in the soil and protected by a frame or hand-glass; but will also thrive in sheltered borders, provided they are protected from the winter's frost. They ripen seeds, from which, or from offsets, they may be readily increased.

1463. *Galaxia*. Thunberg, the author of the name, has not explained its meaning. Like other plants of the bulbous kind, these should be kept dry after flowering and seeding. At the return of the growing season, they should be fresh potted, and kept in a cool part of the greenhouse till they are well rooted, when they may be put into a warmer situation and regularly watered. They seed freely.

1454. *Waltheria*. In memory of Augustin Frider. Walther, professor of medicine at Leipsic; author of *Hortus Proprius*, 1735. The species grow in any light rich soil, and are readily propagated. They are of no importance.

1455. *Hermannia*. In memory of Paul Hermann, who practised physic in Ceylon, and at the Cape of Good Hope, and was afterwards professor of botany at Leyden. He was born in 1640, at Halle, in Saxony, and died in 1695. The species are low shrubs, for the most part, with wrinkled leaves and yellow flowers, which they produce in abundance. They grow freely in any light rich soil, and are readily increased in the same soil.

History, Use, Propagation, Culture,

1456. *Melochia*. According to Forskahl, it is an alteration of the Arabic name *melochieh*, or *melokkieh*. Light rich soil suits all the species, and they strike readily in moist heat.

1457. *Melhania*. A plant which grows upon Mount *Melham*, in Arabia. Pretty plants, which grow in sandy loam, and root in sand under cover. Sweet observes, that "they are very apt to become covered with insects."

1458. *Ochroma*. From *αχρος*, yellow, the flowers being of that color, according to Schreber. *O. Lagopus* is a very large tree, with divaricating branches, and leaves more than a foot long. The wood is white, tender, and so light, that it is used instead of corks to nets. The capsules contain a very soft fine rufous down, in which the seeds are involved, and which down is said to be used in the manufacture of English beavers (*Desportes Plantes de S. Domingue*, iii. 16.)

1459. *Passiflora*. This genus has been so named, on account of its being supposed to represent, in the appendages of its flower, the passion of Jesus Christ. A beautiful genus of climbers, partly herbaceous, but chiefly suffruticose or woody; and all of them exotics and very ornamental. Some species are odoriferous; others bear edible fruits, fleshy juicy berries of considerable size, though not rich in flavor. Of late, a number of hybrid sorts have been raised, some of which, as *P. caruleo-racemosa*, are considered more beautiful than almost any of the natural species.

*P. maliformis*, the sweet calabash of the West Indies, produces large flowers, red, white, and blue, but of short duration. They are succeeded by fruit, roundish, the size of a large apple, yellow when ripe, having a thicker rind than any of the other sorts; inclosing a sweetish pulp, in which are lodged many oblong black seeds, of a brownish color, a little rough to the touch. It grows naturally in the West Indies, where the inhabitants call it *Granadilla*. The fruit is served up there in deserts. It has borne fruit in the garden of the Bishop of Durham in Oxfordshire, and at Vere's, Kensington Gore. (*Hort. Trans.* iii. 101.)

*P. quadrangularis*, the *Granadilla* vine of the French, has leaves five or six inches long, and luxuriant four-

- 9357 Leaves stalked oval blunt wavy crenate and stem hairy, Stipules lanceolate
- 9358 Leaves downy hispid oblong acutish entire subsessile, Stipules lanceolate subulate, Flowers aggregate
- 9359 Leaves downy beneath oblong blunt crenate stalked, Stipules subulate, Pedic. 1-2-f. Calyxes spreading
- 9360 Leaves soft with down whitish obl. blunt toothed cuneate at base entire, Pedunc. 2-f. Cal. campan. velvety
- 9361 Leaves smooth with lanceolate serrate at end acute, Stipules ovate acuminate, Pedic. 2-4-flowered
- 9362 Leaves white with down lanceolate serrate bluntish wavy at edge, Stipules subul. Pedunc. 1-f. very short
- 9363 Leaves smooth broadly obovate cuneiform very blunt crenate emarginate toothed, Stip. lanc. subulate
- 9364 Leaves pubescent obovate cuneiform truncate emarginate toothed, Stipules ovate acute
- 9365 Leaves soft white with down oblong cuneiform rounded at end toothed, Stipules lanceolate
- 9366 Leaves pubescent downy oblong unequally toothed rounded at each end, Stipules ovate some. toothed
- 9367 Leaves beneath white with down oblong obov. cuneiform unequally toothed at end, Stip.  $\frac{1}{2}$  cord. acum.
- 9368 Leaves rough above downy beneath cuneif. obl. unq. toothed entire at base, Stip. half cordate acuminate
- 9369 Leaves smoothish cuneiform oblong truncate toothed at end, Stipules oblong acute, Racemes few-flow.
- 9370 Leaves smooth cuneiform lanceolate truncate toothed at end, Calyxes reflexed
- 9371 Leaves smooth above hairy beneath cuneiform lanceolate truncate toothed at end
- 9372 Leaves pubescent cuneiform lanceolate blunt toothed at end, Calyx inflated downy
- 9373 Leaves velvety cuneiform linear blunt entire or 3-toothed at end, Cal. campanulate
- 9374 Leaves velvety cuneiform lanceolate blunt : upper entire ; lower 3-5-toothed at end, Stipules lin. subul.
- 9375 Leaves velvety lanceolate blunt entire, Stipules linear subulate, Calyxes angular
- 9376 Leaves smooth rough at edge linear 3-cornered entire, Stipules large lanceolate
- 9377 Leaves white with down sess. cuneate obcord. some. crenate at end, Stip. obl. blunt resembling lat. lvs.
- 9378 Leaves smoothish oblong toothed pinnatifid : lower ovate ; upper elongate, Stem procumbent
- 9379 Leaves rough with scattered down linear-cuneiform coarsely toothed, Stipules linear entire
- 9380 Leaves roughish white bipinnatifid, Pedunc. 2-flowered very long
- 9381 Leaves pinnatifid with linear lanceolate entire segments, Petals cut-toothed
- 9382 Leaves linear pinnatifid fleshy smoothish, Stem pubescent
- 9383 Leaves pinnatifid with linear entire acute lobes

- 9384 Leaves ovate lanc. toothed smooth, Pedunc. 5-6-f. longer than petiole, Branches downy in decurrent lines
- 9385 Lvs. uneq. sided ovate obl. acutely crenate plaited hoary on each side, Umbels 3-8-f. longer than petiole
- 9386 Leaves cordate crenate downy beneath, Fl. capitate subsessile axillary and opposite the leaves
- 9387 Leaves ovate somewhat lobed serrated smooth, Flowers subterminal capitate sessile

- 9388 Leaves ovate cordate subpeltate acuminate crenulate beneath downy and reticulated
- 9389 Leaves cordate entire downy on each side

- 9390 Leaves cordate somewhat 3-lobed repand subtomentose
- 9391 Leaves cordate 5-angled somewhat lobed toothletted pubescent beneath

- 9392 Leaves ovate veiny subserrulate, Petioles with 2 glands, Invol. 3-leaved
- 9393 Leaves elliptical entire blunt 3-nerved, Petioles without glands, Invol. O.
- 9394 Leaves oblong ovate cordate 3-nerved veiny entire, Petioles with 2 glands, Invol. 3-leaved larger than fl.
- 9395 Leaves 3-lobed peltate, Petioles with 4 glands, Flowers terminal racemose
- 9396 Leaves obl. ovate subcord. entire veiny, Petioles with 6 glands, Stipules roundish ovate, Invol. 3-leaved

and Miscellaneous Particulars.

cornered ligneous stems. The flowers are red within, and white outside ; they are odoriferous, and generally the plant is covered with fruits and flowers at the same time, which makes a fine appearance. The fruit, Sabine describes (*Hort. Trans.* iii. 100.) as very large, of an oblong shape, about six inches in diameter, from the stalk to the eye, and fifteen inches in circumference. It is externally of a greenish-yellow when ripe, soft and leathery to the touch, and quite smooth ; the rind is very thick, and contains a succulent pulp of a purple color (which is the edible part), mixed with the seeds in a sort of sack, from which it is readily separated. Wine and sugar are commonly added to it when used. The flavor is sweet and slightly acid, and it is very grateful to the taste, and cooling in a hot climate. It has been successfully cultivated for its fruit in a few places, as at Lord Harewood's, Farley Hall, &c. (*Hort. Trans.* iv. 60.)

*P. laurifolia*, the water lemon, *Pomme de Liane*, Fr., has a suffrutescent stem, with divaricating filiform branches, oval smooth leaves, and very long tendrils. Flowers red and violet, sweet-scented ; the fruit about the size of a hen's egg, but rather more elongated, and tapering equally at both ends ; when ripe, it is yellow and dotted over with white spots ; it contains a whitish watery pulp, which, in the West Indies, is usually sucked through a small hole made in the rind ; the rind is tough, soft, and thin ; the juice has a peculiar aromatic flavor, is delicately acid, and allays thirst agreeably. It is grown in our stoves, but has not yet been cultivated for its fruit.

*P. normalis* has berries about the size of small grapes. The root has been extolled as a counterpoison and diuretic.

*P. Murucuja* produces fruit of an oblong oval form, about the size of a large olive, and flesh-colored when ripe. Both the syrup and decoction of the plant are much used in the leeward parts of Jamaica, where it is frequent ; and they are said to answer effectually all the purposes for which syrup of poppies and liquid laudanum are generally administered. The flowers are most in use : they are commonly infused in, or pounded and

History, Use, Propagation, Culture,

mixed immediately with wine or spirits; and the composition is generally thought a very effectual and easy narcotic.

*P. incarnata*, the May apple, has a perennial root, herbaceous shoots, and sweet-scented flowers, variegated with purple. The fruit is about the size of an apple, orange-colored, with a sweetish yellow pulp, but it requires the heat of the stove to bring it forward.

*P. carulea* is the tallest and most ligneous of the species. The stem will grow almost as large as a man's arm, and the shoots will often grow the length of fifteen feet in one summer. The leaves are the most elegant of the genus. The flowers are blue outside, and purple and white within; they have a faint scent, and continue but for one day. The fruit is egg-shaped, of the size and color of the Mogul plum, the yellow skin of which encloses a sweetish disagreeable pulp and black seeds.

Besides the species thus enumerated, some varieties have been procured by cross impregnation, which are very remarkable for their beauty, and for having acquired the hardihood of their parent. The most valuable of these artificial productions, is the *P. ceruleo-racemosa*, raised by Mr. Milne, of Fulham, from seed of *P. racemosa* impregnated by *P. carulea*, and figured in the Transactions of the Horticultural Society, vol. 3. tab. 3., and the *P. alato-carulea*, obtained by Mr. J. H. Masters of Canterbury, between *P. alata* of the West Indies, and *P. carulea*.

All the species grow and flower freely in a mixture of loam, and light rich earth or peat, with plenty of room. Most of them fruit in the stove, but the *P. carulea* seldom fruits in the greenhouse. They are all easily increased either by seeds or very young cuttings, in a close moist heat.

As fruit-bearing plants the Passifloras are thus treated:—"Having procured plants with good roots, plant such as are intended to fruit in a border in the stove, and train them to a trellis near the glass; they will in general produce fruit the second year. The seedlings of the *P. incarnata*, will produce fruit the first year. All the species will fruit even in large pots; but Sabine says, the "best method is to plant them in an angle of the bark-bed, which has been parted off, either by boards or brick-work, as low as the pit goes. At the bottom of

- 9397 Leaves obl. ovate subcord. ent. veiny, Petioles with 4 glands, Stip. lanc. falcate suberrate, Invol. 3-leaved  
 9398 Leaves oblong entire veiny, Petioles with 2 glands, Invol. 3-leaved toothed at end  
 9399 Leaves obl. ent. acute 3-nerved veiny, Petioles with 2 glands, Ped. aggregate axill. Fl. apetalous, Invol. O.  
 9400 Leaves 2-lobed bluntly emarginate, Petioles without glands, Corona campanulate truncate entire  
 9401 Lvs. cord. 2-lobed blunt mucron. ; up. somew. stem-clasp. Petiol. without glands, Pet. twice as long as cal.  
 9402 Leaves cordate 2-lobed acute mucronate pubescent beneath, Petioles without glands, Fruit obovate  
 9403 Lvs. 2-lobed emarginate at base, Lobes linear blunt divaricating ; the intermediate obsolete mucronate  
 9404 Lvs. cord. 2-lobed blunt smooth, Petioles without glands, Pedunc. axillary twin, Threads of corona clav.  
 9405 Leaves cuneiform acuminate divaricating with 2 glands at base, Petioles without glands, Invol. O.  
 9406 Lvs. round. shortly and bluntly 3-lobed dott. downy ben. Petiol. without glands, Pet. twice as short as cal.  
 9407 Lvs. round. subcord. blunt obsolete 3-lobed smooth dott. Petioles without glands, Pet. twice as short as cal.  
 9408 Lvs. cord. 3-lobed blunt smooth, Petioles without glands, Pedunc. axill. twin, Pet. twice as narrow as cal.  
 9409 Lower leaves 3-lobed acuminate ; upper undivided lanceolate, Petioles with 2 glands, Flowers apetalous  
 9410 Leaves roundish cordate, Petioles with 2 glands, Flowers solitary long-stalked, Cal. keeled, Stam. 1-sided  
 9411 Leaves ovate entire 3-nerved veiny, Petioles with 2 glands, Flowers apetalous, Involucrum O.  
 9412 Lvs. 3-lobed smooth, Lobes lanc. ; middle one longest, Petioles with 2 glands, Fl. apetal. Stem corky at base  
 9413 Leaves subcordate 3-lobed, Lobes rounded with 2 glands, Pedunc. axillary solitary, Flower apetalous  
 9414 Lvs. 3-lobed smooth, Lobes oblong ; lat. very short, Petioles with 2 glands, Fl. apetal. Stem corky at base  
 9415 Lvs. peltate deeply 3-lobed smooth, Lobes lin. lanc. divaricating, Petioles with 2 glands, Flow. apetalous  
 9416 Leaves peltate half 3-lobed smooth, Lobes ovate blunt, Petioles with 2 glands, Fl. apetalous  
 9417 Leaves peltate cordate 3-lobed, Lobes equal oblong blunt, Petioles with 4 glands, Petals length of calyx  
 9418 Leaves discolored peltate  
 9419 Leaves 3-lobed downy with a reflexed tooth on each side at the base  
 9420 Leaves 3-lobed vill. ; lower smooth above, Lobes obl. entire ; intermediate longest, Petioles with 2 glands  
 9421 Leaves 2-lobed glandular beneath, Lobes oblong erect, Peduncles twin  
 9422 Leaves palmate about 5-parted suberrulate, Involucres 3-leaved entire, Rays a little shorter than corolla  
 9423 Leaves 3-lobed cordate hairy, Involucres multifid capillary  
 9424 Leaves and stems all fringed with red hairs  
 9425 Leaves 3-lobed cordate smooth ciliated serrated, Involucres multifid capillary  
 9426 Downy, Leaves cordate 3-lobed, Peduncles twice as short as petiole, Corona much shorter than corolla  
 9427 Lvs. rounded trunc. at base slightly 3-5-lobed, Lobes blunt, Petioles without glands, Pet. shorter than cal.  
 9428 Stem square, Leaves 3-lobed : lobes nearly equal serrated, Pedunc. long 1-flowered  
 9429 Leaves 3-lobed serrated smooth, Invol. glandular serrulate caducous, Ovary naked  
 9430 Lvs. 3-lobed serr. Lobes obl. acute, Petioles with 2 glands, Inv. 3-leaved, Threads of corona longer than cor.  
 9431 Lvs. palmate 5-parted entire, Petioles gland. Invol. 3-leaved entire, Threads of corona shorter than corolla

- 9432 Leaves palmate 5-parted serr. Petioles gland. Invol. 3-leaved serrate, Threads of corona longer than cor.  
 9433 Leaves palmate 7-parted serrated, Petioles glandular, Invol. 3-fid entire  
 9434 Leaves 7-pedate serrated, Petioles glandular, Invol. 3-leaved serrated  
 9435 Upper leaves quinate pedate obovate somewhat cut ; lower ternate linear-lanceolate or simple

and Miscellaneous Particulars.

the cavity formed by this division, should be laid some brick-rubbish, over which may be thrown a little dead tan, and the whole be then filled with equal parts of very old tan, and a compost of leaf-mould and rotten dung. Herein the roots will strike freely, and will even spread through the partition into the pit, growing into the fresh tan. Such roots may be trimmed and reduced whenever the tan is changed ; but should the plant have been some time in its station, it will be as well to leave part of the old tan in the bottom of the pit, in which the protruded roots may remain undisturbed. They do not require the full heat of the pine stove, for they flourish best in a temperature of from sixty-five to seventy degrees ; but they do not bring their fruit to perfection if kept in a common greenhouse or conservatory, though they will grow and flower in it. The shoots, as they advance, must be trained near to and under the inclined glass of the stove : the flowers will appear in May, and the blooming will continue until September, the fruit setting the whole time ; but if it does not set well, it will be advisable to impregnate the stigmas by applying the pollen with a feather. As they grow, the very strong shoots should be cut out from their origin, for these do not bear fruit so abundantly as those which are less vigorous ; but the fruiting branches must not be shortened on any account. The temperature must be kept up equally during the time of flowering and fruiting. The crop will begin to come in in August, and will continue until January ; but the earlier produce is the best. When the crop is all off, which will be early in January, the heat must be reduced to about fifty degrees, so as to check or stop the growth ; this being effected, the shoots must be well cut in. As little old wood as possible, besides the main stem, which rises from the pit to the glass, and a few pieces (about two or three feet of each) of the old branches should be retained ; for all that is to be trained under the glass to bear in each year, ought to be the growth of the same season. It is found that the shoots break better, and in greater quantity, from the older wood than from that of two years' standing. In this dormant and reduced state it is to be kept during January and February, after which the necessary heat may be applied to cause it to resume its functions for the ensuing season." (*Hort. Trans.* iii. and iv.)

History, Use, Propagation, Culture,

1460. *Erodium*. From *εραδιος*, a heron, because the fruit resembles the head and breast of that bird. The species are hardy plants, of common treatment, and no great beauty.

1461. *Pelargonium*. So called from *πελαργος*, a stork, in allusion to the beak of the fruit, which resembles the bill of that bird; as well as to preserve an analogy with the Geranium or Crane's-bill. It was detached by the late learned botanist Mons. L'Heritier, along with *Erodium*, from the Liongenus Geranium; and distinguished by its seven fertile stamens, irregular flower, tubular nectary, and spiral-leaved awns, or beaks to the capsule.

"This vast and favorite genus, for which we are almost entirely indebted to the Cape of Good Hope, consists of a number of well marked species. But that number is greatly augmented in almost every book, by the admission of spurious hybrid species or varieties, which continually start up from seed, wherever many of the primary ones are cultivated, and are for a while propagated by cuttings, and even by seed. Sooner or later,

- 9436 Stemless, Peduncles many-f. Lvs. smoothish pinnat. Segm. pinnatifid, Petals retuse twice as long as calyx  
 9437 Stemless, Peduncles many-f. Lvs. downy gland. pinnat. Segm. pinnatif. Petals acute twice as long as calyx  
 9438 Stem smooth. branch. Ped. many-f. Lvs. smooth. bipinnatif. Lobes lin. Pet. blunt long. than long-point. cal.  
 9439 Stem branched diffuse dowry, Lvs. thick pinnatif. cut, Lobes linear, Pedunc. many-f. Bractes ovate scariose  
 9440 Stem prostrate, Leaves bipinnate with linear acute lobes, Stipules and bractes ovate scariose, Ped. many-f.  
 9441 Stem ascend. and lvs. somew. villous pinnated, Seg. blunt pinnatif. tooth. Ped. many-f. Pet. length of calyx  
 9442 Stem prostrate or diffuse hairy, Leaves pinnated, Segm. sess. pinnatifid cut, Pedunc. many-f. Pet. unequal  
 β Caulcescent diffuse, Segments pinnated with linear lobes  
 9443 Nearly stemless, Leaves pinnate with ovate pinnatifid segments, Petals equal larger than calyx  
 β Plant of larger size  
 9444 Stem procumbent, Leaves pinnated with stalked ovate unequally serrated segm. Pedunc. downy glandular  
 9445 Stem erect nearly smooth, Leaves 3-cut. Segments cut-toothed, Pedunc. many-f. Calyx striated nerved  
 9446 Stem erect somewhat diffuse, Leaves smooth subcordate; upper 5-parted with cut toothed lobes  
 9447 Stem erect branch. shrubby at base, Lvs. 3-lobed or 5-parted very blunt, Stipules and bractes scariose ovate  
 9448 Stem erect soft, Pedunc. many-f. Leaves cordate blunt bluntly toothed undivided or 3-lobed  
 9449 Stem branched hairy, Leaves cordate undivided or 3-lobed blunt toothed, Petals length of calyx  
 9450 Stem ½ shrubby and leaves nearly smooth; lower cord. undivided toothed, Lobes cuneate 2-toothed at end  
 9451 Stem erect and leaves smooth oblong lobed crenate fleshy, Awns feathery from middle to end  
 9452 Caulcescent diffuse smooth, Leaves cordate ovate cut-crenate pubescent, Awns beardless  
 9453 Stemless, Leaves cordate crenate blunt smoothish, Pedunc. 1-f. Petals larger than calyx  
 9454 Caulcescent diffuse smoothish, Leaves cordate roundish 3-lobed unequally crenate, Awns bearded  
 9455 Stems diffuse, Leaves opposite 3-cut: segm. lateral cut-toothed divaricating, Peduncles many-flowered

## HEPTANDRIA.

† 1. HOAREA. Sweet. Petals 5, rarely 2 or 4 obl. lin., 2 upper parallel, with long claws abruptly reflexed in the middle. Stamens in a long tube, length of lower petals, bearing 5 or rarely 2-4 anthers, the others sterile, straight or incurved at end, the 3 lower shorter than the fertile ones. Stemless herbs, with tuberous turnip-like roots, and radical stalked leaves.

\* Leaves oblong, entire or lobed. Lobes entire or scarcely toothed.

- 9456 Stemless, Leaves lanceolate entire acute smooth; older pinnatifid linear, Umb. comp. Fl. tetrandrous  
 9457 Stemless, Leaves lanceolate entire acute smooth, Umb. comp. 4-f. Fl. tetrandrous, Petals linear  
 9458 Leaves oval or oval-oblong blunt flat or involute at edge entire hairy, Petals linear wavy twisted  
 9459 Stemless, Leaves ellipt. lanc. or obl. ent. hairy revol. at edge, Fl. pentandr. Pet. lin. spatul. wavy reflexed  
 9460 Stemless, Leaves ovate acute entire subciliated, Umb. compound, Fl. pentandrous, Petals linear spatulate  
 9461 Stemless, Leaves ovate toothed smooth, Umb. compound, Fl. diandrous, Pet. linear; 3 lower shortest  
 9462 Stemless, Leaves oval obl. entire acute at each end smooth ciliated, Umb. simple, Flowers pentandrous  
 9463 Stemless, Lvs. obl. spatul. blunt smooth, Umb. comp. Fl. pentandrous, Petals lin. blunt subrevolute

- 9464 Stemless, Leaves elliptical spatulate entire smooth, Umb. compound, Fl. pentandrous, Petals cuneiform  
 9465 Stemless, Lvs. ellipt. ovate acute at each end smooth, Umb. subcomp. Fl. pentandrous, Pet. lanc. cuneate  
 9466 Stemless, Leaves lin. lanc. entire ciliated, Umb. simple, Flowers pentandrous, Petals wavy nearly equal  
 9467 Stemless, Leaves linear lanceolate repand, Umbel nearly simple, Flowers pentandrous, Petals linear  
 9468 Stemless, Lvs. smooth: lower ovate ent.; upper pinnatif. Petals reflexed; lower ones much the smallest

\*\* Leaves sagittate, cordate, 3-lobed, or with an appendage at base.

- 9469 Stemless, Leaves cordate blunt nerved entire, generally with two ears at base, Leaves of invol. revolute  
 9470 Stemless, Lvs. obl. lanc. acum. at each end hairy ciliat. at edge, generally ent. somet. with 2 obl. lin. append.  
 9471 Stemless, Leaves entire and cut-lobed at end, Scape flexuose, Umbel compound  
 9472 Stemless, Leaves ciliated 3-cut: segm. ovate blunt, Umbel compound  
 9473 Stemless, Leaves smooth 3-cut: segm. blunt lobed nerved glauc. beneath, Scapes hispid, Umbel compound  
 9474 Stemless, Leaves smooth 3-cut: segm. blunt crenated, Scapes and petioles downy  
 9475 Stemless, Leaves smooth 3-cut: segm. lobed cut recurved, Two upper filaments and stigmas reflexed  
 9476 Stemless, Leaves cut-lobed downy, Umb. simple close, Three lower petals much the smallest

and Miscellaneous Particulars.

however, they for the most part vanish, even before the eyes of those who witnessed their origin." (Smith.)

The greater part of the species being of the easiest cultivation, and many bearing the confined air of a sitting room better than most plants, it has happened that they have become objects of universal cultivation and attention: of which, indeed, they are in many cases deserving, for their neatness and beauty alone. There is, however, an uniformity in their form, coloring, and foliage, for which the liveliest colors will scarcely compensate. The popular taste for the Pelargonium tribe, or for Geraniums, as they are commonly called, has been much aided by several splendid publications both in this country and abroad; and especially by the Geraniacæ of Mr. Sweet, in which it is proposed to figure not only all the species formed by the hand of nature, but the multitudes of hybrid creations produced by the assistance of modern ingenuity. It is very doubtful whether any permanent advantage is derived from the obtaining such of these productions as are truly

History, Use, Propagation, Culture,

hybrid; but it is quite certain, that to admit them into works of science, is replete with the greatest inconvenience, and can lead to no useful end. In the arrangement here adopted, all those kinds which are manifestly or avowedly artificial productions, are therefore placed at the end of the legitimate species in alphabetical order, an order much more commensurate with their importance, than an arrangement upon scientific principles.

\*\*\* *Leaves pinnatifid. Segments cut or multifid.*

- 9477 Stemless, Leaves hairy bipinnated, Lobes linear somewhat blunt, Upper petals reflexed; lower connivent  
 9478 Nearly stemless, Lvs. bipinnated hairy, Lobes pinnati. cut multifid linear somewhat toothed, Fl. nodding  
 9479 Stemless, Lvs. hairy pinnated: segm. pinnatifid or trifid, Lobes linear acute  
 9480 Stemless, Lvs. pinnated: segm. trifid, Lobes linear acum. bearded at end, Pet. lin. blunt  
 9481 Stemless, Lvs. pinnated: segm. trifid cut at end naked, Pet. blunt all with an oblong spot  
 9482 Stemless, Lvs. pinnated pubesc: segm. cuneate 3-5-toothed at end, Teeth setose at end, Umb. compound  
 9483 Stemless, Lvs. pinnated smooth: segm. cut-lobed acute, Umb. simple, Petals emarginate  
 9484 Subcaulescent, Leaves pinnated or 3-cut: segm. obl. lanc. smooth entire ciliated at edge acum. at end  
 9485 Stemless, Lvs. pinnated: segments bipartite, Umbel compound  
 9486 Stemless, Lvs. pinnated hairy: segm. cut multifid, Umbel simple 4-6-fl. Petals linear  
 9487 Stemless, Lvs. pinnated: segm. lanc. linear, Umbel compound  
 9488 Stemless, Lvs. lanc. linear entire and pinnatifid, Umb. compound  
 9489 Stemless, Lvs. hairy ciliated obovate or lanc. entire or pinnatifid, Stipules adhering to petiole  
 9490 Nearly stemless, Lvs. hairy pinnated: segm. oval-obl. blunt subpinnatifid or toothed, Petals lin. blunt  
 9491 Stemless, Lvs. hispid entire or 3 cut, Umbel compound, Flowers dioecious [at end  
 9492 Stemless, Lvs. downy: some obl. and entire; others pinnated, Upper sepal erect, Barren filam. incurved

‡ 2. DIMACRIA. Lindl. *Petals 5, unequal, two upper connivent spreading at end. Stamens shorter than sepals, 5 fertile, two lowermost twice as long as the rest, upper very short; 5 sterile, very small, nearly equal. Stamens sterile herbs, with a tubercous turnip-like root; leaves stalked pinnatifid.*

\* *Leaves pinnated, with an odd segment. Segments entire.*

- 9493 Stemless, Lvs. pinnated villous: segm. ovate in 2 or 4 pairs, Petals nearly entire flat  
 9494 Stemless, Lvs. pinnated hairy: segm. elliptical in many pairs, Petals wavy twisted at base  
 9495 Stemless, Lvs. pinnated smooth: segm. of 1 or 2 pairs obovate or oblong  
 9496 Stemless, Lvs. pinnated smooth: segm. of 2 or 3 pair obovate: the terminal ones confluent

\*\* *Leaves pinnate, with an odd one. Segments lobed or multifid.*

- 9497 Nearly stemless, Leaves smooth pinnated: segments lobed blunt, Upper petals orbiculate  
 9498 Stemless, Lvs. smooth bipinnated, Lobes trifid linear blunt, Scape simple

‡ 3. CYNOSBATA. Dec. *Petals oval, nearly equal, almost twice as long as calyx. Stamens 10 erect, the 5 alternate ones bearing the anthers. Stems shrubby, erect.*

- 9499 Stem shrubby at base, Lvs. cordate 5-lobed hairy zoned, Lobes acutely toothed at end  
 9500 Stem shrubby branched, Lvs. cordate 3-lobed toothed hairy: middle lobe 3-lobed, Pedunc. 2-flowered

‡ 4. PERISTERA. Dec. *Petals nearly equal, as long as calyx, or a little larger. Stamens 10, 5 longer, nearly equal, or one only occasionally abortive, 5 alternate, very short, sterile, tooth like. Herbs with stems, and with the appearance of Erodium or Geranium.*

- 9501 Stems many diffuse, Lvs. cordate roundish many-parted, Lobes trifid, Lobelets linear blunt  
 9502 Cauliscent procumbent, Lvs. cord. somewhat lobed crenate-toothed, Pedunc. 2-flowered  
 9503 Stems many procumbent, Lvs. cord. usually 3-parted or 5-lobed toothed, Pedunc. 3-5-flowered  
 9504 Much branched procumbent, Leaves ellipt. blunt hoary toothed, Pedunc. 2-flowered, Anthers 5  
 9505 Diffuse procumbent, Lvs. cordate somewhat lobed villous beneath, Peduncles many-flowered  
 9506 Diffuse procumbent, Lvs. cordate ovate villous 3-lobed toothed: upper sinuated, Umbel many-flowered

‡ 5. OTIDIA. Lindl. *Petals oblong-linear, nearly equal, about twice as long as calyx, the two upper awicrict at the base on the upper side. Stamens 10, erect, 5 fertile, 2 upper spatulate or subulate, 3 lower shorter. Stems shrubby, fleshy. Leaves alternate pinnated, fleshy. Flowers whitish.*

- 9507 Stem shrubby fleshy, Umb. many-flowered loosely paniced, Lvs. pinnated smooth, Petals somew. toothed  
 9508 Stem shrubby fleshy branched, Lvs. fleshy pinnated: lobes lin. round channelled entire or 3-toothed at end  
 9509 Stem shrubby fleshy warted, Lvs. fleshy pinnated: segm. cut pinnatifid subtrifid at end [at base  
 9510 Stem shrubby fleshy, Lvs. fleshy bipinnated: lobes dilated and cut at end, Pedunc. panic. Upper pet. crisp  
 9511 Stem shrubby fleshy, Branches hairy, Lvs. pinnat.: segm. stalked subalternate wedge-shaped toothed at end  
 9512 Stem fleshy thick suffruticose at base, Lvs. smooth thick sinuate-pinnat.: segm. obl. blunt cut toothed at end

‡ 6. POLYACTUM. Dec. *Sepals nearly equal, revolute. Petals 5, nearly equal, obovate. Stamens 10, 5 fertile: the four lower long, subulate; upper broad, spatulate, reflexed at end; the fertile ones shorter, incurved at end. Petals with a very large dark brown spot which is scarcely edged with yellow.*

- 9513 Subcaulesc. Lower lvs. pinnat. hairy: segm. pinnati.; lobes obl. blunt cut-toothed; upper smoothish bipinn.

‡ 7. ISOPETALUM. Sweet. *Upper sepal ending in a honey pore and not in a tube. Petals 5, equal. Stamens 10, united in a very short cup, 5-5 fertile, spreading incurved at end; sterile unequal, subulate incurved. Shrub with a fleshy stem.*

- 9514 Stem thick fleshy branched naked, Lvs. cord. subpeltate rugose pubesc. netted with downy veins beneath

and Miscellaneous Particulars.

The bulbous or fleshy stemmed species are generally very rare in collections, and are far more interesting than the common or vulgar kinds. They are distinguished by so peculiar a habit and constitution, that there can be little doubt of the propriety of separating them into one or more distinct genera, as has been done already by the authors quoted above; especially as the characters upon which they are founded, are generally more certain than those by which *Erodium* and *Geranium* are defined. Here, however, they are placed as

|      |                           |                |                              |                       |      |          |       |   |     |                    |

History, Use, Propagation, Culture,

sectional names, so as to present a double arrangement, in which the purposes of combination and analysis are both combined.

As the cultivation of Pelargonium generally is of the easiest kind, so is that of the bulbous rooted species of the most difficult nature. They require plenty of air and light, not to be over-watered, and a great deal of

- § 8. *CAMPYLIA*. Lindl. *Petals 5, unequal, two upper larger, with an auricled claw. Stamens 10, hairy or pubescent, 5 fertile, erect, 5 alternate sterile, of which the two upper are longer and hooked back. Herbs at the base a little shrubby, branched. Leaves stalked, ovate or oblong, toothed or cut.*  
 \* *Petals with an appendage to the claw: 5 stamens fertile, erect; 5 sterile, of which the two uppermost are hooked backwards.* TRUE *CAMPYLIA*.  
 9515 Stem suffruticose erect, Lvs. ovate round blunt hoary silky toothed, Upper petals roundish: lower oblong  
 9516 Stem suffruticose erect, Lvs. ellipt. roundish blunt crenate silky, Upper pet. obovate sharply emarginate  
 9517 Stem suffruticose erect, Lvs. roundish ovate blunt doubly toothed silky, Upper petals round dark purple  
 9518 Stem herbaceous ascending, Lvs. obl. lanc. blunt toothed hoary, Pedunc. 1-3-fl. Upper petals obovate  
 9519 Stem suffruticose ascending, Lvs. lin. lanc. cut-toothed at end hoary beneath, Upper petals obov. oblong  
 9520 Stem suffruticose, Lvs. ovate plaited serrated downy, 3 upper petals very broad ovate  
 9521 Stem suffruticose ascending, Lvs. ovate unequally toothed or cut, Stipules carinate, Upper pet. oval wavy  
 \*\* *Upper petals warded above the claw. Tube of stamens very short, 5 fertile recurved, spreading, 5 sterile straight.* *PHYMATANTHUS*. Lindl.  
 9522 Stem suffruticose erect, Lvs. lanc. villous cut-toothed trifid, Upper petals blistered at base  
 § 9. *MYRRHIDIUM*. Dec. *Petals 4, or rarely 5, the two upper very large, obovate, cuneate, usually marked with branching lines, the two or three lower much smaller, oblong-linear. Stamens 10, with their tube and filaments straight, generally with 5 anthers, and 5 alternately barren, rarely 1 fertile. Biennial or perennial herbs rarely shrubby. Stems round. Leaves pinnate or ternate, often multifid.*  
 \* *Anthers 5. Petals 4.*  
 9523 Stem suffruticose, Lvs. 3-parted, Lobes toothed at end blunt: lower obovate; middle ovate often trifid  
 9524 Stem herbaceous strigose ascending, Lvs. hispid on each side rigid pinnate, Lobes cut-toothed  
 9525 Stem herbaceous biennial somewhat downy, Lvs. bipinnate smooth, Lobes linear subpinnatifid  
 \*\* *Anthers 5. Petals 5.*  
 9526 Stem herbaceous hairy suberect, Lvs. bipinnatifid, Segm. lanc. blunt toothed at end  
 \*\*\* *Anthers 7. Petals 4.*  
 9527 Stem herbaceous biennial hairy erect, Lvs. pinnated hairy beneath smooth above, Lobes toothed  
 9528 Stem herbaceous hairy, Lvs. bipinnate, Lobes linear smoothish, Pedunc. 1-fl.  
 9529 Stem herbaceous procumbent smooth, Lvs. subpinnatifid toothed, Pedunc. many-fl. capitate  
 § 10. *SEYMOURIA*. Sweet. *Petals 2, distinct at base, abruptly reflexed in the middle. Stamens 5, nearly equal, in a long straight tube, all fertile.*  
 9530 Lvs. roundish cordate bluntish entire ciliated shining on the upper side  
 9431 Leaves ovate entire acute smooth, Umb. simple, Flowers pentandrous  
 § 11. *JENKINSONIA*. Sweet. *Petals 5, the two upper much larger than the rest, emarginate at end, striated with colored lines, the 3 lower much smaller. Stamens 10, ascending, spreading at end, hairy at base, 7 fertile, of which the three upper are shorter, the three sterile shortened, subulate, of equal length. Stems shrubby. Flowers large.*  
 9532 Lvs. bipinnatifid hairy, Stem procumb. hairy, Flowers heptandrous, Petals 4  
 9533 Stem shrubby flexuose, Lvs. pubescent palmate 5-fid, Lobes cuneate 3-toothed at end  
 § 12. *CHORISMA*. Lindl. *Petals 4, rarely 5, the two upper with long claws largest, two lower much smaller. Stamens declinate, in a very long tube, jointed in middle, connate, 7 fertile, of which the two lower are loose; the 3 sterile shortened, subulate of equal length.*  
 9534 Branches 4-cornered fleshy, Leaves cordate bluntly lobed somewhat toothed  
 § 13. *PELARGONIUM*. Lindl. *Petals 5, unequal, the two upper approximating. Stamens 10, unequal, 7 fertile, 3 sterile, subulate.*  
 \* *Petals whole colored, the two upper shorter and narrower. Stamens short, erect, the two lowest very short with nearly sessile anthers. Stem shrubby, fleshy.* *CICONIUM*. Sweet.  
 9535 Leaves very smooth obovate crenate somewhat fleshy, Pedunc. few-fl. Petals linear  
 9536 Leaves roundish obsoletely lobed crenate smooth zoned, Petals linear breadth of sepals  
 9537 Leaves roundish obsoletely lobed crenate: younger somewhat zoned, Pedunc. 4-fl. Petals linear  
 9538 Leaves roundish obsoletely lobed crenate downy zoned, Petals linear narrower than sepals  
 9539 Leaves roundish obsoletely lobed crenate smooth not spotted, Petals linear cuneiform  
 9540 Leaves cordate-orbicular obsoletely lobed toothed zoned upwards, Pedunc. many-fl. Petals cuneate  
 9541 Leaves reniform 5-lobed crenate zoned, Stipules cordate obl. acute ciliated, Umbels many-fl. crowded  
 9542 Leaves round reniform scarcely divided crenate viscid, Petals obovate cuneate  
 9543 Leaves cordate orbicular cut-lobed toothed pubescent on each side, Petals obl. cuneate  
 9544 Leaves roundish reniform obsoletely lobed somewhat zoned complicate crisp downy on each side  
 \*\* *Petals nearly equal in size.*

§ A. *Stems herbaceous. Leaves cordate, palmate, lobed. Petals small.*  
 9545 Stem diffuse, Lvs. cord. ov. obsoletely lobed bluntly toothed ciliated, Pet. equal to the cal. and one another

and Miscellaneous Particulars.

attention at all periods. If well managed, they flower beautifully, and are incomparably superior in all points to the commoner races. They are no where in this country managed with so much success as by Sweet, who seems to hold the reins of nature in his hands in a more steady manner than any cultivator of the age.

The most common free-growing kinds will thrive well in any rich light soil, or a mixture of loam and decayed leaves will suit them very well: the dwarfer woody kinds, as *P. tricolor*, *elegans*, *Blattarium*, *ovale*,

- 9546 Stem diffuse, Lvs. cord. somewhat lobed bluntly crenate villous beneath, Pet. larger than calyx
- 9547 Stem fleshy very short, Branches herbaceous long diffuse, Lvs. roundish cordate very soft
- 9548 Branches spreading soft with down, Lvs. roundish cordate about 3-lobed bluntly toothed very soft
- 9549 Stems square very smooth, Lvs. cordate roundish cut toothed, Pedunc. about 2-fl.
- 9550 Stems 3-cornered 2-edged smooth, Lvs. cordate roundish obsolete lobed toothed, Umb. many-fl.
- 9551 Stem hispid, Lvs. reniform 3-5-lobed blunt toothed at end smoothish, Pedunc. long 2-4-fl.
- 9552 Stem villous, Lvs. cordate 5-lobed palmate villous, Pedunc. few-fl. Stigma sessile
- 9553 Stem erect, Lvs. bipinnatifid laciniate smooth, Involucres and calyxes blunt
- § B. *Stem half shrubby, Leaves pinnate, Lobes multifid.*
- 9554 Leaves cinereous velvety palmately 3-cut, Lobes linear trifid, Calyxes somewhat hispid
- 9555 Leaves 3-cut dark-green, Lobes distant 3-parted lacinated, Petals linear flaccid
- 9556 Stem fleshy naked erect, Leaves hairy bipinnate decompound, Lobes linear subulate
- 9557 Leaves 3-parted fleshy cut-toothed glaucous, Segments subsessile cuneiform, Honey spur very long
- 9558 Leaves cuneiform trifid toothed, Petioles and stipules persistent spiny, Umb. comp. few-fl.
- § C. *Stem half-shrubby, fleshy. Leaves trifid or pinnate, fleshy, Petals yellowish brown.*
- 9559 Stem with tumid articulations, Leaves pinnate of 1 or 2 pairs with an odd one blunt cuneate cut-toothed
- § D. *Nearly stemless. Root fasciated, tuberous. Leaves decompound, lacinated. Petals yellowish brown.*
- 9560 Leaves decompound laciniate hairy, Segm. linear, Umb. many-fl.
- 9561 Leaves hairy pinnate, Segm. bipinnate; divisions ovate toothed somewhat acute
- 9562 Leaves smooth ciliated fleshy 5-7-lobed toothed reflexed at end, Umb. many-flow. Fls. on very long stalks
- 9563 Leaves hairy pinnate, Segm. bipinnatifid; divisions linear acute
- 9564 Leaves ternate oblong blunt wavy hairy on each side and revolute at end, Petals 2-parted multifid
- 9565 Leaves cordate downy beneath bluntly 3-5-lobed sinuate-toothed, Scape divided
- 9566 Leaves decompound smooth, Leaflets cut, Segments channelled linear, Calyx reflexed
- § E. *Stem short, or somewhat fleshy. Leaves divided, cut or toothed. Petals scarlet or crimson.*
- 9567 Leaves hairy pinnate, Segments lacinate pinnatifid decurrent, Lobes linear lanceolate
- 9568 Leaves 3-parted, Segm. sessile cuneate cut toothed, Middle lobe larger pinnatifid
- 9569 Leaves cord. 3-lobed, Segm. toothed: lateral bifid; middle 3-lobed, Stipules cord. acum. somew. toothed
- § F. *Stem half shrubby. Leaves lobed, hairy. Petals with a broad purple spot in the middle.*
- 9570 Leaves hispid 3-parted, Segm. multifid, Lobes linear-lanceolate serrated
- 9571 Leaves cordate 3-fid wavy hairy blunt toothed: lateral segments 3-lobed; upper 5-lobed
- § G. *Stem fleshy, half shrubby. Leaves oblong, or oftener cordate, somewhat cut. Stipules lanceolate, spreading, acute. Roots tuberous, fasciated.*
- 9572 Leaves 3-parted hairy, Lateral segments smaller lobed toothed; term. long cut-toothed, Pet. spreading
- 9573 Leaves oblong lobed pinnatifid, Petioles united at base, Umb. many-flowered
- 9574 Leaves cord. obl. subtruncate toothed downy, Scape branched, Umb. many-fl. Involucres leafy
- 9575 Leaves ovate cordate somewhat lobed crenate villous beneath, Stipules persistent spiny
- 9576 Leaves reniform obacuminate toothed silky on each side, Bractes 4 times shorter than pedicel
- 9577 Leaves reniform obacuminate toothed silky on each side, Bractes twice as short as pedicels
- 9578 Leaves cordate cut-lobed wavy bluntly toothed downy, Honey-tube 4 times as long as calyx
- 9579 Leaves reniform crenate-toothed downy beneath, Stipules persistent dilated at base
- § H. *Stem shrubby, fleshy. Leaves peltate, or cordate 5-lobed, fleshy. Honey-tube as long as stalk. Stipules broad ovate.*
- 9580 Branches fleshy round, Leaves cordate 5-lobed somewhat toothed fleshy smooth, Umb. many-fl.
- 9581 Branches fleshy angular, Leaves peltate 5-lobed entire fleshy, Umb. few-fl.
- \*\*\* Two upper petals broader, shorter, very blunt.
- 9582 Stem weak prostrate, Branches petioles and peduncles softly hairy, Leaves oval acute toothed hoary
- 9583 Leaves elliptical roundish finely serrate blunt rigid smooth, Petals all obovate
- \*\*\*\* Two upper petals longer and broader. Stems shrubby.
- § A. *Leaves smooth, or nearly smooth, more or less glaucous.*
1. *Petals white, the upper generally lined with red, or spotted.*
- 9584 Very smooth and glaucous, Leaves lanceolate entire acuminate, Peduncles 1-2-fl.
- 9585 Smooth glaucous, Leaves lanceolate entire or 3-parted; lower toothed, Pedunc. about 1-fl. panicle
- 9586 Very smooth somewhat glaucous, Leaves ovate acute glaucous somewhat cut remotely serrate
- 9587 Very smooth, Leaves deeply 3-parted, Segm. acinaciform cut serrate, Peduncles 3-flowered
- 9588 Very smooth glaucous, Leaves 3-parted, Segm. trifid cuneate; divisions linear lanc. Pedunc. about 2-fl.
- 9589 Smooth glauc. Lvs. 5-lobed palmati. cord. at base, Lobes toothed tow. the end, Pet. 3 times as long as cal.
- 9590 Smooth glaucous, Leaves 3-5-lobed palmate-parted, Segments trifid toothed, Stipules ovate cordate acute
2. *Petals rosy or violet, upper generally striped with purple.*
- 9591 Smooth glaucous, Leaves long-stalked cordate reniform 3-5-fid toothed, Petals lanceolate-cuneate
- 9592 Smooth glaucous, Leaves on long stalks cordate roundish 5-fid toothed zoned above
- 9593 Smooth glaucous, Leaves cord. 5-lobed toothed glaucous beneath: younger zoned above; upper 5-parted

and Miscellaneous Particulars.

&c. thrive best in an equal mixture of sandy loam and peat, and require their pots to be well drained; the succulent kinds like a light sandy loam, and require scarcely any water when not in vigorous growth; the

History, Use, Propagation, Culture,

tuberous rooted kinds thrive best in very sandy loam and peat, and require no water after they have flowered, till they begin to grow afresh. Cuttings of the shrubby kinds strike root freely under hand-glasses in the same

‡ B. *Flowers white, or scarcely rose-colored; two upper petals deep-red, lined. Leaves ovate, cordate, or reniform toothed, undivided.*

- 9594 Lvs. ovate cut serr.: the younger scabrous backwards; adult nearly smooth, Stipules ovate acuminate
- 9595 Leaves ovate unequally serrate smoothish, Stipules ovate-lanceolate, Peduncles 2-4-flowered
- 9596 Umb. many-fl. Leaves ovate acute concave rigid somew. lobed uneq. tooth. truncate at base many-nerved

§ C. *Petals white, narrow. Leaves cordate, soft with down. Stipules spreading much.*

- 9597 Stem shrubby fleshy, Branches peduncles and leaves hirsute, Leaves cordate hastate 5-lobed very soft
- 9598 Stem shrubby fleshy, Branches and pedunc. subhispid, Lvs. cord. hastate 5-lobed rough, Umb. many-fl.

§ D. *Leaves cordate, flat, toothed. Lower petals linear; upper purple, lined.*

- 9599 Branches leaves and pedunc. hairy, Leaves cordate roundish angular toothed, Umbels paniced many-fl.
- 9600 Lvs. cord. acute toothed flat hoary beneath and downy, Branches and ped. pilose, Lower pet. subulate-lin.
- 9601 Leaves cordate acutely crenulate quite smooth, Stipules linear reflexed, Umbels many-flowered
- 9602 Leaves roundish ovate truncate subcordate at base cut-toothed wavy beneath hoary pubescent

§ E. *Leaves cordate, or cuneate, toothed, undivided, or lobed. Lobes blunt, not divided down to the middle. Flowers purple. Lower petals oblong or obovate.*

1. *Leaves undivided, cucullate.*

- 9603 Leaves reniform cucullate toothed pubescent, Branches and peduncles softly hispid, Lower petals oblong
- 9604 Leaves roundish truncate reniform with acute cartilaginous teeth many-nerved subpubescent
- 9605 Leaves roundish ovate subcord. concave somewhat angular serr. pubesc. Honey-tube the length of calyx
- 9606 Leaves cum. at base entire at end palmately 5-lobed toothed many-nerved rather villous, Stip. cordate ovate
- 9607 Leaves truncate at base subcucul. roundish bluntly 5-lobed toothed pubesc. Stipules cord. ovate acuminate
- 9608 Leaves reniform blunt cucullate toothletted hairy on each side, Umbels many-flowered
- 9609 Leaves cord. roundish somewhat lobed tooth-crenate wavy at edge, Stipules cord. acute somew. toothed

2. *Leaves lobed, flattish.*

- 9610 Leaves cordate bluntly 3-lobed wavy villous soft, Pedunc. about 2-flowered
- 9611 Leaves truncate at base subcuneate 3-fid flat hairy, Lobes divaricating serrated at end, Lower petals lin.
- 9612 Leaves cordate 3-lobed roughish blunt toothed, Stipules broad cordate, Stem erect
- 9613 Leaves cordate lobed wavy softly villous toothed, Stipules broad cordate, Stems diffuse
- 9614 Lvs. subcord. acute slightly 5-lobed serrated, Umb. 5-fl. subcapitate, Ped. scarcely longer than involucrem

3. *Leaves lobed. Lobes acutely cut at end.*

- 9615 Lvs. deeply 3-lobed, Lobes round, blunt unequally toothletted. Veins ben. and cal. roughish, Stipules cord.
- 9616 Leaves cuneate at base trifid, Lobes acute: middle longer subserrate with a midrib mucronate beneath
- 9617 Leaves cuneate at base trifid rough, Lobes lanc. loosely serrated, Pedunc. 1-4-flowered
- 9618 Leaves cuneiform distichous rough plaited truncate at end cut-toothed, Peduncles 2-flowered short
- 9619 Leaves distichous roundish fleshy subcuneate at base trifid wavy plaited rough toothed, Pedunc. about 2-fl.
- 9620 Leaves truncate cord. 3-lobed toothed hoary, Stipules scarcely any, Peduncles 3-4-flowered
- 9621 Lower lvs. deeply 3-lobed beneath pustular, Lateral lobes spreading unequally and acutely toothed
- 9622 Leaves deeply 3-lobed, Lobes spreading unequally and acutely toothed at end beneath and at edge rough
- 9623 Leaves 3-parted cucullate rough, Lobes cuneiform cut-serrate at end: the middle one trifid

§ F. *Leaves divided beyond the middle. Lobes toothed, cut, or pinnatifid. Flowers purplish or pale.*

- 9624 Leaves cord. pinnatifid with rounded recesses, Lobes blunt crenate, Branches and petioles hispid
- 9625 Leaves palmately 7-lobed, Lobes oblong blunt toothed revolute at edge, Umb. many-fl. capitate
- 9626 Leaves cord. hastate 5-angled toothed viscid smoothish, Umb. 2-4-fl. Honey tube a little longer than calyx
- 9627 Leaves palmatifid downy hispid, Lobes acuminate cut toothed, Umb. paniced many-fl.
- 9628 Leaves palmated rough, Lobes narrow pinnatifid revolute at edge, Segm. linear, Umb. few-fl.
- 9629 Leaves palmated roughish cuneate at base, Lobes lanc. remotely toothed, Umb. few-fl.
- 9630 Leaves somewhat palmated rough, Lobes 5-7-oblong blunt crisply toothletted at edge, Umb. 5-fl. in heads
- 9631 Leaves palmated viscid smooth, Lobes linear pinnatifid repand toothed flattish, Umb. few-fl.
- 9632 Leaves rough palmate 5-lobed, Lobes oblong serrated: middle 3-lobed, Umbels few-fl. compound

‡ *Uncertain species.*

- 9633 Stem fleshy branched arboreous. Lvs. cord. peltate pubesc. variably glauc. Petioles villous without stipules
- 9634 Leaves reniform distichous slightly 3-lobed blunt unequally toothed wavy
- 9635 Leaves slightly trifid unequally and acutely toothed wavy hairy, Peduncles 2-4-fl.
- 9636 Leaves roundish ovate blunt subtrifid folded together wavy toothed hairy beneath, Sepals erect
- 9637 Leaves slightly 3-lobed flat blunt, Lobes divaricating unequally and finely toothed, Pedunc. 3-fl.
- 9638 Leaves roundish cuneate slightly 3-lobed wavy toothletted, Branches petioles and peduncles villous
- 9639 Leaves roundish cuneate slightly 3-lobed wavy toothletted, Honey tube twice as short as reflexed calyx
- 9640 Leaves ellipt. blunt: floral obsoletely subtrifid unequally toothed somew. cuneate and entire at the base
- 9641 Leaves flat very smooth half round 7-lobed serrated slightly cordate at base, Pedunc. 2-5-flowered

and *Miscellaneous Particulars.*

kind of soil, or in pots, without being covered by glass, and placed in a shady situation. Many of the kinds may also be increased by pieces of their roots, or from seeds. The tuberous-rooted kinds may be propagated

OCTANDRIA.

9642 The only species

DECANDRIA.

- 9643 Stem erect diffuse branched, Peduncles longer than petiole, Leaves 5-parted, Lobes oblong cut-toothed  
 9644 Stem erect diffuse branched, Ped. longer than petiole, Leaves opp. 5-parted, Lobes trifid, Lobelets linear  
 9645 Stem diffuse, Leaves hoary beneath 7-part. Lobes multifid linear, Pedunc. elongated, Calyxes silky villous  
 9646 Stem diffuse, Leaves hoary beneath 5-parted, Lobes obl. cut-toothed, Ped. very long and cal. gland. hairy  
 9647 Stem very short, Radical leaves on long stalks silky on each side 5-7-parted, Lobes 3-fid, Lobelets linear  
 9648 Stem very short, Rad. leaves stalked glaucous pubescent 5-parted, Lobes cuneiform trifid, Pedunc. radical  
 9649 Stem shrubby, Leaves smooth palmate 5-cut, Segments bipinnatifid, Peduncles opposite erect hairy  
 9650 Stem suffruticose at base dichot. at end, Lvs. smooth 5-parted, Lobes toothed at end, Cal. globose infat.  
 9651 Root subglobose, Stem naked from base to the branches, Leaves 5-parted, Lobes lin. pinnately cut serrate  
 9652 Stem villous dichotomous, Leaves 5-7-parted, Lobes pinnately cut, Calyxes ciliate villous  
 9653 Stem 4-cornered, Lower leaves 5-lobed; upper 3-lobed, Lobes oblong acuminate serrate, Pet. emarginate  
 9654 Stem angular, Rad. leaves 7-lobed; cauline 5-lobed, Lobes oblong acuminate toothed, Petals emarginate  
 9655 Stem erect somewhat angular, Leaves opposite 5-lobed, Lobes cuneate ovate lobed-toothed, Stip. connate  
 9656 Stem round, Leaves 5-lobed, Lobes oval acuminate cut-toothed, Stipules connate bifid  
 9657 Stem round, Lower leaves 5-lobed; upper 3-lobed, Lobes ovate acute cut toothed, Stipules distinct  
 9658 Stem round, Leaves altern. 5-7-lobed cut-toothed; upper sessile, Petals reflexed toothed at end  
 9659 Stem round, Leaves 5-lobed cut-toothed; upper sessile, Petals spreading entire, Filaments hairy at base  
 9660 Like the last, but with dark fuscous petals  
 9661 Like Pheum, but the petals are rose-colored and emarginate  
 9662 Stem round simple, Lvs. 5-lobed, Lobes ovate coarsely toothed; lower on long stalks altern.; up. sess. opp.  
 9663 Stem round erect smooth, Lvs. about 7-lobed, Lobes obl. cut serr. Ped. corymbose, Pet. somew. emarginate  
 9664 Stem round erect downy, Lvs. about 7-lobed, Lobes linear obl. cut serrate, Ped. somew. corymb. Pet. entire  
 9665 Stem round erect smooth, Leaves palmate subpeltate 5-7-lobed, Lobes oblong coarsely cut, Ped. very long

and Miscellaneous Particulars.

sand, under a bell-glass, plunged in heat. The cuttings must not be put in very close together, and the glass must be wiped frequently, as they are apt to damp off." (Bot. Cult. 129.)

1463. *Geranium*. *Γερανιον* of the ancient Greeks, so called from *γερανος*, a crane, the capsule and its beak resembling the head of that bird. These are chiefly European plants, in many cases being mere weeds, of no

History, Use, Propagation, Culture,

interest, and in others, being extremely showy border-flowers. The G. Lancastriense is the most elegant, and G. sanguineum the most ornamental of our British kinds. G. anemonifolium, a Cape species, is singularly beautiful, on account of its fine caulescent stem, loaded with large fern-like glossy leaves of the most delicate green, and its fine red rich blossoms broader than half a crown.

1464. *Brownea*. Named after Dr. Patrick Browne, an English physician, who published a Natural History of Jamaica, in 1756, illustrated with figures from the pencil of Ehret. A splendid genus, as yet rare in British gardens. Loamy soil best suits rooted plants; and ripened cuttings root in sand in close moist heat.

1465. *Monsonia*. In memory of Lady Ann Monson, a lady of eminent botanical acquirements, who resided for many years in the East Indies, and is said to have assisted in compiling Lee's Introduction to Botany. The species are curious and beautiful plants: they grow well in turfy loam and rotten leaves, and are increased by cuttings of the shoots or roots.

- 9666 Stem somew. angul. erect dichotomous pubesc. backw. Lvs. 3-5-part. cut-toothed : radlc. on very long stalks  
 9667 Stem angular diffuse pubesc. backw. Lvs. palmate 5-part. : lobes 3-lobed cut serrate, Ped. and cal. vill. viscid  
 9668 Stem decumbent villous with spreading hairs, Leaves 5-7-lobed : lobes cut-toothed, Ped. very long hairy  
 9669 Stem ascending smoothish, Leaves peltate 7-parted : lobes cut, Peduncles and calyx villous  
 9670 Stem naked at base erect smooth, Caul. lvs. opposite 3-5-part. : lobes cut acute, Ped. 3 times as long as leaf  
 9671 Stems decumbent branched, Petioles and peduncles hispid, Leaves 3-5-parted : lobes linear blunt trifid  
 9672 Stems decumbent, Petioles pedunc. and calyx smoothish, Caul. lvs. opp. 3-5-parted : lobes trifid toothed  
 9673 Stem prostrate compressed, Lvs. opp. 5-lobed : lobes oblong unequally toothed, Ped. elong. and cal. hairy  
 9674 Stem erect branched, Leaves reniform 7-lobed : segm. oblong obtuse trifid ; lobes 3-toothed  
 9675 Stem more flaccid and nearly naked, Grains nearly smooth. Otherwise like the last  
 9676 Leaves ren. : rad. 9-lobed ; caul. 7-lobed : lobes 3-fid, Pet. bifid length of pointless cal. Fruit smooth rugose  
 9677 Leaves subreniform 7-lobed : lobes 3-fid, Petals emarg. length of pointless cal. Fruit downy not rugose  
 9678 Radic. lvs. reniform 7-lobed ; caul. roundish trunc. at base 5-lobed : lobes trifid, Pet. length of awned cal.  
 9679 Leaves 5-parted : lobes multifid linear, Petals emarginate length of awned calyx, Fruit smooth  
 9680 Leaves 5-parted : lobes trifid linear, Petals emarginate length of awned calyx, Fruit hairy  
 9681 Lvs. 5-lob. beyond middle : lobes cut 3-5-fid, Ped. clustered at end, Petals emargin. length of awned calyx  
 9682 Lvs. 5-lobed : lobes cuneate ovate cut-tooth. Hair of stem spread. hispid, Pet. emarg. length of awned calyx  
 9683 Lvs. 5-lob. : upp. 3-lob. : lobes obl. coarsely and irreg. tooth. Hair of stem spread. hisp. Pet. shorter than cal.  
 9684 Very smooth, Leaves rounded 5-lobed, Calyx pyramidal angular transversely wrinkled, Fruit muricate  
 9685 Leaves 3-5-parted : lobes trifid pinnatifid, Petals entire twice as long as the angular awned calyx  
 9686 Like the last, but the petals only a little longer than calyx  
 9687 Stem prostrate nodose, Leaves opposite deeply 5-lobed

9688 Stamens length of cor. Pedunc. aggregate, Branches smooth

### DODECANDRIA.

- 9689 Leaves palmate 5-parted, Segm. finely bipinnatifid, Petioles and calyxes smooth  
 9690 Leaves palmate 5-parted, Segm. 3-parted pinnatifid ; beneath calyxes and petioles hairy  
 9691 Leaves cordate 5-7-fid : lobes blunt serrated ; beneath petioles and calyxes somewhat hairy  
 9692 Leaves ovate oblong subcordate crenate wavy, Stipules rigid, Pedunc. 1-f. with 2 bractes  
 9693 Leaves ovate mucronate entire, some sessile, some on long stalks

- 9694 Decandrous, Leaves cordate finely serrate downy beneath, Peduncles 2-flowered, Calyxes sub-bilabiate  
 9695 Decandrous, Leaves cordate crenate velvety with down on each side, Flowers subterminal few corymbose  
 9696 Decandrous, Leaves cordate ovate tooth-serrate acuminate axillary, Flowers axillary  
 9697 Lvs. cordate acuminate serrate downy green, Peduncles axillary few-flowered, Fruit-stalk very long  
 9698 Leaves cordate lanceolate crenulate downy beneath rusty, Fl. terminal subracemose

- 9699 Young leaves downy, adult smoothish cordate 7-nerved crenate, Corymb bifid  
 9700 Leaves downy beneath smooth above ovate oblong 7-nerved subcordate-peltate toothed

- 9701 Leaves hastate lanceolate serrate  
 9702 Leaves ovate serrated

9703 Leaves roundish cordate acuminate very large, Stipules large persistent ovate wavy

- 9704 Leaves oblong acuminate coarsely somewhat toothed at end, Pedicels scarcely longer than petiole  
 9705 Leaves cordate blunt toothed  
 9706 Leaves oblong acuminate entire cordate at base sagittate on one side

### and Miscellaneous Particulars.

1466. *Helicteres*. Derived from  $\epsilon\lambda\iota\kappa\epsilon$ , a screw, in allusion to the manner in which the fruit is twisted. Free-flowering plants of easy culture, and increased in sand closely covered. They have little or no merit.

1467. *Dombeya*. Named after Joseph Dombey, a famous French botanist, who travelled in Peru with Ruiz and Pavon, in 1777. Ripened cuttings root in sand in moist heat.

1468. *Pentapetes*. One of the names given by the Greeks to the Cinquefoil ; but having no reference to the present genus, except that the calyx and capsules are in five. The species are of easy culture in any rich light soil, and are readily increased by cuttings in sand.

1469. *Astrapea*. So called from  $\alpha\sigma\tau\rho\alpha\iota\mu$ , lightning, in allusion to the splendid colors of the flowers. A noble genus, remarkable for the large heads of flowers, and the great dilated stipules at the base of the leaves.

1470. *Pteropermum*. From  $\pi\tau\rho\epsilon\mu\mu$ , a wing, and  $\sigma\tau\rho\epsilon\mu\mu$ , a seed. Light soil suits the plants, and cuttings with their leaves on root in sand covered close.

History, Use, Propagation, Culture,

1471. Malope. A name given by the Greeks to the Tree Mallow.  
 1472. Malva. Altered by the Latins from the Greek word, μαλαχην, soft, in allusion to the soft mucilaginous qualities of the species. Some of the species are shewy plants, and M. capensis is valued in small greenhouses as flowering all the year. M. sylvestris, Masue, Fr., has still a place in the Materia Medica, on account of its

## POLYANDRIA.

- 9707 Leaves ovate crenate, Stipules oblong-linear  
 9708 Leaves 3-nerved trifid toothed smooth : lobes acuminate
- 9709 Leaves oblong or ovate acute serrate, Flowers axillary clustered  
 9710 Leaves ovate acute crenate serrate hairy, Fl. axillary subsolitary  
 9711 Leaves ovate-lanceolate doubly toothed obsolete 3-lobed beneath rough, Peduncles axillary 2-flowered  
 9712 Leaves ovate crenate-serrate beneath velvety, Fl. axillary clustered  
 9713 Leaves ovate acute coarsely toothed pubescent ; upper cuneate at base, Fl. axillary and terminal spiked  
 9714 Leaves ovate acuminate serrate rough, Fl. axillary and terminal spiked  
 9715 Leaves ovate or subcordate rough above downy beneath, Flowers in ovate spikes  
 9716 Leaves cordate crenate blunt and branches downy, Flowers lateral heaped  
 9717 Leaves subcordate acute toothed downy beneath, Fl. sessile, Lobes of calyx ovate  
 9718 Leaves cordate acuminate serrated rough ; lower lobed, Pedunc. axillary, Flowers in heads  
 9719 Leaves cordate blunt smooth, Flowers sessile heaped  
 9720 Dwarfs, Leaves ovate toothed : adult smoothish ; younger hairy, Fl. axillary solitary on short stalks  
 9721 Leaves reniform broadly crenate and branches leprous, Stems prostrate  
 9722 Leaves cordate roundish 5-angled crenate villous, Pedicels longer than petiole  
 9723 Leaves half orbicular crenate ; upper rhomboid, Stem erect hairy  
 9724 Lower leaves 3-lobed entire ; upper multifid, Segm. trifid toothed at end  
 9725 Leaves 3-parted, Segm. trifid ciliated toothed at end, Cor. less than calyx  
 9726 Leaves 3-parted, Segm. trifid linear blunt, Cor. 3 times as large as calyx  
 9727 Leaves many-parted : lobes trifid linear, Stem decumbent, Hairs stellated  
 9728 Lower leaves angular ; upper 5-parted cut, Stems and calyxes velvety  
 9729 Lower leaves reniform cut ; cauline many-parted, Segments linear, Stems and calyxes hairy
- 9730 Leaves palmated : lobes lanceolate toothed, Hairs simple, Pedicels longer than leaf  
 9731 Stem erect, Leaves 5-lobed blunt, Pedicels and petioles smoothish or downy on the upper side  
 9732 Stem erect, Leaves 5-7-lobed acute, Pedicels and petioles hairy  
 9733 Stem prostrate, Leaves cord. orbic. bluntly 5-lobed, Pedicels in fruit drooping and petioles downy
- 9734 Stem diffuse, Lvs. cord. orbicular 7-lobed soft : lobes acute, Fls. aggreg. stalked, Leaves of involucre bristly  
 9735 Stem erect, Leaves cordate roundish about 5-lobed crenate smooth, Fl. axillary sessile clustered  
 9736 Stem spreading, Leaves roundish bluntly angular crenate smoothish, Fl. axillary sessile clustered  
 9737 Stem erect, Leaves cordate roundish bluntly angular, Fls. axill. clustered sess. Cal. rough somew. inflated  
 9738 Stem erect, Leaves angular toothed crisp smooth, Flowers axillary sessile  
 9739 Pedicels 1-flowered aggregate shorter than leaf, Invol. ovate acuminate, Leaves 5-lobed hairy rugose  
 9740 Pedicels 1-flowered solitary or twin longer than petiole, Invol. linear, Leaves cut crenate smooth rigid  
 9741 Pedicels 1-fl. solitary or twin longer than petiole, Inv. ov. lanc. Lvs. 5-lobed or 3-lobed cren. toothed glutin.  
 9742 Pedicels 1-fl. solitary longer than petiole, Invol. obl. linear, Lvs. sub-three-lobed acute unequally toothed  
 9743 Pedicels 1-flowered solitary length of leaves, Leaves subsessile cuneiform trifid entire  
 9744 Pedicels solitary longer than petiole, Leaves lobate plaited toothed roughish, Branches divaricating  
 9745 Pedicels solitary longer than petiole, Invol. lanceolate, Leaves oblong very blunt 3-lobed toothed  
 9746 Pedicels solitary 1-fl. twice as long as petiole, Invol. ovate acute very large, Leaves cordate crenate hairy  
 9747 Pedicels solitary 1-fl. length of petiole, Invol. lanc. Leaves cordate 5-lobed toothed, Branches glutinous  
 9748 Pedicels solitary 1-fl. length of petiole, Invol. nearly linear, Leaves ovate about 3-lobed toothed hairy  
 9749 Pedicels solitary 1 or 2-fl. shorter than petiole, Leaves cordate about 5-lobed blunt rough with stellat. hair  
 9750 Pedicels solitary 1-3-fl. length of petiole, Invol. obl. linear, Leaves sinuate lobed serrate rugose hairy  
 9751 Pedicels 1-2-fl. solitary longer than petiole, Invol. linear, Leaves 5-lobed blunt rugose very rough  
 9752 Leaves angular acute cordate villous, Petals obovate shorter than calyx, Pedunc. panicled  
 9753 Leaves ovate 3-lobed toothed downy, Pedunc. axillary racemose few-flowered  
 9754 Leaves angular 5-lobed ; middle lobe largest, Pedunc. axillary racemose, Flowers 1-sided  
 9755 Leaves palmate, Spikes axillary 1-sided, Fruit toothletted  
 9756 Leaves 7-lobed rugose, Spikes axillary 1-sided, Fruit smooth  
 9757 Leaves 5-lobed : lobes pinnatifid sinuate toothed, Pedunc. corymbose capitate, Fruit with two beaks  
 9758 Leaves subpeltate 5-lobed blunt, Pedunc. axillary umbelled, Invol. obovate stipitate deciduous  
 9759 Leaves 5 angular downy, Pedunc. axillary bifid few-flowered, Fruit oblong small  
 9760 Leaves 3-parted hoary, Segm. toothed at end ; middle trifid, Pedunc. axillary 1-flowered  
 9761 Leaves lanceolate toothed downy, Pedunc. axillary 2 few-fl. Invol. setaceous deciduous  
 9762 Leaves palmate 5-lobed cut toothed, Pedicels solitary longer than petiole, Fruit villous  
 9763 Leaves palmate 5-lobed cut toothed, Pedicels solitary longer than petiole, Fruit smooth, Petals entire  
 9764 Leaves ovate cut toothed lobed, Pedicels longer than petiole, Fruit villous, Petals entire

and Miscellaneous Particulars.

demulcent properties ; but it is greatly inferior to Althaea, and therefore little used. Malva was an excellent vegetable among the Romans, but what species is uncertain. A tree of the mallow kind is said, by Prosper Alpinus, to afford food to the Egyptians ; and the Chinese use some sort of mallow as food.

All the species are of the easiest culture and propagation.

History, Use, Propagation, Culture,

1473. *Kitabelia*. Named after Dr. Paul Kitabel, professor of botany at Pest, in Hungary, and author, in conjunction with Count Waldstein, of a noble work upon the plants of that country. A tall mallow-like plant with vine-like leaves, and white flowers.

1474. *Althæa*. From ἄλθω, to cure. The salutary effects of the mucilaginous root, are well known in medicine. *Guimanne*, Fr. A. officials has long been in repute as a demulcent. Its roots are sometimes used as an emollient suppurative cataplasm; and a decoction of the leaves forms a useful fomentation in external abrasions, and in cutaneous eruptions, accompanied with a sharp ichorous discharge.

A. rosea is the parent of nearly twenty splendid varieties of border flowers, which seed readily, and the offspring generally resembles the parent variety. All the species are of the easiest culture in common garden soil.

1475. *Lavatera*. In memory of two Lavaters, physicians of Zurich, neither the physiognomist, but two friends of Tournefort. The species resemble those of Malva, in general appearance and culture: much the handsomest is *L. arborea*, which is a magnificent plant in shrubberies, or in the back of wide borders.

9765 Leaves 5-lobed acute toothed

9766 Leaves soft on each side cordate or ovate toothed undivided or 3-lobed. Pedunc. axillary many-fl.  
 9767 Leaves pubescent: lower 5-7-parted; upper trifid, Peduncles many-fl. longer than leaf  
 9768 Leaves downy hoary beneath: lower palmate; upper 3-parted: lobes narrow coarsely toothed  
 9769 Leaves cordate rough with hairs smooth above: lower blunt; upper 5-lobed, Stem hispid  
 9770 Leaves smooth cordate roundish lobed toothed, Pedicels axillary clustered 1-flowered  
 9771 Leaves roundish cordate 5-angled crenate, Pedicels 1-fl. much shorter than petiole  
 9772 Stem upright hairy, Leaves cordate 5-7-angled crenate rugose, Flowers axillary sessile  
 9773 Stem erect hispid, Leaves roundish cordate, Invol. as long as calyx  
 9774 Stem upright smoothish, Leaves rounded lobed crenulate serrate, Flowers solitary subsessile  
 9775 Stem subflexuose hispid, Leaves cordate about 7-lobed blunt on long stalks, Flowers axillary solitary  
 9776 Stem erect hairy, Leaves palmate 7-lobed beyond the middle: lobes oblong blunt irregularly toothed

9777 Leaves 7-angled downy plicate, Pedicels axillary 1-fl. clustered much shorter than petiole  
 9778 Leaves 7-angled acute crenate plaited downy, Racemes terminal  
 9779 Leaves soft hoary 5-lobed; upper 3-lobed: middle lobe elongated; upper oblong undivided  
 9780 Leaves downy on each side acutely 5-lobed; upper 3-lobed, Flowers solitary on short stalks  
 9781 Stem hispid, Leaves hoary 5-lobed; upper 3-lobed or undivided, Flowers subsessile  
 9782 Stem and leaves downy subcordate sub-three-lobed round crenate, Pedicels aggregate, Calyxes acuminate  
 9783 Leaves 7-angular downy plaited, Racemes terminal  
 9784 Stem rough, Leaves 5-lobed downy beneath, Pedunc. axillary aggregate, Petals emarginate  
 9785 Stem and leaves downy roundish bluntly angular crenate, Pedicels axillary solitary  
 9786 Leaves somewhat downy: lower angular; upper 3-lobed: middle lobe longer than the rest  
 9787 Stem herbaceous hispid, Leaves 5-lobed acute, Pedicels axillary 1-flowered aggregate  
 9788 Stem rough, Leaves somewhat downy: lower round cordate; upper 3-lobed, Pedicels solitary 1-fl.  
 9789 Stem herbaceous, Leaves smoothish roundish cordate; upper angular, Pedicels solitary

9790 Leaves cordate roundish bluntly angular toothletted, Invol. stalked 3-leaved 7-flowered, Stem rough  
 9791 Leaves cordate palmate 5-lobed, Heads stalked 5-leaved 10-flowered, Stem with scattered hairs  
 9792 Leaves palmate-lobed, Heads stalked 5-leaved many-flowered, Invol. acuminate, Calyxes and stems hairy

9793 Leaves roundish very bluntly 3-lobed velvety on each side 7-nerved 1-glanded, Cal. oblong lanceolate  
 9794 Lower leaves 3-lobed; upper lanceolate panduriform beneath hoary netted with one gland  
 9795 Leaves trifid downy pale beneath with 3 glands: lobes angular toothletted blunt  
 9796 Leaves broad ovate cut lobed with narrow recesses: lobes acute coarsely and unequally toothed

9797 Leaves broadly obovate truncate crenate at end, Pedic. axillary 1-fl. longer than leaf  
 9798 Leaves ovate acuminate subcordate doubly toothed, Pedicels axillary 1-fl.  
 9799 Leaves ovate subcordate 3-pointed somewhat toothed and branches covered with viscid hairs  
 9800 Leaves cordate 3-lobed serrate, Pedicels axillary 1-fl. ascending, Involucre 3-leaved  
 9801 Leaves 5-angular: lobes toothed acuminate, Pedic. axillary 1-fl. much shorter than petiole  
 9802 Leaves 7-angular acuminate toothed hairy, Fl. axillary subsessile clustered  
 9803 Lower leaves roundish cord. crenate others 3-5-lob. Pedicels axillary 1-fl. Inv. 10-leaved setaceous ciliated

9804 Leaves cordate 3-5-lobed acuminate roughish, Leaflets of invol. erect  
 9805 Leaves cordate about 3-lobed acuminate soft downy, Leaf. of invol. somewhat spreading  
 9806 Leaves cordate crenate blunt or acuminate, Branches and petioles hairy

9807 Leaves ovate acuminate serrate downy beneath, Invol. and cal. downy  
 9808 Leaves ovate toothed somewhat 3-lobed hoary with down beneath  
 9809 Leaves lanceolate oblong entire white with scales beneath

and Miscellaneous Particulars.

1476. *Malachra*. A name under which Pliny speaks of a tree from the north of Persia, producing a certain gum. It had no reference to the plant called Malachra by the moderna. Sow in light rich soil, and transplant as with other stove annuals.

1477. *Urena*, the vernacular name in Malabar. The species are of easy culture, seed freely, or may be propagated by cuttings in sand under a hand-glass.

1478. *Favonia*. In honor of Don José Favon, the companion of Dombey, in his voyage to Peru, and one of the authors of *Flora Peruviana*. The species are free-growers, and seed readily: they are also increased by cuttings in sand under a hand-glass.

1479. *Achanta*. From *axeris*, closed; so called because the corolla does not open out as in most Malvaceous plants, but remains always rolled together.

1480. *Hibiscus*. One of the Greek names of the mallow. The species are for the most part showy plants, and not difficult of culture. All of them abound in mucilage, like many of the same natural family, and the

History, Use, Propagation, Culture,

bark of the ligneous sorts may be manufactured into mats or cordage. Of *H. tilliaceus*, in the island of Otaheite, they make matting of the bark, as fine as our coarse cloth; it also ropes and lines, from the size of an inch to that of a small packthread; and fishing nets. (*Hæuss. Voy.* ii. 217.) Forster informs us, they also suck this bark for food, when the bread-fruit fails them: and in New Caledonia, the inhabitants frequently subsist on it, though it is an insipid food, affording very little nourishment.

*H. Rosa-sinensis* is extremely common in the gardens of China, and the East Indies; but its native country is unknown. Loureiro, however, affirms, that it is spontaneous as well as cultivated both in China and Cochinchina; and that it is so common in the latter, that they have entire hedges of it to their gardens. It has been long known from its appearance on Chinese screens and paper hangings. The variety with double flowers is most frequently cultivated, both in the East and in European hothouses: the plant is, indeed, rarely seen with single flowers. (*Smith, spicil.*)

*H. syriacus* is one of our most beautiful hardy shrubs, the more valuable as it is a free-flowerer, will grow in common garden soil, and propagates freely by seeds, layers, and even by cuttings.

*H. Sabdariffa* (the Turkish name) in the West Indies is called Red Sorrel. The calyxes and capsules, freed

9810 Leaves ovate acuminate bluntly serrate hoary on each side, Pedicels axillary 1-f.  
 9811 Leaves 3-lobed hastate acuminate serrate smooth on each side, Pedicels jointed in the middle  
 9812 Leaves roundish cordate acuminate (Thespesia Dec.)  
 9813 Leaves roundish cordate acuminate crenate hoary beneath, Invol. 10-toothed  
 9814 Leaves roundish cordate entire hoary beneath, Pedunc. very short 1-flowered  
 9815 Leaves cordate 3-pointed smooth dotted beneath, Pedicels solitary 1-f. longer than petiole  
 9816 Leaves cordate acutely serrate, Branches somewhat hairy  
 9817 Leaves cordate ovate-lanceolate acuminate toothed, Pedicels twice as long as petiole  
 9818 Leaves roundish cordate acuminate finely toothed hairy beneath, Pedicels thick villous  
 9819 Leaves ovate acuminate smooth entire at base coarsely toothed at end, Pedicels length of leaf

9820 Leaves ovate acuminate serrate; lower subcordate 3-pointed, Pedicels jointed at end  
 9821 Leaves ovate or roundish undivided serrate rough, Pedic. longer than leaf, Cor. reflexed  
 9822 Leaves cuneiform about 5-toothed hairy, Pedicels longer than leaf, Invol. 8-10-leaved hispid  
 9823 Leaves cordate angular 5-lobed acuminate toothed downy, Pedicels nearly as long as leaf

9824 Leaves cuneiform ovate 3-lobed toothed, Pedic. scarcely longer than petiole, Invol. 6-7-leaved

9825 Leaves cordate 5-lobed hairy: lobes acuminate subrepand, Inv. 6-7-leaved setaceous [undivided  
 9826 Stem and petiol. prickly, Pedic. short unarmed very hairy, Lvs. 3-5-lobed blunt toothed; upper obl. lanc.  
 9827 Stem prickly, Leaves palmate 5-lobed; upper 3-lobed: lobes blunt unequally toothed narrowed at base  
 9828 Leaves toothed: lower ovate undivided; upper 3-lobed cuneate at base, Flowers subsess. Invol. 12-toothed  
 9829 Leaves palmate 5-parted: lobes lanceolate acuminate subserrate at end, Pedicels jointed under the end  
 9830 Stem hairy, Leaves on long stalks ovate about 3-lobed serrate membranous smoothish, Pedic. very short  
 9831 Stem prickly, Leaves linear lanceolate acuminate usually lobed prickly-serrate, Inv. 10-leaved  
 9832 Stem prickly, Leaves palmate 5-parted with 1 gland beneath, Fl. subsess. Cal. covered with glandul. hairs  
 9833 Stem rough with recurved prickles, Stipules 4-cord. Leaves palmate 5-lobed, Pedicels length of petiole  
 9834 Stem rough with recurved prickles, Stipules lanc. Leaves 5-7-parted with lanc. acuminate serrated lobes  
 9835 Leaves smoothish palmate: lobes 5-7-acuminate coarsely toothed, Inv. hispid 4-6-leaved, Fls. declinate  
 9836 Stem rough, Leaves rough roundish truncate at base; upper palmate-lobed: lobes dilat. crenate upwards  
 9837 Stem petioles and calyx muricate, Leaves ovate at base trifid; lower 5-fid: lobes acuminate serrate  
 9838 Leaves palmated: lobes lanceolate serrate, Petioles muricate, Fl. subsessile solitary, Inv. 7-fid  
 9839 Leaves subpeltate cordate 7-angular acuminate serrate, Stem hispid, Pedicels longer than petiole  
 9840 Leaves 3-5-lobed blunt crenate hairy, Pedic. twice as long as leaf, Inv. many-leaved, Cor. campanulate  
 9841 Leaves cord. 5-lobed blunt toothed, Petioles longer than fl. Inv. 10-leaved decidu. Cal. bursting lengthwise  
 9842 Stem strigose, Leaves 3-lobed angular cordate toothed downy, Peduncle longer than petiole  
 9843 Leaves cord. angular sparingly toothed nearly smooth, Branches velvety, Caps. turbinate truncate hispid  
 9844 Stem prickly, Leaves smoothish coarsely toothed without glands, Leaves of the invol. with a tooth inside  
 9845 Leaves cordate unequally toothed beneath hairy: lower about 5-lobed; upper acum. Pedic. 1-f. very short  
 9846 Stem somewhat prickly, Leaves smoothish toothed 5-angular acuminate, Fls. cernuous, Caps. 5-winged hairy  
 9847 Leaves acuminate unequally toothed subvillous: lower undivided cordate; upper ovate-cordate 3-lobed  
 9848 Leaves cordate oblong toothed blunthish angular slightly 3-lobed smooth, Pedicels longer than petiole  
 9849 Lvs. toothed: lower undivided; upper 5-fid: lobes oblong nearly equal blunt, Cal. inflat. membran. nerved  
 9850 Lvs. toothed: lower undivided; upper 3-parted: lobes lanc. middle one very long, Cal. infl. membr. nerved  
 9851 Leaves toothed: lower leaves 3-lobed; upper 5-parted blunt, Stem hispid  
 9852 Leaves hairy 5-lobed: lobes linear oblong coarsely toothed, Cal. very villous longer than involucrem

and Miscellaneous Particulars.

from the seeds, make very agreeable tarts; and a decoction of them, sweetened and fermented, is commonly called sorrel cool drink. It is a small diluting liquor, much used in our sugar colonies, and reckoned very refreshing in those sultry climates. (*Browne's Jam.*) The bark of this species, and also of *H. cannabinus*, is full of strong fibres, which the inhabitants of the Malabar coast prepare and make into cordage; and it seems as if it might be wrought into fine strong thread of any size.

The leaves of *H. surattensis* are gratefully acid, and eaten in salads. The mucilage of the root of *H. manihot* is used in Japan for giving consistence to paper.

*H. Abelmoschus*, from the Arabic *Ab-el-Mosch*, grain or seed of musk, has large seeds of a very musky odor, and are frequently used as a substitute for animal musk in scenting powders and pomatus. In Arabia and Egypt they are ground and mixed with coffee, to render it more agreeable to the head and stomach.

*H. esculentus*, the Okro of the West Indies, is cultivated there, and in some parts of France, for the pods, which are gathered green and used in soups, or pickled like capers. They are full of a nutritive mucilage, and buttered and spiced make a very rich dish.

History, Use, Propagation, Culture.

1481. *Gossypium*. Pliny says, that in Upper Egypt, on the borders of Arabia, grew a shrub called *gossypium* or *aylon*. Its fruit enclosed a sort of soft white wool, of which the garments of the Egyptian priests were manufactured. Golius remarks, that *goz*, which expresses in Arabia, a silky substance, may be the root of the word. An important genus, as furnishing the down used in the cotton manufacture. This down is found lining the capsules which contain the seeds. There are several species cultivated for this purpose in different parts of the world. *G. herbaceum* is the only species cultivated in Europe, especially in the Levant, and in Malta, Sicily, and Naples: it is also grown in many parts of Asia.

*G. hirsutum* is occasionally grown in the West Indies; but *G. barbadense* is the prevailing species there. In the East Indies and China, *G. herbaceum* and *arboreum* are cultivated, and some other species, especially that which produces the nankeen-colored down, not yet introduced to Europe. An oil is obtained from the seeds of all the species, while those of the *G. herbaceum* are eaten in the Levant, and esteemed wholesome and nutritive.

In the Levant, the herbaceous cotton is sown in well prepared land in March, in lines at three feet distance, and the patches of seeds two feet apart in the lines. The plants are thinned out to two or three in a place, and the earth is stirred by a one-horse plough, or by manual labor with hoes, and irrigated once or twice a week by directing the water along the furrows between the rows. The flowering season is generally over about the middle of September, and then the ends of the shoots are pinched off to determine the sap to the capsules. The capsules are collected by hand as they ripen, a tedious process, which lasts till the end of November. The cotton and the seeds are then separated by manual labor, and the former packed in bales or bags for sale. The seeds are bruised for oil or eaten, and a portion kept for sowing.

The Barbadoes cotton plant is sown in the West Indies in rows, about five feet asunder, at the end of September, or the beginning of October; at first but slightly covered, but after it is grown up, the root is well moulded. The soil should not be stiff nor shallow, as this plant has a tap-root. The ground is hoed frequently, and kept very clean about the young plants, until they rise to a moderate height. It grows from four to six feet high, and produces two crops annually; the first in eight months from the time of sowing the seed; the second, within four months after the first; and the produce of each plant is reckoned about one pound weight. The branches are pruned or trimmed after the first gathering; and if the growth is over luxuriant,

- 9843 Leaves 5-lobed 1-glandular beneath : lobes round mucronate, Invol. serrate, Stem smooth  
 9854 Leaves 5-lobed palmate : lobes lanceolate blunt mucronate with 1 gland beneath, Invol. nearly entire  
 9855 Lower leaves 5-lobed palmate ; upper 3-lobed with 1 gland beneath, Inv. tern. Cal. with 3 glands at base  
 9856 Upper leaves undivided cordate ; lower 3-5-lobed with 1 gland beneath, Branches and petioles hirsute  
 9857 Upper leaves 3-lobed ; lower 5-lobed with 1 gland beneath, Branches and petioles spotted with black  
 9858 Upper leaves 3-lobed ; lower 5-lobed with 3 glands beneath, Stem smoothish
- 9859 Leaves ciliated elliptical entire rarely trifold
- 9860 Smoothish prostrate, Peduncles nearly as long as petiole
- 9861 Leaves very cassius, Stem very short
- 9862 Lower leaves cordate acuminate 5-angled somewhat toothed blunt ; upper hastate acuminate  
 9863 Leaves all crenate : lower roundish cordate blunt 5-angled ; upper round hastate acuminate  
 9864 Lower leaves triangular hastate crenate ; upper ovate lanc. nearly entire, Ped. sol. axill. length of leaves
- 9865 Lower leaves cord. about 5-lobed hastate : upper hastate, Petals erect spatulate somewhat toothed at end  
 1. Capsules 5-12, 1-seeded, not bladder.  
 \* Flower-stalks not longer than the leafstalk. Leaves oblong or ovate
- 9866 Leaves linear entire much longer than the diameter of the flower, Racemes terminal  
 9867 Leaves linear-lanceolate toothed, A spiny tubercle at the base of the leaves, Pedic. axill. subsolitary  
 9868 Leaves ovate-lanceolate toothed, A spiny tubercle at the base of the leaves, Pedic. axill. solitary  
 9869 Leaves oblong ovate subcordate blunt tooth, Pedicels as long as petiole  
 9870 Leaves ovate-lanceolate acuminate toothed smooth, Branches round downy, Rac. very short bracteolate  
 9871 Leaves ovate-oblong doubly serrate, Pedunc. axillary very short about 4-flowered, Branches flattened  
 9872 Leaves rhomboid narrowed at base serrate-toothed forwards beneath downy, Pedicels shorter than petiole  
 9873 Lvs. ellipt. subov. blunt toothed at end, Pedic. axill. solitary very short, Stipules ciliated longer than flow.  
 9874 Lower lvs. roundish ov. ; upp. obl. toothed cun. and nearly ent. at base, Pedic. axill. many shorter than pet.
- \*\* Flower stalks elongated, distinctly jointed. Leaves oblong or ovate
- 9875 Lvs. ovate lanc. acumin. toothed hoary beneath, Branches compr. dotted, Pedic. thrice as long as petiole  
 9876 Leaves lanceolate toothed smooth, Pedic. axillary 1-fl. length of leaf  
 9876 Leaves oblong-lanceolate toothed cuneate at base hoary beneath, Pedic. axillary 1fl. shorter than leaf  
 9878 Leaves somewhat rhomboid retuse crenate towards the end hoary beneath, Pedic. longer than petiole  
 9879 Leaves ovate blunt serrated downy shining, Pedic. axillary solitary much longer than petiole
- \*\*\* Flower-stalks elongated. Leaves cordate at base, toothed, not lobed.
- 9880 Leaves ovate cordate blunt toothed, Pedicels solitary 1-flowered longer than petiole

and Miscellaneous Particulars.

this should be done sooner. When great part of the pods are expanded, the wool is picked, and afterwards cleared from the seeds by a machine called a gin, composed of two or three smooth wooden rollers of about one inch diameter, ranged horizontally, close and parallel to each other, in a frame; at each extremity they are toothed or channelled longitudinally, corresponding one with the other; and the central roller being moved with a treadle or foot-lath, resembling that of a knife-grinder, makes the other two revolve in contrary directions. The cotton is laid in small quantities at a time upon these rollers, whilst they are in motion, and readily passing between them, drops into a sack placed underneath to receive it, leaving the seeds, which are too large to pass with it, behind. The cotton thus separated from the seeds, is afterwards hand-picked and cleansed thoroughly from any little particles of the pods or other substances which may be adhering to it. It is then stowed in large bags, where it is well trod down, that it may be close and compact; and the better to answer this purpose, some water is every now and then sprinkled upon the outside of the bag; the marketable weight of which is usually three hundred pounds. An acre may be expected to produce from two hundred and forty pounds to that quantity; or two hundred and seventy pounds on an average. (*Long's Jam.* vol. iii. p. 686. *gc.* and *Browne.*)

1482. *Redoutia*. Named after P. J. Redouté, a celebrated French botanical draughtsman, still living. His drawings are inferior to those of the Bauers as accurate representations of nature; but they are generally tastefully arranged and please the eye, notwithstanding a coldness of coloring which often injures their effect.

1483. *Palavia*. In honor of Don Antonio Palau y Verdera, second professor of botany at Madrid, and author of an excellent translation of the *Species Plantarum* of Linnæus in Spanish.

1484. *Cristaria*. From *crista*, a crest, in allusion to the crested form of the capsules. A pretty plant, not very easily preserved. It answers better in a peat border than a pot, and is increased by division or seed.

1485. *Anoda*. Named by Cavanilles, from  $\alpha$ , privative, and *nodus*, an articulation; because the peduncles do not possess the joints which are found in *Sida*, from which the plants of this genus have been extracted.

1486. *Periptera*. So named from the resemblance of the flowers in form to a shuttlecock,  $\pi\epsilon\rho\iota\pi\tau\epsilon\rho\alpha$ .

1487. *Sida*. A name of Theophrastus, said by some to have been applied to a Malvaceous plant; but

History, Use, Propagation, Culture.

Adanson is of opinion, that our *Nymphæa* was the *Sida* of Theophrastus. The species are free-flowerers of no

- 9881 Leaves roundish cordate hairy above serrated, Pedicels subsolitary longer than petiole  
 9882 Leaves roundish cordate bluish crenate softly velvety, Pedic. solitary 1-fl. longer than petiole  
 9883 Leaves cordate serrate attenuated at end downy on the edge of the petiole and the nerves beneath  
 9884 Leaves ovate cordate toothed somewhat angular bluish downy, Pedic. sol. 1-fl. a little shorter than petiole  
 9885 Leaves cord. somewhat angular blunt serrate cren. downy on each side, Pedic. shorter than petiole 1.5-fl  
 9886 Leaves ovate cordate acuminate toothed, Pedunc. 3-4-flowered very short  
 9887 Leaves cordate ovate acuminate serrate smooth on each side, Peduncles many-fl.  
 9888 Leaves ovate cordate toothed acuminate downy, Pedunc. loosely panicle capillary

\*\*\*\* *Leaves palmate, divided into 3-5-7-9 lobes.*

- 9889 Leaves cordate toothed 3-lobed; middle lobe acute long, Pedicels solitary nearly equal to the leaf  
 9890 Leaves subpeltate 7-lobed: lobes lanceolate acuminate pinnatifid toothed, Peduncles many-fl.  
 9891 Leaves subpeltate 5-lobed: lobes ovate acute toothed undivided, Peduncles about 1-flowered  
 9892 Leaves palmate 5-lobed smooth: lobes oblong acuminate toothed, Peduncles many-fl.  
 9893 Leaves palmate 7-lobed rough: lobes lanceolate cut-toothed, Pedunc. many-fl. bracteate corymbose

2. *Capsules 15-40, 1-seeded, bladdery.*

- 9894 Leaves oblong cordate toothed somewhat lobed, Pedicels solitary shorter than petiole  
 9895 Lvs. cord. ovate acute toothed downy on each side, Petioles and pedicels hairy, Stip. setaceous spreading  
 9896 Lvs. cord. roundish acumin. tooth. velvety, Petioles and branches with spreading hairs, Pedic. very short

3. *Capsules 5-10, many-seeded, often bladdery.*

\* *Capsules 5-8.*

- 9897 Leaves cord. lanc. acuminate entire downy beneath, Pedicels divided slender longer than petiole  
 β Leaves narrow rough above  
 γ Leaves more cordate smooth and a little rugose above  
 9898 Leaves subpeltate cordate ovate acuminate entire downy, Pedic. 1-fl. shorter than petiole  
 9899 Leaves roundish cordate acuminate entire downy beneath, Panicle terminal racemose  
 9900 Leaves cordate shortly acuminate subcrenate slightly downy and green on each side, Panicle leafless  
 9901 Lvs. deeply cord. with a nar. base acumin. serrul. hairy above hoary beneath, Stips. broad-eared acumin.  
 9902 Leaves cordate acuminate serrulate velvety on each side, Pedicels solitary 1-flowered  
 9903 Leaves hoary cordate acuminate acutely crenate, Pedicels 1-fl. longer than petiole  
 9904 Leaves roundish cordate toothed angular acuminate, Pedicels 4-fl. umbellex axillary

\*\* *Capsules 9 or more.*

- 9905 Leaves roundish cordate acuminate crenate downy, Pedicels sol. longer than petiole  
 9906 Leaves cordate acuminate crenate velvety; upper sessile, Pedicels sol. longer than petiole  
 9907 Leaves round cordate acuminate crenate downy, Pedicels longer than petiole  
 9908 Leaves roundish cordate acuminate toothed downy beneath, Pedicels longer than petiole  
 9909 Leaves roundish cordate unequally toothed soft, Pedunc. 2-3-fl. shorter than petiole, Capsules acuminate  
 9910 Leaves roundish cordate with a broad sinus acuminate toothed soft, Pedicels shorter than petiole  
 9911 Leaves cordate oblong undivided downy, Pedicels shorter than leaf  
 9912 Leaves roundish cordate acuminate toothed downy, Peduncles shorter than petiole  
 9913 Leaves cordate ovate oblong toothed velvety on each side, Pedicels longer than petiole  
 9914 Leaves roundish cordate acuminate toothed downy, Peduncles longer than leaves  
 9915 Leaves roundish cordate acuminate unequally repand toothed downy, Peduncles longer than petiole  
 9916 Leaves roundish cordate acuminate toothed velvety, Peduncles 2-flowered shorter than petiole  
 9917 Leaves ovate orbicular reniform toothed hoary beneath, Pedicels longer than petiole  
 9918 Leaves cordate somewhat lobed soft, Stipules reflexed, Pedicels erect 3 times as long as petiole  
 9919 Leaves ovate cordate toothed tricuspidate, Pedicels twice as long as petiole  
 9920 Leaves roundish cordate acuminate toothed hoary on each side, Pedicels length of petiole  
 9921 Leaves cordate subpeltate 3-5-lobed unequally toothed villous, Pedicels 1-flowered longer than petiole

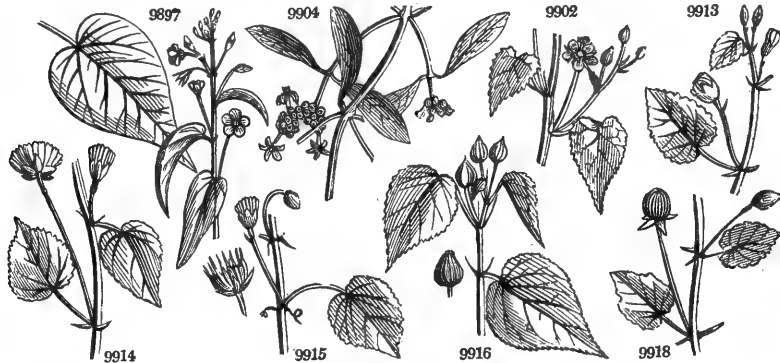

4. *Uncertain species.*

\* *Leaves linear, oblong, ovate, or lanceolate.*

- 9922 Leaves linear lanceolate toothed villous beneath, Pedicels axillary 1-fl.  
 9923 Leaves lanceolate very long entire hairy, Racemes terminal very short  
 9924 Leaves broad lanceolate obtuse crenate entire at base 3-nerved; younger downy beneath  
 9925 Middle leaves oblong blunt acutely crenate in front; upper lanceolate acute serrated in front  
 9926 Leaves oblong lanceolate serrated entire at base smooth, Pedunc. axillary solitary longer than petiole  
 9927 Leaves ovate acuminate 5-nerved scarcely toothletted; beneath and branches downy, Stipules filiform

\*\* *Leaves cordate, undivided.*

- 9928 Leaves subcordate sessile serrate subvillous, Flowers axillary clustered  
 9929 Stem warted, Leaves cordate lanceolate acuminate acutely crenate downy  
 9930 Leaves cordate acuminate crenate toothletted, and stems green and downy, Pedic. axillary 1-fl.  
 9931 Leaves cordate acuminate cut serrate, Peduncles solitary longer than petiole  
 9932 Leaves cordate acuminate repand rarely crenate hoary, Panicle contracted bracteate  
 9933 Leaves cordate acute crenate rugose and stems yellow with down, Flowers subsessile aggregate  
 9934 Leaves cordate acuminate hoary beneath, Pedicels axillary 1-flowered longer than petiole

and Miscellaneous Particulars.

great beauty. They are increased by seeds, which they produce freely, or by cuttings in sand under a hand-glass.

History, Use, Propagation, Culture.

1488. *Lagunea*. Named after Andreas Laguna, a Spanish naturalist, who published, in 1543, a work upon plants. It may be treated like other tender annuals.

1489. *Ruizia*. In honor of Don Hippolito Ruiz, author of *Quinologia*, Madrid, 1792, and other works, and, in conjunction with Pavon, of the famous Flora Peruviana. A plant of easy culture, but of little merit.

1490. *Carolinea*. Named by the younger Linnæus, in honor of the Princess Sophia Caroline, of Baden; a name which, he says, will always be cherished by botanists. A splendid family, which thrive in loam; and large cuttings, well clothed with leaves, root in sand under a hand-glass.

1491. *Adansonia*. In honor of Michel Adanson, a famous French botanist, born in 1727, and author of various works, of which his voyage into Senegal, and *Families des Plantes*, are the most remarkable. He was an eccentric man, but certainly far more learned for his time than many of his modern detractors. 'Monkies'-bread, or *Boabab*, is considered the largest or rather broadest tree in the world. Several measured by Adanson were from sixty-five to seventy-eight feet in circumference, but not extraordinarily high. The trunks were from twelve to fifteen feet high, before they divided into many horizontal branches, which touched the ground at their extremities; these were from forty-five to fifty-five feet long, and were so large, that each branch was equal to a monstrous tree; and where the water of a neighbouring river had washed away the earth, so as to leave the roots of one of these trees bare and open to the sight, they measured one hundred and ten feet long, without including those parts of the roots which remained covered. It yields a fruit which resembles a gourd, and which serves for vessels of various uses; the bark furnishes a coarse thread, which they form into ropes, and into a cloth, with which the natives cover their middle from the girdle to the knees; the small leaves supply them with food in a time of scarcity, while the large ones are used for covering their houses, or, by burning, for the manufacture of good soap. At Sierra Leone this tree does not grow larger than an orchard apple-tree.

The ligneous part of this tree appears to be of little or no use as timber. In our stoves it grows in rich soil in heat, and cuttings root in sand, covered and plunged.

1492. *Bombax*. From *βομβαξ*, one of the Greek names of the cotton; the seeds of the plants now so called are enveloped in a cottony substance. *B. pentandrum* bears oval fruit larger than a swan's egg, having a thick woolly cover, which, when ripe, opens in five parts, and is full of a short dark cotton, inclosing many roundish seeds as large as small peas.

*B. Ceiba* has a spiny trunk, and is one of the tallest trees of both Indies; but the wood is very light, and not much valued, except for canoes. Their trunks are so large as, when hollowed, to make very large ones. In the West Indies they frequently carry from fifteen to twenty hogsheads of sugar, and from six to twelve hundred weight each. When sawn into boards, and then well saturated with lime-water, the wood bears exposure to the weather many years; it is also formed into laths for roofs, curing-pots, and hoghead-heading. When the tree decays, it becomes a nest for the *Macaca* beetle, the caterpillar of which, gutted and fried, is esteemed by many persons one of the greatest delicacies. The down which is enclosed in the seed-vessels is seldom used, except by the poorer inhabitants to stuff pillows or chairs; and it is generally thought unwholesome to lie upon.

9935 Leaves cordate 3-lobed; lobes oval oblong acuminate toothed with a very narrow base

9936 Leaves of the flowering branches palmatifid; of the sterile palmate

9937 Leaves digitate, Filaments numerous forked united at base into a tube

9938 Leaflets 5-8 ovate-lanceolate acuminate

9939 Leaflets 7 elliptical-oblong acute at each end, Calyx truncate, Petals erect

9940 Leaflets 5-7 obovate oblong, Calyx sinuated, Petals erect spreading at end

9941 A tree with a very thick trunk with a diameter of 25 feet

9942 Anthers rectilinear, Leaflets 7, Corolla large woolly outside, Trunk prickly

9943 Anthers anfractuose, Leaflets entire, Trunk generally prickly

9944 Stem prickly, Leaves palmate, Leaflets 5, Fruit turbinate concave at end

9945 Stem prickly, Leaves palmate, Leaflets 7 entire acuminate, Fruit oblong blunt

9946 Leaves ovate-oblong, Calyxes turbinate, Column of stamens shorter than petals

9947 Pedicels axillary half as short as leaves, Leaves oblong coriaceous smooth serrated

9948 Fls. subsessile, Leaves obov. lanc. downy beneath subserrate membranous, Petals and sepals silky outside

9949 Flowers large white, Filaments purple, Anthers blue

9950 Leaves ovate acute, Flowers solitary subsessile

9951 Leaves elliptical oblong subrugose twice as broad as long

9952 Leaves lanceolate flat three times as broad as long

and Miscellaneous Particulars.

1493. *Myrodia*. From *μυρον*, myrrh, and *ωσμη*, smell. A tree which emits an odor similar to myrrh. (Linn.)

1494. *Gordonia*. In memory of James Gordon, an eminent nurseryman at Mile-End, near London, a correspondent of Linnæus and other eminent botanists, and the introducer and successful cultivator of many new plants. *G. Lasianthus* (woolly flower, from *λαειος* and *ανθος*), the loblolly-bay, is said to grow naturally in water or very moist situations. Miller, on that account, was unsuccessful in keeping the plant. Gordon and Lee, who, as Ellis relates, (*Correc. with Linnæus*) were better cultivators than Miller, were probably more successful. Sweet soil suits them best, and a little loam mixed with it; they are readily propagated by layers, or ripened cuttings may be struck in sand under a hand-glass. (*Bot. Cœl.* 189.)

1495. *Stuartia*. So named by Linnæus, in honor of the Marquis of Bute, in memory of whom there also exists another genus named *Butea*, by Roxburgh. The species are handsome shrubs, grow in peat soil, and are most readily increased by layers.

1496. *Camellia*. In honor of George Joseph Kamel, (or *Camellus*) a Jesuit. His *Syllabus Stirpium in Insula Luzone Philippinarum*, forms the appendix to the third volume of Ray's *History*. This is a remarkable genus, as at once furnishing the domestic drug tea, in universal use, and flowering trees and shrubs as universally admired. The seeds of all the species are crushed for oil, which is used like that of hemp or poppy in cookery.

*C. Bohea* and *viridis* are the species which chiefly furnish the tea; but *C. Sasanqua* is also used, and sometimes the leaves of the other species are taken, though that practice is rather to be considered in the light of adulteration. The tea districts of China extend from the twenty-seventh to the thirty-first degree of north latitude. According to the missionaries, it thrives in the more northern provinces; and from Kämpfer, it appears to be cultivated in Japan as far north as latitude 45°. It seems, according to Dr. Abel's observation, to succeed best on the sides of mountains, where there can be but little accumulation of vegetable mould. The soils from which he collected the best specimens consisted chiefly of sandstone, schistus, or granite. The plants are raised from seeds sown where they are to remain. Three or more are dropped into a hole four or five inches deep; these come up without further trouble, and require little culture, except that of removing weeds, till the plants are three years old. The more careful stir the soil, and some manure it; but the latter practice is seldom adopted. The third year the leaves are gathered, at three successive gatherings, in February, April and June, and so on till the bushes become stunted or tardy in their growth, which generally happens in from six to ten years. They are then cut in to encourage the production of fresh roots.

The gathering of the leaves is performed with care and selection. The leaves are plucked off one by one: at the first gathering only the unexpanded and tender are taken; at the second those that are full grown; and at the third the coarsest. The first forms what is called in Europe imperial tea; but as to the other

## History, Use, Propagation, Culture,

names by which tea is known, the Chinese know nothing; and the compounds and names are supposed to be made and given by the merchants at Canton, who, from the great number of varieties brought to them, have an ample opportunity of doing so. Formerly it was thought that green tea was gathered exclusively from *C. viridis*; but that is now doubtful: though it is certain there is what is called the green tea district, and the black tea district; and the varieties grown in the one district differ from those grown in the other. Dr. Abel was told by competent persons, that either of the two plants will afford the black or green tea of the shops, but that the broad thin-leaved plant (*C. viridis*) is preferred for making the green tea.

The tea leaves being gathered, are cured in houses which contain from five to ten or twenty small furnaces, about three feet high, each having at the top a large flat iron pan. There is also a long low table covered with mats, on which the leaves are laid, and rolled by workmen, who sit round it: the iron pan being heated to a certain degree by a little fire made in the furnace underneath, a few pounds of the fresh-gathered leaves are put upon the pan; the fresh and juicy leaves crack when they touch the pan, and it is the business of the operator to shift them as quick as possible with his bare hands, till they become too hot to be easily endured. At this instant he takes off the leaves with a kind of shovel resembling a fan, and pours them on the mats before the rollers, who, taking small quantities at a time, roll them in the palm of their hands in one direction, while others are fanning them, that they may cool the more speedily, and retain their curl the longer. This process is repeated two or three times, or oftener, before the tea is put into the stores, in order that all the moisture of the leaves may be thoroughly dissipated, and their curl more completely preserved. On every repetition the pan is less heated, and the operation performed more closely and cautiously. The tea is then separated into the different kinds, and deposited in the store for domestic use or exportation.

The different sorts of black and green arise not merely from soil, situation, or the age of the leaf; but after winnowing the tea, the leaves are taken up in succession as they fall; those nearest the machine being the heaviest, are the gunpowder tea; the light dust the worst, being chiefly used by the lower classes. That which is brought down to Canton then undergoes a second roasting, winnowing, packing, &c., and many hundred women are employed for these purposes.

As more select sorts of tea, the blossoms of the *C. sasanqua* appear to be collected; the buds also appear to be gathered in some cases. By far the strongest tea which Dr. Abel tasted in China, was that called *guten*, used on occasions of ceremony. It scarcely colored the water, and on examination was found to consist of buds and half expanded leaves of the plant.

As substitutes for tea used by the Chinese, may be mentioned a species of moss common to the mountains of Shan-tung, an infusion of ferns of different sorts, and Dr. Abel thinks the leaves of the common camellia and oil camellia may be added. Du Halde observes, that all the plants called tea by the Chinese, are not to be considered as the true tea plant; and Kämpfer asserts, that in Japan a species of *Camellia*, as well as the *Olea fragrans*, is used to give it a high flavor.

The oil-bearing *Camellia*, *C. oleifera*, is cultivated for its seeds, from which an oil is expressed, in very general use in the domestic economy of China. It grows best in a red sandy soil, attaining the height of six or eight feet, and producing a profusion of white blossoms and seeds. These seeds, as well as those of any of the other species, are reduced to a coarse powder, which is stewed or boiled in bags, and then pressed, when the oil is yielded. (*Dr. Abel's Nar.* 176.)

The culture of the tea *Camellias* in our greenhouses is very simple. The plants are very hardy, and may be preserved in a pit without fire-heat; they grow in loamy soil, or loam and peat well drained, and increase freely by layers, or cuttings of the young wood taken off when it begins to ripen, planted in sand, and covered with a hand-glass in a cool frame or pit.

*C. japonica*, in the groves and gardens of Japan, is a lofty tree, much admired for its fine form, rich clothing of shining deep green foliage, and elegant red or white flowers, single or double. It is equally admired in

9953 Leaves ovate-oblong bluntly serrated, Flowers terminal subsolitary, Petals obcordate

9954 Leaves ovate acuminate acutely serrate, Flowers terminal subsolitary

and Miscellaneous Particulars.

China as in Japan, and much cultivated in both countries. It is of frequent occurrence in Chinese paintings, with Hibiscus and Chrysanthemum, two of their great favorites. There are several varieties of *C. japonica* in China, most of which have been imported here, and their number considerably increased, and daily increasing, from seedlings raised in this country. The double white, double striped, and double Waratah, (from the central petals resembling those of the Waratah plant of New Holland, *Teloepa speciosissima*), are considered the grandest and most marked varieties, and are also free-growers and flowerers; the peony-flowered and fringed white, are also standard beauties; but all are much admired.

The single red *Camellia* is propagated by cuttings, layers, and seeds, for stocks; and on these the other sorts are generally inarched, and sometimes budded or grafted. The cuttings are formed of ripened or ripening shoots, taken off in August, cut smoothly across at a joint or bud, two or three of the lower leaves only taken off, and the cuttings then planted and made firm with a small dibber, in pans of sand or loam, or, by some cultivators, sand and peat, or sand alone. The pans are kept in a pit or cold frame, without being covered with glass, but shaded during powerful sunshine; and in the following spring such as are struck will begin to push, when they are to be placed in a gentle heat. In September or October following, the rooted plants will be fit to pot off; and in the second or third spring they may be used as stocks. Such is the practice in the London nurseries. Henderson, of Woodhall, near Edinburgh, puts in *Camellia* cuttings at any time of the year, excepting when they are making young wood. He puts fifty cuttings in a pot of sand eight inches in diameter, sets them in a cool place in the back of a vinery or peach-house for a month or six weeks, and then plunges them to the brim in a hot-bed where is a little bottom heat. A speedy mode of obtaining stocks is by planting stools in a pit devoted to that purpose, and laying them in autumn; the following autumn most of the layers will have produced roots, when they may be taken off and potted, and used as stocks in the succeeding spring. Inarching or grafting is performed early in spring, when the plants begin to grow; the chief care requisite is so to place and fix the pot containing the stock, as that it may not be disturbed during the connection of the scion with the parent plant. The graft being clayed over, is then covered with moss to prevent its cracking. When independent grafting is resorted to, the mode called side grafting is often used; but the operation of tonguing is generally omitted, as weakening the stock and unnecessary, with a view to prevent the scion from being blown off. A few seeds are sometimes obtained from the single red and semi-double *Camellias*, and from the single Waratah; these require two years to come up, but make the best stocks of any.

Before they are grafted they are often allowed to come into flower, in case some new variety should be produced; but the best cultivators, as Messrs. Loddiges, Sweet, and Mackay, regularly cross-impregnate the blossoms in Knight's manner, by cutting out the stamens before the anthers are mature, and when the stigma is in a proper state, dusting it with the pollen of the species or variety intended as the male parent.

*C. Sasanqua* seeds most readily, and is mostly employed as the female parent for raising new varieties. The plants, if well treated, flower in four or five years, and if nothing new is produced they still make excellent stocks.

Some cultivators grow the *Camellias* chiefly in peat. Messrs. Loddiges, who have the most numerous collection of this genus, formerly used loam, with a little sand and peat; and they are grown in a similar soil in Hammersmith nursery. Of late, Messrs. Loddiges find light loam alone to answer as well or better. In the Comte de Vandes garden at Bayswater, rotten dung is mixed with loam and peat. Sweet recommends sandy loam and peat. Henderson of Woodhall is one of the most successful growers of the *Camellia* in Scotland: his compost is as follows: take one part of light-brown mould, one part of river-sand, one part of peat-earth, one half part rotten leaves; mix them all well together, and when the *Camellias* require shifting, put some broken coal-char in the bottom of the pots, and some dry moss or hypnum over it. (*Caled. Mem.* iii. 316.)

*Camellias* have the best effect, and are grown to most advantage in a house entirely devoted to them. Such

History, Use, Propagation, Culture

a house should be rather lofty, as the plants never look so well as when six or eight feet high, trained in a conic form, and clothed with branches from the root upwards. The plants should be raised near to the glass by means of a stage, which should be so contrived, that, as they advance in height, it may be lowered in proportion: only the very best crown or patent glass should be used; because it is found from experience, that the least inequality of surface or thickness of material, so operates on the sun's rays, as to concentrate them, and burn or produce blotches on the leaves of the plants. Every cultivator must have observed that leathery shining leaves, like those of the orange, myrtle, &c. are more or less subject to this solar injury; but the leaves of the Camellia are particularly so. Some nurserymen recommend a roof which will not admit much light; others the use of green glass; of an opaque roof, with glass in front only; or of a house facing the north. Our opinion is, that a light house facing the south, or, better still, glass on all sides, is essential to the perfect growth of the plants; and that all solar accidents may be avoided, or at least rendered of no consequence, by using the best glass, and placing the plants as near it as possible.

To grow the Camellia to a high degree of perfection, considerable care is requisite. The roots are very apt to get matted in the pot, and, by the space they occupy, so to compress the ball of mould, as after a time to render it impervious to water. Hence frequent attention should be had, to see that the water poured on the pots moistens all the earth, and does not escape by the sides of the pot, moistening only the web of fibres. When the plants are in flower and in a growing state, they require to be liberally watered, and also a degree of heat somewhat greater than is usually given to greenhouse plants. If this heat is not given in November and December, the plants will not expand their blossoms freely; and if both water and heat are not regularly applied after the blossoming season, vigorous shoots and flower-buds will not be produced. To form handsome plants, they should be trained with single stems to rods, and pruned so as to make them throw out side branches from every part of the stem: to encourage these, the plants should not be set close together on the stage. In summer they may either be set out of doors on a stratum of scoria, or on a pavement, in a sheltered but open situation; or the glass roof may be taken off. The hardier sorts, as the double red, blush, paony-flowered, &c. answer very well when planted in the bed or border of a conservatory, provided the roof or entire superstructure can be removed in summer to admit the full influence of the weather. When this cannot be done, the Camellia and most other plants are better in portable utensils, which admit both of examining their roots, and placing them in the open air, or in a greater degree of heat at pleasure. The single and double red Camellia will endure the open air when trained against a south wall, and protected by mats in winter; and there can be no doubt that in time these and other species will be more perfectly inured to our climate.

Henderson of Woodhall gives the following account of his mode of treating the Camellia. "The best time for a regular shifting of the Camellias is the month of February or beginning of March. After shifting all those that require it, put them into the peach-house or vinery, when there is a little heat; if there be no peach-house, vinery, nor pinery, set them in the warmest part of the greenhouse. They will soon begin to make young wood. From the time they begin to make their young shoots, till they have finished their growth, give them plenty of water. They may be kept in the vinery or peach-house till they have formed their flower-buds at the extremity and sides of the young growths, when a few of them may be removed to a colder place, say behind the stage of the greenhouse; for the Camellias are fond of being shaded during

and Miscellaneous Particulars.

strong sunshine. In three or four weeks after, a few more of the Camellias may be brought from the vinery or peach-house, and put into a cooler situation. This may be repeated three or four times, which will make as many different successions of flowering. Those that are wanted to come into flower early, may remain in the warm house till they are beginning to flower, when they should be taken to a cold place, say the coldest place of the greenhouse; then give them plenty of light only, and they will open their flowers well, and stand long. A Camellia cannot stand heat when in flower, indeed they seldom open their flowers fine when in heat, and, at all events, the flowers soon fall off. Those that are kept all the summer in the vinery, will come into flower by the first or middle of October, and a pretty large plant, having perhaps fifty or a hundred flower-buds, will continue in flower till the month of January. Those plants that are removed early from the vinery, will now be in flower, to succeed those that were in flower in October, and have now done flowering. These last should be immediately taken into the heat. They will make their young wood early, and they may remain in heat till they come into flower, which will perhaps be a month earlier next year. By attending to shifting the Camellia plants from the warm-house to the cold, a regular succession of flowers may thus be had from the first of October to the middle of July. I have even had them all the summer, but the flowers are best in the winter. Those produced in summer are far from being so fine, and do not stand half the time of those that come into flower in November, December, January, February, March and April. Camellias delight to be kept damp all the summer months, and a little shaded from the strong sun. Give them plenty of water while they are making their young shoots; they may also get a gentle sprinkling over the leaves once every week during the summer season, except when they are in flower. Camellias will stand a great deal of cold without being much injured, but they will not form many flower-buds without some artificial heat." (*Caled. Mem.* iii. 316.)

1497. *Barringtonia*. In memory of the Hon. Daines Barrington, F. R. S., an active Fellow of the Society of Antiquaries, and author of several papers in their Transactions. A lofty tree, the handsomest in the equinoctial flora. It has thick shady bunches of long wedge-shaped coriaceous leaves, and large handsome purple and white flowers, which open at night, and fall at sunrise. They are succeeded by a reddish brown drupe, the seed of which mixed with the bait, inebriates fish in the same manner as *Cocculus indicus*. It grows on the sea shore and at the mouths of rivers, and is cultivated in the governor's garden at St. Helena. It is very rare in our stoves, though not difficult to manage. Sweet says, "a mixture of two-thirds loam and one-third peat, is a good soil for it. Cuttings taken off at a joint, when the wood is ripe, and put in a pot of sand under a hand-glass in moist heat, will strike root readily: none of the leaves should be taken off or shortened." (*Bot. Cult.* 21.)

1498. *Gustavia*. In memory of Gustavus III., king of Sweden, who presented a great collection of Indian plants to the elder Linnæus. A tree remarkable for its large white flowers, larger than those of the water-lily, but with a large naked bald receptacle between the corolla and the style. The flowers smell sweet, but the wood is extremely fetid. In Surinam it is used for hoops. In the stove it grows in sand and loam, and roots in sand under a hand-glass.

1499. *Careya*. Named after Dr. William Carey, the editor of Roxburgh's *Flora Indica*, and an English physician and botanist residing at Serampore. Beautiful Indian plants, with long red stamens.

CLASS XVII. — DIADELPHIA. STAMENS united in two separate parcels.

This class essentially requires, as its name implies, that the stamens should be united in two separate parcels. These may either be equal, each bearing more anthers than one, as in *Smithia*, *Æschynomene*, *Fumaria*, and others; or unequal, one parcel being reduced to a single stamen, and the other bearing several anthers, as in the greater number of genera included in the class. But besides the plants whose stamens are thus disposed, it has been the practice to admit other genera having papilionaceous flowers, but with their stamens united in one parcel only, such as *Platylobium*, *Bossiaea*, *Arachis*, and others. The propriety of this measure is extremely questionable. It has been before remarked in this work, that the value of an artificial arrangement of objects depends wholly upon the precision with which they are referred to those heads or divisions with the characters of which they agree. If this does not obtain, an artificial system ceases to be useful, and its only merit, that of facilitating the discovery of the name of a given object, cannot be said to exist. This principle is particularly applicable to the genera just mentioned. Their artificial character refers them to Monadelphia, but they are retained in Diadelphia, to which their artificial character does not refer them, because, as is alleged, of the natural relation which they bear to other genera in Diadelphia. If this reasoning, which is only applicable to an arrangement of plants according to their natural affinities, and which has no allowable reference to an artificial system, were to be admitted, it would follow that *Tamarindus*, actually included in Monadelphia by the most eminent Linnean botanists, and all the papilionaceous genera stationed in Decandria, should be referred hither also. With such objections attaching to the contrivance of this class, it is not easy to understand in what way it "does honor to the comprehensive powers of Linneus's mind," as has been somewhere remarked by one of his most distinguished panegyrists.

The structure of the corolla of plants of this class is, for the most part, with the exception of *Fumaria* and its allies, what has been popularly termed papilionaceous; that is to say, it consists of five petals of different forms and direction, of which the upper, called the *vexillum* or standard, is larger than the rest, upon which it is incumbent; the two lateral, called the *alæ* or wings, are oblong, distinct, and parallel with the ovarium; and the two lower, called the *carina* or keel, are enclosed within the *alæ*, are also parallel with the ovarium, and cohere by their lower edges, so as together to form, as it were, one boat-shaped petal. To this common form of corolla there are, however, some exceptions, as in *Amorpha*, where the *alæ* and *carina* are absent, and in *Erythrina*, where the *alæ* are in some cases almost obliterated. In *Trifolium* the petals all cohere by their claws into an undivided tube.

With regard to the importance of Diadelphous plants as applicable to the purposes of mankind, they may be said to hold the very highest rank. All the numerous varieties of pulse, whether eaten by men or cattle, peas, beans, haricots, caravances, lentils, and others, are all produced by Diadelphous plants. The best of our artificial grasses, such as clover, nonesuch, cow-grass, lucerne, saintfoin, serradilla, &c. &c., belong to various Diadelphous genera. A large proportion of the class also consists of useful and ornamental trees and herbs, which will be noticed in their respective places.

Order 1. PENTANDRIA.  Stamens 5.

1500. *Monniera*. Cal. 5-parted, with the upper segment long. Cor. ringent. Stamens 2: upper with two anthers; lower with three. Caps. 5, 1-seeded.

1501. *Petalostemum*. Petals 4, between the stamens, all united into a slit tube. Vexillum none, but in its place a fifth petal. Legume surrounded by calyx, 1-seeded.

Order 2. HEXANDRIA.  Stamens 6.

1502. *Corydalis*. Pet. 4, 1-spurred at base. Pod 2-valved, compressed, many-seeded.

1503. *Cysticapsos*. Petals 4, one gibbous at base. Capsule bladder, many-seeded; the placenta connected by a membranous net work.

1504. *Diclytra*. Petals 4, two outer equally spurred or gibbous at base. Pod 2-valved, many-seeded.

1505. *Adumia*. Petals 4, united in a fungous monopetalous corolla, persistent, and with two protuberances at base. Pod 2-valved, many-seeded.

1506. *Sarcocapsos*. Petals 4, 1-spurred at base. Caps. 2-valved, not opening, 2-seeded. Valves 3-nerved, flattish.

1507. *Fumaria*. One petal gibbous or spurred at base. Cariopsis indehiscent, 1-seeded, not pointed with a style.

Order 3. OCTANDRIA.  Stamens 8.

1508. *Polygala*. Cal. of 5 leaves, two of them wing-shaped and colored. Caps. compressed, orbiculate.

1509. *Murallia*. Sepals 5, glumaceous, nearly equal. Petals 3, united, the middle bifid with blunt lobes. Ovary with 4 horns or tubercles, 2-valved, 2-celled.

1510. *Mundia*. Sepals 5, glumaceous, persistent, the two inner wing-shaped. Petals 3, scarcely united at base; the middle one cucullate, beardless. Stamens 7-8, somewhat villous, monadelphous at base, with a tube divided in front.

1511. *Securidaca*. Sepals 5, the two inner petaloid. Petals 5, united at base: three united into a 3-lobed keel; two oblong. Stamens 8, diadelphous.

Order 4. DECANDRIA.  Stamens 10.

1512. *Nissolia*. Cal. 5-toothed. Legume 1-seeded, ending in a ligulate wing.

1513. *Dalbergia*. Cal. obsolete 5-toothed. Legume leafy, flat, not opening. Seeds solitary or twin.

1514. *Pongamia*. Cal. colored, cyathiform, obliquely truncate, 5-toothed. Petals clawed. Vexillum spreading. Alæ and carina conniving. Legume substipitate, compressed, flat, rostrate, valveless, 1-2-seeded. Anthers ciliate, glandular at end.

1515. *Pterocarpus*. Cal. 5-toothed. Legume falcate, foliaceous, varicose, indehiscent, encompassed by a wing. Seeds a few, solitary.

1516. *Ecastaphyllum*. Cal. campanulate, sub-bilabiate: upper segment emarginate; lower trifid. Filaments equally diadelphous. Legume roundish, valveless, 1-seeded.

1517. *Geoffroya*. Cal. 5-fid. Drupe ovate. Kernel compressed.
1518. *Dipteria*. Segm. of cal. 2, wing-shaped. Legume 1-celled, 1-seeded, coriaceous, 2-valved.
1519. *Pariva*. Cal. 3-4-fid. Vexillum ample. Alæ and carina O. Legume compressed, 1-seeded.
1520. *Amerimum*. Cal. sub-bilabiate. Legume compressed, leafy, 2-valved, dehiscent. Some seeds, solitary.
1521. *Erythrina*. Cal. bilabiate, †. Vexillum very long, lanceolate. Legume torulose.
1522. *Butea*. Cal. sub-bilabiate. Vexillum very long, lanceolate. Legume compressed, membranous, one-seeded at end.
1523. *Viborgia*. Cal. 5-toothed, with rounded recesses. Legume turgid, sulcate, winged.
1524. *Piscidia*. Stigma acute. Legume with four wings.
1525. *Platylobium*. Cal. bracteate, 2-lipped, upper lip round, large, bifid. Stam. all united. Legume stalked, compressed, winged at back, many-seeded.
1526. *Boronia*. Stigma emarginate. Calyx acuminate, spiny. Legume mucronate.
1527. *Rafnia*. Cal. tingent : upper lip bifid ; lower spreading trifold ; the middle tooth narrowest. Legume lanceolate, compressed.
1528. *Aspalathus*. Cal. 5-fid, upper segment largest. Legume ovate, blunt, about 2-seeded.
1529. *Sarcophyllum*. Cal. campanulate, 5-parted, regular. Legume acinaciform, acute.
1530. *Crotalaria*. Legume turgid, inflated, stalked. Filaments united with a dorsal fissure.
1531. *Bossiaea*. Cal. 2-lipped, upper lip largest, half bifid, obtuse. Stam. all united. Legume plano-compressed, stalked, many-seeded, thickened at each edge. Seeds stropholate.
1532. *Scottia*. Cal. imbricated with bractes, 5-toothed, with nearly equal teeth. Vexillum complicate, shorter than alæ, which are as long as carina. Stam. all united. Legume stalked, compressed, thickened at each edge. Seeds 3-4, stropholate.
1533. *Templetonia*. Cal. ebracteate, with 5 nearly equal teeth. Carina oblong. Stamens all united, with uniform anthers. Legume pedicellate, plano-compressed, many-seeded. Seeds stropholate.
1534. *Goodia*. Cal. with 2 nearly equal lips, upper half bifid, acute. Vexillum unfurled, large. Stamens all united. Legume stalked, compressed, about 2-seeded. Seeds stropholate.
1535. *Lodigesia*. Vexillum much shorter than alæ or carina.
1536. *Hovea*. Cal. bilabiate, the upper lip half bifid, retuse. Stamens all united. Carina blunt. Legume sessile, roundish, ventricose, 2-seeded. Seeds stropholate.
1537. *Spartium*. Stigma longitudinal, villous above. Filaments adhering to ovary. Cal. lengthened at the base.
1538. *Genista*. Cal. 2-lipped : upper one with 2 ; lower one with 3 teeth. Vexillum bent backwards from the rest of the flower.
1539. *Lebeckia*. Cal. 5-parted, with acute segments and rounded recesses. Legume cylindrical, many-seeded.
1540. *Ulex*. Cal. of 2 leaves, with a small scale at the base on each side. Legume turgid, scarcely longer than the calyx.
1541. *Ononis*. Cal. 5-cleft, its divisions linear. Vexillum striated. Legume turgid, sessile. Filaments in one undivided set.
1542. *Anthyllis*. Cal. inflated, 5-toothed, inclosing the small roundish 1-3-seeded legume.
1543. *Arachis*. Cal. 2-lipped. Cor. resupinate. Filaments united. Legume gibbous, torulose, veiny, coriaceous.
1544. *Lupinus*. Cal. 2-lipped. Anthers, 5 oblong, 5 round. Legume coriaceous, torulose, compressed.
1545. *Amorpha*. Cal. campanulate, 5-fid. Vexillum ovate, concave. Alæ O. Carina O. Legume 2-seeded, falcate.
1546. *Abrus*. Cal. obsolete 4-lobed, the upper broader. Filaments 9, united at base, opening at back. Stigma blunt. Seed spherical.
1547. *Phaseolus*. Carina with the stamens and style twisted spirally.
1548. *Teramunus*. Carina very small, inclosed in the calyx. Five alternate stamens fertile. Stigma sessile, capitate.
1549. *Carpopogon*. Vexillum not callous. Flowers capitate. Pods short, broad, 1-seeded.
1550. *Dolichos*. Vexillum with two calli at base, parallel, oblong, compressing the wings beneath.
1551. *Strobilium*. Cal. campanulate, 2-lipped : upper lip entire, erect ; lower trifold, with the middle segment longest. Vexillum ascending. Alæ dolabriform, lunate at base, the length of carina. Anthers 2-formed, hairy. Legume torose, 1-celled, with partitions. Seeds round, with a crested hilum.
1552. *Glycine*. Cal. 2-lipped. Carina pushing back the vexillum with its end.
1553. *Kennedia*. Cal. 2-lipped : upper emarginate ; lower trifold, equal. Vexillum reflexed, recurved. Alæ pressed to the carina. Carina remote. Stigma blunt. Legume oblong.
1554. *Cytista*. Cal. 4-fid, larger than cor. : upper segment bifid at end, or emarginate ; lower very large. Cor. persistent. Legume about 2-seeded.
1555. *Galactia*. Cal. 4-toothed, with 2 bractes. Petals all oblong ; the vexillum broadest and incumbent upon the others. Stigma obtuse. Legume round. Seeds roundish.
1556. *Citoria*. Cor. resupinate, with a large spreading vexillum overshadowing the wings.
1557. *Orobus*. Style linear, cylindrical, downy above. Cal. obtuse at the base, its upper segments deeper and shorter.
1558. *Lathyrus*. Style plane, downy above, broader upwards. Cal. with its two upper segments shortest.
1559. *Ochrus*. Cal. with the two upper segments conniving. Vexillum with two teeth at the sides. Style flat, villous above. Legume having a membranous wing upon the seed-bearing suture.
1560. *Pisum*. Style triangular, keeled above, downy. Two upper segments of calyx shorter than the rest.
1561. *Vicia*. Style bearded beneath the stigma.
1562. *Ervum*. Stigma capitate, hairy all over on the outside.
1563. *Ervilia*. Like *Vicia*, but the ovary is plaited in folds.
1564. *Cicer*. Cal. 5-parted, length of cor ; four upper segments incumbent on the vexillum. Legume turgid, 2-seeded.
1565. *Liparia*. Cal. 5-fid, with the lower segment long. Alæ 2-lobed below. Three teeth of the larger stamens shorter than the rest. Legume ovate.
1566. *Cytisus*. Cal. 2-labiate, 2-3. Legume attenuated at base.
1567. *Mullera*. Cal. 4-toothed. Loment moniliform, with fleshy 1-seeded globules cohering by a thread.
1568. *Robinia*. Cal. 4-fid ; upper segment 2-parted. Legume gibbous, long. Leaves unequally pinnate.
1569. *Caragana*. Cal. subcampanulate. Stigma smooth, truncate. Legume cylindrical. Leaves abruptly pinnated.
1570. *Suaionia*. Cal. 5-toothed. Vexillum unfurled, larger than the blunt carina. Stigma terminal. Style bearded lengthwise in front, not bearded at back. Legume turgid, not bladderly.
1571. *Sutherlandia*. Cal. 5-toothed. Vexillum without callosities, folded back at edge, shorter than oblong carina. Stigma terminal. Style with a longitudinal beard behind, a transverse one before. Legume inflated, scarious.
1572. *Lessertia*. Cal. half 5-fid. Vexillum unfurled. Carina blunt. Stigma capitate. Style bearded transversely at end in front, beardless behind. Legume scarious without valves (compressed or inflated).
1573. *Colutea*. Cal. 5-toothed. Vexillum with two callosities, unfurled, larger than the blunt carina. Stigma lateral under the hooked end of the style, which is longitudinally bearded behind. Legume inflated, scarious.
1574. *Glycyrrhiza*. Cal. bilabiate, 3-1. Legume ovate, compressed.
1575. *Liquoritia*. Cal. tubular, equal, 5-parted. Vexillum erect, reflexed at sides. Alæ spreading. Carina bifid. Legume oblong, smooth, 3-4-seeded.

1576. *Coronilla*. Cal. 2-lipped, 2-3. Upper teeth connate. Vexillum scarcely longer than ala. Loment round, jointed, straight.  
 1577. *Hippocrepis*. Loment compressed, with many notches on one edge, curved.  
 1578. *Ornithopus*. Legume jointed, curved, cylindrical.  
 1579. *Scorpiurus*. Loment intercepted by divisions, revolute, round.  
 1580. *Smilix*. Stamens divided into two equal bundles. Legume jointed, plaited, included in the bifid calyx.  
 1581. *Sesbania*. Cal. 5-toothed. Legume long (round or linear), 2-valved, many-celled, with transverse partitions.  
 1582. *Eschynomene*. Stamens divided into two equal bundles. Legume jointed, straight, exserted. Cal. 2-parted, with toothed lips.  
 1583. *Stylosanthes*. Cal. tubular, very long, bearing the corolla. Ovarium below the corolla. Loment one or two-jointed, hooked.  
 1584. *Hallia*. Cal. 5-parted, regular. Legume 1-seeded, 2-valved.  
 1585. *Lespedeza*. Cal. 5-parted, nearly equal. Carina transversely blunt. Legume lenticular, unarmed, 1-seeded.  
 1586. *Flemingia*. Cal. 5-fid. Vexillum striated. Legume sessile, oval, turgid, 2-valved, 2-seeded. Seeds spherical.  
 1587. *Zornia*. Cal. campanulate, 2-lipped. Cor. inferior. Vexillum cordate, revolute. Anthers alternately oblong and round. Legume jointed, hispid.  
 1588. *Hedyarum*. Cal. 5-fid. Carina transversely blunt. Loment with 1-seeded compressed joints.  
 1589. *Indigofera*. Cal. spreading. Carina with a spreading subulate spur on each side.  
 1590. *Tephrosia*. Cal. with subulate nearly equal teeth. Stamens monadelphous. Legume compressed, subcoriaceous.

History, Use, Propagation, Culture,

1500. *Monniera*. In memory of Monsieur Le Monnier, professor of botany in the garden of plants at Paris. He published, in 1745, "Observations sur les Plantes dangereuses des Pyrénées et du Roussillon."  
 1501. *Petalostemum*. From *πτελον*, a petal, and *στημον*, a stamen; in allusion to the union of these two parts into a tube.  
 1502. *Corydalis*. *Καρδαλις* is an ancient Greek name for the Fumitory, from which genus this has been separated. Pretty little plants, well adapted for rock-work or growing on pots. They are easily cultivated and increased.

1591. *Galega*. Cal. with subulate nearly equal teeth. Legume with oblique streaks between the seeds.  
 1592. *Phaca*. Cal. 5-toothed, two upper teeth most distant. Legume half 2-celled, inflated.  
 1593. *Oxytropis*. Carina ending in a mucro. Legume 2-celled or half-2-celled, with the upper suture turned inwards.  
 1594. *Astragalus*. Legume 2-celled, more or less gibbous, with the lower suture turned inwards. Carina blunt.  
 1595. *Biserrula*. Legume 2-celled, flat, with a contrary dissepiment serrated on each edge.  
 1596. *Dalea*. Alæ and carina adhering to the column of stamens. Stamens 5-10, united, without a separate filament. Legume 1-seeded.  
 1597. *Psoralea*. Cal. the length of pod. Stamens diadelphous. Legume 1-seeded, subrostrate, valvulse.  
 1598. *Melilotus*. Cal. tubular, 5-toothed. Carina simple, shorter than alæ and vexillum. Legume longer than calyx, rugose.  
 1599. *Lupinaster*. Cal. campanulate, 5-toothed, with setaceous teeth. Stigma uncinatè. Legume not knotted, round, many-seeded.  
 1600. *Trifolium*. Legume (in general) shorter than the cal., 1 or many-seeded, indehiscent, deciduous. Flowers more or less capitate.  
 1601. *Lotus*. Legume cylindrical, straight. Alæ of the cor. cohering by their upper edge. Filaments dilated upwards.  
 1602. *Tetragonolobus*. The characters of Lotus, but the pod square with 4 wings.  
 1603. *Trigonella*. Vexillum and alæ nearly equal, spreading, in the form of a tripetalous corolla.  
 1604. *Dorycnium*. Cal. 5-toothed, 2-lipped. Filaments subulate. Stigma capitate. Legume turgid, 1 or 2-seeded.  
 1605. *Medicago*. Legume falcate or spirally twisted, compressed, membranaceous.  
 1606. *Hymenocarpus*. Like Medicago, but the legumes reniform, winged at edge.

## PENTANDRIA.

9959 Stem dichotomous, Leaves ternate, Spike bifid

9960 Spike cylindrical stalked, Bractes longer than flower, Leaves in 3 pairs lanceolate

9961 Spike cylindrical stalked, Bractes subulate length of calyx, Leaflets lanceolate

9962 Spike cylindrical stalked, Bractes nearly as long as calyx, Leaves in 2 pairs linear

9963 Heads with a scaly involucre, Calyxes plumose, Leaflets linear pointless

## HEXANDRIA.

9964 Stem erect simple without scales, Leaves bipinnate, Lobes cuneate cut at end, Bractes acute

9965 Stem simple without scales, Lvs. 2 biternate, Segm. cuneate multifid, Bractes ovate entire, Roots hollow

9966 Stem subsimple erect with scales below the lowest leaf, Leaves 3-4-stalked biternate, Segments obl. blunt

9967 Stem subsimple erect with scales below the lowest leaf, Lvs. 3-4-stalk. bitern. cut, Segm. cuneate or oblong

9968 Stem erect branched, Leaves glaucous decomposit, Segm. stalked cuneate trifid, Pods linear

9969 Stem branched diffuse, Leaves glaucous bipinnate, Lobes obl. linear, Bractes lanceol. linear acuminate

9970 Pods roundish shorter than peduncle, Stems angular, Bractes minute, Spur very short and round

9971 Stem erect somewhat branched scarcely longer than radical lvs. Lvs. on long stalks 3-cut, Raceme few-fl.

9972 Stem branched diffuse, Lvs. bipinnate, Segm. obov. cuneate trifid, Pods lin. scarcely longer than pedicel

9973 Stem branched climbing, Leaves bipinnate, Petioles cirrhose, Segm. oval entire

9974 The only species

9975 Spurs 2 straight acute, Scape naked, Raceme simple

9976 Spurs 2 incurved blunt, Scape naked, Raceme compound, Stigma with 2 angles

9977 Spurs 2 incurved blunt, Scape naked, Raceme compound, Stigma with 4 angles

9978 Spurs 2 short blunt, Scape naked simple few-fl. Leaves multifid

9979 The only species. — *Fumaria fungosa*, Hort.

and Miscellaneous Particulars.

1503. *Cystacapsus*. From *κυστις*, a bladder, and *καπνός*, fumitory. A genus divided from *Fumaria* on account of its bladderly fruit.

1504. *Dicytra*. So named by Borkhausen, a German botanist, on account of the two spurs or pouches of the flower. Handsome herbaceous plants, frequently cultivated among choice collections of rare flowers. Their roots are impatient of cold and wet, and should therefore be planted in a warm dry border well exposed to the southern sun.

1505. *Aduma*. A name unexplained by its author, M. Rafinesque Schmalz. A tall climbing annual plant of little beauty in its flowers, but covering a large space in the course of a summer.

History, Use, Propagation, Culture.

1506. *Sarcocapnos*. From *sarcos*, flesh, and *capnos*, fumitory. So named by Decandolle on account of the fleshy substance of the leaves of the plants contrasted with those of other allied genera.

1507. *Fumaria*. From *fumus*, smoke; in allusion to the disagreeable smell of the plant. The French, with the same meaning, call it *Fumeterre*, whence our English word *Fumitory*. The species are handsome weeds. *F. officinalis* was formerly considered a valuable antiscorbatic, and much used in obstructions of the viscera.

1508. *Polygala*. From *polu*, much, and *gala*, milk. Dioscorides says, that the plant was believed to excite the lactal secretions in women. The species are handsome free-flowering plants. The greenhouse kinds are highly ornamental, and some of them continue in bloom all the winter: *P. stipulacea* all the year. They grow freely in sandy loam, or loam and peat; and are readily increased by cuttings of the young wood, in sand, under a bell-glass.

*P. vulgaris* was thought to possess something of the properties of *P. Senega*. Sir J. E. Smith found that an infusion of the herb taken in a morning, fasting, about a quarter of a pint daily, promoted expectoration, and was good in a catarrhus cough. He tried it at Montpellier by the advice of Professor Gouan with success, and has since known it useful. Foreign writers celebrate it as a grateful and nutritious food for cattle. According to the Swedish experiments, kine, sheep, and goats eat it, but swine refuse it.

*P. Senega* has a woody, branched, contorted root, about half an inch thick, and covered with ash-colored

9980 Leaves with a branched stalk triternate, Segments ovate angular

9981 Pods round retuse, Pedicels of fruit erect twice as long as bractes, Racemes lax  
 9982 Pods globose, Pedicels of fruit recurved longer than bract, Racemes lax  
 9983 Pods globose with a little point, Pedicels of fruit erect longer than bract  
 9984 Pods compressed oval smooth, Raceme spiked, Pedicels much shorter than bract

## OCTANDRIA.

- 9985 Flowers crested spiked, Stem herbaceous branched erect, Leaves alternate subulate  
 9986 Fl. crested racem. Wings of cal. 3-nerved blunt longer than cor. Stems erect, Lvs. blunt: radic. obovate  
 9987 Fl. crested racem. Wings of cal. 3-nerved blunt length of cor. Stems procumb. Leaves linear-lanc. acute  
 9988 Fl. crest. racem. Wings of cal. many-nerv. blunt mucron. short than cor. Stems erect, Lvs. lin. lanc. acute  
 9989 Fl. crested term. in threes, Stems quite simple erect naked beneath, Leaves ovate  
 9990 Fl. crested, Raceme term. Wings of cal. cuspidate many-nerv. Stem erect shrubby, Lvs. lin. lanc. smooth  
 9991 Fl. crest. Appendage double, Racemes without bractes subterm. many-fl. Lvs. altern. obl. cuneate smooth  
 9992 Fl. crest. Raceme term. few-fl. Wings of cal. ovate acute many-nerved, Stem shrubby, Lvs. linear subulate  
 9993 Fl. crested somewhat umbelled, Leaves ovate fleshy  
 9994 Fl. crested racemose, Bractes 3-leaved, Leaves obovate oblong  
 9995 Fl. crested, Racemes few-fl. term. Keel falcate, Stem shrubby, Leaves obl. bluntnish smooth  
 9996 Fl. crested, Stem shrubby, Leaves opposite ovate acute  
 9997 Fl. crested, Raceme terminal, Stem shrubby, Branches downy, Leaves cordate mucronate opposite  
 9998 Fl. crested whorled, Leaves cordate downy beneath  
 9999 Fl. beardless, Pedunc. terminal and axill. about 2 fl. Stem shrubby, Leaves obl. lanceolate acute  
 10000 Fl. crested, Branches downy, Leaves decussating coriaceous glaucous ovate downy beneath  
 10001 Fl. crest. Branches vill. Lvs. scattered lingulate smooth, Outer lobe of the petals of vexillum very short  
 10002 Fl. beardless lateral, Leavcs solitary 3-cornered mucronate  
 10003 Fl. beardless axillary sessile, Leaves linear mucronate  
 10004 Fl. crested, Racemes axillary on long stalks, Stems erect branched upwards, Leaves linear acute  
 10005 Fl. beardless, Spike terminal filiform, Stem erect herbaceous quite simple, Leaves oblong lanceolate  
 10006 Fl. beardless, Raceme cylindr. capitate terminal, Stem simple, Leaves obl. lanc. acute  
 10007 Fl. beardless globose capitate terminal, Stem erect simple, Leaves linear bluntnish  
 10008 Leaves ovate-lanceolate imbricated, Stem branched decumbent  
 10009 Flowers beardless, Pedunc. squarrose, Stem branched erect  
 10010 Flowers beardless distant, Leaves linear whorled, Stem branched  
 10011 Flowers beardless in headed spikes, Leaves in fours linear-lanceolate, Stem somewhat branched erect
- 10012 Fl. beardless lateral, Stem arborescent, Leaves 3-cornered mucronate spiny  
 10013 Fl. beardless, Peduncles solitary axillary, Leaves fascicled ovate mucronate ciliated at edge  
 10014 Fl. beardless lateral, Leaves in threes linear acute  
 10015 Fl. beardless sessile, Leaves round mucronate very close

10016 Leaves obovate or oval, Branches short spiny

10017 Branches a little downy, Leaves oval-obl. acute, Racemes lateral

and Miscellaneous Particulars.

bark. It is inodorous; the taste is at first sweetish and nauseous, but after being chewed for less than a minute, becomes pungent and hot, producing a very peculiar tingling sensation in the fauces. Medically, it is considered stimulating, expectorant, and diuretic, and in large doses emetic and cathartic: it increases absorption, and consequently augments the natural excretions, particularly that of urine, and frequently occasions a copious pytalism. It was introduced to the notice of physicians by Dr. Tennant, who, having discovered that it was the antidote employed by the Senegare Indians against the bite of the rattlesnake, and reasoning from the effects of the poison, and of the remedy in removing these, was induced to try it in pneumonic affections, and found it useful. On account of its stimulant properties, however, it can be employed in these complaints only after the resolution of the inflammation by bleeding and evacuations. It proves more directly useful in humoral asthma, chronic catarrh, and some kinds of dropsy. (*Thomson's London Dispensatory*, p. 450.)

1509. *Muraltia*. Named after John Von Muralt, a Swiss botanist, who lived in the commencement of the eighteenth century. Handsome bushes, of easy cultivation in a greenhouse, or even in a good pit.

1510. *Mundia*. So named, in allusion, we presume, to the neatness (*munditia*) of its appearance. No explanation of the word is given by its author. Pretty little Cape bushes, easily cultivated in a good pit.

1511. *Securidaea*. From *securis*, a hatchet, in allusion to the form of the end of the pod. It grows freely in light loam, or loam and peat; and cuttings root in sand covered with a glass.

## History, Use, Propagation, Culture,

1512. *Nissolia*. In honor of William Nissolle, an industrious French botanist. He was a member of the academy of Montpellier, and author of some papers in its Transactions. He was born in 1647, and died in 1735. Cuttings root in sand, but not very readily.

1513. *Dalbergia*. Nicholas Dalberg was surgeon in ordinary to the king of Sweden, and published in 1755 a work upon the Metamorphoses of Plants. Another Dalberg, a pupil of Linnaeus, travelled in Dutch Guiana, whence he communicated specimens to his preceptor. Ripened cuttings root in sand.

1514. *Pongamia*. An alteration of the vernacular name of the plant in India.

1515. *Pterocarpus*. From *πτερον*, a wing, and *καρπος*, fruit. Its pods have membranous wings. *P. santalinus* is a lofty tree, with alternate branches, and a bark resembling that of the common alder; it yields the true official red saunders wood, first detected by Koenig in India. It is brought home in billets, which are very heavy, and sink in water. Red saunders wood has an aromatic odor, and is nearly insipid. It is extremely hard, of a fine grain, takes a high polish, and a bright garnet red color, which depends on exposure to the air. It yields its coloring matter, which appears to be of a resinous nature, to ether and alcohol, but not to water. (*Thomson's London Dispensatory*, 458.)

The sap yields one sort of *Sanguis draconis*. Many of the red Indian woods traude a blood red juice through the clefts of the bark, which hardens into a red resin, not differing from *Sanguis draconis*, which, therefore, is collected from several trees, and from this among others. (*Linn. Suppl.*) This drug, however, is chiefly obtained from the *P. Draco*, and the fruit of *Calamus Rotang*.

In our stoves these plants thrive in light loamy soil; and cuttings, with their leaves untouched, will root in sand under a common hand-glass.

1516. *Ecastaphyllum*. From *εκαστος*, every one, and *φυλλον*, a leaf; that is to say, a leaf which is always simple, and not compounded of several others, as those of neighbouring genera.

1517. *Geoffroya*. In honor of Etienne Francois Geoffroi, Memb. Acad. Par., Professor of botany at the Jardin du Roi, and a foreign member of the Royal Society of London. He was the author of several medical botanical works, especially of a *Materia Medica*. He was born in 1672, and died in 1731. A tree, branching at top, with a smooth grey bark and pinnate leaves; and, what is remarkable in papilionaceous plants, a drupe for a fruit.

## DECANDRIA.

- 10018 Stem shrubby twining, Leaves pinnated, Leaflets ovate acute smoothish  
 10019 Leaves pinnated, Leaflets ovate-oblong emarginate  
 10020 Leaves ternate and quinately, Leaflets oval acuminate smooth, Fl. racemose
- 10021 Leaves pinnated, Leaflets roundish emarginate, Fruit lanceolate  
 10022 Leaves pinnated, Leaflets obl. obtuse, Branches and petioles downy  
 10023 Leaves pinnated, Leaflets ellipt. emarginate smooth, Panicle terminal, Fruit lanceolate
- 10024 Leaves pinnated, Leaflets ovate acuminate smooth, Fruit ovate acute veinless
- 10025 Leaves pinnated, Leaflets elliptical emarginate, Stipules none, Panicle termin.  
 10026 Leaves pinnated, Spines stipulary, Fruit unate  
 10027 Leaves ternate roundish blunt quite smooth, Petals crenate wavy
- 10028 Leaves simple cordate-ovate downy beneath
- 10029 Unarmed, Leaflets ovate-lanceolate
- 10030 Leaves alternate, Raceme terminal
- 10031 Leaves pinnated, Flowers smooth
- 10032 Unarmed, Leaves simple stalked alternate subcordate ovate, Racemes compound axillary and lateral  
 10033 Leaves pinnated, Leaflets ovate acuminate, Stem arborescous  
 10034 Spiny, Leaves subsessile aggregate obovate oblong, Peduncles 2-flowered
- 10035 Leaves ternate rhomboid smooth, Stem herbaceous unarmed, Calyx truncate  
 10036 Leaves ternate smooth, Stem arborescous prickly, Calyx campanulate truncate  
 10037 Leaves ternate unarmed, Stem arborescous prickly, Calyx truncate 5-toothed  
 10038 Leaves ternate unarmed, Stem arborescous prickly, Calyx spatheaceous  
 10039 Leaves ternate unarmed lanceolate, Stem arborescous prickly, Calyx bifid  
 10040 Leaves ternate unarmed, Leaflets blunt, Stem arborescous prickly  
 10041 Leaves ternate prickly, Stem arborescous prickly  
 10042 Leaves ternate prickly beneath, Petioles unarmed, Stem prickly

## and Miscellaneous Particulars.

This drupe is large, subovate, and incloses a woody nut. The bark, which has a mucilaginous sweetish taste and a disagreeable smell, was first noticed as a vermifuge by Peter Duguid; but Dr. Wright, who resided a long time at Jamaica, has communicated the fullest information concerning this tree. According to him, the bark is powerfully medicinal; and its anthelmintic effects have been established at Jamaica by long experience.

1518. *Dipterix*. From *dis*, double, and *πτερυξ*, a wing, in allusion to the two appendages of the calyx. A tree much branched at top, with large alternate pinnate leaves, and racemes of flowers succeeded by almond-like fruits. The kernels of these are very fragrant, and are put by the Creoles into chests of clothes, in order to drive away insects, and communicate a grateful odor. They are in their own country called *Tongva*, and are the sweet-scented seed sold in shops under the corrupted name of *Tonquin* bean, for perfuming snuff and other substances. Ripened cuttings root in sand in moist heat.

1519. *Pariwoa*. The name of the tree in Guiana. A very handsome tree.

1520. *Amerimnum*. One of the names given to the Houseleek by the Greeks. It is derived from *α*, private, and *μεριμνα*, care, because the plants require no attention. It is not easy to tell why the name was applied to this genus, which has nothing in common either with the Houseleek or its ancient name. A. Ebenus is common in the West Indies, and the wood is sent to Europe under the name of American Ebony. Though not the true ebony, yet being of a fine greenish-brown color, and polishing well, it is much coveted by the instrument makers, and is of a very hard durable nature. The flowers of *Amerimnum latifolium* are yellow, and smell like new hay. In our stoves the species may be treated like *Pterocarpus*.

1521. *Erythrina*. From *ερυθρος*, red; nearly all the species being remarkable for the brilliant scarlet color of their flowers. The species are small trees, prickly or unarmed, or else shrubs, sometimes almost herbaceous; leaves, as in *Dolichos*, ternate, stipulaceous, the petiolules jointed and awned, or glandular, very seldom simple; flowers in fascicles from the axils, or in spikes at the end of the stem and branches, often scarlet. (*Jussieu*.)

In our stoves they thrive well in a light loamy soil. "The best way to flower them," Sweet observes, "is to place them on a dry shelf in winter, when they have no leaves, and give them scarcely any water; when they show flower-buds, they may be plunged in a moist heat, which will make the flowers finer than they

History, Use, Propagation, Culture.

would be, if the plants stay out till they are in bloom. Cuttings taken off at a joint, and planted in sand, without being deprived of any of their leaves, strike root readily under a hand-glass in moist heat." (*Bot. Cult.* 54.)

1522. *Butea*. Named in honor of the late Earl of Bute, a munificent patron of botanical science. This splendid genus, though of free growth and easy propagation, is yet rare in British collections. From *B. frondosa* is obtained the *Gum lac* of commerce. Infusions of the flowers dye cotton cloth, previously impregnated with a solution of alum, or of alum and tartar, of a beautiful yellow color. The plant grows in loam and peat, and "cuttings should be taken off at a joint, and planted in a pot of sand, without being deprived of any of their leaves: one pot is enough under a hand-glass, as the leaves take up much room, and, if too confined, are apt to damp off. They should be plunged in a moist heat." (*Bot. Cult.* 30.)

1523. *Viborgia*; usually written *Wiborgia*, received its name after M. Eric Viborg, a learned and acute Danish botanist, author of several botanical treatises in his own language in the end of the eighteenth century. The species, like those of the four preceding genera, may be treated as *Scotia*.

1524. *Piscidia*. From *piscis*, a fish; the inhabitants of America use the bark as a fish poison. This tree has spreading branches and pinnate leaves, and is very common in Jamaica, where it is reckoned one of the best timber-trees in the island. The wood is very hard and resinous, and lasts almost equally in or out of water. It is of a light-brown color, coarse, cross-grained, and heavy. (*Browne*.) It makes excellent piles for wharfs. The stakes soon form a good live fence. The bark of the trunk is very astringent; a decoction of it stops the immoderate discharge of ulcers, especially when it is combined with the mangrove bark; it cures the mange in dogs, and would probably answer well for tanning leather. (*Long*, 824.) The bark of the root is used for the same purposes and with the same effects as the leaves and branches of Surinam poison; it is pounded and mixed with the water in some deep and convenient part of a river or creek, whence it may spread itself;

10043 Leaves ternate, Petioles prickly glandular, Stem arboreous unarmed  
10044 Leaves ternate oblong oval blunt

10045 Branches downy, Leaflets roundish emarginate  
10046 Branches smooth, Leaflets obovate roundish blunt

10047 Leaflets and twiggy branches pubescent

10048 Leaves unequally pinnate, Leaflets ovate

10049 Leaves cordate ovate, Ovary hairy  
10050 Leaves lanceolate ovate, Ovary smooth  
10051 Leaves deltoid or hastate with spiny angles

10052 Leaves sublinear acute villous beneath, Heads terminal  
10053 Leaves lanceolate 3-nerved entire  
10054 Leaves lanceolate many-nerved entire  
10055 Leaves amplexicaul. entire netted  
10056 Leaves amplexicaul. wavy with a reflexed mucro  
10057 Leaves cordate many-nerved entire  
10058 Leaves cordate many-nerved toothbitted  
10059 Leaves ovate cordate acuminate pungent, Stem hirsute  
10060 Leaves rigid pointed pungent oblong dense

10061 Leaves ovate smooth, Branches angular, Peduncles 3 lateral 1-flowered

10062 Leaves fascic.ed 3-angular mucronate stiff hairy, Heads hairy  
10063 Leaves fascicled filiform silvery blunt, Racemes leafy, Flowers not hairy  
10064 Leaves fascicled subulate smooth, Pedunc. filiform twice as long as leaf  
10065 Leaves fascicled filiform blunt hairy, Flowers somewhat racemose  
10066 Leaves fascicled 3-cornered mucronate hairy, Flowers lateral  
10067 Leaves fascicled fleshy round smooth, Fl. lateral and terminal, Flowers smooth  
10068 Leaves fascicled fleshy round smooth setaceous at end, Fl. capitate terminal  
10069 Leaves fascicled scabrous somewhat hairy, Heads terminal  
10070 Leaves fascicled filiform mucronate smooth, Flowers lateral  
10071 Leaves fascicled 3-cornered mucronate smooth  
10072 Leaves linear downy imbricated, Heads terminal crowded  
10073 Leaves fascicled filiform lax hairy, Heads hairy  
10074 Leaves quinately sessile, Peduncles 1-flowered  
10075 Leaves ternate and fascicled ovate silky, Heads downy, Stem dichotomous  
10076 Leaves ternate and fascicled filiform silky, Fl. somewhat lateral, Vexillum naked  
10077 Leaves three 3-cornered smooth, Spikes ovate  
10078 Leaves ternate, Leaflets blunt, Branches spiny  
10079 Leaves fascicled fleshy round smooth. Flowers lateral without bractes, Branches twiggy

and Miscellaneous Particulars.

in a few minutes the fish that lie hid under the rocks or banks rise to the surface, where they float as if they were dead; most of the large ones recover after a time, but the smaller fry are destroyed. The eel is not intoxicated with common doses, though it is affected very sensibly; for the moment the particles spread where it lies, it moves off with great agility. Jacquin observes that this quality of intoxicating fish is found in many other American plants.

It is a very free grower in our stoves, but is seldom allowed to grow large enough to flower. Cuttings root in sand under a hand-glass.

1525. *Platylobium*. From *πλατυς*, broad, and *λοβος*, a pod, in allusion to the form of the pod. Handsome free-flowering plants, which grow in sandy loam and peat; and are increased by cuttings in sand under a hand-glass, or by seeds.

1526. *Borbonia*. In memory of Gaston Bourbon, Duke of Orleans, son of Henry IV. of France, a great lover and patron of botany. See Gastonia. Shrubs of easy culture and propagation.

1527. *Rafnia*. Named, according to Sir James Smith, after Mr. C. G. Rafn of Copenhagen, author of a Flora of Denmark and Holstein, published in 1796 and 1800, in two octavo volumes. A genus of Cape plants, separated from the Linnean *Crotalaria* and *Liparia*.

1528. *Aspalathus*. A native of the island *Aspalathus* on the coast of Lycia. It was a common practice with the ancients to fix the names of places upon certain plants, as *Cytisus*, *Lycium*, and others. It is not certain what plant the ancients intended by their *Aspalathus*. Shrubs and under-shrubs, with fasciculate linear leaves, and yellow flowers, all of which grow freely in a mixture of sandy loam and peat; and young cuttings, planted in sand under bell-glasses will strike root freely, if the glasses are wiped occasionally, otherwise they are liable to damp off. Some species ripen seeds freely, by which young plants are readily produced. (*Bot. Cult.* 140.)

History, Use, Propagation, Culture,

1529. *Sarcophyllum*. From *σαρξ*, flesh, and *φυλλον*, a leaf. The leaves are thick and fleshy. A somewhat succulent plant, easily injured by over-watering; but otherwise not difficult to preserve or increase.

1530. *Crotalaria*. *Κροταλον* was the name of a noisy Greek musical instrument, similar to the cymbals of the present day. The pods of this genus are inflated, and rattle, when shaken, in a similar manner. The species are all of easy culture, mostly free-flowerers; but they are shabby plants under cultivation, and possess no good quality which can render them objects of interest or beauty.

1531. *Bossiea*. Named by Ventenat, after M. Boissieu-Lamartinière, who accompanied the unfortunate La Pérouse in his voyage round the world. This beautiful genus, according to Sweet, "thrives best in an equal mixture of sandy loam and peat; if not very sandy, some sand must be added to it to have the plants in health. The pots must be well drained with broken potsheds, as nothing injures them more than too much

## 10090 The only species

- 10081 Leaves simple obl. lanceolate, Stipules lanceolate acuminate decurrent, Racemes opposite the leaves  
 10082 Leaves simple lanc. ellipt. blunt downy beneath, Racemes opposite the leaves  
 10083 Leaves very small ternate glaucous, Racemes few-flowered, Vexillum reflexed  
 10084 Leaves simple lanc. villous, Upper stipules lanc. decurrent, Racemes opposite the leaves, Cal. villous  
 10085 Branches winged upwards, Lower leaves obl. : upper lanc. acute hairy, Racemes lateral  
 10086 Leaves simple lin. lanc. acute villous beneath, Flowers and pods inclosed in hairy calyx  
 10087 Leaves simple long-lanc. Pods downy, Raceme terminal, Stem square  
 10088 Leaves obl. lanceolate silky beneath, Fl. racemose, Bractes linear much shorter than pedicel  
 10089 Leaves simple lanc. Upper stipules decurrent with 2 short teeth, Racemes opposite the leaves  
 10090 Leaves lanceolate subsessile. Lower lip of cal. 3-parted beyond the middle, Stem virgate simple  
 10091 Leaves simple lanc. subsessile, Pods smooth, Raceme terminal, Stem furrowed  
 10092 Leaves lanceolate blunt hairy, Fl. terminal, Calyx hairy as long as corolla  
 10093 Leaves lanceolate, Raceme terminal, Cal. very villous as long as corolla  
 10094 Leaves simple ov. lanceolate silky ciliated, Standard large erect pointed  
 10095 Leaves simple lanc. beneath, Pods silky, Raceme terminal, Stem furrowed  
 10096 Leaves simple obl. cuneiform retuse, Raceme terminal  
 10097 Leaves simple ovate retuse, Stipules lunate declinate, Raceme term. Branches square  
 10098 Leaflets 3 oval acute, Hairs shining scattered, Racemes opposite the leaves  
 10099 Leaflets 3 oval blunt with scattered hairs, Raceme terminal long, Keel shorter than vexillum  
 10100 Leaves simple obovate oblong silky on each side, Pod 4-seeded length of calyx  
 10101 Stems round striated, Leaves oval emarginate mucronate, Stipules lunate amplicaul  
 10102 Leaves simple lin.-lanceolate blunt hairy, Pedunc. terminal subsolitary, Stem branched diffuse  
 10103 Leaves simple obl. blunt hairy, Stems prostrate herbaceous, Pedunc. 2-3-fl. axillary  
 10104 Leaflets 3 oblong blunt mucronate with scattered hairs beneath, Raceme terminal, Calyx&c silky  
 10105 Leaves ternate, Leaflets oval-lanc. acute twice as long as villous petiole, Pods pendulous  
 10106 Leaves obovate cuneate silky, Racemes term. Bractes and calyx colored  
 10107 Leaves obl. blunt silky villous, Stipules linear subulate reflexed, Panic. terminal bracteate  
 10108 Leaves ternate, Leaflets cuneiform emarginate silky beneath, Peduncles axillary solitary 1-flowered  
 10109 Leaves ternate ovate acuminate smooth, Stipules none, Raceme terminal, Pods stalked pendulous  
 10110 Leaves ternate obovate mucronate, Flowers corymbose, Stem shrubby  
 10111 Leaves ternate, Leaflets obovate retuse, Racemes terminal  
 10112 Leaves ternate, Leaflets linear lanceolate acute half as long again as petiole downy beneath  
 10113 Leaves ternate on long stalks, Leaflets oval downy, Racemes axillary lax, Standard blunt  
 10114 Leaves ternate obl. lanceolate acute silky beneath, Stipules lanceolate subulate, Pedunc. axill. 1-flowered  
 10115 Leaves ternate obovate strigose beneath, Stipules lanceol. and bractes ovate reflexed, Racemes terminal  
 10116 Leaves ternate obovate, Stipules leaf-like stalked, Racemes terminal, Pods stalked  
 10117 Leaves ternate oval villous beneath, Racemes spiked, Keel downy at edge, Pods sessile hairy  
 10118 Leaves ternate lanceolate smooth, Racemes terminal spiked  
 10119 Leaves ternate lanc. hoary silky shorter than petiole, Raceme terminal  
 10120 Leaves quinate  
 10121 Branches flat linear leafless, Denticulations flower-bearing, Keel naked, Calyx smooth  
 10122 Branches flat linear leafless, Denticulations flower-bearing, Keel fringed, Calyx smooth  
 10123 Branches leafy compressed, Leaves obovate and linear flat, Pod many-celled with spongy septa  
 10124 Branches leafy compressed, Leaves linear with recurved edges, Pod 1-celled  
 10125 Branches leafy filiform, Leaves oval smooth, Stipules shorter than petiole, Pod 1-celled  
 10126 Branches leafy round, Stem erect much branched, Leaves ovate-lanc. rough above  
 10127 Branches leafy spiny round, Leaves obovate cuneiform

## 10128 The only species

- 10129 Leaves green retuse  
 10130 Leaves glaucous blunt

and Miscellaneous Particulars.

water. Cuttings, not too ripe, will strike root if planted in sand under a bell-glass, not too close together, as they are apt to damp; when rooted, they must be potted off in little pots and kept in a close frame, and hardened to the air by degrees." (*Bot. Cult.* 151.)

1532. *Scottia*. Named in memory of Robert Scott, M. D., formerly professor of botany at Dublin. A shrub found by Mr. Brown upon the south-west coast of New Holland. Young cuttings root in sand under a bell-glass.

1533. *Templetonia*. Named after John Templeton, Esq., of Orange Grove, near Belfast, a gentleman to whom the editor of the English Botany was under frequent obligations for Irish plants during the progress of that work.

History, Use, Propagation, Culture,

1534. *Goodia*. In memory of Peter Good, an industrious gardener employed by the Kew garden in collecting seeds in New Holland, where he died.

1535. *Loddigesia*. Named in compliment to Mr. Conrad Loddiges, a successful cultivator of plants, an assiduous collector, and a most worthy man, whose virtues are inherited by his sons.

1536. *Hovea*. In honor of Mr. Antony Pantaleon Hove, a Polish botanist, who travelled in the Crimea and Persia, whence many plants were sent to Kew garden. He is still alive, and naturalized in England. Pretty plants, easily cultivated in sandy loam and peat, and rooted in sand under a hand-glass.

1537. *Spartium*. From *σπάρτον*, cordage; the earliest ropes were made of this and similar tough plants. The species are shrubs thick-set with verdant flexible rush-like twigs, which are very ornamental in winter, and generally profusely covered with shewy white or yellow odoriferous and mellifluous blossoms in summer. *S. junceum* is grown as a green food for sheep in the south of France, and there and in Spain it affords a thread from its fibres, which is sometimes wove into cloth, but more generally twisted into cordage. Bees are very fond of the flowers, as they are of those of most of the species.

*S. monospermum*, is a very handsome shrub, remarkable for its numerous snow-white flowers. Osbeck remarks, that it grows like willow-bushes along the shore of Spain, as far as the flying sands reach, where scarcely any other plant exists except the *Ononis repens*, or creeping Restharrow. The use of this shrub is very great in stopping the sand. The leaves and young branches are delicious food for goats. It converts the most barren spot into a fine odoriferous garden by its flowers, which continue a long time. It serves to shelter hogs and goats against the scorching heat of the sun. The twigs are used for tying bundles; and all kinds of herbs that are brought to market are fastened together with them. Forskahl found it in Arabia; and Desfontaines in Barbary, on the sandy coast. The Spaniards call it *Retamas*, from the Arabic name *Retam*.

10131 Leaflets obovate and calyxes smooth, Pod varicose  
 10132 Leaflets obovate cuneate and calyxes downy, Pod smooth

10133 The only species

10134 Leaves linear hairy beneath, Pods smooth  
 10135 Leaves long linear: beneath veiny, Pods downy  
 10136 Branches twiggy, Leaves lanc. mucronate downy beneath, Fl. axill. twin  
 10137 Leaves elliptic oblong  
 10138 Leaves lanc. somewhat rhomboid blunt at end mucronate, Peduncles axillary many-flowered

10139 Branches opposite round flowering at end, Leaves lanceolate

10140 Branches round striated, Racemes lateral few-fl. Flowers subaggregate, Leaves lanceolate silky  
 10141 Branches round striated, Racemes lateral many-fl. Flowers remote, Leaves lanc. sessile a little hairy  
 10142 Branches round striated, Fl. solitary axillary, Pods villous, Leaves lanceolate hairy  
 10143 Branches round striated very close, Fl. terminal racemose, Vexillum smooth, Leaves lanc. silky  
 10144 Branches round striated, Fl. axill. solitary subracemose, Standard and keel downy, Lvs. obl. lanc. silky  
 10145 Branches round striated, Fl. axillary solitary, Leaves lanc. silky subsessile  
 10146 Branches round striated, Fl. term. capitate, Leaves lin. lanc. silky  
 10147 Branches round striated spreading spiny, Pedunc. axill. many-fl. Leaves obl. acute silky  
 10148 Leaves lanc. silky beneath, Corolla silky, Branches erect round  
 10149 Leaves ternate and simple silky, Twigs straight striated flowering on all sides  
 10150 Leaves solitary and ternate linear lanceolate hoary, Branches hexangular flowering at the ends  
 10151 Leaves ternate stalked obovate, Branches round striated, Lateral flowers twin nodding  
 10152 Branches angular, Leaves simple lanceolate silky beneath, Fl. racemose, Pods hairy  
 10153 Branches round with ten furrows, Flowers axillary solitary downy  
 10154 Leaves ternate lanc. hairy stalked, Fl. lateral fascicled, Pods smooth, Branches round striated  
 10155 Leaves ternate sessile linear silky beneath, Raceme terminal, Branches round furrowed  
 10156 Leaves ternate and solitary oblong, Fl. axillary, Pods hairy at edge, Branches angular  
 10157 Leaves ternate linear, Petioles dilated persistent, Racemes capitate term. Branches angl. opp. clustered  
 10158 Leaves ternate and simple oblong mucronate, Raceme terminal, Branches striated round spiny  
 10159 Leaves ternate obovate, Peduncles axillary, Cal. and pods smooth, Branches angular spiny

10160 Leaves tern. obl. downy beneath with spreading hairs, Pedunc. many-fl. terminal, Branches angular  
 10161 Leaves ternate obovate downy with closely pressed hairs, Pedunc. many-fl. terminal, Branches angular  
 10162 Leaves ternate obl. smooth, Racemes terminal, Cal. and pods glandular viscid, Branches round striated  
 10163 Leaves ternate: upper simple, Branches triquetrous procumbent  
 10164 Branches 2-edged membranous jointed, Leaves ovate lanceolate  
 10165 Leaves lanceolate mucronate smooth, Branches 3-cornered ascending, Pods smooth  
 10166 Leaves lanceolate smooth, Branches round striated erect, Pods smooth  
 10167 Leaves lanceolate smooth, Branches equal round erect  
 10168 Leaves oblong ovate and pods hairy, Branches round striated  
 10169 Quite smooth, Leaves not ciliated, Cor. 5 lines long, Calyx smooth

and Miscellaneous Particulars.

*S. scoparium*, though in some places a troublesome weed in old pastures, is a very ornamental shrub in garden scenery: it is also useful in agriculture, domestic economy, and medicine. It is sometimes used as winter food for sheep, frequently for thatching cottages and ricks, and as litter. Bees are fond of the flowers: the flower-buds, just before they become yellow, are pickled in the manner of capers: the branches are said to be capable of tanning leather, and of being manufactured into coarse cloth; when tender, they are mixed with hops in brewing: the old wood furnishes the cabinet-maker with a beautiful material for veneering. The twigs, when bruised, smell disagreeably, which perhaps may be one reason why our broom is generally rejected by cattle (*Curia*); but they have also a nauseous bitter taste. The plant when burnt affords a tolerably pure alkaline salt. Broom tops are diuretic and cathartic; the seeds are said to be emetic. The effects of this plant have been very long known to the common people; and both Mead and Cullen found them useful in dropsy. The usual mode of exhibiting them is in the form of decoction, made by boiling the green tops in water. Speaking of this decoction, of which two table spoonfuls were given every hour till it operated by stool, Cullen says, "it seldom fails to operate both by stool and urine, and by repeated exhibition every day, or every second day, some dropsies have been cured. (*Thompson's London Dispensatory*, 514.)

1338. *Genista*. *Gen*, signifies, in Celtic, a small bush, whence also *Génet*, French. The species are shrubs or undershrubs, some of them evergreen, and many with numerous flexible rush-like green twigs like the brooms. They are of easy culture and free flowerers. *G. tinctoria* is common in most parts of Europe, in unimproved pastures on dry gravelly soils. When cows feed on it, their milk, and the butter or cheese made from it, are said to be very bitter. A bright yellow color may be prepared from the flowers; and for wool that it is to be dyed green with woad, the dyers prefer it to all others. A dram and a half of the powdered seeds operates as a mild purgative. A decoction of the plant is sometimes diuretic, and therefore

History, Use, Propagation, Culture,

has proved serviceable in dropical cases. A salt prepared from the ashes is recommended in the same disorder.

*G. triquetra* is the handsomest hardy species: it is evergreen, and produces a vast profusion of bloom. 1539. *Lebeckia*. Named by Thunberg; possibly in honor of some forgotten botanist. Young cuttings root freely in sand under close cover.

1540. *Ulex*. A word of very obscure meaning. De Theis derives it from *ae*, a point in Celtic. *U. europæus, Jonc-marim*. Fr., is a beautiful evergreen shrub, which flowers freely, both when wild and cultivated, the greater part of the year. It abounds in some places, and there it is despised by the common people; but the greatest botanists have admired its deep green shoots and leaves, brilliant yellow flowers, and tufted picturesque shape. About Petersburg, it forms one of their most valuable greenhouse plants, flowering in winter. Linnæus lamented that he could hardly preserve it alive in a greenhouse. Many parts of Germany are wholly destitute of the furze bush, inasmuch that Dillenius was in a perfect extasy when he first saw our commons covered with its golden flowers. And Gerard relates, that about Dantzic, Brunswick, and in Poland, there was not a branch of it growing, except some few plants and seeds that he sent, which were most curiously kept in their fairest gardens. As an agricultural plant the furze has been sown in several parts of the island as hedges; but excepting where it occupies a breadth of ten or twelve feet on a raised mound, it does not last long, getting naked below. Sown on a mound the sides may be cut, and the prunings used as fuel or as green food, and the fence thus rendered close at bottom and durable. It is sown in fields, and

- 10170 Leaves lanceolate silky, Branches striated round, Racemes 1-sided  
 10171 Leaves lanceolate acute, Pedunc. axill. 3 longer than leaves, Cor. smooth, Branches striated round  
 10172 Leaves lanceolate blunt silky beneath, Pedunc. axillary as long as leaf, Cor. silky, Branches angular  
 10173 Leaves lanceolate complicate, Pedunc. axill. very short, Cor. hairy, Stem warted striated procumbent  
 10174 Leaves lanceolate smooth subulate, Pedunc. axillary, Cor. smooth, Branches 3-cornered procumbent  
 10175 Leaves lanceolate silky beneath, Fl. terminal somewhat racemose, Cor. silky, Branches erect round  
 10176 Spines simple or compound, Flowering branches unarmed, Leaves oblong smooth, Racemes leafy term.  
 10177 Spines warted compound, Fl. branches unarmed, Lvs. lanc. hairy, Racemes term. naked, Keel pubesc.  
 10178 Spines compound pungent, Leaves lanceolate villous, Racemes terminal subcapitate  
 10179 Stem leafless, Spines crossing each other  
 10180 Leaflets ternate obovate, Racemes short, Bracts linear under the flower

- 10181 Leaves simple linear filiform smooth, Flowers umbelled  
 10182 Leaves ternate silky, Leaves linear, Flowers racemose  
 10183 Leaves ternate villous, Raceme long terminal  
 10184 Leaves simple binate or ternate sessile lanceolate acute rough

- 10185 Teeth of cal. conniving, Bracts ovate loose  
 10186 Teeth of cal. distant, Bracts minute appressed

- 10187 Fl. solitary larger than leaflet, Lower leaves ternate lanceolate toothed at end, Branches spiny smooth  
 10188 Fl. twin axillary, Lower leaves ternate lanc. serrate, Branches spiny villous  
 10189 Fl. twin, Lower leaves ternate ellipt. serrate pubescent, Stem unarmed villous viscid  
 10190 Fl. solitary axill. Lower leaves ternate roundish serrate, Branches ascending spiny villous  
 10191 Fl. subsess. lateral, Leaves ternate obl. pubesc. Stipules lanc. tobletted, Cal. scarious longer than cor.  
 10192 Fl. sessile spiked, Bracts stipular ovate ventricose scarious imbricated  
 10193 Fl. subsess. lateral spiked, Leaves simple ovate blunt, Stipules dilated, Cal. larger than smooth corolla  
 10194 Fl. somewhat stalked axill. Lvs. simple obov. striated serrated, Stipules ovate toothed, Stem procumbent  
 10195 Pedunc. unarmed very short, Upper leaves simple, Stipules ovate lanc. entire  
 10196 Racemes straight, Leaves cuneiform, Pods nodding linear recurved  
 10197 Leaves ternate obovate, Pedunc. lateral 2-flowered  
 10198 Pedunc. unarmed 1-fl. Leaves ternate roundish crenate, Pods cernuous  
 10199 Pedunc. unarmed 1-fl. Leaves ternate cuneate, Stipules serrate, Stems prostrate  
 10200 Pedunc. 1-fl. awned, Leaves sessile ternate, Stipules sheathing toothed  
 10201 Pedunc. 1-fl. awned, Leaves tern. cuneate toothed at end villous viscid, Cal. larger than corolla  
 10202 Pedunc. 1-fl. awned length of leaves, Leaves simple oblong serrated viscid; lower ternate  
 10203 Pedunc. 2-fl. awned shorter than petiole, Leaves tern. oblong, Pods linear cernuous  
 10204 Pedunc. 1-fl. awned longer than leaf, Awns length of cor. Leaves ternate lanc. serrated at end  
 10225 Pedunc. 1-fl. awned longer than leaf, Leaves ternate viscid obl. toothed at end  
 10206 Pedunc. awned about 1-fl. Leaves all ternate channelled recurved wholly serrated

- 10207 Shrubby, Leaves tern. linear fleshy 3-toothed, Pedunc. 2-flowered  
 10208 Shrubby, Leaves tern. roundish wavy toothed viscid, Pedunc. 1-flower unarmed  
 10209 Shrubby, Leaves sessile ternate lanceolate serrated, Stipules sheathing, Pedunc. 3-flowered  
 10210 Shrubby, Leaves tern. ovate toothed, Cal. with 3 bracts, Pedunc. 3-flowered

- 10211 Herbaceous, Leaves quaternate-pinnate, Flowers lateral  
 10212 Herbaceous, Leaves pinnated unequal, Head double

and Miscellaneous Particulars.

allowed to grow three or four years, and then it is cut down for fuel or for heating ovens; but the most profitable application of furze, whether sown or grown wild, is that of using it as green food for cattle. For this purpose, the shoots should not be more than two years old, and they require to be passed between rollers to bruise the ligneous parts and the thorns. It has been tried in this way by a number of agriculturists, and found a highly nutritive food for horses, oxen, and kine. Though a hardy plant and enduring the sea breeze, yet it is frequently killed by severe winters. It is never found on wet-bottomed clays, but generally on dry rocky or stony soils. There is a very luxuriant variety called the Irish whin, and one with double flowers found a few years ago in Devonshire, and now in propagation by cuttings in the nurseries.

*U. nanus* greatly resembles the common species, but is smaller in all its parts. It flowers from August to January, which renders it valuable in shrubberies as a successor to the other.

1541. *Ononis*. From *ovis*, an ass, because asses only feed upon so prickly a plant. *O. spinosa*, *Arrêtée boeuf*, Fr., *Rest harrow*, Eng., was formerly very troublesome in corn fields, on account of its long ligneous roots obstructing the progress of the plough, and its thorny branches the harrow; but in all properly cultivated lands the plant has disappeared. It is frequent in aboriginal pastures on dry soils, and is eaten by cows, sheep, and goats, but not freely by horses. All the species are of easy culture, and the greenhouse kinds are readily increased by young cuttings under a bell-glass in sand.

1542. *Anthyllis*. From *anthes*, a flower, and *ουλας*, a beard. So called from the silky appearance of its heads of flowers; whence also one species is called *Barba Jovis*. *A. Vulneraria* is recommended as a herbage

History, Use, Propagation, Culture.

plant by some agricultural writers, as A. Young; and is by others confounded with Birdsfoot trefoil (*Lotus corniculata*, and major), and with the Liquorice-vetch (*Astragalus glycyphyllos*), to which, to a curious observer, it bears considerable resemblance. Linnaeus observes, that in Oeland, where the soil is a red calcareous clay, the flowers of *Anthyllis vulneraria* are red; but that in Gothland, where the soil is white, the flowers also are white: ours are yellow.

A. Barba Jovis is a silvery looking bush, with white and hairy leaves, pale yellow flowers, and woolly pods. Like most of the *Leguminosae*, this genus seeds freely; but in default of seeds, increase may be effected by young cuttings planted under a bell-glass in sand, which are not difficult to root; the glasses must be kept wiped, or the dew is apt to make them mouldy, which destroys them." (*Bot. Cult.* 135.)

1543. *Arachis*, *Aracos*, or *Araciana*, is a name applied by Pliny to a plant which had neither stem nor leaves, but was all root. The moderns have applied it to a plant, the fruit of which is borne underground. The specific name *hypogæa* (*ορα γη*, below ground), is in allusion to the curious circumstance of the pods, as they increase in size, forcing themselves into the earth, where they ripen their seeds, thence called earth-nuts. The plant is generally cultivated in the warmer parts of North and South America, but is supposed to be originally from Africa. In South Carolina the seeds are used as chocolate; in the eastern countries as almonds, and in Cochinchina they furnish an oil used for lamps, and as a substitute for oil of olives. About Paris it is raised on hotbeds and transplanted into the open garden, where it ripens its seeds, which are used as other legumes. It has also been brought to maturity in a stove in England, and proved very prolific. (See *Hort. Trans.* vol. v. p. 372.)

1544. *Lupinus*. Said to be derived from *lupus*, a wolf, because this plant devours, as it were, all the fertility

- 10213 Herbaceous, Leaves pinnated equal, Head terminal 1-sided, Flowers oblique
- 10214 Herbaceous, Leaves pinnated equal silky, Spike peduncled ovate
- 10215 Herbaceous, Leaves pinnated unequal, Head solitary stalked, Pods hooked blunt shorter than calyx
- 10216 Herbaceous, Cauline leaves ternate : radical pinnate unequal trifid or simple
- 10217 Herbaceous, Leaves pinnated unequal, Pedunc. lateral longer than leaf, Heads leafless
- 10218 Shrubby, Leaves pinnated equal silky, Bractes as long as globose many-flowered head
- 10219 Shrubby, Leaves pinnated equal and ternate villous, Flowers spiked
- 10220 Shrubby, Leaves pinnated : floral ternate
- 10221 Shrubby, Leaves ternate unequal, Calyxes woolly lateral
- 10222 Shrubby, Leaves ternate linear-cuneate somewhat stalked, Calyxes campanulate, Branches spiny
- 10223 Shrubby, Petioles spiny, Leaves pinnated, Flowers axillary subsessile, Cal. inflated
- 10224 Shrubby spiny, Leaves simple

10225 Leaves in fours cuneate rounded, Stipules undivided, Stem nearly smooth

- 10226 Cal. altern. without appendage : upper lip emarginate ; lower entire
- 10227 Cal. whorled without appendage : lower lip entire, Stem and leaves hairy
- 10228 Cal. altern. without appendage : upper lip entire ; lower 3-toothed
- 10229 Cal. altern. with an appendage : upper lip entire ; lower 3-toothed
- 10230 Cal. half-whorled with an appendage : upper lip bifid ; lower about 3-toothed
- 10231 Cal. altern. with an appendage : upper lip 2-parted ; lower 3-toothed
- 10232 Leaves digitate, Cal. whorled without append. Upper lip emarg. ; lower bifid, Pods 2-seeded
- 10233 Cal. altern. with an appendage : upper lip half-bifid ; lower obscurely 3-toothed
- 10234 Cal. whorled with an appendage : upper lip 2-parted ; lower entire
- 10235 Cal. altern. with an appendage : upper lip 2-fid ; lower entire, Leaflets linear-lanceolate flat
- 10236 Cal. altern. with an appendage : upper lip 2-fid ; lower subtrifid, Leaflets linear channelled
- 10237 Cal. whorled with an appendage : upper lip 2-parted ; lower 3-toothed
- 10238 Cal. half-whorled with an appendage : upper lip 2-fid ; lower undivided, Leaves simple obl. villous
- 10239 Shrubby, Cal. whorled without appendage stalked : lips acute entire

10240 Teeth of calyx 4 blunt, one acuminate

β Leaflets emarginate, Calyxes hoary

- 10241 Smoothish, Leaves on short stalks blunt at each end, Spikes solitary short, Pods 1-seeded
- 10242 Leaves on short stalks without a point obtuse smooth, Spikes long paniced downy
- 10243 Hoary, Leaflets subsessile ovate-elliptical acute mucronate, Spikes paniced hoary
- 10244 Said to be the same as *A. microphylla*
- 10245 Ferruginous, Spikes simple clustered, Leaflets ovate-lanceolate downy mucronate

10246 The only species

- 10247 Raceme solitary shorter than leaves, Pedunc. 2, Bractes less than cal. spreading, Pods pendulous
- 10248 Raceme solitary length of leaves, Pedunc. 2, Bractes less than cal. appressed, Pods pendulous
- 10249 Pods scymetar-shaped somewhat lunate smooth
- 10250 Vexillum of flowers revolute, Calyxes whole colored
- 10251 Peduncles subcapitate, Seeds 4-cornered cylindrical powdery
- 10252 Peduncles thicker than petiole capitate, Wings subfalcate deformed, Pods linear straight
- 10253 Flowers capitate, Cal. bracteate, Vexill. short, Wings expanded very large, Leaflets deitoid oblong

and Miscellaneous Particulars.

of the soil : but this is a very doubtful explanation. The species are border flowers, in much esteem for their velvet-like leaves and fine large flowers. They are vigorous growing plants, and most of them would afford the agriculturist a considerable bulk of herbage.

*L. albus* is supposed to be the species that was cultivated for this purpose by the Romans ; though *L. luteus* is what is at present grown in the fields in the south of Italy as human food. In the south of France, it is grown in poor dry extensive plains, as a meliorating crop to be ploughed in where no manure is to be had, and the ground is too sterile for clover or other better plants. (*Villars.*) The perennial and ligneous species may be increased by pieces of the root, but they all seed freely.

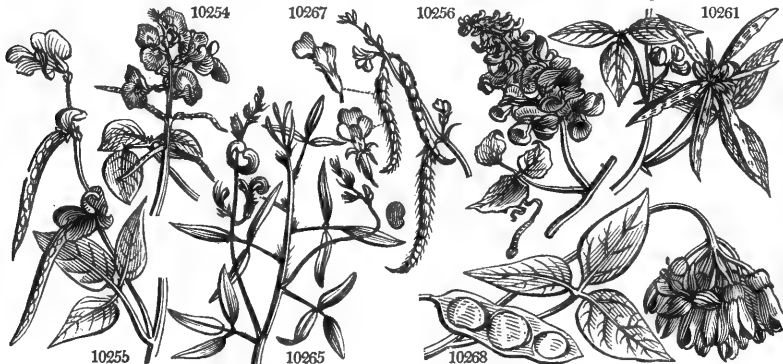

1545. *Amorpha*. From α, privative, and μορφη, form, in allusion to the deformity of the corolla, which has neither ale or carina. *A. fruticosa* was once used in Carolina as an indigo plant, but is now neglected. All the species are of easy cultivation, and increase by seeds or cuttings in sand.

1546. *Abrus*. From αβρος, elegant. The roots are used in the West Indies similarly to those of our liquorice, and the seeds are strung and worn as beads for ornaments, and also as rosaries, whence the specific name *precatorius*. They are frequently thrown, with other West Indian seeds, on the north-west coast of Scotland. *Linneus* affirms, that they are very deleterious ; but they are eaten in Egypt, though the hardest and most indigestible of the pulse tribe. In our stoves the plant requires a good deal of room and heat in order to flower freely. It is generally raised from seed, but cuttings will root in sand plunged in heat.

1547. *Phaseolus*. From φασέλιος, a little boat, which the pods may easily be supposed to resemble. *P. vulgaris* and multiflorus, *Haricot*, Fr., *Schminkbohne*, Ger., *Fagiolata*, Ital., are well known culinary legumes. The dwarf kidney bean is earlier than the other, and better adapted for forcing ; but much the largest crop

History, Use, Propagation, Culture,

is produced by the twining species. Neither sorts can be safely planted in the open air before the end of April, or first week of May, and the leaves are blackened by the first frosts of autumn. But in a stove or pit, green pods of the dwarf kinds may be gathered all the winter, and with this advantage over forced productions of the fruit kind required to be ripened, that the pods are as good from plants in the stove in midwinter, as from those in the open garden in midsummer. The garden culture of both species is so easy and universally known, that we shall not occupy ourselves with details. Though in this country the green pods only are used, on the continent the ripened seeds are as much the object of culture. In Holland, the twiner is grown in every cottage garden for both purposes; and in France and Switzerland, it is grown chiefly for the ripened seeds: in the latter countries it grows on very poor dry soil. On the first blackening of the leaves with frost, the plants are pulled up, dried like tobacco leaves under the dripping eaves of the houses; and in winter threshed out for the seeds, to be boiled and eaten with cream or butter, stewed in haricots, or put in soups. According to the analysis of Einhoff, 3840 parts of kidney bean afforded 1805 parts of matter analogous to starch, 857 of vegeto-animal matter, and 799 parts of mucilage: from which is to be inferred, that it is the most nourishing of all the legumes.

The perennial stove species thrive best in a light rich soil, and may be propagated readily from cuttings or from seed. *P. caracalla*, or Snail-flower, is a very curious species, and will grow and flower freely, if kept clear from the red spiders. This species was so named by the Portuguese, who first brought it from South America, in consequence of its hooded flower. *Caracalla* (from the Celtic words *car*, a head, and *cal*, a covering) was the name of a hooded dress much worn by the Gauls, and gave his nickname to the Emperor Marcus Aurelius Antoninus, who was accustomed to wear the dress.

- 10254 Flowers spiked, Cal. without bractes, Wings expanded larger, Leaflets ovate  
 10255 Flowers loosely spiked, Wings the length of vexillum  
 10256 Vexillum and keel spirally twisted together  
 10257 Stem hairy, Lateral leaflets 3-lobed : terminal 5-parted, Segm. lanceol. Peduncles 3-f. shorter than petiole  
 10258 Stem smooth, Lateral leaf. 2-lobed ; terminal 3-lobed : segments ovate, Pedunc. 3-f. longer than petiole  
 10259 Stem smooth, Leaf. blunt : lateral sinuose ; terminal hastate 3-lobed, Peduncles longer than leaf spiked  
 10260 Stem smooth, Bractes larger than calyx, Pods pendulous compressed rugose  
 10261 Stem round, Flowers capitate, Pods cylindrical horizontal  
 10262 Stem angular hispid, Pods pendulous hairy  
 10263 Stem flexuose round hairy, Pods capitate hairy  
 10264 Downy, Lower leaves rhomboid oval : upper 3-lobed, Heads on long stalks, Pods round subulate  
  
 10265 Leaflets oblong acuminate, Peduncles elongated, Pods round subulate  
 10266 Leaflets about 3-lobed, Lobes acuminate, Racemes axillary  
  
 10267 Leaflets ovate-lanceolate downy  
  
 10268 Leaflets ternate smooth, Flowers in heads, Calyxes hairy campanulate  
 10269 Flowers imbricated  
  
 10270 Pods ovate acinaciform, Seeds ovate with a hilum curved towards one end  
 10271 Pods pendulous cylindrical torulose, Peduncles erect many-flowered  
 10272 Pods capitate many cylindrical, Seeds rounded  
 10273 Pods capitate subcylindrical with a recurved concave end  
 10274 Pods capitate few cylindrical with a mucronate straight point  
 10275 Pods racemose ensiform with 3 keels at back straight at point, Seeds with an arillus  
 10276 Pods membranous quadrangular  
 10277 Pods subcylindrical smooth very long  
 10278 Pods racemose compressed hairy, Outer leaflets 2-lobed  
 10279 Pods subracemose linear hairy, Leaflets ovate-lanceolate downy  
 10280 Pods racemose compressed 4-seeded, Leaflets rhomboid  
 10281 Pods racemose acinaciform 4-seeded, Leaflets rhomboid smooth  
 10282 Leaves ovate downy, Flowers solitary, Seeds 2-horned  
 10283 Leaves ovate acute rugose netted villous, Racemes few-flowered  
 10284 Leaves smooth toothed with many angles  
 10285 Stem smooth, Petioles downy, Wings of corolla spreading  
 10286 Peduncles capitate, Pods straight linear  
 10287 Flowers somewhat spiked, Pods subcylindrical smooth, Leaves roundish rhomboid blunt entire smooth  
 10288 Pods acinaciform with 3 keels  
 10289 Racemes axillary erect, Pods pendulous hispid about 2-seeded  
 10290 Pods twin linear nearly erect  
 10291 Stem smooth, Peduncles 2-flowered, Outer leaflets somewhat angular  
 10292 Stem creeping, Leaflets roundish shining, Fl. racemose, Pods with 3 keels at back  
  
 10293 Pods racemose hairy equal, Seeds surrounded by the hilum, Leaves smooth on each side  
 10294 Pods racemose with transverse lamellæ hairy, Seeds surrounded by the hilum  
 10295 Pods racemose : valves keeled hairy, Peduncles in threes

and Miscellaneous Particulars.

1548. *Teramnus*. So called by Browne, apparently in allusion to its delicately-shaped legume, *τεραμνότης* being used particularly to express the tenderness of eatable pulse ; *ατεραμνότης* was a weed hostile to leguminous plants.

1549. *Carpopogon*. From *καρπος*, fruit, and *πυγών*, a beard ; the pods being bearded. Rapid growing climbers of the easiest culture.

1550. *Dolichos*. A name under which Dioscorides describes a plant supposed to have been the kidney bean of the moderns. The species are climbers, some of them to the height of the highest trees. The pods of most of them are eatable, but far inferior to the kidney bean. Some of them have tuberous roots which may be eaten. The seeds of *D. Soja* (*Soja*, Jap.), which are usually called *Miso* in Japan, are put into soups, and are the most common dish there, inasmuch that the Japonese frequently eat them three times a day. The *Soja* of the Japanese, which is preferred to the Kitjap of the Chinese, is prepared from these seeds, and is used in almost all their dishes instead of common salt. The Chinese also have a favorite dish made of these seeds, called *Tau hu* or *Tau hu*, which looks like curd, and though insipid in itself, yet with proper seasoning is agreeable and wholesome. (*Thunb.* and *Loureiro*.)

The perennial kinds are easily increased by cuttings, and all the species seed freely. *D. purpureus* and *ligulosus* have the handsomest flowers, but none of them can be considered of much beauty.

1551. *Stizolobium*. From *στίζω*, to prick, and *λοβός*, a pod. *S. urens* and *pruriens* produce on the outside of their pods the irritating substance used in medicine as a vermifuge, under the name of Cowhage. The species are twining shrubs of the West Indies, with long bunches of yellow scentless flowers. The seeds of *S. urens* are often seen in cabinets of curiosities : many qualities are attributed to them by the superstitious Creoles. The French settlers call them *Yeux bourrique*, asses' eyes. *S. pruriens* is considered a powerful diuretic.

History, Use, Propagation, Culture,

1552. *Glycine.* From γλυκύς, sweet. *G. monica* perfects its seeds under ground like *Arachis hypogæa*, *Trifolium subterraneum*, and *Lathyrus subterraneus*. They are all of easy culture, like their preceding and following allies. *G. frutescens*, and especially *G. sinensis*, are most beautiful hardy climbing shrubs, with long pendulous branches of blue flowers, like the *Laburnum*.

1553. *Kennedia.* Named after Mr. Kennedy, a nurseryman of celebrity in the vicinity of London. Handsome conservatory climbers of the easiest culture.

1554. *Cylista.* From κύλις, a calyx, that of the species so called being very large.

1555. *Galactia.* From γάλα, milk; the plant is milky in all its parts. A pretty flowering climber of easy culture in the soil indicated, and increased by cuttings in sand under a bell-glass.

1556. *Clitoria.* A name derived from an anatomical term, a resemblance to the subject of which has been fancied to exist in the flower. *C. Ternatea* was first brought to Europe from Ternate, one of the Molucca islands, which induced Tournefort to adopt *Ternatea* as a generic appellation, and it was continued by Linnaeus as a specific one.

- 10296 Leaves ternate ovate smooth, Racemes filiform about 3-fl. Flowers apetalous, Pods oblong 2-seeded  
 10297 Leaves ternate ovate smooth, Stem hairy, Racemes pendulous, Fls. of stem with cor. of root apetalous  
 10298 Leaves ternate, Leaflets linear lanceolate silky, Fl. axillary solitary, Pods 2-seeded  
 10299 Leaves ternate, Leaf. oval hairy beneath, Pods subsolitary linear many-seeded, Style persistent straight  
 10300 Leaves ternate hairy, Racemes lateral  
 10301 Leaves ternate tomentose, Racemes axillary very short, Pods 2-seeded  
 10302 Downy, Leaves simple reniform rounded rugose netted, Racemes few-flowered  
 10303 Leaves ternate ovate acute hairy viscid, Peduncles jointed 1-2-fl. Pods oblong  
 10304 Leaves tern. ovate rhomboid pubesc. beneath netted tomentose, Racemes axillary, Pods subpubescent  
 10305 Leaves ternate ovate rhomboid beneath dotted with resin, Racemes longer than leaf  
 10306 Leaves ternate, Flowers racemose, Pods tumid villous  
 10307 Leaves ternate ovate somewhat hairy, Racemes axillary, Pods linear hooked at end  
 10308 Leaves simple sagittate, Petioles winged, Stem twining shrubby  
 10309 Leaves tern. roundish rhomboid smooth beneath dotted with resin, Racemes 1-sided longer than leaf  
 10310 Leaves pinnate, Leaflets 5 oblong apiculate, Flowers 3 axillary  
 10311 Leaves ternate villous beneath, Racemes terminal  
 10312 Leaves pinnated, Leaflets 11 ovate lanceolate silky, Raceme terminal nodding lax many-flowered  
 10313 Root tuberous, Lvs. pinn. Leaf. 5-7 ov. lanc. narrowed towards the end, Spikes dense shorter than leaves  
 10314 Leaves pinnated, Leaflets 9 ovate downy, Racemes dense terminal with bractea, Pods coriaceous
- 10315 Leaves ternate, Leaflets ovate, Pedunc. about 3-fl. Pods very hairy  
 10316 Leaves ternate, Leaflets obovate, Flowers capitate, Pods smoothish  
 10317 Leaves ternate, Leaflets obovate villous, Pedunc. 1-2-fl. Keel longer than obl. wings, Stem prostrate  
 10318 Leaves ternate, Leaflets ovate retuse netted, Racemes erect many-flowered  
 10319 Leaves simple smooth netted subcordate at base, Flowers racemose  
 10320 Leaves simple ovate, Racemes axillary few-flowered

- 10321 Cal. membranous, Upper segment bifid  
 10322 Down rusty, Cal. half 5-fid, Bractes ovate acuminate, Cor. larger than cal.  
 10323 Cal. scarious, Upper segment emarginate

- 10324 Leaves ternate, Raceme erect, Flowers pendulous

- 10325 Leaves quinate pinnate, Peduncles axillary 1-flowered  
 10326 Leaves pinnate, Leaflets 5 round lanceolate or linear  
 10327 Leaves ternate, Calyxes solitary campanulate  
 10328 Leaves ternate, Calyxes twin campanulate  
 10329 Leaves ternate, Calyxes cylindrical  
 10330 Leaves ternate, Peduncles many-flowered, Ovary downy, Style villous  
 10331 Leaves ternate, Leaflets ovate-oblong acuminate, Cal. campanulate shorter than ovate bractes  
 10332 Leaves ternate, Leaflets mucronate glaucous beneath hairy, Cal. cylind. much larger than bractes

- 10333 Leaves conjugate subsessile, Stipules toothed  
 10334 Leaves pinnate in 4 or 5 pairs obl. glaucous beneath, Stipules half sagittate toothed at base  
 10335 Leaves of 2 pairs linear subulate approximating, Stip. half-sagittate subulate 1-toothed at base  
 10336 Leaves pinnate in 3 pairs ovate acuminate, Stipules half-sagittate entire, Stem simple  
 10337 Leaves pinnate in 3 or 4 pairs lanceolate, Stipules half-sagittate entire, Stem winged  
 10338 Leaves of 2 pairs linear-subulate downy, Stip. half-sagittate subulate nearly entire, Stem simple downy  
 10339 Stem branched, Leaves in 2 pairs linear, Stipules half sagittate subulate  
 10340 Leaves in 2 pairs ensiform stalked, Stipules simple, Stem simple  
 10341 Leaves in 4 pairs lin. lanc. Stipules half-sagittate entire, Stem winged branched upwards  
 10342 Leaves of 2 pairs lin-lanc. mucronate stalked nerved, Stipules half-sagittate toothed at base  
 10343 Leaves conjugate stalked, Stipules entire, Plant covered with long hairs

and Miscellaneous Particulars.

1557. *Orobis*. From *œsa*, to excite, and *βωc*, an ox; that is to say, a food nourishing to cattle. Handsome plants, and free flowerers. *O. luteus* Haller considers as one of the handsomest of the papilionaceous tribe. *O. tuberosus*, according to Lightfoot, is in great esteem among the Highlanders of Scotland for the tubercles of the root; they dry and chew them in general to give a better relish to their liquor; they also affirm them to be good against most disorders of the thorax, and that by the use of them they are enabled to repel hunger and thirst for a long time. In Breadalbane and Ross-shire, they sometimes bruise and steep them in water, and make an agreeable fermented liquor with them. They have a sweet taste, something like the roots of liquorice, and when boiled are well flavored and nutritive, and in times of scarcity have served as a substitute for bread. (*Lightfoot*.)

Boiled well, a fork will pass through them, and dried slightly and roasted, they are served up in Holland and Flanders in the manner of chestnuts, which they resemble in flavor. Dickson (*Hort. Trans.* ii. 359.) recommends cultivating them in a bed or border of light rich soil, paved at the depth of twenty inches, to prevent their roots from running down. Plant the tubers six inches apart, and three inches below the surface;

History, Use, Propagation, Culture,

the second year some will be fit to gather, and by taking only the largest, the bed will continue productive for several years, adding some fresh compost every year.

1558. *Lathyrus.* A name employed by Theophrastus to designate a leguminous plant. It is said by his commentator Bodæus a Stapel, to have been derived from *λαε*, an augmentative particle, and *βωπος*, any thing which is exciting; and to have been applied to this plant in consequence of certain aphrodisiacal qualities ascribed to it. *L. sativus*, *Gessæ*, Fr., is frequently sown in Switzerland for soiling horses. In several parts of the continent, a white light pleasant bread is made from the flour of this pulse, but it produced such dreadful effects in the last century, that the use of it was forbid by an edict of George, Duke of Wurttemberg, in 1671; and this not being observed, was enforced by two other edicts under his successor Leopold, in 1705, and 1714.

Mixed with wheat flour in half the quantity, it makes a very good bread, that appears to be harmless. But bread made with this flour only has brought on a most surprising rigidity of the limbs in those who have used it for a continuance; inasmuch that the exterior muscles could not by any means be reduced, or have their natural action restored. These symptoms usually appeared on a sudden, without any previous pain; but sometimes they were preceded by a weakness and disagreeable sensation about the knees. Baths, both hot and cold, fomentations and ointments of various kinds have been tried without effect; inasmuch that it is regarded as incurable, and being neither very painful nor fatal, those who are seized with it usually submit to it with patience.

Swine fattened with this meal lost the use of their limbs, but grew very fat lying on the ground. A horse fed some months on the dried herb, was said to have his legs perfectly rigid. Kine are reported to grow lean on it, but sheep not to be affected. Pigeons, especially young ones, lose the power of walking by feeding on the seed. Poultry will not readily touch it, but geese eat it without any apparent damage. In some parts of Switzerland, cattle feed on the herb without any harm. It would be worth enquiring, therefore, whether the soil may not contribute something to the ill qualities of the plant; and it is remarked that the seed from a strong, fat, moist soil, is much more deleterious than from a light dry one. (*Duvernoy.*)

Fabroni, from Florence, in 1786, says, that the government there has cautioned the peasants against the

- 10380 Petioles round, Stipules rounded below crenate, Peduncles many-flowered

and Miscellaneous Particulars.

use of *Lathyrus sativus*; swine having lost the use of their limbs, and become pitiable monsters by being fed on this pulse exclusively. The peasants, however, eat it boiled, or mixed with wheat flour, in the quantity of one-fourth, without any harm.

The poisonous *Lathyrus* from Barbary, is *L. semine punctato* of Casp. Bauhin, and seems to be only a variety; for in the crops of *L. sativus* in Italy, they find black seeds striped with white, as in the African seed. Fabroni suspects it to be a male between *L. sativus* and *Cicera*, for the flower and seed partake of the characters of both; having a black seed marked with white; and a white banner with a red keel to the corolla. (*Fabroni's Letters* in MSS. Banks.)

*L. odoratus* is one of our most esteemed border annuals, and is extensively grown in pots for decorating chambers and windows. *L. tingitanus*, *articulatus*, and *annuus* are also sown as border annuals.

*L. tuberosus* produces tubers on the roots, like those of the earth nut (*Bunium bulbocastanum*); these are sold in the markets of Holland, like those of *Orobus tuberosus* and *Trapa natans*, and their flavor is highly esteemed.

*L. latifolius* is a very showy plant for shrubberies, arbors, and trellis work, and yields a great quantity both of green fodder and seeds, which some botanists have suggested might be applied to agricultural purposes.

1559. *Ochrus*; *oxces*, yellow, in allusion to the color of its flowers. A small annual plant with yellow flowers, native of hedges in the south of Europe.

1560. *Pisum*. From the Celtic *pis*, a pea. *P. sativum*, *Pois*, Fr., *Erbs*, Ger., and *Pisello*, Ital., is the most valuable of culinary legumes. Like most domestic plants of great antiquity, its native country is unknown, though it is commonly referred to the south of Europe. The varieties of the pea are numerous, and differ widely among themselves from the early frame, a low plant bearing only one white blossom on each footstalk, to the crown-bearing, having pink blossoms on a terminating corymb. The rouncival grows ten or twelve feet high, and the imperial not two feet. The sugar-pea has pods in which the inner film is wanting, or much less tough than usual, which admits of boiling the pods entire, and eating them in the same manner as kidney beans.

In the open garden, the pea is sown at intervals from January to the middle of July, and a succession of

History, Use, Propagation, Culture.

crops is thus obtained from the end of May to the beginning of November. By raising in hotbeds and transplanting, the first crop may be gathered in the beginning of May; and by raising and maturing in pits, pease may be gathered in April. The pea, however, does not force well, and requires extraordinary attention to giving air, otherwise the blossoms will not set. The culture of the pea is known to every countryman.

The grey pea, cultivated in agriculture, is by some considered as a species, though it is obviously a mere variety, not further removed from the frame pea than is the blue Prussian, or the crown pea. A dry soil and season is essential for a good crop, unless the plants can be supported by sticks like the garden crops. The seed is chiefly used for feeding pigs, and splitting for soup. In boiling split pease, some samples, without reference to variety, fall or moulder down freely into pulp, while others continue to maintain their form. The former are called boilers. This property of boiling depends on the soil; stiff land, or sandy land that has been limed or marled, uniformly produces pease that will not melt in boiling, no matter what the variety may be. Pease straw cut green and dried, is reckoned as nourishing as hay, and is considered as excellent for sheep. The produce of pease in flour is as three to two of the bulk in grain, and husked and split for soups as four to two. A thousand parts of pea flour afforded Sir H. Davy 57 1/2 parts of nutritive or soluble matter; viz. 501 of mucilage, or vegetable animal matter, 22 of sugar, 35 of gluten, and 16 of extract, or matter rendered insoluble during the operation.

*P. maritimum* has seeds of a bitterish disagreeable taste, but are reported nevertheless to have been eaten in times of scarcity. (Turner's Herbal.)

1561. *Vicia*. From *gwig*, Celtic; whence *vicino*, Greek, *vicia*, Latin, *vesce*, French, *vetch*, English, &c. *V. sylvatica* and *cracca*, where they occur in meadows, are considered valuable herbage plants. They yield great bulk of fodder, which is allowed to be very nutritive. Some have proposed to cultivate them alone, but Curtis observes, they would probably in that case choke themselves for want of support.

*V. sativa*, the winter and summer tare, fetch or vetch, is a valuable agricultural plant. Some consider the winter variety as a distinct species; but Professor Martyn proved, by cultivating both, that they were not

 10392 Peduncles many-fl. Petioles sulate 12-leaved, Leaflets lanc. smooth, Stip. half-sagittate stalked  
 10393 Peduncles many-fl. Leaflets obl. Stipules entire, Pods villous ovate oblong  
 10394 Peduncles many-fl. Leaves entire, Stipules entire, Pods nearly erect  
 10395 Peduncles many-fl. long, Upper leaves subcirrhous, Stipules half-sagittate entire, Leaf. oval-obl. hoary  
 10396 Peduncles many-fl. long, Leaves not cirrhous, Leaf. obl. lanc. silky beneath, Stip. lanceol. entire  
 10397 Peduncles many-fl. shorter than leaf which is not cirrhous, Leaflets obovate emarginate, Stip. oblong  
 10398 Peduncles 2-flowered awned shorter than leaf, Leaflets linear narrowed at each end, Stip. half-sagittate  
 10399 Pods subsessile solitary, Leaflets ovate, Stipules marked 4-toothed  
 10400 Pods sessile sub-binate, Leaflets obl. ovate truncate mucronate, Stipules toothed marked

- 10401 Pods sessile sub-binate spreading, Lower leaflets ovate emarginate : upper lin. entire, Seeds globose  
 10402 Pods sessile : lower subterranean, Leaflets linear truncate, Stipules half-sagittate  
 10403 Pods sessile solitary erect smooth, Leaflets 6 : lower subcordate  
 10404 Pods sessile solitary reflexed hairy, Stems diffuse, Stipules colored, Standard smooth  
 10405 Pods sessile solitary reflexed hairy 5-seeded, Standard villous  
 10406 Pods stalked reflexed, Standard silky, Stipules lanceolate marked, Upper leaflets obl. elliptical acute  
 10407 Pods sessile solitary reflexed smooth, Stems nearly erect, Leaves quite smooth  
 10408 Pods sessile solitary reflexed downy, Leaflets linear blunt, Stipules half-sagittate entire  
 10409 Pedunc. 1-fl. in fruit longer than leaf and awned, Leaflets linear blunt mucronate, Stipules multifid  
 10410 Pods stalked about 3, and the standard hairy, Stipules lanceolate marked  
 10411 Pods subsessile twin reflexed smooth, Leaflets obl. ovate retuse, Stipules marked  
 10412 Pedunc. 1-fl. very short, Leaf. lin. lanc. truncate, Stipules lanc. undivided, Pods finely downy  
 10413 Pods subsessile pendulous smooth 4-seeded, Leaflets linear emarginate  
 10414 Pedunc. 1-fl. awned, Leaflets lanceolate blunt, Stipules bifid  
 10415 Pods stalked about 4 erect, Leaflets ovate entire  
 10416 Pods stalked solitary erect, Leaflets 4 oval-lanceolate, Stipules to thed  
 10417 Pods subsessile solitary compressed somewhat inflated, Leaflets oate toothed at end, Stip. cil. toothed  
 10418 Pods subsessile subternate compressed, Leaflets ovate entire, Stipules ciliate toothed at base  
 10419 Pods subsessile subternate, Leaves and stipules serrate  
 10420 Pods subsess. subtern. torulose, Leaflets ovate entire, Petioles not cirrhous, Stip. sagittate toothed at base

and Miscellaneous Particulars.

even very distinct varieties. The winter variety is sown in September and October, and the summer at different periods, from February to June, for successional cuttings. The soil requires to be in a good heart, otherwise they will produce but a poor crop of herbage: on a good soil they will yield ten or twelve tons, which is found excellent for milch cows and working stock. The crop is seldom left to ripen its seeds, but when seeds are wanted; the only use made of them being for sowing or feeding pigeons.

*V. narbonensis* and *serratifolia* are cultivated in Germany in the same manner as our tare. *Vicia sepium* has been recommended to be sown among clover for mowing.

*V. Faba* is a well known legume both of the garden and the field. The garden varieties are numerous; the earliest is a small seeded variety, the Mazagan, and the largest the Windsor. Beans are planted at the various times in which pease are sown; but the late sowings of this plant do not answer so well as those of the pea. When the ground is properly pulverised and in good heart, they succeed well when transplanted; and where a first crop is injured by insects, if the stems are cut down to the ground during their flowering season, they will send up a succession of shoots, which will bear a crop. In this way, according to some, the bean may be rendered perennial, as it is certain the scarlet kidney bean may by merely protecting the roots from the frost.

The field bean, of which there is a larger and smaller sort. the latter called *ticks*, is sown in drills by a machine, so as to admit of horse hoeing, and otherwise ploughing or stirring between the rows. By this means a larger crop is produced, and the land cleaned and brought into a better state for a succeeding corn crop. Beans are excellent food for hard working horses, and for fattening hogs for bacon. The flower of beans and pease is more nutritive than that of oats, but less easy of digestion. A bushel of beans is supposed to yield fourteen pounds more of flour than a bushel of oats, and a bushel of pease eighteen pounds more, or, according to some, twenty pounds. A thousand parts of bean flour were found, by Sir H. Davey, to yield 570 parts of nutritive matter, of which 426 were mucilage or starch, 103 gluten, and 41 extract, or matter rendered insoluble during the process.

History, Use, Propagation, Culture,

1562. *Ervum*. From *erv*, tilled land, in Celtic; to which this plant is a pest. *E. lens* (from *lentil*, Celtic), *Lentille*, Fr., *Lentze*, Ger., and *Lenticia*, Ital., is a legume of the greatest antiquity, being in esteem in Esau's time, and much prized in eastern countries ever since. In Egypt and Syria they are parched in a frying-pan and sold in the shops, and considered by the natives as the best food for those who undertake long journeys. There are three varieties of lentils cultivated in France and Germany; the small brown, which is the lightest flavored, and the best for haricots and soups; the yellowish, which is little larger, and the next best; and the lentil of Provence, which is almost as large as a pea, with luxuriant straw, and more fit to be cultivated as a tare, than for the grain as human food. A dry warm sandy soil is requisite for the lentil; it is sown rather later than the pea, at the rate of a bushel, or one and a half bushel, to the acre; in other respects its culture and harvesting are the same, and it ripens sooner. The produce of the lentil in grain is about a fourth less than that of the tare; and in straw it is not a third as much, the plants seldom growing above one and a half foot high. The straw is, however, very delicate and nourishing, and preferred for lambs and calves; and the grain, on the continent, sells at nearly double the price of pease. Einhoff obtained from 3840 parts of lentils, 1260 parts of starch, and 1433 of a matter analogous to animal matter.

1563. *Ervilia*. A word with the same meaning as *Ervum*. See that word.

1564. *Cicer*. All authors agree in deriving the name from *cicus*, force; on account of the eminent qualities the ancients attributed to it. It grows naturally in the South of Europe, and is cultivated there for the same purposes as the lentil, but it is too delicate for field culture in this country. It is called *Arietinum*, because the young seed bears a very curious resemblance to a ram's head.

1565. *Liparia*. From *liparag*, brilliant, in allusion to the surface of the leaves. "The species," Sweet observes, "thrive very well in a mixture of loam and peat, and do not require so much water as some other genera of the order. *L. villosa*, *vestita*, *sericea*, and some others, if they get too much water over their leaves

- 10421 Pedunc. 2-fl. Seeds compressed, Leaflets entire  
 10422 Pedunc. about 2-fl. Pods smooth 4-seeded, Leaflets oblong truncate  
 10423 Pedunc. many-fl. Pods hairy 2-seeded, Leaflets lin. blunt  
 10424 Pedunc. 2-fl. awned, Pods smooth 2-seeded, Leaflets lin. lanceolate downy
- 10425 Pedunc. awned shorter than leaf, Leaflets obl. truncate smooth, Stipules hastate
- 10426 Pedunc. 1-fl. Seeds globose gibbous, Leaflets serrated
- 10427 Flowers capitate, Leaves lanceolate nerved smooth  
 10428 Flowers capitate: head erect, Leaves lanceolate smooth  
 10429 Flowers capitate, Leaves lanceolate downy  
 10430 Flowers capitate, Leaves ovate concave woolly beneath  
 10431 Flowers spiked hairy, Leaves lanceolate, and angular stem smooth  
 10432 Flowers fasciated, Leaves ovate villous downy  
 10433 Flowers racemose, Leaves obovate oblong smooth, Stem hairy  
 10434 Flowers somewhat spiked, Leaves ovate villous downy
- 10435 Racemes simple pendulous, Leaflets ovate oblong, Pods hairy  
 10436 Racemes simple pendulous, Leaflets ovate oblong rounded at base, Pods quite smooth  
 10437 Racemes lateral erect, Branches round spreading, Leaflets ovate downy  
 10438 Racemes terminal erect, Calyxes hairy: teeth minute, Leaflets ellipt. hairy  
 10439 Racemes terminal erect, Calyxes villous: segments falcate, Leaf. obovate oblong  
 10440 Racemes terminal erect, Calyxes and pods viscid, Leaflets oblong  
 10441 Racemes erect, Calyx with a triple bractea, Floral leaves sessile  
 10442 Racemes terminal l-sided, Leaves pinnated hoary, Leaflets rounded elliptical  
 10443 Racemes axillary erect, Leaflets sublanceolate downy: the middle one in a long stalk  
 10444 Raceme term. 1-sided 4-fl. Leaflets obovate downy beneath, Calyxes deeply 3-parted  
 10445 Pedunc. aggregate subterminal, Calyxes hairy trifid, Leaflets obov. mucronate hairy beneath  
 10446 Flowers capitate, Branches straight round villous, Leaflets ovate ellipt. villous, Bract linear  
 10447 Fl. in term. umbels, Stems erect, Leaflets lanc. strigose pubescent  
 10448 Fl. umbelled term. Stems erect, Leaflets ellipt. smooth acute  
 10449 Fl. axillary solitary stalked, Stems procumbent, Leaflets obovate, Pods linear repand
- 10450 Fl. stalked sub-binate axillary, Stem decumbent, Leaflets obovate blunt  
 10451 Pedunc. sub-binate axillary, Stems diffuse-erect, Leaflets oblong lanceolate  
 10452 Flowers stalked lateral about 3 erect, Stem declinate branched, Leaflets obovate mucronate  
 10453 Flowers stalked axillary about 3, Calyxes campanulate, Leaflets obovate blunt hairy  
 10454 Flowers stalked lateral about 4, Stem erect, Branches long, Cal. tubular, Leaflets obovate  
 10455 Racemes term. erect, Leaflets obl. rhomboid blunt, Stipules rounded ovate oblique  
 10456 Flowers in lateral umbels, Stems erect, Leaves ellipt. erect silky beneath, Calyxes woolly  
 10457 Pedunc. about 3 term. Leaflets oblong lanceolate silky, Pods linear silky, Stems decumbent  
 10458 Flowers umbelled terminal, Cal. 3-parted: lower tooth trifid, Leaflets rounded obovate, Stems ascending

and Miscellaneous Particulars.

will be killed. Very young tops, taken off for cuttings, and planted under a bell-glass, in sand, are not difficult to root. (*Bot. Cult.* 217.)

1566 *Cytisus*. Pliny says it was so called because found in *Cythus*, one of the Cyclades. The *Cytisus* of the ancients is believed to have been our *Medicago arborea*. A genus of ornamental trees and shrubs, of which the *Laburnum*, *Cytisus des alpes*, Fr., *Bohnenbaum*, Ger., are well known and universally admired examples. There are two species of *Laburnum*, which are so much alike, that in most nurseries they are confounded together, or only one in cultivation. *C. alpinus* is the tree *Laburnum*, whose timber (the false ebony of the French) is much prized by cabinet-makers and turners, for its hardness, beauty of grain, and durability. The tree is frequently sown in plantations infested with hares and rabbits, who will touch no other tree as long as a twig of *laburnum* remains. "Though eaten to the ground in winter," as Boutcher observes, "it will spring again next season, and thus afford a constant supply for these animals, so as to save the other trees till of a size to resist their attacks. The timber has been sold for upwards of half a sovereign per foot." It becomes most valuable in light loams and sandy soils.

*C. volgaricus* and *purpureus* are very handsome shrubs; and make a fine appearance when grafted on stocks of *laburnum* five or six feet in height.

*C. cajan* (an alteration of the Malay name, *Catjang*), *Pois d'Angola*, Fr., is frequently planted in the West India Islands, chiefly in rows as a fence to the sugar plantations, and will thrive on barren land. The seed is much eaten by poor people and negroes, and is esteemed a wholesome pulse. In the island of Martinico even the better sort of people hold it in estimation, and prefer it to the European pea. The chief use of it in Jamaica is for feeding pigeons, whence its name. The branches, with the ripe seed and leaves, are given to feed hogs, horses, and other cattle, which grow very fat on them. (*Sloane and Jacq. Obs.*)

History, Use, Propagation, Culture,

1567. *Mullera*. In honor of Otho Frederick Müller, a Dane, one of the editors of the *Flora Danica*. There have also lived four other Müllers, Germans, and botanists. The fruit is remarkable for its form, which is that of a necklace; a number of little balls being united by stalks, and not opening as in other leguminosæ, but always remaining closed. The flowers are pink, and the size of a bunch of Laburnum.

1568. *Robinia*. In memory of Jean Robin, herbarist to Henry IV. of France, author of *Histoire des Plantes*, &c., Paris, 1620. His son, *Vespasian*, was subdemonstrator at the Jardin de Roi, and was the first person who cultivated the *R. pseudacacia* in Europe.

*R. pseudacacia* is a thorny fast-growing tree, of middling stature, of no great beauty as a tree, but ornamental when young, and very well adapted for copse-wood and rough timber. The leaves come out late in spring, and fall off early in autumn, like those of the ash. The timber is much valued in North America, and said to be superior to that of the laburnum; "being close-grained, hard, and finely veined; and in America more valued by the cabinet-maker than any other native timber whatever. Pursh, in his *Flora*, asserts, that being nearly incorruptible, it is equally useful for posts and gates. We are informed by a friend, that gate-posts of this timber, on a property near Baltimore, have remained fresh for nearly a century. The finest pinnated leaves, and pendulous white odorous flowers, add greatly to its beauty. Its value is scarcely known in this country." (*Cated. Mem.* ii. 414.) It prefers a deep sandy soil, and rather sheltered situation; being very apt to throw up suckers from the running roots, and as it stoles freely, it seems peculiarly calculated for copse-woods. *Beatson* (*Conn. to Board of Agr.*) has cultivated it in this way to great advantage.

In North America the use of the locust-tree has hitherto been confined to treails, on account of its scarcity, but were it as plentiful as oak, it would be applied for more purposes by the shipwright, such as knees, floor-timbers, and foot-hooks, being much superior to oak for its strength and duration, and, from the tree spreading into branches, affords full as large a proportion of crooks or compass timber as oak.

A cubic foot of acacia, in a dry state, weighs from 48 to 53 pounds avoirdupois. If we compare its toughness in an unseasoned condition with that of oak, it will not be more than 2-100 less. Its stiffness is equal to 99-100 of oak; and its strength nearly 96-100; but were it properly seasoned, it might, possibly, be found much superior to oak in strength, toughness, and stiffness. A piece of unseasoned acacia, two feet six inches long, and an inch square in the vertical section, broke when loaded with a weight of 247 pounds avoirdupois. Its medium cohesive force is about 11,500 pounds. (*Dict. of Archi.*)

10459 The only species

10460 Racemes with 1-fl. pedicels, Leaves pinnated with an odd one, Stipules spiny, Pods smooth

10461 Racemes with 1-fl. pedicels, Leaves pinnated with an odd one, Branches and pods viscid with glands

10462 Racemes with 2-fl. pedicels, Cal. truncate, Leaves pinnated with an odd one, Stem unarmed

10463 Racemes axillary few-flowered, Leaflets lanceolate mucronate downy, Pedic. 1-flowered

10464 Racemes axillary few-flowered, Calyxes and branchlets finely bristly

10465 Racemes axillary, Leaves pinnate with an odd one, Stem hispid

10466 Pedunc. simple several, Leaves in 4 pairs, Petioles unarmed, Pods cylindrical

10467 Leaves about 4 pair; leaflets obcordate, Peduncles twin shorter than flower

10468 Pedunc. simple, Leaves 4 stalked hoary terminated by a weak spine, Pods downy

10469 Pedunc. simple solitary, Leaves in about 8 pairs, Stipules spiny, Pods compressed

10470 Pedunc. simple, Leaves in many pairs downy, Petioles filiform spiny, Branches villous

10471 Pedunc. simple, Leaves in 2 pairs, Leaf. obl. lanc. silky, Stipules and petioles spiny

10472 Pedunc. simple, Leaves in 4 pairs, Leaf. cuneate smooth, Stipules and petioles spiny

10473 Pedunc. 3-fl. Leaves in 2 pairs silky, Petioles spiny persistent, Pods bladderly

10474 Pedunc. simple, Leaves in 2 pairs, Leaflets obovate shining, Stipules and petioles spiny

10475 Pedunc. simple, Leaves about 4 somewhat petiolated terminated by a weak spine

10476 Pedunc. simple, Leaves 4 sessile

10477 Stalk of pod longer than persistent filaments

10478 Stalk of pod shorter than persistent filaments

10479 Leaflets obl. blunt hoary beneath, Stem shrubby, Branches silky with down

10480 Leaflets linear emarginate smooth, Stem weak, Raceme axillary

10481 Leaflets linear emarginate hairy, Cal. without bracts with black hairs

10482 Leaf. obl. downy, Stem erect, Racemes terminal

10483 Leaflets in 7 pairs ovate acute smoothish, Racemes axillary subcapitate 1-sided

10484 Leaflets ellipt. retuse, Prominences of the standard short

10485 Leaflets obcordate glaucous, Pedunc. about 6-flowered, Pods closed at end

10486 Leaf. obovate emarginate glauc. Prom. of standard blunt very small, Pods open at end

10487 Leaf. roundish ellipt. very blunt mucronate, Prom. of standard long ascending, Stem shrubby

and Miscellaneous Particulars.

*R. hispida* is a very handsome shrub, but it requires a sheltered situation, otherwise the branches are very liable to be shattered or blown off by high winds. In young trees grafted above ground, the fracture commonly takes place at the graft, so that a good preventative is to graft on the root a little below the surface. Grafts in this manner are also much more certain of success.

*R. viscosa* resembles, in its leaves and flowers, the common acacia; but is, altogether, a much handsomer tree. 1569. *Caragana*. This genus has been confounded by Linnæus and his followers with *Robinia*. The name is derived from the appellation of the most common species in Tartary, where it is called among the Moguls, *Carachaná*. *Altagana*, the name of another species, is in like manner a slight alteration of the Tartar name *Aldachaná*.

*C. spinosa*, on account of the length and toughness of the branches, and its large stout thorns, is admirably adapted to form impenetrable hedges, and is sufficiently hardy to bear our climate. About Pekin, they stick the bushes in clay on the tops of their walls, to prevent persons from getting or looking over them. (*Pallas*.)

*C. Halodendron* is a handsome shrub, and grows in Siberia on dry naked salt-fields, and it is probably from the want of this principle in our garden soils, that it so seldom flowers here.

*C. pygmaea* is a weak low shrub, with a shining yellow bark, with wood of a deep bay, almost as hard as horn.

*C. frutescens* is used by the Tartars for the same purposes as osiers, for which its tough shoots render it proper.

*C. jubata* is remarkable plant, its shoots always remaining covered by the persistent brown stipulae of the fallen leaves. It is extremely difficult to propagate, and is rarely even seen in this country. The most successful cultivators of it are Messrs. Loddiges and Son.

1570. *Swainsonia*. Named after the late Mr. Isaac Swainson, who had a botanic garden at Twickenham.

1571. *Sutherlandia*. In honor of Mr. James Sutherland, who published, in 1683, an 8vo. catalogue of the Physic Garden at Edinburgh. This and the former genus seed freely, and may also be readily increased by cuttings.

1572. *Lessertia*. Named by Decandolle in honor of M. Stephen Delessert, to whose mother Rousseau's Letters on Botany were addressed.

1573. *Colutea*. An ancient name of a bush with sweet-scented flowers; probably similar to the genus now

History, Use, Propagation, Culture,

so called. Shrubs with membranaceous inflated pods, free-growers and flowerers, well adapted to introduce in extensive shrubberies.

*C. arborescens* grows on Mount Vesuvius, even in the ascent to the crater, where there are scarcely any other plants. The leaves are recommended as answering all the purposes of senna, and Allioni has given particular directions for the preparation of them. A larger dose seems to be required to produce the same effect. The seeds, in a quantity of a drachm or two, excite vomiting. It is said by Haller and Ray to afford food grateful to cattle.

1574. *Glycyrrhiza*. From γλυκυσ, sweet, and ῥίζα, a root; the sweet taste of the liquorice root is well known. But the species from which the name is derived now constitutes a different genus. See Liquiritia.

1575. *Liquoritia*. A Latinized appearance of our common English word *Liquorice*, which in its turn is said to be an alteration or corruption of the French word *Reglisse*, itself a corruption of *Glycyrrhiza*. So, at least, says De Theis. To others, however, it is appears more probable that the name alludes to the quantity of *liquid* or *liquid* which the roots contain, and which constitutes their great value.

*L. officinalis* is a deep-rooting perennial, which has long been much cultivated in Spain; and since Elizabeth's time has been grown in different parts of England. The soil should be a deep sandy loam, trenched by the spade or plough, or with the aid of both, to two and a half or three feet in depth, and manured, if necessary. The plants are procured from old plantations, and consist of the side-roots, which have eyes or buds. These may be taken off, either in autumn, when a crop of liquorice is taken up for use, and laid in earth till spring; or taken from a growing plantation, as wanted for planting. The planting season may be either October, or February and March. In general the latter is preferred. The plants are dibbled in, in rows three feet apart, and from eighteen inches to two feet in the row, according to the richness of the soil. The after-culture consists in horse-hoeing and deep stirring, in weeding, and in cutting over and carrying away the haulm every autumn, after it is completely withered. As the plants do not rise above a foot the first season, a crop of onions or beans is sometimes taken in the intervals. The plants must have three summers' growth, at the

 10492 Pods hirsute, Leaf. obl. lanc. Flowers racemose

10493 Pods smooth, Stipules 0, Leaflets ovate retuse clammy beneath

- 10494 Pedunc. about 3-fl. Claws of cor. three times as long as calyx, Stem angular  
 10495 Leaves 5-nate and 3-nate linear lanceolate fleshy blunt  
 10496 Leaflets about 9, Stipules nearly round  
 10497 Leaflets 7 very blunt, Stipules lanceolate  
 10498 Leaflets 6-10 pair more or less obovate and retuse, Pods very long curved upwards  
 10499 Leaflets 9 ellipt. : inner close to stem, Stipules opp. the leaves lanceolate  
 10500 Procumbent, Leaf. 9 ovate, Stipule opp. the leaf emarg. Pods angular knotty  
 10501 Leaflets 11 silky: the outer the largest  
 10502 Leaflets several lanceolate smooth, Pods rounded erect  
 10503 Leaflets 15 cuneate retuse, Pods rounded erect 5 together  
 10504 Leaflets several obl. cuneate, Pods compressed ensiform  
 10505 Leaflets 9 very blunt somewhat emarginate, Stipules round toothletted

- 10506 Pods sessile solitary erect  
 10507 Pods stalked clustered circular: lobed on one edge  
 10508 Pods stalked clustered smooth lobed on the outer edge, Leaves and cal. hairy  
 10509 Pods stalked clustered arcuate rough sinuated on one side

- 10510 Leaves pinnated, Flowers capitate with a bractea, Pods roundish incurved  
 10511 Leaves pinnated, Flowers capitate without a bractea, Pods round incurved

- 10512 Leaves pinnated, Flowers capitate with a bractea, Pods compressed recurved rugose  
 10513 Leaves ternate subsessile: the odd one very large  
 10514 Leaves ternate or quinate: the odd one largest, Stipules large membranous 2-toothed  
 10515 Leaves pinnated, Pods rugose pendulous scarcely bowed, Joints compressed roundish

- 10516 Pedunc. 1-fl. Pods covered over with blunt scales  
 10517 Pedunc. 2-fl. Pods bluntly aculeate outwardly  
 10518 Pedunc. about 3-fl. Pods bearing outwardly distinct acute spines  
 10519 Pedunc. about 4-fl. Pods bearing outwardly clustered acute spines

10520 Lips of calyx entire, Racemes stalked few-flowered

and Miscellaneous Particulars.

end of which the roots may be taken up by trenching over the ground. The roots are either immediately sold to the brewers' druggists, or to common druggists, or preserved, like carrots or potatoes, in sand, till wanted for use. They are used in medicine and porter-brewing.

1576. *Coronilla*. From *corona*, a crown. Its pretty flowers are disposed in little tufts like coronets. Hand-some free-flowering shrubs, of easy culture. *C. valentina*, glauca, and *viminalis* are valuable as flowering in winter, and often all the summer. *C. argentea* bears a profusion of flowers, which have a strong sweet scent. The silvery color of this plant is occasioned by its growing on a poor dry soil; and if it is removed into better ground, it will take a glaucous color; and the contrary. *C. emerus* is a popular shrub of much beauty.

*C. varia* is a strong coarse-growing plant, and has been grown as an adjunct to clover, lucern, &c. Curtis says, it is bitter; but others have found horses and cows to eat it greedily.

1577. *Hippocrepis*. From *hippos*, an horse, and *crepis*, a shoe; in allusion to the form of its pod. Pretty little annual plants, with bright yellow flowers.

1578. *Ornithopus*. From *ornis*, a bird, and *pus*, a foot. The pods are twisted and curved in such a manner as to resemble the claws of a small bird. Curious on account of their jointed pods, but not worth culture as plants of ornament. *O. sativus* is a most valuable agricultural plant. It was introduced for purposes of field culture about the year 1818, from Portugal, under the name of Serradilla. Sown upon the barren, light, sandy downs of Theiford, in Norfolk, it produced an abundant crop of most excellent fodder, where nothing else would grow. It is exceedingly like *O. scorpioides*, except that it arrives at the height of two feet instead of as many inches.

1579. *Scorpiurus*. From *scorpius*, a scorpion, and *ura*, a tail; on account of the twisted pod, which is very like the tail of some reptile.

1580. *Smithia*. In memory of Sir James Edward Smith, M. D., F. R. S., knight, president of the Linnean Society, possessor of the Linnean herbarium, and author of various elementary and other useful botanical works. These are inconspicuous worthless weeds, possessing little interest beyond their irritable foliage.

History, Use, Propagation, Culture,

1581. *Sesbania*. The Arabic name *Sesban*, a little Latinized. Most of these plants are ornamental. *S. grandiflora* is a beautiful plant; it grows in peat and loam, and cutting root in sand under a hand-glass.

1582. *Æschynomene*. A name given by Pliny to a plant which withdrew its leaves from the contact of the hand. It is derived from *αἰσχρῶναι*, to be modest. One of the species of *Æschynomene* is sensitive, but it is not the plant of Pliny.

1583. *Stylosanthes*. From *σῦλος*, a style, and *ανθος*, a flower: a flower with a very long style. Worthless tropical weeds.

1584. *Hallia*. Named after Birger Martin Hale, a pupil of Linnaeus, and the student under whose name the thesis called *Nectararia florum* stands in the *Amenitates Academicæ*.

1585. *Lespedeza*. Named by Michaux, in honor of Lespedez, a governor of Florida, who protected that botanist in his botanical researches. Herbaceous, chiefly North American plants with little merit.

1586. *Flemingia*. Named after Dr. John Fleming, president of the East India Company's Medical Board at Bengal.

1587. *Zornia*. Supposed to have been named after Mr. John Zorn, an apothecary at Kempton, in Bavaria, author of a work called *Icones Plantarum Medicinalium*, in five volumes, octavo, between the years 1779 and 1784. There was also a Dr. Bartholomew Zorn, of Berlin, author of *Botanologia Medica*, 1714, &c. &c.

1588. *Hedysarum*. From *ἴδως*, sweet, and *αρωμα*, smell; some the species have fragrant flowers. A

- 10521 Racemes about 3-fl. Leaf. obl. emarg. smooth, Pods filiform straight compressed  
 10522 Racemes many-fl. Leaf. lin. blunt mucronate, Rachis of leaves smooth, Pods filiform round  
 10523 Racemes few-fl. Leaf. linear blunt mucronate, Rachis of leaves prickly, Pods filiform round  
 10524 Pedunc. 1-fl. Leaf. lin. blunt mucronate, Rachis of leaves smooth  
 10525 Racemes many-fl. pendulous, Leaf. lin. blunt, Pods filiform round moniliform
- 10526 Stem smooth, Leaf. lin. blunt, Racemes few-flowered, Pods smooth

- 10532 Leaves lanc. mucronate smooth, Pedunc. 1-fl. the length of leaves  
 10533 Leaves cordate obl. acute smooth, Pedunc. the length of leaves  
 10534 Leaves cordate ovate convolute imbricated, Flowers axillary sessile
- 10535 Leaf. subovate villous beneath, Flowers in sessile fascicles, Stem shrubby  
 10536 Leaf. oblong, Fascicles of flowers sessile numerous, Pods nearly naked acute  
 10537 Leaf. somewhat lin. hairy beneath, Racemes axillary, Pods smooth length of calyx  
 10538 Simple, Leaf. ellipt. Spikes capitate on short stalks axillary and terminal, Cal. vill. length of cor.  
 10539 Branched villous, Leaf. round oval, Spikes axillary on long stalks, Cor. as long as calyx  
 10540 Branched diffuse, Leaf. ellipt. blunt hairy beneath, Racemes short umbelled  
 10541 Leaves ternate ovate, Racemes oblong, Pods inflexed, Calyx hairy
- 10542 Stem subsimple upright, Leaf. broad lanc. smooth, Racemes axill. sol. length of petiole  
 10543 Branched nearly upright, Leaf. ellipt. smooth, Petioles winged, Racemes paniced term. and axillary  
 10544 Nearly erect, Leaf. broad-lanc. Racemes axillary clustered  
 10545 Somewhat branched, Leaf. obovate, Petioles winged, Racemes clustered, Pods gland. viscid  
 10546 Erect branched, Leaf. obovate cuneate, Racemes axill. on long stalks dichotomous  
 10547 Leaves simple, Spikes like cones, Bractes cucullate foliaceous netted
- 10548 Leaves ternate large, Bractes numerous orbicular lined  
 10549 Leaves binate ovate-lanc. Bractes ovate acute
- 10550 Leaves simple lanc. blunt, Stem spiny  
 10551 Leaves simple lanc. acute, Stem unarmed, Stipules scarious  
 10552 Leaves simple obovate roundish, Stipules scarious shorter than petiole, Pods smooth netted  
 10553 Leaves simple cordate-roundish blunt smooth above downy beneath  
 10554 Leaves simple ovate acute with stipules  
 10555 Leaves simple cordate oblong stalked winged, Branches 3-cornered  
 10556 Leaves simple ovate blunt  
 10557 Leaves simple cordate oblong, Petioles simple, Stipules sheathing  
 10558 Leaves simple cordate lanc. sagittate, Flowers solitary, Pedunc. capillary very long  
 10559 Leaves simple and ternate intermediate 2-lobed : lobes spreading lanc. Joints of pod wavy plaited

and Miscellaneous Particulars.

numerous genus, not remarkable for beauty, but containing two curious species, the manna plant, and the turning Hedyсарum ; and one of considerable importance in European agriculture, the Saint-foin.

H. Alhagi is a thorny shrub, with lanceolate leaves, and coriaceous, subcylindric, and scarcely jointed pods. It is on this plant that Manna Truncheon is found in Mesopotamia (*Russ. Aleppo*.) and other eastern countries. It is chiefly gathered about Tauris, where the shrub grows plentifully. Sir George Wheeler found it growing in Tinos; Tournefort also found it in many plains of Armenia and Georgia, and made a distinct genus of it, under the name of Alhagi, from the Arabic *Aghul* or *Al-gul*.

H. gyrans is a native of Bengal near the Ganges; and is called there *Burram Chadali*, or *Burram Chandali*. This is a wonderful plant, Linnaeus observes, on account of its voluntary motion, which is not occasioned by any touch, irritation, or movement in the air, as in *Mimosa*, *Oxalis*, and *Dionea*; nor is it so evanescent as in *Amorpha*. No sooner had the plants raised from seed acquired their ternate leaves, than they began to be in motion this way and that; this movement did not cease during the whole course of their vegetation, nor were they observant of any time, order or direction; one leaflet frequently revolved, whilst the other on the same petiole was quiescent; sometimes a few leaflets only were in motion, then almost all of them would be in movement at once: the whole plant was very seldom agitated, and that only during the first year. It continued to move in the stove during the second year of its growth, and was not at rest even in winter. (*Suppl. Linn.*) Swartz observes, that the motion is irregular, and that it sometimes ceases entirely; that in a very hot day it is immovable, being agitated only in the evening, and that slowly. In our climate, the leaves, in

History, Use, Propagation, Culture,

general, only make a faint and feeble attempt towards the middle of the day at exerting their extraordinary faculty. (Shaw.)

This motion does not depend upon any external cause that we can trace, and we are not able to excite it by any art that we possess. It is not the action of the sun's rays, for this plant is fond of shade, and the leaves revolve well on rainy days, and during the night: exposed to too much wind or sun, it is quiet. Perhaps, says Linnaeus, there may be some part in vegetables, as in animals, where the cause of motion resides.

H. coronarium, *Sulla*, or *Sainfoin à bouquets*, Fr., is an esteemed border biennial, and some speculative agriculturists recommend it for cultivation as a field plant. In Calabria it grows wild in great luxuriance, near four feet high, affording excellent nourishment to horses and mules, both green and made into hay; but it does not well bear the spring in the north of Italy; we may presume, therefore, that it will scarcely bear our climate well enough to answer the purposes of husbandry. Osbeck mentions, that he saw it brought into Cadiz in great bundles, as food for cattle.

H. Onobrychis, *L'eparcet*, Fr., *Espazette*, Ger., and *Cedrangolo*, Ital., is a deep rooting perennial, with branching spreading stems, compound leaves, and shewy red flowers. It is a native of many parts of Europe, but never found but on dry warm chalky soils, where it is of great duration. It has been long cultivated in France, and in other parts of the continent, and as an agricultural plant, a good deal in England, in the chalky districts; and its peculiar value is, that it may be grown on soils unfit for being constantly under tillage, and which would yield little undergrass. This is owing to the long and descending roots of the saint-foin, which will penetrate and thrive in the fissures of rocky and chalky understrata. Its herbage is said to be equally suited for pasturage or for hay, and eaten green it is not so apt to swell or hove cattle as the clovers or lucern. Arthur Young says, that upon soils proper for this grass no farmer can sow too much of it, and in

 10605 Leaves pinnate, Racemes long, Pods inflexed

and Miscellaneous Particulars.

*The Code of Agriculture*, it is said to be "one of the most valuable herbage plants we owe to the bounty of providence."

The deeper the soil is stirred previously to sowing the better; the seed is generally put in broad cast, at the rate of three or four bushels the acre, and sometimes a little red clover is sown afterwards to produce a crop the second season, when the saint-foin plants are but small. When saint-foin is annually mown, it should be top-dressed with manure; but if only occasionally mown, the benefits derived from the grazing of sheep or cattle will, to a considerable extent, answer for surface dressings in a plant that derives a part of its nutriment from the subsoil. Saint-foin is highly nutritive, either cut green or made into hay. The produce, on a medium of soils and cultivation, may probably be estimated at from about one and a half to two tons the acre. And on the poorer and thinner staple sorts of land, it will perhaps seldom afford less than from a ton to a ton and a half on the acre. One thousand parts of saint-foin afforded Sir H. Davy thirty-nine of nutritive matter, which is the same as that afforded by the red and white clover.

The usual duration of saint-foin, in a profitable state, is from eight to ten years. It usually attains its perfect growth in about three years, and begins to decline towards the eighth or tenth on calcareous soils, and about the seventh and eighth on gravels. There are instances, however, of fields of saint-foin, which had been neglected and left to run into pasture, in which plants have been found upwards of fifty years from the time of sowing. It has been cultivated upwards of a century on the Cotswold hills, and there roots of it have been traced down into stone quarries from ten to twenty feet in length, and in Germany, Von Thaeer found them attain the length of sixteen feet. In general, the great enemy to the endurance of saint-foin, is the grass which accumulates, and forms a close turf on the surface, and thus chokes up the plant.

History, Use, Propagation, Culture,

1589. *Indigofera.* That is to say, a plant bearing *indigo*. The species are elegant little shrubs, free-flowerers, and of easy culture. Most of them will yield the dye, but those chiefly cultivated for this purpose are the *I. Anil* (*Alnyl*, Arab.), in the West Indies, and the *I. tinctoria*, *argentea*, and some other species in the East Indies. The indigo is one of the most profitable articles of culture in Hindustan; because an immense extent of land is required to produce but a moderate bulk of the dye; because labor and land here are cheaper than any where else; and because the raising of the plant and its manufacture may be carried on without even the aid of a house. The first step in the culture of the plant is to render the ground, which should be friable and rich, perfectly free from weeds, and dry if naturally moist. The seeds are then sown in shallow drills about a foot apart. The rainy season must be chosen for sowing, otherwise if the seed is deposited in dry soil, it heats, corrupts, and is lost. The crop being kept clear of weeds, is fit for cutting in two or three months, and this may be repeated in rainy seasons every six weeks. The plants must not be allowed to come into flower, as the leaves in that case become dry and hard, and the indigo produced is of less value; nor must they be cut in dry weather, as they would not spring again. A crop generally lasts two years. Being cut, the herb is first steeped in a vat till it has become macerated and parted with its coloring matter; then the liquor is let off into another, in which it undergoes the peculiar process of beating, to cause the fecula to separate from the water. This fecula is let off into a third vat, where it remains some time, and is then strained through cloth bags, and evaporated in shallow wooden boxes placed in the shade. Before it is perfectly dry, it is cut in small pieces of an inch square; it is then packed in barrels, or sowed up in sacks for sale. Indigo was not extensively cultivated in India before the British settlements were formed there; its profits were at first so considerable, that, as in similar cases, its culture was carried too far, and the market glutted with the commodity. The indigo is one of the most precarious of oriental crops; being liable to be destroyed by hail storms, which do comparatively little injury to the sugar-cane and other plants. The indigo cultivated in the West Indies, thrives best in a free rich soil, and a warm situation, frequently refreshed with moisture. Having first chosen a proper piece of ground, and cleared it, hoe it into little

- 10606 Leaves simple filiform, Flowers racemose  
 10607 Leaves simple linear hoary, Pods globose

 10631 Pods falcate backwards compressed villous spiked, Calyxes woolly, Leaf. oval-obl. acuminate  
 10632 Leaf. obl. mucronate downy beneath, Stip. ovate acuminate, Raceme 4-fl. terminal, Pods pendulous  
 10633 Leaf. cuneate-obl. recurved mucronate villous beneath, Stipules subulate, Raceme few-fl.  
 10634 Pods straight spreading ciliated, Stip. subulate, Leaf. 9-11 obl. acute downy beneath  
 10635 Leaf. lanc. cuneate retuse silky beneath, Stip. setaceous, Pods falcate backwards villous pendulous  
 10636 Pods straight ascending villous, Stip. subulate, Pedunc. 2-edged, Leaf. obl. blunt  
 10637 Leaf. obl. cuneate emarg. mucronate smooth, Stip. subulate, Pods racemose straight ascending  
 10638 Leaf. inversely lanc. obtuse emarg. silky beneath, Racemes terminal short  
 10639 Leaf. inversely lanc. emarg. mucronate hairy, Stip. subulate, Racemes terminal

10640 Leaf. lanc. mucronate smooth, Stip. lanc. sagittate, Pods erect straight

- 10641 Leaf. ovate acuminate smooth, Stip. ovate, Flowers cernuous  
 10642 Leaf. obl. acute downy beneath, Stip. subulate, Pods smooth racemose pendulous  
 10643 Leaf. ovate acute downy, Stip. subulate, Pods straight pendulous smooth racemose  
 10644 Leaves pinn. ovate mucron. villous, Stem erect, Branches downy

and Miscellaneous Particulars.

trenches, not above two inches, or two inches and a half in depth, not more than fourteen or fifteen inches asunder. In the bottom of these, at any season of the year, strew the seeds pretty thick, and immediately cover them. As the plants shoot, they should be frequently weeded, and kept constantly clean, until they spread sufficiently to cover the ground. Those who cultivate great quantities, only strew the seeds pretty thick in little shallow pits, hoed up irregularly, but generally within four, five, or six inches of one another, and covered as before. Plants raised in this manner, are observed to answer as well, or rather better, than the others; but they require more care in the weeding. They grow to full perfection in two or three months, and are observed to answer best when cut in full blossom. The plants are cut with reaping hooks, a few inches above the root, tied in loads, carried to the works, and laid by strata in the steeper. Seventeen negroes are sufficient to manage twenty acres of indigo; and one acre of rich land, well planted, will, with good seasons and proper management, yield five hundred pounds of indigo in twelve months, for the plant ratoons (i. e. it sends out stolones), and gives four or five crops a year; but must be replanted afterwards.

Indigo has long been cultivated in Spain, but is on the decline in that country, owing to the more favorable circumstances of the East and West Indies. It was tried in the south of France and Italy, during the Buonaparte dynasty, but found not worth following for the same reason.

1590. *Tephrosia*. From *tepeos*, ash-colored, in allusion to the color of the foliage. *T. toxicaria* is a spreading shrubby plant. The leaves and branches, well pounded, and thrown into a river or pond, very soon affect the water, and intoxicate the fish, so as to make them float on the surface, as if dead; most of the large ones recover after a short time, but the greatest part of the small fry perish on these occasions. It has been introduced to Jamaica, and cultivated there, on account of its intoxicating qualities. (*Browne*)

1591. *Galega*. A name of unexplained meaning. Ruellius says, it is the word *Glaux*, Italianized! *G. officinalis* was formerly accounted cordial and sudorific, but is now out of repute. The species are handsome border flowers.

History, Use, Propagation, Culture.

1592. *Phaca*. Φακκν, or φακκος, was the Greek name of the lentil; and was derived from φακκα, to eat. These are pretty herbaceous plants, with the habit of *Astragalus*.  
 1593. *Oxytropis*. From οξυς, pointed, and τροπις, a keel. A genus entirely resembling *Astragalus* in habit; but considered distinct by modern botanists.  
 1594. *Astragalus*. This was a name given by the Greeks to one of their leguminous plants, but it is not known to which. The modern genus is composed of plants, the greater number of which are very orna-

- 10645 Erect hairy, Leaf. oval acute, Stip. lanc. Pods obl. cymbiform compressed  
 10646 Erect undivided, Leaf. 11 obl. blunt subciliated, Pods oblong inflated  
 10647 Erect branched downy, Leaf. in many pairs obl. lanc. blunt, Pods half ovate acute  
 10648 Branched ascending, Leaf. about 17 lanc. : the odd one subsessile, Alæ bifid  
 10649 Branched ascending smooth, Leaf. about 11 lin.-lanc. : the odd one subsess. Pods obovate inflated erect  
 10650 Caulescent procumb. Fl. pendulous racemose, Pods acute at each end hairy
- 10651 Stemless villous, Pods erect roundish-obl. villous acuminate with style half 2-celled  
 10652 Stemless silky, Leaf. 19 lanc. ellipt. acute at each end, Spikes capitate  
 10653 Stemless villous silky, Pods erect ovate cylindr. inflated 2-celled  
 10654 Stemless, Leaf. lanc. silky, Scape longer than leaf and calyxes silky, Heads few-fl. cernuous
- 10655 Stemless, Calyx and pods villous, Leaf. lanc. acute, Stem decumbent  
 10656 Stemless, Pods subulate hooked longer than leaf, Leaf. obovate  
 10657 Stemless, Leaf. lanc. smooth, Scapes as long as leaves hairy, Flowers in obl. heads  
 10658 Stemless; Leaf. cuneiform retuse subsessile, Pods smooth, Flowers nearly apetalous  
 10659 Caulescent erect hairy, Leaf. lanc. acute, Spikes stalked longer than leaf, Pods subulate hairy  
 10660 Caulescent erect hairy, Leaf. 3-pair lanc. acute, Stip. obl. acun. Spikes stalked longer than leaf  
 10661 Caulescent ascending, Leaf. ovate lanc. deflexed hairy, Spikes stalked longer than leaf  
 10662 Caulescent diffuse downy, Stipules united, Wings emarg. Peduncles as long as leaf
- 10663 Caulescent erect, Leaf. ellipt. stalked, Stip. lin. subulate, Pedunc. about 3-fl. axill. clustered  
 10664 Caulescent erect, Leaf. roundish cordate sessile downy, Stip. ovate acuminate, Pedunc. 1-fl. axill.  
 10665 Caulescent erect, Spikes cylindrical subsessile, Cal. and pods woolly  
 10666 Caulescent erect, Heads of flowers stalked globose, Pods 4-seeded inclosed in woolly calyx  
 10667 Caulescent erect, Heads of flowers sessile axill. short, Corolla larger than calyx  
 10668 Caulescent erect, Heads globose, Pedunc. very long, Leaf. emarginate  
 10669 Caulescent erect striated, Leaf. lin. lanc. smooth, Stip. lanc. Racemes longer than leaf  
 10670 Caulescent erect panicled, Leaves of 2 or 3 pair linear cuneate retuse smooth, Racemes filiform  
 10671 Caulescent erect shrubby, Leaves in 6 pairs lin. lanc. hoary, Racemes long spiked  
 10672 Caulescent erect, Leaf. linear lanc. Spikes obl. stalked longer than leaf, standard twice as long as alæ  
 10673 Caulescent erect rough, Leaf. lin. lanc. Spikes stalked longer than leaves straight, Pods 3-cornered  
 10674 Caulescent erect straight smooth, Leaf. ellipt. blunt, Fl. racemose pendulous, Pods 3-cornered smooth  
 10675 Caulescent erect straight smooth, Leaf. ellipt. blunt, Fl. racemose pendulous, Pods inflated rugose  
 10676 Caulescent erect smooth, Leaf. lanc. acute, Racemes longer than leaf, Pods falc. acute pendulous  
 10677 Caulescent erect, Peduncles as long as leaves, Leaflets 33-41, Pods about 3-cornered acute  
 10678 Caulescent erect, Leaf. obl. downy, Spikes stalked, Bractes obl. length of calyx  
 10679 Caulescent erect, Leaf. obl. downy beneath, Spikes stalked, Bractes lanc. length of peduncle  
 10680 Caulescent diffuse, Pods subcylindrical mucronate, Leaf. naked beneath  
 10681 Pedunc. as long as leaves, Leaf. 33-41 scarcely downy, Pods 3-cornered bowed nodding  
 10682 Pedunc. as long as lvs. Leaf. smoothish obl. blunt mucro. Stip. lanc. Racemes stalked longer than leaf  
 10683 Pedunc. as long as lvs. silky-white, Leaf. 21 ellipt. smooth above, Spikes subsessile, Pods fleshy  
 10684 Pedunc. longer than leaf, Fl. erect closely spiked, Pods half 2-celled
- 10685 Caulescent prostrate, Leaf. smooth ovate mucronate blunt, Stip. ovate-lanceolate  
 10686 Caulescent erect spread, Leaf. ov. hairy, Stip. solitary opp. the lvs. 2-parted, Spikes stalked long. than leaf  
 10687 Caulescent, Scapes 2-fl. Pods hooked subulate with 2-keels  
 10688 Caulescent prostrate, Leaf. ellipt. cuneate emarg. Racemes few-fl. Peduncles longer than leaf  
 10689 Caulescent procumbent, Leaf. cuneate emarg. Stip. ov. Racemes few-fl. stalked shorter than leaf  
 10690 Caulescent erect, Leaf. obl. retuse, Fl. axill. sol. subsessile, Pods deeply channeled  
 10691 Caulescent procumbent downy, Leaf. obovate emarg. Racemes stalked arcuate twisted  
 10692 Caulesc. procumb. Leaf. obl. blunt mucro. Spikes stalked few-fl. shorter than lvs. Pods obl. hooked at end  
 10693 Caulescent diffuse, Heads stalked lateral, Pods straight subulate mucronate  
 10694 Caulescent diffuse, Leaf. ellipt. emarg. Racemes few-fl. stalked shorter than leaf, Pods hooked  
 10695 Stemless, Leaves ellipt. downy, Scapes racemose longer than leaf, Pods obovate the length of calyx  
 10696 Caulescent, Leaflets oval-oblong or obovate smooth, Stipules very large leafy  
 10697 Stem decumb. Leaf. obl. downy, Pedunc. axill. few-fl. Pods arcuate with elevated veins  
 10698 Stemless, Leaf. subulate 4 whorled pilose, Scapes spiked longer than leaf, Lower flowers remote  
 10699 Caulescent diffuse, Heads subsessile lateral, Pods erect subulate with a reflexed point  
 10700 Caulescent diffuse, Pods subulate incurved smooth, Leaf. obovate  
 10701 Caulescent procumb. Leaf. obl. retuse, Heads stalked shorter than leaf, Pods half ovate squamose at end  
 10702 Caulescent procumb. Leaf. lin. narrowed at base, Heads subsessile, Pods half ovate reflexed downy

and Miscellaneous Particulars.

mental. *A. glycyphyllos* is the largest of the European species. The leaves are sweet, with a mixture of bitterness, and do not seem to be agreeable to cattle; at least the plant, in its wild state, is left untouched; otherwise it might have been desirable to cultivate it.

*A. Tragacantha* was formerly considered as the plant yielding the gum *Tragacanth* of commerce; but Olivier (*Voyage dans l'Empire Ottoman*, v. 342, pl. 44.) discovered that it was generally procured from *A. verus*. It is probable that both species, and perhaps some others, yield this gum. *A. verus* is a native of the north

History, Use, Propagation, Culture,

of Persia, flowering in July and August. It rises two or three feet only in height, on a stem about an inch in thickness; with many branches closely crowded together, and covered with imbricated scales and spines, formed from the petioles of the former year. The leaves, which scarcely exceed half an inch in length, are composed of six, seven, or eight pairs of opposite, villous, stiff, pointed leaflets; and the mid-rib is terminated with a sharp yellowish point. The flowers are small, yellow, and proceed from the axillæ of the leaves with cottony bracts. The calyx is five-toothed, and shorter than the corolla, which is papilionaceous. The gum exudes in summer, more or less copiously according to the heat of the weather, in tortuous filaments, which are allowed to dry on the plant before being collected. A large portion of the Tragacanth collected in Persia, is sent to India, Bagdad, Bassorah, and Russia. But what we receive is sent to Aleppo, whence it is exported, packed in cases.

Good gum Tragacanth is inodorous; impressing a very slightly bitter taste as it dissolves in the mouth. Its mucilage differs from that of acacia gum, in being precipitated by the superacetate of lead, and oxymuriate of tin; and not by silicated potass (*Bostock. Nich. Journ.* lviii. 30.), or the oxysulphate of iron. Medically it is de-

- 10703 Caulescent procumb. Leaf. obl. blunt, Spikes ov. stalked longer than leaf, Pods erect ovate channelled  
 10704 Caulescent procumb. Leaf. lin. trunc. emarg. Racemes stalked longer than leaf, Wings of cor. bifid  
 10705 Caulescent erect. Lvs. 7 pairs obl. bluntnish subpubescent, Heads few-flowered stalked, Pods obl. villous  
 10706 Caulescent branched prostrate, Leaf. lin. lanc. silky complicate, Racemes 6-fl. longer than leaf  
 10707 Caulescent procumb. Leaf. obcordate silky beneath, Racemes stalked as long as leaves  
 10708 Subcaulescent procumb. Leaf. obovate, Racemes shorter than petiole, Pods round lanc. reflexed  
 10709 Caulescent decumb. Leaf. ellipt. blunt, Spikes obl. stalked longer than leaf  
 10710 Caulescent diffuse, Heads stalked imbricated ovate, Fl. erect, Pods ovate callous inflated  
 10711 Caulescent prostrate, Umbels stalked, Pods prismatical 3-cornered erect subulate at end  
 10712 Caulescent diffuse hoary, Leaves 5 pairs, Leaf. ellipt. blunt, Spikes stalked longer than leaf  
 10713 Caulescent diffuse, Pedunc. spiked, Standard twice as long as flower  
 10714 Caulescent procumb. Spikes long, Pods oblong 3-cornered furrowed mucronate villous  
 10715 Stemless, Leaf. ov. glauc. Scapes longer than leaf, Fl. capitate, Pods inflated membranous smooth  
 10716 Stemless smooth, Calyxes bladdery contracted at mouth  
 10717 Stemless, Leaf. ov. obl. acute hairy, Scapes racemose erect twice as short as leaf, Pods ovate villous  
 10718 Stemless, Leaf. ellipt. retuse somewhat hairy, Scapes racemose few-fl. twice as short as leaf  
 10719 Stemless, Leaf. ellipt. blunt, Scapes racemose declinate longer than leaf, Standard long  
 10720 Stemless, Scapes decumb. Leaf. ovate subsessile downy beneath, Pods hoary  
 10721 Stemless, Leaf. obl. blunt hairy, Flower somewhat stalked aggregate, Cal. appressed hairy  
 10722 Nearly stemless, Fl. numerous radical subsessile  
 10723 Petioles spiny, Leaf. obl. mucro. hairy, Pedunc. very short about 4-fl. Cal. teeth setaceous  
 10724 Petioles spiny, Leaf. ellipt. hoary, Pedunc. about 4-fl. as long as leaves, Cal. teeth ovate  
 10725 Petioles spiny, Leaf. obl. hoary, Pedunc. very short 2-flowered

10726 The only species

- 10727 Pentandrous, Spikes obl. stalked terminal, Bractes length of cal. Leaves in 6 pairs lin. cuneate retuse  
 10728 Pentandrous, Spikes cylindric. stalked term. Bractes shorter than cal. Lvs. in 10 pairs ellipt. retuse mucr.  
 10729 Spikes obl. term. sol. Lvs. about 3 pair obl. and obovate obtuse  
 10730 Spikes long paniced, Lvs. about 4 pairs linear  
 10731 Decandrous, Spikes capitate stalked axillary, Leaves in 4 pairs obl. blunt  
 10732 Decandrous, Spikes capitate stalked term. Lvs. in 10 pairs obovate  
 10733 Decandrous, Spikes cylindr. terminal, Lvs. of 15 pairs lanc. blunt  
 10734 Decandrous, Spikes cylindr. terminal, Lvs. of 10 pairs obcordate  
 10735 Decandrous, Spikes term. long, Lvs. of 5 pairs obovate

- 10736 Lvs. pinn. of 2 pairs lin. Pedunc. axill. 1-fl.  
 10737 Lvs. pinn. of 7 pairs lin-lanc. Pedunc. 1-fl. axillary  
 10738 Lvs. pinn. and term. lanc. Pedunc. axill. 1-3-flowered, Branches warted  
 10739 Lvs. tern. cuneiform recurve mucronate, Flowers axillary solitary approximated  
 10740 Lvs. tern. obovate recurve mucro. with pellucid spots, Spike term. capitate, Bractes ciliated  
 10741 Lvs. tern. obovate recurve mucronate dotted beneath, Spike terminal oblong  
 10742 Lvs. of the stem and branches ternate and simple; of the branchlets none, Stipules imbricated  
 10743 Upper lvs. simple; rest ternate, Leaf. lin. lanc. mucronate, Pedunc. axill. clustered capitate  
 10744 Upper lvs. simple; rest ternate, Leaf. lin. lanc. mucro. Pedunc. axill. solitary  
 10745 Leaves tern. lanc. cuneate with a recurved mucro. Pedunc. axill. aggregate  
 10746 Leaves tern. obovate with a recurved mucro. Pedunc. axill. solitary  
 10747 Leaves tern. stalked obl. mucro. Spikes terminal interrupted, Calyxes villous  
 10748 Leaves tern. obovate emarg. Stem creeping, Flowers in umbels  
 10749 Leaves tern. Leaf. ov-lanc. Petioles downy smooth, Spikes capitate stalked axillary  
 10750 Leaves tern. Leaf. ov-lanc. acum. Petioles rough, Racemes axillary  
 10751 Leaves ternate silky beneath, Pedunc. axillary about twice as long as leaves, Heads depressed involucred  
 10752 Leaves tern. ovate, Petioles downy sulcate, Spikes capitate stalked axillary

and Miscellaneous Particulars.

mulcent, and may answer the purposes of the acacia gum; being even better adapted for allaying tickling cough, and sheathing the fauces in catarrhal affections, owing to its great viscosity. It is chiefly, however, employed for pharmaceutical purposes. (*Thomson's London Dispensatory*, 187.) The seeds of *A. bœticus* are roasted, ground, and used as a substitute for coffee in Hungary.

1595. *Biserrula*. From *bis*, twice, and *serrula*, a little saw. The pods are toothletted on each edge. Pelecinon was the name given by the Greeks to the plant called by the Latins *Securidaca*.

1596. *Dalea*. Named after Thomas Dale, an English botanist, who lived in the beginning of the last century. There was another Dale, an author of a Pharmacologia. These are pretty little plants, with the aspect of Psoralea.

1597. *Psoralea*. From *ψωραλέος*, warted, on account of the numerous little tubercles with which most of the species are covered. The species are chiefly low shrubs; some of them are ornamental, and all are of easy culture and propagation by young cuttings in sand or seeds, which they produce in abundance. *P. esculenta*, the bread-root of America, is cultivated in Missouri, and other parts of that country. In this climate it will

History, Use, Propagation, Culture,

grow in the open air, but requires the protection of a frame to produce abundant crops of roots, which are used like those of the potatoe in the countries where it is a native. (Pursh. Amer. t. 22.)

1598. *Melilotus*. From *Mei*, honey, and *Lotus*. These plants are similar to the Lotus, and are the favorite resort of bees. *M. officinalis* is the chief ingredient in favoring the Gruyère cheese. This cheese no doubt owes its chief excellence to the mixture of herbs in the mountain pasturage which surrounds the valley of Gruyère, but partly also to the flowers and seeds of this plant, which are bruised and mixed with the curd before it is pressed.

1599. *Lupinaster*. That is to say, *Lupine-like*. A pretty little herbaceous plant, with bright flowers.  
 1600. *Trifolium*. A plant with three leaves; the *τριφυλλον*, of the Greeks, *trèfle*, of the French, and *trefoil*, of the English. This genus includes the two most valuable herbage plants adopted in European agriculture, the white and red clover. Notwithstanding all that has been said of the superiority of lucern to clover, and of the excellence of saint-foin, and various Leguminosæ of the pea kind, yet the red clover for mowing, and the white species for pasturage, are, and probably ever will be, found to excel all other plants in these respects. The yellow clover, *T. procumbens*, and the cow or meadow clover, *T. medium*, are also in cultivation, but are far inferior to the others. The meadow clover is a useful addition to the white sort in laying down permanent pastures; the yellow grows on poor soils, but the herbage is not much liked by cattle. The soil best adapted for clover is a deep sandy loam, which is favorable to its long tap-roots; but it will grow in any soil, provided it is dry. So congenial is calcareous matter to clovers, that the mere strewing of lime on

- 10753 Leaves tern. roundish ovate repand at end, Spikes interrupted axillary

 10759 Leaves 3 lanc. Spikes obl. Bractes with long points, Pods round rugose  
 10760 Leaves pinnate of 5 pairs, Leaflets linear lanceolate, Pedunc. axillary 1-fl. longer than leaf  
 10761 Leaves ternate, Leaflets ovate-lanceolate somewhat downy, Racemes 1-sided on long stalks  
 10762 Leaves ternate lanc. smooth, Spikes interrupted stalked axill. longer than leaf  
 10763 Leaves tern. ovate-obl. downy, Spikes interrupted stalked axill. shorter than leaf

- 10764 Racemes obl. stalked, Stipules lanc. membranous  
 10765 Pods racemose naked smooth mucronate 1-seeded  
 10766 Pods racemose about 4-seeded oblong rugose, Leaflets ellipt. toothed

- 10767 Pods 1-seeded ovate acute naked rugose, Racemes shorter than leaf  
 10768 Pods racemose naked 2-seeded lanceolate  
 10769 Pods racemose naked rugose 1-seeded, Stems and branches ascending, Leaf. linear  
 10770 Pods racemose naked 2-seeded somewhat rugose acute, Stipules toothed at base  
 10771 Pods racemose naked 2-seeded rugose acute, Stipules lanc. subulate undivided  
 10772 Pods racemose naked 1-seeded rugose obovate acute, Stipules setaceous  
 10773 Pods racemose naked 2-seeded smoothish ovate acute compressed, Stipules toothed  
 10774 Pods racemose naked 1-seeded rugose obovate, Stipules setaceous  
 10775 Pods racemose naked 2-seeded rugose blunt, Leaflets entire  
 10776 Pods racemose naked 2-seeded membranous oval, Stem nearly erect  
 10777 Pods naked 8-seeded about 3 times as long as calyx, Stems declinate  
 10778 Pods 1-seeded obovate blunt naked rugose, Racemes longer than leaf, Stems diffuse

- 10779 Pods racemose naked compressed 1-seeded nerved hooked, Stipules subulate

- 10780 Heads halved, Leaves quinate sessile

- 10781 Heads in fruit reflexed, Pods 3-seeded  
 10782 Heads umbelled: in fruit reflexed, Pods 4-seeded, Stem angular with furrows flexuose  
 10783 Heads globose, Pods 2-seeded, Cal. the length of corolla, Leaf. serrulate, Stipules rhomboid  
 10784 Heads umbelled, Pods 4-seeded, Teeth of cal. nearly equal, Leaf. ovate-obl. emarg. serrulate  
 10785 Heads umbelled stalked, Teeth of cal. subulate equal, Leaf. obcord. serrate  
 10786 Heads umbelled, Pods 4-seeded, Teeth of calyx equal, Leaf. obovate blunt serrated  
 10787 Heads umbelled, Pods 4-seeded, Teeth of calyx nearly equal, Leaf. ovate obl. emarg. serrulate  
 10788 Heads in globose umbels imbricated, Standards deflexed persistent, Pods 4-seeded  
 10789 Heads umbelled, Scape naked, Pods 2-seeded pendulous, Leaves linear lanc.  
 10790 Heads umbelled, Pods 2-seeded, Teeth of cal. unequal, Leaf. obovate blunt toothed  
 10791 Heads villous 5-flowered, Central tuft reflexed rigid wrapping up the fruit  
 10792 Heads villous globose, Upper calyxes without florets  
 10793 Heads villous globose terminal solitary, Teeth of calyx setaceous longer than corolla  
 10794 Heads villous globose terminal solitary, Teeth of calyx setaceous shorter than corolla  
 10795 Heads subglobose hispid, Teeth of calyx subulate as long as cor. Leaf. obovate retuse  
 10796 Spikes roundish ovate villous, Teeth of calyx unequal setaceous as long as corolla

and Miscellaneous Particulars.

some soils will call into action clover-seeds, which it would appear have lain dormant for ages. At least this appears the most obvious way of accounting for the well-known appearance of white clover in such cases.

The climate most suitable for the clovers, as of most plants natives of Europe, is one neither very hot nor very dry and cold. Most leguminous plants delight both in a dry soil and climate, and warm temperature; and the clover will be found to produce most seed under such circumstances; but as the production of seed is only in some situations an object of the farmer's attention, a season rather moist, provided it be warm, is always attended by the most bulky crops of clover herbage.

The time of sowing seeds is generally the spring, during the corn-seed time, or from February to May; but they may also be sown from August to October; and when they are sown by themselves, that is, unaccompanied by any corn crop, this will be found the best season, as the young plants are less liable to be dried up and impeded in their progress by the sun, than when sown alone in spring, and remaining tender and unshaded during the hot and dry weather of July.

The manner of sowing is almost always broad-cast. When sown with spring corn, clover and grass-seeds are usually put in immediately after the land has been pulverized by harrowing in the corn-seed, and are themselves covered by one course more of the harrows; or, if the corn is drilled, the small seeds are sown immediately before or after hand-hoeing; and the land is then finished by a course of the harrows.

In the operation of sowing, some consider it best to sow the clover and rye-grass separately, alleging that the weight of the one seed and lightness of the other, are unfavorable to an equal distribution of both.

History, Use, Propagation, Culture,

The quantity of seed varies from eight to fourteen pounds per acre, according to the intention of the crop, the quantity of grass-seeds sown, &c. The after culture of clover and rye-grass consists chiefly of picking off any stones or rather hard bodies which may appear on the surface in the spring succeeding that in which it was sown, and cutting out by the roots any thistles, docks, or other large grown weeds. After this, the surface should be rolled once to smooth it for the scythe. This operation is best performed in the first dry weather of March. Some give a top-dressing of soot, gypsum, common lime, peat, or wood-ashes, at this time or earlier; gypsum has been particularly recommended as a top-dressing for clovers and the other herbage legumes, because as their ashes afford that substance in considerable quantities, it appears to be a necessary ingredient of their food.

The taking of the clover, or clover and rye-grass crop, is either by cutting green for soiling, by making into hay, or by pasturing. It is observed in *The Code of Agriculture*, that it is a most important point to ascertain, in what cases cutting or feeding is most beneficial. If fed, the land has the advantage of the dung and urine of the pasturing stock; but the dung being dropt in irregular quantities, and in the heat of summer, when it is devoured by insects, loses much of its utility. If the dung arising from the herbage, whether consumed in soiling, or as hay, were applied to the land in one body and at the proper season, the operation would be more effectual. The smother of a thick crop, continued for any time upon the ground, greatly tends to promote its fertility; and it has been pretty uniformly found, after repeated trials, upon soils of almost every description, that oats taken after clover that has been cut, either for soiling or hay, is superior to the crop taken after clover pastured by sheep.

The produce of clover-hay, without any mixture of rye-grass, on the best soils, is from two to three tons per acre, and in this state in the London market it generally sells twenty per cent. higher than meadow-hay, or

clover and rye-grass mixed. The weight of hay from clover and rye-grass varies according to the soil and the season, from one to three tons per English acre, as it is taken from the tramp-ricks; but after being stacked, and kept till spring, the weight is found to be diminished twenty-five or thirty per cent.

The value of clover and rye-grass hay, in comparison with the straw of beans or peas, may be in the proportion of three to two; and with the finest straw of corn crops, in the proportion of two to one. One acre of red or broad clover will go as far in feeding horses or black cattle, as three or four of natural grass. And when it is cut occasionally, and given to them fresh, it will probably go still much farther, as no part of it is lost by being trod down.

The saving of clover seed is attended by considerable labor and difficulty. Clover will not perfect its seeds, if saved for that purpose early in the year; therefore it is necessary to take off the first growth either by feeding or with the scythe, and to depend for the seed on those heads that are produced in the autumn.

The produce in seed may generally be from three to four or five bushels per acre, when perfectly clean, weighing from two to three hundred weight. But there is great uncertainty in the produce of clover-seed, from the lateness of the season at which it becomes ripe; and the fertility of the soil is considerably impaired by such a crop. Yet the high value of the seed is a great inducement to the saving of it, in favorable situations.

T. incarnatum is sometimes sown as a border flower.

1601. *Lotus. Lotus*, in Greek. There were three sorts of *Lotus* distinguished by the ancients; viz. their tree lotus, which was our *Zizyphus lotus*; the marsh lotus, which was our *Nymphaea lotus*; and the herbaceous lotus, which appears to have been the present genus.

The pods of *L. edulis* are still eaten in Candia, by the poorer inhabitants. *Lotus rectus* has by some been

History, Use, Propagation, Culture,

supposed the Cytisus of Virgil, but, as other contend, without sufficient foundation. Lotus jacobæus is a valuable greenhouse plant, as flowering all the year. L. major and corniculatus are very suitable to sow with white clover and cow-grass, in laying down lands to permanent pasture. Dr. Henderson has written a good deal in their favor; Miller is against them; but Sinclair, in his work on the British Grasses, found it a valuable ingredient in meadows, especially where the soil was rather moist. (See *Ency. of Agr.* p. iii. b. 6.) *Gebélie* is the Arabic name (*Gébélis*) of the species to which it has been applied.

1602. *Tetragonolobus*. From *τετραγώνος*, four, *γωνίας*, an angle, and *κόβης*, a bean, in allusion to the four wings of the pods. *Tetragonolobus edulis* is now a popular border annual, on account of its curious pods; but it was formerly an esculent legume, these pods being used like those of the kidney bean, by the poor of Sicily and Spain.

1603. *Trigonella*: From *τρίων*, three, and *γωνία*, an angle. The standard of the flower is flat, and the keel very small and narrow, which gives the flower a triangular appearance. *T. fenugrum-græcum*, a plant cultivated by the Romans, is still occasionally employed in the agriculture of the south of Europe. The seeds have a strong

- 10843 Pods subnate cylindr. smooth, Leaf. subcuneif. fleshy hoary, Stip. leaf-shaped

 10871 Pods stalked compressed ovate veiny, Leaf. cuneiform nearly entire smooth  
 10872 Pods sessile heaped erect straightish long linear, Pedunc. not awned  
 10873 Pods stalked racemose hooked round, Pedunc. spiny longer than leaflet  
 10874 Pods stalked heaped declinate subfalcate compressed, Pedunc. spiny short  
 10875 Pods stalked heaped declinate subfalcate, Pedunc. long somewhat spiny  
 10876 Pods sessile heaped arcuate divaricating inclined short, Pedunc. mucronate unarmed  
 10877 Pods sessile about 3 linear nearly erect, Leaves truncate cuneate pinnatifid toothed  
 10878 Pods sessile straight nearly erect a little falcate acuminate  
 10879 Racemes stalked, Common pedunc. longer than leaf, Pods linear falcate heaped pendulous  
 10880 Pods sessile subsolitary subfalcate, Leaflets entire  
 10881 Pods stalked longer than leaf, Leaves streaked  
 10882 Pods stalked umbelled erect incurved, Leaf. cuneate serrate, Stem much branched  
 10883 Pods about 4 arcuate erect, Pedunc. unarmed: when in flower as long as leaf, Leaf. cuneate  
 10884 Pods about 6 arcuate erect wavy torulose, Pedunc. unarmed: when in fl. longer than leaf, Leaf. cuneate  
 10885 Pods stalked heaped declinate falcate furrowed, Pedunc. awned longer than leaf  
 10886 Pedunc. very short spiny, Pods short curved upwards  
 10887 Pods sessile nearly erect falcate acuminate downy, Stem spreading

10888 Leaf. linear lanc. acute, Teeth of calyx ovate

10889 Leaf. obate blunt, Teeth of calyx ovate

and Miscellaneous Particulars.

disagreeable smell, and an unctuous farinaceous taste, accompanied with a slight bitterishness. An ounce renders a pint of water thick and slimy. To rectified spirit, they give out the whole of their distinguishing smell and taste, and afterwards to water a strong flavorless mucilage. These seeds are never given internally, their principal use being in cataplasms and fomentations, for softening, maturing, and dispersing tumours; and in emollient glysters. They were also an ingredient in the *oleum e mucilaginosus*; but this has no longer a place in the pharmacopœia. (*Woodville* and *Lewis*.) They are used by grooms and farriers for horses. Fenugreek has not been cultivated in any quantity for use in England, because it is an uncertain crop, occasioned by the inconstancy of our weather.

1604. *Dorycnium*. The Greek name of an herb, supposed to be the *Convolvulus Dorycnium* of the moderns. The plant now called by the name has no resemblance to that of the ancients. *D. hirsutum* is a beautiful half-hardy shrub, well deserving cultivation.

History, Use, Propagation, Culture,

1605. *Medicago*. A native of the country of the *Medes*, whence this plant was brought to Greece during the expedition of Darius. *M. arborea*, the *Cytisus* of the ancients, flowers great part of the year, and when sheltered is seldom destitute of flowers. In the open air it begins to flower in April, and continues till December. Those flowers which appear early in summer, will have the seeds ripe in August, or the beginning of September, and the others will ripen in succession. It grows in great plenty in Abruzzo, and many parts of the kingdom of Naples, where the goats feed upon it; and with their milk abundance of cheese is made there. It also abounds in several of the islands in the Archipelago, where the Turks use the wood to make handles for their sabres; and the caloyers, or Greek monks, form their beads of it. In old shrubs, the heart is of a dark color, and hard like ebony.

According to Miller, this shrub bids the fairest of any to be the *Cytisus* of Virgil, Columella, and the other ancient writers on husbandry; and being celebrated by them as an excellent fodder, has been recommended for cultivation here. But however useful it may be in Candia, Rhodes, Sicily, Abruzzo, and other dry warm countries, yet it will never thrive in England, (where we have also many plants of this leguminous tribe far more succulent than this,) so as to be of any real advantage; for in severe frost it is very subject to be destroyed, or at least so much damaged, as not to recover its former verdure before the middle or end of May; (and even after a mild winter, it will generally appear injured by our cold spring winds, even at that season; so that it cannot be of any use here for early spring fodder.) Besides, the shoots will not bear cutting above once in a summer, and then will not be of any considerable length: and the stems growing very woody, the cutting of it will be very troublesome. Upon the whole, therefore, it is not worth the trial; though in hot, dry, rocky countries, where few other plants will thrive, it may be cultivated to great advantage. But, however unfit *Tree Medick* may be for use as fodder in England, yet for the beauty of its hoary leaves, abiding all the year, together with its long continuance in flower, it deserves a place in every good garden and plantation, with shrubs of the same growth. (*Dict. in loco, and Martyn's Virg.*)

*M. sativa*, *Foin de Bourgogne*, Fr., *Alfalfa*, Span., and *Lucerne*, Eng., (from the Languedoc patois *Lauserda*), is a deep rooting perennial plant, sending up numerous small and tall clover-like shoots, with blue or violet spikes of flowers. It is highly extolled by the Roman writers; it is also of unknown antiquity in old Spain, Italy, and the south of France; is much grown in Persia and Peru, and mown in both countries all the year round. It is mentioned by Hartlib, Blythe, and other early writers, and was tried by Lisle; but it excited little attention till after the publication of Harte's Essays, in 1757. But though it has been so much extolled, it has yet found no great reception in this country. If any good reason can be given for this, it is, that lucern is a less hardy plant than red clover, requires three or four years before it comes to its full growth, and is for these and other reasons ill adapted to enter into general rotations. When the climate and soil suit, perhaps, a field of it may be advantageously sown, adjoining the homestall, to afford early cutting or food for young or sick animals, for which it is said to be well adapted; but though it will produce good crops for eight or ten years, yet from the time the farmer must wait till this crop attains its perfection, and from the care requisite to keep it from grass and weeds, we do not think it is ever likely to come into general culture.

There are no varieties of the lucern deserving the notice of a cultivator. What is called the yellow lucern, or Swiss lucern, is the *Medicago falcata*, a much more hardy and coarser plant, common in several parts of England, but not cultivated any where excepting in some poor soils in Switzerland.

 10910 Pedunc. about 2-fl. Pods cochleate cylindr. convex at each end aculeate, Aculei straight  
 10911 Pedunc. about 2-fl. Pods cochleate oval with downy pubescent setaceous appressed reflexed prickles  
 10912 Pedunc. about 2-fl. Pods cochleate oval with straight subulate downy prickles  
 10913 Pedunc. many-fl. Pods cochleate compressed at each end with subulate straight prickles  
 10914 Pedunc. about 2-fl. Pods cochleate compressed at each end with subulate arcuate prickles  
 10915 Pedunc. many-fl. Pods cochleate cylindr. flat at each end pubesc. with close-pressed subul. prickles  
 10916 Pedunc. many-fl. Pods cochleate flat at each end with 3 netted folds muricate at edge  
 10917 Pedunc. about 2-fl. Pods cochleate cylindr. flat at each end with smooth lanc. distich. close-pressed prickles

and Miscellaneous Particulars.

The soil for lucern must be dry, friable, inclining to sand, and with a subsoil not inferior to the surface; unless the soil be good and deep, it is in vain to attempt to cultivate lucern.

The preparation of the soil consists in deep ploughing and minute pulverisation; and, in our opinion, the shortest way to effect this, is to trench it over by the spade to two or three feet in depth, burying a good coat of manure in the middle, or at least one foot from the surface. This is the practice in Guernsey, where lucern is highly prized.

The climate for lucern, as we have already hinted, must be warm and dry; it has been grown in Scotland and Ireland, and might probably do well in the southern counties of the latter country, but in the former it has not been found to answer the commendations of its admirers.

The season most proper for sowing lucern, is as early as can be done in the spring months, as in this way the plants may be fully established before the season becomes too hot. If the plants be intended to be transplanted out in the garden method, it will also be the best practice to sow the seed-bed as early in the spring as the frosts will admit, in order that they may be strong, and fit to set out about the beginning of August.

The manner of sowing lucern is either broad-cast or in drills, and either with or without an accompanying crop of corn for the first year. Broad-cast, and a very thin crop of barley or other spring corn, is generally, and, in our opinion, very properly preferred.

The quantity of seed, when the broad-cast method is adopted, is said to be from fifteen to twenty pounds per acre, and from eight to twelve if drilled. The seed is paler, larger, and dearer than that of clover; it is generally imported from Holland, and great care should be had to procure it plump and perfectly new, as two years old seed does not come up freely. The same depth of covering as for clover will answer.

The after-culture of lucern, sown broad-cast, consists in harrowing, to destroy grass and other weeds; rolling, after the harrowing, to smooth the soil for the scythe, and such occasional top-dressings of manure as the state of the plants may seem to require.

The top-dressings given to lucern may be either of the saline or mixed manures. Ashes are greatly esteemed, and also gypsum and liquid manure of any kind.

The taking of lucern by mowing for soiling, or hay, or by tethering, hurdling, or pasturing, may be considered as the same as for clover. Lucern frequently attains a sufficient growth for the scythe towards the end of April, or beginning of the following month; and in soils that are favorable for its culture, will be in a state of readiness for a second cutting in the course of a month or six weeks longer, being capable of undergoing the same operation at nearly similar distances of time during the whole of the summer season.

The application of lucern is also the same as of clover. The principal and most advantageous practice, in the application of lucern, is that of soiling horses, neat cattle and hogs; but as a dry fodder, it is also capable of affording much assistance, and as an early food for ewes and lambs, may be of great value in particular cases. All agree in extolling it as food for cows, whether in a green or dried state.

The produce of lucern, cut three times in a season, has been stated at from three to five and even eight tons per acre. In soiling, one acre is sufficient for three or four cows during the soiling season, and a quarter of an acre, if the soil be good, for all sorts of large stock, for the same period, or half an acre on a moderate soil.

The nutritive product of lucern, according to Sir H. Davy, is 2.3-tenths per cent, and is to that of the

History, Use, Propagation, Culture,

clovers and saintfoin as 23 to 39. This result does not very well agree with the superior nutritive powers attributed to lucern; and is one proof, among many, how little the analysis of the chemist agrees with the experience of the farmer.

To save seed, the lucern may be treated precisely as the red clover, and it is much easier threshed, the grains being contained in small pods, which easily separate under the flail, or a threshing machine, or clover mill.

M. lupulina, Hop-trefoil, sometimes called Shamrock, and in Norfolk Black Nonesuch, is cultivated occa-

sionally along with the perennial clovers, and sometimes confounded with the common yellow clover, which is an annual and much smaller plant. Its treatment is the same as that of white clover; but its herbage is little relished by cattle, and both it and the yellow clover are going fast out of repute.

M. scutellata and intertexta are sown as border flowers for the curiosity of their pods.

1606. *Hymenocarpus*. From *ἕμειν*, a membrane, and *καρπος*, fruit, in allusion to the membranous texture of the pods. Little inconspicuous plants resembling *Trifolium*.

CLASS XVIII. — POLYADELPHIA. STAMENS united into several parcels.

ONE of the smallest of the Linnean classes, characterized by the cohesion of the filaments in several parcels. It almost wholly consists of plants remarkable either for their beauty or importance otherwise. From the *Theobroma* the nutritious substance which forms the basis of Chocolate is procured. *Melaleuca* and its allies are among the most elegant of New Holland plants. The genus *Symplocos* contains a plant useful as a dye. To *Citrus* belong the Orange, Lemon, Lime, and all their delicious varieties; and the *Loasa*, with which the class is here concluded, consists of some of the most ornamental and curious of our garden annuals. By some botanists this class is distributed among others, especially *Icosandria* and *Polyandria*.

Order 1. DECANDRIA.  Stamens 10 or 12.

1607. *Theobroma*. Cal. 5-leaved. Petals 5, forcinate. Nectary urceolate, with 5 horns. Filaments 5, each with 2 anthers. Style filiform. Stigma 5-parted. Caps. 5-celled, without valvæ. Seeds in a buttery pulp.  
 1608. *Bubroma*. Cal. 3-leaved. Petals 5, 2-horned. Nect. campanulate, 5-rid. Filam. 5, attached to the outside of nectary; each with 3 anthers. Style simple. Capsule woody, warted, valvæless, bored with 12 rows of holes.

History, Use, Propagation, Culture,

1607. *Theobroma*. From *Θεος*, God, and *βρομα*, food, in allusion to the excellent nature of its produce. The Mexicans call the beverage obtained from it *Chocolatl*. (*Nieremb.*) *T. Cacao* is a tree which grows in a very handsome form to the height of twelve or sixteen feet; the trunk is upright, and about as high as a man before the head spreads out; the wood is light and of a white color; the bark brownish. Leaves lanceolate-oblong, bright green, quite entire; flowers small, reddish, inodorous. Fruits smooth, yellow, red, or of both colors, about three inches in diameter: rind fleshy, near half an inch in thickness, flesh-colored within: pulp whitish, the consistence of butter, separating from the rind in a state of ripeness, and adhering to it only by filaments, which penetrate it and reach to the seeds. Hence it is known when the seeds are ripe, by the rattling of the capsule when it is shaken. The pulp has a sweet and not unpleasant taste, with a slight acidity; it is sucked and eaten raw by the natives. The seeds are about twenty-five in number: when fresh they are of a flesh-color: gathered before they are ripe, they preserve them in sugar, and thus they are very grateful to the palate: they quickly lose their power of vegetation, if taken out of the capsule; but kept in it, they preserve that power for a long time. The tree bears leaves, flowers, and fruit all the year through; but the usual seasons for gathering the fruit are June and December. In two years from the seed it is above three feet high, and spreads its branches, not more than five of which are suffered to remain: before its third year is complete it shows for fruit. A tree yields from two to three pounds of seeds annually. These seeds are remarkably nourishing, and agreeable to most people; which occasions them to be commonly kept in most houses in America, as a necessary part of the provisions of the family: they are generally ground or pounded very fine, a little arnatto added, and made into paste: they are much charged with oil, but mix well with milk or water, and are formed into rolls of one pound each.

This simple preparation of chocolate is the most natural and the best. It is in daily use amongst most

1609. *Abroma*. Cal. 5-part. Petals 5, with saccate dilated claws Cup of stamens 10-fid; with 5 segments, each bearing 3 anthers; the other 5 petaloid. Styles 5. Caps. 5-celled, 5-winged, many-seeded.

Order 2. POLYANDRIA.  Stamens indefinite.

1610. *Melaleuca*. Parcels of stamens 5, opposite the petals, long; anthers incumbent. Caps. 3-celled, many-seeded, connate, and included in the thickened tube of the calyx which is grown to the branch.  
 1611. *Tristania*. Parcels of stamens 5, opposite the petals, and scarcely longer than they are; anthers incumbent. Caps. 3-celled, many-seeded, united with the turbinate stalked tube of the calyx.  
 1612. *Calothamnus*. Parcels of stamens 4-5, opposite the petals (some either connate or sterile). Anthers inserted by the base, entire. Caps. 3-celled, many-seeded, connate, and included in the thickened tube of the calyx, which is grown by the base to the branch.  
 1613. *Beaufortia*. Parcels of stamens 5, opposite the petals. Anthers inserted by the base, bifid at the end, with deciduous lobes. Caps. 3-celled, 1-seeded, connate, and included in the thickened tube of the calyx, which is grown by the base to the branch.  
 1614. *Symplocos*. Cal. 5-fid, superior. Petals 5-8; cohering at the base in a tube. Stamens united to the corolla in 4 rows. Drupe dry, 5-celled.  
 1615. *Citrus*. Cal. 5-fid. Petals 5, oblong. Anthers 20; the filaments variously divided. Berry 9-celled.  
 1616. *Xanthochymus*. Cal. 5-leaved. Petals 5. Nectaries 5. Stamens united in 5 parcels. Apple 1-5-seeded.  
 1617. *Hypericum*. Cal. 5-parted. Petals 5. Filaments many in 3 or 5 parcels. Capsule superior.  
 1618. *Ascyrum*. Cal. 4-leaved. Petals 4. Caps. 1-celled, 2-3-valved.  
 1619. *Loasa*. Cal. 5-leaved. Petals 5. Nectary 5-leaved. Caps.  $\frac{1}{2}$ -inferior, 1-celled,  $\frac{1}{3}$ -3-valved, many-seeded.

DECANDRIA.

10933 Leaves entire smooth

10934 Leaves acuminate repand-toothed downy beneath

10935 Leaves cordate ovate acute with unequal serratures

10936 Leaves 7-angled : floral ov. lanc. acuminate somewhat toothed, Pedunc. axill. Branches unarmed

10937 Adult lvs. with simple and stellate hair beneath, Wings of caps. subtruncate at end, Branches muricated

and Miscellaneous Particulars.

families in Jamaica, where the tree is largely cultivated, and affords a nutritious food for children, as well as adults. But as chocolate made abroad cannot by law be imported into this country, consequently all chocolate consumed in Britain ought to be made here. It is composed principally of the kernel of the cocoa, as above mentioned; but the art is in very few hands: and we believe that a small portion of soap is added to most British chocolate, in order to cause it to froth when it is dissolved in hot water.

Cocoa is a simple preparation made in Britain, from the cocoa-nut, or from the shells of it, or from a mixture of both. It is considered much easier of digestion than chocolate, and very nourishing.

In our stoves Theobromas thrive in light rich soil, and cuttings root in sand under a hand-glass.

1608. *Bubroma*. In contradistinction to Theobroma; from *βουρ*, an ox, and *βρωμα*, food, as if producing a substance fit only to be eaten by cattle. *Orme d'Amerique*, Fr. A wide spreading tree, not unlike the Elm, with oblong heart-shaped leaves, which sleep hanging quite down, whilst the petioles remain entirely stiff and straight. It grows in the lowlands of Jamaica, forming a very agreeable shade for the cattle, and supplying them with food in dry weather, when all the herbage is burned up or exhausted. The seeds are very mucilaginous, but otherwise agreeable to the palate. The wood is light, and so easily wrought, that it is generally used by coachmakers in all the side pieces. (*Broune*.) It is also frequently cut into staves for casks. A decoction of the inner bark is very glutinous, and very like that of the elm. In our stoves it thrives well in a loamy soil, and cuttings root freely in sand under a hand-glass.

1609. *Abroma*. Still named with reference to the two preceding genera, from *α*, privative, and *βρωμα*, food; as if unfit for either gods or oxen. This, Sweet observes, "is a hardy stove genus, and easily managed; the species flower freely at various seasons, and will grow in the common garden soil: but a mixture of good loam with a little peat is an excellent compost for them. They propagate freely by seeds and cuttings." (*Bot. Cult.* 10.)

History, Use, Propagation, Culture.

1610. *Melaleuca*. From *μela*, black, and *λευκος*, white: because the original tree has black wood and white branches. A beautiful Australasian genus, which grows and flowers freely in equal parts of sandy loam and peat, with common greenhouse treatment. "Some cultivators," Sweet observes, "grow them entirely in peat, in which they will grow very well for a time; but they will not be strong and healthy, nor flower so well as in a mixture. Ripened cuttings, not too old, will root freely in sand under a bell-glass." (*Bot. Cult.* 223.)

The bark of *Melaleuca Leucadendron* is used by the Chinese as oakum, for making good the spaces between the timbers of their vessels. They also use it in the roofing their houses. From the same tree is obtained the Cajeputi oil, remarkable for its green color, its peppermint flavor, and turpentine smell. It is rarely to be procured in Europe in an unadulterated state. When pure it is one of the best preservatives of preparations of natural history, and is used externally with much success as a cure for rheumatic affections and pains in the joints.

1611. *Tristania*. From *τρίς*, three, and *στάναι*, to stand; in allusion to the ternate disposition of the flowers and leaves. The species may be treated like *Melaleuca*, and are pretty little evergreen shrubs.

1612. *Calothamnus*. From *καλος*, beautiful, and *θάμνος*, a rod, in allusion to the splendid appearance of the branches covered with scarlet blossoms. The species are beautiful plants, and not difficult of culture or propagation in sand, and the air kept still and moderately moist by covering with a hand-glass.

 10954 Leaves opp. lanc. nerveless, Spikes few-fl. Parcels of stamens polyandrous  
 10955 Leaves opp. decussate oval-lanc. 3-nerved, Spikes oval quite smooth, Parcels of stamens polyandrous  
 10956 Leaves opp. lanc. lin. acute 1-nerved, Spikes oval quite smooth, Parcels of stamens multifid  
 10957 Leaves opp. lanc. lin. acute 3-nerved, Spikes obl. smooth, Parcels of stamens longitudinally pinnated  
 10958 Leaves opp. ellipt. obl. 3-nerved : lateral nerves obsol. and close to the recurved edge, Spikes quite smooth  
 10959 Leaves opp. ovate acute 5-7-nerved stalked, Spikes obl. and oval, Bractes leafy  
 10960 Leaves opp. ovate-lanc. 3-5-nerved subsess. Clusters few-fl. Segm. of cal. acute nerveless  
 10961 Leaves ternate obovate 3-nerved smooth, Spikes oblong or oval  
 10962 Leaves tern. lin. lanc. hoary on both sides, as are the branches, Spikes oval or oblong

- 10963 Leaves opp. lanc. Parcels of stamens 3-5-androus  
 10964 Leaves altern. cun. lanc. Branches and calyxes downy, Caps. half superior  
 10965 Leaves lanc. ellipt. acute alternate : terminal clustered, Segm. of calyx acute leafy

- 10966 Flowers 4-fid, Parcels of stamens distinct equal 12-15-androus, Old leaves and fruit smooth  
 10967 Flowers 5-fid, Parcels of stamens distinct equal polyandrous, Old leaves and fruit villous  
 10968 Flowers 5-fid, Parcels of stamens distinct equal 3-androus, Leaves very long and fruit smooth

- 10969 Leaves opp. decussate ovate or oval many-nerved  
 10970 Leaves scattered oval many-nerved

- 10971 Flowers clustered sessile, Leaves glaucous  
 10972 Leaves ellipt. lanc. downy on each side corrugate veiny, Sepals acuminate

- 10973 Peti. somew. winged, Lvs. obl. acute toothed, Fl. 35-androus, Fruit obl. with a thin rind and very acid pulp  
 10974 Petioles naked, Lvs. ov. rounded serrated, Fl. 30-androus, Fruit globose with a nipple and sweet pulp  
 10975 Petioles nearly naked, Lvs. ov. obl. and acute, Fl. 20-androus, Fruit globose with a thin skin and sweet pulp  
 10976 Peti. winged, Lvs. ellipt. acute crenulat. Fl. 20-androus, Fruit glob. with a thin rough skin and bitter pulp

## and Miscellaneous Particulars.

1613. *Beaufortia*. So called in honor of Mary, Duchess of Beaufort, who died January 7, 1714, in the 85th year of her age. She had a fine collection of plants at Badmington, in Gloucestershire, during the life-time of her husband, Henry, first duke of Beaufort. Splendid plants, free-growers, and abundant flowerers, with common greenhouse treatment, in two-thirds peat, and one-third loam. Cuttings, Sweet found to answer best when "taken from nearly ripened wood, planted in sand, and covered with a bell-glass."

1614. *Symplocos*. From *συμπλοκη*, connection ; union. The petals are naturally five, but united at the base so as to seem but one. A tree with oblong fragrant shining leaves, and sweet-smelling flowers, succeeded by subsessile drupes. A decoction of the leaves is used in North America for dying linen and silk of a bright yellow color.

1615. *Citrus*. The meaning of this word has escaped the ingenuity of etymologists. An ancient genus, combining in its species many excellencies, handsome evergreen shining tree-like forms, most odoriferous flowers, and brilliant, fragrant, delicious fruits. It is one of the most striking of fruit-bearing trees, and must have attracted the notice of aboriginal man long before other fruits of less brilliancy, but of more nutriment or flavor. The golden apples of the heathens, and forbidden fruit of the Jews, are supposed to allude to this family, though it is remarkable that we have no authentic records of any species of *Citrus* having been known ; certainly none were cultivated by the Romans. The citron was introduced into Europe from Media, under the name of *malus medica*, and was first cultivated in Italy by Palladius, in the second century. The orange

History, Use, Propagation, Culture,

is supposed to have been introduced into Italy in the fourteenth century, above a thousand years after the citron. In England, these trees have been cultivated since 1629. Parkinson, writing at that time, says, "the orange hath abiden with some extraordinary looking and tending, when neither citron nor lemon trees could be preserved any length of time." The orange trees he alludes to were those of Beddington, in Surrey, introduced from Italy by a knight of the noble family of the Carews (*Gib. on's* edit. of *Camb. Brit.*), and the first that were brought into England; they were planted in the open ground and placed under a moveable cover during the winter months. It has been said that these trees were raised by Sir Francis Carew, from seeds brought to England by Sir Walter Raleigh: but as such trees would not have readily borne fruit, Professor Martyn thinks it much more likely that they were plants brought from Italy. Bradley says, they always bore fruit in great plenty and perfection; that they grew on the outside of a wall, not nailed against it, but at full liberty to spread; they were fourteen feet high, the girth of the stem twenty-nine inches, and the spreading of the branches one way nine feet, and twelve feet another. These trees, Evelyn informs us, were neglected in his time, during the minority of their owner, and finally entirely killed by the great frost in 1739-40; they were planted before 1595.

During the latter end of the seventeenth and beginning of the eighteenth centuries, the orange tree was a very fashionable article of growth in conservatories, when there were but few exotics of other sorts kept there. The plants were procured from Genoa, with stems generally from four to six feet in height; they were planted in large boxes, and were set out during summer to decorate the walks near the house, in the manner still practised at Versailles and the Thuilleries. About the middle of the eighteenth century, when a taste for botany and forcing exotic fruits became general, that for superb orange trees began to decline; many of these large trees have decayed through neglect; and those which are now to be found in the greater number of greenhouses, are generally dwarf plants bearing few fruit, and those of small size. In some places, however, are still to be found large and flourishing trees. Those at Smorgony, in Glamorganshire, are the largest in Britain; they are planted in the floor of an immense conservatory, and bear abundantly. It is said that the plants were procured from a wreck on the coast in that quarter, in the time of Henry VII.

At Nuneham, near Oxford, are some fine old trees, planted under a moveable case, sheltered by a north wall. In summer the case is removed, and the ground turfed over, so that the whole resembles a native orange grove. At Wormleybury, Hertfordshire, and Shipley Hall, in Derbyshire, are very fine large orange and lemon trees grown in borders and in boxes. (*Hort. Trans.* vol. ii. 295, and iv. 306.)

At the Wilderness, Kent, are three trees in boxes, not surpassed by any trees so grown in Europe.

At Woodhall, near Hamilton, trees of all the species of Citrus are trained against the back walls of forcing houses, in the manner of peaches, and produce large crops of fruit.

In the south of Devonshire, and particularly at Saltcombe, one of the warmest spots in England, may be seen, in a few gardens, orange trees that have withstood the winter in the open air upwards of a hundred years. The fruit is as large and fine as any from Portugal. Trees raised from seed, and inoculated on the spot, are found to bear the cold better than trees imported.

The common character of the Citrus family is that of low evergreen trees, with ovate or oval-lanceolate, entire or serrated leaves. On the ungrafted trees are often axillary spines. The flowers appear in peduncles, axillary or terminating, and one or many-flowered. The fruits are large berries, round or oblong, and generally of a yellow color. The species seem best distinguished by the petiole, which in the orange and shaddock is winged; in the citron, lemon, and lime, naked. The form of the fruit, although not quite constant, may also serve for a distinction. In the orange and shaddock it is spherical, or rather an oblate spheroid, with a red or orange-colored rind; in the lime, spherical, with a pale rind; in the lemon, oblong, rough, with a nipple-like protuberance at the end; in the citron, oblong, with a very thick rind. The flowers of the citron and lemon have ten stamens, and those of the orange more. It is very difficult to determine what is a variety, and what is a species in this genus; many of the sorts in cultivation are by buds.

Dr. Sickler, who spent several years in Italy, and paid great attention to the kinds and culture of the orange, published in 1815, *Der Vollkommen Orangerie-Gartner* (The complete Orange Gardener), in which he describes above seventy sorts of Citrus.

Gallezio (*Traité du Genre Citrus*, &c. Savonna, 1818.) has given a synopsis of the forty principal sorts cultivated in Italy.

The most splendid work on oranges which has yet appeared is the *Histoire Naturelle des Orangers*, by Risso, of Nice, and Poiteau, of Versailles. (Paris, fol. 1818.) Here 169 sorts are described, and 105 of them figured, and their French and Italian culture given at great length. They are arranged as sweet oranges, of which they describe 42 sorts; bitter and sour oranges, 32 sorts; bergamots, 5 sorts; limes, 8 sorts; shaddocks, 6 sorts; lumes, 12 sorts; lemons, 46 sorts; citrons, 17 sorts.

All the species of Citrus endure the open air at Nice, Genoa, and Naples; but at Florence and Milan, and often at Rome, they require protection during the winter, and are generally placed in conservatories and sheds. The largest conservatory in Italy is that of Prince Antonio Borghese, at Rome, which contains seventy select sorts of *agrumi*. The largest trees are at Sorenta, Terracina, Gaeta, and Naples; but the most regular and garden-like culture of the orange, is in the orange-orchards at Nervi, Monaco, and other places in the neighbourhood of Genoa. At Nervi are also the orange nurseries which may be said to supply all Europe with trees; they are, in general, wretchedly cultivated, and the stocks inoculated in the most unscientific manner; but the fine climate, strong clayey soil, and abundant manurings, supply in a great degree the nicer practices

- 10977 Petioles lin. very short, Lvs. ovate retuse, Flowers racemose  
 10978 Petioles sublinear straight, Branches ascending unarmed, Fruit depressed, Skin separated from flesh  
 10979 Petioles naked, Lvs. obl. acute, Fl. 40-androus, Fruit obl. rugose with acid pulp  
 10980 Petioles winged, Lvs. blunt emarg. Fruit very large with a thick skin

and Miscellaneous Particulars.

of gardening. There the names of varieties vary as much as those of gooseberries do in England; but from upwards of 180 names, not above 40 distinct sorts can be procured. Good plants of the Maltese and other varieties of orange may be procured from Malta; and some sorts also from Lisbon. From the nurseries at Paris about thirty sorts may be obtained, much smaller plants than those from the other places named, but more scientifically grafted or inoculated. The catalogues of London nurserymen enumerate about thirty varieties of oranges, twelve of lemons, and several varieties of the other species; the plants are partly Genoese, partly French, and partly propagated here.

The *C. aurantium*, the common orange; *orange*, Fr., *pomcranzse*, Ger., and *arancio*, Ital., is a middle-sized evergreen tree, with a greenish-brown bark; and, in its wild state, with prickly branches. The fruit is nearly round, from two to three inches in diameter, and of a gold color. It is now cultivated in most countries of Europe; in the open air in Italy and Spain; and in conservatories or greenhouses in Britain and the north of Europe.

The two principal varieties are the sweet or China orange, the *orange douce* of the French, and *porto-gallo* or *poma de sino* of the Italians; and the bitter or Seville, the *bigarade* of the French, and *arancio volgare* of the Italians. The Maltese orange, distinguished by its red pulp, is also a noted and much-esteemed sort. The box-leaved, willow-leaved, and some others, are cultivated more as curious varieties than for their fruit.  
*C. Medica*, the citron, *citron*, Fr., *citronier*, Ger., and *cedrate*, Ital., in its wild state grows to the height of about eight feet, erect and prickly, with long, reclining branches. The leaves are ovate, oblong, alternate, serrate, smooth, pale green. The fruit or berry is half a foot in length, ovate, with a protuberance at the lip. There are two rinds, the outer thin, with innumerable miliary glands, full of a most fragrant oil; the inner thick, white, and fungous.

In China they have a variety of the *C. Medica*, of very considerable size, quite solid, with scarcely any pulp or cells, and divided at the end into five or more long round lobes, on which account it is called *Phat thu*, or finger-orange. The fruit is laid upon fine porcelain vessels in the sitting-rooms of the Chinese, for the sake of its agreeable perfume.

Dr. Sackler enumerates only about a dozen citrons and citronates as grown in Italy. The French nurseries have nearly twenty names in their lists. In England six are cultivated for sale.  
*C. Limonum*, the lemon; *limon*, Fr., *limonier*, Ger., and *limone*, Ital., has the fruit less knobbed at the extremities, is rather longer and more irregular, and the skin is thinner than in the citron; the wood is more knotty, and the bark rougher.

Dr. Sackler enumerates twenty-eight varieties as grown in Italy. The French, according to Ville Hervé have eleven sorts; in the London nurseries are cultivated twelve.

*C. Limetta*, the lime, by some esteemed a variety of the *C. Medica*, *lime*, Fr., Ital., and Ger., grows to the height of about eight feet, with a crooked trunk, and many diffused branches, with prickles. The leaves are ovate lanceolate, almost quite entire. Berry an inch and a half in diameter, almost globular, with a protuberance at the top; the surface regular, shining, greenish-yellow, with a very odorless rind, enclosing a very acid juice.

The French have two sorts of lime; and, according to Dr. Sackler, the Italians have four varieties; five kinds are grown in the London nurseries.

*C. decumana*, the shaddock, *orange pampelmouse*, Fr., *arancio massimo*, Ital., is above the middle size, with spreading prickly branches. The leaves are ovate, subacute, seldom obtuse; the petioles are cordate, winged; the wings as broad as the leaves. The berry spheroidal, frequently retuse at each end, of an even surface, and greenish-yellow color; pulp red or white; juice sweet or acid; rind white, thick, fungous, and bitter. Thunberg says, the fruit in Japan grows to the size of a child's head, and Dr. Sackler states its weight as fourteen pounds, and its diameter as from seven to eight inches. It is a native of China and Japan, and was brought to the West Indies by Captain Shaddock, from whom it has derived its name.

The Italians, according to Dr. Sackler, have one, and the French, according to the *Nouveau Cours*, &c., four sorts. Four are grown in the English nurseries.

All the sorts may be propagated by seeds, cuttings, layers, and grafting, or inoculation.

The object of raising plants from seed is either to obtain new varieties or stocks for grafting. To attempt raising new varieties in Britain will in general be found a tedious process, as the trees do not even in Italy show fruit for six or eight years or more; and there is now in the botanic garden at Toulon, a large handsome tree, of twenty-five years' growth, which in 1819 had not blossomed. Shaddock stocks are the strongest, and next to these the citron. Budding and grafting are performed at the usual season; but these operations may be performed at any time when the sap is in motion.

Henderson, of Woodhall, a most superior cultivator of the *Citrus* tribe, considers cuttings as the quickest mode of getting plants, and has practised it for thirty-seven years past; his directions are as follows: "Take the strongest young shoots, and also a quantity of the two years old shoots; these may be cut into lengths from nine inches to eighteen inches. Take the leaves off the lower part of each cutting to the extent of about five inches, allowing the leaves above that to remain untouched: then cut right across, under an eye; and make a small incision in an angular direction on the bottom of the cutting. When the cuttings are thus prepared, take a pot, and fill it with sand; size the cuttings, so that the short ones may be all together, and those that are taller in a different pot. Then, with a small dibble, plant them about five inches deep in the sand, and give them a good watering overhead, to settle the sand about them. Let them stand a day or two

History, Use, Propagation, Culture,

in a shady place, and if a frame be ready with bottom heat, plunge the pots to the brim. Shade them well with a double mat, which may remain till they have struck root; when rooted, take the sand and cuttings out of the pot, and plant them into single pots, in the proper compost. Plunge the pots with the young plants again into a frame, and shade them for four or five weeks, or till they are taken with the pots; when they may be gradually exposed to the light. From various experiments, I found that pieces of two year old wood struck quite well; and in place, therefore, of putting in cuttings six or eight inches long, I have taken off cuttings from ten inches to two feet long, and struck them with equal success. Although I at first began to put in cuttings only in the month of August, I now put them in at any time of the year, except when the plants are making young wood. By giving them a gentle bottom heat, and covering them with a hand-glass, they will generally strike root in seven weeks or two months. The citron is most easily struck, and is the freest grower; therefore, frequently strike pieces eighteen inches long, and as soon as they are put into single pots, and taken, with the pots, they are grafted with other sorts, which grow freely. I am not particular as to the time either of striking cuttings or of grafting." (*Caled. Hort. Mem.* iii. 308.)

At Genoa and Florence, citrus trees are grown in a strong yellow clay, which is richly manured; and this soil is considered by the first Italian gardeners as best suited to their natures.

The French gardeners, in preparing a compost for the orange-tree, endeavour to compensate for quantity by quality; because the pots or boxes in which the plants are placed ought always to be as small as possible, relatively to the size of the tree. The following is the composition recommended: to a fresh loam, which contains a third of clay, a third of sand, and a third of vegetable matter, and which has lain a long time in a heap, add an equal bulk of half-rotten cow-dung. The following year turn it over twice. The succeeding year mix it

10981 Leaves oblong

10982 Leaves smaller oval blunt

§ 1. *Sepals united at base and unequal. Stamens 00. Styles 3-5. ASCYREIA.*

10983 Young stem winged, Lvs. ov. obl. acute dilated at base somew. emarg. revolute at edge, Fl. corymbose

10984 Branches double-edged, Lvs. ov. elongated blunt at end narrow at base, Fl. large subsolitary

10985 Branches double-edged, Lvs. obl. ellipt. bluntnish at end narrowed at base with a crisp revolute edge

10986 Branches winged, Lvs. emarg. at base dilated sess. acute at end ovate lanc. glandular at edge

10987 Branches winged, Lvs. sess. open ovate obl. somewhat acute slightly perforated

10988 Stem round, Lvs. sess. lanc. not dotted numerous, Peduncles dilated at end

10989 Stem round, Lvs. ellipt. ovate bluntnish with pellucid dots, Calyx ovate acute

10990 Stem obsolete quadrangular, Branches compressed, Lvs. ov.-lanc. acute, Cal. blunt ovate

10991 Stem round, Lvs. ellipt. blunt a little dotted with black, Styles united

10992 Stem round shrubby, Lvs. ov. amplexicaul. cordate not dotted clustered, Flowers few

10993 Stem winged, Lvs. amplexicaul. obl. lanc. acute revolute at edge, Pedunc. short thick

10994 Stem square herbaceous simple erect, Leaves amplexicaul. lanc. acute with pellucid dots

10995 Stem winged at base square at end herbaceous simple, Lvs. obl. lanc. acute

10996 Stem round suffruticose purple, Lvs. ovate lanc. acute narrowed at base revolute at edge with pellucid dots

10997 Branches square, Lvs. lin. lanc. Flowers in terminal corymbs

10998 Styles 5, Fl. solitary, Segm. of the cal. unequal obovate obtuse, Lvs. obl. Stem shrubby branched square

10999 Stem square warted, Lvs. ovate blunt amplexicaul. warted

11000 Styles 3, Caps. pulpy, Stem shrubby compressed, Cal. leaflets unequal, Leaves ovate sessile

§ 2. *Sepals 5, equal, entire. Stamens deeply triadelphous; parcels pencilled at end. Styles 3. TRIDESMOS.*

11001 Flowers trigynous, Leaves subpetiolate very dense, Pedunc. about 5-fl. axillary

§ 3. *Sepals 5, equal, entire. Styles 3. Filaments definite in number, 9-15-18, deeply united. ELODEA.*

11002 Stem herbaceous round, Leaves oblong blunt narrowed into a stalk with pellucid dots

11003 Stem round half-shrubby, Leaves oblong blunt amplexicaul. with pellucid dots

§ 4. *Sepals 5, equal, sometimes entire, or with glandular teeth, Stamens 00. Styles usually 3. PERFORARIA.*

\* *Sepals entire.*

11004 Stem herbaceous square erect, Leaves distant long ovate amplexicaul. sinuated at edge acute not dotted

11005 Stem round black dotted, Leaves ovate-lanc. somewhat acute amplexicaul. dotted with black

11006 Stem erect purple, Leaves lin. lanc. reflexed with pellucid dots, Flowers corymbose

11007 Stem procumbent square herbaceous, Leaves linear-lanceolate blunt revolute at edge with pellucid dots

11008 Stem round straight, Leaves amplexicaul. blunt ovate revolute at edge, Styles united

11009 Stem straight square, Leaves ovate-lanceol. slightly amplexicaul. dotted with black revolute at edge

11010 Stem round, Leaves ovate cordate amplexicaul. or cuneate lanc. revolute at edge

11011 Stem round, Branches angular, Lvs. linear lanc. revolute at edge with pellucid dots, Styles often united

11012 Stem round, Leaves cordate amplexicaul. blunt revolute at edge glaucous with pellucid dots

11013 Flowers trigynous, Styles united, Lvs. ovate subamplex. Sepals ov. acute, Middle flower of panicle sessile

11014 Stem square and winged, Leaves ovate obl. blunt needle-dotted not pellucid, Panicle naked

11015 Styles 3, Stem herbaceous 4-angular somewhat branched, Leaves ovate with pellucid dots, Cal. lvs. lanc.

β Stem obsolete quadrangular, Leaves elliptical ovate obtuse destitute of pellucid dots, Cal. lvs. elliptical

11016 Stem round dotted with black, Leaves ovate obl. blunt amplexicaul. dotted with black

11017 Stem weak square smooth, Leaves ovate subcordate blunt revolute at edge scarcely dotted beneath

and Miscellaneous Particulars.

with nearly one-half its bulk of decomposed horse dung. Turn it over twice or three times, and the winter before using add a twelfth-part of sheep dung, a twentieth of pigeon dung, and a twentieth of dried ordure.

Henderson, already mentioned, takes one part of light-brown mould from a piece of ground that has not been cropped nor manured for many years; one part of peat earth, such as is used for growing heaths; two parts of river sand, or pit sand, if it be free from mineral substances; and one part of rotted hot-bed dung, with one part of rotted leaves of trees, and mixes them all well together, so as to form a compost-soil of uniform quality. (*Calcd. Hort. Mem. iii. 302.*)

Though orange-trees will grow exceedingly well in large pots and boxes, yet to have them produce the finest crop of fruit they should be planted in the ground like peach-trees, and trained like them, or as standard cherries in a conservatory. The latter has by far the best effect, especially when the stems of the trees are seven or eight feet high, and the head forms a handsome cone; but the largest fruit is produced when the trees are planted against the back-wall trellis of a narrow house, and treated like peach-trees. Henderson grows his largest fruit in this manner, and we have seen them fully as large as any we ever saw at Genoa or Naples.

1616. *Xanthochymus*. From *ξανθοχυμος*, yellow, and *χυμος*, any thing which exudes: in allusion to the color of the juice which flows from the ripe fruit when wounded, and which, being inspissated, yields a material for water-color painting which is as good as Gamboge. Handsome plants, of the usual culture in light loam, and propagated by cuttings in sand under a hand-glass.

1617. *Hypericum*. A name of unknown meaning. The species are chiefly under-shrubs, generally with dotted leaves, and almost, without exception, yellow flowers. The hardy species are useful for the fronts of

History, Use, Propagation, Culture,

shrubberies. *H. calycinum* soon spreads over a considerable surface, and being evergreen, and growing under the shade, it is well adapted for covering bare spots under trees, and at the base of walls where few plants will thrive.

*H. Androsæmum*; from *ærgo*, a man, and *æiua*, blood, because the fresh capsules, bruised between the fingers, give out a blood-colored juice, is called Tutsan from *Toute-saine*, Fr., from its bruised capsules being formerly applied to fresh wounds.

*H. perforatum* was formerly used in external wounds and hemorrhages as a balsamic, and was reputed to have other medical properties. The semi-transparent dots on the leaves are the receptacles of an essential oil. The flowers tinge spirits and oils of a fine purple color; and the dried plant, boiled with alum, dyes wool of a yellow color. The common people in France and Germany gather it with great ceremony on St. John's day, and

 11052 Sepals toothed shorter than petals, in fruit erect and shorter than the pear-shaped capsule  
 11053 Stem twining, Leaves bipinnatifid with narrow obtuse segments  
 11054 Hispid, Leaves opposite and alternate cordate ovate lobed, Petals flattish, Flower very large

*and Miscellaneous Particulars.*

hang it in their windows as a charm against storms, thunder, and evil spirits ; mistaking the meaning of some medical writers, who have fancifully given this plant the name of *Fuga Demonum*, from a supposition that it was good in maniacal and hypochondriacal disorders. In Scotland it was formerly carried about as a charm against witchcraft and enchantment.

*H. humifusum* is one of the prettiest little plants of the genus, well adapted for growing in pots.

1618. *Ascyrum*. From *as*, privative, and *scyrus*, roughness ; that is to say, a smooth plant, *Linna.* Curious little plants, of the same culture as the *Hypericum*.

1619. *Loasa*. A name applied to these plants by Adanson, but of unknown meaning. Stinging, mostly annual plants ; some of the species are handsome hardy annuals, remarkable for the beauty of their highly curious flowers. *L. volubilis* will not succeed in the open air.

CLASS XIX. — SYNGENESIA. STAMENS 5. ANTHERS united by their edges.

THIS is one of the most extensive and best defined of all the Linnæan classes. Its essential character depends, as its name indicates, (*syn*, together, and *genesis*, generation,) upon the adhesion of the anthers or male organs of the flower into a single tube. It comprehends the whole of the Corymbiferae, Cichoraceae, and Cinarocephalæ of Jussieu; and, with the exception of Acicarpeae, nothing else. The genera constituting the order Monogamia of Linnæus are excluded by Linnæan botanists of the present day.

In addition to the cohesion of the anthers, upon which this class immediately depends, it is further characterized by the flowers, commonly called florets, being clustered together in heads, and inserted upon a common receptacle, which is surrounded by an involucre, commonly, but very improperly, termed calyx. The few genera, such as Kuhnia, Euxenia, Acicarpha, &c., in which a union of anthers either does not exist at all, or in a very incomplete degree, are therefore retained in Syngenesia, because of their congruity in the structure of their inflorescence.

The real nature of the various constituent parts of syngenesious inflorescence being, from its complicated nature, very puzzling to the unlearned, and, as it would seem, to some professors also, it may be useful to explain briefly the analogy the various parts bear to the organs of other plants, and the terms employed in describing them.

The *Head* or *Capitulum* is a cluster of flowers of the nature of an umbel, inserted upon a common rachis, which, by contraction or incomplete development, assumes the form of a conical or flat body, out of which the flowers proceed, and which is called a receptacle. This is surrounded by the involucre. M. Cassini calls the head *Calathide*.

The *Involucre* is the most external part of the head. It consists of a more or less considerable number of scales or leaves, placed in a single row, either distinctly from each other, or united at their edges, in which case the involucre is called one-leaved; or placed in many rows, becoming gradually shorter as they are external, in which case they are called imbricated. If the external scales surround the internal at the base in a regular manner, then the involucre is said to be calyculate. The involucre was called *common calyx* by Linnæus, and has been more recently denominated a perianthium. M. Cassini names it *Pericinium*.

The *Receptacle* (Cinanthium of Cassini) is a cellular fungous surface surrounded by the involucre, and bearing the florets. It is either columnar, conical, flat, or depressed; and naked, or covered with appendages called hairs or bristles, according to their nature or paleæ, when they are dilated and have a glutinous appearance. If naked, and merely scarred by the insertions of the florets, it is called dotted or punctulate; when the scars are more considerable and deeper, the receptacle is said to be scrobiculate; if the insertions are so deep as to appear to be divided by membranous partitions, it is cellular, or favose, or alveolate; if furnished with hairs, it is villose; if with paleæ, it is paleaceous or chaffy.

The *Paleæ* are of the same nature as bractæe, and exist in various degrees of development. Occasionally they are as large as the scales of the involucre, which they in that case closely resemble.

The flower, usually termed *Floret*, consists of two parts, the ovarium and the corolla, each with its appendages.

The *Ovarium* is always one-celled, but it occasionally has two additional obsolete cells, as in Arctotis. It is either naked, or covered with hairs in various degrees, occasionally becoming enveloped in fine wool, and it is surmounted by an organ named the pappus.

The *Pappus* has generally been esteemed a superior calyx, and it is the opinion of M. Cassini that it is analogous to the scales of the receptacle, and the leaves of the involucre.

The *Corolla* is placed on the top of the ovarium. It is either funnel-shaped, with a limb divided into four or five equal lobes, in which case the florets are denominated *tubular*; or it is split on one side, and spread open into the form of a strap, when the florets are called *ligulate*; or it is divided into two portions, of which one is unequal to the other; this form is called bilabiate or two-lipped. Bilabiate corollas may be either ligulate or flosculosal, according to the species to which they belong. Occasionally the corolla appears to be absent.

The *Stamens* are attached to the orifice of the tube of the corolla, just below the limb. Their *filaments* are usually, but not always, distinct; their *anthers* are adherent by their edges, and furnished with a little membranous appendage at the tip, and sometimes with two spur-like processes at their base.

The *Style* is filiform, and either split at the summit into two linear spreading stigmas, or consists of a single piece from the base to the summit. The form and surface of the stigma, and the upper part of the style are subject to a great diversity of appearances, which are of the utmost importance in determining the affinities of the genera.

The *Florets* are either hermaphrodite, unisexual, or neuter. Upon these differences of sex the orders of Linnæus are founded.

In *Syngenesia æqualis* the florets are all hermaphrodites.

In *Syngenesia superflua*, those of the disk or centre are hermaphrodite, of the circumference or ray female, (and *superfluous*.)

In *Syngenesia frustranea*, those of the disk are hermaphrodite, of the ray neuter, (and *useless*.)

In *Syngenesia necessaria*, those of the disk are male, of the ray female, (and *necessary*.)

*Syngenesia segregata* is only characterized by the heads themselves being clustered and surrounded by a common involucre.

The genera of Syngenesia have always attracted much attention from systematic botanists, who have met with very unequal success in characterizing them. The older botanists comprised them all under a few general heads or names. Tournefort, with his usual happiness, pointed out a large proportion of the most natural genera. Vaillant established a considerable number. Linnæus, profiting by the labours of his predecessors, rejecting some genera, and dividing others, increased their number, and adapted them to his sexual system, in nearly the same order in which they exist at the present day. Jussieu, by applying to the genera the principles of his natural method, reduced them to an arrangement much superior in point both of facility and of natural affinity to that of his northern rival. But however meritorious the labours of these great systematists may have been, much remained to be effected, even among their own plants, by those who followed them. The indefatigable Gærtner, who worked upon the only satisfactory or philosophical principle, that of strict analysis, soon discovered that the combinations of Linnæus and Jussieu were often too vague and ill defined to accord with his notions of accurate subdivision. Hence many other genera arose. But since his days, the extent of Syngenesia has, like all other parts of botanical science, increased exceedingly, and has arrived in our days at a state little short of absolute confusion. Injudicious or superficial botanists, impressed with the fear of innovation, and with a pious reverence even for the errors of those who went before them, have from time to time crowded the genera of Jussieu and Linnæus with the most incongruous species, and so have rendered many of those which were originally pure and simple, heterogeneous masses of species. Much has been done by our learned countryman, Mr. Robert Brown, to reduce to order this class of individuals, and, as far as his published observations have extended, with the happiest success. In France, an ingenious and accurate observer, Mr. Henry Cassini, has undertaken a revision of the whole class, upon principles peculiar to himself; and it must be allowed, that what he has executed has given ample room for regret that he has not published more. Unfortunately, his observations are scattered over the face of many books, and are in no case in such a state of arrangement as to be extensively useful. It is hoped that a period will soon arrive when he, or at least some

of his countrymen, will place in one view the result of his labours, so as to enable the world to judge with more accuracy, both of their extent, and of their real importance in defining the limits of the genera and their orders. The style and stigma, which had been previously almost overlooked, have furnished M. Cassini with what appear to be beautiful distinguishing marks of his orders; and it is upon these organs that much of the peculiarity of his arrangement depends. In the mean while, till it can be ascertained what the ultimate division of Compositæ is likely to be, it has been considered more prudent in this work to indicate none of the divisions of either M. Cassini, or of his fellow-labourers in France or elsewhere.

In a popular point of view, Syngenesia may be considered interesting in a high degree. It abounds in plants of ornament, all of which are, without exception, of easy cultivation. It is not necessary to particularize the merits of the brilliant varieties of the Dahlia, or of the Chinese Chrysanthemum, which are the chiefest ornaments of every autumnal garden; nor to point out the beauty of the various tribes of Aster, Helianthus, Coreopsis, Xeranthemum, or Gnaphalium. These and an hundred others must be familiar to every lover of gardening. It is, however, worth remarking, that nearly all syngenesious plants are autumn flowers. In the tropics, many become trees of considerable dimensions; in temperate climates, they are mostly herbaceous or low bushes.

With regard to the qualities of syngenesious plants, considered economically or medicinally, it may be stated, that, whatever they may be, they consist in a bitter principle, and an oily secretion. But these vary in particular tribes. In some the bitter is combined with a resinous principle, by which its powers are increased in different degrees. In those plants in which the resin is found in small quantities only, and mixed with a bitter or astringent mucilage, tonic, stomachic, and febrifugal properties seem to be acquired, as in the camomile, the golden rod, the feverfew, and the Eupatorium perfoliatum; and the stimulant powers of these plants appear to increase in proportion as the resin is abundant. Some kinds are anthelmintic, as the wormwood and tansy; others are emmenagogue, as the feverfew, the yarrow, and various kinds of wormwoods. Certain species possess sudorific qualities, as the Eupatorium, the yarrow, the wormwood, and the marigold; others, again, are powerful diuretics, as Liatris; while stimulating powers exist in considerable activity in others, as in the Sneezewort and Arnica. The Splanthus, Anthemis, Pyrethrum, and some others, excite salivation. The Eupatorium Ayapana of Brazil, and the Guaco of Peru, which is another species of Eupatorium, are most powerful alexiterics. According to the analysis of M. Braconnot, the wormwood owes its bitterness to an extremely bitter animalized matter, which forms a little less than one fifth of its weight; the same chemist also states that plant to contain a volatile oil, and an acid, apparently new, which is found in combination with potash. Before the perfect development of the leaves, the bitter principle is so much diluted with insipid mucilage, that the young shoots of some of the thistle tribe, the Cardoon for example, are used for culinary purposes; and it is probable, that it is owing to the small proportion which the bitter bears to the whole mass, that the receptacle of the artichoke, of the Onopordum, and of the cotton thistle, is found fit for food. The corollas of the Cardoon, and of many thistles, have the power of curdling milk. The juice of the lettuce and other cichoraceous plants is milky, bitter, astringent, and narcotic. In a wild state, the narcotic principle is so abundant, that the inspissated juice of *Lactuca virosa* has been used as a substitute for opium, and with much success. But under the effect of cultivation, the mucilage is so much more abundant than any other substance, that the same species often form well-known articles of wholesome and agreeable food. And, indeed, under any circumstances, wild or domesticated, the young shoots, when the narcotic principle is scarcely developed, are frequently eaten with safety; it is for the same reason, namely, the incomplete formation of the bitter principle, and the superabundance of mucilage, on account of the absence of light, that the blanched leaves of cardoons and chicory, and the white roots of the Scorzonera and the Salsify, are capable of being eaten without inconvenience. The seeds of all syngenesious plants abound in oil, which is expressed from those of the *Madia* of Chili, the *Verbena sativa*, and the common sunflower. Owing to the difficulty of procuring this oil in a pure state, its virtues are not ascertained with much accuracy. They are generally believed to be slightly purgative and diaphoretic.

Order 1.  ÆQUALIS.

*Flowers of the disk and ray all hermaphrodite.*

1620. *Geropogon*. Receptacle setose-paleaceous. Invol. many-leaved, simple, or with bracteola. Pericarpis of disk with branched pappus, of the ray with five awns.
1621. *Tragopogon*. Involucre simple, of many leaves. Receptacle naked. Pappus feathery, stipitate. Pericarpis longitudinally striated.
1622. *Troximon*. Invol. oblong, conical, simple, or imbricated with unequal scales. Recept. naked, dotted. Pappus sessile, hairy.
1623. *Arnoglosson*. Recept. naked. Pappus feathery, stipitate. Involucre 1-leaved, 8-parted, turbinate.
1624. *Podospermum*. Recept. warted. Pericarpis cylindrical on a long stalk. Leaves finely cut. Otherwise as *Scorzonera*.
1625. *Scorzonera*. Recept. naked. Pappus feathery, somewhat stalked. Invol. imbricated, with scales scarios at edge.
1626. *Picridium*. Invol. ventricose at base, imbricated with broadish scales, membranous at edge. Pappus sessile, villous, simple. Pericarpis 4-cornered, warted across.
1627. *Sonchus*. Involucre imbricated, swelling at the base. Receptacle naked. Pappus simple, sessile.
1628. *Lactuca*. Involucre imbricated, cylindrical, its scales with a membranous margin. Receptacle naked. Pappus simple, stipitate.
1629. *Chondrilla*. Receptacle naked. Invol. with bracteola. Pappus simple, stalked. Florets in many rows. Pericarpis muricated.
1630. *Prenanthes*. Involucre with scales at the base. Receptacle naked. Pappus simple, sessile. Florets few.
1631. *Leontodon*. Involucre with scales that are frequently lax and flaccid. Receptacle naked. Pappus simple, stipitate.
1632. *Apargia*. Involucre imbricated with scales at the base. Receptacle naked, dotted. Pappus feathery, sessile, unequal.
1633. *Thrinchia*. Recept. foveose. Pappus of the ray membranous, multifid, of the disk stalked, feathery. Invol. with 8 angles and 8 leaves.
1634. *Picris*. Cal. double, the inner equal, the outer lax. Receptacle naked. Pappus feathery. Pericarpis transversely striated.
1635. *Hieracium*. Involucre ovate, imbricated. Receptacle nearly naked, dotted. Pappus simple, sessile.
1636. *Lagoseris* has the characters of *Crepis*, but the pappus is stalked.
1637. *Borkhausia*. Invol. oblong in two rows, the outer much shorter than the inner. Recept. alveolate. Pappus of the centre stalked, of the circumference sessile or subsessile.
1638. *Crepis*. Involucre surrounded with deciduous scales, and at length swelling into protuberances. Receptacle roughish. Pappus sessile.
1639. *Helminthia*. Recept. naked. Invol. double: outer 8-leaved, equal; inner 5-leaved, as long as outer. Pericarpis striated across. Pappus stalked, feathery.
1640. *Myoseris*. Recept. paleaceous. Paleæ capillary. Invol. calcylated. Pappus hairy, sessile.
1641. *Tolpis*. Recept. foveose. Invol. with bracteola, which are subulate, and as long as invol. Pappus of the ray toothed, of the disk with 2 or 4 awns.
1642. *Andryala*. Recept. villous. Invol. many-parted, nearly equal, rounded. Pappus simple, sessile.

1643. *Rothia*. Recept. villous, chaffy at edge. Invol. many-leaved, equal. Pappus hairy, of the disk sessile, of the ray none.
1644. *Krigia*. Recept. naked. Pappus membranous, 5-leaved, with 5 bristles between. Invol. many-leaved, simple.
1645. *Hyoeris*. Recept. naked. Invol. with bracteolæ. Pappus double: exterior capillary; interior paleaceous, awned.
1646. *Hedypnois*. Recept. naked. Invol. with bracteolæ. Pappus of disk double: outer obsolete, of many bristles; inner paleaceous, 5-leaved; of the ray a membranous toothletted margin.
1647. *Robertia*. Invol. many-leaved, equal. Recept. scaly. Pappus feathery, the hairs being slightly membranous at base.
1648. *Seriola*. Recept. paleaceous. Invol. simple. Pappus somewhat hairy.
1649. *Soldovilla*. Invol. imbricated, in fruit ventricose at base, with scales conniving at end. Recept. paleaceous; paleæ very short, setose. Pappus O.
1650. *Hypochaeris*. Involucre oblong, imbricated. Receptacle chaffy. Pappus feathery, stipitate, or sessile.
1651. *Lapsana*. Involucre with scales at the base. Receptacle naked (its inner leaves equal, channelled, Sm.) Pericarpis destitute of pappus (deciduous).
1652. *Zacintha*. Recept. naked. Pericarpis of the ray incurved, of the disk straight. Pappus very short, somewhat feathery. Invol. with bracteolæ, which are membranous.
1653. *Rhagadiolus*. Recept. naked. Pericarpis arcuate, spreading. Pappus O. Invol. with bracteolæ.
1654. *Moscaria*. Invol. 6-leaved, equal. Recept. flat, paleaceous. External pericarpis with a short feathery pappus; central with none.
1655. *Catananche*. Recept. paleaceous. Invol. imbricated, scarious. Pappus paleaceous, 5-leaved; paleæ awned.
1656. *Triptilion*. Invol. imbricated, the exterior scales somewhat squarrose. Florets bilabiate: the upper lip 3-toothed; lower entire revolute. Recept. villous. Pappus with 3 feathers.
1657. *Cichorium*. Involucre surrounded with scales or smaller leaflets. Receptacle naked or slightly hairy. Pappus sessile, scaly, shorter than the pericarp.
1658. *Baccharis*. Invol. imbricated, scarious. Florets, one in the middle large tubular; the others 4-toothed, with a revolute bristle inserted in the mouth of the tube. Recept. pilose. Pappus feathery.
1659. *Scolymus*. Receptacle paleaceous. Invol. imbricated, spiny. Pappus O.
1660. *Arctium*. Involucre globose, each of its scales with an incurved hook at the extremity. Receptacle chaffy. Pappus simple.
1661. *Serratula*. Involucre cylindrical, imbricated with scales that are not spinous. Receptacle chaffy. Pappus roughish or feathery, rigid, persistent.
1662. *Saussurea*. Involucre imbricated, not spiny, outer scales acute, inner obtuse, membranous. Pappus feathery, in two rows, the exterior being shortest, the inner somewhat united at base.
1663. *Carduus*. Involucre swelling, imbricated with spinous scales. Receptacle hairy. Pappus deciduous, roughish.
1664. *Silybum*. Invol. ventricose, imbricated: outer leaves with appendages at end; inner cochleate. Recept. chaffy. Pappus linear, chaffy, deciduous.
1665. *Cnicus*. Involucre swelling, imbricated with spinous scales. Receptacle hairy. Pappus deciduous, feathery.
1666. *Onopordum*. Involucre swelling, its scales spreading, and spinous. Receptacle cellular. Pappus deciduous, rough.
1667. *Beuardia*. Invol. imbricated with linear unarmed scales. Recept. somewhat favose, naked. Pappus hairy, generally twisted spirally, persistent.
1668. *Cynara*. Recept. setose. Invol. dilated, imbricated; scales fleshy, emarginate, with a point. Pappus sessile, feathery.
1669. *Carlina*. Involucre swelling: the exterior scales with numerous spines; the inner ones colored, scarious.
1670. *Arctylis*. Recept. paleaceous. Pappus feathery. Invol. imbricated with bracteolæ. Florets of ray 5-toothed.
1671. *Acarna*. Recept. paleaceous. Pappus feathery. Invol. imbricated with bracteolæ. Florets fuscous.
1672. *Stokesia*. Recept. naked. Pappus with 4 bristles. Invol. leafy, somewhat imbricated. Heads radiated florets of ray funnel-shaped, irregular.
1673. *Stobæa*. Invol. imbricated, with toothed spiny scales. Florets fuscous. Recept. hispid, favose. Pappus paleaceous.
1674. *Onobroma*. Invol. ventricose: outer scales large, herbaceous, spiny, acuminate; inner coriaceous, unarmed. Recept. paleaceous. Pappus setaceous, rigid, unequal.
1675. *Carthamus*. Recept. paleaceous, setose. Invol. ovate, imbricated; scales ovate, leafy at end. Pappus paleaceous, hairy, or none.
1676. *Cardopatum*. Invol. 6-8-fl. many-leaved, imbricated, the outer scales branched, spiny. Recept. paleaceous, with long fasciated paleæ. Pericarpis villous.
1677. *Stachytia*. Recept. with very short paleæ. Pappus feathery. Anthers awned at base. Invol. hemispherical, imbricated.
1678. *Palafoxia*. Invol. oblong, somewhat imbricated, 8 or many-leaved, many-flowered. Cor. fuscous, longer than calyx, with a 5-fid limb. Pappus chaffy. Receptacle naked. Fruit marginal, wrapped up in the involucre.
1679. *Pteronia*. Recept. paleaceous; paleæ many-parted. Pappus somewhat feathery. Invol. imbricated with keeled scales.
1680. *Vernonia*. Recept. naked. Invol. ovate, imbricated. Pappus double: outer paleaceous; inner capillary.
1681. *Ammobium*. Invol. imbricated, colored, radiant. Anthers with 2 bristles at the base. Chaffs of receptacle distinct. Pappus a toothed edge.
1682. *Liatris*. Recept. naked. Invol. oblong, imbricated. Pappus feathery.
1683. *Mikania*. Recept. naked. Invol. 4-6-leaved, equal, 4 or 6-flowered. Pappus hairy.
1684. *Sparganophorus*. Invol. subglobose, imbricated with unequal scales, recurved, spreading at end. Recept. naked. Pericarpis crowned with a somewhat cartilaginous cup.
1685. *Eupatorium*. Involucre imbricated, oblong. Florets few. Receptacle naked. Pappus rough.
1686. *Dumerilia*. Invol. many-parted, equal. Receptacle paleaceous. Florets bilabiate. Anthers spurred at base. Pappus feathery, sessile.
1687. *Ageratum*. Recept. naked. Pappus with 5 somewhat-awned paleæ. Invol. oblong in a double row. Corollas 4-5-fid.
1688. *Cælestina*. Invol. cylind. many-leaved, imbricated. Recept. convex, naked. Florets all tubular. Stigmas very long, spreading. Pericarpis truncate, 5-cornered. Pappus a membranous rim.
1689. *Stevia*. Recept. naked. Pappus paleaceous. Invol. cylindrical in a single row.
1690. *Cephalophora*. Recept. naked, hemispherical. Pappus paleaceous, many-leaved. Invol. many-leaved, reflexed.
1691. *Amphirepis*. Invol. hemispherical, imbricated. Recept. flat, naked. Florets all tubular. Pericarpis cylindrical, naked. Pappus hairy, deciduous.
1692. *Hymenopappus*. Invol. many-leaved, spreading; scales ovate, colored. Recept. naked. Pappus many-leaved, paleaceous.
1693. *Melananthera*. Recept. paleaceous, convex. Invol. many-leaved, in a double row. Pappus of from 2 to 18 rough bristles. Pericarpis turbinate, angular.

1694. *Marshallia*. Recept. paleaceous. Pappus of 5 membranous acuminate paleæ. Invol. imbricated; scales somewhat lanceolate, incumbent.
1695. *Spilanthes*. Recept. paleaceous, conical. Pappus with 2 awns, one smaller than the other. Invol. nearly equal.
1696. *Salmea*. Recept. conical, paleaceous. Pappus with 2 awns. Pericarps depressed. Invol. imbricated.
1697. *Bidens*. Involucre of many leaves, with many foliaceous bracteas at the base. Receptacle plane, chaffy. Cor. sometimes radiant. Pericarps crowned with from 2-5 persistent awns, which are rough, with minute deflexed bristles.
1698. *Platypteris*. Invol. many-leaved, imbricated, squarrose. Recept. convex, paleaceous. Pericarps compressed, winged, with 2 awns at top.
1699. *Lagascea*. Invol. 1-leaved, tubular, 1-flowered, divided at end. Floret tubular, hermaphrodite. Pericarps linear, cuneate, compressed. Pappus a small fringed crown.
1700. *Lavenia*. Recept. naked. Pappus with 3 awns, glandular at end. Invol. ovate, somewhat imbricated.
1701. *Cacalia*. Recept. naked. Pappus pilose. Invol. cylindrical, oblong, at the base only with bracteola.
1702. *Kleinia*. Recept. naked. Pappus hairy. Invol. simple, equal, 5-leaved.
1703. *Ethulia*. Recept. naked. Pappus a very narrow rim. Invol. equal, in a double row.
1704. *Pigueria*. Recept. naked. Invol. equal, 4-leaved, 4-flowered, Pappus none. Pericarps pentagonal.
1705. *Chrysocoma*. Recept. naked. Pappus simple. Invol. hemispherical, imbricated. Style scarcely longer than florets.
1706. *Tarchoanthus*. Recept. villous. Pericarps enveloped in hair. Invol. 1-leaved, half 7-fid, turbinate.
1707. *Calea*. Recept. paleaceous. Pappus hairy. Invol. imbricated.
1708. *Isocarpha*. Recept. paleaceous conical, the outer paleæ forming the involucre. Pappus O. Anthers not spurred at base. Stigmas with a long appendage.
1709. *Petrobium*. Recept. paleaceous, flattish. Invol. many-leaved, in 2 rows: outer row shortest. Pericarps angular. Pappus awned.
1710. *Neuvolana*. Recept. paleaceous, flattish. Pappus capillary, toothletted, persistent. Invol. imbricated, leafy. Anthers awnless at the base.
1711. *Humea*. Recept. minute, glandular. Pappus none. Invol. loosely imbricated, membranous. Florets about 3, tubular. Anthers awned.
1712. *Cesulia*. Recept. paleaceous: paleæ enveloping the pericarps. Pappus O. Invol. 3-leaved.
1713. *Isodia*. Recept. paleaceous. Pappus O. Invol. imbricated: inner scales radiant colored.
1714. *Santolina*. Recept. paleaceous. Pappus O. Invol. imbricated, hemispherical.
1715. *Otanthus*. Invol. hemispherical imbricated. Florets with 2 appendages at base. Recept. convex, paleaceous. Pappus O.
1716. *Caleacte*. The same as *Calea*, but it has a radius of ligular female florets.
1717. *Athanasia*. Recept. paleaceous. Pappus paleaceous, very short. Invol. imbricated.
1718. *Balsamita*. Recept. naked. Pappus O. Invol. imbricated.
1719. *Pentzia*. Recept. naked. Pappus a membranous torn rim. Invol. imbricated, hemispherical.

## SUPERFLUA.

## § Florets of the disk hermaphrodite: of the ray female.

1720. *Tanacetum*. Invol. hemispherical, imbricated. Recept. naked. Florets of the ray trifid, obsolete sometimes wanting. Pericarps crowned with a membranous margin or pappus.
1721. *Artemisia*. Invol. ovate or rounded, imbricated. Recept. naked (or downy, *Sm.*). Florets of the ray subulate. Pericarps crowned with a membranaceous pappus.
1722. *Gnaphalium*. Recept. naked. Pappus hairy or feathery. Invol. imbricated: marginal scales round, scarios, colored.
1723. *Leontopodium*. Heads sessile in the leaves. Invol. woolly. Florets 5-fid. Pappus pencilled or hairy. Otherwise Guaphalium.
1724. *Evax*. Heads surrounded by bracteæ. Invol. ovate, imbricated, with appressed acuminate scales. Florets of disk 4-toothed: of the ray not toothed. Recept. subulate, paleaceous. Pericarps of the female flowers without pappus.
1725. *Antennaria*. Recept. scrobiculate. Pappus capillary. Invol. imbricated, scarios, colored. Anthers spurred at base. Florets dioecious.
1726. *Metalsia*. Invol. cylindrical, radiant colored. Pappus deciduous, capillary, clavate. Florets few, hermaphrodite. Otherwise as *Gnaphalium*.
1727. *Astelma*. Recept. naked. Pappus feathery, sessile: rays connate at base. Invol. imbricated: with scarios scales, the interior of which are connivent.
1728. *Athrisia*. Heads radiant. Invol. obl. imbricated, awned, squarrose. Florets bilabiate. Pappus feathery. Recept. alveolate.
1729. *Xeranthemum*. Recept. paleaceous. Pappus paleaceous-setaceous. Invol. imbricated, radiated: with a colored ray.
1730. *Ellichrysum*. Recept. naked. Pappus hairy or feathery. Invol. imbricated, radiated: ray colored.
1731. *Carpesium*. Recept. naked. Pappus O. Invol. imbricated, with the outer scales reflexed.
1732. *Baccharis*. Recept. naked. Pappus pilose. Invol. imbricated, cylindrical. Female florets mixed with the hermaphrodite ones.
1733. *Molina*. Invol. campanulate, imbricated. Pappus feathery. Recept. convex, naked, dotted. Florets dioecious.
1734. *Congra*. Invol. roundish, imbricated. Recept. naked. Florets of the ray 3 cleft. Pappus rough.
1735. *Madia*. Recept. naked. Pappus O. Invol. double: outer 8-10-leaved, equal, longer than the inner, which is many-leaved.
1736. *Erigeron*. Invol. imbricated. Recept. naked. Florets of the ray numerous, very narrow, mostly of a different color from the disk. Pappus simple.
1737. *Tussilago*. Invol. simple, equal, submembranaceous, swelling. Recept. naked. Pappus simple.
1738. *Senecio*. Invol. subcylindrical, equal, scaly below; the scales withered at the tip. Recept. naked. Pappus simple.
1739. *Aster*. Invol. imbricated, its lowermost scales spreading (except in *A. trifolium*). Recept. naked. Florets of the ray more than 10. Pappus simple.
1740. *Solidago*. Invol. imbricated, its scales connivent. Recept. naked. Florets of the ray (of the same colour as the disk) about 5. Pappus rough.
1741. *Cineraria*. Recept. naked. Pappus simple. Invol. simple, many-leaved, equal.
1742. *Calotis*. Recept. naked. Pericarps crowned with two opposite paleæ and 1-3-barbed awns. Invol. nearly equal, many-leaved, in a single or double row.
1743. *Kaukasia*. Invol. simple: leaflets keeled. Recept. naked, convex. Pappus of the ray a minute fringed rim; of the disk stiff and feathery.
1744. *Senecio*. Invol. imbricated. Recept. naked. Florets of the ray very numerous, linear. Anthers with 2 bristles at the base. Pappus simply composed of hairs.
1745. *Pulicaria*. Invol. roundish, imbricated: scales linear, acuminate. Recept. naked. Pappus compound: outer a membranous cup; inner setaceous. Pericarps uniform.
1746. *Grindelia*. Recept. naked. Pappus setaceous, deciduous. Invol. imbricated, hemispherical.

1747. *Podolepis*. Recept. naked. Pappus hairy. Invol. imbricated, scarious, hemispherical: scales unguiculate.
1748. *Chaetanthera*. Invol. many-leaved, ciliated. Florets of ray linear, 3-toothed, with a fine bifid spiral segment at the divisions. Anthers spurred at base. Recept. naked, flat. Pappus hairy.
1749. *Arnica*. Recept. naked. Pappus simple. Invol. with equal leaves. Florets of ray generally with 5 filaments without anthers.
1750. *Gerberia*. Florets bilabiate, those of the ray ligulate. Invol. imbricated, coriaceous. Recept. flat, naked. Pappus with long bearded palea.
1751. *Doronicum*. Scales of the invol. in 2 equal rows, longer than the disk. Recept. naked. Pericarp of the disk crowned with a simple pappus, those of the ray without a pappus.
1752. *Pedicularis*. Recept. naked. Pappus hairy. Florets 2-lipped.
1753. *Tetragonatheca*. Recept. paleaceous. Pappus O. Invol. 1-leaved, 4-cornered, 4-parted.
1754. *Ximenesia*. Recept. paleaceous. Pappus O. Pericarp of ray naked, emarginate; of the disk winged. Invol. many-leaved, nearly equal.
1755. *Helcintium*. Recept. naked, of the ray paleaceous. Pappus 5-awned. Invol. 1-leaved, many-parted. Florets of ray half-trifid.
1756. *Bellis*. Invol. hemispherical, its scales equal. Recept. naked, conical.
1757. *Bellium*. Recept. naked. Pericarp conical, with a paleaceous 8-leaved crown and awned pappus. Leaves of invol. equal.
1758. *Dahlia*. Recept. paleaceous. Pappus O. Invol. double: outer many-leaved; inner 1-leaved, 8-parted.
1759. *Bæbra*. Invol. double: outer many-leaved; inner 8-leaved. Recept. naked. Pappus hairy.
1760. *Tagetes*. Recept. naked. Pappus with 5 erect awns. Invol. simple, 1-leaved, 5-toothed, tubular. Florets of ray 5, persistent.
1761. *Heterospermum*. Recept. naked. Outer grains compressed with a membranous edge; inner oblong with two awns. Invol. double: outer 4-parted; inner many-leaved.
1762. *Schkuhria*. Recept. naked. Pappus paleaceous. Invol. 5-leaved. Florets of ray solitary.
1763. *Pectis*. Recept. naked. Pappus with 3 or 5 awns. Invol. 5-leaved. Florets of ray 5.
1764. *Longchampsia*. Differs from *Pectis* and *Leysera*, in having a double pappus, the exterior of which is edget, the inner feathery.
1765. *Leysera*. Recept. somewhat paleaceous. Pappus paleaceous: of the disk feathery. Invol. scarious.
1766. *Selloa*. Invol. imbricated, ovate. Recept. naked. Pappus O. Female florets inconspicuous, mixed among the leaves of the involucrum.
1767. *Relbania*. Recept. paleaceous. Pappus membranous, cylindrical, short. Invol. imbricated, scarious. Rays numerous.
1768. *Zinnia*. Recept. paleaceous. Pappus with 2 erect awns. Invol. ovate, cylindrical, imbricated. Florets of ray 5, persistent, entire.
1769. *Chrysanthemum*. Invol. hemispherical, imbricated with scales whose borders are membranous. Recept. naked. Pappus none.
1770. *Pyrethrum*. Recept. hemispherical, imbricated with scales whose borders are membranous. Recept. naked. Pericarp crowned with a membranous margin.
1771. *Matricaria*. Invol. hemispherical or almost plane, imbricated with scales whose borders are membranous. Recept. naked, almost cylindrical. Pappus none.
1772. *Boltonia*. Recept. fovee, hemispherical. Pappus toothed, awned, somewhat 2-horned. Rays numerous. Invol. imbricated.
1773. *Lidbeckia*. Recept. naked. Pappus O. Pericarp angular, with the lowest joint of style persistent. Rays numerous. Invol. many-parted.
1774. *Cenia*. Invol. in fruit turbinate, multifid. Florets of ray very numerous, short. Recept. naked. Pericarp compressed.
1775. *Cotula*. Recept. nearly naked. Pappus margined. Florets of disk 4-fid, of the ray scarcely any.
1776. *Granga*. Invol. imbricated, spreading. Marginal florets 3-toothed. Recept. hemispherical. Pericarp with a toothed edge at top.
1777. *Anacyclus*. Recept. paleaceous. Pappus emarginate. Pericarp with membranous edges.
1778. *Anthemis*. Invol. hemispherical, its scales nearly equal, their margins scarious. Recept. convex, chaffy. Pericarp crowned with a membranous border or pappus.
1779. *Centrospermum*. Invol. hemispherical, of many imbricated, round, scarious scales. Recept. naked. Pappus spiny. Outer pericarp cymbiform, smooth.
1780. *Sanvitalia*. Recept. paleaceous. Pericarp of ray with 3 awns: of the side naked, warted; of the disk winged. Invol. imbricated, flat.
1781. *Achillea*. Invol. ovate, imbricated, unequal. Recept. plane, chaffy. Florets of the ray 5-10, roundish, obcordate. Pericarp naked.
1782. *Tridax*. Invol. cylindrical, imbricated, with ovate oblong scales. Florets of ray 3-parted. Recept. paleaceous. Pappus hairy, simple.
1783. *Amelus*. Recept. paleaceous. Pappus simple. Invol. imbricated. Florets of ray undivided.
1784. *Starken*. Recept. hirsute. Pappus sessile, hairy. Invol. imbricated.
1785. *Columellia*. Invol. cylindrical, imbricated. Florets of ray undivided. Recept. naked, fovee. Pappus a toothed edge.
1786. *Eclipta*. Recept. paleaceous. Pappus O. Florets of disk 4-fid.
1787. *Meyera*. Invol. 4-leaved, the 2 inner smallest. Recept. small, paleaceous, 2 paleæ enveloping the pericarp, keeled. Pappus O.
1788. *Chrysanthellum*. Invol. cylindrical, about as long as florets, scaly at base. Recept. paleaceous. Florets numerous, linear, 2-toothed, short, of the centre few, and generally abortive. Pericarp naked, roundish, furrowed, with an entire edge.
1789. *Siegesbeckia*. Recept. paleaceous. Pappus O. Outer invol. 5-leaved, inner spreading. Ray halved.
1790. *Verbesina*. Recept. paleaceous. Pappus awned. Invol. in one row. Florets of the ray about 5.
1791. *Synedrella*. Invol. generally of 2 leaves. Florets fuscous. Recept. obsolete, paleaceous: paleæ glutinaceous; the outer ovate. Pericarp oval, flat, edged; the central dissimilar, near, oblong, with 2 or 3 awns.
1792. *Galinsoga*. Recept. paleaceous. Pappus many-leaved, paleaceous. Invol. imbricated.
1793. *Acnella*. Invol. simple, with a few somewhat leafy divisions. Recept. oblong, paleaceous. Heads radiant. Pericarp 4-cornered, truncate at end, naked.
1794. *Zaluzania*. Invol. with distinct, somewhat ovate, equal segments. Head radiant. Recept. conical, paleaceous; paleæ membranous, trifid, involving the pericarp, which are 4-cornered and naked.
1795. *Pascalia*. Recept. paleaceous. Pericarp drupaceous. Pappus a toothed rim. Invol. imbricated.
1796. *Heliosis*. Invol. imbricated, with ovate lined squamæ. Cor. of ray linear, large. Recept. paleaceous, conical, with lanceolate paleæ. Pericarp 4-cornered. Pappus O.
1797. *Bupthalmum*. Recept. paleaceous. Pappus an obsolete rim. Sides of pericarp, especially of the ray, edged.

Order 3.  FRUSTRANEA.

Florets of the disk fertile: of the ray sterile.

1798. *Helianthus*. Recept. paleaceous, flat. Pappus 2-leaved. Invol. imbricated, subsparrose.
1799. *Gymnoloma*. Invol. hemispherical, loosely imbricated. Recept. convex, paleaceous. Central florets sterile; marginal radiant. Pappus O.

1800. *Rudbeckia*. Recept. paleaceous, conical. Pappus with a 4-toothed rim. Invol. with a double row of scales.
1801. *Galaridia*. Recept. paleaceous, hemispherical. Pappus paleaceous, many-leaved. Invol. imbricated, many-leaved, flat. Rays 3-parted.
1802. *Tithonia*. Invol. many-leaved, cylindrical. Rays 3-toothed. Recept. paleaceous, convex. Pappus paleaceous, 5-leaved.
1803. *Cosmea*. Recept. paleaceous. Pericarps 4-cornered. Pappus with 2 or 3 awns. Invol. double, each 1-leaved, 8-parted.
1804. *Coreopsis*. Recept. paleaceous. Pericarps compressed, emarginate. Pappus with 2 horns. Invol. double, each many-leaved.
1805. *Simsia*. Invol. subcylindrical, nearly equal, with linear lanceolate incumbent scales. Recept. paleaceous. Pericarps flatish, somewhat edged, each edge awned.
1806. *Osmites*. Recept. paleaceous. Pappus obsolete. Florets of ray ligulate. Invol. imbricated scarious.
1807. *Encelia*. Recept. paleaceous. Pappus O. Pericarps vertical, flat, with a ciliated edge. Invol. imbricated.
1808. *Sclerocarpus*. Recept. paleaceous. Pappus O. Invol. double, each 3-leaved.
1809. *Cultumia*. Recept. favose. Pericarps smooth. Pappus O. Invol. 1-leaved, covered with imbricated leaflets.
1810. *Berckheya*. Recept. favose. Pericarps villous. Pappus paleaceous (sometimes bristly-paleaceous, ciliated). Invol. 1-leaved, covered with imbricated leaflets.
1811. *Didelta*. Recept. favose, inclosing the pericarps. Pappus many-parted, setaceous, paleaceous, toothed. Invol. 1-leaved, covered with leaflets, the exterior very large.
1812. *Gorteria*. Recept. scrobiculate. Pappus a ciliated edge. Invol. 1-leaved, covered with imbricated leaflets, of the fruit indurated, connivent, deciduous.
1813. *Guzmania*. Recept. naked, or alveolate. Pericarps very villous. Pappus hairy-paleaceous. Invol. 1-leaved, the tube naked, or covered with imbricated leaflets.
1814. *Cryptostemma*. Recept. favose. Pappus paleaceous, covered by the entangled wool of the pericarp. Invol. imbricated.
1815. *Arctotheca*. Recept. favose. Pappus O. Invol. imbricated.
1816. *Spheogyme*. Recept. with distinct paleæ. Pappus paleaceous, simple. Stigmas with a dilated truncated end. Invol. imbricated, the inner scales or all with a dilated scarious end.
1817. *Zoogea*. Recept. setose. Pappus setaceous. Rays ligulate. Invol. imbricated.
1818. *Leuzea*. Invol. imbricated, spherical, not spiny. Recept. bristly. Pappus feathery, in many rows. Florets all hermaphrodite.
1819. *Centaurea*. Invol. scaly. Recept. bristly. Corollas of the ray infundibuliform, irregular, longer than those of the disk. Pappus simple.
1820. *Galaactites*. Invol. imbricated, with somewhat squarrose spiny scales. Recept. favose. Pappus feathery, deciduous.
1821. *Wedelia*. Invol. 5-leaved, with broad leafy segments. Recept. paleaceous. Florets of the centre generally abortive, of the ray many, oval, 2-3-fid. Stigmas setaceous. Pappus stipitate, membranous, tooth-letted.

## Order 4.

## NECESSARIA.

*Florets of the ray female fertile : of the disk male.*

1822. *Milleria*. Recept. naked. Pappus O. Invol. of 3 valves. Ray halved.
1823. *Baltimora*. Recept. paleaceous. Pappus O. Invol. cylindrical, many-leaved. Ray 5-flowered.
1824. *Silphium*. Recept. paleaceous. Pappus with a 2 horned edge. Invol. squarrose.
1825. *Trixis*. Invol. imbricated. Cor. of ray 3-fid. Recept. paleaceous. Pappus O. Pericarps villous at end.
1826. *Polymnia*. Recept. paleaceous. Pappus O. Invol. double : outer 4 or 5-leaved ; inner 10-leaved, with common leaflets.
1827. *Chrysogonum*. Invol. 5-leaved. Recept. paleaceous. Pappus 1-leaved, 3-toothed. Pericarps with a little 4-leaved calyx.
1828. *Melampodium*. Recept. paleaceous, conical. Pappus 1-leaved, vulviform. Invol. 5-leaved.
1829. *Chapalia*. Recept. naked. Pappus capillary. Florets of the ray in a double row, deformed ; of the disk bilabiate.
1830. *Catandula*. Recept. naked. Pappus O. Invo. many-leaved, equal. Pericarps of the disk membranous.
1831. *Arctotis*. Recept. setose-alveolate. Pericarps half 2-celled, or 2-furrowed at the back. Pappus paleaceous. Invol. imbricated, with scales scarious at end.
1832. *Osteospermum*. Recept. naked. Pappus O. Invol. many-leaved. Pericarps globose, colored, bony.
1833. *Othonna*. Recept. naked. Pappus hairy. Invol. 1-leaved, many-cut.
1834. *Hippia*. Recept. naked. Pappus O. Pericarps with very broad edges, naked. Invol. hemispherical, somewhat imbricated. Florets of ray 10, obsoletely trifid.
1835. *Soliva*. Invol. 7-leaved, leaflets with imbricated edges, the 3 outer largest. Ray none. Recept. very small, somewhat villous. Pericarps compressed, surrounded by a membrane, crowned by 2 prickles and the style.
1836. *Psiadia*. Recept. naked. Pappus hairy, sessile. Invol. imbricated, ovate. Florets of ray short.
1837. *Erioccephalus*. Recept. paleaceous. Pappus O. Invol. double : inner 1-leaved ; outer 5-leaved.
1838. *Filago*. Recept. paleaceous. Pappus O. Invol. imbricated. Female florets mixed among the scales of involucre.
1839. *Micropus*. Recept. paleaceous. Pappus O. Invol. calyculate. Rays none. Female florets enwrapped in the scales of involucre.
1840. *Parthenium*. Recept. paleaceous, flat. Pericarps obovate, nearly naked. Invol. 5-leaved.
1841. *Iva*. Recept. pilose. Pericarps naked, blunt. Invol. 3-leaved. Florets of ray 5. Styles 2, long.
1842. *Acicarpa*. Invol. 5-parted. Cor. all tubular. Recept. paleaceous, the palea being united with the pericarps after flowering. Pappus O. Stamens half-separate.

## Order 5.

## SEGREGATA.

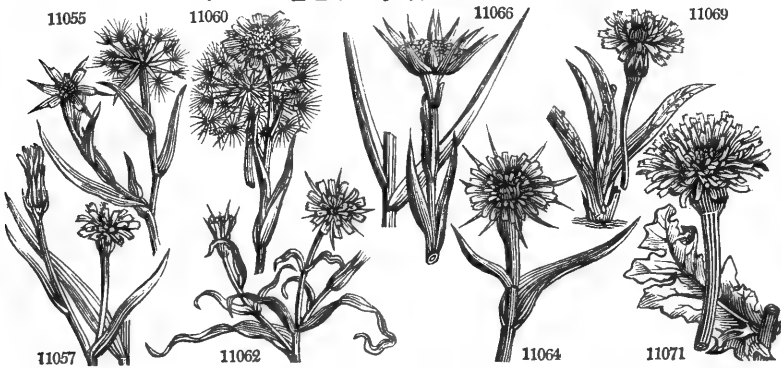

*Each floret having its own peculiar involucre.*

1843. *Elephantopus*. Invol. 4-flowered. Florets ligulate, hermaphrodite. Recept. naked. Pappus setaceous.
1844. *Edera*. Invol. many-flowered. Tubular florets hermaphrodite, and one or more female and ligulate. Recept. paleaceous. Pappus with many paleæ.
1845. *Flaveria*. Partial invol. 2-5-leaved, 2-5-flowered. Common invol. imbricated with unequal scales. Florets tubular, 1 often ligulate. Pappus O. Recept. naked.
1846. *Stæbe*. Invol. 1-flowered. Floret tubular, hermaphrodite. Recept. naked. Pappus feathery.
1847. *Nauenbergia*. Partial invol. 2-leaved, 1-flowered ; common invol. leafy. Pappus O. Receptacle setose.

1848. *Cassinia*. Invol. 2-flowered, 4-leaved. Florets hermaphrodite. Pappus paleaceous, pencilled. Recept. naked.  
 1849. *Sphaeranthus*. Invol. 8-flowered. Florets tubular, hermaphrodite, and obsoletely female. Recept. scaly. Pappus O.  
 1850. *Echinops*. Invol. 1-flowered. Florets tubular, hermaphrodite. Recept. setose. Pappus obsolete.  
 1851. *Rolandra*. Florets fasciated in a head, with scales between. Invol. 2-valved, 1-flowered. Florets hermaphrodite. Pappus O.

*History, Use, Propagation, Culture,*

1620. *Geropogon*. So named from γειρον, an old man, and πωγων, a beard; in allusion to the long silky beard of the seeds.

1621. *Tragopogon*. From τραγος, a goat, and πωγων, a beard; a name applied in the same way as *Geropogon*. *T. porrifolius*, or *Salsafy*, has a long tapering fleshy white root, which is used like carrots or parsneps, and cultivated in gardens for that purpose. The flavor of the root is mild and sweetish; dressed like asparagus, there is some resemblance in taste. It is occasionally grown in British gardens, and a good deal in those of France and Germany. It is raised and treated in all respects similar to the carrot. *T. pratensis* answers equally well for culture as this species, and was formerly preferred to it.

1852. *Brotera*. Partial invol. 1-flowered, many-leaved, common 6-8-flowered, imbricated, many-leaved. Florets tubular, uniform. Recept. naked. Pericarp covered by the adhering involucre.  
 1853. *Gundelia*. Invol. O. Hollows of the recept. 5-flowered. Florets tubular, male and hermaphrodite. Recept. paleaceous. Pappus O.  
 1854. *Euxenia*. Invol. 1-leaved, 10-cleft, reflexed, two of the segments larger than the rest. Anthers distinct. Pappus none. Recept. chaffy.

EQUALIS.

- 11055 Leaves smooth  
 11056 Leaves hairy  
 11057 Involucrum with scales at the base
- 11058 Invol. 8-leaved as long as ray, and peduncles downy, Leaves linear straight  
 11059 Involucre 8-leaved longer than rays of corolla, Leaves entire straight smooth  
 11060 Invol. about as long as the cor. Leaves undivided glabrous acuminate channelled, Peduncles cylindrical  
 11061 Invol. 8-leaved as long as rays of cor. Leaves entire straight lanc. acuminate  
 11062 Invol. as long as rays of cor. Leaves entire sub-linear; those of the stem very wavy  
 11063 Invol. shorter than ray of cor. Leaves entire somewhat wavy  
 11064 Invol. longer than ray of cor. Lvs. entire straight, Pedunc. thickened upwards, Florets rounded at end  
 11065 Woolly with down, Invol. shorter than ray of cor. Lvs. linear channelled: cauline revolute  
 11066 Invol. much longer than the cor. Leaves undivided straight, Peduncle thickened upwards  
 11067 Invol. 5-leaved longer than ray of cor. Leaves entire, Radical and peduncles villous at base  
 11068 Invol. half as long again as ray of cor. Stem and leaves villous
- 11069 Scape 1-fl. Leaves of invol. imbricated cuspidate, Leaves linear entire glaucous on each side  
 11070 Smooth glaucous, Stem erect 2-3-fid somewhat naked, Leaves smooth: radical sublyrate
- 11071 Invol. downy unarmed, Leaves runcinate toothed  
 11072 Invol. hispid aculeate, Leaves runcinate toothletted: cauline dilated at base  
 11073 Invol. hispid aculeate, Leaves entire: cauline obl. attenuated at base
- 11074 Lower leaves lyrate with obl. mucronate segments: upper pinnatifid  
 11075 Lower leaves pinnatifid: upper linear, Invol. smooth: lower scales spreading mucronate  
 11076 Lower leaves decursively pinnatifid lanc.: upper linear-lanceolate, Invol. before opening 8 angular
- 11077 Stem 1-flowered leafy, Leaves linear downy beneath, Root tuberous  
 11078 Leaves ovate nerved downy entire sessile  
 11079 Stem somewhat naked about 1-flowered, and scales of invol. woolly, Leaves obl. lanc. nerved flat  
 11080 Stem branched, Leaves amplexicaul. lanc. entire subserrulate at base  
 11081 Stem about 1-fl. leafy, Leaves lin. lanc. acuminate smooth nerved flat  
 11082 Stem about 1-fl. leafy ascending, Leaves lanc. ensif. smooth nerved flat, Ray longer than invol.  
 11083 Leaves lin. subul. channelled triquetrous, Stem branched  
 11084 Leaves lanc. lin. flat: cauline keeled linear, Stem 1-flowered  
 11085 Leaves lin. ensif. acum. rigid nerved keeled, Invol. villous leafy at base, Stem somewhat branched  
 11086 Leaves subulate entire, Pedunc. thickened, Stem villous at base  
 11087 Leaves lin. acun. keeled woolly at base, Stem branched, Invol. woolly, Fruit downy  
 11088 Leaves runcinate blunt smooth, Scape leafless branched, Peduncles thickened  
 11089 Stem leafy many-fl., and invol. downy, Lower leaves lanc. acuminate entire downy: upper lin. subulate  
 11090 Stem branched leafy at base, Leaves lanc. ensif. smooth nerved flat, Ray shorter than cal.  
 11091 Stem 1-fl. leafy at base, Leaves lin. lanc. wavy silky with down all over  
 11092 Stem leafy many-flowered erect, Leaves nerved filiform acuminate, Invol. and seeds woolly  
 11093 Leaves linear and 1-flowered, Stem hairy

and Miscellaneous Particulars.

1622. *Troximon*. So named by Gärtner, from *τροξιμος*, eatable: but, as Sir James Smth observes, without much propriety.  
 1623. *Arnopogon*. So named from *αγς αγνος*, a lamb, and *πωγων*, a beard: see Geropogon. This is the same genus as has been called by Scopoli and Willdenow, *Urospermum*.  
 1624. *Podospermum*. From *πυς ποδος*, a foot, and *σπερμα*, seed, on account of the long stalk of the fruit. Small herbaceous plants with the flowers of *Scorzonera*.  
 1625. *Scorzonera*. From *scorizon*, the Catalonian name of the viper. The plants are esteemed in Spain as a certain remedy for the bite of a viper; but it is believed that the slender tortuous form of the roots has

History, Use, Propagation, Culture,

given rise to this belief, rather than any quality inherent in the plant : for it is a rule to which there are few exceptions, that all plants used as food by man, possess very inactive qualities. If their action was powerful, they would be unfit for food.

*Scorzonera hispanica* is esteemed diuretic, stimulant, and sudorific. A drink is made from it for variola; and a distilled water is also prepared from it. It is also an esculent of occasional culture. The root is carrot-shaped, about the thickness of one's finger, tapering gradually to a fine point, and thus bearing some resemblance to the body of a viper. The outer rind being scraped off, the root is steeped in water, in order to abstract a part of its bitter flavor. It is then boiled or stewed in the manner of carrots or parsneps. The roots are fit for use in August, and continue good till the following spring. Its culture is the same as that of carrot or salsafy.

1626. *Picridium*. A diminutive of *Picris*, which see. *Picridium sativum*, *Picridium cultivé*, Fr., is sown in the spring as a small salad, and, if not allowed to become too old before it is cut, is an excellent vegetable, with a pleasant delicate flavor, wholly devoid of the bitterness of endive, and of the insipidity of very young lettuces. *P. tingitanum* is a favorite border annual.

1627. *Sonchus*. *Sonchus*, in Greek, said to be altered from *sonchos*, hollow, or soft, in allusion to the soft feeble stem of the plants. *Sonchus oleraceus*, *Sow-thistle*, Eng., *Hasenkohl*, Ger., seems to have nearly the same properties as the Dandelion and Succory, but it is little regarded as a medicine. It is a favorite food with hares and rabbits; and is said to be eaten by goats, sheep and swine, but not to be relished by horses. The young tender leaves are in some countries boiled and eaten as greens: and it is even affirmed, that the tender

- 11094 Lower leaves linear : upper pinnatifid, Lobes remote linear  
 11095 Leaves runcinate hispid, Stem about 2-f. somewhat leafy hispid
- 11096 Cauline leaves amplexicaul. obl. nearly entire : radical sublyrate runcinate, Scales of invol. appressed
- 11097 Leaves amplexicaul. obl. pinnatifid toothed, Invol. squarrose  
 11098 Leaves scabrous, Scales of invol. membranous at edge ciliated
- 11099 Pedunc. subsol. term. naked, Leaves lanc. amplexicaul. undivided finely toothed backwards  
 11100 Pedunc. branched somewhat scaly, Leaves lanc. runcinate, Stem shrubby  
 11101 Pedunc. naked, Invol. smooth, Leaves pinn. Pinnæ lin.-lanc. somewhat toothed  
 11102 Pedunc. naked, Invol. turbin. smooth : lower scales reflexed at end, Leaves pinnatifid  
 11103 Pedunc. naked, Inv. turbin. smooth : low. scales reflexed at end, Lvs. lyrate pinnatif. Corymb divaricating  
 11104 Pedunc. naked and invol. smooth, Stem nearly naked, Radic. lvs. lyrate smooth on each side, Lobes triang.  
 11105 Pedunc. and invol. hispid somewhat umbelled, Leaves runcinate sagittate at base [ovate  
 11106 Peduncles and invol. hispid sub-umbellate, Leaves runcinate dentato-ciliate cord. at the base  
 11107 Peduncles sub-tomentose umbellate, Involucre glabrous, Lvs. runcinate dentato-ciliate amplexic. at base  
 11108 Pedunc. downy umbell. Invol. hairy, Leaves bipinnatifid cordate sagittate at base  
 11109 Pedunc. naked, Flowers paniced, Lvs. runcinate  
 11110 Peduncles and involucre hispid racemose, Leaves sublyrate, Terminal lobe deltoid very large  
 11111 Pedunc. squarrose, Fl. racemose, Leaves runcinate acuminate smooth glaucous beneath  
 11112 Pedunc. sub-squarrose, Fl. paniced, Leaves lyrate-runcinate toothletted stalked  
 11113 Leaves sessile : lower cordate toothed ; upper hispid entire, Peduncles scaly  
 11114 Pedunc. sub-squarrose, Fl. paniced, Radic. leaves sub-runcinate : cauline ovate acuminate stalked  
 11115 Raceme comp. terminal, Leaves lanc. ensiform amplexicaul. toothed  
 11116 Pedunc. squarrose, Fl. corymb. Leaves lanc. sessile : lower runcinate toothed ; upper entire  
 11117 Pedunc. naked, Fl. in corymbose panicles, Leaves lanc. runcinate narrowed at base  
 11118 Leaves pinnatifid with little white spiny teeth, Calyx slender  
 11119 Pedunc. and invol. smooth a little downy, Leaves sub-runcinate spiny-toothed amplexicaul.  
 11120 Pedunc. somewhat downy umbellate, Invol. smooth, Leaves pinnatif. toothed auricled cordate at base  
 11121 Radic. leaves unequaly pinnatifid : cauline linear lanc. toothed, Pedunc. long l-flowered  
 11122 Peduncles hirsute naked, Fl. paniced, Leaves lyrate cordate at base hairy beneath  
 11123 Pedunc. scaly, Fl. racemose, Leaves runcinate acuminate, Stem paniced virgate
- 11124 Leaves rounded : cauline cordate, Stem corymbose  
 11125 Leaves sinuate-crenate toothed wavy curled : radical with a hairy keel, Florets 5-parted  
 11126 Lower leaves tripartite pinnatifid with obl. blunt segm. : upper cordate  
 11127 Leaves runcinate tooth-ciliated blunt amplexicaul. sagittate : radical obovate, Stem paniced  
 11128 Leaves smooth beneath : lower runcinate toothletted at base dilated and sagittate ; upper lanc. sagittate  
 11129 Leaves smooth beneath : radical runcinate lyrate toothed ; upper runcinate pinnatifid  
 11130 Leaves smooth beneath : lower runcinate entire amplexicaul. : upper lanceolate sessile  
 11131 Leaves vertical prickly at keel acute at end sagittate at base runcinate pinnatifid  
 11132 Leaves oblong toothed horizontal, their keel prickly, their apex obtuse  
 11133 Leaves smooth beneath obl. lanc. ciliate-toothed sagittate at base  
 11134 Leaves smooth beneath : lower oblong narrowed at base toothletted ; upper lanceolate entire  
 11135 Leaves with a prickly keel : radical lanc. pinnatifid ; cauline linear entire sagittate  
 11136 Leaves lacinate ensiform sessile unequaly toothed  
 11137 Leaves toothletted smooth : lower situated ; upper lanceolate sagittate acuminate, Pan. much branched

and Miscellaneous Particulars.

shoots of the smooth variety, boiled in the manner of spinach, are superior to any greens not in common use.

Nearly the same thing may be affirmed of *S. arvensis*, *palustris*, and other species.

*Sonchus oleraceus* is used as a cure for the bite of the rattle-snake, in the same way as *Prenanthes serpentina*. It is called by the American settlers *Gall of the Earth*.

*S. tenerrimus* is eaten by the common people in Italy as a salad.

1628. *Lactuca*. From *lac*, milk, on account of the milky sap, which flows copiously when the plants are cut. Besides *Lactuca sativa*, the French cultivate as small salad both *L. quercina*, *palmata*, and *intybea*, which are all excellently adapted for such a purpose. *L. sativa* is well known as furnishing among its numerous varieties the best vegetable of the salad kind grown in the open garden. Whoever has the command of lettuce, onions, and cucumbers, may well dispense with most other acetarious plants. It is questioned by some, whether the greater number of what are set down as species in this genus, are any thing more than variations of one type ; and, at all events, it is thought *L. virosa*, a poisonous plant, is the parent of our cultivated sorts ; which would not be more remarkable than the fact that the indigenous celery is one of our strongest poisons.

All the species of *Lactuca* abound in a milky juice, which is found to partake, in a considerable degree, of the qualities of opium. The production of this juice is lessened by culture, and especially by blanching. It is most abundant in plants in a wild state, and in both wild and cultivated lettuce during inflorescence. Of late years, this juice has been collected by incisions and scraping off the thickened juice, as in the collecting the opium of the poppy (See p. 461.), and an opium has been produced little inferior to that of the East. It is called

History, Use, Propagation, Culture.

Lactucarium, and was first brought into notice by Dr. Duncan of Edinburgh, who finds it can be administered with effect in cases where poppy opium is inadmissible. Details of the process of collecting and preparing the article, will be found in the Caledonian Horticultural Memoirs. (Vol. i. 160-259. li. 314, and iv. 153.)

The culture of lettuce as a salad plant is familiar to every one who has a garden. It is sown monthly, or oftener, throughout the year, in order to have a successional supply, and thinned out or transplanted to increase the size and succulency. The latter quality is greatly increased by watering in summer; and blanching, another desirable property, is promoted by tying up the leaves when the plant has attained about two-thirds of its usual size. Snails and slugs are very fond of this plant, and should either be watched and hand-picked, or the ground well watered with lime water, which effectually destroys them. The lettuce, unlike the cabbage and spinage, is a vegetable which can be grown to as great perfection in a warm as in a temperate climate, provided it be grown on rich soil, and abundantly supplied with water. Hence the lettuces of Paris, Rome, and Calcutta, are as large and tender as those of London and Amsterdam.

This genus is the type of the tribe *Lactuceæ* of M. Cassini. It differs essentially from all other tribes of Compositæ, in having a divided or ligulate corolla only, and from nearly all other tribes in its style, which can be compared to that of *Vernoniæ* only. The radiant head of flowers is a character common both to *Lactuceæ* and *Nassauviæ*. The greater part of *Lactuceæ* are found in Europe, a smaller number in Asia and Africa, very few in America, and in the southern hemisphere none at all.

1629. *Chondrilla*. Derived from *χονδρος*, a lump. Dioscorides says, it bears on its stems little lumps of gummy matter. But Theophrastus speaks of the grumous or tubercled roots of his *Chondrilla*. The plant now so called is an inconspicuous perennial plant, of no recorded use.

1630. *Prenanthes*. From *πρηνες*, drooping, and *ανθος*, a flower. The heads of flowers of all the species are

- 11138 Leaves decurrent : lower pinnatifid toothed outwards ; upper linear, Stem branched  
 11139 Lower leaves lanc. runcinate toothed narrowed at base and sessile ; upper linear sagittate  
 11140 Leaves runcinate pinnatifid unequally toothed : floral lanceolate, Flowers racemose  
 11141 Radic. leaves pinnatif. toothed : cauline linear entire sagittate, Branches 1-flowered  
 11142 Leaves all pinnatifid : segments linear toothed upwards, Fl. in corymbose panicles
- 11143 Radic. leaves runcinate : cauline linear entire  
 11144 Radic. leaves runcinate : cauline undivided filiform, Stem and invol. smooth
- 11145 Invol. 5-fl. Leaves obl. lanc. amplexicaul. cordate denticulate glaucous beneath  
 11146 Invol. many-fl. Leaves angular hastate toothed, Flowers nodding racemose paniced  
 11147 Invol. 5-fl. Leaves 3-lobed stalked angular toothletted rough at edge, Racemes axillary, Fl. nodding  
 11148 Stem paniced upwards, Leaves stalked cordate toothed ciliated, Panicle lax racemose  
 11149 Leaves linear tooth-sinuated sessile, Stem shrubby much branched, Branches spiny  
 11150 Florets 5, Leaves lyrate-pinnatifid and toothed, the terminal lobe with about 5 angles  
 11151 Leaves pinnated, Leaf. linear filiform, Panicle corymbose stalked, Stem shrubby  
 11152 Leaves pinnatifid pinnate with linear segments  
 11153 Leaves pubesc. toothed, those on the stem subsagittate, Stem paniced corymb. Invol. pyramidal glabrous
- 11154 Outer scales of the involucre reflexed, Leaves runcinate glabrous toothed  
 11155 Outer invol. spreading, Leaves runcinate scabrous, Segments round toothletted  
 11156 Outer scales of the involucre erect appressed, Leaves sinuato-dentate nearly glabrous
- 11157 Outer invol. spreading, Scales ovate, Scape 1-fl. Leaves obov. bluntish toothed  
 11158 Outer invol. spreading, Scales ovate-lanceol. Lvs. runcinate pinnatifid glabrous with lin. falc. distant lobes  
 11159 Leaves pinnatifid to the nerve smooth, Leaves of invol. smooth reflexed

- 11160 Scape 1-fl. naked thickened and hairy upwards, Invol. hispid, Leaves lanc. obl. somewhat toothed  
 11161 Scape 1-fl. squarrose thickened and somewhat hairy upwards, Invol. hispid, Leaves lanc. obl. smoothish  
 11162 Scape 1-fl. naked and invol. smooth, Leaves lanc. runcinate-toothed smooth  
 11163 Scape 1-fl. nearly naked upward and invol. hairy, Leaves lanc. toothed at base with a few forked hairs  
 11164 Scape 1-fl. naked smooth. Scales of invol. acute hairy, Lvs. obov. runcin. hairy scabrous, Root tuberous  
 11165 Scape 1-fl. nearly naked and calyx pubesc. Lvs. lanceol. acute somewhat toothed hoary, Hairs multifid  
 11166 Scape single-flow. thickened upwards, Leaves glab. runcinato-dentate, Involucre very hairy  
 11167 Scape branched scaly upwards, Lvs. lanc. toothed or pinnatif. sub-glab. Pedunc. swelling beneath invol.  
 11168 Scape naked 1-fl. and invol. hairy, Lvs. runcinate pinnatifid hairy, Segm. recurved tooth. Hairs 3-forked  
 11169 Scape single-flowered, Leaves dentate scabrous, Florets hairy at their orifice glandular at the tip  
 11170 Stem leafy somewhat branched hairy, Invol. smooth, Leaves lanc. runcinate hairy, Hairs forked  
 11171 Scape 1-fl. scaly thickened upwards and hairy, Invol. hispid, Leaves runcinate smooth  
 11172 Scape naked 1-fl. glabrous, Invol. hairy, Leaves runcinate toothed scab. somewhat hairy, Hairs prostrate  
 11173 Scape naked 1-fl. and invol. smoothish, Leaves pinnatifid-toothed hispid, Hairs simple subulate

and Miscellaneous Particulars.

nodding. *Prenanthes serpentaria* grows to the height of two feet, bearing pale purple flowers. It is known by the inhabitants of Virginia and Carolina under the name of the Lion's Foot, and is in high esteem as a cure for the bite of the rattle-snake. The juice of the plant boiled in milk is taken inwardly, and steeped leaves, frequently changed, are applied to the wound. It must not be confounded with *Prenanthes rubicunda*, called False Lion's Foot, which is a less powerful plant.

*Prenanthes virgata* has a very fine effect in large plantations.

1631. *Leontodon*. So named from *λεων*, a lion, and *odus*, a tooth ; in reference to the deep tooth-like divisions of the leaves. The English name *Dandelion*, is a corruption of the French translation of this word, *Dent de lion* ; in German *Pfaffenröhlein* and *Dotterblume*. It has been recommended as a winter salad, blanched like Endive ; but it possesses too much bitter principle to render it fit for table under any management. *Dent de lion*, Fr., from its cut leaves, and *Piss-en-lit*, in French, and most other European languages, from its diuretic qualities. The tender leaves in spring, used in compound salads, are equal to those of Endive or Succory. The roots, which are fusiform, and abound in a milky juice, are eaten raw as a salad by the French, and boiled by the Germans, like Salsify and Scorzonera. Dried and ground into powder, they afford a substitute for coffee, in all respects equal to that of Chicory roots. It is a difficult weed to extirpate, because every inch of root will form buds and fibres, and thus constitute a new plant. Swine are fond of it, and goats will eat it ; but sheep and cows dislike it, and by horses it is refused.

1632. *Apargia*. *Araxysia* is the Greek name of a plant now unknown. It has been employed by Dalechamp and Scopoli for a species of Hieracium. At the present day it is given to a genus of weedy plants, with the appearance of *Leontodon*.

History, Use, Propagation, Culture,

1633. *Thrinicia*. From *Squacos*, a feather; in allusion to the feathery pappus of the seeds. Small uninteresting weeds of no value or beauty.  
 1634. *Picris*. From *squacos*, bitter; a name given by the Greeks to some plant resembling Lettuce, on account of its bitterness. None of the species are remarkable for their qualities.

- 11174 Scape single-fl. Leaves dentate scab. Involucre nearly glab. Outer pericarps with a scaly pappus  
 11175 Scape 1-fl. pilose, Invol. hoary naked, Leaves lanc. blunt toothed, Hairs forked  
 11176 Scape 1-fl. hispid, Leaves obl. runcinate toothed hispid, Hairs forked

- 11177 Stem erect scabrous, Leaves amplexicaul. lanc. toothed, Fl. corymbose, Outer invol. lax  
 11178 Stem ascending scabrous, Leaves obl. lanc. blunt sinuate pinnatifid, Pedunc. thickened  
 11179 Leaves obl. lanc. nearly entire sessile, and invol. hispid, Hairs glochidate  
 11180 Stem branched spreading leafy, Leaves amplexicaul. obl. repand hispid

§ 1. *Scape one-flowered, naked.*

- 11181 Scape 1-leaved, Invol. hairy, Leaves lanc. runcinate toothed subpubescent, Teeth recurved  
 11182 Scape somewhat naked villous, Invol. very villous, Leaves lanc. entire acute villous  
 11183 Scape 1-leaved downy upwards, Invol. cylindr. downy, Leaves lanc. toothletted  
 11184 Leaves entire ovate downy beneath, Stolones creeping  
 11185 Scape naked thickened upwards hairy, Invol. smooth, Leaves lanc. obl. somewhat toothed smooth  
 11186 Scape nearly naked, Invol. hispid, Leaves lanc. spatulate runcinate-toothed smoothish

§ 2. *Scape many-flowered, naked.*

- 11187 Scape about 4-fl. naked, Leaves obl. blunt entire, Stolones creeping  
 11188 Scape 1-leaved with about 6 fl. Fl. umb. Leaves lanc. acute entire, Stolones creeping  
 11189 Scape leafy pilose at base, Fl. corymbose, Peduncles downy, Leaves lanc. acute nearly entire pilose  
 11190 Scape leafy smoothish, Fl. in corymbose panicles, Pedunc. spreading, Invol. hairy  
 11191 Scape leafy hispid, Fl. in corymbose panicles, Pedunc. clustered, Invol. hispid  
 11192 Scape about 3-fl. 1-leaved hairy, Leaves lin. lanc. acute pilose  
 11193 Scape somewhat naked branched about 3-fl. Pedunc. squarrose, Leaves lin. lanc. toothletted smooth  
 11194 Scape about 2-fl. Peduncles long, Leaves spatulate lanc. entire pilose, Stolones creeping  
 11195 Scape forked about 2-fl. and leafy at base, Leaves lanc. acute entire, Stolones O  
 11196 Resembles *H. murorum*, but the stem is naked  
 11197 Scape naked corymbose, Leaves lyrate runcinate hairy  
 11198 Leaves ovate somewhat toothed, Scape naked racemose, Upper flowers opening first  
 11199 Scape naked scabrous at base, Fl. in racemose corymbs, Leaves oblong blunt toothletted hairy  
 11200 Scape leafy hispid, Fl. corymbose, Pedunc. clustered, Leaves obl. acutish pilose-hispid  
 11201 Scape somewhat naked branched, Invol. with glandular hairs, Leaves oblong acute entire woolly  
 11202 Scape naked branched, Invol. smooth, Leaves obovate acute entire ciliated, Veins colored  
 11203 Scape leafy in corymbose panicles, Invol. pubescent, Radic. leaves entire obovate blunt ciliated

§ 3. *Stem leafy.*

A. *Leaves entire.*

- 11204 Stem erect, Leaves alternate lanc. naked toothed, Panicle capillary  
 11205 Stem erect branched, Leaves lanc. sessile somewhat toothed glaucous narrowed at each end  
 11206 Stem erect branched, Leaves lin. lanc. nearly entire narrowed at each end ciliated at base  
 11207 Stem erect simple, Leaves lanc. cordate amplexicaul. toothletted downy, Fl. racemose corymbose  
 11208 Stem erect few-fl. Cauline leaves lanc. acum. runcinate: radical obl. lanc. undivided  
 11209 Stem erect pilose panicle, Leaves ovate oblong subcordate sessile remotely toothed entire at end  
 11210 Stem erect hairy, Fl. subcorymbose, Cauline leaves oblong lanceolate stem-clasping: radical toothed  
 11211 Stem erect villous, Lvs. pilose somewhat toothed: radic. obov.; caul. obl. half-amplexicaul. Inv. hirsute  
 11212 Stem erect branched, Lvs. ovate cord. amplexicaul. toothed towards the base, Pedunc. and invol. hirsute  
 11213 Stem erect simple furrowed smoothish, Rad. lvs. obl. deeply toothed at base; caul. hastate sagit. Inv. lax

- 11214 Stem erect panicle furrowed downy, Leaves rugose: upper lanceol. Invol. lax hispid  
 11215 Stem ascending simple furrowed viscid, Leaves lanc. with recurved teeth, Involucre hispid  
 11216 Stem erect branched hispid, Leaves lanc. toothed sessile narrowed at each end, Invol. lax hispid  
 11217 Stem erect about 2-fl. Leaves pilose toothed: radical oblong; cauline lanc. sessile, Invol. villous  
 11218 Stem cymose fistulous many-leaved, Leaves ovate-lanceolate toothed forwards  
 11219 Stem cymose solid few-leaved, Leaves lanceolate broadly toothed forwards  
 11220 Stem erect branched leafy, Leaves linear entire  
 11221 Stem erect simple leafy 1-fl. Leaves ovate-lanc. toothletted sessile  
 11222 Radic. leaves oblong and lanceolate bluntnish narrowed at base toothletted woolly, Invol. hoary  
 11223 Stem leafy erect simple, Leaves oblong villous somewhat toothed, Fl. panicle  
 11224 Stem erect somewhat branched and lvs. villous: radic. obl. lanc. toothed; caul. ovate cord. amplexicaul.  
 11225 Differs from *H. villosum* in having the involucre covered with dense short brown hairs  
 11226 Radical lvs. lanc. narrowed into stalk: caul. sub-amplex. toothed backwards acute smooth, Inv. villous  
 11227 Stem erect smooth below, Leaves sub-villous lanc. acute: radical toothletted, Invol. villous

and Miscellaneous Particulars.

1635. *Hieracium*. It was believed formerly, that birds of prey made use of the juice of this kind of plant to strengthen their vision; whence it was called *Hieracium*, from *hawk*, a hawk; the French word *Epervière*, the English *Hawk-weed*, and the German *Habichtskraut*, all bear witness to the universal belief in this very strange opinion. An extensive genus of plants, many of which, especially *H. aurantiacum*, are objects

History, Use, Propagation, Culture,

deserving cultivation; others are of little interest; but all most difficult to distinguish or characterize. The species appear to intermix with the same facility as roses and willows.

*Hieracium venosum*, a very pretty plant, is called in America, *Pooi Robin's Plantain*, and is believed to possess considerable medical powers.

1636. *Lagoseris*. From *λαγος*, a hare, and *σειει*, a lettuce. Obscure weed-like plants.

- 11298 Near *H. villosum*, but the leaves are broader  
 11299 Stem erect many-fl. Leaves lanc. toothed, Peduncles downy  
 11290 Stem at base and lvs. here and there covered with hairs, Fla. smaller and inv. less vill. than in *H. villosum*  
 11291 Stem erect many-fl. Leaves sessile ellipt. lanc. toothletted smoothish glaucous beneath  
 11292 Radic. lvs. obl. narrowed at base acute : caul. sub-amplexic. lanc. Pedunc. glandular. Inv. glandul. hairy  
 11293 Stem erect strigose hispid, Leaves lanceolate nearly entire strigose hispid, Flowers corymbose  
 11294 Stem pilose warted glandular upwards, Leaves sub-amplexical. oblong acute with long hairs beneath  
 11295 Stem erect branched hoary, Leaves obov. obl. hoary toothed towards the base, Hairs feathery  
 11296 Stem erect many-fl. Leaves amplexical. somewhat rough toothed at edge, Pedunc. downy

- 11297 Stem densely leafy, Leaves amplexical. 3 inches long  $1\frac{1}{2}$  inch wide toothed hairy  
 11298 Stem erect simple, Leaves ovate cordate amplexical. toothletted ciliated, Fl. panicled, Invol. smooth  
 11299 Stem erect simple, Lvs. ovate-obl. smoothish acute sess. sub-amplexic. toothed towards base, Fla. corymbose  
 11240 Stem erect branched, Leaves obl. lanc. smooth stalked deeply toothed in the middle, Fl. panicled  
 11241 Leaves narrowed at base sessile with long points toothed, Invol. downy hoary  
 11242 Stem erect simple, Leaves linear somewhat toothed, Fl. in corymbose umbels  
 11243 Leaves broader than in the last and less toothed, Stem few-flowered  
 11244 Leaves mostly radical with long points toothletted hairy, Invol. hairy with long white and black hairs  
 11245 Stem branched shrubby, Leaves oblong toothed stalked, Peduncles sub-corymbose, Invol. downy

*B. Leaves sublyrate, lyrate, pinnatifid.*

- 11246 Stem erect few-fl. Peduncles and invol. pilose, Leaves oblong sub-pinnatifid at base  
 11247 Stem naked few-fl. Pedunc. and invol. glandular downy blackish, Leaves oblong stalked toothed at base  
 11248 Stem procumb. branch. at base few-fl. Ped. and invol. downy, Lvs. ovate unequal at base toothletted stalked  
 11249 Stem erect leafy pilose simple, Fl. panicled, Leaves ovate deeply toothed at base  
 11250 Stem simple, Leaves smooth obl. narrowed at base runcinate toothed : caul. amplexical. Invol. hispid  
 11251 Stem simple, Cauline leaves lyrate runcinate amplexical. hairy, Fl. panicled, Invol. hispid  
 11252 Stem erect panicled, Leaves ovate stalked deeply toothed at base, Flowers panicled  
 11253 Stem simple, Leaves smooth : radical runcinate lyrate ; cauline lanceolate, Invol. and pedunc. hispid  
 11254 Leaves lanc. runcinate roughish, Flowers in umbels  
 11255 Stem erect leafy simple smooth, Leaves sessile obl. acute finely toothed, Pedicels of panic. in bundles

- 11256 Leaves pinnatifid crenate, Scape naked few-flowered

- 11257 Leaves long lanceolate acute repand smooth, Fl. cylindrical, Outer invol. very small  
 11258 Leaves runcin. toothed smooth, Scape naked many-fl. ascending, Invol. downy : outer scales appressed  
 11259 Radic. leaves and lower cauline pinnated lyrate, Flowers corymbose, Invol. and pedunc. glandular  
 11260 Leaves scabrous : radic. lyrate runcinate ; cauline lanc. amplexical. toothed at base, Invol. downy  
 11261 Lower lvs. runcin. pinnatifid : upper entire, Branches naked, Invol. downy with leaflets bristly at the back

- 11262 Leaves runcin. pinnatifid pilose scabrous, Stem panicled, Leaves of invol. keeled channelled downy  
 11263 Leaves ovate cordate-sagittate amplexic. toothed, Peduncles long l-f. Invol. hispid : outer membranous  
 11264 Radic. leaves runcinate-lyrate : cauline amplexical. lanceol. ; lower pinnatifid, Invol. hispid  
 11265 Leaves runcinate pinnatifid scabrous sessile : upper lanceol. deeply cut at base, Invol. ovate angular  
 11266 Leaves amplexical. pinnatifid hairy, Leaves of invol. downy hoary flat  
 11267 Leaves amplexical. : lower obl. toothed ; upper cut-toothed, Stem setose hispid, Inv. muricated in fruit  
 11268 Setose hispid, Leaves runcinate auricled at base : upper lanc. sagitt. hastate, Invol. very hispid

- 11269 Leaves runcin. lyrate bluntly toothed, Scape naked many-fl. hispid, Lvs. of invol. membranous at edge  
 11270 Hispid-scabrous, Leaves oblong amplexical. remotely toothed, Stem divaricating branched  
 11271 Leaves rigid scabrous toothed : radic. obovate ; caul. sagittate amplexical. Fl. in racemose panicles  
 11272 Leaves hispid ovate obl. finely and deeply biserrate, Scape naked corymbose  
 11273 Leaves smooth toothed : radical ovate-spatulate ; cauline oblong sessile, Corymb terminal  
 11274 Lvs. glab. runcin. : the upper ones linear-sagitt. amplexic. Stem glab. Panic subcorymb. Inv. pubescent  
 11275 Leaves lanc. : lower entire toothed smooth ; cauline lanceolate amplexic. Stem furrowed branched  
 11276 Radic. leaves lanc. runcinate : cauline lanc. toothed at base sagittate, Panicles corymbose  
 11277 Leaves hispid runcinate pinnatifid : upper sessile lanc. toothed prickly upon the keel  
 11278 Leaves smooth : lower remotely toothed ; upper nearly entire subsagittate, Invol. downy  
 11279 Radic. leaves lyrate runcinate : cauline hastate lanceolate, Branches divaricating, Invol. downy  
 11280 Leaves pinnatifid : segments linear ; radical toothed ; cauline entire, Stem panicled, Invol. downy  
 11281 Leaves linear-filiform entire smooth, Pappus sessile

1637. *Borkhausia*. Named after Moritz Borkhausen, a German botanist, author of some useful works, especially upon the useful plants of Germany, published in one volume octavo, in 1790. Small annual plants, formerly referred to *Crepis*.

1638. *Crepis*. A name made use of by Pliny, to designate a plant of which he gives no description. The plants of this genus are common weeds of the hedges of Europe.

History, Use, Propagation, Culture,

1639. *Helminthia*. An abridgment of *Helminthotheca*, a name employed for this genus by Vaillant. It is derived from ἕλμινς, a worm, and θηκη, a case: in allusion to the corrugated seeds, which may be fancied to resemble bundles of little worms. The genus was united by Linnæus with *Picris*, but has been again separated by modern botanists.

1640. *Myoseris*. So named from μῦς μῦος, a mouse, and σείσις, lettuce; a name invented for the purpose of maintaining a resemblance in nomenclature with *Hyoseris*, *Lagoseris*, and other similar plants.

1641. *Tolpis*. A name invented by Adanson, and supposed to have no meaning. Handsome annual flowers.

1642. *Andryala*. A name, the meaning of which has not been discovered. Rather pretty plants, natives of the south of Europe and north of Africa.

1643. *Rothia*. Named by Schreber, in honor of Dr. A. G. Roth, author of a *Flora Germanica*, in 1788, *Catalecta Botanica*, in 1797, and other works. It has been united with *Andryala* by Richard.

1644. *Krigia*. Named after Dr. Krieg, a German botanist, who accompanied Mr. Vernon to America in search of plants. See *Vernonia*. A pretty little North American plant, with grassy leaves and bright yellow neat flowers.

11282 Involucrum large prickly, Leaves repand

11283 Leaves runcinate pinnatifid : lobes oblong acute toothed spreading, Scape naked many-fl. smooth

11284 Leaves obl. toothed, Pedunc. 1-flowered

11285 Leaves lanc. oblong : lower sinuate-toothed, Pedunc. proliferous

11286 Leaves obl. linear scabrous toothed, Stem branched divaricating, Lower scales of invol. downy

11287 Leaves gland. downy : lower runcinate toothed ; upper ovate lanc. entire, Stem and pedunc. glandular

11288 Leaves downy pinnatifid, Invol. downy pilose, Hairs rigid

11289 Leaves pinnated linear downy

11290 Leaves pinnatifid lyrate, Flowers corymbose aggregate, Pedunc. and invol. hispid

11291 Leaves downy oblong : lower toothed, Stem branched, Branches 1-flowered

11292 Leaves ovate woolly : lower somewhat toothed, Corymb terminal, Pedunc. about 2-flowered

11293 Stem branched at base diffuse, Leaves downy ovate lanceolate amplexicaul. nearly entire

11294 Stem erect corymbose, Leaves somewhat downy linear sinuate-toothed sessile : upper entire

11295 Stem erect corymbose, Leaves downy sessile : lower obl. runcinate, Pedunc. gland. villous

11296 The only species

11297 Scapes 1-fl. naked, Leaves smooth lyrate runcinate toothed : term. lobe trifid

11298 Scapes 1-fl. naked, Leaves smooth lyrate runcinate somewhat fleshy : segm. angular imbricated.

11299 Scapes 1-fl. naked thickened at end, Leaves lyrate pinnatifid toothed ciliated roughish

11300 Stem branched leafy diffuse, Leaves amplexicaul. oblong toothed scabrous ciliated at edge

11301 Scapes 1-fl. hispid, Leaves obl. runcinate toothed hispid, Hairs forked

11302 Stem diffuse branched, Leaves obl. toothed narrowed at base sessile, Scales of invol. in fruit smooth

11303 Stem diffuse branched, Lvs. obl. toothed narr. at base sess. Scales of invol. in fruit hairy

11304 Stem diffuse branched, Lvs. obl. toothed subcordate amplexicaul. Scales of invol. in fruit smooth

11305 Related to the last, but the leaves are deeply toothed with 3-forked hairs

11306 Leaves somewhat toothed, Hairs simple, Pedunc. very thick

11307 Stem erect branched, Lvs. obl. somew. toothed subcordate amplex. Scales of invol. in fruit alternately setose

11308 Stem erect panicled, Lvs. obl. hispid deeply toothed, Scales of invol. in fruit smooth muricated at the end

11309 The only species

11310 Smooth, Leaves obovate toothed

11311 Hispid, Leaves obovate somewhat toothed

11312 Stinging, Stem branched, Leaves toothed

11313 Radical leaves spatulate toothed pilose, Stem ascending smooth, Pappus stalked

11314 Hairy with very short stellate hairs and bristles, Lvs. lanc. entire, Pedunc. term. thickened upwards 1-fl.

11315 Stem simple leafy 1-fl. Leaves lanc. toothed

11316 Stem almost leafless solitary, Leaves ovate-oblong undivided toothed (spotted above)

and Miscellaneous Particulars.

1645. *Hyozeris*. From *υς υος*, a hog, and *σεις*, the Greek name of the Lettuce, or of a plant resembling it : hogs-lettuce, in allusion to the abominably fetid smell of the plant.

1646. *Hedynnois*. Under this name, a kind of wild endive, the medicinal qualities of which he much extols, is described by Pliny. Dalechamp, his commentator, derives the word from *ἡδύς*, sweet, and *πνεύμα*, to breathe, on account of a pleasant flavor communicated to other vegetables in cookery. But the modern genus, which consists of uninteresting weeds, has not been discovered to possess this quality.

1647. *Robertia*. Named by the authors of the Flore Française, after M. Robert, a Corsican botanist. A small weedy plant resembling Dandelion.

1648. *Seriola*. A diminutive of *σεις*, chicory. Small chicoraceous weeds of the south of Europe. *S. Alliate* is not, as its name would lead one to suspect, named from any smell of garlic which it possesses, but in honor of Prince Joseph Alliate, a Sicilian nobleman, and patron of Bivona Bernardi.

1649. *Soldevilla*. So named by Lagasca, apparently in honor of some botanist. A little Spanish weed with terminal solitary flowers.

1650. *Hypochæris*. From *υρα*, for, and *χαις*, a pig ; *Porcelle*, Fr., for the same reason, viz., that pigs eat the roots with avidity. All the species are uninteresting weeds.

History, Use, Propagation, Culture,

1651. *Lapsana*. From λαπαζω, to purge. The *Lapsana*, says Pliny, gently relaxes the body. *L. communis* is called *nipple-wort*, in English, and *herbe aux mamelles*, Fr., having been formerly applied to the breasts of women to allay the irritation occasioned by nursing.

1652. *Zacintha*. A plant growing in the island of *Zacintha* or Zante. It was formerly included in *Lapsana*, under the name of *L. Zacintha*.

1653. *Rhagadiolus*. From ραγας, a slit; each division of the calyx being hollowed out in the middle so as to resemble a furrow, or little gutter.

1654. *Moscharia*. This plant gives out an agreeable smell of *musk*. An annual plant, with stem-clasping pinnatifid deeply cut leaves, found in sandy waste places in Chili, where it is commonly called *Almizello*.

1655. *Catananche*. Vaillant explains the meaning of this word, by deriving it from the two Greek words, κατα, and αναγκη, necessity: that is to say, a plant which compels admiration. What is certainly known of its origin is, that it was employed by Dioscorides to designate a plant used by the women of Thessaly, in philtres and love potions. The modern genus, which contains two or three species of ornamental border annuals, can have no reference to that of the ancients, one kind of which is believed to have been *Ornithopus compressus*, and another *Astragalus pugniformis*. John Bauhin calls *Lathyrus Nissolia* by the name of *Catananche leguminosa*.

1656. *Triptilion*. A genus instituted by the authors of the *Flora Peruviana*, and named from τρεις, three, and πτελον, a feather, on account of the three divisions of the pappus. The species mentioned above is a very pretty little annual, or rather biennial plant, flowering during all the winter months in any place whence frost is excluded, but it requires not to be kept too dry. There is a fine species in Chili, with bright blue flowers, but it has not been yet introduced. The inhabitants of South America employ the flowers of the different species as overlying flowers, for which their dryness renders them very well adapted.

1657. *Cichorium*. In Greek κικωρον. De Theis's remarks are upon this subject excellent. Bodeus, he observes, Linnæus, and others, have derived this name from κω, to come, and κωρον, the field; that is to say,

- 11317 Leaves toothed roughish, Invol. hispid, Pappus of disk stipitate plumose : of the ray sessile setose  
 11318 Hispid, Calyxes hairy, Stem branched, Lvs. lanc. toothed  
 11319 Nearly glab. Invol. obl. imbricated, Stem branched somewhat leafy, Radical leaves dentato-sinuate  
 11320 Stem branched leafless glab. Pedunc. with small scales, Lvs. runcinate obtuse scab.  
 11321 Different from the last in having a smooth involucreum
- 11322 Stemless, Scape 1-fl. Leaves runcinate pinnatifid, Terminal lobe rhomboid
- 11323 Scape branched very thick and fistulose upwards, Leaves obovate oblong toothed
- 11324 Invol. of the fruit angular, Stem panicled, Pedunc. slender, Lvs. ovate petiolate angulato-dentate  
 11325 Caulicent branched, Leaves ovate stalked doubly toothed  
 11326 Caulicent branched, Lvs. angulato-toothed : lower lyrate-pinnatifid, Pedunc. and invol. smooth  
 11327 Caulicent panicled, Stem downy below, Radical leaves lyrate toothed : upper lanc. entire
- 11328 Rad. leaves lyrate acute, Cauline sagittate amplexicaul. toothed
- 11329 Fruit smooth spreading, Cauline leaves lanc. undivided  
 11330 Fruit smooth spreading, Leaves lyrate  
 11331 Fruit prickly spreading, Leaves linear lanc. entire
- 11332 Leaves amplexicaul. pinnatifid : segments deeply jagged
- 11333 Lower scales of invol. ovate mucronate, Leaves villous linear sub-bipinnatifid at base  
 11334 Lower scales of invol. lanc. Leaves lanc. toothed 3-nerved
- 11335 Leaves cordate spiny
- 11336 Flowers sess. axill. in pairs, Leaves runcinate  
 11337 Flowers axillary twin sessile, Leaves obovate toothed  
 11338 Pedunc. axill. twin : one long 1-fl. ; the other very short about 4-fl. Flowers capitate  
 11339 Pedunc. axill. twin : one long 1-fl. ; the other very short about 2-fl. Stem dichotomous, Rad. lvs. runcinate  
 11340 Flowers axill. solitary, Stem dichotomous, Branches naked spiny, Lvs. lanc. runcinate toothed
- 11341 Leaves obovate mucronate cartilaginous, Flowers solitary
- 11342 Fl. solitary lateral sessile, Lvs. decurrent, Stem subsimple villous erect  
 11343 Fl. solitary, Lvs. roughish smooth, Stem winged toothed  
 11344 Fl. subaggregate, Lvs. scabrous with the middle rib below hairy interruptedly decurrent

and Miscellaneous Particulars.

it is a plant found wild in fields, — which grows every where : but this etymology is overstrained. It is much more natural to suppose that the Egyptians, who used this plant in great quantities, would have communicated to the Greeks, along with the manner of using it, the name by which it was known in Egypt, which appears from Forskahl to be *chikouryeh*. Pliny remarked, that the Egyptians made their chicory of much consequence, and it is very well known that, at the present day, chicory or similar plants constitute half the food of the common people in Egypt. In like manner, there can be little doubt that the specific terms *Endivia* and *Intybus*, are both derived from the Arabic name *hendibeh*.

The leaves of *Cichorium Intybus* are employed by the French under the name of *Barbe du Capucine*, as a kind of winter salad ; for which purpose the leaves are blanched like *Endive*. The most common method of cultivating the plant, is to sow the seed in drills in the end of July, and to keep the plants about six inches apart, and quite free from weeds. In the winter the roots are taken out of the ground and packed up in a warm cellar among earth, in layers, like bottles in a wine cellar, the crowns only of the roots being exposed. In a few days, young leaves are produced in great abundance, from the situation in which they are cultivated quite blanched, and, if not grown too rapidly, with an agreeable taste. There is also a variety of *C. Intybus*, called *Chichoree à café*, which is cultivated extensively in France for the sake of its roots, which are taken up in the winter season, cut into squares, dried artificially, and afterwards, being roasted, are ground along with their coffee, for which they serve as an adulteration. There are those, however, who assert, that it is to this admixture of Succory root that the superior flavor of the French to the English coffee is to be attributed.

1658. *Bacaxia*. Named by the authors of *Flora Peruviana*, in honor of George Bacas, professor of botany at Carthagena.

1659. *Scotymus*. The Greek name of a spiny plant, which appears to have been the modern artichoke. The word itself is derived from *σκαλος*, a spine. *S. hispanicus* has simple fusiform roots, soft and sweet like *Scorzoneria*, and equally good to eat. The leaves and stalk also abound with a milky juice, and the people of Salamanca eat it in the same manner as Cardoons. The flowers are used for adulterating saffron.

History, Use, Propagation, Culture.

1660. *Arctium*. From *αρκτος*, a bear, (*arth*, Celtic); on account of the rough bristly fruit, which may be compared to the coarse hair of a bear. *Lappa* is derived from *lapp*, a hand, in Celtic, because it lays hold of every thing near it. The burdock is too familiar to every schoolboy to need illustration. It is equally common in Europe and Japan, by road sides and on ditch banks. Few quadrupeds, except the ass, will eat the plant; but birds feed on the seeds, and snails and caterpillars on the leaves. The stems, stripped of their rind before the flowers appear, may be eaten, either boiled or raw, with oil and vinegar. Withering says, a decoction of the roots is esteemed by some equal to that of Sarsaparilla. Burnt green, between the time of flowering and seeding, three pounds of the ashes produced sixteen ounces of very white alkaline salt, as good as the best potash.

1661. *Serratula*. A diminutive of *serra*, a saw; the leaves being edged with cutting teeth. Plants with the habit and qualities of thistles. *Serratula tinctoria* dyes cloth of a yellow colour.

1662. *Saussurea*. Named in honor of the celebrated Swiss philosopher Horace Benedict de Saussure, who, among his other acquirements, possessed a considerable knowledge in botany. He died in 1793, in the fifty-ninth year of his age.

1663. *Carduus*. This word appears to be derived from *ard*, a point, in Celtic, in allusion to the numerous

- 11345 Leaves cordate petiolate  
 11346 Cauline leaves cordate stalked entire, Invol. cobwebbed downy  
 11347 Invol. woolly: inner scales subulate somew. colored scarcely longer than outer, Racemes axill. panicled
- 11348 Leaves sharply serrate glab. pinnatifid: the terminal lobe the largest, Flowers in a small clust. umbel  
 11349 Leaves serrated unequally pinnate of about 5-pairs, Pinnæ confluent, Pedunc. 1-fl. Fl. rayed  
 11350 Lvs. serrated unequally pinn. of about 2-pairs, Pinnæ confluent, Pedunc. 1-fl. Inner scales of invol. long  
 11351 Lvs. lin. lanc. hirsute revolute at edge, Stem 1-fl. vil. Scales of invol. ov.-lanc. appressed [colored  
 11352 Leaves lin. entire hirsute, Fl. terminal corymbose  
 11353 Leaves lin. entire downy beneath revolute at edge, Corymb fastigiate  
 11354 Leaves pinnatifid oblique acute, smooth unarmed, Scales of invol. mucronate: inner scarious  
 11355 Leaves pinnatifid: lobes distant, Stem nearly simple 1-flowered, Invol. globosc squarrose  
 11356 Like *S. tinctoria*, but the lower leaves are oval and entire  
 11357 Leaves pectinate-pinnatifid naked: segm. lin. unarmed; terminal ovate, Scales of invol. ov. mucronate  
 11358 Invol. unarmed somewhat awned radiate, Leaves pinnatifid  
 11359 Leaves ov. pinnatifid toothed unarmed hoary beneath: upper sess. Stem 1-fl. Scales of invol. ov. unarmed  
 11360 Leaves lin. entire downy beneath, Corymb nearly simple, Invol. obl. ovate downy  
 11361 Invol. ovate: scales roundish scarious at edge, Leaves lanc. lower somewhat toothed at base  
 11362 Stem somewhat downy, Lvs. obl. acute narrowed at base serrated, Fl. subsessile, Invol. unarmed  
 11363 Lvs. downy beneath somewhat toothed: radical cord. stalked, Cauline lanc. decurrent, Invol. squarrose
- 11364 Invol. corymb. somewhat downy, Leaves fleshy smooth: radical lyrate hastate, Cauline hastate  
 11365 Leaves villous beneath toothed: radic. ovate-lanc. Flowers terminal somewhat umbelled  
 11366 Lvs. downy beneath toothed: radic. ovate-subcordate; cauline ovate-lanc. Fl. terminal somew. umbelled
- 11367 Leaves decurrent toothed spiny, Pedunc. naked very long 1-fl. Invol. spiny inclining  
 11368 Lvs. half decurrent obl. spiny-toothed somewhat fleshy smooth glauc. beneath, Pedunc. very long 1-fl.  
 11369 Leaves obl. decurrent sinuate spiny with white veins villous beneath, Fl. sessile clustered, Invol. cylind.  
 11370 Leaves decurrent spinous, Fl. drooping, Scales of the invol. lanc. cotony: outer ones spreading  
 11371 Leaves decurrent pinnatifid downy: segments palmate spiny, Flowers clustered  
 11372 Leaves decurrent runcinate spiny, Pedunc. somewhat downy 1-fl. Invol. ovate mucronate unarmed  
 11373 Leaves decurrent sinuate spiny smooth, Pedunc. short subcorymbose downy  
 11374 Leaves decurrent spiny glabrous, Pedunc. erect 1-fl. unarmed  
 11375 Lvs. decur. sinuated spinous, Invol. globosc nearly sess.: its scales lin. slightly recurved [lanc. erect  
 11376 Lvs. decurrent sinuated spinous somew. cottony beneath; Invol. nearly cylind. clustered sess. their scales  
 11377 Lvs. decurrent obl. sinuated spiny at edge downy beneath, Fl. stalked clustered terminal  
 11378 Lvs. decurrent lanc. pinnatifid toothed spiny vill. beneath, Pedunc. 1-fl. downy, Scales of invol. sub. spiny  
 11379 Leaves half decurrent lanc. pinnatifid spiny downy beneath, Pedunc. scaly downy  
 11380 Caul. lvs. half decurrent obl. undivided spiny toothed subvillous beneath: radic. pinnatifid at base  
 11381 Leaves decurrent sinuated ciliated naked beneath, Fl. stalked heaped  
 11382 Leaves half decurrent pinnatifid toothed spiny white with down beneath, Fl. subsessile term. clustered  
 11383 Leaves half decurrent toothed sinuate spiny smooth, Flowers panicled  
 11384 Leaves decurrent pinnatifid sinuated downy spiny, Pedunc. naked downy, Invol. deciduous  
 11385 Lvs. downy beneath: upper finely decurrent lin. Stem 1-fl. Scales of invol. lanc. mucron. downy  
 11386 Lvs. decurrent deeply pinnatifid: segments toothed upwards spiny with setaceous cilia: at end  
 11387 Leaves half decurrent pinnatifid acuminata: segm. 2-lobed ciliated spiny, Pedunc. downy  
 11388 Leaves half decurrent pinnatifid-serrate somew. spiny ciliated naked: radic. undivided, Pedunc. very long  
 11389 Leaves adnate at base lanc. naked eroded ciliate-spiny unarmed [woolly  
 11390 Leaves unarmed: radic. ovate toothed somewhat cut at base; cauline sessile pinnatifid linear  
 11391 Leaves naked: radical obl. entire; cauline lanc. somewhat toothed, Scales of invol. ovate mucronate

## and Miscellaneous Particulars.

points with which it is beset. *C. marianus*, the milk-thistle, derived its name from the Virgin Mary, some of whose milk is said to have fallen upon the leaves of the plant, and changed them to white. An extensive genus of rather handsome weeds. *C. Personata* is said to have been so called, because its ample leaves were formerly used as a mask (*persona*). Some of the gigantic species make handsome ornaments for the shrubbery, but the greatest number are nuisances to the husbandman; some on account of their deep vivacious roots, which cannot be eradicated without extreme difficulty; but the greater number because of their bulky herbage, and the extensive dissemination of their seeds by the wind.

The footstalks of the leaves of most or all of the species of this and the allied genera might be eaten in the manner of Cardoons, if similarly blanched. The dried flowers of *C. arabicus* and nutans might curdle milk. The seeds of all the species of *Serratula*, *Cnicus*, *Onopordum*, and similar genera, are greedily eaten by small birds, especially the finches.

The *Carduineæ* of *M. Cassini* differ from *Carlineæ* of the same author, in the filaments being hairy or papillose, from *Centauriæ* in the structure of ovarium and of pappus, and from *Echinopseæ*, to which they bear a general resemblance, by many very important characters. The species inhabit Europe, Asia, and Africa; there are scarcely any in America, and none in the southern hemisphere.

*History, Use, Propagation, Culture,*

1664. *Silybum*. A name under which Greek writers describe a plant not well known at present. Sprengel refers it to *S. marianum*. This plant was formerly cultivated, and the young leaves used in spring as a salad, or boiled as pot greens; the young stalks, peeled and soaked in water, to extract a part of their bitterness, were also eaten, and were said to be excellent. In the spring of the second year, the root is prepared like salsify or skirret; and the receptacle of the flower is pulpy, and eats like that of the artichoke. In Apulia the whole plant is much used as fodder for cattle.

1665. *Cnicus*. This is a name under which Dioscorides describes a prickly rough plant; derived from *κνίξ*, to prick. It is now referred to a tribe of plants having such characters in an eminent degree. *Acarna* and *Eristhales* are both names by which the ancients distinguished plants, either the very same as those now so called, or very similar to them. The tender stalks of *C. palustris*, as of most of the species, being peeled, are eatable either raw or boiled. *C. arvensis* is well known as one of the most troublesome weeds in arable land. It is never found, however, in very sandy, gravelly, or peaty soils; but generally in such as are loamy and dry. An instance is given in the Farmer's Magazine, of the descending roots of this plant having been dug out of a quarry nineteen feet long; nor is it less remarkable for its horizontal roots. Mr. Curtis planted about two inches of a root in his garden in April, and by November following it had thrown out under ground stolons on every side, some of them eight feet long; some of these stolons had thrown up leaves five feet

- 11392 Lvs. amplexicaul. waved spinous : radic. ones pinnati. Scales of invol. subfoliac. recurved spinous at margin  
 11393 Leaves downy beneath ovate toothed : radical cord. Petioles winged toothed, Invol. subsolitary cernuous
- 11394 Lvs. decurrent scabr. pinnatif. spinous. Invol. ovate clustered their scales ovate-lanc. mucro. appressed  
 11395 Lvs. half decurrent somew. hoary lanc. ciliate spiny, Pedunc. naked downy solit. Scales of invol. appressed  
 11396 Leaves decurrent lanc. hoary toothed spiny, Fl. aggregate involucrete, Invol. with pinnated spines  
 11397 Lvs. decurrent lanc. smooth subrepand uneq. ciliated, Pedunc. naked downy alternate [lanc. spreading  
 11398 Lvs. decurr. hispid pinnatif their segm. generally 2-lobed spreading spinous, Invol. ov. toment. their scales  
 11399 Lvs. subdecurr. pinnatif. : segm. 2-lobed spreading spiny vill. beneath, Invol. hemispher. sessile  
 11400 Lvs. amplexicaul. hispid pinnatif. : segm. 2-lobed spreading spiny downy beneath, Invol. ovate  
 11401 Leaves sess. pinnatif. every other segm. pointing upwards spin. scabr. Involucres spherical woolly  
 11402 Leaves sess. pinnatif. hairy downy beneath : segm. 2-lobed spreading spiny, Invol. globose with cobweb down  
 11403 Leaves sess. obl. lanc. scabrous downy beneath toothed ciliated : radic. pinnatifid, Invol. bracteate ovate  
 11404 Leaves sess. lanc. waved at the edge and unequally spin. pubesc. cottony beneath, Flowers mostly solitary  
 11405 Lvs. amplexic. lanc. ciliato-dentate undivided or laciniated white and downy beneath, Fl. mostly solitary  
 11406 Lvs. subcordate amplexicaul. lanc. ciliated downy beneath : lower somewhat cut, Fl. clustered  
 11407 Lvs. lanc. sessile ciliated strigose beneath : radical sinuated, Scales of invol. recurved at end  
 11408 Lvs. pinnatifid with strong spines somewhat downy beneath, Fl. sess. aggregate, Lvs. of invol. spiny  
 11409 Lvs. half decurr. obl. sinuate toothed spiny hoary beneath, Heads close together with appressed scales  
 11410 Leaves half decurrent lanc. entire ciliated, Pedunc. very long 1-f. woolly  
 11411 Very like *C. arvensis*, but the leaves are decurrent  
 11412 Stem somew. downy, Lower lvs. sinuate-toothed with strong spines rough above finely downy beneath  
 11413 Lvs. amplexic. hispid pinnatifid : segm. 2-lobed spreading spiny downy beneath, Heads ov. glabrous spiny  
 11414 Lvs. amplexic. hispid pinnatif. : segm. 2-lobed spread. spiny downy beneath, Heads ov. cobwebbed with down  
 11415 Lvs. amplexic. hispid pinnatif. : segm. 2-lobed spread. spiny beneath naked subvillosus, Heads ov. cobwebbed  
 11416 Lvs. amplexic. hispid pinnatifid : segm. 2-lobed spreading spiny naked beneath, Heads ov. glabrous  
 11417 Lvs. amplexicaul. hispid pinnatifid prickly : segm. angular lobed spiny, Heads nodding cobwebbed  
 11418 Stem branched many-f. Heads terminal solitary spiny at base, Lvs. amplexicaul. sinuate toothed spiny  
 11419 Leaves sess. pinnatifid hispid woolly beneath : segm. 2-lobed spreading spiny, Invol. ovate woolly  
 11420 Leaves sess. lanc. cut-toothed : radical. pinnatifid, Scales of invol. ovate lanc. membranous at edge  
 11421 Leaves ciliate spiny downy beneath : lower stalked obl. acum. subsinuate; upper pinnatifid auricled  
 11422 Like the last, but the leaves of involucrem are reflexed  
 11423 Leaves obl. smooth serrulate with bristly ciliae blunt mucro. Stem corymbose  
 11424 Leaves unarmed sess. obl. toothed : radical undivided and pinnatifid, Invol. scarious villous  
 11425 Leaves sess. pinnati. spin. Stem panicled, Invol. ovate, Scales appressed mucronated

- 11426 Leaves toothed ciliated naked : cauline amplexicaul. : lower and radical pinnatifid, Fl. clustered capitate  
 11427 Leaves amplexicaul. ovate sublyrate ciliate serrate scabrous : radic. lyrate, Fl. clustered  
 11428 Leaves amplexicaul. obl. lanc. toothed ciliate-spinous, Pedunc. 1-f. Invol. bracteate  
 11429 Leaves sess. pinnatifid : segm. cut serrate spiny at edge, Invol. bracteate : scales ovate appressed  
 11430 Leaves cordate amplexicaul. ovate obl. toothed ciliated : radical obl. blunt ciliated sinuate  
 11431 Leaves amplexicaul. cord. pinnatif. ciliate serr. Fl. terminal subracemose bracteate, Bracts colored ovate  
 11432 Leaves amplexicaul. obl. pinnatif. toothed spiny hispid above downy beneath, Tern. fl. sess. axill. stalked  
 11433 Leaves amplexicaul. pinnatif. toothed spiny glabrous, Fl. term. aggreg. sess. surrounded by colored bracts  
 11434 Leaves amplexicaul. pinnatifid ciliated, Pedunc. cernuous, Invol. glutinous : scales lanc. spreading  
 11435 Leaves amplexic. pinnati. downwards ciliated : pinnæ lanc. 3-nerved; upper confluent, Pedunc. cernuous  
 11436 Leaves amplexicaul. pinnatifid ciliate-spinous : segm. 2-lobed toothed upwards at the base  
 11437 Stemless, Invol. glabrous  
 11438 Leaves sess. lanc. entire downy beneath with triple spines at the edge, Fl. axill. sessile  
 11439 Leaves sess. lanc. downy beneath subrepand : lobes emarg. with 2 spines, Fl. stalked subcorvombos

## and Miscellaneous Particulars.

from the original root. The whole together, when dug up and washed, weighed four pounds. In the spring following, it again made its appearance, on or about where the small piece was originally planted. There were between fifty and sixty young plants, which must have sprung from fragments of the roots that had eluded the gardener's search, though he was particularly careful in extracting them. From these facts it may readily be conceived how difficult it is to eradicate this weed from arable land; a naked fallow, with frequent and deep ploughing, will not accomplish it, unless the season is more than usually dry. Laying land down to grass, keeping it in that state seven or eight years, and during the whole time pulling up every shoot as soon as it appears, is found fully more effectual than a naked fallow. But the plant is so common by road sides, and seeds so abundantly, that it is hardly possible to effect its extermination. In common field lands, and others indifferently cultivated, it often forms the larger half of the produce, and formerly used to be pulled when beginning to come into flower, and given as food to horses and cows. Those who pull this weed require to be furnished with strong gloves or thistle pickers. (*Encyc. of Agr.* § 2394.) Some English botanists seem doubtful if horses and cows will eat it; but those who know any thing of the history of agriculture in Scotland will recollect, that before the introduction of naked fallows and turnips, it formed the *supper* of housed cattle, during five or six weeks of every summer. The ashes of the plant yield a very pure vegetable alkali. *C. canus* has fleshy white roots like the skirret, and may be dressed and eaten

History, Use, Propagation, Culture.

in the same manner. *C. lanceolatus* is one of the most common and noxious weeds of the genus, chiefly on account of its great bulk, its numerous downy seeds, and the facility with which they are distributed by the wind; its dried flowers curdle milk. *C. helenioides*, used to be called the melancholy thistle, and was used by quacks as a cure for madness. *C. Casaubonæ* is so named after Casaubona, herbarist to the Grand Duke of Tuscany, who sent the seed to John Bauhin. *C. syriacus* is spotted with white, as are a number of Egyptian plants. *C. oleraceus*, according to Schreber, is not eaten by cattle; but the Russians are said to boil the leaves in the spring, and eat them as coleworts. The tender stalks of *C. cernuus* are so used in Siberia.

1666. *Onopordum*. A name employed by Pliny for a plant which he describes too imperfectly to be recognized now. The virtues which he ascribes to it, and whence the name has been derived (*ovos* and *περδω*), certainly have no existence in the modern genus, which consists of noble thistle-like plants, that, if allowed plenty of room, form very magnificent specimens of annual vegetation. *O. acanthium* (from its leaves being like those of the *Acanthus*) was formerly used like the artichoke and Cardoon. The seeds of this plant, unlike those of other thistles, are strongly defended by the calyx, and are not subject to be blown about by winds. The whole plant is white, tomentose, and one of the most magnificent of the family.

1667. *Berardia*. So named by Villars, after M. Berard, a botanist of Grenoble.  
 1668. *Cynara*. Said to be derived from *κυνος*, a dog, on account of the stiff hard spines of the involucreum, which resemble the teeth of a dog. The English word *Artichoke* is said to be derived from the Celtic *art*, a spine, and *chauls*, a cabbage; but it must be confessed that the word is very like the Arabic name of the plant, *Carciáf* or *Kharchiáf*. *C. scòlymus* is a well known garden esculent. In some parts of France and Italy it is eaten raw in its wild state by the common people. According to Gerarde, it was introduced into this country from Italy, but is become, "by reason of the great moisture which our country is subject unto," greater and better than those of Italy; a circumstance not to be doubted, and applicable to many other plants of culture; for it is a fact, that art can in many cases surpass nature; always, however, working upon nature's principles. The artichoke is one of those plants the most patient of drought, and in this unusually dry and hot season (1825) was almost the only vegetable procurable in the neighbourhood of Paris, during three or four weeks in July and August. Once in the seventeenth century, and again about 1739, most of the artichokes in England were destroyed by frost, but replaced from France. There are three varieties in cultivation, the conical, French, or oval; the globe, which has a large dusky purplish head; and the dwarf globe, a prolific variety, which is smaller. The parts used are the lower part of the leaves of the calyx; and the fleshy receptacles of the flower, freed from the bristles and seed down, vulgarly called the choke; and some-

11440 Leaves narr. pinnatifid downy beneath with strong spines, Fl. large solitary, Lvs. of invol. spiny recurved  
 11441 Leaves sess. lanc. entire unarmed downy beneath, Spines axill. branched at base, Fl. axill. sessile  
 11442 Leaves amplexicaul. obl. toothed spiny with white veins, Fl. subsess. bracteate, Scales of invol. appressed  
 11443 Leaves amplexicaul. pinnatifid toothed spiny pubescent, Stem simple, Fl. terminal clustered  
 11444 Leaves pinnatifid, Invol. scariosus : scales acuminate  
 11445 Leaves pinnatifid, Invol. scariosus villous

11446 Scales of invol. spreading subulate, Lvs. ov.-obl. sinuated and spin. decurrent woolly on both sides  
 11447 Scales of invol. much spreading, Lvs. decurrent smooth on each side sinuated toothed spiny  
 11448 Scales of invol. much spreading as long as invol. Lvs. decurr. downy sinuated toothed spiny ; radic. pinnate  
 11449 Lower scales reflexed : upper much spreading, Lvs. decurrent downy sinuated toothed spiny  
 11450 Invol. squarrose with covebbed down, Leaves stalked ovate angular downy beneath  
 11451 Scales of invol. ovate-lanc. mucronate spreading, Lvs. decurrent downy subsinuate toothed spiny  
 11452 Stem and leaves tomentose : radical pinnatifid ; cauline obl. adnate decurrent toothed spiny  
 11453 Scales of invol. ovate mucronate appressed, Lvs. decurrent somewhat downy sinuate toothed spiny  
 11454 Stempl. Invol. glob. subsess. Scales of invol. lanc. spiny spreading, Lvs. stalked pinnatif. toothed spiny downy

11455 Stemless, Invol. obl. subsess. Scales of invol. obl. lanc. downy unarmed, Lvs. stalked roundish ovate

11456 Leaves somewhat spiny pinnate and undivided, Scales of invol. ovate  
 11457 Leaves pinnatifid downy beneath spiny, Spines of the base of leaves and pinnae connate at base  
 11458 Leaves spiny : all pinnatifid, Scales of invol. ovate  
 11459 Leaves spiny pinnatifid downy beneath, Scales of invol. subulate  
 11460 Stemless, Leaves unarmed downy beneath pinnatifid : segm. cut-toothed, Scales of invol. lanc.  
 11461 Stemless, Leaves pinnatifid spiny  
 11462 Stemless, Leaves pinnatifid smoothish : segm. toothed spiny, Inner scales of invol. scariosus at end

11463 Stemless, Leaves pinnatifid downy beneath : segm. toothed angular spiny  
 11464 Stem simple 1-fl. Lvs. pinnatifid naked : segm. cut-toothed spiny  
 11465 Stem simple 1-fl. longer than flower, Leaves deeply pinnatifid squarrose  
 11466 Stem simple 1-fl. numerous aggregate, Leaves pinnatifid smooth : segm. pinnatifid spreading spiny  
 11467 Stem subdiffid, Middle flower sessile, Lvs. hoary lanc. toothed spiny  
 11468 Stem many-fl. corymbose smoothish, Lvs. lanc. pinnatifid toothed smooth  
 11469 Stem many-fl. corymb. pubesc. Leaves lanc. unequally spin. and sinuated downy beneath  
 11470 Stem somewhat divided, Fl. axill. sess. Leaves lanc. toothed downy spiny pubescent  
 11471 Stem many-fl. Leaves decurrent

and Miscellaneous Particulars.

times the tender central leafstalk in a blanched state like the Cardoon. Medicinally, the plant is reputed to be aperient, stomachic, and somewhat heating. It is said to dye a good yellow, and the flowers curdle milk.

The plant is propagated by suckers in March and April, and requires a light rich soil, well dunged, and pulverised to a good depth. The leaves being large, the plants are placed in rows at four feet distance, and two feet apart in the row. They will produce some heads the first season, a full crop the next, and, if well manured, will last for five or six years. The plants require to be covered a foot thick with litter during winter, which is removed, and the ground dressed in March and April. The heads will appear in the beginning of June.

When the artichoke is to be cultivated as Cardoon, the plants are to be cut over by the surface about mid-summer ; in September they will have produced leaves about two feet high ; they are then bound close with a wreath of hay or straw, and earth drawn round them. The blanching will be perfected in a month or six weeks.

Bauhin thought the Cardoon a hybrid from the common artichoke, to which it bears a great resemblance. The tender stalks of the inner leaves, rendered white and crisp by earthing up, are used for stewing, and for soups and salads during winter, like celery. It requires the same soil as the artichoke, to be planted at three or four feet apart in May, or sown where it is to remain in March. In September the leaves may be tied together and earthed up, and in October and November they will be blanched from one to three feet in length.

With the florets of *Cynara Cardunculus*, which the Portuguese call *Cardo do coalho*, milk was formerly coagulated by the people of Portugal, as it is by rennet in England.

1639. *Carlina*. Olivier de Serres says, this plant was named after the famous Charlemagne, whose army was cured of the plague by means of this plant. Linnæus ascribes the name to the Emperor Charles V., whose army was relieved from the plague in Barbary in the same way. *C. acaulis* has black woody roots an inch thick, the upper part of which, with the receptacle of the flower, when tender, may be eaten, but the root of the adult plant becomes acrimonious, and is recommended as an alexipharmic. It contains an acrid resinous principle, by which it stimulates the solids, dissolves the humours, and promotes perspiration. *C. vulgaris* is found all over Europe in dry barren soils. The flowers expand in dry, and close in moist weather, retaining this property a long time.

Upon this and a few other genera *M. Cassini* has founded a tribe, which he denominates *Carlinae*, which although possessing no very precise characters of difference, is, he believes, distinct from both his *Centauriæ* and *Carduineæ*, from which it may always be distinguished by the perfect smoothness of the filaments. The species of *Carlinae* are found in every part of the world.

History, Use, Propagation, Culture.

1670. *Atractylis*. Vaillant (*Mem. Acad. Sc.* 1718.) derives this from *ατρακτος*, a distaff, because the light stems were very fit to make spindles.

1671. *Acarna*. A name under which Theophrastus describes a plant resembling a thistle. Willdenow applied it to the present genus, which consists of thistle-like plants.

1672. *Stokesia*. Named in honor of Jonathan Stokes, M.D., well known as the coadjutor of Dr. Withering in his botanical arrangement of British plants. A perennial plant, with large handsome blue flowers.

1673. *Stobæa*. Named after Dr. Stobæus, of Lund, one of Linnæus's earliest patrons, and said to have been a practical naturalist.

1674. *Onobroma*. From *ονος*, an ass, and *βρομη*, food, in allusion to the worthlessness of its herbage. Thistle-like plants of little value.

1675. *Carthamus*. From its Arabic name *qortom*, a word which signifies to paint, on account of the fine color yielded by the flowers. Tournefort, with little reason, derives it from the Greek *καρμη*, to purge. The flowers of *Carthamus tinctorius* are used by the Chinese to give some of the fine rose, scarlet, purple, and violet colors to their silks. For this purpose, the flowers are thrown into an infusion of some alkali, and left to macerate; the colors are afterwards drawn out by the addition of lemon juice in various proportions, or of any other vegetable acid.

It is cultivated at present in many parts of Europe, and in the Levant, whence great quantities are annually imported into England for dyeing and painting. In Spain it is grown in gardens, as Marygold, as in England, to color soups, olives, and other dishes. The Jews in Poland are remarkably fond of it, and mix it with their bread, and most of their viands. According to Houghton, it was formerly cultivated in Gloucestershire, both for the flowers and seed. The common people took it for saffron, and used it in their puddings, cakes, and

11472 Stem and leaves smooth

11473 Stemless, Leaves pinnatifid, Outer leaves of invol. tricuspidate

11474 Stem branched, Leaves lanc. ciliate toothed downy, Outer leaves of invol. setaceous pinnatifid conniving  
[larger than flower]

11475 The only species

11476 Leaves downy pinnatifid : pinnæ linear terminated by a spine

11477 Stem about 1-fl. Leaves ovate lanc. spiny-toothed

11478 Stem shrubby, Leaves sessile lanceolate downy beneath spiny-toothed, Branches 1-flowered

11479 Stem quite smooth, Leaves ovate entire spiny toothed, Fruit naked

11480 Stem woolly, Lower leaves pinnatifid toothed : upper amplexicaul pinnatifid toothed spiny

11481 Stem smoothish, Invol. somewhat woolly, Lower leaves lyrate : upper half-amplexicaul.

11482 Radic. leaves pinnated : cauline pinnatifid, Stem 1-flowered

11483 Leaves unarmed : radical toothed ; cauline pinnate

11484 Cauline leaves linear pinnated as long as plant

11485 Leaves ensiform sinuate toothed

11486 Spiny much branched with small blue flowers

11487 Leaves sessile linear toothletted downy beneath, Inner scales of invol. lanc. long

11488 Leaves stalked ellipt. blunt entire silky with down beneath

11489 Leaves lin. clustered very long revolute at edge hoary beneath, Branches downy

11490 The only species

11491 Leaves scattered and fascicled filiform ciliated, Leaves of invol. ciliated, Hairs of recept. clustered

11492 Lvs. scattered and fascicled filiform subciliate at base, Lvs. of invol. entire, Holes of recept. multipartite

11493 Leaves connate linear filiform glabrous, Scales of invol. ovate, Stem wavy, Fl. terminal in threes stalked

11494 Leaves ovate powdery downy, Scales of invol. ovate entire

11495 Leaves ovate smooth, Scales of invol. ovate mucronate membranous

11496 Leaves lanc. scabr. serrulate, Corymb fastigiate, Scales of invol. filiform at end

11497 Leaves ovate-lanc. serrate downy beneath, Corymb fastigiate, Scales of invol. ovate acuminatæ

11498 Stem simple, Lvs. many long and narrow lin. nearly entire, Corymb somewhat umbell. Scales of inv. stiff well pulverised ; it is sown in rows about eighteen inches distance, and afterwards thinned to three or four inches apart in the row : in September the plants begin to flower, and the field is then gone over once a week, for six or seven weeks, to gather the expanded florets, which are dried in a kiln in the same manner as true saffron. Turkeys and geese are said to feed greedily on the seed, and in a short time become very fat.

11499 Leaves oblong acuminate serrate, Corymb fastigiate, Scales of invol. ovate acute

11500 Leaves linear-lanc. silky beneath downy on each side nearly entire, Flowers alternate 1-sided sessile

11501 Stem straight dichotomous upwards : branches flexuose, Heads in the forks of the branches sessile

and Miscellaneous Particulars.

bread ; but by putting in too great a quantity they found it communicate a purgative quality, and gave up its use. It is still, however, used in this way by some pastrycooks. In Germany it is cultivated on light land well pulverised ; it is sown in rows about eighteen inches distance, and afterwards thinned to three or four inches apart in the row : in September the plants begin to flower, and the field is then gone over once a week, for six or seven weeks, to gather the expanded florets, which are dried in a kiln in the same manner as true saffron. Turkeys and geese are said to feed greedily on the seed, and in a short time become very fat.

*C. lanatus* is used by the women of the south of France and Spain for distaffs, and hence it had the name of distaff thistle. The root of *C. carduncellus* is eaten in Africa.

1676. *Cardopatum*. A name of unknown meaning. A spiny branched plant with little blue flowers, formerly referred to *Carthamus*.

1677. *Stæhelina*. One Benoit Stæhelin, a Swiss botanist, published, in 1730, an academical dissertation upon the *Filicula saxatilis corniculata* and the *Equisetum*. These are pretty half-shrubby thread-leaved plants, mostly deserving cultivation.

1678. *Palafoxia*. Named after Lagasca, after the Spanish General Palafox, of whose merits as a botanist we are uninformed. A small perennial plant with the habit of *Stevia*.

1679. *Pteronia*. From *pteron*, a wing ; altered by Linnaeus from the *Pterophorus* of Vaillant, a word which seems to allude to the feathery scales of the receptacle. A genus of humble rigid shrubs.

1680. *Vernonia*. Named after Mr. William Vernon, fellow of St. Peter's College, Cambridge, who travelled in North America in search of plants, and left behind him an Herbarium, which came into the hands of Sir Hans Sloane, and contributed to enrich the third volume of Ray's *Historia Plantarum*. Vernoniae constitutes the twentieth of M. Cassini's subdivisions of *Compositæ*. They are distinguished from *Lactuceæ* by

History, Use, Propagation, Culture,

their corolla, which is not ligulate, and from every other tribe by their style, which is absolutely the same as that of Lactuceæ. The greater part of Vernoniæ are found in America; a few in Asia and Africa, but none in Europe.

1681. *Ammobium*. From *αμμος*, sand, and *βιω*, to live, in allusion to the places where it grows. A pretty half-hardy New Holland herbaceous plant, with dry white involucre scales, like a *Gnaphalium*.

1682. *Liatris*. A word of unknown meaning. A genus of charming North American herbaceous plants. They should be taken out of the borders in the autumn, and preserved in pots till the succeeding spring. Of *Liatris odoratissima*, the leaves when dry give out a very pleasant smell resembling *Vanilla*, and which lasts for years. It is called the Carolina *Vanilla* plant.

*Liatris squarrosa* is a very handsome species, with large heads of most beautiful flowers of a rich purple. It and *L. scariosa* are known in North America under the name of rattlesnake's master. In case of being bitten by this reptile, the bruised bulbs of the plants are applied to the wound, while, at the same time, a decoction in milk is taken inwardly.

- 11502 Leaves oval blunt serrate-crenate : lower with a winged amplexicaul. stalk, Fl. subcorymbœ  
 11503 Leaves ovate entire acute downy beneath, Spikes recurved 1-sided, Bractes reflexed  
 11504 Leaves ovate-lanc. narrowed at each end serrated roughish pubescent beneath, Fl. term. about 3  
 11505 Leaves oblong wavy decurrent  
 11506 Stem simple pubescent, Leaves very long linear nerved roughish at edge, Racemes few-fl. leafy  
 11507 Stem simple pubescent, Lvs. lanc. narrowed at each end smooth rough at edge, Inv. squarrose at bottom  
 11508 Stem simple pubescent, Leaves smooth : lower stalked broad-lanc. Invol. subglobose with scariosus scales  
 11509 Stem simp. vill. Lvs. lin. subfalc. dot. rough, Spike somew. leafy, Panic. short, Inner scales ligul. colored  
 11510 Stem simple pubesc. Lvs. lin. pilose ciliated, Invol. racemose lax, Scales lin. obl. blunthish [ mucronate  
 11511 Slender all over hairy, Lvs. grassy, Spike few-fl. Inv. subseas. cylindr. few-fl. Scales round, at end abruptly  
 11512 Stem simple smooth, Leaves lanc. smooth : upper lin. lanc. very small, Invol. spiked subsquarrose  
 11513 Stem simple hirsute, Lvs. straight narrow-lin. downy, Spike long, Fl. closely cluster. Inv. appress. squarrose  
 11514 Stem simple tall, Lvs. lin. smooth ciliated at base nerved and dotted, Spike very long, Fl. sessile [at end  
 11515 Quite smooth, Stem simple, Rad. leaves obl. : cauline amplexicaul. Panicle corymbœ lax spreading  
 11516 Dwarf, Leaves linear, Stem simple, Flowers spiked  
 11517 Stem climbing, Leaves ovate entire, Flowers spiked  
 11518 Stem climbing, Leaves subcordate hastate toothed, Flowers in spikes  
 11519 Stem climbing smooth, Lvs. cord. repand toothed acuminate with spreading unequal lobes, Fl. corymbœ  
 11520 Flowers sessile lateral  
 11521 Flowers axillary sessile, Corollas all triffid  
 11522 Leaves lanc. veiny obsoletely serrate smooth, Invol. 4-fl. Stem shrubby  
 11523 Stem paniced, Leaves smooth : lower pinnated ; upper fascicled, all filiform  
 11524 Leaves opp. subverticill. linear entire pubescent 3-nerved dotted : radical somewhat toothed  
 11525 Leaves sessile amplexicaul. distinct ovate-lanc. rounded at base serrated smooth, Stem smoothish  
 11526 Leaves sessile distinct ovate scabrous : upper coarsely serrated at base ; uppermost entire  
 11527 Leaves sessile distinct roundish cordate bluntly serrate veiny  
 11528 Leaves subsessile lanceolate 3-nerved narrowed at each end downy : lower serrated in middle  
 11529 Leaves stalked 3 or 4-nate ovate narrowed at each end serrated roughish  
 11530 Leaves opposite subpetiolate tri-quinque-partite : their segments lanceol. deeply serrate  
 11531 Leaves petiolate ternate and simple downy beneath unequally serrate, Stem smooth  
 11532 Leaves stalked 4 or 5-nate ovate lanceolate serrate rugose veiny roughish, Stem hollow  
 11533 Leaves stalked 4 or 5-nate ovate lanceolate unequally serrate downy beneath, Stem solid furrowed  
 11534 Leaves stalked 4 or 5-nate ovate acuminate serrated scabrous on each side, Stem solid round  
 11535 Leaves stalked 3 or 4-nate ovate-lanceol. cuneate at base unequally serrate smoothish, Stem solid smooth  
 11536 Leaves connate perfoliate downy  
 11537 Leaves stalked cordate ovate bluntish 3-nerved bluntly serrate, Fl. corymbœ  
 11538 Hispid, Leaves stalked cordate cut serrate, Panic. terminal, Invol. many-fl. subulate pungent  
 11539 Leaves stalked ovate acute 3-nerved bluntly serrate glabrous, Stem paniced upwards, Fl. corymbœ  
 11540 Leaves stalked ovate acuminate 3-nerved unequally coarsely serrated smooth, Corymb many-fl. spreading  
 11541 Leaves stalked triangular ovate serrated entire at end downy beneath, Corymb spreading term. sessile  
 11542 Leaves narrow lanceol. 3-nerved subserrated, Invol. squarrose many-flowered  
 11543 Leaves amplexicaul. lanc. acuminate rugose serrated, Flowers paniced clustered  
 11544 Leaves stalked ovate acuminate unequally and bluntly crenated pubescent, Panicle contracted  
 11545 Leaves stalked ovate acuminate toothed 3-nerved glabrous  
 11546 Stem twining villous, Lvs. deltoid ovate acute 3-nerved soft beneath, Panicle term. trichotomous diffuse  
 11547 Like E. lamifolium, but the flowers smaller and paniced

and Miscellaneous Particulars.

1683. *Mikania*. Named by Willdenow, after Professor Mikan, of Prague. Climbing tropical plants, one of which, *M. Guaca*, is employed in South American medicine as a powerful febrifuge.

1684. *Sperganophorus*. From *σπέρμα*, a file, and *φορος*, to bear, because the seed is crowned with a membranous band or border.

1685. *Eupatorium*. This plant, says Pliny, derives its name from Eupator King of Pontus, who first used it in medicine. *Aya-pana* is the vernacular name of the species so called among the natives of the banks of the river Amazon. The tribe of Eupatorieæ is distinguished from Vernoniæ by its style. They are chiefly found in America, very few inhabit Asia, scarcely any Africa, and not one has been found in Europe.

The *Eupatorium perfoliatum* has some reputation as a medicinal plant. A dissertation upon the subject of its merits was published a few years since by an American physician, from which it appears, that the virtues of the plant reside chiefly in the leaves, and that the most efficient mode of exhibiting it is by means of a simple decoction. The medical powers of *Eupatorium* are, as its sensible properties would seem to indicate, those of a tonic stimulant. Given in moderate quantities, either in substance, or in cold infusion or decoction, it promotes digestion, strengthens the viscera, and restores tone to the system. Like other vegetable bitters,

History, Use, Propagation, Culture,

if given in large quantities, especially in warm infusion or decoction, it proves emetic, sudorific, and aperient. Even in cold infusion, it tends to bring on diaphoresis. The plant is also stated to be an excellent remedy for the cure of intermittent fevers. When employed as a tonic, this plant may be taken in doses of twenty or thirty grains, or a teacup full may be used of the infusion rendered moderately bitter. When intended to act as an emetic, a strong decoction may be made from an ounce of the plant in a quart of water boiled to a pint. (*Bigelow.*)

1686. *Dumerilia*. Named after M. A. M. Constant Duméril, author of an Elementary Treatise upon Natural History, published in one volume octavo, at Paris, in 1804. Small half-shrubby South American plants, with firm hairy leaves.

1687. *Ageratum*. A name employed by Dioscorides, and probably applied by him to some plants similar to what we call properly "everlastings;" it is derived from *α*, privative, and *γενεος*, old age, because it never grows old; that is to say, always preserves its color.

1688. *Cælestina*. From *cælestis*, blue, in allusion to the color of the flowers.

1689. *Stevia*. Dedicated by Cavanilles to the memory of Peter James Esteve, a Spanish physician of the sixteenth century. He left behind him a dictionary of the plants natives of the kingdom of Valencia.

1690. *Cephalophora*. From *κεφαλη*, a head, and *φορεω*, to bear, its flowers being united in little heads.

1691. *Ampherephitis*. From *αμφερεφθη*, which signifies well covered, on account of the double involucre of the genus.

11548 Lvs. sessile distinct ovate scabrous veiny: lower doubly serrate; upper subserrate, Stem panicled downy  
 11549 Leaves stalked cordate acute subserrate villous beneath, Invol. 8-15-fl. Stem shrubby  
 11550 Leaves stalked hastate triangular 3-nerved unequally serrate downy beneath, Panic. corymbose  
 11551 Stem twining, Leaves reniform ovate acuminate serrate-toothed, Panicle axillary

11552 Leaves roundish 7-lobed: lobes crenate, Panicle corymbose terminal

11553 Leaves ovate subcordate, Stem hairy, Paleæ of pappus awned toothletted  
 11554 Leaves ovate cuneate at base, Stem pilose, Paleæ of pappus lanceolate acute  
 11555 Stem erect simple scabrous, Leaves cordate rugose unequally serrated  
 11556 Hispid, Leaves cordate ovate crenate rugose, Corymb compound, Paleæ of pappus lanceolate awned

11557 Leaves stalked ovate acute rounded at base serrated pilose above hairy beneath

11558 Leaves lanc. channelled narrowed into the footstalk 3-nerved, Corymb fastigate  
 11559 Leaves lanc. 3-nerved entire, Corymb fastigate, Pappus paleaceous and awned  
 11560 Leaves oblong ovate entire, Corymb spreading, Pappus awned as long as corolla  
 11561 Leaves lanc. narrowed at each end serrated in the middle, Corymb spreading, Pappus with 2 awns  
 11562 Leaves lin. lanc. serrated at end, Corymb fastigate, Pappus paleaceous and awned  
 11563 Leaves lanc. narrowed into the footstalk 3-nerved finely serrated at end, Corymb fastigate  
 11564 Leaves ovate 3-nerved serrated cuneate and entire at the base, Pappus chaffy and awned  
 11565 Leaves stalked digitate pedate entire, Pappus paleaceous. (*Florestina*, Cass.)  
 11566 Leaves sessile narrowed at base rough with minute hairs, Pappus with 3 awns  
 11567 Leaves 10 lines long 4 lines broad finely downy beneath, Flowers purple

11568 The only species

11569 Leaves of invol. foliaceous: inner ovate obl. rounded; outer awned

11570 Hoary, Leaves sub-bipinnatifid, Flowers in compound corymbs

11571 Leaves 3-nerved ovate acuminate scabrous unequally toothed

11572 Flowers solitary stalked winged, Leaves oblong triple-nerved unequally serrate: scabrous

11573 Leaves long-lanc. Leaves of invol. blunt, Paleæ spatulate  
 11574 Leaves lanc. oval acuminate 3-nerved, Paleæ narrow linear

11575 Leaves lanceolate serrate, Stem erect  
 11576 Leaves ovate repand: lower alternate, Stem branched ascending, Invol. many-leaved  
 11577 Leaves ovate subcordate serrated, Stem branched diffuse

11578 Leaves opp. ovate-acumin. serrate, Pedunc. panicled, Heads ovate  
 11579 Leaves opp. ovate-lanceolate entire downy, Pedunc. opp. diverging many-flowered

and Miscellaneous Particulars.

1692. *Hymenopappus*. From *ὕμην*, a membrane, and *πᾶππος*, pappus, in allusion to the membranous pappus of its seeds.

1693. *Melananthera*. From *μαλας*, black, and *anthera*. A plant with black anthers, a very unusual character in this tribe of plants, the anthers of which are usually either white or yellow, according to the color of the corolla.

1694. *Marshallia*. Named after Henry Marshall, an Englishman, author of a sort of history of the trees and shrubs of North America, published in 1778.

1695. *Spilanthes*. From *σπίλος*, a spot, and *ανθος*, a flower, in allusion to the heads of flowers of the original species, which are yellow with a brown disk. Jacquin says he so called it, because the flowers are spotted with black points. *S. salivaria* is used by the natives of South America to relieve the tooth-ache by the salivation which it produces copiously. The flower-heads of *S. oleracea* are an excellent ingredient in salads, on account of their agreeable and lasting piquancy.

The leaves of *Spilanthes tinctoria* of Loureiro, which is said to be very similar to the *Abcedaria* figured by Rumphius, vol. ii. t. 65., give out when bruised a beautiful blue color, quite equal to indigo.

1696. *Salmea*. This name was originally given by Cavanilles to a genus related to *Aloe*, and was named after Prince Charles of Salm-Salm, a great promoter of botanical science. It was transferred to the genus which now bears the name by Professor Decandolle, in the appendix to his *Hortus Monspelienis*.

History, Use, Propagation, Culture,

1697. *Bidens*. So called because its seeds are surmounted with two teeth. Very worthless inconspicuous weeds.

1698. *Platypteris*. So called from *πλατυς*, broad, and *πτειρον*, a wing, in allusion to the margin of the seeds. A small stove herbaceous plant of little merit.

1699. *Lagasca*. Named in honor of Don Mariano La Gasca, professor of botany at Madrid, an amiable man and excellent botanist. He is, at the time of writing this, residing in England, whither he has fled from the dangers of persecution in his own country.

1700. *Lavenia*. A name of unknown meaning, originating with Sherard. Small useless annuals, natives of the East and West Indies.

1701. *Cacalia*. A name applied by Dioscorides to a mountain plant with large whitish leaves. By some it is believed to have been what is now called *Cacalia alpina*. To Sprengel it appears to be the *Bupierum*

- 11580 Flowers discoid stalked, Outer invol. 3 times as long as flower, Lvs. ovate with 1 or 2 teeth on each side  
 11581 Leaves tripartite, Leaflets lanceolate deeply serrated, Bristles of the pericarp 2-3  
 11582 Fls. droop. Bractæas lanc. ent. (longer than inv.) Lvs. lanc. serrat. undivid. Bristles of pericarp about 4 erect  
 11583 Flower radiant erect, Outer invol. longer than inner, Cauline leaves lanc. serrated : radical subternate  
 11584 Fls. discoid, Outer invol. 6 times as long as flower, Leaflets ciliated at base, Lower lvs. pinn. : upper ternate  
 11585 Fls. radiant, Outer inv. the length of inner, Lower leaves pinnate : upper ternate, Leaflets ovate serrated  
 11586 Fls. radiant, Outer inv. length of inner, Low. lvs. pinn. : upper tern. Leaf. ov. subcord. serr. uneq. at base  
 11587 Fls. discoid, Outer inv. length of inner, Low. lvs. pinn. : upper tern. Tern. leaf. twice as large as the rest  
 11588 Flowers radiant, Outer invol. longer than inner, Leaves decussively pinnated serrated  
 11589 Flowers subradiant, Outer invol. length of inner, Leaves bipinnate : leaflets lanc. pinnatifid  
 11590 Fls. discoid, Outer inv. longer than flower, Lvs. scabr. toothed : low. roundish ov. : upp. tern. Stem hairy  
 11591 Leaves bi-tripinnate : pinnæ linear acute channelled entire, Outer leaves of invol. blunt downy  
 11592 Flowers radiant erect, Outer involucre longer than inner, Leaves lanc. stalked equally serrate  
 11593 Leaves lanc. acute serrated subciliated, Outer involucre leafy  
 11594 Flowers discoid, Outer invol. 3 times as long as flower, Cauline leaves ternate : lateral connate  
 11595 Flowers discoid, Outer invol. longer than inner, Leaves ternate : leaflets 3-parted cut-toothed  
 11596 Flowers radiant, Outer invol. length of inner, Leaves bipinnate, Leaflets cuneiform 3-toothed  
 11597 Leaves lyrate-pinnated : pinnæ ovate acute serrated pubescent, Flowers paniced

11598 Leaves hoary toothed, Stem with 4 wings

11599 Leaves stalked ovate acuminate subrenate softly silky

11600 Leaves on short stalks elliptical blunt obsolete toothed rigid

11601 Stem branched erect, Leaves elliptical finely serrated

11602 Stem shrubby with cylindr. truncate papillæ, Leaves lanc. flat

11603 Stem shrubby, Leaves ovate-oblong flat, Petioles with a triple line at base

11604 Stem shrubby, Leaves lanc. flat, Flowers corymbose

11605 Stem shrubby, Leaves compressed fleshy

11606 Stem shrubby, Leaves roundish fleshy incurved, Pedunc. terminal 1-fl. naked

11607 Stem shrubby, Leaves depressed fleshy

11608 Stem shrubby, Leaves depressed fleshy woolly

11609 Stem shrubby, Leaves fleshy flat ternate, Leaflets 3-lobed

11610 Stem suffruticose, Leaves ovate-lanc. toothed downy beneath

11611 Shrubby downy, Leaves cordate ovate acute angular downy beneath : stalks with leafy appendages

11612 Stem herbac. branched, Lvs. lanc. smooth toothed : of the stem amplexicaul. ; of the branches stalked

11613 Leaves thickish villous : lower oval repand-toothed stalked ; upper sublyrate amplexicaul.

11614 Stem herbaceous, Leaves amplexicaul. toothed : lower lyrate ; upper sagittate toothed

11615 Leaves obl. lanceolate connate downy beneath, Racemes axillary

11616 Radical leaves ovate spatulate : cauline entire amplexicaul. crenate edged

11617 Stem herbaceous, Leaves sessile obl. lanc. serrated : at the base cuneate entire decurrent

11618 Stem herbaceous, Leaves stalked 3-lobed hastate serrate, Flowers racemose nodding

11619 Stem herbaceous, Lvs. stalked rhomboid hastate unequally toothed, Flowers corymbose spreading erect

11620 Stem herbaceous, Leaves stalked hastate-sagittate serrated, Flowers corymbose erect

11621 Stem herbaceous, Leaves stalked : radical cordate toothed ; cauline rhomboid with 2 teeth on each side

11622 Stem herbaceous, Leaves stalked : radical cordate reniform repand toothed ; cauline oblong toothed

11623 Stem herbaceous, Leaves stalked cordate toothed, Petioles naked, Corymbs fastigiate, Invol. 5-flowered

11624 Stem herbac. Leaves stalked cordate toothed hoary beneath, Petioles auricled at base, Corymbs fastigiate

11625 Stem twining, Leaves triangular sinuate-toothed

11626 Stem herb. Rad. lvs. bipinnatifid : caul. pinn. Pinnæ toothed : upper confluent, Corymb comp. fastigiate

11627 Stem herbaceous, Leaves toothletted : lower stalked obovate ; upper obl. lanc. sagittate amplexicaul.

and Miscellaneous Particulars.

longifolium of the moderns. The species are nearly all objects of ornament. Some of them are remarkable for their fleshy awkward looking stems, others for their discolored leaves. The succulent kinds require to be grown in old rubbish, and to be treated as directed for Mesembryanthemums. The leaves of some species (*C. procumbens* and *sonchifolia*) are used as salad by the Chinese ; and those of *C. Ficoïdes* are sometimes picked by the French.

*C. Kleinia* is called cabbage tree, from the resemblance which the stalks have to those of the cabbage ; and carnation tree, from the shape of the leaves and color of the flowers.

Upon *Cacalia alpina*, &c., M. Cassini has founded his genus *Adenostyles* and tribe of *Adenostylæ* ; distinguished from *Senecioneæ*, to which *Cacalia* belongs, by the roughness of all the back of the two lobes of the style. But we do not find the division adopted by other botanists. M. Cassini himself suspects that *Adenostylæ* may be united with *Tussilagineæ*.

History, Use, Propagation, Culture,

1702. *Kleinia*. Named after James Henry Klein, a German botanist, who published, in 1719, a dissertation upon the Juniper.

1703. *Ethulia*. A word formed by Linnaeus without any explanation of its meaning. It is not easy to understand wherefore Vaillant's more ancient name of Sparganophorus should not have been adopted.

1704. *Piqueria*. So named by Cavanilles, in honor of Andreas Piqueria, a Spanish botanist, who published a translation of Hippocrates, in 1757.

1705. *Chrysocoma*. From χρυσος, gold, and κωμα, hair, in allusion to the tufts of yellow flowers with which the stems are terminated. The specific name Comaurea is a mere translation of the generic appellation. *Linosyris*, the name of another species, is so called from *linum*, flax, and *osyris*, an ancient name for a plant with long flexible branches and flax-like leaves, which is the character of *C. linosyris*; which, when handled, sends forth a very fine aromatic smell.

1706. *Tarchonanthus*. *Tarchon* is a name given by the Arabian physicians to the *Artemisia Dracunculus*, and is the root of our English word *Tarragon*. *Ανθος* signifies flower, and the word thus compounded may be Englished *Tarragon-flower*.

1707. *Calea*. Derived from καλος, beautiful. The species are ornamental shrubs of South America, with undivided leaves, and corymbose, terminal, or axillary heads of yellowish purple flowers. Mr. Brown's history

- 11628 Leaves obl. lanc. acute at each end nearly entire  
 11629 Leaves elliptical blunt mucronate repand with pellucid dots  
 11630 Leaves linear entire with pellucid dots, Stem suffruticose
- 11631 Flowers paniced  
 11632 Leaves linear toothed decurrent, Pedunc. opposite the leaves 1-fl. Stem divaricating  
 11633 Stem winged, Leaves lanc. acute serrated downy decurrent, Flowers corymbose
- 11634 Leaves opp. ovate-lanc. serrated 3-nerved, Invol. with 4 flowers
- 11635 Leaves linear straight smooth decurrent at back  
 11636 Leaves linear recurved roughish, Flowers cernuous  
 11637 Leaves linear straight ciliated, Branches pubescent  
 11638 Leaves lanc. ovate recurved toothletted serrated, Peduncles pubescent  
 11639 Leaves oblong tapered at base toothletted wavy  
 11640 Leaves linear glabrous, Involucres lax  
 11641 Leaves linear-lanceolate 3-nerved scabrous, Flowers corymbose, Invol. lax  
 11642 Paniced, Leaves lanc. 3-nerved dotted naked  
 11643 Leaves lanc. villous, Involucres contracted
- 11644 Leaves oblong entire downy beneath
- 11645 Flowers about 3 stalked, Leaves ovate-oblong subserrate stalked
- 11646 Corymbs heaped, Peduncles very long, Leaves lanc. Stem herbaceous
- 11647 Leaves opp. undivided, Panicle terminal brachiate
- 11648 Corymbs heaped, Leaves alternate: upper ovate-lanceolate; lower toothed hastate sinuate serrate
- 11649 Panicles very large erect diffuse capillary
- 11650 Leaves lanc. narrowed at base serrated alternate
- 11651 The only species
- 11652 Pedunc. 1-fl. Leaves hoary toothed in 4 rows, Teeth blunt, Branches dowy, Invol. pubescent  
 11653 Pedunc. 1-fl. Leaves hoary toothed in 4 rows, Teeth subulate much spreading, Branches downy  
 11654 Pedunc. 1-fl. Leaves smooth toothed in 4 rows, Teeth subulate straight, Branches and invol. smooth  
 11655 Pedunc. 1-fl. Leaves linear warted at edge: upper entire  
 11656 Pedunc. 1-fl. Leaves bipinnate, Stems simple  
 11657 Pedunc. 1-fl. Leaves bipinnate, Stems much branched villous  
 11658 Like Santolina alpina, but segments of leaves are shorter and thicker

and Miscellaneous Particulars.

of this genus, in the twelfth volume of the Transactions of the Linnean Society, is a model of botanical erudition and acuteness, such as has been rarely seen in modern days.

1708. *Isocarpha*. From *ισος*, equal, and *καρφη*, chaff, in allusion to the equality of the chaff of the receptacle and the leaves of the involucre. Herbs of South America, with opposite undivided leaves, and ovate terminal heads of whitish flowers.

1709. *Petrobium*. From *πετρος*, a stone, with reference, it is presumed, to the texture of the grains. A small tree, native of St. Helena, where it is called *white wood*.

1710. *Neurolena*. From *νευρον*, a nerve, and *λαινος*, stony. An erect shrub of South America, with alternate, undivided, and lobed leaves, and terminal compound corymbs of yellow flowers.

1711. *Humea*. Named in honor of Sir Abraham Hume, Bart. of Wormleybury, in Hertfordshire, a gentleman whose whole life has been devoted to the protection and assistance of the arts and sciences, and especially of botany. A beautiful plant with immense capillary panicles of brilliant crimson flowers.

1712. *Casulia*. Meaning unknown. Little creeping weed-like plants, rooting at the joints.

1713. *Isodia*. From *ισωδης*, viscid. A greenhouse shrub, native of the south coast of New Holland; flowering most part of the year.

1714. *Santolina*. Supposed to be a diminutive of *sancta*; a holy little herb; in allusion to some reputed virtues. A genus of slightly shrubby somewhat aromatic plants, with yellow discoid flowers.

History, Use, Propagation, Culture,

1715. *Otanthus*. From *ὄστρος*, an ear, and *ἄστρος*, a flower, in allusion to the appendages which are placed on each side of the base of the florets. An infusion of the leaves and stem is said to be employed successfully in the east in cases of stone and gravel.

1716. *Caleacte*. So called because it is the ornament of the sea coasts where it grows, and derived from *καλός*, beautiful, and *αἴθρη*, the sea shore.

1717. *Athanasia*. From *α*, privative, and *θανάτος*, death; that is to say, a plant which does not perish. But the application of the word, as far as the present genus is concerned, is far from obvious.

1718. *Balsamita*. Derived from *βαλσαμων*, balm, in allusion to its strong balsamic smell. Ugly plants of no merit whatever. *B. vulgaris* has the English name *Costmary*, from the Greek *κοστός*, an aromatic shrub, and *Mary*; the Virgin Mary's *costus*: from its being put into ale, it has our old English name of *Ale-cost*. It is more aromatic and has a pleasanter smell than tansy, to which it is nearly allied.

1719. *Pentzia*. Named by Thunberg, after his pupil Charles John Pentz. A bushy branching hoary shrub, with little yellow flowers.

11659 Pedunc. corymbose, Leaves oblong blunt crenated densely woolly

11660 The only species

- 11661 Leaves ovate villous, Heads terminal subsessile  
 11662 Leaves obov. lanc. blunt villous, Umbels terminal, Branches villous  
 11663 Corymbs simple contracted, Leaves pinnatifid toothed  
 11664 Corymbs compound, Leaves recurved : lower linear toothed ; upper ovate serrate  
 11665 Leaves cuneiform cut-trifid, Flowers in umbels  
 11666 Leaves cuneiform : lower pinnatifid cut : upper 3 or 5-toothed, Flowers in umbels  
 11667 Leaves linear tomentose, Panicle compound  
 11668 Leaves linear filiform smooth, Flowers panicled  
 11669 Leaves trifid with linear smooth segments, Flowers somewhat in umbels  
 11670 Leaves pinnated : pinnæ linear smooth, Panicle decompound  
 11671 Leaves pinnated : pinnæ linear smooth, Panicle compound  
 11672 Stem herbaceous branched at base, Branches 1-fl. Leaves sessile lanc. serrated  
 11673 Leaves obovate serrated sessile clustered, Flowers subcorymbose  
 11674 Leaves ellipt. toothed : lower stalked ; upper sessile auricled at base, Flowers corymbose  
 11675 Radical leaves bipinnate : cauline many pinnated downy ; pinnæ linear acute mucronate

11676 Corymbs simple, Leaves deltoid serrated at end

### SUPERFLUA.

- 11677 Leaves lanceolate channelled, Raceme terminal fastigiate  
 11678 Leaves pinnated : pinnæ linear toothed pubescent, Corymb fastigiate leafy at base  
 11679 Leaves pinnated silky with down, Pinnæ lanc. somewhat toothed at end, Corymb terminal  
 11680 Leaves bipinnatifid inciso-serrate  
 11681 Leaves pinnatifid : segm. lanceolate serrated, Corymb contracted, Invol. angular  
 11682 Leaves obovate blunt lobed small, Flowers panicled stalked  
 11683 Leaves hoary : lower pinnated with palmate pinnæ ; upper palmate sessile, Heads panicled simple  
 11684 Cauline leaves pinnated smoothish : floral undivided linear, Panicle virgate, Heads glob. stalked nodding  
 11685 Stem upright, Lower leaves bipinnate : upper pinnated capillary, Invol. downy hemispherical  
 11686 Caul. lvs. pinnat. very smooth : floral undivided setaceous, Involucres downy, Heads glob. stalk. nodding  
 11687 Stem upright, Leaves bipinnate capillary : floral simple, Invol. oblong  
 11688 Leaves tripinnatifid silky cinereous, Leaflets linear, Heads globose, Flowers branched simple  
 11689 Leaves bipinnatifid silky white, Leaflets lanc. linear, Heads globose, Flowers branched virgate  
 11690 Stem quite simple, Leaves all palmate multifid white, Heads terminal clustered  
 11691 Stem quite simple, Leaves all palmate multifid white, Lower heads stalked : upper sessile  
 11692 Stem branched spreading, Leaves all bipinnate capillary, Invol. smooth hemispherical  
 11693 Stem quite simple, Leaves all palmate multifid silky acute  
 11694 Leaves hoary : lower cuneiform obtuse 3-lobed ; upper linear blunt, Flowers globose stalked cernuous  
 11695 Stem quite simple, Leaves hoary : radical palmate multifid ; caul. pinnatifid ; upper linear entire blunt  
 11696 Stem quite simple, Leaves pectinate pinnatifid glabrous, Pinnæ linear filiform, Pedunc. 1-fl. axillary  
 11697 Stem quite simple, Lvs. bipinnatifid subpub. beneath : segm. lin. lanc. acum. entire, Raceme naked term.  
 11698 Cauline leaves pinnated linear smooth, Branches undivided, Spikes 1-sided reflexed  
 11699 Cauline leaves pinnated setaceous smooth : radic. pinnated multifid silky, Stem erect, Branches divided

and Miscellaneous Particulars.

1790. *Tanacetum*. An alteration of *Athanasia*, which see. *Tanaisie*, Fr., *Tansy*, Eng., *Reinfahren*, Ger. The common Tansy has a strong aromatic smell, and an extremely bitter taste. It is stimulant and carminative ; and its seeds are reckoned anthelmintic and sudorific. It is said to drive bugs away from a bed in which it is laid. A distilled water and a kind of stomachic bitter are prepared from it. The young leaves are shredded down and employed to give color and flavor to puddings ; they are also used in omelets and cakes, and those of the curled variety for garnishing.

1721. *Artemisia*. *Artemis* was one of the names of Diana, the goddess of chastity. The plant is said to have been named after this goddess, on account of the purposes to which it was applied in bringing on precocious puberty. Pliny, however, informs us, that in his time, there was an opinion that the plant was named after Artemisia, the Queen of Mausolus, King of Caria.

*A. Abrotanum*, *Santonica*, *maritima*, and *Absinthium*, are included in the *Materia Medica*, but, according to Dr. Thomson, the latter species is the only one deserving to be retained. It is tonic, antispasmodic, and anthelmintic ; and when externally applied, is discutient and antiseptic. It has been used with advantage in inter-

History, Use, Propagation, Culture,

mittents, gout, scurvy, and dropsy; and although modern practitioners will scarcely rely on its efficacy in these complaints, yet it is undoubtedly of some value as a stomachic. (*London Dispens.* p. 182.) The seed of wormwood is used by the rectifiers of British spirits, and the species is a good deal cultivated on dry soil near Mitcham, in Surrey, for that purpose. A vulgaris is used in some parts of Sweden instead of hops, in order to increase the inebriating quality of malt liquor. The plant is readily eaten by cattle and sheep, and is found in our best natural pastures on dry soils. It is said to be stomachic and slightly stimulating.

The species called *Abrotanum*, *Garde-robe*, Fr., derives its name from *α*, private, and *ερος*, mortal; on account of the great virtues attributed to it as a preservative of life; *Absinthium*, from *α*, private, and *ψυθος*, pleasure, i. e. unpleasant.

*Dracunculus*, *Tarragon*, Eng., *Estragon*, Fr., *Dragon*, Ger., and *Dragoncelia*, Ital., is said to have been so called on account of its tortuous roots, which may be likened to the sinuous tail of a dragon; but it is much

- 11700 Caul. lvs. pinnated setae. smooth : radice. pinnated with 3-fid hoary segm. Stem procumb. branched virgate  
 11701 Leaves bipinnatifid downy beneath : segm. lanceolate blunt, Panic. 1-sided, Heads nodding  
 11702 Cauline leaves pinnated or trifid filiform pubescent, Stem ascending somewhat divided  
 11703 Cauline leaves pinnated smooth : pinnæ filiform remote very long, Heads globose erect sessile  
 11704 Cauline lvs. pinnated smooth : lower and radice. 3-partite multifid, Stem panic. erect, Peduncles nodding  
 11705 Cauline lvs. pinnated smooth somewhat fleshy : pinnæ simple or bifid lin. blunt, Heads obl. stalked erect  
 11706 Cauline lvs. hoary pinnated linear filiform : floral undivided filiform, Heads roundish angular nodding  
 11707 Leaves glaucous downy : lower pinnated, Pinnæ linear-lanceolate, Heads globose stalked nodding  
 11708 Leaves multipartite hoary, Racemes erect 1-sided, Heads erect about 5-f. Only one female floret or none  
 11709 Leaves pilose triply-pinnatifid, Stem simple with a leafless panicle, Heads globose nodding  
 11710 Leaves simply pinnate with some of the segments bifid subpinnate, Heads erect  
 11711 Leaves hoary-silky : lower pinnated, Stem nearly erect much branched, Heads sessile ovate  
 11712 Leaves downy pinnated : the uppermost undivided, Racemes drooping, Recept. naked, Flow. obl. sessile  
 11713 Leaves downy pinnate : the uppermost undivided, Racemes drooping, Recept. naked, Flowers obl. sessile  
 11714 Leaves hoary : radical bipinnate, Pinnæ close linear blunt : of the branches pinnated sessile  
 11715 Leaves pinnated white with down, Fascicles of flowers bracteate, Heads downy  
 11716 Leaves hoary : lower pinnated ; pinnæ linear 3-parted, Heads stalked roundish nodding  
 11717 Leaves snow-white : cauline bipinnate linear filiform ; floral simple, Heads obl. sessile erect  
 11718 Leaves hoary : radical pinnated ; pinnæ 3-parted linear-filiform, Heads obl. stalked nodding  
 11719 Leaves subpubescent : cauline pinnated ; pinnæ linear acute, Heads globose stalked nodding  
 11720 Leaves silky : cauline pinnate ; pinnæ 3-parted linear runcinate, Heads globose nodding  
 11721 Leaves silky white, Pinnæ 3-parted linear acute, Heads roundish stalked cernuous  
 11722 Cauline leaves pinnated or trifid linear, Stem erect panicled, Branchlets nodding 1-sided  
 11723 Cauline lvs. hoary pinnated linear-filiform, Stem ascending branched panicled, Invol. roundish angular  
 11724 Leaves downy beneath : cauline bipinnate, Leaflets linear, Heads roundish stalked nodding  
 11725 Leaves smooth : lower tripinnate ; upper bipinnate, Leaflets linear acute, Heads globose stalked nodding  
 11726 Leaves smooth triply pinnatifid, Stem straight, Heads roundish subsessile erect  
 11727 Cauline leaves pinnated hoary white : pinnæ trifid linear, Stem erect, Invol. hoary, Heads globose  
 11728 Leaves hoary : lower bipinnate, Pinnæ linear-filiform, Heads oblong sessile  
 11729 Leaves smooth : radice. triply pinnate ; upper undivided linear, Heads roundish subsessile erect  
 11730 Lvs. bi-tripinnatif. clothed with short silky down, Segments lanc. Heads hemispheric. droop. erect hairy  
 11731 Lvs. somewhat hoary : caul. bipinnatifid ; floral trifid or lanc. Heads globose stalked nodding, Inv. scarious  
 11732 Lvs. downy : lower decompound ; upper simple, Panicle corymbose, Heads fasciated ovate hoary  
 11733 Leaves pinnatifid : their segm. cut downy beneath, Heads somewhat racemed ovate, Recept. naked  
 11734 Leaves downy beneath : caul. pinnatifid ; floral undivided linear, Heads sessile obl. erect, Invol. smooth  
 11735 Leaves lanc. acuminate downy beneath somewhat toothed, Heads ovate subsessile erect  
 11736 Leaves smooth lanc. acute : cauline trifid at end, Heads roundish stalked nodding  
 11737 Leaves hoary lanceolate entire : radical cut ; floral oblong stalked nodding  
 11738 Lvs. smooth lanc. narrowed at each end, Heads roundish stalked erect, Scales of invol. membr. at edge  
 11739 Leaves smooth lanceolate narrowed at each end, Heads roundish stalked erect

- 11740 Leaves downy beneath scabrous above : radical stalked oblong ; cauline amplexicaul. wavy  
 11741 Leaves sessile linear smooth above revolute at edge, Heads capitate, Pedunc. long  
 11742 Leaves amplexicaul. ovate oblong 3-nerved woolly above, Corymb. stalked, Invol. cylindrical  
 11743 Leaves amplexicaul. panduriform spatulate blunt downy, Corymb and branches divaricating  
 11744 Branches downy, Lvs. linear revolute at edge smooth above downy beneath, Leaves of invol. lanc. acute  
 11745 Branches pubesc. Lvs. lanc. lin. acum. smooth above finely downy beneath, Heads corymb. cylindrical  
 11746 Tomentose, Leaves linear acute curved, Heads in capitate stalked corymbs  
 11747 Leaves lanc. sessile 3-nerved naked above woolly beneath, Corymb contracted-capitate  
 11748 Leaves amplexicaul. spatulate downy acute, Corymb. term. Branches spreading  
 11749 Leaves sessile lanc. Involucres white : lower scales brown  
 11750 Leaves lin.-lanc. mucronate revolute at edge downy beneath, Heads sessile capitate terminal  
 11751 Leaves lanc. mucronate revolute at edge downy beneath, Heads corymbose  
 11752 Leaves obl. blunt downy, Corymbs fastigate, Heads cylindrical  
 11753 Leaves lin. spreading recurved scabrous above, Corymb. dense, Invol. cinereous at base  
 11754 Leaves sessile linear, Outer involucre rough : inner flesh-colored  
 11755 Leaves clustered roundish, Corymbs branched, Involucres downy outside  
 11756 Leaves linear, Corymb compound, Branches virgate

and Miscellaneous Particulars.

more probable that the word is a corruption of *Tarchon*, the Arabic name of the plant. See *Tarchoanthus*. The leaves and points of the shoots are used as an ingredient in pickles. A simple infusion of the plant in vinegar makes a pleasant fish sauce ; it is eaten along with beef steaks, as horse-radish is with roast beef ; and is employed, both in Europe and Persia, to correct the coldness of salad herbs, and season soups and other compositions. The plant is of the easiest culture, but, like other species of the genus, dislikes a wet soil.

From the acrid leaves of *A. chinensis* the drug called *Moxa* is obtained ; a substance much in use among the Chinese as an actual cautery. For this purpose, the *Moxa* is laid upon the part affected and set on fire. The Cochinchinese, and also the Japanese, according to Kæmpfer, use *Artemisia vulgaris* for the same purpose, and it is said with great success, in removing tumours and rheumatic pains, or slight convulsions.

1722. *Gnaphalium*. A word under which Dioscorides describes a plant with soft white leaves, which served the purpose of cotton. It agrees pretty well with the modern genus, which consists of very pretty, sometimes

History, Use, Propagation, Culture,

beautiful woolly leaved shrubs or herbs, all of the description called Everlasting, on account of the permanence of the colors and form of their dry flowers.

1723. *Leontopodium*. From *leion*, a lion, and *pus*, a foot. The soft tufted silky heads have been compared to the foot of such an animal as a lion.

1724. *Evax*. A name, the meaning of which has not been explained. A little white annual weed.

1725. *Antennaria*. In allusion to the awns of the pappus, which resemble the antennae of some insect. A genus founded upon the *Gnaphalium margaritaceum* of Linnæus. It consists of herbaceous plants, natives of Europe and North America, having the male and female flowers in distinct involucre, and on different individuals.

1726. *Metalasia*. Apparently so called from *μετα λασσω*, to change or alter: but the application of the name is not evident.

- 11757 Leaves sublanc. downy sessile, Corymbs altern. round, Heads globose  
 11758 Leaves broad-lanc. somewhat stalked coriaceous downy, Corymb compound, Stem proliferous  
 11759 Much branched, Leaves lanc. acutish sessile, Inner scales of invol. yellow  
 11760 Leaves lanc. acute 3-nerved at base wavy pilose: beneath tomentose, Corymb contracted bracteate  
 11761 Leaves lin. lanc. hoary: radical blunt; cauline acute, Corymb compound, Pedunc. long  
 11762 Leaves lanc. 3-nerved smooth above, Raceme terminal, Stem branched below  
 11763 Leaves lanc. Corymb decomposed, Stem branched below  
 11764 Leaves hoary downy blunt: radical spatulate lanc.; cauline lin.-lanc. Corymb compound  
 11765 Leaves linear long narrow downy replicate at edge, Corymb compound umbellate  
 11766 Leaves half amplexicaul. linear-lanc. subrepand downy on each side: lower blunt, Corymb clustered  
 11767 White with down, Lvs. lin.-lanc. undivided below, Heads clustered conical  
 11768 Leaves subspatulate downy naked at end membranous or subulate, Flowers panicled  
 11769 Leaves decurrent blunt mucronate downy on each side flat  
 11770 Leaves decurrent lanc. downy flat with a naked point  
 11771 Leaves white silky-downy linear-lanc. acute, Corymb compound  
 11772 Leaves amplexicaul. entire acute downy beneath, Stem branched  
 11773 Leaves subamplexicaul. lanc. Corymbs compound, Scales of invol. plaited  
 11774 Leaves sessile lingulate very downy, Inner scales of invol. subulate recurved  
 11775 Leaves lin. spatulate downy beneath, Stem erect simple, Heads sessile terminal and axillary  
 11776 Leaves lin. lanc. Invol. with white lanceolate rays  
 11777 Stem herbaceous diffuse, Lower scales of invol. subulate naked, Leaves subamplexicaul.
- 11778 Head terminal enveloped in woolly bractes
- 11779 Stem branched at base, Bractes obovate
- 11780 Leaves lin. mucronulate reflexed, Corymbs few-flowered simple or proliferous, Scales of invol. blunt  
 11781 Stem erect simple, Lvs. ellipt. mucronate amplexicaul. 3-nerved [elongated obtuse colored  
 11782 Shoots procumb. Stems simp. Corymbs crowded, Rad. lvs. spatulate, Fl. dioecious, Inner scales of invol.  
 11783 Stem simple, Rad. leaves lanc.: floral terminal aggregate sessile, Inner scales of invol. long  
 11784 Runners procumb. Rad. lvs. ov. nerved, Corymb contracted, Fl. dioecious, Inner scales of invol. long blunt  
 11785 Leaves lin. lanc. acuminate alternate, Stem branched upwards, Corymb fastigiate  
 11786 Leaves decurrent lanc. acute wavy downy beneath, Stem branched  
 11787 Leaves lin. lanc. acutish: smooth above; pubescent beneath, Corymbs terminal contracted
- 11788 Leaves small fascicled lin. subulate downy above, Flowers lateral
- 11789 Leaves sessile ovate close erect downy, Corymb sessile  
 11790 Leaves amplexicaul. ovate-oblong 3-nerved acute woolly beneath on each side
- 11791 The only species
- 11792 Scales of invol. blunt scariose: the inner ones of the ray lanc. blunt spreading  
 11793 Scales of invol. acute membranous at edge: the inner ones of the ray lanc. acute conniving  
 11794 Scales of invol. roundish scariose: the inner ones of the ray ovate acuminate erect
- 11795 Leaves sess. lanc. linear woolly acute: floral with a membrane at end, Branches 1-flowered  
 11796 Leaves sess. lanc. downy keeled spirally imbricated, Branches 1-flowered  
 11797 Leaves obl.-lanc. silky imbricated, Branches 1-flowered, Peduncles squarrose  
 11798 Leaves linear subulate erect imbricated, Peduncle scaly 1-flowered  
 11799 Leaves sessile lanc. obovate acute 3-nerved woolly, Branches 1-flowered  
 11800 Leaves lanc. white beneath silky recurved-spreading, Branches 1-fl. Peduncles nearly naked  
 11801 Leaves amplexicaul. ovate lanc. downy beneath tomentose at edge, Branches 3-flowered

and Miscellaneous Particulars.

1727. *Astelma*. From  $\alpha$ , privative, and  $\sigma\tau\epsilon\lambda\mu\alpha$ , a crown, in allusion to the construction of the fruit. Beautiful Cape shrubs with everlasting flowers.

1728. *Athrixia*. So called by Mr. Ker, we presume from  $\alpha$ , without, and  $\theta\epsilon\tau\iota\kappa\iota$ , hair, in allusion to the absence of hairs upon the receptacle and the stigmas of the ray. A pretty greenhouse shrub, with narrow lanceolate leaves, and bright crimson solitary heads of flowers.

1729. *Xeranthemum*. From  $\xi\eta\epsilon\sigma$ , dry, and  $\alpha\nu\theta\omega\varsigma$ , a flower, on account of the dry nature of the leaves of the calyx, which retain their color and form for years. The species are popular annual flowers, of easy culture in light rich soil. They are valued for their properties of retaining their texture and color, when gathered and dried, in the manner of *Gnaphalium*, *Elchrysium*, and other genera of what are vulgarly called everlastings.

1730. *Elchrysium*. From  $\eta\lambda\iota\omega\varsigma$ , the sun, and  $\chi\epsilon\upsilon\sigma\sigma\alpha\varsigma$ , gold, in allusion to the brilliant yellow color of the flowers. The species are much admired for the brilliancy of their flowers even in a dried state. *E. bracteatum* is the handsomest annual species, and should be raised on a hotbed, and afterwards transplanted into a warm situation.

History, Use, Propagation, Culture,

The woody species require a sandy peat soil, and to be struck in sand on a hotbed, but not covered with a bell-glass, as they are very apt to damp.

1731. *Carpesium*. Named from *καρπαιον*, a bit of straw; the long dry leaves of the involucre resemble straws.

1732. *Baccharis*. A name given by the Greeks to an aromatic plant dedicated to Bacchus. The species now

- 11802 Leaves oblong downy imbricated, Branches 1-headed, Heads nodding  
 11803 Diffuse proliferous, Leaves roundish ovate smooth convex closely imbricated, Heads sessile  
 11804 Leaves obl. blunt imbricated, Branches 1-f. Scales of invol. ovate  
 11805 Leaves obl. silky recurved  
 11806 Decumbent, Leaves lanc. silky somewhat recurved, Branchlets 1-flowered, Peduncles squarrose  
 11807 Leaves acerose lin. keeled smooth appressed, Branches 1-f. Flowers sessile  
 11808 Lvs. acerose lin. roundish downy above : lower spreading ; upper appressed, Branches 1-f. Pedunc. scaly

- 11809 Leaves linear lanc. channelled amplexicaul : adult smooth, Branches woolly  
 11810 Branches numerous very fine filiform, Leaves very small 3-cornered imbricated appressed  
 11811 Leaves obl. lanc. narrowed at base silky, Peduncles naked 1-flowered terminal  
 11812 Leaves wavy woolly reflexed at end, Heads small terminal few  
 11813 Leaves amplexicaul. oblong revolute at edge woolly, Flowers terminal solitary shining

- 11814 Leaves linear-lanc. silky, Corymb simple terminal  
 11815 Leaves lanc. acute at each end roughish, Peduncles 1-flowered long, Invol. bracteate

- 11816 Heads terminal solitary cernuous  
 11817 Heads axill. subsolitary

- 11818 Leaves narr. linear entire, Panicle compound many-flowered, Invol. small  
 11819 Leaves lanc. longitudinally toothed serrate  
 11820 Leaves lanc. serrated with one or two teeth forwards  
 11821 Leaves obovate emarginate crenate forwards  
 11822 Leaves lanc. serrate at end subdecurrent downy beneath  
 11823 Leaves obl. sessile toothed : teeth of the base deeper and stipule-like

- 11824 Leaves lanc. 3-nerved tooth-serrated, Corymbs terminal leafy

- 11825 Lvs. pubesc. ov.-lanc. serr. the upper ones ent. Stem herbaceous corymb. Scales of the invol. recurved leafy  
 11826 Leaves sessile broad-lanc. acute serrated, Corymbs terminal fastigate  
 11827 Leaves ovate acute at each end toothed stalked pilose, Stem erect branched, Pedunc. many-headed  
 11828 Leaves stalked ovate lanc. very acute toothletted, Corymbs term. and axillary shorter than leaf  
 11829 Leaves ellipt. serrated villous beneath, Invol. subglobose, Leaves lanc. subulate, Branches spreading  
 11830 Leaves oblong lanc. doubly toothed acute downy beneath rugose veined, Petioles toothed  
 11831 Leaves spatulate oblong amplexicaul. serrated rugose  
 11832 Leaves sess. lanc. obl. : lower obovate-obl. subserrated at end, Branches corymbose-fastigate  
 11833 Leaves ovate stalked entire obtuse downy, Pedunc. 1-f. solitary term. axillary thickened  
 11834 Leaves lanc. ovate reflexed serrated downy beneath, Flowers terminal heaped  
 11835 Leaves ov. stalked crenate blunt downy rugose veiny, Pedunc. 1-f. solitary terminal and axillary  
 11836 Leaves sublyrate : cauline entire, Stem downy paniced, Invol. campanulate  
 11837 Leaves toothed radical smoothish obovate : cauline obl. downy, Scales of invol. subulate  
 11838 Leaves oval entire hirsute beneath  
 11839 Leaves obl. spatulate tooth pilose, Heads paniced globose, Leaves of invol. subulate soft  
 11840 Lvs. lanc. serrated at end scabrous above, Heads heaped, Lvs. of invol. membranous at edge  
 11841 Stem hairy, Leaves sessile oval blunt denticulate hairy, Panicle terminal contracted  
 11842 Leaves lin. lanc. scabrous nearly entire revolute at edge, Stem paniced, Scales of invol. lax  
 11843 Leaves lin. attenuate at base mucronate, Corymbs stalked contracted terminal  
 11844 Leaves lin. nearly entire, Peduncles long 3-headed  
 11845 Leaves lin. somewhat toothed, Peduncles very long 1-headed  
 11846 Leaves spatulate somewhat toothed and stem downy, Pedunc. long 1-f.  
 11847 Leaves linear filiform and stems silky with down, Flowers paniced  
 11848 Leaves cuneiform lin. blunt crenate toothletted smooth, Stem shrubby, Anthers with two setae  
 11849 Leaves ovate stalked hoary beneath serrated, Corymb terminal compound  
 11850 Leaves broad lanc. blunt serrulate downy scabrous, Heads clustered surrounded by bracts  
 11851 Stem branched with spreading hairs, Leaves subamplexicaul. blunt coarsely serrated hairy  
 11852 Leaves ovate entire acute downy beneath, Spikes recurved 1-sided, Bracts reflexed  
 11853 Leaves ovate subcordate pilose viscid toothed auricled at base, Recpt. foveose  
 11854 Leaves decurrent ovate mucronate downy : lower serrated, Flowers corymbose  
 11855 Leaves decurrent lin. lanc. serrulate downy beneath, Spike long terminal interrupted  
 11856 Stem white with down, Leaves lanc. serrulate downy beneath, Heads terminal

and Miscellaneous Particulars.

called *B. Dioscorides* is supposed to have been the *Baccharis* of the Greeks. An extensive genus of shrubby plants, few of which are deserving of cultivation.

1733. *Molina*. Named after John Ignatius Molina, a Spaniard, who published, in 1782, a *Natural History of Chili*.

1734. *Conyza*. This plant was believed to have the property, when suspended in a room, of driving away

History, Use, Propagation, Culture.

gnats and fleas. From this imaginary property, its Greek name (from *κωνίς*, a gnat), its Latin name, *pulscaria*, its English name, *Flea-bane*, and its French name, *Herbe aux puces*, are all derived. *Conyza marilandica* gives out a strong smell of camphor.

1735. *Madia*. *Madia* is the name of the plant in Chili. Clammy weeds, only seen in botanical gardens.  
 1736. *Erigeron*. A name synonymous with *senecio*, which is a translation of it. Named from *εἰς*, the spring, and *γενω*, an old man; because it becomes old in the beginning of the season. The name *Senecio* having been applied to another genus, the Greek term is preserved for this, which is related to it. *E. viscosum* is used to drive away fleas and gnats, probably from its strong scent, or, as some suppose, from the clammy juice of the leaves and stalks; hence the old name of *Flea-bane*, or *Flea-wort*.

1737. *Tussilago*. From *tussis*, a cough, for curing which the flowers are frequently employed at this day. *Farfara* is the name under which the Greeks designated the White Poplar, the leaves of which are like the modern *T. Farfara*.

*T. Farfara* is a certain indication of a clayey soil, and, according to Dr. Withering, is the first plant which vegetates in marle or lime stone rubble. The clayey part of the pestiferential Maremmes of Tuscany, where scarcely any other plant will grow, is covered with common colts foot. The cotton of the leaves wrapped in a rag,

- 11857 Leaves ovate-lanc. entire hoary downy beneath, Corymb compound terminal  
 11858 Leaves decurrent ellipt. crenate downy beneath, Heads capitate
- 11859 Leaves lanc. sessile viscid, Outer involucre 10-leaved  
 11860 Leaves amplexicaul. lanc. viscid
- 11861 Leaves sublinear entire, Branches lateral many-flowered  
 11862 Nearly stemless, Rad. leaves on long stalks triply 3-parted, cauline linear undivided  
 11863 Stem paniced, Flowers subsolitary terminal, Leaves linear entire  
 11864 Stem and flowers paniced hairy, Leaves lanc. ciliated  
 11865 Lower leaves lanc. lacinate : cauline linear, Heads racemose  
 11866 Leaves scabrous : lower lanc. toothed in middle ; upper linear, Heads corymbose  
 11867 Stem many-fl. Lvs. lanc. subserrate : cauline half amplexicaul. Florets of ray capillary the length of disk  
 11868 Radical leaves oval-lanc. acute somewhat toothed, Stem nearly leafless simple long  
 11869 Stem many-fl. pilose, Leaves obl. somew. toothed amplexicaul. Florets of ray capillary longer than disk  
 11870 Rad. leaves obovate serrated : cauline lanc. entire, Stem about 2-fl. Ray longer than disk  
 11871 Rad. leaves roundish ovate deeply toothed stalked : cauline lanc. toothed subserrated in middle  
 11872 Stem few-fl. subvillosus, Leaves cuneiform lanc. Serratures 2 on each side  
 11873 Branches spiked, Scales of invol. long, Peduncles scaly, Leaves very long smooth sessile  
 11874 Leaves entire bluntly mucronate : radical oblong stalked ; cauline cordate ovate sessile  
 11875 Stem nearly naked, Rad. leaves spatulate smooth dotted : cauline linear, Heads corymbose  
 11876 Leaves lanc. 3-nerved scabrous somewhat toothed sessile, Stem paniced, Ray shorter than disk  
 11877 Pedunc. alternate (scarcely racemose) single-fl. Pappus as long as the florets of the ray, Lvs. lanc. obtuse  
 11878 Stems with usually only one fl. Pappus much shorter than the florets of the ray, Lvs. lanceolate  
 11879 Stem 1-flowered, Invol. pilose  
 11880 Leaves ciliated glaucous clammy : radical with winged stalks and few teeth ; cauline sessile entire  
 11881 Leaves pinnatifid ; segments of the cauline leaves linear entire ; of the radical lanc. somewhat toothed
- 11882 Scape 1-fl. naked, Head radiated nodding, Lvs. stalked obovate toothed sinuated at base downy beneath  
 11883 Scape 1-fl. nearly naked, Head discoid, Lvs. reniform toothed smooth  
 11884 Scape 1-fl. nearly naked, Head discoid, Lvs. reniform toothed downy beneath  
 11885 Scape about 1-fl. nearly naked, Head discoid, Lvs. smooth reniform slightly 7-lobed  
 11886 Scape single-fl. imbricated with scales, Lvs. cordate angular toothed downy beneath  
 11887 Thyrus fastigiate, Heads radiant, Lvs. roundish cordate unequally toothed downy beneath  
 11888 Thyrus fastigiate, Heads radiant, Lvs. roundish cordate equally toothed downy beneath  
 11889 Thyrus fastigiate, Heads discoid, Lvs. orbicular cordate doubly and finely toothed  
 11890 Thyrus oblong, Heads discoid, Lvs. obl. cordate unequally toothed white beneath : lobes spreading  
 11891 Thyrus ovate-oblong, Lvs. cordate unequally toothed with the lobes approximate downy beneath
- 11892 Thyrus oblong, Heads discoid, Lvs. obl. cordate unequally toothed snow-white beneath  
 11893 Thyrus fastigiate, Heads obsoletely radiant, Lvs. roundish cordate half 7-lobed downy beneath
- 11894 Heads flocculous, Cor. naked, Invol. ventricose somewhat imbricated, Lvs. filiform lin. entire smooth  
 11895 Heads flocculous, Cor. naked, Lvs. obl. amplexicaul. unequally and deeply toothed, Stem virgate  
 11896 Heads flocculous, Cor. naked, Lvs. lyrate hairy : upper lanc. toothed  
 11897 Heads flocculous, Cor. naked, Lvs. ellipt. tooth-serrated hairy, Peduncles long many-flowered  
 11898 Heads flocculous, Cor. naked, Lvs. lyrate pilose on each side viscid  
 11899 Heads flocculous, Cor. naked, Lvs. lanc. toothed scabrous, Flowering branches spreading  
 11900 Heads flocculous, Cor. naked, Lvs. obl. lanc. finely serrated smooth, Heads corymbose  
 11901 Heads flocculous, Cor. naked, Lvs. lyrate pinnatifid toothed, Scape nearly naked  
 11902 Heads flocculous, Cor. naked, Lvs. obl. pinnatifid toothed acuminate stalked caudate at base  
 11903 Heads flocculous, Cor. naked, Lvs. pinnatifid : segm. lanc. acute cut, Stipules leafy subpalmate

and Miscellaneous Particulars.

dipped in a solution of saltpetre, and dried in the sun, makes an excellent tinder. The leaves are the basis of the British herb tobacco ; they have been regarded as expectorant from the earliest ages, having been smoked through a reed in the days of Dioscorides, with the view of relieving the chest from accumulated mucus in catarrh, asthma, and phthisis. At present, though it occupies a place in the *Materia Medica*, very little reliance is placed on its powers. (*London Disp.* p. 542.)

*T. Petasites*, from the Greek *πεταστος*, a broad covering, in allusion to the leaves, which are larger than those of any British plant, and afford shelter from rain to poultry and other small animals. It is called *Butter bur*, in allusion to a former application, and *Pestilent-wort*, from its supposed efficacy in the plague. *T. hybridus* is by some considered, a variety of this species, as *T. alba* is of *T. paradoxa*. *T. fragrans* is valued in gardens as an early and fragrant flower ; like all the species, it is apt to run very much, and is therefore best kept in pots.

It is remarkable that no plant belonging to the tribe of *Tussilagineae*, has been discovered with hermaphrodite flowers. They are distinguished from other tribes by their stigma, which occupies both surfaces of the lobes of the style. They are nearly all natives of Europe.

1738. *Senecio*. For the explanation of this word, see *Erigeron*. Most of these species are annual weeds, or

History, Use, Propagation, Culture.

rude gigantic yellow flowered autumnal perennials; S. venustus and cinerascens, however, are elegant plants with purple flowers. Of S. elegans there is a double flowered variety, common in green houses, and readily propagated by cuttings. Senecio hieracifolius is the pest of newly cleared ground in North America, as S. vulgaris is in Europe. It is known by the name of the Fire-weed. Senecio vulgaris is esteemed emollient and resolutive. It is employed in spitting of blood, in the form of a poultice, and against the gout and hemorrhoids. It is given to horses suspected to be troubled with worms.

- 11904 Herb downy upwards, Lvs. sinuate toothed and pinnatifid, Heads clustered, Invol. cylindrical  
 11905 Herb hirsute, Lvs. broad-lanc. sinuate-toothed and toothletted: teeth callous at end, Heads paniced  
 11906 Leaves semiamplexicaul pinnatifid toothed, Heads in clustered corymbs destitute of a ray  
 11907 Heads fuscous, Cor. naked, Leaves subpinnate stalked smooth, Invol. not withered  
 11908 Heads radiant, Leaves half-amplex. pinnatifid, Segments linear acute toothed distant, Peduncles long  
 11909 Heads fuscous, Cor. naked, Leaves obovate stalked cut-toothed, Pedunc. filiform 3-headed  
 11910 Heads radiate, Ray revolute, Leaves stalked obl. sinuate, Pedunc. 3-headed, Invol. conical  
 11911 Heads radiate, Ray revolute, Leaves amplexic. lin. lanc. pinnatifid, Scales of invol. sphaclate in part  
 11912 Heads radiate, Ray revolute, Leaves amplexicaul. lanceolate-linear fleshy bluntly sinuated  
 11913 Heads radiate, Ray revolute, Leaves amplexicaul. lanceolate toothed, Scales of invol. all unwithered  
 11914 Heads radiate, Ray revolute, Leaves amplexicaul. obovate 3-lobed at end serrated  
 11915 Heads radiate, Ray revolute, Leaves pinnatifid downy revolute at edge, Panicle spreading  
 11916 Leaves amplexicaul. cut toothed scabrous above downy beneath, Heads racemose  
 11917 Ray revolute, Leaves pinnatifid and viscid, Scales of the involucre lax hairy  
 11918 Ray revolute, Lvs. sess. pinnatifid lobed and toothed, Scales of invol. very short glab. Stem erect straight  
 11919 Ray revolute, Leaves lyrate sinuate blunt stalked, Stem hirsute [Corymbosae  
 11920 Ray revolute, Leaves amplexicaul. lanceolate blunt toothed entire  
 11921 Heads radiate, Petiole amplexicaul. Peduncles 3 times as long as pinnate sinuated leaves  
 11922 Heads radiate, Leaves amplexicaul. pinnatifid hirsute crisp-toothed, Stem woolly  
 11923 Cor. radiant, Leaves pinnate multifid : segm. filiform smooth, Heads corymbosae  
 11924 Cor. radiant, Lvs. amplexic. pinnatifid glabrous above : segm. angular toothed, Stem and invol. glabrous  
 11925 Cor. radiant, Stem invol. and leaves glabrous, Leaves pinnatifid : segm. linear acute toothed  
 11926 Cor. radiant, Leaves pilose viscid pinnatifid equal spreading, Rachis narrowed below  
 11927 Cor. radiant, Leaves half-amplexicaul. pinnatifid : segm. linear subdentate distant  
 11928 Cor. radiant, Stem simple nearly naked, Radical leaves stalked oblong toothed ciliated  
 11929 Cor. radiant, Leaves pinnatifid toothed somewhat hairy, Stem erect  
 11930 Cor. radiant, Leaves tomentose oblong toothed, Stem leafy 1-flowered  
 11931 Cor. rad. Lvs. toment. on each side snow-white pinnatif. : segm. lin. blunt somew. tooth. Corymb contracted  
 11932 Cor. radiant, Leaves pinnate multifid linear naked acute, Peduncles about 2-flowered  
 11933 Cor. radiant, Leaves pinnate : pinnæ lin.-subulate somewhat cut downy beneath, Stem somewhat hairy  
 11934 Ray spreading, Leaves lyrate bipinnatifid divaric. toothed glabrous, Stem erect, Pericarps hairy  
 11935 Ray spreading, Florets elliptical, Leaves lyrate serrated : lower obovate entire, Pericarps glabrous  
 11936 Cor. radiant, Rad. lvs. ovate-cordate serrated stalked : cauline pinnatifid toothed, Peduncles thickened  
 11937 Cor. radiant, Lvs. lanc. lin. nearly entire smoothish, Corymb contracted terminal stalked  
 11938 Cor. radiant, Lvs. lanc. lin. toothed rigid scabrous, Corymbs terminal and axillary stalked  
 11939 Cor. radiant, Lvs. lanc. lin. subtomentose glauc. finely toothletted or entire, Corymb contracted terminal  
 11940 Cor. radiant, Leaves linear entire, Corymb squamose, Stem herbaceous  
 11941 Cor. radiant, Lvs. half amplexicaul. lanc. finely serrate subvillous beneath, Corymb terminal spreading  
 11942 Cor. radiant, Lvs. ovate lanc. serrated ciliated at edge sessile unequal at base  
 11943 Ray spreading, Lvs. lanc. sharply serrated nearly glabrous, Corymbs of rather few flowers  
 11944 Cor. radiant, Lvs. ovate-lanc. finely serrated smooth on each side subsessile  
 11945 Cor. radiant, Outer scales of invol. subulate spreading, Lvs. subdecurrent obl. lanc. villous  
 11946 Cor. radiant, Lvs. sess. obovate toothed at end glaucous : younger silky, Corymb compound terminal  
 11947 Cor. radiant, Lvs. toothed : lower ovate decurrent in the stalk : upper cordate obl. amplexicaul.  
 11948 Cor. radiant, Scales of invol. appressed, Lvs. subdecurrent villous beneath lanc. serrated  
 11949 Cor. radiant, Outer scales of invol. spreading, Lvs. subdecurrent obl. lanc. glauc. serrate  
 11950 Cor. radiant, Stem undivided about 1-fl. Lvs. undivided serrated : radical ovate villous beneath  
 11951 Cor. radiant, Lvs. lanc. cordate at base amplexicaul. smooth finely serrated  
 11952 Cor. radiant, Lvs. lin. scattered  
 11953 Cor. radiant, Lvs. obovate fleshy somewhat toothed  
 11954 Cor. radiant, Lvs. obl. sessile toothed downy beneath : upper amplexicaul. toothed only at base  
 11955 Cor. radiant, Lvs. amplexicaul. spatulate repand eroded scabrous

§ 1. *Shrubby.*

- 11956 Leaves ovate subimbricated recurved serrate-ciliated, Heads terminal  
 11957 Leaves ovate serrate spreading downy beneath, Heads terminal about 3  
 11958 Leaves obl. lanc. sessile entire 3-nerved silky with down, Flowers terminal  
 11959 Leaves stalked roundish ovate hairy with 1 or 2 teeth on each side, Peduncles 1-headed long terminal  
 11960 Stem fluted, Leaves alternate stalked lanc. blistered repand-toothed downy beneath, Flowers paniced  
 11961 Leaves ovate lanc. toothed silky beneath, Panicles compound axillary, Rays 3

*and Miscellaneous Particulars.*

The tribe of Senecionæ is nearly related to Anthemideæ, and a portion of Inuleæ, from which the differences in the style are insufficient to distinguish them. They appear, however, to be sufficiently well characterized by their other floral organs. They are found in every part of the world, especially in the south of Africa. Humboldt has observed, that they are very numerous in the upper region of the Andes, just below the limits of eternal snow, where the sun has little influence, where hurricanes are incessant, and not a tree is able to rear its head.

1739. *Aster.* The flowers of all the species of *Aster* resemble little stars, on account of the numerous rays

History, Use, Propagation, Culture,

of their circumference. A very numerous genus of plants, commonly called in England, Christmas Daisies, in allusion to the late period of the year at which they blossom. They are not very ornamental, and yet their flowers are acceptable at a season when few others are to be seen in open air. The species are extremely

- 11962 Leaves linear acute not dotted somewhat hoary, Pedunc. term. solitary 1-fl. long
- 11963 Leaves linear filiform obtuse hairy, Invol. imbricated
- 11964 Leaves linear fleshy smooth dotted blunt, Pedunc. 1-headed, Invol. imbricated shorter than disk
- 11965 Leaves linear blunt glabrous dotted, Pedunc. 1-headed long, Invol. imbricated as long as disk
- 11966 Leaves linear filiform fasciated smooth dotted, Ligules entire
- 11967 Leaves linear scattered revolute at edge : prickly above ; downy beneath, Heads in racemose panicles
- 11968 Stem and leaves rough, Leaves dense linear reflexed, Flowering branches short racemose
- 11969 Leaves obl. narrowed at each end sess. Stem somewhat climbing, Branches downy, Scales of invol. squarrose

§ 2. *Herbaceous.*  
\* *Leaves entire.*

- 11970 Leaves lin. lanc. 3-nerved dotted acute scabr. at edge, Ray about 5-fl. Invol. imbric. twice as short as disk
- 11971 Lvs. lin. lanc. obso. 3-nerv. blunt scab. at edge, Hds. in sess. clust. Ray about 5-fl. Inv. imbr. short. than disk
- 11972 Lvs. cuneate obov. acute nervef. scab. on each side twisted spread. Inv. cylindr. imbr. with 2 bractes at base
- 11973 Lvs. lin. lanc. narr. at base nerveless roughish revolute at edge, Inv. lax imbr. Branches filiform 1-headed

- 11974 Lvs. lin. mucro. somew. keeled rigid scabrous at edge : cauline reflexed ; of the branches much spreading
- 11975 Lvs. many lin. mucron. nerveless not dotted keeled scabrous rigid, Branches fastigate 1-headed
- 11976 Lvs. narrow lin. nerveless not dotted smooth erect, Branchlets term. nearly naked 1-headed
- 11977 Lvs. lin. nerveless dotted scabr. reflexed spreading, Branches corymb. fastigate leafy, Invol. imbr. short
- 11978 Lvs. lin. lanc. hoary, Stem branched villous, Branchlets somew. 1-sided 1-headed, Invol. obl. lax imbricated
- 11979 Lvs. lin. lanc. narrowed at each end acum. Stem downy paniced erect, Branches few-headed, Inv. imbr.
- 11980 Very smth. with small fl. Stem paniced, Branch. many-head. Lvs. lin. subulate, Invol. cylindr. Ray minute
- 11981 Lvs. lin. lanc. narrow. both ways hispid at edge, Stem smth. branched erect, Branches 1-headed, Inv. imbr.
- 11982 Lvs. lin. glabrous : those of the branches very short, Branches paniced, Invol. cylindr. closely imbricated
- 11983 Lvs. lin. glab. : those of the branches subul. close together ; of the stem long. Invol. subsquarr. Leaf. acute
- 11984 Lvs. lin. glab. Stem much branched diffuse downy, Branchlets 1-sided, Inv. imbr. : scales obl. squarr. acute
- 11985 Lvs. ciliat. : caul. lin. lanc. nerv. : those of the br. very short lanc. 3-nerv. Stem branch. downy, Br. panic.
- 11986 Hoary, Lvs. lin. Panic. corymb. much branched leafy, Invol. imbr. very acute longer than disk [at base
- 11987 Lvs. remote lin. amplexicaul. erect very smth. scabr. at edge, Pedunc. almost naked, Inv. squarr. with 2 lvs.
- 11988 Very smth. Lvs. subul. lin. somew. fleshy subreflex. Stem slender much branch. Branchl. setaceous 1-head.
- 11989 Lvs. very numerous lin. blunt reflexed hispid at edge, Stem branch. diffuse smooth, Branches 1-headed
- 11990 Dwarf with creeping roots, Stems weak simple, Lvs. long lanc. smoothish, Invol. with lin. obl. blunt scales
- 11991 Lvs. very numerous ovate-acum. reflexed hispid at hedge, Stem branched hairy, Branches 1-headed
- 11992 Lvs. obl. lanc. silky sess. Stem slender decumbent loosely branched, Branchlets and branchlets 1-headed
- 11993 Lvs. obl. lanc. hoary on each side, Stem simple erect downy, Raceme terminal
- 11994 Cauline leaves amplexicaul. scabrous : of the branches small, Invol. imbricated : scales length of disk
- 11995 Hoary all over, Lvs. lanc. obl. acute at each end sess. revolute at end netted and 3-nerved beneath
- 11996 Smooth, Lvs. obl. ovate acuminate shortly stalked scabrous at edge, Panicles few-headed, Stem smth
- 11997 Lvs. subrhomboid oval-lanc. acuminate at each end somew. stalked glabr. hispid at edge, Corymb diverging
- 11998 Lvs. lanc. narrowed at base acuminate scabrous at edge, Stem simple corymb. at end, Invol. loosely imbr.

- 11999 Lvs. lin. lanc. nearly entire smth. Stem smth. paniced at end, Invol. lanc. imbr. Scales acute spread, at end
- 12000 Lvs. lanc. somew. amplexicaul. narrowed at end scabrous at edge, Stem erect hispid, Branchlets pilose
- 12001 Lvs. lin. lanc. pilose amplexicaul. auricled at base, Stem simple pilose straight, Heads sess. term. clustered

- 12002 Lvs. lin. lanc. amplexicaul. polished, Stem virgate panicl. Branches racemose, Inner scales of invol. colored

- 12003 Lvs. lin. rigid acute subamplexicaul. : those of the branches reflexed hispid at edge, Scales of invol. squarr.
- 12004 Lvs. lanc. cordate amplexicaul. downy beneath, Stem quite simple downy, Pan. term. lax few-headed
- 12005 Lvs. obl. lanc. ciliate cordate amplexicaul. scabrous on each side hairy, Stem branched hairy
- 12006 Stem 1-fl. Rad. lvs. lanc. spatulate : cauline lanc. Scales of invol. nearly equal lanc. blunthish
- 12007 Stem 1-fl. Rad. lvs. spatulate : cauline lin.-lanc. Scales of invol. nearly equal linear acuminate
- 12008 Lvs. lin. remote 3-nerved acuminate dotted scabrous at edge, Branches corymb. fastigate, Ray 10-fl.
- 12009 Lvs. lin. lanc. glabrous not dotted 3-nerved, Invol. imbricated twice as short as disk
- 12010 Lvs. lin. lanc. 3-nerved hoary on each side, Invol. twice as short as disk imbricated
- 12011 Lvs. lin. lanc. hispid at edge, Stem simple corymbose, Scales of invol. lanc. blunt equal
- 12012 Lvs. obl. lanc. scabrous, Invol. imbr. subsquarrose : lvs. blunt ; inner membranous colored at edge
- 12013 Lvs. lin. lanc. sessile scabrous at edge, Stem paniced smooth, Invol. lax imbricated
- 12014 Lvs. lin. lanc. rarely toothed long smooth, Heads terminal, Invol. squarrose

\*\* *Leaves lanceolate and ovate : lower serrate.*

- 12015 Lvs. ov.-obl. acute amplexicaul. cordate serrated smooth, Stem paniced smooth, Branches 1-2-headed
- 12016 Lvs. amplexicaul. spatulate lanc. acuminate serrated in middle cordate at base, Branches pilose
- 12017 Lvs. amplexic. lanc. : lower subserr. smooth ; of the branches lin. squarr. Invol. squarr. shorter than disk
- 12018 Lvs. subamplexicaul. broad-lanc. subserrate smooth, Stem glabrous, Branches many-headed

and Miscellaneous Particulars.

difficult to distinguish : the most ornamental are *A. puniceus*, *Novæ Angliæ pulchellus*, and *macrophyllus* *A. chinensis* is a well known border annual ; of which there are varieties of different colors, and semi-double, and double. It is raised on a hotbed, and transplanted into the open ground in April or May.

History, Use, Propagation, Culture,

Asteræ are chiefly characterized by their style, which, in its most complete state, is alone sufficient to distinguish them from every other tribe. They are found in every part of the world, but especially in North America and Africa.

1740. *Solidago*. From *solidari*, to unite, on account of the vulnerary qualities of the plants. The species are all autumnal coarse-looking herbaceous plants with yellow flowers; in the shrubbery they make a pretty

- 12019 Lvs. subamplexicaul. broad-lanc. subserrate smooth, Stem glabrous, Scales of invol. shorter than disk  
 12020 Lvs. subamplexic. : upper lanc. acum. entire; lower lanc. narrowed at base serrated, Branchlets virgate  
 12021 Lvs. subamplexicaul. remote obl. entire lucid : radic. subserrated, Invol. imbr. with cuneiform leaflets  
 12022 Lvs. subamplexicaul. lanc. lower subserrate smooth, Stem simple paniced at end, Invol. closely imbricated  
 12023 Lvs. amplexicaul. lanc. serrate roughish, Branches paniced, Invol. lax longer than disk  
 12024 Lvs. obl. lanc. scabrous ciliated : lower ovate, Stem hispid, Branches 1-headed, Scales of invol. obl. imbr.  
 12025 Lvs. subamplexicaul. lanc. : lower serrate, Stem smooth, Branches corymbose  
 12026 Lvs. subamplexicaul. lanc. glabrous scabrous at edge : lower subserrated, Branches divided  
 12027 Lvs. amplexicaul. narr. lanc. scabr. above lower subserr. Stem much branched, Invol. with spread, scales  
 12028 Lvs. lanc. roughish somewhat amplexicaul. : lower serrate in the middle, Scales of invol. lax leafy  
 12029 Lvs. obl. lanc. acuminate sessile smooth scabrous at edge : lower serrated, Branches corymbose smooth  
 12030 Lvs. sessile serrated smooth spatulate lanc. narrowed at base and bent down towards each side  
 12031 Lvs. subamplexic. obl. lanc. acuminate serrated smooth, Stem pyramidal, Racemes scarcely longer than lvs.  
 12032 Lvs. ov. coarsely toothed stalked : cauline sessile cuneate at base, Stem hispid, Branches with single heads  
 12033 Lvs. broad lanc. narrow. at base entire with a very long point, Stem simp. flexuose angul. Panic. corymb.  
 12034 Lvs. obl. 3-nerved narrowed at base acute : upper sess. nearly entire; lower stalked serrated, Stem corymb.  
 12035 Lvs. lanc. serrate acuminate rugose very rough, Stem erect angular simple  
 12036 Lvs. sess. narrow lanc. serrated scabrous, Stem 1 or few-headed  
 12037 Lvs. lanc. sess. serr. smooth, Branches virgate, Invol. imbricated, Stem round smooth  
 12038 Lvs. sess. narrow lanc. : lower serrated in middle, Stem branched smooth recurved, Invol. lax imbricated  
 12039 Lvs. lin. lanc. acum. scabrous at edge : lower subserrated, Stem paniced, Branches 1-headed  
 12040 Lvs. lin. lanc. acum. scabrous at edge : lower subserrated; cauline reflexed, Stem lax paniced  
 12041 Lvs. lanc. acum. scabrous at edge : cauline serrated at end; those of the branches entire, Stem paniced  
 12042 Lvs. lin. entire : radic. obl. subserrated, Stem much branched downy, Invol. loosely imbricated  
 12043 Lvs. lanc. lin. sessile smooth : lower subserrate, Stem paniced smooth, Invol. imbricated  
 12044 Lvs. lin. lanc. sessile entire smooth : lower lanc. subserrate, Stem branched diffuse smoothish  
 12045 Lvs. lin. acuminate entire : lower lin. lanc. subserrate, Branches corymbose, Invol. imbricated  
 12046 Lvs. lin. acuminate entire : radical obl. serr. Branches in corymbose panicles, Invol. imbricated  
 12047 Lvs. sess. lanc. serrated smooth, Obl. imbricated : leaflets acute, Stem rather villous  
 12048 Lvs. ellipt.-lanc. serrated smooth : cauline lan.-lanc. long, Branches spreading, Invol. imbr. Stem pubesc.  
 12049 Lvs. ellipt.-lanc. serrated smooth even-sized, Branches spreading, Invol. imbricated, Stem pubescent  
 12050 Lvs. ellipt.-lanc. serr. smooth : those of the branches distant, Branches much spreading pendulous  
 12051 Stem l.f. Lvs. ovate sessile scabrous, Scales of invol. nearly equal linear  
 12052 Lvs. lin. lanc. entire blunt mucronate 3-nerved at base resin, Stem simple corymbose downy  
 12053 Lvs. filiform acuminate ciliate, Invol. hemispherical, Leaflets equal  
 12054 Stem glabr. corymb. Lvs. lin.-lanc. fleshy obscurely 3-nerv. Scales of invol. lanc. membran. obt. imbricated  
 12055 Leaves lanc. subamplexicaul. serrate pilose scabrous, Invol. lax : leaf. lanc. acuminate foliaceo-hispid  
 12056 Leaves scabr. : caul. obl. lanc. acute; radical obl. stalked, Scales of invol. obl. cuneate blunt subsquarrose  
 12057 Leaves sessile obl. lanc. serrate : floral ciliated, Stem branched glabrous, Invol. closely imbricated  
 12058 Lvs. obl. lanc. serrat. narrow. at base, Stem hairy, Inv. imbric. nearly equal, Outer scales somewhat spreading

\*\*\* Leaves cordate and ovate, serrate.

- 12059 Leaves obl. cordate amplexicaul. entire, Petioles winged, Stem paniced hispid, Branchlets 1-sided  
 12060 Leaves ovate-lanc. subserrated stalked smooth, Petioles naked, Stem much branched smooth, Invol. lax  
 12061 Lvs. cordate pilose beneath finely serrated stalked, Stem paniced smoothish, Panicle spreading  
 12062 Leaves ov. finely serrated acum. smoothish : lower cord. stalked, Branches hairy, Scales of invol. blunt  
 12063 Leaves ovate stalked serrated scabrous : upper ovate cordate sessile, Stem branched diffuse, Scales acute  
 12064 Leaves smooth : cauline ovate subcord. acuminate deeply serrated entire at end, Stem paniced smooth  
 12065 Leaves ovate narrowed at base entire about 5-nerved, Invol. lax squarrose, Ray very fine

§ 1. Racemes 1-sided, Leaves 3-nerved.

[exceeding disk

- 12066 Stem downy, Lvs. lanc. serrat. triple-ribb. rough, Clusters copious panice. unilateral recurv. Radius hardly  
 12067 Leaves obl. 3-nerved subserrated, Racemes 1-sided, Ligula: middling, Stem smooth, Peduncles downy  
 12068 Stem villous erect, Lvs. lanc. serrated triple-ribbed rough villous beneath, Clusters spiked erect drooping  
 before flowering, Radius short  
 12069 Stem erect round very smooth, Leaves lin.-lanceol. smooth triple-ribbed serrated rough-edged, Clusters  
 paniced unilateral, Stalks downy  
 12070 Stem erect smooth, Lvs. lanc. smooth serrated rough edged obscurely triple-ribbed, Clusters paniced  
 unilateral, Stalks hairy, Radius short  
 12071 Stem erect smooth, Leaves lanc. somewhat triple-ribbed smooth rough-edged slightly serrated, Clusters  
 paniced unilateral, Stalks smooth, Bract. fringed, Radius short  
 12072 Stem erect vill. Lvs. lanc. somew. serrat. triple-ribbed rough reflexed, Clusters paniced slightly unilateral  
 12073 Stem erect rather hairy, Lvs. lanc. obscurely triple-ribbed smooth rough-edged : the lower ones slightly  
 serrated, Clusters paniced unilateral somewhat recurved

and Miscellaneous Particulars.

appearance among other coarse things, but there is not one of them which is worth a place in a choice collection of ornamental plants. The leaves of the *Solidago odora* have a delightfully fragrant odor, partaking of that of anise and Sassafras, but different from either. When subjected to distillation, a volatile oil, possessing the taste and aroma of the plant in a high degree, collects in the receiver. This oil apparently has its residence in the transparent cells which constitute the dotting of the leaves. The effects of the *S. odora* are

History, Use, Propagation, Culture,

aromatic, pleasant to the taste, gently stimulant, diaphoretic, and carminative. An essence made by dissolving the essential oil in proof spirit, is used in the eastern states as a remedy in complaints arising from flatulence, and as a vehicle for unpleasant medicines of various kinds. It has been employed successfully to allay vomit-

§ 2. *Racemes 1-sided. Leaves not 3-nerved.*

- 12074 Stem erect round hairy, Lvs. ov. rather ellipt. very rough rugged serrated without lateral ribs, Clusters panicled unilateral  
 12075 Stem erect hairy, Lvs. lanc. the lower ones deeply serrated very rough rugose, Panicles unilateral  
 12076 Stem erect hairy, Lvs. ovate-lanc. the lower ones closely serrated rugged very rough, Clusters panicled compound widely spreading unilateral  
 12077 Stem erect vill. Lvs. lanc. rather soft serrated without lateral ribs, Clusters panicled unilateral  
 12078 Stem erect hairy, Lvs. oblong pointed smooth above rugged and rough beneath, Clusters unilateral  
 12079 Stem erect downy, Stem lvs. lanc. hisp. ent. : radic. ones somew. wedge-shap. serrat. Clust. panic. unilateral  
 12080 Stem erect smooth angular, Lvs. ellipt. serrated smooth : the radic. ones obl-spatulate, Clusters panicled unilateral spreading, Pedunc. downy  
 12081 Stem erect striated smooth, Lvs. ellipt. pointed deeply serrated vill. beneath : radical ones obovate, Clusters panicled unilateral, Pedunc. villous, Rays short  
 12082 Stem erect smooth, Lvs. smooth sharply and unequally serr. : those of the stem ellipt. ; radical ones ovate-obl. Clusters panicled unilateral, Rays elongate  
 12083 Stem erect smooth, Lvs. lanc. smooth rough-edged : the lower ones serrated, Clusters panicled unilateral  
 12084 Stem erect smooth, Lvs. ellipt. smooth serrated, Clusters panicled unilateral, Rays of a middling length  
 12085 Stem erect downy, Lvs. lanc. serrated rough edged, Clusters elongated unilateral recurved panicled  
 12086 Stem erect smth. Lvs. lin.-lanc. rather fleshy smth. entire rough-edg. Clust. panic. unilateral, Ped. roughish  
 12087 Stem erect striated downy, Lvs. lin.-lanc. entire smooth rough-edged, Clust. panic. unilateral nearly simple

§ 3. *Racemes erect.*

- 12088 Smooth somewhat shrubby, Lvs. lanc. obtuse without ribs, Panicle compound many-fl. tuft of flowers erect, Invol. narr.-oblong with 5 flor. in the disk and 1 in the radius  
 12089 Stem hairy, Lvs. ellipt. hairy : the lower ones serr. ; those on the fl.-branches entire numerous and small, Clusters erect, Scales of invol. obtuse  
 12090 Stem erect villous, Lvs. ellipt. roughish stalked, Clusters erect, Rays twice the length of the invol.  
 12091 Stem erect smth. Stem-lvs. lanc. entire smth. rough-edg. : radic. ones serrat. Clust. panic. erect, Ped. smth.  
 12092 Stem smooth. furrowed much branched, Lvs. almost lin. ent. roughish nearly erect with 3 or 5 rough ribs, Rays not longer than the disk  
 12093 Stem rough angular branch. corymb. Lvs. spread. lin. very narr. slightly 3-ribb. rough with axilla tufts of smaller ones, Rays scarcely exceeding the disk  
 12094 Stem nearly erect very smooth and even, Lvs. lanc. smooth with roughish edges and ribs, Clusters erect, Rays rather longer than the disk  
 12095 Stem smooth panic. Lvs. lanc. serrat. smth. rough-edged, Branches racemose at the extremity, Rays elong.  
 12096 Stem panic. hairy, Lvs. lanc. rough on both sides : those of the stem serrat. ; of the branches ent. Clusters erect, Rays elongated  
 12097 Stem branch. downy, Lvs. lanc. rough on both sides tapering 3-ribb. entire, Clusters erect, Rays elongated  
 12098 Stem erect smth. Lvs. lanc. fleshy entire smooth in every part, Clusters panic. erect, Pedunc. scaly hairy, Radius twice the length of invol.  
 12099 Stem oblique smooth, Lvs. lanc. somew. fleshy entire smooth in every part, Clusters panic. erect, Pedunc. scaly smooth, Rays longer than invol.  
 12100 Stem erect slightly downy, Lvs. lin. lanc. smooth rough-edged tapering at the base : the lower ones somew. serrated, Clusters erect, Rays elongated  
 12101 Stem rather vill. Lvs. lanc. veiny smooth entire somewhat stalked  
 12102 Lower lvs. ov. pointed taper. unequally and sharply serr. smooth : those of the stem lanc. tapering at each end serr. nearly sess. Clusters axill. stalked leafy the length of the leaves  
 12103 Stem zig-zag roundish smooth, Lvs. lanc. pointed serrated smooth nearly sess. Clust. axill. erect  
 12104 Stem somew. zig-zag angular smooth, Lvs. ovate pointed strongly serrated smooth : tapering into a winged footstalk, Clusters axillary erect  
 12105 Stem slightly zig-zag smooth angul. branch. Lvs. ov.-lanc. pointed densely serrated rather hairy beneath tapering into a wing. footstalk : upper ones ent. Clust. axill. erect the upper ones much long. than the lvs.  
 12106 Stem smooth round erect, Lvs. lanc. serr. glabrous, Racemes axill. subglobose erect, Rays long  
 12107 Cauline leaves lanc. : the lower ones ellipt. Racemes panicled erect crowded  
 12108 Stem quite simple downy, Lvs. cuneiform lanc. downy, Racemes erect, Rays long  
 12109 Stem a little villous, Lvs. sessile lanc. smooth ciliated : lower serrated at end, Rays long numerous  
 12110 Stem quite simple pilose, Lvs. lanc. acute serrated smooth, Raceme term. simple erect, Rays long  
 12111 Stem simple erect smooth, Lvs. lanc. serrated smooth tapering and elongated at the base, Clusters erect  
 12112 Stem hairy round, Lvs. lanc. rather hairy beneath, Clusters erect, Rays elongated  
 12113 Lvs. ov.-obl. rough like the corymbose stem with minute rigid hairs : the lowermost serrat. ; upper entire, [Clusters compact, Rays twice the length of the obtuse calyx

- 12114 Pedunc. branched, Lvs. reniform narrowed somewhat lobed downy, Petioles auricled at end  
 12115 Pedunc. branched, Lvs. cordate 5-lobed toothed woolly, Petioles with appendages, Ray 3-flowered

and *Miscellaneous Particulars.*

ing, and to relieve spasmodic pains in the chest of a milder kind. The leaves are also used in some parts of the United States as an agreeable substitute for tea. (*Bigelow.*)  
 1744. *Cineraria*. From *cineres*, ashes, in reference to the soft white down which clothes the lower, and

History, Use, Propagation, Culture,

often the upper surface of the leaves. *C. discolor*, *populifolia*, &c. are popular half-shrubby plants, well calculated for bearing the confined air of a sitting room. Most of the hardy herbaceous species are fine ornamental plants of easy culture. *C. lanata* and *amelloides* flower the greater part of the year; the former species is considered the handsomest of the genus; its petals exteriorly are of a most vivid purple; interiorly they are white.

1342. *Calotis*. The name has been derived from *καλος*, beautiful, and *στος*, an ear, in allusion to the two membranous ear-shaped pales of the pappus. A pretty little New Holland herbaceous plant.

1743. *Kaulfussia*. Named after Dr. George Frederick Kaulfuss, professor of botany at Halle, a distinguished living Cryptogamic botanist. A small plant with bright blue flowers.

1744. *Inula*. The derivation of this word is uncertain. The Latins applied it to a plant which was eaten as

- 12117 *Lvs. cordate angular downy beneath, Corymbs terminal paniced, Scales of invol. recurved at end*  
 12118 *Heads corymbose, Lvs. cordate angular toothed purple beneath, Petioles winged auricled at base*  
 12119 *Pedunc. about 1-headed, Branches corymb. Lvs. cord. angular toothed downy beneath, Petioles winged*  
 12120 *Heads corymbose, Lvs. cordate subangular downy beneath, Petioles with many appendages at end*  
 12121 *Heads subcorymbose, Lvs. roundish many-lobed smooth, Petioles auricled at base, Invol. calyculate*  
 12122 *Heads cymose, Lvs. cordate angular downy beneath, Petioles simple*  
 12123 *Leaves large round lobed downy and green on each side*  
 12124 *Heads corymbose, Leaves oblong lanc. acuminate toothletted smooth white beneath*  
 12125 *Lvs. cord. subangular smooth above downy beneath, Petioles with an appendage at top, Heads corymb.*  
 12126 *Stem simple, Heads paniced, Lvs. smooth tooth. : lower deltoid stalked : upper obl. lanc. amplexicaul.*  
 12127 *Panicles axillary, Lvs. alternate stalked broad lanc. serrated smooth above hoary beneath* [above  
 12128 *Heads corymb. Invol. hoary pubesc. Lvs. obl. pinnatif. at base : segm. somew. toothed shining and smooth*  
 12129 *Raceme simple, Lvs. reniform toothletted, Petiole inflat. Stem simple leafy, Bractes in the midd. of stalk*  
 12130 *Raceme simple, Lvs. cordate blunt toothletted smooth, Stem simple 1-leaved*  
 12131 *Heads corymb. Lvs. cauline ov. acute finely serrated downy beneath : petioles winged at base ; radic. cord.*  
 12132 *Raceme simple, Lvs. spatulate cordate entire smooth, Stem simple*  
 12133 *Heads corymbose, Lvs. broad lanc. tooth-sinuated, Stem villous*  
 12134 *Heads umbellate, Stem simple, Lvs. downy : radical ovate subrenulate ; cauline lanc. entire*  
 12135 *Heads in corymbose umbels, Stem simple, Lvs. somewhat toothed : radic. spatulate ; caul. obl. lanc.*  
 12136 *Panicle few-headed, Stem simple, Lvs. all stalked cordate doubly toothed, Petioles toothed at base*  
 12137 *Heads corymbose, Lvs. pinnated : term. pinnæ large cordate cut-toothed ; lateral cuneate toothed at end*  
 12138 *Heads paniced, Invol. downy, Lvs. pinnatifid : segments blunt about 3-lobed downy beneath*  
 12139 *Heads paniced, Lvs. pinnatifid subvillous : segments sinuated, Stem herbaceous*  
 12140 *Pedunc. 1-headed axillary, Lvs. linear subulate glabrous, Stem shrubby*  
 12141 *Pedunc. 1-headed, Lvs. reniform somewhat angular, Petioles auricled at end or naked*  
 12142 *Pedunc. 1-headed, Lvs. pinnatifid lobed acute viscid fleshy*  
 12143 *Pedunc. 1-headed, Lvs. cordate roundish with 7 angles woolly beneath*  
 12144 *Pedunc. 1-headed, Lvs. opposite ovate naked*

12145 *Leaves cuneate cut-toothed at end*

12146 *The only species*

- 12147 *Lvs. amplexic. somewhat toothed ovate rugged downy beneath, Scales of the involucre downy*  
 12148 *Leaves amplexic. oblong entire hirsute, Stem pilose corymbose*  
 12149 *Leaves amplexic. lanc. serrated at base pilose beneath, Stem corymbose villous*  
 12150 *Leaves amplexic. cordate lanceolate wavy*  
 12151 *Leaves amplexic. cordate lanc. quite smooth serrated, Stem corymbose smooth, Pedunc. 1-headed filiform*  
 12152 *Leaves oval rigid sessile serrulate scabrous netted, Scales of invol. ovate reflexed*  
 12153 *Leaves sessile reflexed at base lanc. serrated, Stem downy clammy, Peduncles axillary leafy*  
 12154 *Leaves sessile lanc.-lin. Stem pilose branched, Branches spreading 1-headed, Root tuberos*  
 12155 *Leaves lanc. recurved serrate scabrous, Branches angular, Lower heads tallest*  
 12156 *Lvs. sess. obl. obsolete serrated : serratures glandular, Stem hairy 1-headed, Scales of invol. lanc. villous*  
 12157 *Lvs. sess. obl. with cartilaginous teeth scabrous rigid, Stem corymbose, Scales of invol. blunt squarrose*  
 12158 *Lvs. sessile lanc. bluntly serrated rigid pilose, Stem villous 1-headed, Scales of invol. lanceolate*  
 12159 *Leaves ellipt. narrowed at base stalked pilose : lower toothed, Stem many-flowered*  
 12160 *Leaves sessile oblong lanc. serrated downy beneath, Heads stalked about 4 in terminal umbels*  
 12161 *Leaves lanc. acute serrulate hairy, Lvs. of invol. lanc. hairy outer reflexed*  
 12162 *Leaves amplexicaul. toothed very hairy : radical ovate ; cauline lanceolate*  
 12163 *Leaves sessile oblong lanc. attenuated at base obtuse entire mucronate with a gland, Pedunc. fl. if viscid*  
 12164 *Leaves sessile obl. acute entire scabrous, Stem branched at top, Heads corymbose*  
 12165 *Leaves sessile lin. acuminate nerved smooth scattered, Stem about 1-headed*  
 12166 *Leaves linear fleshy generally 3-pointed*  
 12167 *Leaves suberrate downy beneath : radical stalked ovate, Stem erect 1-flowered*  
 12168 *Leaves lanc. hirsute entire, Stem 1-headed, Invol. short imbricated*

and Miscellaneous Particulars.

a preserve with sugar. Inuleæ in many respects resemble Anthemideæ, Senecioneæ, and Nassauviæ, especially in their style ; but they are perfectly well characterized by the peculiarities of their ovarium, pappus, stamens, and corolla. They are also related to Carlineæ. They are found in every part of the world, and especially in southern Africa ; almost all the Compositæ of the southern latitudes being referable to them.

I. Helenium, called Elecampane, from the officinal name *Enula campana*, is one of the largest of British herbaceous plants. It was formerly esteemed a tonic, and is still retained in the *Materia Medica*, though little used. Bruised and macerated in wine, with balls of ashes and whortle berries, it dyes a blue color. The young branches of *I. Crithmifolia* are frequently sold in the London markets for samphire, to which they bear some resemblance in appearance, but none in virtues.

History, Use, Propagation, Culture.

1745. *Pulicaria*. So named in allusion to its property of driving away fleas, *pulices*. See Conyza. *P. dysenterica* has its specific name from having cured certain Russian soldiers of the bloody flux. It is called by our old authors middle flea-bane, and was supposed by its smoke in burning to chase away fleas and other insects. Forskahl says, it is named in Arabic *Rara ejub*, or *Job's tears*, from a notion that Job used a decoction of this herb to cure his ulcers. Of course it was formerly recommended to cure the itch. *P. vulgaris* is also said to drive away fleas and gnats.

1746. *Grindelia*. A handsome genus of herbaceous plants, with neat foliage, and pretty yellow flowers. They are sometimes called *Donia*.

1747. *Podolepis*. From *πυς*, a foot, and *λεπίς*, a scale. The stalks of the flowers are covered with scales.

1748. *Chaetanthera*. From *χαιτα*, hair, and *ανθηρα*, an anther, the anther being furnished with a hairy tuft.

1749. *Arnica*. This is said to be a corruption of *ptarmica*, derived from *πταρω*, to sneeze. The *Arnica montana* is a powerful sternutatory; in the Vosges it is even called *tabac* on that account. The whole plant has important medicinal properties; it is fortifying, diuretic, emmenagogue, vulnerary, antiseptic, resolutive, and sternutatory. The root powdered is employed in diarrhœa, dysentery, and quartan fevers; it is also applied outwardly to bad ulcers, and in cases of gangrene. The flour is used in asthma, rheumatic pain,

- 12169 Leaves ovate-oblong decurrent toothed entire at end, Flowers corymbose clustered  
 12170 Leaves sessile opp. linear lanc. entire dotted beneath, Pedunc. long 1-headed  
 12171 Leaves lanceolate linear entire, Corymbs branched, Rays of flowers very short

- 12172 Leaves amplexicaul. oblong wavy villous, Stem erect paniced, Pedunc. 1-fl. opposite the leaves  
 12173 Leaves oblong sessile, Pedunc. filiform, Invol. cylindrical  
 12174 Leaves oblongo-cordate amplexic. rugged downy, Stem woolly paniced, Scales of involucre setaceous

- 12175 Leaves ovate-obl. serrated, Involucre viscid  
 12176 Leaves sessile obl. lanceolate acute serrated at end not viscid  
 12177 Leaves obl. amplexicaul. serrated, Scales of involucre filiform at end revolute squarrose  
 12178 Stems simple, Lower leaves spatulate: upper linear-oblong serrated 1-nerved  
 12179 Leaves oblong blunt half-amplexicaul. ciliate serrated, Leaves of invol. linear flat bristle-pointed

- 12180 Scales of invol. rugose blunt, Stem quite simple  
 12181 Scales of invol. equal ovate acuminate, Stem nearly simple

12182 Leaves lanceolate ciliated

- 12183 Leaves ovate entire: cauline twin opposite  
 12184 Leaves toothed, Teeth acuminate: radical stalked elliptical roundish; cauline alternate oblong  
 12185 Leaves remotely toothed hirsute: radical stalked obl. narrowed at base; caul. alternate obl. lanceolate  
 12186 Scape 1-headed naked, Leaves stalked obovate repand  
 12187 Leaves somewhat toothed and hairy: radical stalked obl. rounded at base; caul. altern. obl. lanceolate

12188 Leaves obovate crenate smooth, Scape 1-headed

- 12189 Leaves cordate repando-dentate: radical ones petiolate; cauline ones amplexicaul.  
 12190 Leaves remotely toothletted: upper oblong amplexicaul.; lower ovate stalked, Petioles winged auricled  
 12191 Leaves toothletted: upper lanc. amplexicaul.; lower spatulate ovate; radical cordate stalked  
 12192 Leaves toothed obov. amplexic.: radical obov. spatulate narrowed into the stalk, Stem simple 1-headed  
 12193 Smooth, Radical leaves cordate deeply toothed; cauline oblong amplexicaul. Stem about 1-headed  
 12194 Downy, Lower leaves stalked ovate with winged petioles: upper amplexicaul.; all toothed

12195 Leaves stalked or ovate toothed subsinuate at base downy beneath: the old ones quite smooth

12196 The only species

12197 The only species

- 12198 Leaves serrated quite smooth  
 12199 Leaves serrated downy  
 12200 Lower leaves pinnatifid: upper entire smooth, Florets of disk 4-toothed  
 12201 Leaves lanceolate decurrent, Ray of corolla 4-parted

and Miscellaneous Particulars.

bruises, gutta serena, and paralysis of the bladder. The root is given in doses of six to twelve grains; the flowers of from three to four grains. Dr. Thomson observes, that in the hands of British practitioners it has not merited the eulogium of the French and German. (*Lond. Disp.* p. 169.)

1750. *Gerberia*. T. Gerber, a German naturalist, is only known as a traveller in Russia. A very pretty little greenhouse plant with neat purple flowers.

1751. *Doronicum*. Derived from the Arabic name *Doronigi*. *Pardalianches* is from *παρδαλις*, a tiger, and *αρχις*, to strangle; on account of the use said formerly to have been made of the plant for the purpose of destroying wild animals.

1752. *Ferdicium*. A name given by Pliny to a plant of which the partridge, *perdris*, is very fond. The plant is not now recognized.

1753. *Tetragonotheca*. From *τετρα*, four, *γωνια*, an angle, and *θραξιν*, a capsule, in allusion to the four angles of the grains.

1754. *Ximenesia*. Named by the Abbé Cavanilles, after Joseph Ximenez, a Spanish apothecary, who is said to have attended to plants.

1755. *Helenium*. Named after the celebrated Helen, who is said to have availed herself of the cosmetic properties of the plant named after her. That is believed to be the modern *Inula Helenium*; the ancient name being unoccupied, it has been applied to this American genus, which resembles the other.

#### History, Use, Propagation, Culture,

1756. *Bellis*. So called from *bellus*, pretty. Every one knows the daisy.

1757. *Bellium*. See *Bellis*, from which this genus differs chiefly in the pappus of the grains.

1758. *Dahlia*. Named after Andrew Dahl, a Swedish botanist, and pupil of Linnaeus. Continental botanists call the genus *Georgina*. This genus grows in Mexico, in sandy meadows, and till the peace of 1814 was more cultivated in France than in England: at present it is one of the most fashionable hardy plants. Though its leaves are coarse, resembling those of the common dwarf elder, yet the flowers are showy, and continue in beauty till late in autumn. The plants grow freely in any soil or situation; but the poorer the ground is, the smaller the size of the plant, and the earlier and more abundant the flowers. The single-flowered varieties of *D. superflua* are almost without end; the double varieties of both species are much less numerous. Any number of the former may be raised from seeds, which ripen in abundance, and if sown in February on artificial heat, and transplanted in the end of April, they will flower in the July or August following. The double varieties are increased by dividing the roots, or by grafting, or by cuttings; they may also be sometimes raised from seeds. A very general way in which both kinds are propagated is by cuttings. They may be either taken from the root-shoots in spring, or the tops of the young shoots early in summer; the lower end of each cutting should be cut smoothly off in the middle of a joint, and all the leaves left on, excepting those that would be buried in planting the cutting. If planted in sandy soil, on a gentle bottom heat, and covered with a hand-glass, they will soon strike root, and produce both flowers and tubers the same autumn. The double sorts are grafted on tubers of the single varieties much in the manner of whip-grafting, but without a tongue. There must be no buds on the tuber; cut off a slice from the upper part of it, in a sloping direction, and make, at the bottom of the part so cut, a ledge, whereon to rest the graft; next, cut the scion sloping to fit, it should contain two joints, and be cut so that one of these may be at the bottom of it to rest on the ledge; from that joint the scion will occasionally put forth roots; from the other the future stem will be formed. Having tied the graft, clay it as in common grafting; then put the root in fine mould, burying half the graft, and place the pot in a gentle moist heat under a glass. If this be done in March, the plant may be shifted into a larger pot in April, and planted out in the end of May.

As the *Dahlia* is a bulky plant, it requires either to be grown in a very large pot, or in from three quarters to a yard and a half of surface. They look well in rows, or occurring singly in a shrubbery.

The treatment of the *Dahlia* bears a considerable resemblance to that of the potato and the marvel of Peru; as soon as the frost has blackened the tops of these three plants, their roots require to be taken up, and

12202 Scape naked single-headed, Leaves obovate crenate

12203 Scape naked single-headed, Leaves obovate crenate 3-nerved

12204 Stem somewhat leafy

12205 Stolones creeping, Scapes 1-headed, Leaves spatulate

12206 Stem leafy capillary

12207 Rachis of lvs. winged, Leaf. ovate acumin. serrated shining and smooth beneath, Outer invol. reflexed

12208 Rachis of lvs. naked, Leaflets ovate acuminate serrated roughish beneath, Outer invol. spreading

12209 Leaves pinnated: leaflets linear pinnatifid-toothed

12210 Leaves simple lanceolate finely serrated ciliate at base

12211 Leaves pinnated: leaf. lanc. ciliate-serrated, Pedunc. 1-headed thickened, Inv. smooth, Stem spreading

12212 Leaves pinnated: leaflets lanc. ciliate-serrated, Pedunc. 1-headed ventricose, Invol. angular, Stem erect

12213 Leaves pinnated: leaf. lanc. serrated; term. subdecurrent, Pedunc. many-fl. scaly, Flowers dense

12214 Leaves pinnated: leaflets linear serrated; lower serratures long, Stem panicled, Invol. clavate

12215 Leaves pinnated: leaflets filiform, Ray not longer than involucrem

12216 Leaves pinnated: leaflets filiform subulate entire, Stem branched diffuse, Pedunc. 1-headed solitary

12217 Leaves pinnated: lower segments lanceolate; upper linear, Serratures with intermediate glands

12218 Stem smooth, Leaves pinnated, Leaflets linear subulate entire

12219 Leaves altern. pinnate linear setaceous

12220 Leaves linear amplexicaul. ciliated at base attenuated at end

12221 Leaves linear sessile acute ciliated at base

12222 Stem filiform branched, Leaves woolly subulate filiform, Peduncles naked axillary 1-headed

and Miscellaneous Particulars.

kept in a dry place, where the frost cannot get at them till spring. About April they may be divided, and planted in the open air where they are to flower; or, what is more common planted in large pots, and forwarded in heat till the middle of May, when they may be turned out of the pots where they are finally to remain. In this case they will flower a month or six weeks earlier than by the other method, and will, in general, continue flowering till they are destroyed by frost. Some care is requisite to preserve the roots sufficiently moist and plump to maintain the living principle, and yet not to rot, shrivel, or freeze them. The safest mode is to plant them in pots or boxes of dry earth, and place them in a shed or cellar, or under an ample covering of litter thatched over.

1759. *Boebera*. Boeber is said by Willdenow to have been a learned Russian botanist.

1760. *Tagetes*. Named after Tages, a Tuscan divinity, the son of Genius, and the grandson of Jupiter. *T. patula* is a tender annual, deservedly popular, from the brilliancy and variegation of its flowers: it is cultivated in Japan, China, and many parts of India, but does not appear to be indigenous of those countries. The varieties of *T. erecta* differ chiefly in the shades of the same color, but there are also double and quilled flowers. Both species are raised from seeds, upon a moderate hot-bed, in the beginning of April, and when they are three inches high, transplanted to where they are finally to remain. The varieties are very apt to degenerate, and can only be reproduced by the most careful selection and separation.

This genus serves for the basis of M. Cassini's *Tagetineæ*, which do not appear to be at all distinct from *Heliantheæ*, from which they differ principally in the form of their ovarium. M. Cassini's principal motive for distinguishing them as a separate race, seems to have been his wish to reduce his tribe of *Heliantheæ*, which he finds too extensive. Nearly all the species are found in America.

1761. *Heterospermum*. From *ἕτερος*, various, and *σπέρμα*, seed; on account of the variable shape of the grains.

1762. *Schkuhrka*. Named in honour of Christian Schkuhr, an acute German botanist, who has published some of the most accurate and useful, if not splendid, botanical works which the world has seen. It is to be regretted that their rarity makes them more generally unknown than they deserve to be.

1763. *Pectis*. From *pecten*, a comb, to which the teeth of the pappus may be compared.

1764. *Longchampsia*. So named after Doctor J. L. A. Loiseleur Deslongchamps, a French botanist, author of a useful *Flora Gallica*, in two small duodecimo volumes, published at Paris, the first in 1806, the second in 1807.

History, Use, Propagation, Culture,

1765. *Leysera*. So called in honor of Frederick William Leyser, a German, and author of a *Flora Halensis* in 1783.

1766. *Selloa*. Named after Mr. Sello, a German botanist, employed by the Prussian government in collecting materials for a natural history of Brazil. An uninteresting stove perennial plant, remarkable for having florets mixed among the leaves of the involucre.

1767. *Relhania*. In honor of the Rev. Richard Relhan, an English botanist, and author of a *Flora Cantabrigiensis*. The genus was named by L'Heritier. Plants of no beauty and easy culture.

1768. *Zinnia*. John Godfrey Zinn, a German, published, in 1757, a Catalogue of the Plants in the Garden of Gottingen, &c. Handsome border annuals, with persistent flowers, of the same culture as *Tagetes*.

1769. *Chrysanthemum*. From *χρως*, gold, and *ανθος*, a flower; because many of the kinds bear flowers of a yellow color. *Chrysanthemum*, Fr., *Goldblume*, Ger., and *Crisantero*, Ital. C. sinense is one of the handsomest of autumnal flowers, and of the easiest possible culture in any soil. It is a popular flower in China, whence all our numerous varieties have very recently been obtained, and chiefly through the exertions of the Horticultural Society. These are certainly a very great addition to the beauties of the flower garden in a dry autumn, and to the green-house or conservatory in the wet and foggy months of November and December, when scarcely any thing else is in flower. The plants are propagated by divisions, by suckers, and by cuttings;

- 12223 Leaves linear subulate ciliate rough, Scales of invol. lanceolate  
 12224 Leaves filiform downy, Scales of invol. membranous reflexed
- 12225 The only species
- 12226 Leaves oblong acuminate nerveless recurved at end  
 12227 Leaves linear somewhat pungent striated beneath, Heads sessile  
 12228 Leaves linear villous, Pedunc. lateral shorter than leaf
- 12229 Heads sessile, Leaves opp. cordate-lanceolate amplexicaul. sessile  
 12230 Heads stalked, Leaves opp. ovate-lanceolate somewhat stalked  
 12231 Heads stalked, Leaves whorled ovate-lanceolate stalked, Ray double  
 12232 Heads stalked, Leaves opp. cordate ovate sessile amplexicaul. Stem hairy, Pales serrated  
 12233 Heads stalked, Leaves opp. cordate lanceolate stalked, Ray linear-lanceolate reflexed  
 12234 Leaves cordate sessile rough at edge, Grains of disk with 2 awns : of the ray awnless
- 12235 Leaves smooth attenuated at base pinnatifid : segments cut  
 12236 Leaves all cuneiform oblong finely serrated, Stem simple 1-headed erect  
 12237 Leaves sessile : lower linear lanceolate serrated ; upper spatulate  
 12238 Leaves amplexic. obl. obt. cut pinnatifid at base ; radical ones obovate petiolate, Stem erect branched  
 12239 Lower leaves stalked spatulate serrate : upper lin. lanc. serrated, Stem 1-headed  
 12240 Leaves pinnated : pinnæ linear acute, Stem erect 1-headed  
 12241 Leaves linear nearly entire, Stem quite simple  
 12242 Lower leaves palmated : leaflets linear pinnatifid  
 12243 Leaves bipinnate : pinnæ oblong serrated, Heads corymbose  
 12244 Leaves bipinnate hoary : leaflets acute entire, Stem 1-headed simple  
 12245 Radical leaves 3-parted cut-toothed : cauline cuneiform 3-parted blunt  
 12246 Leaves bipinnated fleshy smooth, Scales of invol. keeled  
 12247 Leaves bipinnated linear subulate smooth, Stem erect somewhat branched  
 12248 Very near *C. leucanthemum*, but the lower leaves are more spatulate  
 12249 Leaves amplexic. glaucous inciso-serrate above toothed at the base  
 12250 Leaves lingulate blunt serrated, Scales of involucre equal  
 12251 Leaves bipinnate serrated, Rays length of disk, Stem procumbent  
 12252 Leaves bipinnatifid acute broadest externally, Stem branched  
 12253 Leaves flaccid stalked pinnatifid finely toothed : upper entire, Ray a little longer than flower  
 12254 Leaves coriaceous stalked sinuate-pinnatifid toothed glaucous, Ray very long

and Miscellaneous Particulars.

as they are very apt, in every case, to throw up suckers, the latter mode is decidedly the best. The cuttings may be taken from the side branches at any season from April to September; taken off before the end of May, they will flower the succeeding autumn; those taken off afterwards will not flower till next year. Chrysanthemums are so very prolific in suckers, that they soon become unsightly plants, and produce small and degenerate blossoms, unless frequently renewed from cuttings. The Chinese are said to do this every year; they take off the cuttings in May, strike them as we do, and then put each plant in a very small pot, in which it flowers the succeeding autumn. The plants are thus kept in a dwarf state, and clothed with green foliage from the ground to the flower. In order that the blossoms may be strong, they leave only one or two flower-buds on the summit of each plant, and they remove all suckers and side shoots till the blossom is over. This mode is now generally adopted with us; but sometimes the plants are retained a second, or even a third year, in which case care is requisite to leave no more stems, and to have no more suckers growing at one time than the roots can support in a vigorous state. As under this management the stems attain a great height, they require to be supported by a rod, and adjusted so as to form a symmetrical figure by a nice application of black threads, or small copper wires.

Sometimes the Chrysanthemum is grown in beds or borders, in which case the plants should be taken up every year, and their superfluous suckers removed; or, which is better, they should be totally renewed by cuttings.

History, Use, Propagation, Culture,

Though these plants will grow in any soil, yet when in small pots they require a rich loam, and are the better for being watered, as in China, with liquid manure. The different varieties are well described by Mr. Sabine, in the fourth and fifth volumes of the Horticultural Transactions.

1770. *Pyrethrum*. An ancient Greek name, applied to this plant from its supposed resemblance to the *pyrethron* of Dioscorides. That plant is believed to have been the Anthemis pyrethrum, or Pellitory of Spain, of the moderns, and to have received its name from the burning qualities of its root; *rug*, fire. All the plant of *Pyrethrum Parthenium* has a strong unpleasant smell, and a bitter taste. It is used externally, in the form of lotion and of poultice, and internally as an infusion for colic, hysterical affections, and weak digestion. There are some double-flowering varieties, which are very ornamental.

1771. *Matricaria*. So named on account of the use which is made of it in disorders of females. *Matricaire*, Fr., *Mutterkraut*, Ger., and *Matricaria*, Ital. It excites menstruation. Chamemille is an alteration of the

- 12255 Leaves all cuneiform oblong bluntly serrated, Stem branched diffuse  
 12256 Leaves stalked serrated : lower roundish ; upper ovate, Stem 1-headed  
 12257 Leaves with very narrow segments, Petioles very short connate
- 12258 Leaves pinnatifid fleshy : segments linear entire, Pedunc. long corymbose  
 12259 Leaves trifid fleshy ; segments somewhat toothed linear blunt, Pedunc. long subcorymbose  
 12260 Leaves bipinnatifid linear acute, Pedunc. 1-headed terminal  
 12261 Leaves lanceolate serrated : radical oblong, Stem 1-headed  
 12262 Cauline leaves lanceolate deeply toothed : radical pinnatifid, Stem 1-headed  
 12263 Leaves pinnatifid : segments of the lower linear lanc. entire or bifid ; upper linear entire  
 12264 Leaves fleshy pinnatifid linear toothed : upper linear trifid  
 12265 Leaves pinnatifid : segments lanc. somewhat 3-toothed fleshy, Pappus unequally toothed  
 12266 Leaves pinnatifid : segm. lanc. deeply toothed somewhat fleshy : upper lin. toothed, Pappus uneq. toothed  
 12267 Leaves downy glaucous subsessile lyrate pinnatifid unequally toothed, Heads corymbose  
 12268 Leave pinnate powdery, Leaflets pinnatifid blunt toothed, Pedunc. corymbose, Pappus toothed  
 12269 Leaves woolly bipinnate, Pinnæ and pinnules obl. imbricated, Stem 1-headed, Invol. woolly  
 12270 Leaves bipinnate : pinnæ lin.-filiform 2 or 3-parted, Stem erect branched, Pappus 2-lobed  
 12271 Leaves pinnatifid : segm. lanc. finely serrated, Grains subulate, Pappus unequally toothed  
 12272 Leaves linear serrulate, Heads corymbose  
 12273 Leaves lanc. : lower serrated at end ; upper entire, Branches corymbose  
 12274 Leaves lanc. all deeply serrated, Stem erect branched at end  
 12275 Lower leaves pinnatifid toothed : upper linear entire, Stem 1-headed  
 12276 Leaves ovate obl. serrated : radical stalked ; cauline sessile auricled at base, Heads corymbose  
 12277 Leaves hoary subsessile pinnatifid toothed blunt, Corymb terminal compound  
 12278 Leaves pinnated smooth : pinnæ once or twice pinnatifid with acute diverging segments, Invol. smooth
- 12279 Leaves bipinnate linear silky : pinnæ crossing, Pedunc. corymbose, Ray shorter than involucre  
 12280 Leaves pinnated, Pinnæ lanc. pinnatifid finely serrated : upper confluent, Pedunc. corymbose  
 12281 Lvs. petiol. flat bipinnate the segm. ovate cut, Pedunc. branch. corymb. Stem erect, Invol. hemispherical  
 [pubescent]
- 12282 Leaves pinn. : pinnæ obl. obt. pinnatifid toothed ; upper confluent, Stem virgate, Heads corymbose  
 12283 Leaves bipinnate : leaflets linear subulate, Stem 1-headed  
 12284 Rad. leaves bipinnate : pinnæ linear pinnatifid ; cauline bipinnatifid, Heads corymbose  
 12285 Leaves sess. bipinnatifid with segm. capillary, Stem branched spreading, Pappus entire  
 12286 Leaves bipinnatifid the segm. linear fleshy awnless, Stem diffuse branched, Pappus lobed  
 12287 Leaves bipinnate linear blunt, Stem ascending somewhat corymbose, Ray length of invol.  
 12288 Leaves hoary bipinnate linear blunt, Stem simple, Pedunc. twin, Ray shorter than disk  
 12289 Leaves pinnatifid : pinnæ cut-toothed, Pedunc. long nearly naked 1-headed, Scales of invol. blunt

- 12290 Leaves triply pinnate, Scales of invol. acute  
 12291 Leaves glabrous bipinnatifid the segments capillary, Invol. nearly plane : its scales obtuse  
 12292 Leaves glabrous bipinnatifid : stem branched suffruticose  
 12293 Leaves pinn. somewhat fleshy, Pinnæ linear blunt, Scales of invol. blunt, Grains margined on one side
- 12294 Leaves all entire  
 12295 Lower leaves serrated
- 12296 Leaves pinnatifid glaucous beneath  
 12297 Leaves stalked 5-lobed

12298 Ray short white : red on the lower surface

- 12299 Leaves pinnate multifid dilated, Ray none  
 12300 Leaves lanc. lin. amplexicaul. pinnatifid toothed, Stem procumbent, Branches 1-headed

and Miscellaneous Particulars.

Greek *χαμαί μελον*, a dwarf-apple, which Pliny informs us was applied to the plant, on account of its smelling of apples, or rather quinces. It is remarkable, that the Spaniards call it *mancinilla*, which also means a little apple. The chamomile of medicine is another plant. See Anthemis.

M. Chamomilla is supposed to possess the same qualities with the officinal chamomile (*Anthemis nobilis*), but in an inferior degree. Most of the species, and chiefly this one, are rejected by quadrupeds.

1772. *Boltonia*. Named after I. B. Bolton, an English botanist, who wrote a work upon the Ferns of Great Britain, and another upon the fungi growing about Halifax, published in 1783-9.

1773. *Lidbeckia*. E. G. Lidbeck, a German botanist, published some works upon agricultural matters.

1774. *Cenia*. From *ενως*, empty, in allusion to its inflated calyx.

1775. *Cotula*. A diminutive of *Cota*, an old name for some species of *Anthemis*, which this resembles in miniature.

History, Use, Propagation, Culture.

1776. *Grangea*. A genus of Adanson's. The meaning of the word is unknown.  
 1777. *Anacyclus*. An abridgement of *Anastikoyelia* which was the name originally proposed by Vaillant, and which does not appear to have been altered for the better. He formed it from *an*, privative, *an* *σος*, a flower, and *κυκλος*, a circle; on account of the rows of ovaries without flowers, which are placed in a circle round the disk.  
 1778. *Anthemis*. From *ανθος*, a flower, on account of the multitude of flowers with which the plants are covered. *A. nobilis* is in considerable repute, both in the popular and scientific Materia Medica. The flowers, which are the parts used, have a strong and fragrant smell, and a bitter aromatic taste; both are extracted by water and alcohol. The active principles appear to be bitter extractive, resin, and essential oil. Medicinally, the flowers are considered tonic, carminative, and slightly anodyne: yet when a strong infusion of them is taken in a tepid state, it proves powerfully emetic. Given in substance, united with opium and astringents, if the bowels be easily affected, they have been successfully used for the cure of intermittents; and the infusion, in combination with ginger, or other aromatics, and the alkalies, is an excellent stomachic in dyspepsia, chlorosis, gout, flatulent cholc, and chronic debility of the intestinal canal. The tepid strong infusion is a ready emetic, and is often employed to promote the operation of other emetics. By coction in water, the essential oil is

- 12301 Leaves lyrate pinnated, Flowers radiant  
 12302 Leaves tripinnate : segment acute, Stem erect, Heads flosculose corymbose  
 12303 Stem hirsute, Leaves lyrate pinnatifid hairy, Heads terminal hemispherical  
 12304 Leaves cuneiform smooth 3-toothed stalked, Heads axill. sessile  
 12305 Leaves obl. cuneate repand-toothed stalked, Heads axill. sessile  
 12306 Leaves obl. sinuate toothed downy, Stem branched procumbent, Pedunc. 1-headed opp. the leaves  
 12307 Leaves obovate toothed cut at base stalked, Peduncles branched

- 12308 Leaves bipinnate, Leaflets oblong, Stem procumbent  
 12309 Leaves bipinnate, Leaflets linear subulate flat, Stem ascending, Peduncle naked terminal  
 12310 Leaves bipinnate roundish hoary with excavated dots  
 12311 Leaves decomposed linear : segm. divided roundish acute, Heads flosculose  
 12312 Leaves 3-pinnate, Pinn. linear-subulate downy, Stem branched divaricating, Pedunc. thick

12313 Leaves bipinnate linear, Pedunc. inflated, Grains winged

- 12314 Leaves bipinnatifid : segm. somewhat toothed rigid, Paleæ oblong acuminate  
 12315 Leaves bipinnatifid : segm. lin. subulate toothed, Paleæ round pungent dilated at base  
 12316 Leaves bipinnatifid : segm. lanc. somewhat toothed ; lower teeth reflexed, Paleæ lanc. cuspidate  
 12317 Leaves bipinnatifid dotted beneath : segm. lanc. entire, Grains naked, Stem herbaceous  
 12318 Snow-white, Leaves pinnate : pinnæ 3 or 5-fid, Invol. downy, Stem erect  
 12319 Leaves bipinnate : pinnæ linear, Stem erect and invol. downy, Inner scales sphacelate at end  
 12320 Leaves sessile pinnatifid : segments toothed, Stem erect branched subcorymbose  
 12321 Leaves pinnate : pinnæ linear entire subpubescent, Floral leaves simple, Branches 1-headed  
 12322 Rad. leaves bipinnatifid toothed : cauline pinnatifid somewhat toothed  
 12323 Leaves bipinnatifid stalked : segm. trifid oblong acute, Petioles sheathing, Sheaths toothed  
 12324 Lvs. bipinn. the segm. lin. subul. a little downy, Scales of recept. membranous scarcely long, than the disk [entire pappus  
 12325 Lvs. bipinnatif. their segments lin. lanc. pubesc. Recept. conical its scales lanc. Pericarps crowned with an  
 12326 Recept. conical : paleæ obl. mucronate, Grains naked, Leaves bipinnate woolly  
 12327 Leaves bipinnatif. glabrous their segm. subul. Receptacle conical its scales setaceous, Pappus O.  
 12328 Recept. subconical, Paleæ obl. blunt, Grains naked, Lvs. bipinnate linear filiform 3-parted  
 12329 Leaves pinnated downy : pinnæ linear trifid bluntish, Stem ascending, Pedunc. long naked downy  
 12330 Leaves 3-pinnate : leaflets linear, Stem decumbent, Branches axillary 1-headed  
 12331 Leaves hairy bipinnatifid : segments trifid lanc. linear, Stem nearly erect divided  
 12332 Leaves bipinnatifid serrated downy beneath, Stem erect branched subcorymbose  
 12333 Leaves bipinnate serrated smooth, Stem erect branched, Pappus membranous toothed cut on one side  
 12334 Leaves pinnated : pinnæ linear 3-parted, Stem proliferous, Heads solitary axillary sessile  
 12335 Leaves smooth pinnatifid : lobes cuneate trifid or cut, Heads solitary  
 12336 Leaves bipinnatifid dotted beneath : segments entire, Crown of grains toothed  
 12337 Leaves woolly bipinnate : pinnæ lanc. acute, Flowering branches corymbose, Recept. conical  
 12338 Leaves stalked silky bipinnate : segm. linear acute, Invol. downy, Rays ovate  
 12339 Leaves linear sessile pinnatifid : segm. entire, Stem erect branched  
 12340 Leaves sessile pinnatifid : segm. linear subulate pectinate entire, Stem downy 1-headed  
 12341 Leaves pinnated : pinnæ linear entire blunt, Stem downy 1-headed [edge  
 12342 Leaves pinnated revolute at edge : segm. lin. subul. subtrifid, Upper scales of invol. blunt with a membran.

12343 The only species, resembling a Calendula

12344 Stem procumbent, Leaves ovate entire

and Miscellaneous Particulars.

dissipated : chamomile flowers, therefore, ought never to be ordered in decoctions. Externally, they are used as fomentations in cholick, intestinal inflammation, and to phagedenic ulcers : and their infusion is also found to be a useful addition to emollient anodyne gylsters in flatulent cholick, and in irritations of the rectum producing tenesmus. (*London Disp.* p. 158.) There is a double variety generally grown for the apothecaries ; it is more ornamental than the single, but much less efficacious as a medicine.

A. cotula is said by Linnæus to be a very grateful plant to toads ; to drive away fleas, and to annoy bees. It is a very common weed on soft rich soils and dunghills, and increases by seeds with amazing rapidity. The tribe of Anthemidea, of which this genus is the example, are nearly related to Heliantheæ. In their style they resemble Inuleæ, Senecioneæ, and Nassauvieæ, but their floral organs are different. They inhabit Europe, Asia, and Africa, scarcely one has been found in America, or the southern parts of the world.

1779. *Centrospermum*. From *serotum*, a spur, and *ovigena*, a seed, in allusion to the spiny points of the pappus. A small annual plant with the aspect of Calendula.

1780. *Sanvitalia*. Named by Lamarck without any explanation. A hardy annual plant, with flowers having a yellow ray and dark purple disk, like some species of Rudbeckia.

1781. *Achillea*. Named after Achilles, a disciple of Chiron, and the first physician who used it in healing wounds. *A. Ptarmica* is called sneeze-wort, because the dried powder of the leaves snuffed up the nostrils provokes sneezing. In the spring, the young tender shoots were formerly put into salads, to correct the coldness of other herbs. There is a variety with double flowers, which is very ornamental, especially in pots. *A. moschata*, the *Genipi* of the Swiss, is an excellent sudorific, aromatic, and acrid, and is a grateful food to cattle.

- 12345 Leaves obl. linear blunt doubly serrulated downy ciliated, Stem villous.  
 12346 Leaves linear narrowed at base serrated and stem smooth [at end  
 12347 Leaves lin. acute equally and finely serrulate smooth, Stem panicled, Corymbs few-headed, Paleæ bifid  
 12348 Leaves linear lanc. acuminate sharply serrated
- 12349 Leaves lin. plane acuminate toothed : teeth emarginate transversely ciliated, Stem diffuse  
 12350 Leaves obl. blunt serrated narrowed into the petiole fascicled glabrous, Corymb compound contracted  
 12351 Leaves linear acuminate equally and finely serrated smooth : serratures of the base deepest, Paleæ entire  
 12352 Leaves lanc. equally and finely serrated downy, Serratures of base deepest, Stem panicled, Paleæ entire  
 12353 Leaves linear pectinate pinnatifid glabrous : segm. subserrated, Corymb compound  
 12354 Leaves downy linear lanc. pinnatifid : segments deepest at base, Corymb compound  
 12355 Leaves downy pinnatifid smooth : segm. linear blunt : upper toothed at end, Corymb simple  
 12356 Leaves pectinate pinnatifid smooth : segm. linear acute ; lower 2-parted, Corymb simple  
 12357 Leaves pectinate pinnatifid : segm. linear subulate entire, Corymb compound contracted, Stem downy
- 12358 Leaves pinnatifid : segm. obl. cuneate unequally toothed vertically bent, Corymbs simple  
 12359 Leaves pinnated roundish pilose : pinnæ 3-parted toothed imbricated across, Corymbs simple  
 12360 Leaves pinnat. somew. downy, Pinnæ 3-part. blunt entire transversely imbr. Ray scarcely long. than invol.  
 12361 Leaves pinnated somewhat downy, Pinnæ 3-parted transverse distant : segm. 3-toothed, Stem branched  
 12362 Leaves pinnated downy : pinnæ linear entire blunt ; lowest longest, Cymes simple  
 12363 Leaves pectinate pinnate smooth : pinnæ linear acuminate usually 3-parted  
 12364 Leaves linear-lanc. acuminate unequally and finely biserrate villous beneath  
 12365 Leaves downy pinnatifid : segm. lanc. serrated, Corymb compound  
 12366 Stem downy, Leaves pinnated minutely cut acute rigid bent upwards with a downy nerve  
 12367 Leaves pinnated : pinnæ long distant very narrow linear entire, Corymb compact branched  
 12368 Cauline lvs. pinnatifid with entire segm. : radice pinnatifid with 3-fid segm. Ray scarcely larger than invol.  
 12369 Leaves pectinate pinnate smooth, Pinnæ linear bluntish entire dotted  
 12370 Leaves pinn. villous : pinnæ toothed linear ; radical bipinnate, Stem quite simple  
 12371 Leaves pinn. downy : pinnæ roundish 4-fid concave spreading, Stem branched at end  
 12372 Leaves pinn. downy : pinnæ roundish bluntly toothed, Corymb compound  
 12373 Leaves pinn. smooth : pinnæ lanc. cut-serrated ; outer confluent, Corymb compound  
 12374 Leaves bipinnate downy : pinnæ linear-lanc. toothed, Corymb simple, Peduncles long  
 12375 Leaves bipinnatifid hoary : segm. lin. lanc. serrated, Corymb compound globose, Flowers flosculus  
 12376 Leaves bipinnatifid setaceous villous : segm. lanc. entire, Corymb compound contracted, Flowers flosculus  
 12377 Leaves bipinnatifid pubescent : segm. linear lanc. unequal acute, Corymb compound  
 12378 Leaves downy : cauline bipinnatifid with linear blunt segm. ; radical bipinnate, Corymbs compound  
 12379 Leaves bipinnatifid : segm. lanc. serrated, Corymb compound spreading  
 12380 Leaves bipinnatifid : segm. lanc. cut-serrated, Rachis winged cut-serrated, Corymbs fastigate compound  
 12381 Leaves bipinnatifid villous : segm. lanc. blunt, Corymbs fastigate compound  
 12382 Leaves thrice pinnatifid : segm. lanc. acute, Corymbs compound fastigate  
 12383 Leaves bipinnate slightly hairy their segm. linear toothed acute, Stems furrowed
- 12384 Leaves pinnatifid downy beneath : segm. toothed, Stem branched fastigate smooth  
 12385 Leaves bipinnatifid downy : segm. lanc. entire, Corymb compound  
 12386 Leaves bipinnatifid woolly : the segm. crowded linear acute, Corymbs repeatedly compound  
 12387 Leaves subbipinnatifid : pinnæ of the base undivided : segm. lin. lanc. Corymb compound, Invol. cylindr.  
 12388 Leaves bipinnatifid shorter than the intervals between them : segm. lin. entire, Corymbs comp. fastigate  
 12389 Leaves bipinnatifid : segm. lin. finely serrated, Rachis winged entire, Corymb compound fastigate  
 12390 Cauline leaves bipinnatifid : segm. lin. somew. toothed, Rachis winged toothed : radical thrice pinnatifid  
 12391 Leaves bipinnate downy : pinnæ pinnatifid, Segments linear-subulate, Corymbs compound fastigate  
 12392 Leaves bipinnate pilose beneath : pinnæ linear entire, Corymb simple  
 12393 Leaves bipinnate : leaflets linear setaceous mucronate very compact pilose, Corymbs compound fastigate  
 12394 Leaves bipinnate downy : pinnulæ very fine linear entire distant, Corymbs compound fastigate

12395 The only species

- 12396 Leaves hoary linear lanc. opposite : those of the branches alternate  
 12397 Very villous, Leaves sessile oblong acuminate entire, Heads axillary on short stalks  
 12398 Hoary, Lvs. bipinnatifid cut-toothed, Segm. linear rigid mucronate, Heads lateral and terminal clustered

and Miscellaneous Particulars.

1782. *Tridax*. From *tridax*, cut into three pieces. The rays of the flower are divided in three.  
 1783. *Amellus*. A name used by Virgil for a beautiful flower growing on the banks of the river *Mella*. The plant of Virgil is supposed to have been *Aster Amellus*.

History, Use, Propagation, Culture,

1784. *Starkea*. Named by Willdenow, after the Rev. Mr. Starke, of Gros Tchirna, in Silesia, who paid much attention to the Cryptogamous plants of that country. This genus was included by Linnaeus in *Amellus*, from which Willdenow remarks that it differs in habit, and in its hairy receptacle.

1785. *Columella*. So called by Jacquin, after the celebrated Geoponic writer, Lucius Junius Moderatus Columella, a Spaniard, born forty-two years before Christ. A plant resembling *Amellus annua*. The flowers are yellow and sessile in the dichotomies of the branches. The *Columella* of Loureiro is a different thing.

1786. *Eclipta*. A translation of the Malay name *Wangi-wangi-maih*, which signifies an eclipse of the sun, to which the form and disposition of the radiated flower has been likened. Worthless weeds with white flowers.

1787. *Meyera*. Named after Gotthelb-Andrew Meyer, a German, who published, in 1694, a dissertation upon the *Sycomerus* of Scipure.

1788. *Chrysanthellum*. A diminutive of *Chrysanthemum*, which see.

1789. *Siegesbeckia*. Dr. John George Siegesbeck, a German physician, director of the garden at St. Petersburg, published in 1736, a catalogue of it under the title of *Flora of St. Petersburg*. There was also a *Botanosophia* from his pen in 1737.

- 12399 Leaves opp. 3-nerved downy beneath, Heads in umbels
- 12400 The only species
- 12401 Stem erect strigose, Leaves oblong lanc. sessile remotely serrated  
12402 Stem prostrate strigose, Leaves obl. lanc. somewhat stalked subserrate somewhat wavy scabrous
- 12403 Stem erect, Leaves amplexicaul. ovate toothed
- 12404 Leaves alternate 3-parted toothed : radical oblong serrated, Stem creeping
- 12405 Leaves stalked ov. unequally toothed subtriangular at base somewhat cut, Outer invol. longer than inner  
12406 Leaves sessile ovate toothed, Florets of disk 3-toothed triandrous
- 12407 Leaves alternate decurrent wavy blunt  
12408 Leaves alternate lanc. subserrate, Corymb compound  
12409 Leaves alternate deeply pinnatifid, Stem shrubby  
12410 Leaves opposite ovate lanc. serrated acuminate at each end decurrent  
12411 Stem winged, Lvs. lanc. acuminate somewhat stalked serrated, Heads corymbose, Cor. of ray lanceolate
- 12412 Leaves opposite ovate-lanc. serrated downy beneath  
12413 Leaves opposite cordate-lanc. amplexicaul. remotely serrated, Invol. simple 5-leaved  
12414 Leaves opposite obl. lanc. bluntnish strigose serrated at end, Pedunc. 1-headed long, Invol. simple  
12415 Leaves opposite ov. acuminate serrated 3-nerved hairy, Pedunc. winged 1-headed, Invol. simple  
12416 Leaves opposite ov. acuminate serrated 3-nerved scabrous on each side, Pedunc. 1-headed axillary
- 12417 Leaves opposite ov. serrated 3-nerved, Heads axillary subsessile, Invol. simple, Stem trichotomous
- 12418 Leaves ovate 3-nerved serrated  
12419 Leaves oblong lanceolate toothed 3-nerved : lower hastate 3-lobed
- 12420 Stem procumbent downy, Lvs. ovate entire, Pedunc. lateral, Ray shorter than disk
- 12421 Leaves ovate serrated 3-nerved downy beneath, Ray many-flowered
- 12422 Leaves ternate 3-lobed : lower opposite, Stem suffrutescent
- 12423 The only species
- 12424 Leaves opposite ovate serrated 3-nerved, Invol. leafy, Stem herbaceous
- 12425 Leaves opposite obovate hoary, Petioles with 2 teeth  
12426 Leaves opposite lanceolate narrowed at base not toothed smooth

and Miscellaneous Particulars.

1790. *Verbesina*. A name with the same meaning as *Verbena*, which see. The *V. alata* resembles *Vervain* in the appearance of its foliage.

1791. *Synedrella*. A name of unknown meaning. A little worthless weed.

1792. *Galinsoga*. Named after after Mar. Ma. Galinsoga, first physician to the queen of Spain, and intendant of the garden of Madrid. One of the species, *G. trilobata*, is sometimes cultivated as a hardy annual. But it does not possess much merit.

1793. *Acmella*. From *ακμω*, a point, on account of the pricking taste of the foliage.

1794. *Zaluzianskia*. Apparently an alteration of *Zaluzianskia*, a name applied in error to *Marsilea trifolia*, and formed in honor of an obscure Polish botanist.

1795. *Pascalia*. A genus dedicated by Ortega to Didan Pascal, doctor of medicine, and a professor at Parma.

1796. *Helioopsis*. A name with the same meaning, and a genus with the same habit, as *Helianthus*, which see.

1797. *Bupthalmum*. From *εὐς*, an ox, and *ὀφθαλμος*, an eye, in allusion to the broad open disk of the flowers. It is believed that the *Bupthalmum* of Pliny is a species of *Anthemis*.

History, Use, Propagation, Culture,

1798. *Helianthus*. From  $\eta\lambda\iota\alpha\varsigma$ , the sun, and  $\alpha\nu\theta\epsilon\varsigma$ , a flower. Nothing can be a more complete ideal representative of the sun, than the gigantic sun-flower, with its golden rays; it is dedicated with great propriety to the sun, which it never ceases to adore while the earth is illuminated by his light. When he sinks into the west, the flowers of *Helianthus* are turned towards him; and when he rises in the east, the flowers are again ready to be cherished by the first influence of his beams.

*H. annuus* is a well known border annual, which will grow in any soil. There are varieties with double flowers, the tubular florets being changed into ligular ones, like those in the ray. The whole plant, and particularly the flower, exudes a thin pellucid odorous resin, resembling Venice turpentine. From the seeds an edible oil has been expressed, and they are also excellent food for domestic poultry. The flowers turning with the sun, is by some considered a popular error; Gerardé says he never could observe it; and Professor Martin has seen four flowers on the same stem pointing to the four cardinal points. *H. tuberosus*, *Topinambour*, Fr., *Erdapfel*, Ger., and *Girasole*, Ital., is called Jerusalem, from the corruption of the Italian word *Girasole*; and Artichoke, from the resemblance in flavor which the tubers have to the bottoms of artichokes. These tubers are in considerable esteem on the continent as a substitute for potatoes; and before the introduction of that vegetable, they were a good deal in use in this country. Their culture and treatment is the same as for that vegetable. *H. multiflorus* a showy autumnal flower.

- 12427 Leaves opposite close spatulate oblong silky, Scales of invol. setaceous hirsute  
 12428 Leaves alternate obl. lanc. amplexicaul. entire hirsute, Invol. leafy mucronate  
 12429 Invol. bluntly leafy sessile axillary, Leaves oblong blunt alternate entire, Stem dichotomous  
 12430 Invol. bluntly leafy stalked, Lvs. alternate spatulate, Stem herbaceous  
 12431 Leaves alternate obl.-lanc. subserrate 3-nerved villous, Invol. naked, Stem herbaceous  
 12432 Leaves alternate lanc. somewhat toothletted smooth, Invol. naked, Stem herbaceous  
 12433 Leaves alternate: lower stalked cordate doubly serrate: upper sess. ovate serrated, Stems herbaceous

## FRUSTRANEA.

- 12434 Leaves all cordate 3-nerved, Pedunc. thick, Heads cernuous  
 12435 Leaves all cordate 3-nerved, Pedunc. evensized, Invol. leafy  
 12436 Leaves cordate cuneate at base villous 3-nerved, Pedunc. thick fistular  
 12437 Leaves ovate acuminate narrowed at base unequally serrate scabrous, Pedunc. filiform, Rays obovate  
 12438 Leaves 3-nerved scabrous: lower cordate; upper ovate, Ray many-fl. Scales of invol. lanceolate  
 12439 Leaves 3-nerved scabrous: lower cordate-ovate; upper ovate acum. alternate, Petioles ciliated at base  
 12440 Stems slender about 1-headed, Leaves linear revolute at edge rough  
 12441 Leaves ovate acuminate 3-nerved serrated scabrous above hoary beneath, Invol. squarrose  
 12442 Leaves ovate acuminate 3-nerved closely serrated scabrous above: hoary and soft beneath  
 12443 Lvs. ov. acum. remotely serrat. 3-nerv. scabr. Scales of invol. lanc. nearly equal subciliated, Rays 10 or 12  
 12444 Lvs. lanc. acuminate scabr. serrated 3-nerved: upper entire, Scales of invol. lanc. ciliated, Stem procumb.  
 12445 Lvs. ovate acuminate serrated 3-nerved scabrous beneath, Scales of invol. lin. lanc. ciliated at base  
 12446 Lvs. altern. lanc. serr. scabr. 3-nerved narrow. at end stalked, Petioles ciliated, Scales of invol. lanc. ciliat.  
 12447 Lvs. altern. lanc. serr. scabr. obsol. 3-nerv. narrow. at each end subsess. ciliat. at base, Scales of inv. lanc. cil.  
 12448 Smooth, Stem paniced, Branches few-flowered at top, Lvs. sessile very long entire: lower serrated  
 12449 Stem hispid spreading, Leaves ovate rigid scabrous, Peduncles very long 1-flowered  
 12450 Leaves altern. or opp. sessile linear revolute at edge entire 1-nerved, Heads corymbose  
 12451 Leaves ov. lanc. acuminate serrated 3-nerved very rough on each side, Scales of invol. lin. lanc. ciliated  
 12452 Leaves altern. lanc. serrated scabrous 3-nerved narrowed at each end woolly at base, Stem vill. in 2 rows  
 12453 Leaves amplexicaul. Heads on long stalks, Disk of head dark purple  
 12454 Stem erect hairy, Lvs. stalked 3-lobed very rough, Invol. hairy, Pappus with 2 setæ  
 12455 Stem smooth much branched, Lvs. opp. sessile lanc. ovate 3-nerved, Panicle trichotomous slender few-fl.  
 12456 Leaves subsess. cordate ovate 3-nerved amplexicaul. closely serrated downy, Scales of invol. lanc. villous  
 12457 Leaves opp. spatulate crenate 3-nerved scabrous, Scales of invol. erect the length of disk  
 12458 Leaves oblong-lanceolate subserrate, Heads 1-3, Ray 8-flowered

- 12459 Lvs. all pinnat.: one or other of the lower pinnæ 2-parted; the rest undivided, Pappus ent. Stem furrowed [hispid]  
 12460 Rad. lvs. pinn.: leaflets sessile lanc. toothed somewhat cut; upper confluent, Pappus entire  
 12461 Rad. lvs. pinn.: leaflets ovate uncut at base about 3-lobed toothed, Pappus 4-toothed  
 12462 Stem upright simple few-fl. at top, Leaves pinnatifid cut: segm. linear, Invol. simple 5-leaved  
 12463 Stem branched, Branches erect many-fl. Lvs. obl. lanc. acute serrated: lower 3-lobed  
 12464 Leaves spatulate: lower 3-lobed; upper undivided  
 12465 Leaves undivided spatulate ovate 3-nerved serrated hairy, Recept. conical, Paleæ lanceolate  
 12466 Leaves obl. lanc. toothletted hispid narrowed at base subcordate, Recept. hemispherical, Paleæ lanceolate  
 12467 Quite smooth, Peduncles long 1-headed, Lvs. ovate-lanc. acuminate each way 3-nerved  
 12468 Leaves obl. lanc. cordate amplexicaul.: lower serrated, Disk cylindrical conical  
 12469 Leaves lanc. ovate alternate undivided, Rays bifid  
 12470 Stem hispid, Lower leaves broad-ovate tapered at base remotely toothed very rough, Rays 3-toothed

and Miscellaneous Particulars.

This genus has given rise to a most important and extensive tribe of plants, the Heliantheæ, which is at once the most numerous of the various tribes of Compositæ, and on account of its strict affinity with several others, the most difficult to characterize with precision. Although it is perfectly natural, yet there is scarcely a character belonging to it which is not subject to many exceptions, and to more or less important modifications. Almost all the species of Heliantheæ are natives of America, several of Asia, a few of Africa, and scarcely any of Europe. They appear to be entirely unknown in the southern parts of the world.

1799. *Gymnolomia*. From *γυμνος*, naked, and *λωμα*, an edge; in allusion to the nature of the margin of the grains.

1800. *Rudbeckia*. Named after the famous Olaus Rudbeck, professor of botany at Upsal, who died of grief in 1709, at witnessing the destruction by fire of his laborious work, called *Campi Elysi*, which was nevertheless published in 1701 and 2, by the diligence of his son. He is also celebrated for having made the discovery that the Paradise of Scripture was situated somewhere in Sweden. Handsome border annuals or perennials. *R. purpurea* is remarkable for bearing purple flowers.

History, Use, Propagation, Culture,

1801. *Galardia*. Fougereux de Bondaroy, the nephew of Duhamel, dedicated this genus to M. Gaillard de Charentonneau, an amateur of botany.

1802. *Tithonia*. A fanciful name given to this plant by Desfontaines, because of the color of its flower, which resembles Yellow Morning, or Aurora, whose husband was Tithonus.

1803. *Cosmea*. From *cosmos*, beautiful, on account of the elegance of the foliage.

1804. *Coreopsis*. From *opsis*, a bug, and *opsis*, resemblance. Its seed is convex on one side, and concave on the other; it has a membranous margin, and it has two little horns at the end which gives it very much the appearance of some insect. *C. verticillata* is a handsome shrubby plant, continuing long in flower; the florets are used in North America, to dye cloth red. *C. tinctoria* is a very handsome border annual.

1805. *Simsia*. Named by Persoon, after Dr. John Sims, the co-editor with Mr. König, of the excellent *Annals of Botany*, and for many years the sole editor of the *Botanical Magazine*.

12471 Stem branched, Leaves lanc. Paleæ of pappus entire awned

12472 The only species

12473 Leaves pinnate and bipinnatifid, Pinnae serrated somewhat decurrent, Ray few-flowered neuter

12474 Leaves bipinnatifid : segm. lanc. Segm. of exterior invol. lanceolate

12475 Leaves bipinnate, Leaflets linear subulate, Scales of outer invol. ovate

12476 Leaves bipinnate, Leaflets filiform, Scales of outer invol. lanceolate

12477 Leaves bipinn. Pinnules lin. lanc. not broader than their rib

12478 Leaves whorled 3 or 5-pinnated : pinnae lin. 3-parted and undivided, Disk discolored

12479 Leaves whorled 3 or 5-pinnated : pinnae lin. 3-parted and undivided, Disk same color as ray

12480 Leaves ternate ovate-obl. serrated, Ray same color as disk

12481 Leaves serrated : radical 3-parted : cauline trifid or entire lanc. linear

12482 Leaves entire : radical pinnated ; cauline in threes lanc. stalked

12483 Leaves entire ternate sessile

12484 Leaves subternate cuneate serrated

12485 Villous, Leaves stalked quinate and ternate : leaflets ovate-lanc. subpinnatifid or cut serrated

12486 Leaves serrated ovate : upper ternate, Stem creeping

12487 Leaves lanceolate entire ciliated

12488 Rad. leaves pinnate or bipinnate entire, Outer leaves of involucre short, Ray discolored at base

12489 Leaves entire ovate : lower ternate

12490 Leaves ovate acuminate crenate toothed, Grains naked

12491 Leaves stalked lanc. ovate by degrees acuminate finely serrated, Corymbs dichotomous term. and axillary

12492 Leaves obovate oblong entire downy

12493 Leaves alternate lin. lanc. entire smooth, Ray oblong trifid : middle segm. largest

12494 Stem winged, Leaves alternate scabrous roundish ovate cuneate at base 3-nerved

12495 Leaves ellipt. acuminate serrated stalked veiny decurrent : lower whorled ; upper alternate

12496 Leaves 3-lobed toothed roughish, Petiole naked at base

12497 Hoary, Leaves somewhat palmate 3-lobed, Petiole leafy at base amplexicaul.

12498 Leaves lanc. obsolete serrated toothed at base smooth

12499 Leaves obovate toothed villous

12500 Cor. of ray 4-fid nearly equal to disk, Leaves hoary with down

12501 The only species

12502 Leaves ovate smooth imbricated at the edge and rib ciliate-spiny, Spine of the end reflexed

12503 Leaves alternate obl. recurved smooth ciliate-spiny, Leaves of invol. ciliated

12504 Leaves altern. lanc. subulate recurved smoothish ciliat. spiny decurr. at base, Segm. of invol. ciliate spiny

12505 Cauline leaves altern. amplexicaul. ciliate spiny : radical entire unarmed, Scales of invol. entire

12506 Leaves opp. obl. lanc. narrowed at base spiny-toothed smooth, Scales of invol. ciliate spiny

12507 Leaves altern. ovate spiny-toothed 3-nerved netted hoary villous, Scales of invol. toothed spiny villous

12508 Leaves altern. obl. cuneiform spiny-toothed villous on each side, Scales of invol. toothed spiny

12509 Leaves altern. lanc. pinnatifid downy beneath : segm. entire spiny at end, Scales of invol. 3 or 5-fid

12510 Leaves opp. lanc. 3-nerved spiny-toothed downy beneath, Scales of invol. spiny-toothed [toothed

12511 Leaves altern. lanc. spiny-toothed downy beneath, Stem herbaceous 1-headed, Scales of invol. lanc. spiny-

12512 Leaves altern. lanc. amplexicaul. spiny-toothed ciliated smooth on each side, Heads cernuous

12513 Leaves altern. lanceolate oblong fleshy

12514 Leaves opp. somewhat amplexicaul. ovate

and Miscellaneous Particulars.

1806. *Osmites*. From *οσμη*, perfume. One of the species gives out a strong smell of Camphor.

1807. *Encelta*. A name of Adanson's, the meaning of which is unknown. A pretty half shrubby plant, with grey soft leaves.

1808. *Scierocarpus*. From *σκληρος*, hard, and *καρπος*, fruit, with reference to the bony covering of the grain.

1809. *Cullumia*. Named after Sir Thomas Cullum, an English baronet, and one of the earliest promoters of the principles of Linnæus in this country. He is still living, at a very advanced age.

1810. *Berckheya*. Named after John Lefranc de Berckhey, a Dutch botanist.

1811. *Didelta*. From *δις*, double, and *δελτα*, a Greek letter equivalent to the English D; because the receptacle resembles a double triangle.

History, Use, Propagation, Culture,

1812. *Gorteria*. Named after David Gorter, a Dutchman, professor of botany at Harderwyck, and afterwards physician to Elizabeth, Empress of Russia. He published a *Flora Belgica* in 1767, and assisted Kraechenninikoff in his *Flora Ingrica*. *G. Rigens* is a very showy plant when the flowers are fully expanded. All the species are of easy culture.

1813. *Gazania*. Supposed to have been so called from γαζα, riches, in allusion to the splendour of the flowers.

1814. *Cryptostemma*. From κρυπτος, concealed, and στεμμα, a crown; the scaly crown of the grains being involved in wool. Tender annuals, natives of the Cape of Good Hope.

1815. *Arctotheca*. See *Arctotis*, from which this has been divided.

1816. *Sphenogyne*. So called from σφην, a wedge, and γυνη, a female, in allusion to the wedge-shaped stigmas. Pretty annual flowers.

1817. *Zœgea*. Named after Dr. J. Zœge, who published a *Flora Islandica* in 1775. *Leptaurea* is an abbreviation of *Lepto-centaurea*, small centaurea.

1818. *Leuzea*. Divided by M. DeCandolle, from *Centaurea*, from which it differs in not having the outer florets barren, nor the pappus with simple hair, nor the insertion of the fruit oblique. He named it after his friend Deleuze.

12515 Leaves lanc. entire and sinuated, Stem erect, Flowers stalked

12516 Leaves lanc. spatulate and pinnatifid entire white with down beneath, Pedunc. 1-headed terminal  
 12517 Stem shrubby decumbent, Leaves spatulate-lanceolate downy beneath, Ray same color as disk  
 12518 Leaves pinnatifid hairy above downy beneath : segm. oval-lanc. Scape 1-headed, Stem decumbent  
 12519 Stem leafy decumbent 1-headed, Leaves subulate linear revolute at edge downy beneath

12520 Ligulae undivided, Leaves pinnatifid toothed downy beneath  
 12521 Ligulae 3-5-parted, Leaves lyrate downy  
 12522 Ligulae 3-5-parted, Leaves runcinate toothed downy beneath

12523 The only species

12524 Smooth, Lvs. bipinnatifid or pinnatifid linear-filiform, Lvs. of pappus white  
 12525 Smooth, Lvs. pinnatifid linear filiform, Outer leaflets of invol. subulate  
 12526 Leaves bipinnatifid or pinnatifid linear filiform smooth, Scales of invol. scarious blunt shining  
 12527 Leaves bitripinnatifid and invol. downy  
 12528 Leaves pinnatifid smoothish : segm. 2-3-toothed, Teeth piliferous, Outer scales of invol. lanceolate  
 12529 Leaves flat smooth cut pinnatifid at end, Outer lvs. of invol. scarious at end, Pappus obsolete  
 12530 Leaves fleshy linear pinnatifid and bipinnatifid, Pappus much shorter than the florets of disk

12531 The radical and lower cauline leaves pinnatifid

12532 Leaves tomentose : root ones lanceolate ; stem ones pinnatifid, Stem simple  
 12533 Flower very large

§ 1. CYANUS. *Involucrum ciliated, unarmed.*

\* *Involucrum with feathery setae.*

12534 Inv. recurved-feathery, Leaves oblong undivided scarious mucronate serrulated  
 12535 Inv. recurved-feathery top-shaped, Leaves oblong undivided scarious mucronate serrulated, Stem simple  
 12536 Inv. recurved feathery, Leaves mucronate-serrated : lower stem ones sinuate pinnatifid  
 12537 Invol. recurv. feathery, Lvs. egg-shap. undivid. scabr. gross. tooth. : upp. ones and those of branches undivid.  
 12538 Invol. recurved feathery, Leaves lanceolate sometimes toothed downy  
 12539 Invol. recurved feathery, Head without a neutral ray, Leaves hairy lanceolate remotely toothed  
 12540 Invol. recurved feathery, Leaves ovate lanceolate toothed at base nerved downy, Corollas fuscous  
 12541 Invol. recurved feathery pubescent, Leaves linear-lanceolate quite entire scarious  
 12542 Invol. erect feathery, Lower lvs. lanc. attenuat. into the petiole serrul. ; caul. ov.-obl. downy on each side  
 12543 Invol. recurved feathery pubesc. Head without a neutral ray, Lvs. lin. quite entire, Stem somew. shrubby

\*\* *Involucrum with ciliated appendages.*

12544 Scales of the invol. ovate ciliated with capillary teeth, Lower leaves angular lyrate : upper ones ovate  
 12545 Innermost invol. scales scarious, Root lvs. obsoletely pinnatif. : lower stem ones somew. tooth. at the base ; upper ones undivided quite entire  
 12546 Invol. serrated with white ciliae, Leaves decurrent deeply pinnatifid, Pinnæ generally two  
 12547 Invol. serrated, Leaves smoothish lanceolate quite entire decurrent, Stem simple  
 12548 Invol. ciliated variegated, Leaves sessile linear downy, Stem 1-headed  
 12549 Scales of the involucre serrated, Leaves linear entire ; the lowermost toothed  
 12550 Invol. ciliated egg-shaped, Scales flat close-pressed : Lower lvs. bipinnatif. : upper pinnatif. Stem paniced  
 12551 Invol. ciliated, Root lvs. undivided and pinnatifid smooth, Stem lvs. downy pinnatifid, Branches spinous

and Miscellaneous Particulars.

1819. *Centaurea*. It is said, that with this plant, the *Centaurea* Chiron cured the wound in his foot made by the arrow of Hercules. Crupina is from the Dutch verb *kruipen*, which signifies to creep ; because the dark multifid pappus resembles the legs of a creeping insect.

*Phrygia* signifies dry (*φρυγία*), in allusion to its calyx.

*Jacea* is said to have been so named from *jacere*, to lie down, on account of its prostrate habit.

*Calcitrapa*, the Latin of a caltrop, or iron ball covered with stiff spines, formerly used in warfare to impede the operations of cavalry. Its calyx is very like one of these instruments.

*Centaurea Crocodilium* is so named, because the spines of the calyx have been fancifully likened to the claws of a Crocodile.

*Verutum*, the name of another species, is the Latin of a short javelin used by the Roman foot-soldiers. The spines on its calyx resemble a small dart.

*C. nigra* is a harsh stubborn weed in meadows and permanent pastures, seldom touched by cattle either green or in hay, and with difficulty extirpated. *C. cyanus*, *Bluet*, Fr., *Kornblume*, Ger., and *Ciano*, Ital., is a common weed in corn fields, on gravelly soils, throughout Europe, and also a popular border annual. The expressed juice of the natural florets makes a good ink ; it also stains linen of a beautiful blue, but the color is not permanent. *C. benedicta* was so called from its being supposed to possess extraordinary medical powers ; it was

History, Use, Propagation, Culture,

said not only to destroy worms and cure fevers, but also the plague, and the most putrid and stubborn ulcers and cancers. At present it is in no estimation whatever. It has by some botanists been thought advisable to separate this genus into several others; but the differences upon which the separation has been made depend upon variations in the form of the involucre,

- 12558 Invol. ciliated, Leaves downy very white all compound: lowest bipinnatifid; highest pinnate-laciniate  
 12553 Invol. ciliated, Leaves somewhat downy cinereous: lower ones pinnate-laciniate; upper ones simple  
 12554 Invol. ciliated, Lvs. downy undern. Root lvs. bipinnatifid: segm. lanceolate acute, Stem-leaves pinnatifid  
 12555 Invol. serrated, Leaves downy: root ones pinnated; upper 1-eared  
 12556 Invol. ciliat. smooth, Lvs. pinnatif. scabr. Segm. obl. lanc. acute: highest root ones sometimes cut at base  
 12557 Invol. ciliated spheacelate, Scales spreading, Leaves obl. lanc. entire villous downy: cauline decurrent  
 12558 Invol. scales roundish egg-shaped ciliated, Leaves oblong lanc. undivided very scabrous acute serrated  
 12559 Invol. scales ovate lanceolate serrate-ciliated, Leaves bipinnatifid, Segments lanceolate  
 12560 Invol. egg-shaped smooth, Scales somew. scar. at tip, Lvs greenish decurr. undivided: radical ones lyrate  
 12561 Inv. scales scar. at tip serr. Lvs. scab. at edge: root ones obl. tooth.; stem ones lanc. somew. decurr. quite ent.  
 12562 Scales of the involucre ciliated ovate pubescent, Leaves pinnatifid roughish: the segm. lanceolate acute  
 12563 Invol. ciliated nearly globular, Leaves deeply pinnatifid, Segments linear  
 12564 Invol. ciliated ovate roundish beautifully spotted, Leaves slender bipinnatifid, Stem a little paniced  
 12565 Invol. ciliated oblong, Leaves pinnatifid linear quite entire  
 12566 Invol. serrated, Leaves oblong serrated decurrent and undivided [branched divaricated  
 12567 Invol. ciliat. Scales ovate-lanc. spread. at tip, Lower lvs. bipinnatif. lanc. lin.: upper ones pinnatifid, Stem  
 12568 Invol. ciliated, Leaves lanceolate serrated: lowest tooth elongated so as to appear like a stipule  
 12569 Invol. ciliated, Leaves downy pinnatifid, Segments obtuse egg-shaped quite entire: outer ones largest  
 12570 Invol. ciliated, Leaves scabrous: underneath pinnatifid, Segments lanceolate sometimes toothed  
 12571 Invol. scariosus, Scales ovate lanceolate serrated ciliated, Leaves scabrous beneath: radical bipinnatifid

§ 2. *CALCITRAPA. Involucrum ciliated with spines.*

\* *Spines simple.*

- 12572 Invol. erect feathery, Head without a neutral ray, Lower lvs. pinnatif.: upper ones lin. All quite ent. Stem [paniced  
 12573 Invol. ciliate-spinous egg-shaped, Scales reflexed at tip, Lvs. hoary: root ones lyrate; stem ones linear  
 12574 Invol. ciliate-spinous at tip, Spines of lower scales reflex. Lvs. pinnat. Pinnæ lin. obt. Root leaves bipinnat.  
 12575 Invol. ciliate-spinous, Leaves lyrate-pinnated generally entire: terminal lobe large toothed  
 12576 Invol. ciliate-spinous, Stem-leaves pinnatifid: root ones bipinnatifid, Segments lanceolate  
 12577 Invol. ciliate-spinous, Stem-leaves pinnated: root leaves bipinnated, Pinnæ linear-filiform  
 12578 Invol. ciliate-spin. at tip, Stem-lvs. pinnatif. lin. lanc.: root ones bipinnatif. Segm. lanc. terminal 1-toothed  
 12579 Invol. ciliate fringed with straight rigid white bristles, Lvs. obl. a little toothed, Head yel. without a ray  
 12580 Invol. simply spinous, Spines spreading, Florets equal, Leaves hairy: lower ones pinnatifid  
 12581 Invol. bristly spinous, Leaves lanceolate petioled toothed near the base  
 12582 Invol. scarcely spinous somewhat awned rayed, Leaves pinnatifid  
 12583 Invol. ciliated spinous, Stem-leaves pinnated quite entire: root-leaves bipinnatifid  
 12584 Invol. ciliate spinous at the tip, Leaves hoary pinnatifid quite entire: upper ones linear-lanceolate  
 12585 Invol. ciliate subsipiny, Leaves oblong downy sessile somewhat toothed; narrowed at base deeply toothed

\*\* *Spines palmate.*

- 12586 Invol. palm.-spin. Spines reflex. Lvs. obl. smooth, embracing the stem  $\frac{1}{2}$  decurr. repand tooth. Teeth prickly  
 12587 Invol. palm.-spinous, Spines reflex. Lvs. obov. somew. tooth. stalked: floral somew. decurr. mucro.-toothed  
 12588 Inv. palm.-spin. Spines reflex. Lvs. obl. hoary embrac. stem  $\frac{1}{2}$  decurr. tooth. cut at base, Teeth rather prickly  
 12589 Invol. palm. spinous, Lvs. decurr. not prickly: root ones pinnatifid; terminal lobe very large  
 12590 Inv. palm. spin. Spines reflex. larger than calyx, Lvs. hoary obl. sess. decurr. pinnatifid, Teeth not prickly  
 12591 Invol. palmate spinous, Lvs. ovate-lanc. petioled toothed  
 12592 Invol. palmate spinous solitary sess. Lvs. lanc. a little embracing the stem pinnatifid toothed  
 12593 Invol. palmate spinous, Stem lvs. lanc. toothed decurrent: root lvs. lyrate obtuse  
 12594 Invol. palmate spinous, Spines 3 or 5, Lvs. lanc. sessile toothed  
 12595 Invol. ciliated surrounded by a whorl of long lvs. Lvs. lyrate toothed obtuse  
 12596 Invol. palmate spinous, Lvs. embracing the stem runcinate pinnatifid prickly: toothed root ones lyrate  
 12597 Invol. doubly spinous woolly bracteated, Leaves half decurrent toothed spinous  
 12598 Invol. palm. spinous term. solitary, Spines straight, Lvs. lanc. decurr. not prickly: root ones lyrate  
 12599 Invol. palm. spin. term. ones clustered sess. Spines straight, Lvs. lanc. scabrous decurr. not prickly: lower stem ones a little toothed; root ones sinuated  
 12600 Invol. palm. spinous solitary subsessile, Spines straight, Lvs. lanc. scabrous toothletted decurrent  
 12601 Inv. palm. spin. Spines spread. Lvs. scabr.: stem lvs. lanc. a little embrac. stem finely tooth.; root ones lyrate  
 12602 Invol. palm. spinous solit. Spines straight: inner scales scariosus at the tip, Lvs. downy lanc. decurr.: lower ones finely toothed pinnatifid at the base  
 12603 Invol. palmate spinous terminal sess. glomerated, Leaves petioled pinnatifid cut-toothed

\*\*\* *Appendages of involucrum spiny-pinnate.*

- 12604 Invol. doubly spinous woolly, Lvs. half decurrent entire and sinuated, Stem proliferous  
 12605 Invol. doubly spinous sess. Lvs. pinnatifid toothed, Stem divaricated spreading hairy  
 12606 Invol. somewhat doubly serrated, Lvs. embracing the stem lanc. undivided serrated [entire decurr.  
 12607 Inv. palm. spin.: mid. spine very long; lat. ones short, Root-lvs. sinuate-pinnatif. Stem ones lanc. quite  
 12608 Invol. doubly spinous somewhat woolly, Lvs. sess. lanc. entire and toothed, Stem proliferous

and Miscellaneous Particulars.

unconnected with differences of organization; they are therefore not adopted here. The tribe of Centaureæ of M. Cassini is not distinguished from Carduineæ by any very important characters. The greater part of the species are natives of Europe and Asia, several of Africa, a very few of America, and none of the southern parts of the world.

History, Use, Propagation, Culture,

*C. moschata* is a handsome border annual, of which there is a white-flowered variety. *C. Centaureum*, *montana*, *splendens*, and *glastifolia*, are among the most ornamental of the perennials.

1820. *Galactites*. A plant formerly included in *Centaurea*, and named on account of the milky veins of its leaves (*γλακτα*, milk).

1821. *Wedelia*. Named after George Wolfgang Wedel, a German, born in 1625, died in 1721. He was professor at Jena, and published many learned dissertations upon the plants of the ancients. There was also a John Adolphus Wedel, professor in the same university.

§ 3. *CROCODYLIUM*. *Involucrum not ciliated, but spiny at end.*

- 12609 Invol. globul. smth. Spine very small weak a little reflex. Lvs. lanc.serrat. : root ones lyrate, Stem divaricat.  
 12610 Invol. simply spinous villous, Lower lvs. lyrate toothed : upper ones lanc. Peduncles very long  
 12611 Invol. scarios simply spinous, Lvs. pinnatifid quite entire terminal : segm. larger toothed

§ 4. *RHAPONTICUM*. *Leaves of involucrum with a round scarios appendage, which is often lacerated.*

- 12619 Invol. scales lacerated, Lvs. ovate-obl. finely toothed tomentose [ones lyrate  
 12613 Invol. conical hard, Scales ending in a patulous point, Lvs. somew. tomentose decurr. undivided : root  
 12614 Inv. egg-shap. Scales mucronat. Lower lvs. bipinnatif. lin. : upper one pinnat. Pinnæ lin. sometimes toothed  
 12615 Invol. ciliated, Scales acum. somew. thorny, Lvs. obl. pinnatif. Florets of the ray longer than those of disk  
 12616 Invol. scarios, Scales dilated cut, Lvs. linear-lanc. : radical cut  
 12617 Scales of invol. scarios torn : lower ones pinnatifid, Lvs. lin. lanc. : the lower ones broader and toothed  
 12618 Invol. scales roundish quite ent. Lvs. obl. smth. : root ones serrat. Stem ones sometimes slightly cut at base  
 12619 Invol. scales entire mucronated, Lvs. pinnate toothed : stem ones linear toothed at the base  
 12620 Stems decumbent, Lvs. lanc. quite entire  
 12621 Invol. cylindrical, Scales mucronated, Lvs. pinnated, Pinnæ lin. mucronated quite entire  
 12622 Invol. scales egg-shaped obtuse ciliated, Lvs. downy on both sides pinnatif. and undivided, Stem declining  
 12623 Leaves undivided quite entire decurrent  
 12624 Invol. scales pectinate ciliated, Lvs. deeply pinnatifid, Segm. linear lanceolate [the stem decurrent  
 12625 Invol. conical, Scales quite ent. Lvs. coriaceous reticularly veined : root ones lyrate ; stem ones embracing  
 12626 Leaves lanc. toothed somewhat petioled, Peduncles filiform leafless

§ 5. *Leaves of involucrum neither ciliated, nor spiny, nor with a scarios appendage.*

- 12627 Invol. roundish smooth, Scales egg-shaped, Lvs. lyrate toothed  
 12628 Invol. scales egg-shaped, Lvs. pinnated, Leaflets decurrent serrated  
 12629 Invol. scales egg-shap. obt. Lvs. pinnat. smooth, Leaf. cartilagin. sharply serrat. termin. one obl. egg-shaped  
 12630 Invol. round. smooth, Lower lvs. broad somew. spatul. tooth. : upp. ones lyr. at base, Head yell. sweet-scent.  
 12631 Invol. scales linear awl-shaped, Leaves pinnated serrated  
 12632 Invol. scales mucronate, Leaves somewhat decurrent lyrate toothed  
 12633 Invol. pubescent, Scales roundish obtuse, Leaves deeply pinnatifid : lowest segments toothed  
 12634 Invol. scales egg-shaped obtuse, Leaves pinnated smooth quite entire old one serrated

- 12635 Invol. bristly spinous, Leaves decurrent sinuated spinous downy underneath.

## NECESSARIA.

- 12636 Leaves lanceolate acuminate serrated with a large tooth on each side at the base  
 12637 Leaves ovate-lanceolate, Invol. urceolate squarrose, Rays imbricated  
 12638 Stem herbaceous, Leaves rhomboid narrowed at base connate

- 12639 Leaves stalked roundish-ovate narrowed at base : floral subcordate, Pedunc. terminal dichotomous  
 12640 Leaves stalked oblong ovate ciliated, Pedunc. terminal aggregate

- 12641 Stem winged, Heads pale-yellow small

- 12642 Radical and cauline leaves pinnatifid, Stem hirsute  
 12643 Cauline leaves sinuate pinnatifid : radical ternate sinuate multifid  
 12644 Leaves alternate ovate serrated scabrous : radical cordate  
 12645 Leaves opposite deltoid stalked perfoliate, Stem square smooth  
 12646 Lvs. opp. conn. unequally toothed, Stem smooth square, Four outer sc. of invol. longer than the inner  
 12647 Leaves sessile stalked, Stem round scabrous  
 12648 Leaves opposite or alternate sessile oblong hairy : lower serrate, Stem round hispid  
 12649 Stems 6-angled, Leaves ternate ovate toothed, Panicle trichotomous  
 12650 Stems round, Leaves ternate somewhat toothletted, Panicle dichotomous  
 12651 Stems round, Leaves about 4 toothletted, Panicle dichotomous

## and Miscellaneous Particulars.

1822. *Millertia*. So named by Linnæus, after Philip Miller, F. R. S., the well known author of the Gardener's Dictionary, and considered the first botanical gardener of his time. He was born in 1692, and died in 1769.

1823. *Baltimora*. This plant grows in the neighbourhood of Baltimore.

1824. *Silphium*. D'Herbelot asserts, that *silphi* or *serpi*, was a name given by the natives of Africa to the plant which produced the *laser* of the Romans, a substance held in great esteem among them for its flavor and its medicinal properties. All the species are tall herbaceous plants with bright yellow flowers, and are very proper ornaments for a shrubbery.

History, Use, Propagation, Culture.

1825. *Trixis*. From *τριξίς*, three, on account of its triangular capsule with three cells.

1826. *Polymnia*. *Polymnia* was the name of one of the Muses. Why it has been applied to this plant is not very obvious. A coarse broad-leaved weedy plant.

1827. *Chrysogonum*. From *χρῆσος*, gold, and *γόνυ*, a knee. The bright yellow flowers are usually produced in the bends of the stems.

1828. *Melampodium*. One of the Greek names of black hellebore, with which the modern plant has no relation. The plant of the ancients was probably named from the blackness of the roots, (*μελας*, black, and *πυρ*, a foot).

1829. *Chaptalia*. Dedicated by Ventenat to the famous French chemist, M. Chaptal. A pretty little North American herbaceous plant.

1830. *Calendula*. So named because it may be found in flower during the *Calends* of each month, or, which is the same thing, during every month in the year. *C. pluvialis* has been named from its flowers closing at the approach of rain.

- 12652 Herbaceous downy, Leaves sinuate pinnatifid toothed : cauline amplexicaul.
- 12653 Leaves toothletted acuminate : lower pinnatifid ; upper 3-lobed or entire  
 12654 Leaves 3-lobed acute running down the petiole : lobes angular sinuated  
 12655 Leaves opposite sessile oblong lanceolate somewhat toothed, Invol. 5-parted, Florets all female
- 12656 Leafstalks longer than leaves
- 12657 Stem erect, Leaves somewhat linear 1-toothed on each side  
 12658 Stem erect, Leaves lyrate-toothed sessile
- 12659 Leaves ovate-oblong entire silvery beneath, Scape naked 1-headed, Head nodding
- 12660 Pericarps cymbiform mucricated incurved : outer lanceolate-subulate mucricated at back  
 12661 Pericarps cymbiform mucricated incurved : outer ovate with a membranous edge toothed crested at back  
 12662 Pericarps cymbiform incurved mucricated : outer 5 ovate-lanceolate membranous toothed at edge  
 12663 Pericarps cymbiform all incurved mucricated
- 12664 Pericarps urceolate obovate smooth, Involucre somewhat mucricated  
 12665 Pericarps cymbiform smooth : outer subulate erect somew. mucricat. Lvs. obl. spatul. downy on each side  
 12666 Leaves narrow lanceolate sinuate toothletted, Stem leafy, Peduncles filiform  
 12667 Leaves oblong lanceolate blunt toothed, Stem leafy, Peduncles thickened at end  
 12668 Leaves lanceolate sinuate toothed, Stem nearly naked  
 12669 Leaves linear nearly entire, Stem nearly naked  
 12670 Leaves linear somewhat toothletted mucricate dotted beneath, Pericarps orbicular, Stem suffruticose
- 12671 Leaves cuneate cut toothed glabrous, Invol. downy ciliated, Stem shrubby weak  
 12672 Leaves opposite linear entire somewhat fleshy smooth  
 12673 Leaves obovate somewhat toothed, Stem fruticose decumbent  
 12674 Leaves obovate sublyrate roughish, Stem suffruticose erect  
 12675 Lvs. obl. toothed scarious, Invol. in fruit cernuous, Pericarps nearly orbicular, Stem fruticose panicled  
 12676 Peric. cymbif. incurv. mucricat. : outer lanc. subulate mucricated erect, Lvs. obl. spatul. downy on each side  
 12677 Pericarps all uniform incurved cymbiform mucricated, Leaves lanceolate toothletted acute smoothish  
 12678 Leaves oblong papillose scarious : lower toothed ; upper entire, Stem shrubby
- 12679 Radiant florets fertile, Stem very short decumbent, Leaves hoary on each side ternate lyrate  
 12680 Radiant florets fertile, Leaves downy beneath ovate entire or lyrate-toothed, Scape furrowed 1-headed  
 12681 Radiant florets fertile, Leaves downy beneath wavy-toothed ovate or lyrate, Scapes 1-headed  
 12682 Leaves pinnatifid toothletted cobwebbed 3-nerved  
 12683 Radiant florets fertile, Leaves hoary pinnatifid repand somewhat toothed, Outer scales of invol. reflexed  
 12684 Radiant florets fertile, Leaves lanceolate ovate nerved toothletted amplexicaul.  
 12685 Radiant florets fertile, Leaves lanceolate linear entire downy  
 12686 Radiant florets fertile, Stem procumbent, Leaves spatulate-lanceolate repand-toothed hoary  
 12687 Radiant florets fertile, Stem procum. Leaves obl. lanc. unequally toothed hoary downy beneath 3-nerved  
 12688 Radiant florets fertile, Stem branched ascending, Leaves downy spatulate lanceolate 3-nerved pubescent  
 12689 Radiant florets fertile, Stem branched ascending, Leaves spatulate lanceolate entire 3-nerved downy  
 12690 Radiant florets fertile, Stem shrubby, Leaves hairy oblong undivided somewhat toothed  
 12691 Radiant florets fertile, Stem shrubby erect hoary, Lvs. obov. oblong vill. toothed decurr. down the petiole  
 12692 Radiant florets fertile, Stem ascend. Lvs. hairy hoary beneath : lower lyrate-toothed ; upper lanc. tooth.  
 12693 Radiant florets fertile, Stem snow white, Leaves lyrate amplexicaul. downy toothed : term. lobe rhomb.  
 12694 Radiant florets fertile, Stem erect, Leaves hairy oblong toothed, Outer scales of invol. reflexed ciliated

and Miscellaneous Particulars.

C. officinalis, *Souci du jardin*, Fr., *Goldblume*, Ger., and *Furrancio*, Ital., has been a garden plant time out of mind, and used in soups and broths, both to color them, and as comforters of the heart and spirits. It had formerly many virtues ascribed to it, but is now totally out of use in this country. According to Linnæus, the flowers are open from nine in the morning till three in the afternoon. There are double, lemon-colored, and prolific varieties. From the flowers of *Calendula officinalis* is obtained a distilled water, a kind of vinegar, and a conserve.

With this genus for his type, M. Cassini has formed a small tribe which he calls *Calenduleæ*, remarkable for a peculiar smell, very perceptible in the common pot-marygold, which is said to be confined to themselves alone. But this seems to be almost the only character by which they are distinguished from *Helianthes*. The greater part of *Calenduleæ* are found in the country of the Cape of Good Hope ; but some are found in Europe and Asia.

1831. *Arctotis*. Vaillant, who named this genus, called it *Arctothea*, from *αρκτος*, a bear, and *θηνη*, a capsule, because its fruit is shaggy like a bear. This and some neighbouring genera have given rise to M.

History, Use, Propagation, Culture,

Cassini's tribe of Arctotideæ, which has the remarkable peculiarity of occasionally producing an ovary with three cells. In the peculiarities of their style they approach the tribes of Echinopseæ, Carduineæ, Centaureæ, and Carlineæ. They are entirely confined to the regions of the Cape of Good Hope.

1832. *Osteospermum*. From *ostion*, a bone, and *σπερμα*, seed, in allusion to the hardness of the fruit.  
 1833. *Othonna*. Dioscorides mentions this name as being applied to various things, but especially to a plant with a leaf like rocket, but perforated with little holes, whence it was called *Othonna*, from *ὄθον*, linen. The plant of the ancients can have had little affinity with that of the moderns.

1834. *Hippia*. A name applied by Cordus to the common Chickweed, because it was agreeable food for

12695 Radiant florets fertile, Stem erect, Leaves hoary viscid oblong amplexicaul. mucronate-toothed  
 12696 Radiant florets fertile, Leaves pinnatifid lyrate angular toothed downy beneath  
 12697 Radiant florets fertile, Stem erect, Leaves pinnatifid scabrous downy beneath revolute at edge  
 12698 Radiant florets fertile, Outer scales of invol. reflexed cuneate obl. with a broad short point somew. cobw.  
 12699 Radiant florets fertile, Stem erect, Leaves pinnatifid lyrate hoary downy beneath. Invol. imbricated  
 12700 Stemless, Leaves lyrate pinnatifid hoary beneath 3-nerved, Outer scales of invol. linear recurved  
 12701 Radi. flor. fertile, Stem erect, Branches downy hairy, Lvs. pinnatif. downy ben. : seg. lin. lanc. angul. downy  
 12702 Radiant florets fertile, Stem erect, Pedunc. hairy, Lvs. pinnatif. hoary downy ben. : seg. lanc. angul. toothed  
 12703 Radiant florets fertile, Stem erect, Leaves downy beneath : segm. linear subpinnatifid wavy  
 12704 Radiant florets fertile, Leaves hoary downy long-stalked pinnatifid : segm. lanceolate blunt toothed

12705 Leaves lanceolate glabrous, Heads panicled  
 12706 Leaves obovate serrate downy, Spines branched  
 12707 Leaves lanceolate pinnatifid-toothed scabrous, Spines branched  
 12708 Leaves lanceolate mucronate somewhat stalked smooth serrated, Branches toothletted angular  
 12709 Leaves obovate serrated stalked subdecurrent  
 12710 Leaves oblong toothed-angular scabrous  $\frac{1}{2}$ -amplexicaul. Branches furrowed  
 12711 Leaves toothed pinnatifid hairy, Branches unarmed  
 12712 Leaves pinnatifid smooth, Segments lanceolate unequally serrated  
 12713 Leaves lanceolate scattered decurrent smooth entire, Axillæ woolly

12714 Leaves pinnatifid : pinnæ lanceolate entire decurrent  
 12715 Leaves pectinate-pinnatifid downy : segm. linear toothed at the edge  
 12716 Leaves pinnate filiform, Invol. hemispherical many-toothed  
 12717 Leaves multifold pinnated linear, Joints of stem villous  
 12718 Leaves lanceolate 1-toothed on each side in the middle or entire, Peduncles axillary, Stem divaricating  
 12719 Lower leaves lanceolate entire : upper sinuate toothed  
 12720 Leaves lanceolate 3-nerved entire, Stem suffruticose creeping  
 12721 Leaves deeply pinnatifid glabrous : segments linear somewhat toothed, Stem herbaceous  
 12722 Leaves pinnatifid very small, Peduncles long slender axillary 1-headed, Ray longer than disk  
 12723 Leaves lanceolate entire somewhat fleshy, Stem erect  
 12724 Leaves oblong toothletted smooth narrowed at base amplexicaul. Heads panicled  
 12725 Radical leaves ovate angular toothed : cauline lanceolate entire  
 12726 Leaves entire : radical lanceolate ; cauline lanceolate subcordate  $\frac{1}{2}$ -amplexicaul. Stem erect  
 12727 Leaves entire : radical cordate ; cauline ovate-lanceol. cordate at base amplexicaul. Stem flaccid filiform  
 12728 Leaves ovate somewhat toothed, Peduncles 1-headed very long  
 12729 Root tuberosus, Leaves amplexicaul. Peduncles 1-headed  
 12730 Leaves lanceolate smooth amplexicaul. Heads panicled  
 12731 Stem dichotomous imbricated : leaflets acerose, Peduncle very long solitary in the divarications  
 12732 Leaves filiform fleshy, Stem shrubby  
 12733 Leaves oblong entire, Stem arborescent fleshy with woolly scars  
 12734 Fleshy naked smooth a span high, Leaves fascicled obovate sessile, Peduncle 1-headed

12735 Shrubby villous, Leaves pinnatifid, Heads corymbose  
 12736 Hispid erect, Leaves ovate serrated 5-nerved, Racemes terminal

12737 Leaves pinnated : leaflets linear many-times lobed acute, Pericarps cuneiform hairy

12738 The only species

12739 Leaves entire and divided, Heads corymbose  
 12740 Leaves linear silky

12741 Stem erect prolifer. at summit, Lvs. lanc. downy acute, Fls. capitate in the axils of branches and terminal  
 12742 Stem erect dichotom. Lvs. lin. acum. downy, Fls. crowded axil. and term. Clust. much shorter than leaves  
 12743 Stem erect subdichotomous, Leaves lanceolate spatulate downy, Flowers clustered axillary and terminal

and Miscellaneous Particulars.

horses, *isnos*, a horse ; and given to this plant by Linnæus for no reason whatever. Little plants resembling Tansy.

1835. *Soliva*. Named by the authors of the Flora Peruviana, after Salvator Soliva, a Spanish physician and botanist.

1836. *Psiadia*. From *ψια*, a drop of dew, in allusion to the dew-bespangled foliage of the plants.

1837. *Eriocephalus*. From *ειω*, wool, and *κεφαλη*, a head, on account of the woolly grains collected in terminal heads.

1838. *Fuago*. All the parts of these plants are covered with delicate threads or *fila*.

History, Use, Propagation, Culture,

1839. *Micropus*. From *μικρος*, small, and *πους*, a foot; so called with reference to *Leontopodium* (which see), than which it is smaller, but which it resembles in its velvety silvery leaves.

1840. *Parthenium*. The Greek name of the *Matricaria*, which see. The indecent derivation of the word *Hysterophorus*, is sufficiently explained by Vaillant. (*Mem. Acad. Sciences, anno 1720.*)

1841. *Iva*. This name, according to Fuchsius, is a mere abbreviation of *abiga*; see *Ajuga*. It has been applied by Linnæus to these plants because their smell resembles that of the ancient *Iva*.

1842. *Acicarpha*. From *ακκις*, a point, and *καρφος*, a palea, because that appendage is spiny.

1843. *Elephantopus*. It is said that some resemblance may be found between the radical leaves of this plant and an elephant's foot (*αλεφας*, an elephant, and *πους*, a foot).

1844. *Cedera*. After George Eder, a Dane, professor of botany at Copenhagen, and the founder of the extensive *Flora Danica*.

1845. *Flaveria*. From *flavus*, yellow, because the plants are used in Chili for dyeing of that color.

- 12744 Stem erect subdichotomous, Lvs. lin. lanc. appressed downy, Flowers clustered axillary and terminal  
 12745 Stem erect branch. Branch. sprdg. Lvs. lanc. acute cottony, Fls. conic. clust. lat. term. Clust. longer than lvs.

- 12757 Leaves opposite obovate cuneate  
 12758 Leaves alternate lanceolate, Heads woolly

- 12759 Leaves bipinnatifid  
 12760 Leaves undivided oblong toothed

- 12761 Leaves lanceolate-ovate, Bracts lanceolate and petioles downy  
 12762 Leaves lanceolate dotted scabrous deeply serrated, Stem shrubby

- 12763 Leaves spatulate

SEGREGATA.

- 12764 Leaves scabrous : radical narrowed at base ; cauline lanceolate, Stem branched strigose  
 12765 Radical and cauline leaves oblong narrowed at base somewhat hairy, Stem simple hairy  
 12766 Leaves ovate downy

- 12767 Leaves lanceolate serrated reflexed

- 12768 Leaves somewhat stalked lanceolate 3-nerved mucronate-serrate

- 12769 Leaves mucronate subulate reflexed, Stem erect  
 12770 Leaves linear subulate oblique, Spike cylindrical

- 12771 The only species

- 12772 Leaves lanceolate-linear smooth glandular beneath, Corymbs decompound  
 12773 Panicle decompound, Leaves lanceolate decurrent with their under surface and the branches woolly  
 12774 Corymb nearly sessile, Leaves small linear white beneath

- 12775 Leaves lanceolate serrate decurrent glabrous, Peduncles winged, Wings of stem and peduncles serrated  
 12776 Leaves decurrent ovate serrated, Peduncles rounded  
 12777 Leaves obovate serrated hairy decurrent, Peduncles winged, Wings of stem and peduncles serrated

and Miscellaneous Particulars.

1846. *Stæbe*. The name under which Theophrastus and Pliny designate a plant of a rough and spiny habit. This is the character of the modern plant, which is very dissimilar to that of the ancients, which is believed to have been *Poterium spinosum*.

1847. *Naumburgia*. Named by Willdenow without explanation ; but we presume in honor of John Samuel Naumburg, author of a Dissertation upon *Veronica Chamædrys*, &c., published at Erfurt in 1792.

1848. *Cassinia*. Named after M. Henri Cassini, a celebrated French botanist, who has devoted much attention to the study of the very difficult tribe of plants to which this belongs, and with singular success. But his observations are scattered through so many different works, that it is almost hopeless to acquire a knowledge of their actual extent. Neat New Holland shrubs with white or yellow flowers.

1849. *Sphaeranthus*. From *σφαῖρα*, a globe, and *ανθος*, a flower, on account of the globular form of the heads of flowers.

History, Use, Propagation, Culture,

1850. *Echinops*. From *εχινος*, a hedgehog, and *opsis*, resemblance; because of the bristly round heads of flowers protected in every direction by stiff spines. The woolly leaves of *Echinops strigosus* are employed in Spain as tinder. Upon this genus M. Cassini has founded his tribe of *Echinopseae*, which it must be confessed is entirely distinct from any other, and extremely remarkable on account of its very singular aberrations from the ordinary structure of *Compositae*.

1851. *Rolandra*. After Daniel Rolander, a pupil of Linnæus, who visited Surinam. Nothing appeared from him except an account of *Doliciocarpus* in the seventeenth volume of the Transactions of the Academy of Sciences of Stockholm.

- 12778 Leaves pinnatifid downy above woolly beneath, Stem branched  
 12779 Heads scattered with long spines  
 12780 Head globose, Leaves pinnatifid smooth above  
 12781 Heads fascicled, Lateral invol. sterile, Leaves strigose on the upper side  
 12782 Stem branched woolly, Leaves subbipinnate: segments narrow smooth above, Head sessile  
 12783 Leaves rugose squarrose pinnatifid smooth above glaucous with down beneath  
 12784 Stem simple upright 1-headed, Leaves eroded pinnatifid spiny-toothed smooth above downy beneath

12785 The only species

12786 Heads corymbose numerous

12787 Leaves long and spiny

12788 The only species

and Miscellaneous Particulars.

1852. *Brotera*. Named after Felix Avelhar Brotero, a Portuguese botanist, professor at Coimbra; author of a useful *Flora Lusitanica*.

1853. *Gundelia*. Named after Andrew Gundelsheimer, a German botanist, who accompanied Tournefort in his journey into the Levant in 1709.

1854. *Euxenia*. A name unexplained by its author. Apparently derived from *εὐξενος*, hospitable, but in what sense we do not perceive.

## CLASS XX. — GYNANDRIA.

THE singular plants which constitute this class are distinguished from all others by the anomalous structure of their flowers. These do not, as is usually the case, contain a certain number of stamens surrounding a central ovarium or style, but on the contrary are furnished with a solitary fleshy undivided process, round which the sepals radiate, and which supplies the place of stamens and style. The nature of this process has been variously explained: the modern opinion is that it is formed by the accretion of the stamens and style into a single mass, and this opinion seems to be confirmed by analysis and analogy. Omitting, therefore, a notice of such theories respecting its nature as are opposed to that which is now received as the most correct, it will suffice to explain a little in detail, the opinion which is adopted in this work. The central process, called the columna or column, is understood to be formed by the filaments of three stamens surrounding a style, and by mutual accretion firmly united with it and with each other into a solid mass. Of these three stamens, it most frequently happens that the two lateral are sterile, and not furnished with even the vestige of an anther; and that their presence is not indicated by more than two irregular excrescences, as in *Orchis*, or by the same number of small appendages, as in *Satyrrium*, or by two horn-like or tooth-like processes, present in several of the genera with waxy pollen-masses: it even happens, and not infrequently, that no vestige whatever of them remains. But in *Cypripedium* both are fertile and bear perfect anthers, while the central stamen is barren and foliaceous. When the lateral stamens are, as above stated, abortive, which is the most common form of the columna, the central stamen bears at its upper extremity an anther, which is either moveable or fixed firmly in its place. The pollen which this contains, assumes three very distinct appearances in different tribes. It is either granular, dividing into many separable small pieces, as in *Orchis*; or powdery, consisting of an infinite number of granules, as in *Spiranthes*; or waxy, when it consists of a few large concrete masses, as in *Epidendrum*. The stigma is most frequently concave, and placed nearly under the anther, but in such a manner, that there is no contact between it and the pollen. In what way, therefore, fecundation can take place among truly Gynandrous plants, is one of those mysterious contrivances of nature which has not yet been explained. It is generally believed to take place by absorption in some undiscovered manner, before the flowers expand; but it is extremely difficult to understand how this can occur in many genera. The foregoing remarks apply only to the tribe of plants called Orchidoceus. The few genera attached to the latter part of the class are Gynandrous by the cohesion indeed of their stamens and style, but in a much more obvious manner.

Gynandrous plants are among the most interesting of the vegetable productions of the globe, whether we consider the vivacity of their colors, or the singularity of their organization, or the grotesque appearance of their tortuous roots, or the delicious perfume of their flowers. They are distributed in abundance over all the earth. In Europe and the temperate parts of the world, they are principally found in meadows and pastures among grass; but in tropical regions they often constitute the chief beauty of the forest, occupying the forked branches of living trees, or the prostrate trunks of fallen timber, over which, in company with ferns and parasitical Aroidæ, they climb and trail in every direction, until they adorn the one with bright hues and rich odours foreign to their nature, and render the others more beautiful in death, than in the full vigour of their existence.

## Order 1. MONANDRIA.

## Stamen 1.

§ 1. *Anther terminal, erect. Pollen granular, cohering by an elastic thread.*

1855. *Disa*. Flowers ringent: helmet with a spur or bag at the base. Inner sepals united to the column. Lip without a spur.

1856. *Satyrrium*. Flower ringent: five anterior sepals united at base. Lip behind, fornicate with two spurs or bags at the base. Anther resupinate. Stigma 2-lipped.

1857. *Platanthera*. Flower vaulted. Lip entire with a spur. Cells of the anther widely divided at their base by the broad interposed stigma. Glands of pollen masses naked. Lips of stigma absent.

1858. *Gymnadenia*. Cor. ringent. Lip spurred at the base beneath. Glands of the stalks of the pollen-mass naked, approximate.

1859. *Orchis*. Cor. ringent. Lip spurred on the underside at the base. Glands of the stalks of the pollen-mass (1-2) contained in one common little pouch.

1860. *Nigritella*. Ovary straight. Flower spreading. Lip posterior, entire, with a scrotiform spur. Glands of pollen-masses distinct, and enclosed in a single 2-celled pouch.

1861. *Habenaria*. Cor. ringent. Lip spurred on the upper side at the base beneath. Glands of the stalk of the pollen-mass naked, distinct, with the cells of the footstalks adnate or separated.

1862. *Bartholina*. Flower ringent: inner sepals united below with the lip. Lip spurred beneath at the base. Stalks of the pollen-masses long; cells united to the column: glands distinct, half covered by the exterior lobe.

1863. *Glossula*. Sepals conniving in a galea: the upper without a spur. Lip anterior, spurred, 3-parted, with an inflated spur. Pollen-masses 2, 2-parted, with 2 glands inclosed in distinct pouches.

1864. *Anacamptis*. The flower of *Orchis*, from which it differs in having the gland of the pollen-masses single, with inflexed edges, and enclosed in a pouch.

1865. *Aceras*. Flower ringent. Lip without a spur. Glands of the pollen-masses included in a common pouch.

1866. *Ophrys*. Flower somewhat spreading. Lip without a spur. Glands of the pollen-masses inclosed in two distinct pouches.

1867. *Chamorchis*. Ovary reclinate at end. Flower galeate. Lip without a spur, undivided. Glands of the pollen-masses naked. Upper lip of stigma divided. Anther of *Orchis*.

1868. *Herminium*. Flower somewhat spreading. Lip without a spur. Glands of the pollen-masses naked, distinct.

1869. *Serapias*. Flower ringent. Lip without a spur. Column sharp-pointed. Pollen-masses attached to a single gland inclosed in one pouch.

§ 2. *Anther parallel with stigma. Pollen powdery.*

1870. *Goodyera*. Cor. ringent, with the 2 exterior or lateral segments of the perianth placed beneath the lip, which is gibbous at the base and undivided at the extremity. Column free. Pollen angular.

1871. *Diuris*. Flower irregular. Two outer linear sepals placed beneath the trifold lip: the inner clawed and spreading. Column with the lateral lobes petaloid. Pollen farinaceous.

1872. *Ponthieva*. Flower irregular. Lip behind, with the inner sepals inserted in the column. Pollen farinaceous.

1873. *Neottia*. Flowers connivent. Lip sessile, 2-lobed, with no calli. Anther terminal, sessile. Stigma 2-lipped perversus; the front lip thickened.

1874. *Spiranthes*. Spike spiral. Ovary oblique at the end. Sepals connivent. Lip clawed, parallel with columna, with 2 calli at the base, entire. Anther terminal stalked. Stigma flat, cuspidate, membranous, finally split.

1875. *Stenorkhynchus*. Like the last; but the lip adheres to the columna by means of the margins of its lateral lobes: it has no callosities. Stigma corneous, always entire.

1876. *Listera*. Flowers connivent. Lip 2-lobed, sessile, with no calli. Anther intramarginal, half covered over by the hooded clinandrium. Stigma closed, nearly flat, with a strong transverse furrow.

§ 3. *Anther terminal, persistent. Pollen powdery.*

1877. *Arethusa*. Lip united at base with the columna, at the end hooded, in the inside crested. Sepals 5, united at base. Pollen angular.

1878. *Calopogon*. Lip at the back clawed, with a bearded inside. Sepals 5, distinct. Column separate. Pollen angular.

1879. *Pogonia*. Lip sessile, hooded, crested inside. Sepals 5, distinct, without glands. Pollen farinaceous.

1880. *Epipactis*. Lip ventricose below: the extremity either undivided or 3-lobed: the middle lobe the largest, connected as it were by a joint. Pollen farinaceous.

1881. *Caleana*. Lip unguiculate, placed at the back, with a pettate hollow lamina, having a perforation on the outside. Pollen farinaceous.

1882. *Corallorhiza*. Lip produced behind, adnate with the spur or free. Column free. Masses of pollen 4, oblique, not parallel.

§ 4. *Anther terminal, opercular deciduous. Pollen waxy.*

1883. *Rodriguezia*. Perianth. 4-leaved ringent. Lip entire, unguiculate cornute at base; callous in the middle. Pollen-masses 2, with an elastic caudicula. Stigma with 2 horns.

1884. *Gomora*. Like the last, but lip not cornute at base.

1885. *Cymbidium*. Lip not spurred, concave, jointed with the simple base of the columna. Sepals spreading, distinct. Pollen masses 2, 2-lobed behind.

1885. *Brassia*. Lip expanded, undivided. Sepals spreading, distinct. Column not winged. Pollen-masses 2, 2-lobed behind; fixed by the middle to a common process of the stigma.

1887. *Lissochilus*. Pollen-masses 2, obliquely 2-lobed. Lip saccate at base, sessile, undivided, convex at the base, united with the apterous toothless column. Inner sepals divaricating, petaloid; outer reflexed, calycine.

1888. *Geodorum*. Lip cucullate-ventricose, sometimes spurred at base, sessile, not jointed with the column. Sepals like the lip, 1-sided. Pollen-masses 2, lobed at back.

1889. *Catasetum*. Perianth, not inverted, generally globose. Lip saccate, concave, different from the sepals. Pollen-masses 2, 2-lobed behind, inserted on a large naked transverse caudicula, which finally separates with elasticity.

1890. *Trizeuxis*. Perianth 2-parted; upper segment 2-lobed; lower 3-parted, inflated. Lip parallel with columna, with a recurved dilated limb. Stigma excavated. Anther 1-celled, fleshy. Pollen-masses 2, adhering to a fusiform caudicula.

1891. *Xylobium*. Perianth. spreading. Lip behind jointed, with an unguiform process of the columna, 3-lobed, incumbent on columna. Outer lateral sepals united by their bases, with the process of columna. Pollen-masses 2, furrowed on one side, seated on a broad caudicula.

1892. *Maxillaria*. Perianth. spreading. Lip in front 3-lobed, jointed with the unguiform process of the columna. Lateral outer sepals united by their bases with the process of columna. Pollen-masses 2, bipartite, united by their bases to a common gland.

1893. *Notylia*. Perianth. 4-leaved: upper sepals spreading. Lip divaricating entire. Columna acuminate. Pollen-masses 2, entire. Anther posterior, not terminal.

1894. *Pleurothallis*. Lip jointed with the simple or slightly lengthened base of columna. The two anterior sepals united at base. Pollen-masses 2, not furrowed.

1895. *Oncidium*. Lip expanded, lobed, tubercled at base. Petals spreading, sometimes only 4. Column winged. Pollen-masses 2, 2-lobed behind, fixed by the middle to the common process of the stigma.

1896. *Cystodilium*. Sepals 5, distinct. Lip 3-lobed, connected with a joint with the unguiform process of the base of the apterous column. Pollen-masses 2, 2-lobed behind.

1897. *Caelogyne*. Perianth. resupinate, spreading. Lip 3-lobed, cucullate, jointed with columna. Column winged. Anther lateral, 2-celled. Pollen-masses 2, 2-parted. Stigma funnel-shaped, 2-lipped.

1898. *Macradenia*. Lip sessile, cucullate, concave, undivided, acuminate. Sepals distinct, spreading. Column distinct, with the lobes of its end conniving. Pollen-masses 2, unfurrowed, seated on a long filiform caudicula.

1899. *Dendrobium*. Lip without a spur, jointed with the unguiform process of the columna, to whose edges the anterior sepals adhere. Pollen-masses 4, parallel.

1900. *Anisopetalum*. Flowers erect. Sepals conniving. The two lateral exterior large, cohering at end: two inner very small subulate. Lip oblong, with 2 teeth near the base. Pollen-masses 4, without gland or caudicula.

1901. *Camaridium*. Perianth. resupinate, expanded. Sepals distinct. Lip distinct, sessile, cucullate, 3-lobed. Column round. Stigma arched. Pollen-masses 4, parallel, compressed, without a caudicula at the time of expansion.

1902. *Ornithidium*. Lip sessile, hooded, connate with the base of columna. Sepals conniving. Pollen-masses 4, oblique, furrowed at base.

1903. *Isochilus*. Lip almost of the same shape as the distinct, connivent, sepals. Pollen-masses 4, parallel.

1904. *Pholidota*. Flowers resupinate. Sepals uniform; the three outer erect, keeled at back. Lip ventricose. Column dilated at end. Anther 2-celled. Pollen masses 4, each pair having a gland.

1905. *Broughtonia*. Column distinct, or at the very base united with the unguiculate lip, which is lengthened at the base into a tube, connate with the ovarium. Pollen-masses 4, parallel, with a granular caudicula reflexed upon the masses.

1906. *Cattleya*. Sepals spreading. Lip sessile, cucullate, surrounding the half round column. Pollen-masses 4, with as many powdery reflexed caudiculae.

1907. *Epidendrum*. Column united with the claw of the lip, and forming a tube which sometimes runs down the ovarium. Pollen-masses 4, with as many powdery reflexed caudiculae.

1908. *Polystachya*. Perianth. not inverted, cuneate, closed. Pollen-masses 4, placed on a simple naked caudicula with a gland.

1909. *Cryptarrhena*. Sepals 5, distinct, spreading. Lip not spurred, with a dilated flat lamina. Column distinct, not winged. Anther enclosed in the cucullate head of the columna. Pollen-masses 4.

1910. *Ornithocephalus*. Flowers resupinate. Lip stalked. Sepals nearly equal; the two upper finally reflexed. Column short, with a very long beak. Pollen-masses 4, adhering to a very long glandular caudicula.

1911. *Bletia*. Lip sessile, cucullate; sometimes spurred at the base. Sepals 5, distinct. Column separate. Pollen-masses 8 or 4, 2-lobed.

1912. *Eria*. Perianthium woolly, conniving or expanded. Lip 3-lobed, jointed with an unguiform process of the columna to whose sides the anterior sepals are united. Pollen-masses 8, cohering at the end by means of a powdery substance.

1913. *Ocoteima*. Lip jointed with an unguiform process, to the edges of which the anterior sepals adhere. Pollen-masses 8.

1914. *Brassavola*. Lip with a simple claw, undivided. Sepals distinct, spreading. Pollen-masses 8 or more.

1915. *Sarcanthus*. Lip fleshy, entire, calcarate; the spur furnished with various appendages in the interior. Sepals spreading equally. Pollen-masses 2, seated on an elastic caudicula.
1916. *Vanda*. Lip saccate, continuous with the simple base of the apterous column, trifold, with the middle lobe fleshy. Sepals spreading, distinct. Pollen-masses 2, obliquely 2-lobed, attached to an elastic caudicula.
1917. *Aerides*. Lip spurred or saccate, inserted at the end of the unguiform process, to whose edges the anterior sepals are united. Pollen-masses 2, two-lobed behind, fixed by a common process to the middle of the stigma.
1918. *Renanthera*. Like the last, but sepals very long and spreading, and lip only a little saccate at base.
1919. *Ionopsis*. Sepals connivent, the anterior placed under the labellum. Lip spurred at base. Pollen-masses 2.
1920. *Eulophia*. Sepals 5, distinct, uniform, ascending, spreading. Lip spurred at base, with a sessile crested lamina, 3-lobed. Pollen-masses 2, two-lobed, with a posterior lobe attached to an elastic caudicula.
1921. *Angraecum*. Sepals conniving, galeate. Lip spurred 3-lobed, jointed with column. Pollen-masses 2. Stigma concave, transverse.
1922. *Aeranthes*. Lip spurred, membranous, entire, jointed with an unguiform process of the column, to which the two front sepals are adherent. Pollen-masses 2, hollow, perforated on one side, with no caudicula, and two glands.
1923. *Calanthe*. Lip spurred, lobed, united with the columna. Perianth. spreading. Pollen-masses 8.
1924. *Stelis*. Lip of the same form as the inner dwarf vaulted sepals. Three outer sepals united at base. Pollen-masses 2.
1925. *Malaxis*. Lip flat, expanded, regularly vertical. Column round. Pollen-masses 4, loose.
1926. *Prescotia*. Perianth. spreading. Two upper sepals connate at base. Lip behind, erect, fleshy, cuculate, entire, embracing the very minute column. Pollen-masses 2, twin, granular, united by the end to a gland.
1927. *Microstylis*. Lip flat, sagittate, or deeply cordate. Column very small, round. Pollen-masses 4, loose.

History, Use, Propagation, Culture,

1855. *Disa*. A name of unknown meaning, adopted by Linnæus from Bergius. Beautiful Cape herbaceous plants, with flowers of various colors, either growing singly, or in long spikes. *Disa cornuta* produces a spike, often a foot or a foot and a half long. *D. grandiflora* has large, nearly solitary flowers, of a brilliant scarlet color. The species are cultivated without difficulty in a stove or in a greenhouse, if the roots are planted in light sandy peat, mixed with a very little loam, and not overwatered. The same treatment is suitable to the other tender tuberous or fibrous-rooted *Orchideæ*.

1856. *Satyrium*. The aphrodisiacal properties of *Orchideous* plants induced the ancients to give this name to almost all the species they knew; from *satyrus*, a satyr. The bag-like appendages of the lip have perhaps assisted in the application of the name. The species are mostly handsome plants, with yellow or pink flowers. Mr. Salisbury says, he preserved *Satyrium cucullatum* some years, by attending to planting the bulb in a pot, nearly full of broken tiles, mixed with pure sandy loam, and keeping it quite dry when not vegetating.

1928. *Liparis*. Perianth. spreading. Lip flat, expanded, entire, turned various ways. Column winged. Pollen-masses 4, with neither caudicula nor glands.

1929. *Calypso*. Lip ventricose, spurred beneath near the end. Sepals ascending, 1-sided. Column petaloid, dilated. Pollen-masses 4.

§ 5. *Pollen granular. Seeds not arillate.*

1930. *Vanilla*. Flower jointed with ovary, and deciduous. Lip united at base with column. Capsule fleshy.

Order 2. DIANDRIA.

Stamens 2.

1931. *Cypripedium*. Lip ventricose, inflated. Column terminated by a petaloid lobe dividing the anthers. Two anterior sepals usually united.

1932. *Stylidium*. Cal. 2-lipped. Cor. irregular, 5-fid; the fifth segment dissimilar. Column reclinate, with a double bend. Anthers with 2 spreading lobes. Caps. 2-celled.

1933. *Gunnera*. Cal. 2-toothed, superior. Cor. O. Style 2-parted. Drupe 1-seeded, crowned by the teeth of the calyx.

Order 3. HEXANDRIA.

Stamens 6.

1934. *Aristolochia*. Cal. O. Cor. 1-petalous, ligulate, ventricose at base. Caps. 6-celled, many-seeded, inferior.

MONANDRIA.

- 12789 Helmet blunt : spur conical deflexed, Inner sepals 2-toothed, Lip obovate velvety flat, Spike lax
- 12790 Helmet erect acute, Lip stalked dilated at end trifid, Stem few-flowered, Leaves linear
- 12791 Helmet blunt : spur obl. keeled convex at back, Lip linear acutish, Spike lax, Bracts shorter than fls.
- 12792 Helmet blunt : spur obl. Lip linear broadest at end, Spike cylindrical, Bractes erect longer than flowers
- 12793 Helmet acute erect : spur conical nodding, Lip linear blunt, Stem about 2-fl.
- 12794 Leaves filiform shorter than 3-flowered scape, Spur blunt ascending

- 12795 Radical leaves twin cordate roundish concave : cauline remote cucullate bluish
- 12796 Radical leaves twin cordate roundish : cauline sheath-like close, Spike compact, Sepals keeled outside
- 12797 Leaves ovate acuminate somew. reflexed sheathing coriaceous crenated at edge, Fls. and helmet cernuous

- 12798 Horn filiform twice as long as ovary, Lip linear entire, Rad. leaves twin oblong narrowed at base
- 12799 Lip lanceolate obtuse dilated at base, Spur the length of lip a little shorter than the ovary, Stem leafy
- 12800 Lip linear lanceolate, Three upper sepals erect conniving : lateral reflexed, Leaves 2 orbicular

- 12801 Bulbs palmate, Lip trifid entire, Spur setaceous twice as long as ovary
- 12802 Horn short double, Lip linear 3-toothed : lateral teeth acute ; middle very short
- 12803 Horn blunt 3 times shorter than ovary, Lip 3-parted : segments acute ; middle one largest

- 12804 Lip 3-lob. : lobes cren. obt. midd. one emargin. Seg. of perianth ascend. obt. Spur conic. ascend. shorter than
- 12805 Lip 3-lobed : lateral reflexed toothletted ; middle shorter than blunt, Spur long comp. truncate ascending
- 12806 Lip 3-lob. crenul. obt. : the midd. lobe cleft, Seg. of the perianth cleft ; exterior one reflex. Spur lin. ascend. compressed at the extremity rather longer than the ovary

and Miscellaneous Particulars.

1857. *Platanthera*. So named from *πλατυς*, broad, and *ανθησα*, an anther, on account of the width of that organ, which is as broad or broader than the base of the labellum. Curious wood plants with greenish flowers.

*Platanthera bifolia* is one of our indigenous plants, which may be cultivated without any difficulty, if planted in pure loam from a lime-stone bottom. It succeeds in a pot, if filled half full of broken tiles ; and when in the open ground, the border should be well drained, at least six inches in depth. No plant bears forcing better, or exhales a more delightful perfume. This species is never observed but in a lime-stone soil, and is exceedingly plentiful near Buxton.

1858. *Gymnadenia*. From *γυμνος*, naked, and *ανθησα*, a gland ; because it differs from *Orchis* in not having the glands enclosed in a pouch, but altogether uncovered. The principal species of the genus is the *Orchis conopsea* of old botanists.

1859. *Orchis*. The Greek name of the plant. In Arabic, according to Forskahl, it is called *sahhleb*, from

History, Use, Propagation, Culture,

whence doubtless our word *salep* has been obtained. This is a curious and beautiful genus, but rather difficult of culture. Few of the species produce seeds, but are propagated by their bulbs or tubers, which, in most of the species, are of a peculiar structure and economy. An Orchis being taken out of the ground is found with two solid masses, ovate or fasciculated at the base of the stem, above which proceed the thick fleshy fibres which nourish the plant. One of these bulbs or tubers is destined to be the successor of the other, and is plump and vigorous, whilst the other or decaying one is always wrinkled and withered. From this withered one has proceeded the existing stem, and the plump one is an offset, from the centre of which the stem of the succeeding year is destined to proceed. By this means, the actual situation of the plant is changed about half an inch every year; and as the offset is always produced from the side opposite to the withered bulb, the plant travels always in one direction at that rate, and will in a dozen years have marched six inches from the place where it formerly stood.

In the garden, the Orchis can hardly be said to be propagated; the species are generally taken up from their native habitations with balls, and transferred to a shady border, where they remain for a year or two, but seldom increase. Those which grow in the open fields are generally found in calcareous soil, and those in bogs or woods thrive best in peat, or peat and loam mixed. The culture of this genus, however, has been very little attended to. According to Sweet, the best time to transplant the British Orchideae, is when they are in a growing state.

The Orchis affords the preparation known as Salep, imported from Turkey, and other parts of the Levant; and which has also been made in this country from *O. mascula*, and other species. The root is washed, the brown skin rubbed off, and then dried in an oven and ground into powder. This powder, as an article of diet, is accounted extremely nutritious, containing a great quantity of farinaceous matter in a small bulk. *O. mascula* is very abundant in the meadows of Gloucestershire, and Salep has been made from its bulbs, equal to that imported. (*Encyc. of Agr.* 5527.)

 12817 Lip obov. undiv. cren. ret. Sep. straight : lat. long. Spur clav. short than ovary, Bract. longer than fl. [ovary  
 12818 Lip obov. undiv. tooth. emarg. Sep. nerv. conniv. Spur subul. short. than ovar. Bract. membr. col. as long as  
 12819 Bulbs undivided, Sepals conniving, Lip trifid : middle segment projecting 2-lobed, Bractes longer than fl.  
 12820 Lip trifid dotted : segments ovate serrulate ; middle broadest emarginate, Spike ovate compact  
 12821 Scape naked, Lip slightly 3-lobed at end, Spur ascending, Bractes as long as ovary

12822 The only species

- 12823 Spur short double, Lip linear retuse 3-toothed : lateral blunt ; middle obsol. Bractes twice as long as fl.  
 12824 Spur cylindrical shorter than ovary, Lip entire linear oblong. [than flower  
 12825 Spur filif. shorter than ovary, Lip obl. blunt toothed on each side at base, Palate 1-toothed, Bractes longer  
 12826 Spur filiform longer than ovary, Lip 3-parted with cuneiform fringed segments  
 12827 Spur filiform shorter than ovary, Lip lanceolate pinnately fringed, Inner sepals toothed cut  
 12828 Spur filiform longer than ovary, Lip lanceolate pinnately fringed, Inner sepals fringed cut  
 12829 Lip long 3-parted : segm. somewhat digitate filiform, Spur length of ovary, Spike obl. Flowers alternate  
 12830 Roots fascicled, Lip lanc. ciliated the length of upper sepals, Spur very long a little shorter than ovary  
 12831 Sepals conniving, Lip nearly equal broad ovate bluntly 3-toothed, Spur filiform curved longer than ovary

12832 The only species

12833 The only species

[spread. Spur filif.

12834 Lip 3-cleft : lobes eq. ent. with 2 longitud. append. on upp. side near base, Seg. of perin. lanc. 2 outer ones

12835 Lip the length of ovary

- 12836 Lip 3-fid : middle lobe largest 4-trifid ; middle segm. longest subulate deflexed  
 12837 Lip 2-lobed villous obovate appendaged, Sepals spreading : three outer oblong blunt ; inner very short  
 12838 Lip 3-lobed : lateral short blunt ; middle retuse

and Miscellaneous Particulars.

*Orchis fusca* and *militaris*, according to Salisbury, succeed best in chalky soil, free from all manure whatever ; but they endure more moisture than would be supposed ; for he found them in a very wet part of the meadow below the terrace, at Mill Hill, where they had, no doubt, been planted by Mr. Peter Collinson. *Gymnadenia conopsea* affords another singular instance of this sort, which is found growing wild on the driest limestone, mixed with *Anacamptis pyramidalis*, and in bogs where one can hardly tread, mixed with *Epipactis palustris*.

1860. *Nigritella*. So named by M. Richard, from *niger*, black, in allusion to the color of the flowers.  
 1861. *Habenaria*. From *habena*, a thong or rein, on account of the long spur of the flower, which resembles something of that sort. Most of the species have white flowers, and natives of America. Some have bright yellow flowers, others purple ones.  
 1862. *Bartholina*. Named in honor of Thomas Bartholini, a Danish physician, who flourished at the end of the seventeenth century. A small Cape plant, with a beautifully fringed white flower.  
 1863. *Glossula*. So called by Mr. Lindley, from *γλωσσα*, a tongue, in reference to the tongue-like segments of the labellum. An obscure Chinese plant, with pale green minute flowers.  
 1864. *Anacamptis*. From *ανακαμπτωσα*, to bend back, in allusion, it is presumed, to the reflexed edges of the appendage of the pollen-masses. In all respects similar to *Orchis* in habit. It is the *Orchis pyramidalis* of Linnæus.  
 1865. *Aceras*. From *α*, without, and *ακρας*, a horn, in allusion to the absence of the spur from the labellum, by which character it is chiefly distinguished from *Orchis*. *Aceras anthropophora* is difficult to cultivate. It can only be propagated by seeds, which thrive best in a mixture of sand, loam, and chalk.  
 1866. *Ophrys*. From the Greek word *οφρυς*, which signifies an eye-lash, to which the delicate fringe of the inner sepals may be very well compared. *O. ipifera* is a singularly beautiful plant, not uncommon on calcareous soils, near woods, and in open meadows. It ripens seeds plentifully, as will all the species, if care be taken, as

History, Use, Propagation, Culture,

Sweet directs, to "rub the pollen on the stigma." The seeds must be sown as soon as ripe, and the plants transplanted to where they are finally to remain, when of a small size. Several species of this genus, and of *Orchis*, were successfully cultivated by Collinson, in his botanic garden at Mill-Hill. His method was to place them in a soil and situation as natural to them as possible, and to suffer the grass and herbage to grow round them. *O. aranifera*, with a little attention and management, will grow and flower freely in pots. Curtis found the following method successful: "take up the roots carefully when in flower; bare them no more than is necessary to remove the roots of the other plants; fill a large sized garden-pot with three parts choice loam moderately stiff, and one part chalk, mixed well together, and passed through a sieve somewhat finer than a common cinder sieve; in this mixture place your roots at about the depth of two inches, and three inches apart; water them occasionally during summer, if the weather prove dry; at the approach of winter place the pot in a frame under a glass, to keep it from wet and frost, which combined, destroy the beauty of the foliage, if not the plant itself; in the autumn, before any of the others make their appearance, this species emerges." (*Curtis, Fl. Lond.* n. 68.)

Salisbury says, that *Ophrys muscifera*, and most of its congeners, are very easily cultivated; but require the purest loam from a chalky bottom, and the border to be most effectually drained; for any permanent wet in summer makes them push too soon. On the hillocks and declivities where they grow wild, the slight showers are absorbed by the surrounding turf or long grass, and the heavy rains we usually have after midsummer-day run off quickly.

1867. *Chamorchis*. From *χαμαί*, dwarf, and *Orchis*. A pretty little alpine plant, exceedingly difficult to cultivate. Roots have been brought in damp moss from Switzerland, but they probably have perished ere now.

1868. *Herminium*. A name which is not explained by its author. It is the *Ophrys Monorchis* of old botanists.

1869. *Serapias* is the name of an Egyptian divinity, whose temples were notorious scenes of profrigacy. In this sense, with reference to the uses of the plant, as also in *Satyrion*, the word seems to have been applied by Pliny. Rare herbaceous plants of the south of Europe, but cultivated in a frame.

1870. *Goodyera*. So called after Mr. John Goodyer, an obscure British botanist. The species grow freely in sandy peat, and, unlike most of the *Orchideæ*, may be increased by dividing the roots.

- 12839 Lip 3-fid : middle lobe large 2-lobed, Anther blunt  
 12840 Stem leafy, Lip vill. 3-lobed ; midd. lobe obov. shortly 3-lobed at end, Inner sepals linear-lanc. very short  
 12841 Stem leafy, Lip downy obov. 3-lobed at end : lobes nearly equal, Inner sepals lanc. twice as short as outer

12842 Leaves linear setaceous, Scape naked

12843 The radical leaves lanceolate twin

- 12844 Lip 3-parted : middle lobe oblong lanceolate acute smoothish hanging down  
 12845 Lip 3-parted : middle lobe ovate acuminate hanging down with a hairy disk

12846 Radical leaves ovate, Lip and petals lanceolate

12847 Radical leaves ovate, Lip ovate acuminate, Sepals ovate

12848 Leaves fleshy chocolate-colored ovate without nerves

12849 Stem leafy, Leaves ovate-lanceolate stalked, Lip rounded glandular inside, Petals broad ovate

12850 A smooth variety of *G. pubescens*

12851 Leaves linear channelled shorter than scape, Middle segm. of lab. with a double keel inside

12852 Lip unguiculate acuminate, Inner sepals  $\frac{1}{2}$ -ovate

12853 Spike lax erect, Leaves stalked erect crisp smooth, Flowers discolored

12854 The only species

12855 Rad. lvs. obl. lanc. Scape with bractes, Anterior sepals decurrent placed under the  $\frac{1}{2}$ -inferior labellum

12856 Lip obovate emarginate, Scape sheathed, Bractes shorter than flower, Leaves ovate stalked flat at edge

12857 Leaves linear-lanc. Lip subsessile crenulate at end, Sepals ovarium and rachis quite smooth

12858 Lvs. linear lanceolate 2-colored, Scape villous much longer than leaves, Fl. gibbous on its outside at base

12859 Leaves lanceolate 3-nerved, Stem sheathed, Flowers recurved cernuous, Lip oblong entire acute

12860 Rad. leaves oblong somewhat stalked, Spike twisted with the flowers on one side, Lip ovate

12861 Lip lanc. undivided, Scape bracteate, Bractes longer than flower, Leaves oblong wavy towards the end

12862 Rad. leaves broad lanceolate, Spike erect, Lip saccate at base with the sepals, Lip acuminate

12863 Stem with only a pair of ov.-ellipt. opp. lvs. Col. of fructification having an appendage in which the anther  
 12864 Stem with only 2 cordate opposite leaves, Col. without any appendage behind, Lip with 2 teeth at the base

12865 The only species, Flower solitary large lilac

and Miscellaneous Particulars.

1871. *Diuris*. From *dis*, double, and *ura*, a tail, in allusion to the form of the sepals. Beautiful New Holland plants, which may be cultivated in the same way as *Disa*.

1872. *Ponthieva*. Named after De Ponthieu, who sent many specimens of West Indian plants to Sir J. Banks. The species may be cultivated in pots, well drained, and filled with sandy loam and peat. Water must be sparingly given when the plants are not in a growing state.

1873. *Neottia*. This word in Greek signifies bird's nest, and has been applied to the present plant on account of the interwoven fibres of its roots. No means of cultivating the only species has been yet discovered. It grows naturally in woods among decayed leaves, and is supposed to be parasitical.

1874. *Spiranthes*. From *σπῆρα*, a screw, or any thing spirally twisted; on account of the disposition of the flowers on their spike. Delicate little herbaceous plants with fibrous roots, and generally white flowers. *S. æstivalis* has the germs on the flower-stalks placed regularly one above another, somewhat resembling tresses of plaited hair; whence its name of Ladies' traces or tresses. This species grows more readily in the garden than most of its tribe.

According to Salisbury, no plant whatever is more easy to cultivate than this. At Chapel-Allerton it propagated itself every where, springing up from seeds in the neighbouring pots, whatever soil or plants happened to be in them; and they were once found germinating on a dead root of a Persian Cyclamen, in a pot, which, for want of draining, was full of Jungermannias.

1875. *Stenorrhynchus*. A splendid genus of evergreen stove herbaceous plants, with brilliant red or yellow flowers. They have been named from *σῆνος*, narrow, and *ῥυξος*, a beak, on account of the long pointed stigma. *N. orchoides* is one of the most beautiful plants of this genus, introduced by E. J. A. Woodford, Esq. in 1806, from the Island of Barbadoes, where it grows wild in the most arid places among grass. It requires, nevertheless, moderate waterings here while the leaves are green.

1876. *Listera*. Dr. Martin Lister was a celebrated English physician and naturalist, who died in 1711. The species require a shady situation and a light sandy soil, with some peat intermixed. They will grow on a bank under the drip of trees, or in small pots. They are increased by dividing the roots.

1877. *Arethusa*. A poetical name. Arethusa was a nymph of Diana, who was transformed into a fountain. The species of this genus are all found in moist places. They are very impatient of cultivation. The best way to manage them, is to plant them in loose wet peaty soil, and to keep them in a frame well exposed to the sun.

History, Use, Propagation, Culture,

1878. *Calopogon*. From *καλος*, beautiful, and *παρων*, a beard, in allusion to the beautiful fringe of the lip. An elegant plant, which was introduced accidentally, as Mr. Curtis informs us, by the laudable exertions of his gardener, who, in the spring of 1783, examining attentively the bog earth which had been brought over with some *Dionæas*, found several tooth-like knobby roots, which, upon being planted in heat, afforded this plant: on the shelf of a stove, or on a bark pit it thrives exceedingly; and seems merely to require a longer and hotter summer than our climate affords.

1879. *Pogonia*. A name with the same derivation as the last genus. The species also require the same treatment.

1880. *Epipactis*. A name given by the Greeks to a sort of Hellebore, and used by Swartz to distinguish a tribe of plants previously called Helleborine. Pretty herbaceous hardy plants. "Some of its species thrive in the borders in the common garden soil, and most of them will do well in pots, in a mixture of loam and peat; they require but little water when in a dormant state, and are increased by dividing the roots." (*Bot. Cult.* 365.)

1881. *Calceana*. Named after Mr. George Caley, a most indefatigable and acute botanical collector, who resided several years among the natives of New South Wales, where he made a valuable collection of plants. The name has been subsequently changed by Mr. Brown to *Calceya*: which as being too similar to *Calea*, a very different plant, we cannot prefer to the original designation. The species require the common treatment of the tribe, and are increased by division of the roots.

1882. *Corallorrhiza*. From *κοραλλον*, coral, and *ρίζα*, a root, on account of its branched roots, which much resemble coral. A plant supposed to be incapable of cultivation. It is a native of boggy places in the northern parts of the world. The three American species *C. verna*, *multiflora*, and *odontorrhiza*, are said to have been introduced in 1824, but we have not heard of their having been cultivated with any success.

12866 Leaves plaited long linear lanceolate. The only species

12867 Root fibrous, Leaf of the scape and bractea elliptical lanceolate, Outer sepals oblong-ovate  
 12868 Root subpalmate, Leaf and bractea of scape linear oblong, Outer sepals lanceolate linear  
 12869 Leaves ovate squamiform amplexic. Fls. subcernuous solitary, Middle lobe of lip obl. crisp, Stem angular

12870 Lvs. ov. amplexic. Lower bractes long. than fls. Fls. drooping, Lip entire acuminate shorter than petals  
 12871 Lvs. lanc. amplexic. Bractes short. than fl. Fls. slightly drooping, Lip cren. obt. rather long. than perianth  
 12872 Leaves ovate-lanceolate sessile, Bractes longer than the flower, Lip obtuse shorter than perianth  
 12873 Lvs. lanc. much acum. substidich. Bract. very minute subul. Fls. erect, Lip obt. much short. than perianth  
 12874 Lvs. lanc. Bractes longer than ovary, Flowers erect, Lip acute with wavy elevated lines, Ovary smooth

12875 Leaf lanc. lin. flat, Scape with a single bract in the middle, Lip smooth narrowed and  $\frac{1}{4}$ -ovate at each end

12876 Spur abbreviated adnate

12877 Spikes nodding 1-sided, Leaves lanceolate complicate

12878 Spikes nodding 1-sided, Leaves lanceolate flat

12879 Stemless, Leaves growing on a bulb : radical sheathing, Scapes many-flowered, Ovary 3-winged  
 12880 Leaves radical broad-linear channelled fleshy retuse at end, Scapes many-flowered pendulous  
 12881 Leaves radical ensiform nerved, Scape round few-flowered, Lip ovate somewhat recurved spotted  
 12882 Leaves radical ensiform nerved, Scape few-flowered, Flowers 1-sided, Sepals striated : 3 outer reflexed  
 12883 Leaves radical lanceolate nerved narrowed at base, Scape round few-fl. Lip obl. recurved at end spotted  
 12884 Bulbous, Leaves plaited, Racemes divaricating pendulous radical  
 12885 Leaves thickish lin.-subulate channelled nerved crenate as long as scape, Spike few-fl. Lip not spotted

12886 Sepals lanceolate spreading not longer than ovary

12887 Sepals linear lanceolate acuminate : the lower caudate very much longer than ovary

12888 The only species. A tall plant with long rigid linear lanceolate leaves on a bulbous base

12889 Scape longer than leaves, Raceme pendulous, Flowers alternate, Lip ovate acute pointed

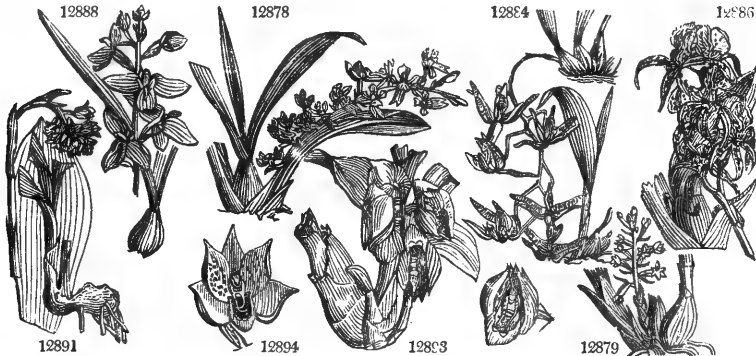

12890 Scape shorter than lvs. Spike pendulous, Fls. close, Lip somewhat spurred at base blunt and entire at end

12891 Scape shorter than lvs. Spike pendulous, Fls. close, Lip somew. spurred at base dilated and crenul. at end

12892 Two inner sepals spotted, Lip galeate 3-toothed

12893 Spike shorter than leaves, Leaves galeate fleshy 3-toothed at end, Sepals oblong : inner spotted

12894 Spike short. than lvs. Lip gal. blunt. 3-tooth. Two inner sep. mott. with purple, others as well as col. green

and Miscellaneous Particulars.

1883. *Rodriguezia*. Named by the authors of the Flora Peruviana, after Emanuel Rodriguez, a Spanish physician, and, as it is said, of considerable botanical merit. A beautiful herbaceous plant, growing upon decayed wood. Its flowers are placed in cernuous racemes of a lively pink color.

1884. *Gomezia*. So called by Mr. Brown, in honor of Senor Gomez, a Spanish apothecary. Mr. Lindley thinks it not distinct from the last. A bulbous epiphyte, with drooping spikes of yellow flowers.

1885. *Cymbidium*. From *κυμα*, a little boat, in allusion to the form of the labellum. All the genuine species of *Cymbidium* are terrestrial, and rarely are found growing upon trees. In cultivation the species grow in loam, chips of wood, potsherds, and other rubbish, broken small, and put in well-drained pots. They are increased by dividing at the root.

1886. *Brassia*. Named after Mr. Brass, an intelligent gardener, who collected seeds and plants in Africa for the Kew Garden. The two species now known are among the most beautiful of the various tribes of Epidendrum. *Brassia maculata* has large pale yellow flowers, elegantly spotted with brown ; *B. caudata* has similar flowers, with long tails to their lower segments.

1887. *Lissochilus*. From *λίσος*, smooth, and *χίλος*, a lip, in reference to the absence of callosity or crests from that part. An exceedingly rare and very noble plant, which grows freely in sandy loam with a little peat. The flowers grow in long spikes of a bright yellow color.

1888. *Geodorum*. From *γῆς*, the earth, and *δορον*, a gift, in reference to the beauty of the blossoms lying on the earth. Handsome plants, succeeding with the treatment of *Cymbidium*.

1889. *Catasetum*. Apparently a word of hybrid extraction, from *κατα*, and *seta*, a bristle, in allusion to the two long bristles or horns of the column, which constitute one of the most remarkable characters of the genus.

History, Use, Propagation, Culture,

Very fine epiphytes, with large bulbous roots, plaited leaves, and fine, often spotted, flowers of a greenish purple color. The bulbs contain a quantity of viscid juice, which is used, when fresh, in Brazil, for the purpose of sealing letters. The plants are there called *Cebolleta*.

1890. *Trizeuxis*. So called by Mr. Lindley without explanation. We suppose the name has been formed from τριζε, three, and ξωεις, union, in allusion to the remarkable union of three segments into one, which takes place in this genus. A very singular epiphyte, which is with difficulty kept alive in the stove by being placed in finely pulverised decayed wood.

1891. *Xylobium*. From ξυλον, wood, in allusion to the substance upon which it grows. A curious Brazilian bulbous epiphyte with plaited leaves. This is of easy cultivation.

1892. *Maxillaria*. So called by the authors of the Flora Peruviana, as they inform us, because the labellum when looked at sideways, resembles the *Maxilla* of some insects. All fine South American plants, with plaited leaves and showy flowers. They are cultivated like other epiphytes, and not with much difficulty.

1893. *Notylia*. So called, we presume, from νωτος, the back, and τυλος, a hump, in reference to a singular callosity at the back of the stigma, which Mr. Lindley, the author of the genus, considers very curious. An unostentatious epiphyte without bulbs, and with solitary leaves, out of the bosom of which grows a pendulous raceme.

1894. *Pleurothallis*. From πλευρα, a rib, and θαλλειν, to flower, in allusion to the one-sided disposition of the flowers. Singular little epiphytes with solitary leaves, no bulbs, and flowers of a green color. They grow rarely in decomposed wood.

12895 Spike length of leaves erect, Flowers globose, Sepals rounded  
 12896 Perianth. spreading, Lip opened out saccate crested

12897 The only species. Flowers very small in little heads upon a branched scape

12898 Bulbs conical truncate, Flowers close, Leaves lanceolate plaited about 3-nerved twice as long as scape

12899 Leaves about 3 oblong nerved seated on a bulb, Scape about 1-flowered sheathed  
 12900 Lvs. solitary lanc. plaited, Raceme 2-fl. Perianth. very large wavy spreading, Lobes of lip recurved crisp

12901 Spikes pendulous lax as long as the narrow oval nerved leaves

12902 Stem long 1-leaved, Scape erect longer than obl. emarginate leaf, Fls. racemose 1-sided  
 12903 Stem long 1-leaved, Leaf ovate-lanceolate, Flowers clustered in the bosom of the leaf

12904 Sepals 5 lanceolate longer than lip, Scape panicled  
 12905 Sepals 5 obovate unguiculate a little shorter than lip, Scape panicled  
 12906 Sepals 4 obov. wavy, Lip long. than sep. : midd. lobe dilated reniform  $\frac{1}{2}$ -bifid, Scape racem. Bulbs 2-leaved  
 12907 Sepals 4 acute, Middle lobe of lip roundish undivided, Scape racemose, Leaves 3-cornered  
 12908 Leaves ellipt. acute, Scape upright branched, Sepals wavy retuse spreading nearly equal, Lip reniform  
 12909 Lvs. flat obl. lanc. Sepals 5 obovate undulate blunt, Lip transverse shorter than seg. bearded in the middle  
 12910 Lip 2-lobed spotted much longer than the sepals, Bulbs ovate comp. leafy at base and end, Scape panicled  
 12911 Lvs. rigid oval oblique, Panicle thyrsoid length of lvs. Sep. obov. Lip 3-lobed crested, Wings of col. ent.  
 12912 Lvs. solitary oval dotted spread. Scape jointed 2-edged few-fl. Upper sepals lin. very long, Col. 2-horned

12913 Lip narrow clawed : lateral lobes divaricating longer than the middle which is hollowed out  
 12914 Lip ventricose : lateral lobes shorter than middle which is crested and callous

12915 Bulbs fascicled, Lvs. lanc. atten. at base, Sepals lanc. finely dotted, Midd. lobe of lip acute, Crest obsolete

12916 Bulbs and leaves coriaceous and shining

12917 Lvs. twin obl. lanc. spreading, Fls. terminal solitary, Inner sepals filiform, Lip fringed with two crests

12918 Bulbs 1-leaved : leafy at base, Leaves oblong 3-nerved, Spike erect shorter than leaves

12919 Leaves lanceolate keeled solitary on their bulb, Spike imbricated radical very little longer than the bulb

12920 Stems erect 2-3-leav. at end, Lvs. oval obl. shorter than many-fl. terminal raceme, Sepals narrow oblong  
 12921 Stems creep. Lvs. oval blunt depressed fleshy several times shorter than raceme, Sepals long linear acute  
 12922 Stems pendul. Lvs. bifarious lanc. acum. Ped. opp. the leaves about 2-fl. Lip undivided ov. cucul. at base  
 12923 Stems pendul. Lvs. bifarious broadly lanc. Pedunc. about 2-fl. Lip undivid. tubul. oblique almost truncate  
 12924 Leaves lanc. striated, Racemes many-fl. Lip undivided obliquely campanulate fringed  
 12925 Stem branched somewhat compr. tubercous at base, Leaves ovate-lanc. Spikes erect, Fls. remote alternate

and Miscellaneous Particulars.

1895 *Oncidium*. From *ογκος*, a tumour, on account of the callosities with which the disk of the labellum is covered. Among the most beautiful of epiphytous plants, conspicuous by their long loose panicles of olive-colored or yellow flowers. *Oncidium altissimum* grows to the height of three or four feet. *O. Papilio*, the curious Butterfly-plant of Trinidad, has large yellow and red blossoms poised on slender footstalks, and dancing about in the air like some gaudy insects. All the species are cultivated without any difficulty in almost any soil, with plenty of heat and moisture.

1896. *Cyrtopodium*. From *κυρτος*, convex, and *πους*, a foot, in allusion to the labellum of the original species. These are handsome bulbous plants, growing either upon the ground or upon trees. Their flowers, which are rarely produced, are rather difficult to manage well, and are seldom seen in collections. Their flowers, which are handsome, are rarely produced.

1897 *Cælogyne*. So named by Mr. Lindley, from *καλος*, hollow, and *γυνη*, a female, on account of the form of the stigma, which is peculiar for an Epidendrum. Some of the species, natives of Nepal, which have not yet been introduced into our gardens, are most beautiful bulbous epiphytes, with shining fleshy leaves, and spikes of gorgeous flowers proceeding from a rigid imbricated scaly base.

1898. *Macradenia*. From *μακρος*, long, and *αδην*, a gland, on account of the long subulate process to which the pollen-masses are attached. A singular little epiphyte with yellowish brown flowers.

1899. *Anisopetalum*. From *α*, without, *ισος*, equal, and *πτερον*, a petal, on account of the inequality of the sepals, or petals as they commonly called. A curious Nepal plant, with bulbous roots, and little erect spikes of brownish flowers.

1900. *Denitrobium*. From *δενδρον*, a tree, with reference to the habit of the species in growing upon trees. In the woods of the East Indies they climb and twist themselves about the branches of live trees, or throw

History, Use, Propagation, Culture,

down their long shoots almost in the same manner as the Miseltoe in England. The flowers are generally very beautiful, and frequently highly fragrant: they vary from a deep yellow to nearly white. All the species in the gardens are cultivated without the least difficulty by being planted in any light vegetable earth. Sometimes they are put in baskets among damp moss, but they do not succeed so well under that treatment as when planted in earth.

1901. *Camarydium*. Named by Mr. Lindley, from *καμαρυς*, an arched roof. The stigma of this genus has the upper lip vaulted in a remarkable degree. An inelegant leafy caulescent bulbous epiphyte, with solitary white flowers.

1902. *Ornithidium*. From *ορνις*, a bird, in allusion to the resemblance which exists between the cuspidate upper lip of the stigma, and a bird's beak. The habit of this plant is like that of the last, but the flowers are red. They are both cultivated without difficulty in a stove, by being planted among rotten wood, or tan.

Mr. Salisbery says, *Ornithidium coccineum* is a parasite on old trees, near torrents, in the island of Martinico; its fibrous roots insinuating themselves into the crevices of their moist bark. Here it thrives exceedingly, in pots filled with the same, flowering at various seasons, but chiefly in October and November. During summer it should be placed in a shady part of the stove, and often sprinkled with water, but it requires little or none in winter, especially when plunged.

1903. *Isochilus*. From *ισος*, equal, and *χιλος*, a lip, because the lip and the other divisions of the flower are of nearly equal breadth. The species grow in baskets of moss and old tan, or planted in pots of sandy soil, and chips of wood, and other dry rubbish. They are increased by divisions at the root.

1904. *Pholidota*. A singular bulbous epiphyte, native of Nepal, remarkable for the close manner in which the flowers are covered over by the imbricated scale-like bractæ, from which circumstance (*φολις*, a scale), we

- 12926 Stems erect 2-3-leaved at end, Leaves oval obl. entire shorter than terminal many-fl. raceme  
 12927 Stem round jointed striated moniliform naked quite simple, Leaves oblong lanceolate  
 12928 Stems creeping, Leaves obl. lanceolate acute fleshy the length of the few-flowered spreading raceme

12929 The only species

12930 Flowers small and appearing in the axillæ of the long leaves, Stems branched bulb-bearing

12931 Spike terminal, Leaves distichous linear blunt emarginate, Stem simple

12932 Flowers axillary, Leaves distichous lanceolate oblong, Stem proliferous, Bulbs axillary 2-leaved

12933 Lvs. solitary on a truncated conical naked bulb: lanceolate plaited, Raceme pendulous densely imbricated

12934 Leaves twin oblong seated on a bulb, Scape divided

12935 Outer sepals linear lanceolate acute 3 times as narrow as inner, Lip undivided

12936 Sepals nearly equal obtuse, Lip 3-lobed with the middle lobe saddle-shaped

12937 Sepals lanceolate: inner narrower wavy obtuse, Middle lobe of lip cordate lunate

12938 Leaves twin oblong seated on a bulb, Scape long, Lip cordate blunt

12939 Leaf lanceolate seated on a bulb, Scape short many-flowered, Lip cordate acuminate

12940 Stem simple, Leaves oblong emarginate, Peduncle terminal very long, Spike lax 1-sided

12941 Stem simple, Leaves obl. or acuminate, Peduncle terminal long, Spike globose, Col. shorter than sepals

12942 Stem simple, Leaves oblong, Peduncle terminal long, Spike lax, Lip toothed ciliated

12943 Stem simple, Leaves obl. somewhat emarginate, Flowers clustered in the bosom of a terminal leaf

12944 Stem simple, Leaves ov. lanc. amplexicaul. Flowers spiked nodding, Lip 3-lobed: middle lobe 3-toothed

12945 Stem simple, Fls. spiked erect, Lip 3-lobed: middle lobe retuse, Inner sepals narrower, Leaves lanceol.

12946 Stem simple, Lvs. twin oblong veinless, Lip 3-parted: middle seg. subulate longest; lateral fringed

12947 Stem simple, Leaves 3, Spike remote few-fl. Lip 3-parted: middle segm. linear; lateral cut fringed

12948 Stem simple 2-edged, Leaves oblong, Panicle terminal much branched, Lip cordate acuminate

12949 Stem simple, Leaves obl. veinless, Flowers terminal, Lip 3-parted entire: intermediate segm. linear long

12950 Stem 1-leaved, Leaf ellipt. lanc. obt. Raceme few-fl. from the bosom of the leaf, Two inner sepals small

12951 Stem creeping bulbiferous, Bulbs 2-leaved 1-flowered, Lip cordate

12952 Spike compound: spikelets alternate erect, Flowers smooth

12953 Spike panic. thyriform, Leaves lanc. 7-nerved longer than scape, Fls. and ovaries downy, Bulbs ovate

12954 Leaves tufted lanceolate nerved shorter than erect spike

and Miscellaneous Particulars.

presume, Mr. Lindley has constructed the name. No explanation, however, of his names is ever given by this author, who seems to attach too little importance to the etymology of botany.

1905. *Broughtonia*. Named by Brown, in the Hortus Kewensis, without explanation. A handsome plant, with fine scarlet flowers. It is very rare, and cultivated with little success.

1906. *Cattleya*. Named by Mr. Lindley, after William Cattley, Esq. a munificent encourager of botany, and his early friend. A superb genus of bulbous epiphytes, with fleshy leaves growing in pairs, and large violet or yellow flowers.

1907. *Epidendrum*. From *επι*, upon, and *δενδρον*. All the species are found naturally growing upon trees, not however, as De Theis tells us, sucking their sap, by insinuating their little roots beneath the bark, but vegetating in the soil which collects upon the forks of the branches. Many of the species have singular flowers, but none of those in the gardens are remarkable for their beauty. They are generally cultivated with less difficulty than most other epiphytes. Salisbury tells us, *Epidendrum ciliare* should be planted in pots, filled with porous stones, a few decayed leaves, and knobs of bark taken fresh from the woods: but it requires very little water; and if the leaves turn yellow, it is a sign that they have either too much wet, or too much sun. With such treatment, by keeping four or five pots of it, the stove will be enlivened with their long tubular flowers, slowly succeeding one another, at most periods of the year. It is easily propagated by dividing its stems.

1908. *Polystachya*. From *πολυς*, many, and *σπικος*, a spike, on account of the compound nature of the inflorescence. Inconspicuous plants, requiring the treatment applied to similar kinds.

1909. *Cryptarrhena*. A pretty little stemless epiphyte with distichous leaves, and neat yellow flowers. It was named by Mr. Brown, from *κρυπτος*, concealed, and *αγγον*, a male, on account of the hooded apex of the column which covers up the anther. The plant is believed to be now lost to the gardens.

History, Use, Propagation, Culture,

1910. *Ornithocephalus*. A very curious little plant, only an inch or two in height, found in Trinidad growing upon rotten sticks in the woods. It bears two or three green flowers, which contain a column, the upper extremity of which is lengthened out into a fine subulate process, resembling a snipe's bill in miniature, whence the name, from *ornis*, a bird, and *cephalus*, a head. No successful method of cultivating this plant has yet been discovered.

1911. *Blettia*. Dedicated to Luis Blet, a Spanish apothecary, who has always, as we are informed by the authors of the Flora Peruviana, distinguished himself in his botanical studies. Very noble plants, growing in the earth.

*Blettia Tankervilleæ* is a common but beautiful species. The first plant which flowered in this country, was cultivated at Apperly Bridge, near Bradford, in Yorkshire, in May 1776, and had been sent there to Mrs. Hird, by her uncle, Dr. Fothergill, in a black Chinese pot full of stiff loam, in which it had been imported. Many small bulbs, with leaves like those of a snow drop, grew near the edge of the same pot in a regular circle, and these afterwards proved to be *Amaryllis Aurea*. The *Blettia Tankervilleæ* delights in warmth, fresh loam, and plenty of water, by which treatment, and attention to fecundate the stigma, it will ripen fruit abundantly.

1912. *Eria*. From *eria*, wool, on account of the wooliness of the flower of all the known species. Curious epiphytous plants, with bulbous roots, and flowers usually of a yellowish color. They differ from *Dendrobium* chiefly in the number of their pollen-masses, and in habit. *E. stellata* is a fine free-growing plant, with long broad fleshy leaves, and spikes of beautiful brown-yellow flowers nearly a foot and half in length.

1913. *Octomeria*. So called by Mr. Brown, with reference to the eight parts, *οκτω*, and *μερος*, into which the pollen is divided. A singular little plant, with filiform leaves and small nearly solitary flowers. The true limits between this genus and the last remain to be determined. The two seem to be separated by nature.

1914. *Brasavola*. Named after Antonio Musa Brasavola, an Italian botanist, born at Ferrara in 1500. Plants with long subulate fleshy leaves, and large white flowers. They are cultivated without difficulty in peat and sand, if good decomposed wood is not to be procured.

1915. *Sarcanthus*. A curious genus of plants not remarkable for their beauty. Their habit is various, but always caulescent; their flowers either yellow or yellowish, marked with various shades of purple. The name

12955 Leaves distichous obtuse compressed

12956 Lip spurred undivided; spur short, Leaves radical ovate lanceolate

12957 Lip not spurred: ribs of the disk branched; middle lobe broader than long, lateral narrower upwards

12958 Lip not spurred: ribs of the disk simple; middle lobe somewhat cuneiform, lateral broader at end

12959 Lip not spurred beardless, Pollen-masses 4, 2-lobed, Stem leafy, Flowers racemose

12960 Lip not spurred with a callus in the inside near the base, Stem leafy, Flowers capitate

12961 Leaves linear-lanceolate plaited, Sepals connivent, Scape higher than leaves

12962 Lvs. lanc. fleshy 5-nerved, Sep. ov. lanc. acum: midd. lobe of lip acum. Ovary and outer sep. ferruginous

12963 Bulb obl.-ov. Lvs. distich. lanc. smooth, Fls. loosely spik. Lip obl. 3-lobed, Three exterior sep. unit. at base

12964 Stem long 1-leaved, Leaf lanceolate, Peduncles twin 1-flowered, Root creeping

12965 Stem 1-flowered, Lip ciliated

12966 Stem paniced, Spur straight hanging down scarcely so long as ovary, Leaves bifid and unequal at end

12967 Leaves subulate, Lip spurred 2-celled, Raceme shorter than leaves

12968 Leaves lanc. flat somewhat recurved, Spike simple horizontal, Lip and anther rostrate

12969 Caulicent, Leaves remotely distichous broad linear channelled obtuse, Spikes opp. the leaves

12970 Sepals oblong obovate wavy, Leaves obliquely 3-toothed at end

12971 Lip without a spur, Sepals linear-lanceolate nearly equal, Leaves cylindrical

12972 Spur ascending conical subulate, Middle lobe of lip shorter than lateral ones, Leaves blunt

12973 Stem branched rooting, Leaves lanceolate, Sepals revolute dilated at the end, Lip bifid in front

12974 The only species

12975 Leaves lanceolate lined flat, Scape paniced, Sepals shorter than the lip

12976 Scape very slender 3 times as long as the lanceol. 3-nerved leaves, Spur clavate, Midd. lobe of lip obsolete

12977 Leaves lanceolate nerved, Spur ascending, Lip membranous complete

and *Miscellaneous Particulars.*

has been given by Mr. Lindley, from *ragé*, flesh, and *avros*, a flower, in allusion to the texture of the sepals and labelum.

1916. *Vanda*. The Hindoo name of the original species. Noble caulescent plants adhering to old decayed arms of trees or fallen wood, by means of their tendril-like fleshy tortuous roots. The flowers of all the species are large and showy. Their treatment is the same as the next.

1917. *Aerides*. Derived from *aër*, the air; in allusion to the peculiar property the species possess of existing many months suspended in that element. This genus and the two last are those to which the name of Air-plant is most properly applied, very few others being capable of enduring for any considerable period such a removal from their natural places of growth. The true species of this genus are beyond all comparison the most delightful productions of the vegetable world. Their flowers are arrayed in long spikes or racemes of delicate colors and delicious fragrance. Hung up in a room in their native country, a little before flowering, they continue to unfold their blossoms in gradual succession for many weeks. In this country they are rarely seen in flower. The only genuine species, the *A. odoratum*, should be planted in rotten wood with a little peat, or a few decayed leaves, or any light black vegetable mould, and kept in the hottest and dampest place of the stove. If put in baskets among moss and kept very damp, the plants will succeed for a short time, but they soon languish, and put on a yellow appearance, the certain indication of unhealthiness.

1918. *Renanthera*. A name contrived by Loureiro, to express the kidney-form or reniform shape of the pollen-masses. This plant is not uncommon in good collections, where it has sometimes acquired the height of six or eight feet; but it has never yet produced its flowers. These appear, in the native country of the plant, in large loose panicles, and are individually of considerable size and of a rich crimson color, a little mottled with yellow.

1919. *Ionopsis*. So called by Mr. Kunth, from *ion*, a violet, and *opsis*, resemblance. *I. utricularioides* is a pretty little epiphyte, with purplish calceat leaves. It succeeds ill under any management which has hitherto been applied to it.

1920. *Eulophia*. From *εὐλοφός*, well crested, with reference to the surface of the middle lobe of the lip. The two species in the gardens are terrestrial tender stove plants, with bulbous roots, plaited leaves, and flowers, in *E. exaltata*, green and inconspicuous, in *E. guineensis*, whitish pink, and very handsome. They should be treated like *Cymbidium*.

History, Use, Propagation, Culture,

1291. *Angræcum*. A latinized form of the Malay appellation *angrec*, which is bestowed upon all epiphytous plants. This is a pretty genus, remarkable for the distinct spur to the lip. *A. maculatum* has handsome flat fleshy spotted leaves, and varies with flowers of a delicate pink and of a pale green color. *A. luridum* is an exceedingly rare species, with plaited leaves and conical bulbs covered with the vestiges of former leaves. *A. falcatum* is a little Japanese plant, whose flower has a spur nearly as long as the plant itself. It is easily grown among loose moss in a warm damp place, but there should always be some bits of rotten wood mixed among the moss for the tender roots to adhere to.

1292. *Aerantes*. A word with the same meaning as *Aerides*. Fine Madagascar plants. *A. sesquipedalis*, which has not yet blossomed, bears in its own country very large white flowers, with a spur a foot and half in length. The species are not caulescent as in *Aerides*, and the flowers appear singly, or two or three together, not in long racemes.

1293. *Calanthe*. From *καλος*, beautiful, and *ανθος*, a flower. The genus consists of robust terrestrial, not epiphytous, plants, with long plaited leaves, and fine white flowers, remarkable for the curious conformation of the labellum. They are easily cultivated as *Cymbidium*.

1294. *Stelis*. This was the Greek name of some parasitical plant found growing upon trees. The modern genus consists of little inconspicuous West Indian plants, with solitary leaves, and minute green flowers disposed in long filiform axillary spikes. They are not very easily managed; the best mode of cultivation is to plant them in very rotten wood with a little moss about them, and to keep them in a hot damp stove.

1295. *Malaxis*. From *μαλαξίς*, softness, in allusion to the delicate texture of the genuine species. They are natives of moist places in marshes, and are scarcely capable of successful cultivation.

1296. *Prescotia*. So called by Lindley in compliment to his friend John Prescott, Esq., an English gentleman resident at St. Petersburg, and highly distinguished for his botanical acquirements. A curious little plant, with long spikes of green flowers. It is easily cultivated in peat and sand.

1297. *Microstylis*. From *μικρος*, little, and *στυλος*, a column, on account of the minuteness of the column. Little bog plants, resembling *Malaxis* in habit and manner of growth.

1298. *Liparis*. Probably derived from *λιπαρος*, unctuous, in allusion to the surface of the leaves of the original species, *L. Loeselii*. This genus consists of plants varying somewhat in habit, but agreeing in having pale green or greenish purple flowers, in terminal spikes or racemes. Part of the species are terrestrial, requiring the treatment of *Malaxis*; the remainder are epiphytes.

1299. *Calypto*. A poetical name, from *καλυπτω*, to conceal; not merely alluding to the covering of the stigma, but preserving an analogy between this botanical beauty, so difficult of access, and the secluded goddess, whose isle was fabled to be protected miraculously from the observation of navigators.

1300. *Vanilla*. An alteration of *vanilla*, which is a diminutive of *vaina*, a Spanish word, signifying a sheath. The fruit is a long cylindrical pod, very like the sheath of a knife. *Vanilla aromatica* produces the fruit of that name, which is used in England to flavor chocolate, and in Spanish America for that purpose, for perfuming snuffs, and as a medicine. The Spaniards have three different sorts, which they distinguish in com-

- 12978 Leaves lanceolate spotted flat entire  
 12979 Leaves somewhat radical ensiform channelled falcate, Scapes few-fl. Spur filiform very long  
 12980 Stem compr. sheathing panicled, Branches quite simple spreading, Lip 3-lobed, Spur inflex. blunt emarg.
- 12981 Leaves 2-lobed and very unequal at end shorter than the weak radical sheathed scape, Spur emarginate  
 12982 Spur very long filiform, Spikes sheathed axillary
- 12983 Leaves lanc. plaited nerved, Spike dense many-flowered, Bractes small lanceolate
- 12984 Stem 1-leaved, Leaves oblong lanceolate the same length as raceme, Flowers 3-cornered  
 12985 Stem long 1-leaved, Leaf broad-lanceolate shorter than raceme, Flowers 6-cornered
- 12986 Lvs. about 4 at the base of the stem scabrous at the extremity, Scape pentagonal, Lip concave acute
- 12987 Leaves oblong caesious flat nerved, Flowers in a long dense spike
- 12988 Scape 1-leaved, Leaf amplexicaul. Lip truncate emarginate
- 12989 Lvs. twin ovate-lanc. Scape 3-cornered, Inner sepals reflexed discolored, Lip concave obov. acute at end  
 12990 Leaves twin ovate-lanceolate, Scape 3-cornered, Lip ovate at end recurved  
 12991 Somewhat bulbous, Leaves 4-ovate plaited striated wavy, Lip reflexed with two tubercles at base  
 12992 Radical leaves unequal lanceolate entire acute fleshy about the same length as raceme, Lip oblong retuse  
 12993 Leaves lanceolate ensiform keeled, Raceme many-flowered, Lip 3-toothed at end
- 12994 Lip narr. at base somew. clawed, Spur  $\frac{1}{2}$ -bifid long. than lip with acute teeth, Pedunc. longer than ovary

- 12995 Leaves ovate oblong nerved, Sepals wavy, Lip acute, Caps. cylindrical very long  
 12996 Leaves oblong lanceolate flat obsolete striated, Lip retuse

and Miscellaneous Particulars.

merce, viz. ; the *pompona*, the *ley*, and the *simarona*. When the fruit begins to turn yellow, it is gathered and fermented in small heaps, in the same manner as is practised with the cocoa or chocolate pods (*Theobroma*) ; it is then spread in the sun to dry, and when about half dried, pressed flat with the hand and rubbed over with the oil of Palma Christi, or of the cocoa ; it is then exposed to the sun to dry, the oiling repeated, and the pods covered with the leaves of the Indian reed to preserve them. The fruits which are brought to Europe are of a dark brown color, about six inches long, and scarce an inch broad ; they are wrinkled on the outside, and full of a vast number of black seeds, like grains of sand, of a pleasant smell, resembling Balsam of Peru.

The species of this genus, like many other Epidendreae, are falsely called parasitical ; but are no more so than our *Polypodium vulgare*, which is often found growing on the trunks of old trees, especially pollards, rooted in the decaying bark. The *Vanilla* shoot out roots at every joint like the Ivy, and may be either grown on a piece of a rotten trunk of a tree, or planted in a pot of rotten tan mixed with rubbish, and the stem trained against any surface which it can root into. Like all the tribe, these plants require very little water.

Mr. Salisbury has the following observations upon *Vanilla planifolia*. "It was discovered by Father Plumier, in the island of St. Domingo, where it grows wild, climbing to the tops of the highest trees ; and is easily preserved in our stoves, throwing out one or more roots at every leaf ; but as it seldom flowers here, I would recommend the following treatment : — plant it at one end of a low bark stove, the temperature of which must be kept constantly hot and damp, never below sixty degrees of Fahrenheit in the night, during winter. Let the earth be fat loam, taken about an inch deep from the surface, in some old wood : mix this with a few decayed leaves and small pieces of rotten sticks, either in a tub bored full of holes, and sunk at the back corner of the bark pit ; or pale off a space of two square feet for it, draining the bottom a foot in depth very effectually with hollow tiles and porous stones. Select a healthy young plant to place in this earth, and as soon as it pushes vigorously, divide the stem, by pinching off its top, into three or four principal branches, which train backwards and forwards over that end of the bark pit, at two inches and a half distance from each other, on stout rods of a rough-barked elm nailed firmly across ; the roots which issue from the bottom of the stem or branches, must be suffered to penetrate into the earth, where they will swell and nourish the plants ; but if those beyond attempt to strike downwards, wind them gently along the elm rods, to which they will soon cling by small fibres, like those of Ivy. When the principal branches have extended to fifteen or twenty feet in length, divide them again by pinching their tops, as you find it necessary, into about a dozen branches in all, which must be left to flower, guiding them first horizontally, and afterwards in every possible direction, upon smaller rods of rough-barked elm, stuck into the bark pit at various angles. From the twentieth of March to the twentieth of September, shade that end of the stove by the light foliage of a *Passiflora*, trained all over the top, but pruned so thin as to admit the rays of the sun to play on the bed underneath : I prefer this method to a mat, for many reasons. Let the earth be always damp by gentle sprinklings of water, but never very wet, except in the great heats of summer, when I should be inclined to give the plant two or three drenching showers all over from a fine-nosed watering-pot, shutting up the house at night full of steam."

History, Use, Propagation, Culture.

1931. *Cypripedium*. From *Κυπρις*, Venus, and *σλιππιν*, a slipper, in allusion to the elegant slipper-like form of the labellum. Handsome plants "which will only thrive in a shady border in peat soil. The American species should be covered with some dry straw in very severe frosts, or if there should be too much wet; they are not easily increased, but will sometimes perfect seeds in favorable situations, particularly if pains be taken to apply the pollen to the stigma." (*Bot. Cult.* 358.)

1932. *Stylidium*. From *στυλις*, a column, in reference to the manner in which the stamen and style are united into one columnar mass. Beautiful little New Holland plants with pink flowers, remarkable for the singular elasticity of their column, which, being touched with a pin, starts with violence from the side to which it was turned when stimulated. The species grow in sandy loam and peat, and are increased by seeds, or dividing at the root; some of them by cuttings.

1933. *Gunnera*. So called after Ernest Gunner, bishop of Norway, who published a Flora of his country from 1766 to 1772. An uninteresting plant with orbicular leaves. May be planted in a pot of loam and peat, and plunged in water; it is increased by dividing at the root.

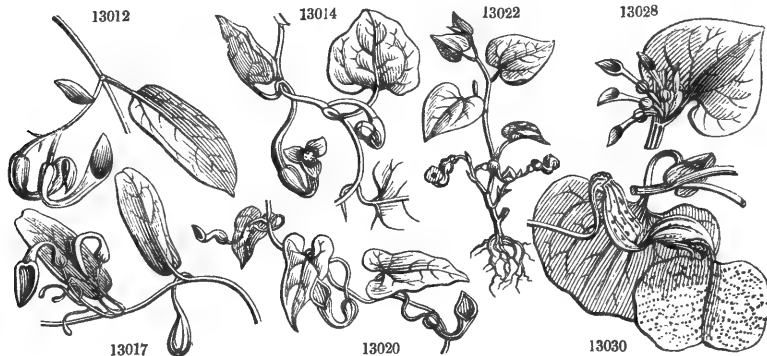

1934. *Aristolochia*. From *αριστος*, excellent, and *λοχος*, a female in child-birth; the plant was considered formerly to possess considerable powers in aiding the expulsion of the placenta, and in exciting the lochial

## DIANDRIA.

- 12997 Stem leafy, Lobe of column elliptical blunt, Lip shorter than sepals compressed  
 12998 Stem leafy, Lobe of column triangular acute, Lip shorter than sepals compressed  
 12999 Stem leafy, Lobe of column triangular oblong blunt, Lip shorter than sepals compressed  
 13000 Stem leafy, Lobe of column elliptical cordate blunt, Lip longer than blunt sepals, Spike in front  
 13001 Stem leafless 1-flowered, Leaves 2 radical oblong blunt, Scape scarcely longer than leaves  
 13002 Flowers with 5 sepals, Lip saccate spurred, Stem leafy  
 13003 Leaves distichous fleshy nerveless spotted, Scape little longer than leaves  
 13004 Leaves cartilaginous ligulate not spotted twice as short as the hairy scape  
  
 13005 Leaves linear toothletted at edge, Raceme spiked simple and scape glandular  
 13006 Leaves narrow linear decurrent smooth, Throat 4-crowned, Lip with an appendage  
 13007 Stem scandent, Leaves linear cirrhose, Throat crowned, Lip with an appendage, Column downy upwards  
 13008 Leaves setaceous linear sessile somewhat hairy, Orifice naked, Lip with an appendage  
  
 13009 Leaves linear, Spike subsessile divided: partial few-fl. Capsules adnate at base linear 1-celled  
  
 13010 Leaves reniform toothed shorter than the scape in fruit

## HEXANDRIA.

- 13011 Leaves 3-lobed, Stem twining, Corollas cylindrical broken saccate at base, Lip cordate cuspidate  
 13012 Lvs. obl. acum. 3-nerved, Stem twining, Peduncles many-flowered, Cor. incurv. Lip ovate mucronate  
 13013 Lvs. cord. acute, Stem twining, Pedunc. 1-flowered with an ovate bract. Cor. ascend.: limb twisted equal  
 13014 Stem twining, Lvs. stalked cord. downy beneath, Pedunc. sol. without bractes, Tube of cor. twisted back  
 13015 Lvs. cordate ovate, Stem twining, Pedunc. 1-fl. longer than leaf, Lip cordate lanceolate longer than cor  
 13016 Leaves cordate obl. Stem twining, Cor. straight: limb spreading, Lip spatulate bearded at end  
 13017 Leaves elliptical blunt somewhat emarginate slightly cordate, Pedunc. many-fl. Cor. erect  
 13018 Leaves roundish cordate acute, Stem twining, Peduncles about 3, Cor. incurved, Lip ovate  
 13019 Leaves cordate ovate blunt glaucous beneath, Stem twining, Cor. incurved, Lip ovate retuse  
 13020 Leaves cordate oblong acuminate, Stem prostrate flexuose somewhat climbing, Cor. erect, Lip lanc. acute  
 13021 Leaves cordate ovate retuse, Stem prostrate flexuose somewhat climbing, Cor. incurved, Lip ovate  
 13022 Leaves cordate oblong acuminate, Stem prostrate flexuose somewhat climbing, Cor. erect, Lip lanc. acute  
 13023 Leaves cordate blunt, Stem weak, Flowers solitary, Bractes cordate stalked  
 13024 Lvs. cordate ovate crenate scabrous netted beneath, Stem branched at base flexuose prostrate, Cor. erect  
 13025 Lvs. cordate ovate blunt subsess. Stem nearly erect and simple, Pedunc. sol. 1-fl. Cor. erect  
 13026 Lvs. cordate ovate blunt emarginate stalked, Stem flexuose nearly erect, Pedunc. sol. 1-fl. Cor. erect  
 13027 Lvs. cordate ovate blunt downy stalked, Stem erect hairy, Pedunc. sol. 1-fl. Cor. recurved  
 13028 Lvs. roundish cordate bluntish stalked, Stem erect, Pedunc. 1-fl. heaped, Cor. erect  
 13029 Leaves cordate lanceolate, Stem erect shrubby  
 13030 Leaves reniform roundish cordate amplexicaul. Corolla incurved at base saccate: 2-lipped in the middle  
 13031 Leaves cordate acuminate, Flowers in racemes, Capsules acutely hexangular

## and Miscellaneous Particulars.

discharge. The root of *A. serpentaria* is said to be the substance which the Egyptian snake-jugglers chew, for the purpose of stupefying the snakes by the introduction of their saliva into the reptiles' mouths. *A. clematita* (from *κλημα*, a young shoot of the vine, in allusion to its appearance) is a species which furnishes one of the roots employed in European medicine. It is stimulant, stomachic, and emmenagogue; use has been made of it for various purposes, as for paleness of the countenance, fistula, sarcoma, &c. *A. pistolochia* is also employed for the same purposes. It grows upon the dry stony places of Languedoc and Provence. It is used in cases of obstructed perspiration, and in disorders of the lungs. The roots should be chosen of a plump texture, and a yellowish color. They should be newly dried, and possess an aromatic flavor and a bitter taste.

*Aristolochia trilobata* and *odoratissima* have strong smelling roots, which are looked upon in Jamaica as powerful medicines, and used as stomachics by the slaves. The first species is called *Contrayerva* of the north side, from its growing in that part of the island; and the other *Contrayerva* of the south side, for a corresponding reason. The root of *A. serpentaria* retains a place in the *Materia Medica*. The dried root is imported into this country from North America; it has an aromatic odor, not unlike that of *Valerian*; and a sharp, warm, bitter, pungent taste, resembling in some degree that of camphor. Medicinally, it is stimulating, diaphoretic, and tonic.

## CLASS XXI. — MONOECIA.

*Male and female organs in distinct flowers, but upon the same plant.*

This class consists of a variety of plants of all kinds, natures, and affinities, combined by the character of having their flowers unisexual, but upon the same plant, in which respect Monoecia is distinguished from the next class, Dioecia. It contains nearly all the most important timber-trees of the temperate countries of the world, such as the oak, the pine, the birch, the beech, the walnut, the plane, the cypress, and many others. The bread-fruit, so important an article of food in some parts of the world, is placed in Monandria. Various palms occupy a station in other parts of the class. The dangerous Manchineel-tree, and many poisonous or medicinal plants, are also placed here. To Monoecia Polyandria belongs the famous Upas-tree of Java, to which so many fables are attached. It is described in Rumphius's *Herbarium Amboinense* (2. 37.), under the name of Ipo, and is now ascertained to be a species of *Antiaris*. From *Siphonia elastica*, a plant of Monoecia Monadelphia, and native of Brazil, one of the kinds of Caoutchouc or gum elastic of commerce is obtained. Sprengel, and others, refer most of the genera of Monoecia to other classes, considering those only to be truly referable to it, of which the male and female flowers have some differences of structure.

## Order 1. MONANDRIA.

Stamen 1.

1935. *Artocarpus*. Male. A cylindrical catkin. Cal. O. Petals 2. Filament the length of cor. Female. Cal. O. Cor. O. Ovaries numerous, collected in a globe. Style filiform. Drupe compound.

1936. *Casuarina*. Male. Catkin filiform. Calyx 2-valved. Cor. O. Female. Catkin globose. Calyx an ovate scale. Cor. O. Caps. 2-valved, 1-seeded. Seed winged at end.

1937. *Ceratocarpus*. Male. Cal. 2-parted. Cor. O. Filament long. Female. Calyx 1-leaved, 2-horned, attached to the superior ovary. Cor. O. Style 2. Seed 1, tightly enclosed in the calyx.

1938. *Zannichellia*. Barren fl. Perianth. none. Fertile fl. Perianth. single of 1 leaf. Germens 4 or more. Style 1. Stigma peltate. Capsules sessile.

## Order 2. DIANDRIA.

Stamens 2

1939. *Lemna*. Male. Cal. 1-leaved. Cor. O. Female. Calyx 1-leaved. Cor. O. Style 1. Capsule 1-celled, 2-seeded.

1940. *Anguria*. Male. Calyx 5-fid. Petals 5. Female. Cal. 5-fid. Petals 5. Fruit inferior, 2-celled, many-seeded.

## Order 3. TRIANDRIA.

Stamens 3.

1941. *Comptonia*. Male. A catkin. Calyx a scale. Petals 2. Filaments 2-forked. Female. A catkin. Calyx a scale. Petals 6. Styles 2. Nut ovate.

1942. *Hernandia*. Male. Calyx 3-parted. Petals 3. Female. Calyx truncate, entire. Petals 6. Drupe hollow, open at orifice, with a moveable kernel.

1943. *Azyris*. Male. Calyx 3-parted. Cor. O. Female. Calyx 5-leaved. Cor. O. Styles 2. Seed 1.

1944. *Tragia*. Male. Calyx 3-parted. Cor. O. Female. Calyx 5-parted. Cor. O. Style 3-fid. Caps. of 3 pieces, and 3 cells. Seed solitary.

1945. *Typha*. Flowers collected into cylindrical dense spikes or catkins. Barren fl. Perianth. O. Stam. 3. together, upon a chaffy or hairy receptacle, united below into 1 filament. Fertile fl. Perianth. O. Pericarp pedicellate, surrounded at the base with hairs resembling a pappus.

1946. *Sparganium*. Flowers in spherical dense heads. Barren fl. Perianth single, of 3 leaves. Fertile fl. single, of 3 leaves. Drupe dry, with 1 seed.

1947. *Carex*. Flowers collected into an imbricated catkin. Barren fl. Calyx of 1 scale, glumaceous. Cor. O. Fertile fl. Calyx of 1 leaf, glumaceous. Cor. of 1 leaf, urceolate, ventricose. Stigm. 2-3. Nut triquetrous, included within the persistent cor.

1948. *Cobresia*. Flowers in an imbricated catkin. Male. Calyx a solitary scale. Cor. O. Female. Cal. generally a double scale; one flat, the other involving the ovary. Cor. O. Stigmas 3. Nut somewhat three-cornered, naked.

1949. *Uncinia*. Flowers in an imbricated catkin, androgynous. Male. Cal. a solitary beardless scale. Female. Cal. bearded; beard hooked from the base of the inside of scale. Stigmas 3.

1950. *Zea*. Male in distinct spikes. Cal. a two-flowered blunt glume. Cor. a blunt glume. Female. Cal. a 2-valved glume. Cor. a 2-valved glume. Style 1, filiform, pendulous. Seeds solitary, immersed in an oblong receptacle.

1951. *Coix*. Male in remote spikes. Cal. a 2-flowered blunt glume. Cor. a blunt glume. Female. Calyx a 2-flowered glume. Cor. a blunt glume. Style 2-parted. Seed covered by the ossified calyx.

1952. *Tripsacum*. Male. Glume 2-flowered: outer male; inner neuter. Cor. a membranous glume. Female. Calyx a 1-fl. glume, surrounded by a 1-leaved involucre, perforated at the recesses. Cor. a 2-valved glume. Styles 2. Seed 1.

1953. *Heteropogon*. Spike simple, monoecious. Flowers male on one side, female on the other. Male. Cal. 2-valved. Cor. 2-valved, beardless: the inner valve setaceous. Nectary 2-lobed, turgid. Female. Cal. two-valved. Cor. 2-valved, one thickish and bearded. Beard very long and hairy.

1954. *Olyra*. Male. Calyx a 1-flowered somewhat awned glume. Cor. O. Female. Cal. a 1-fl. spreading, ovate, awned glume. Cor. a 2-valved blunt glume. Style bifid. Seed cartilaginous.

## Order 4. TETRANDRIA.

Stamens 4.

1955. *Alnus*. Flowers collected into imbricated catkins. Barren fl. Scale of the catkin 3-lobed, with three flowers. Perianth. single, 4-partite. Fertile fl. Scale of the catkin subtrifid, with 2 flowers. Perianth. O. Styles 2. Fruit compressed.

1956. *Betula*. Barren flower in a cylindrical catkin, its scales 3-fl. Perianth. O. Stam. 10-12. Fertile fl. Scale of the catkin imperfectly 3-lobed, 3-flowered. Perianth. O. Styles 2. Germens compressed, 2-celled, one abortive. Nuts compressed, with a membranaceous margin, 1-seeded.

1957. *Bursera*. Male. Calyx 3-leaved. Petals 2. Rudiment of an ovary. Female. Calyx 4-leaved. Petals 3. Styles 3. Caps. with 3 beaks and 3 cells. Seeds 2.
1958. *Cicca*. Male. Calyx 4-leaved. Cor. O. Female. Cal. 4-leaved. Cor. O. Styles 4. Capsule 4-cocous, not splitting, somewhat fleshy.
1959. *Morus*. Male. Cal. 4-parted. Cor. O. Female. Calyx 4-leaved. Cor. O. Styles 2. Calyx berried. Seed 1.
1960. *Behmeria*. Male. Cal. 4-parted. Cor. O. Nut O. Female. Cal. O. Cor. O. Style 1. Seed 1.
1961. *Pilea*. Male. Cal. 4-parted membranous. Stamens 4 elastic. Female. Calyx 3-leaved, with one sepal fleshy and gibbous. Stigma sessile fringed.
1962. *Urtica*. Barren fl. Perianth, single, of 4 leaves, containing the cup-shaped rudiment of a germen. Fertile fl. Perianth, single, of 2 leaves. Pericarp 1-seeded, shining.
1963. *Pachysandra*. Male. Calyx 4-leaved. Cor. O. Female. Calyx 4-leaved. Cor. O. Styles 3. Caps. 3-horned, 3-celled. Seeds 2.
1964. *Diotis*. Male. Calyx 4-leaved. Cor. O. Female. Calyx 1-leaved, 2-horned. Style 2-parted. Seed 1, villous at base, covered with the 2-horned calyx.
1965. *Empleurum*. Male. Calyx 4-fid. Cor. O. Female. Cal. 4-fid, inferior. Cor. O. Stigma cylindrical, seated on a lateral tooth of the ovary. Caps. splitting at side. Seed 1, with an arillus.
1966. *Aucuba*. Male. Cal. 4-toothed. Petals 4. Recept. with a square hole. Female. Cal. 4-toothed. Petals 4. Ovary inferior. Style 1, short. Nut ovate, 1-celled.
1967. *Littorella*. Barren fl. Calyx of 4 leaves. Cor. 4-fid. Stam. very long. Fertile fl. Calyx O. Cor. unequally 3-cleft. Style very long. Nut 1.
1968. *Serpicula*. Male. Cal. 4-toothed. Petals 4. Female. Cal. 4-parted. Pericarp a downy nut.
1969. *Maclura*. Male. A catkin. Female. Cal. O. Corolla O. Style 1, filiform, villous. Ovaries numerous, coalescing into a compound globose berry of many cells; cells 1-seeded. Seed obovate, compressed.

## Order 5. PENTANDRIA.

Stamens 5.

1970. *Exocarpus*. Male. Cal. 5-leaved. Cor. O. Stamens inserted in calyx. Female. Style simple, short. Stigma peltate. Drupe 1-seeded, placed on a fleshy receptacle.
1971. *Nephetium*. Male. Cal. 5-toothed. Cor. O. Female. Cal. 4-fid. Cor. O. Ovaries 2. Styles two to each. Drupes 2, dry, mucronate, 1-seeded.
1972. *Schinandra*. Male. Cal. 9-leaved in a triple row. Cor. O. Anthers subsessile, cohering at end. Female. Cal. of male. Cor. O. Ovaries numerous, capitate. Berries 1-seeded, inserted on a long filiform receptacle.
1973. *Franzeria*. Male. Cal. common, 1-leaved, many-toothed. Cor. 1-petalous, tubular, 5-toothed. Recept. naked. Female. Calyx many-leaved. Cor. O. Styles 4. Drupe dry, 4-celled, setose.
1974. *Xanthium*. Male. Common calyx imbricated. Cor. monopetalous, 5-fid, funnel-shaped. Female. Cal. a 2-leaved, 1-flowered involucre. Cor. O. Drupe dry, mucronate, 2-fid. Nut 2-celled.
1975. *Amaranthus*. Male. Cal. 3-5-leaved. Cor. O. Stamens 3-5. Female. Cal. of the male. Cor. O. Styles 3. Caps. 1-celled, cut round about.
1976. *Luffa*. Male. Cal. 5-parted. Cor. 5-parted, attached to calyx. Female. Cal. and cor. of male. Filaments 5, sterile. Ovary inferior. Stigma clavate. Gourd with a lid, 3-celled, furrowed.
1977. *Ambrosia*. Male. Common cal. 1-leaved. Cor. 1-petalous, 5-fid, funnel-shaped. Recept. naked. Female. Cal. 1-leaved, entire, 5-toothed beneath, 1-flowered. Cor. O. Nut formed by the indurated calyx, 1-seeded.
1978. *Securinega*. Male. Cal. 5-parted. Cor. O. Stamens 5, inserted under a rudiment of a pistillum. Female. Capsule 3-celled.

## Order 6. HEXANDRIA.

Stamens 6.

1979. *Zizania*. Male. Cal. O. Cor. a 2-valved blunt glume, mixed with the females. Female. Cal. O. Cor. a 2-valved glume, cucullate, and awned. Style 2-parted. Seed 1, enveloped in the plaited corolla.
1980. *Pharus*. Male. Cal. a 2-valved 1-fl. glume. Cor. a 2-valved glume. Female. The cal. of the male. Cor. a long involute 2-valved glume. Seed 1.
1981. *Gaetarda*. Male. Cal. cylindrical. Cor. 4-7-fid, funnel-shaped. Female. Cal. cylindrical. Cor. 4-7-fid. Ovary 1. Drupe dry.
1982. *Saguo*. Common spatula 1-valved. Spadix branched. Male. Cal. 3-leaved. Cor. O. Filam. dilated. Female. Cal. 3-leaved, with two of the leaves bifid. Cor. O. Style very short. Stigma simple. Nut tessellated-imbricated, 1-seeded.
1983. *Cocos*. Common spatula 1-valved. Spadix branched. Male. Cal. 3-leaved. Cor. 3 petals. Female. Cal. 2-leaved. Cor. 6 petals. Style O. Stigma a depression. Drupe fibrous.
1984. *Elate*. Common spatula 2-valved. Spadix branched. Male. Cal. 3-toothed. Petals 3. Anthers sessile. Female. Cal. 3-toothed. Petals 3. Stigmas 3. A drupe.
1985. *Bactris*. Common spatula 1-valved. Spadix branched. Male. Cal. 3-parted. Cor. 3-fid. Female. Cal. 3-toothed. Cor. 3-toothed. Style very short. Stigma capitate. Drupe fibrous, succulent.

## Order 7. POLYANDRIA.

Stamens more than 6.

1986. *Ceratophyllum*. Barren fl. Cal. multipartite. Cor. O. Stam. 16-20. Fertile fl. Cal. multipartite. Cor. O. Stigma nearly sessile, oblique. Nut 1-seeded.
1987. *Myriophyllum*. Barren fl. Cal. of 4 leaves. Petals 4. Stamens 8. Fertile fl. Cal. of 4 leaves. Petals 4. Stigmas 4. Sessile. Nuts 4, subglobose, 1-seeded.
1988. *Sagittaria*. Male. Cal. 3-leaved. Petals 3. Stamens about 24. Female. Cal. 3-leaved. Petals 3. Ovaries many. Seeds many, naked.
1989. *Begonia*. Male. Cal. O. Petals 4: the two opposite the largest. Stamens numerous. Female. Cal. O. Petals 4 or 6, like the male. Styles 3, bifid. Caps. inferior, 3-angular, winged, 3-celled, many-seeded.
1990. *Poterium*. Barren fl. Cal. of 4 leaves. Cor. 4-partite. Stamens 30-40. Fertile fl. Cal. of 4 leaves. Cor. 4-partite. Germens 2. Fruit 2-celled, invested with the cal.
1991. *Amirola*. Male. Calyx 5-fid: lower segm. cut down to the base. Cor. O. Stamens 8, declinate. Female as in the male. Style incurved. Caps. 3-cocous, inflated, 3-valved. Seeds globose.
1992. *Acidoton*. Male. Cal. 5-leaved. Cor. O. Stamens 35-40. Female. Cal. 6-leaved. Cor. O. Style 3-fid. Caps. 3-cocous.
1993. *Thelygonum*. Male. Cal. 2-fid. Cor. O. Stamens about 12. Female. Cal. 2-fid. Cor. O. Ovary 1. Caps. coriaceous, 1-celled, 1-seeded.
1994. *Castanea*. Barren fl. in a very long cylindrical catkin. Perianth, single, of 1-leaf, 6-cleft. Stamen 5-20. Fertile fl. 3, within a 4-lobed, thickly mucronate involucre. Perianth, single, urceolate, 5-6-lobed, having the rudiments of 12 stamens. Germen incorp. with the perianth, 6-celled, with the cells 2-seeded, 5 of them mostly abortive. Styles 6. Nut 1-2-seeded, invested with the enlarged involucre.

1995. *Ostrya*. Male, an imbricated catkin. Cal. a scale. Cor. O. Filaments branched, Female, a naked catkin. Cal. O. Cor. O. Caps. inflated, imbricated, 1-seeded at base.
1996. *Carpinus*. Barren fl. in a cylindrical catkin, its scales rounded ciliated at the base. Stamens 8-20 Fertile fl. in a lax catkin, its scales large, foliaceous, 3-lobed, 1-flowered. Invol. O. Perianth. of 1 leaf, urceolate, 6-dentate, incorporated with the 2-celled germs, of which 1 cell is abortive. Style 2. Nut ovate, striated, 1-seeded.
1997. *Fagus*. Barren fl. in a globose catkin. Perianth. single, of 1 ear, campanulate, 6-cleft. Stamens 5-12. Fertile fl. 2, within a 4-lobed prickly involucre. Perianth. single, urceolate, with 4-5 minute lobes. Germen incorporated with the perianth., 3-celled, two of them becoming abortive. Style 3. Nuts 1-seeded, invested with the enlarged involucre.
1998. *Corylus*. Barren fl. in a cylindrical catkin, its scales 3-cleft. Perianth. O. Stamens 8. Anthers 1-celled. Fertile fl. Perianth. obsolete. Germens several, surrounded by a scaly involucre. Stigmas 2. Nut 1-seeded, surrounded at the base with the enlarged united coriaceous scales of the involucre.
1999. *Juglans*. Male, an imbricated catkin. Cal. a scale. Cor. 6-parted. Filaments 4-18. Female. Cal. 4-fid, superior. Cor. 4-fid. Styles 2. Drupe coriaceous, with a furrowed nut.
2000. *Quercus*. Barren fl. in a lax catkin. Perianth. single, somewhat 5-cleft. Stamens 5-10. Fertile fl. invol. cup-shaped, scaly. Perianth. single, incorporated with the germs, 6-lobed. Germen 3-celled, 2 of them abortive. Style 1. Stigmas 3. Nut (acorn) 1-celled, 1-seeded, surrounded at the base by the enlarged cup-shaped involucre.
2001. *Liquidambar*. Male, a conical catkin, surrounded by a 4-leaved involucre. Cal. O. Cor. O. Filaments numerous. Female, a globose catkin, surrounded by a 4-leaved involucrum. Cal. 1-leaved, urceolate, 2-flowered. Cor. O. Styles 2. Capsules 2, surrounded at base by calyx, 1-celled, many-seeded.
2002. *Platanus*. Male, a globose catkin. Cal. O. Cor. scarcely any. Anthers growing about the filament. Female, a globose catkin. Cal. many-leaved. Cor. O. Styles with a recurved stigma. Seeds roundish, mucronate with the style, papoose at base.
2003. *Salisburia*. Male, a naked catkin. Cal. O. Cor. O. Anthers imbricated. Female. Cal. 4-fid. Drupe with a 3-cornered nut.
2004. *Carludovica*. Common spathe 4-leaved. Spadix cylindrical. Male. Common calyx a cubical 4-flowered receptacle: proper calyx many-toothed. Female. Cal. an edge. Styles 4, very long. Stigmas anther-like. Berry cubical, many-seeded.
2005. *Caladium*. Male. Cal. and cor. O. Anthers peltate, many-celled, disposed in a spike at the end of the spadix. Female. Cal. and cor. O. Ovaries inserted at base of spadix. Style O. Berry 1-celled, many-seeded.
2006. *Arum*. Spathe of 1 leaf, convolute at the base. Perianth. O. Spadix with germens at the base. Stem (sessile) near the middle of the spadix, which is naked above. Berry 1-celled, 1-seeded.
2007. *Caryota*. Common spathe compound. Male. Cal. 3-leaved. Petals 3. Female. Cal. 3-leaved. Cor. 3-parted. Style 1. Berry 1-celled, 2-seeded.

## Order 8. MONADELPHIA.

Stamens united into a single body.

2008. *Nipa*. Palm. Male. Cal. O. Petals 6. Filament 1, 12-fid. Female. Stigma a lateral furrow. Drupe angular, 1-seeded.
2009. *Areca*. Common spathe 2-valved. Male. Cal. 3-parted. Petals 3. Stamens 6, cohering at base. Female. Cal. 3-leaved. Petals 3. Nect. 5-toothed. Styles 3, very short. Drupe 1-seeded.
2010. *Belis*. Male. Anthers 2-celled. Female. Scales imbricated in a lupuliform cone, very short, crested, bracteate at back, trigynous. Lateral pericarps auricled, middle cuneate, deciduous with the cone.
2011. *Agathis*. Male. Anthers many-celled. Female. Scales imbricated in a round cone, naked at back, persistent monogynous. Pericarps winged, united to the inside of scale. Cotyledons 2.
2012. *Pinus*. Male. Anthers 2-celled. Female. Scales in a conical cone, bracteate at base, digynous. Pericarps attached to the inside of scale, more or less winged, deciduous. Stigmas 2-3-fid. Cotyledons 4-8.
2013. *Abies*. The same as *Larix*, excepting its habit and stigma, which is that of *Pinus*. Cotyledons 3-9.
2014. *Larix*. Male. Anthers 2-celled. Female. Scales imbricated in a round cone, bracteate at base, digynous. Pericarps attached to inside of scale, winged, deciduous. Stigma hemispherical, cupped, glandular. Cotyledons 5-9.

*History, Use, Propagation, Culture,*

1935. *Artocarpus*. From *aëros*, bread, and *xæros*, fruit, in allusion to the well-known name and uses of the bread-fruit. *Rîme* or *Fruit-à-pain*, Fr., *Brodbaum*, Ger., and *Albero di pane*, Ital. *A. incisa* grows in the South Sea Islands to the size of a moderate sized oak, with alternate leaves, deeply gashed, glaucous, and two feet long. The whole tree and the fruit before it is ripe, abound in a very tenacious milky juice. The fruit is about the

2015. *Schubertia*.

2016. *Podocarpus*. Male. Cal. leaflets of the bud imbricated. Anthers many, adnate, bilocular, rostrate, fixed to the lengthened column of the filament. Female. An ovate 1-celled nut, half immersed in a firm receptacle.

2017. *Cupressus*. Male, an imbricated catkin. Cal. a scale. Cor. O. Anthers 4, sessile, without filaments. Female, a cone-like catkin. Cal. a 1-fl. scale. Cor. O. Stigma 2 concave dots. Nut angular.

2018. *Thuja*. Male, an imbricated catkin. Cal. a scale. Pet. 4. Anthers 4. Female, a cone-like catkin. Cal. a 2-fl. scale. Cor. O. Nut 1, surrounded by an edged wing.

2019. *Trichosanthes*. Male. Cal. 5-toothed. Cor. 5-parted, ciliated. Filaments 3. Female. Cal. 5-toothed. Cor. 5-parted, ciliated. Style 3-fid. Gourd oblong.

2020. *Atomorpha*. Male. Cal. 5-fid. Cor. 5-parted. Filaments 3. Female. Cal. 5-fid. Cor. 5-parted. Styles 3-fid. Gourd dropping off with elasticity.

2021. *Cucurbita*. Male. Cal. 5-toothed. Cor. 5-fid. Filaments 3. Female. Cal. 5-toothed. Cor. 5-fid. Ovary 3-fid. Seeds of gourd with a tumid edge.

2022. *Cucumis*. Male. Cal. 5-toothed. Cor. 5-parted. Filaments 3. Female. Cal. 5-toothed. Cor. 5-parted. Ovary 3-fid. Seeds of gourd with a sharp edge.

2023. *Sicyos*. Male. Cal. 5-toothed. Cor. 5-parted. Filaments 3. Female. Cal. 5-toothed. Cor. 5-parted. Style 3-fid. Gourd 1-seeded.

2024. *Bryonia*. Barren fl. Cal. 5, dentate. Cor. 5-cleft. Filaments 3. Anthers 5. Fertile fl. Calyx 5-dentate. Cor. 5-cleft. Style trifid. Berry inferior, globose, many-seeded.

2025. *Andrachne*. Male. Cal. 5-leaved. Petals 5. Stamens 5, inserted into the rudiment of a style. Female. Cal. 5-leaved. Cor. O. Styles 3. Caps. 3-celled. Seeds 2.

2026. *Stillingia*. Male. Cal. hemispherical, many-fl. Cor. tubular, eroded. Female. Cal. 1-flowered. inferior. Cor. superior. Style 3-fid. Caps. 3-coccus.

2027. *Phyllanthus*. Male. Cal. 6-parted. Cor. O. Filament columnar. Anthers 3. Female. Cal. 6-parted. Cor. O. Disk with 12 angles. Styles 3. Capsule 3-coccus.

2028. *Aleurites*. Male. Cal. 3-fid. Petals 5. Scales 5. Filament columnar. Anthers numerous. Female. Cal. 3-fid. Petals 5. Scales 5. Style O. Stigmas 2. Berry dicoccus.

2029. *Omphalea*. Male. Cal. 4-parted. Cor. O. Disk a fleshy ring. Filament columnar. Anthers 2-5. Female. Cal. 4-parted. Cor. O. Style very short. Stigma trifid. Caps. 3-coccus, 3-celled: cells with a solitary nut.

2030. *Hippomane*. Male. Cal. campanulate, emarginate. Cor. O. Filament columnar. Female. Cal. 3-leaved. Cor. O. Style very short. Stigma 7-fid. Drupe with a 7-celled nut.

2031. *Sapium*. Male. Cal. 2-fid. Cor. O. Filament 2-fid. Female. Cal. 3-toothed. Cor. O. Style very short. Stigma 3-fid. Caps. 3-coccus.

2032. *Croton*. Male. Cal. cylindrical, 5-toothed. Petals 5. Stamens 10-15. Female. Cal. many-leaved. Cor. O. Styles 3, bifid. Caps. 3-celled. Seed 1.

2033. *Jatropha*. Male. Cal. O, or 5-leaved. Cor. monopetalous, funnel-shaped. Stamens 10, alternately shorter. Female. Cal. O. Cor. 5-petalous, spreading. Styles 3, bifid. Caps. 3-celled. Seed 1.

2034. *Ricinus*. Male. Cal. 5-parted. Cor. O. Stamens numerous. Female. Cal. 3-parted. Cor. O. Styles 3, bifid. Capsule 3-celled. Seed 1.

2035. *Hura*. Male. An imbricated catkin. Perianth truncate, 2-leaved. Cor. O. Filament cylindrical, peltate at end, surrounded by many double anthers. Female. Cal. cylindrical. Cor. O. Style funnel-shaped. Stigma 12-fid. Caps. 12-celled. Seed 1.

2036. *Sterculia*. Male. Cal. 5-parted. Cor. O. Filament columnar, surmounted by numerous anthers. Female. Cal. 5-parted. Cor. O. Anthers sterile, surrounding the base of the stalked ovaries. Follicles 5, many-seeded.

2037. *Heritiera*. Male. Cal. 5-toothed. Cor. O. Filament columnar, surmounted below the end with anthers. Female. Cal. 5-toothed. Cor. O. Sterile anthers at base of ovaries. Drupes 5, dry, 1-seeded.

2038. *Acalypha*. Male. Cal. 3-4-leaved. Cor. O. Stamens 8-16. Female. Cal. 3-leaved. Cor. O. Styles 3. Caps. 3-coccus, 3-celled. Seed 1.

2039. *Dalechampia*. Common involucre outside, with 4 leaflets: inside with 2, trifid. Male. Umbel 10-fl.; with a 2-leaved involucre and numerous palea. Cal. 5-leaved. Cor. O. Filaments many, connate. Female. Florets 3, with a 3-leaved involucre. Cal. 11-leaved. Cor. O. Style filiform. Caps. 3-coccus.

2040. *Plukenetia*. Male. Cal. 4-parted. Cor. O. Stamens 20. Female. Cal. 4-parted. Cor. O. Style very long, with a peltate 4-lobed stigma. Caps. 4-coccus.

History, Use, Propagation, Culture,

resembling that of the crumb of wheaten bread mixed with Jerusalem Artichoke. The plant was first brought to England by the unfortunate Captain Bligh. A fresh supply has been more than once received, and there are now a number of plants in the nurseries about London. The bread-fruit, according to Sweet, is generally supposed to be difficult of cultivation in this country. He considers that the plants have been, in general, treated too tenderly, and not allowed sufficient air. "They appear," he says, "to be of the same nature as the Fig, to which they are nearly allied. Large cuttings root freely in a pot of sand, plunged under a hand-glass, in a moist heat, with all their leaves entire: if the leaves are shortened, it is a great chance if they succeed." (*Bot. Cult.* 19.)

There are several varieties of the bread-fruit, as of all plants that have been long in cultivation. The principal of these varieties are without seeds; the natives of Otaheite reckon at least eight, differing in the form of the leaf and fruit. A. integrifolia is also by many considered a variety of the other; for the leaves are sometimes lobed, and the situation of the fruit varies with the age of the tree, being first borne on the branches, then on the trunk, and finally on the roots.

The bread-fruit is ripe in December, and is used boiled, or fried in Palm oil. Besides the use of the fruit, the economical purposes to which the other parts of the tree are applied are various. The wood is used in building boats and houses; a cloth is made of the inner bark; the male catkins serve for tinder; the leaves for wrapping up food, and for wiping the hands instead of towels; and the juice for making bird-lime, and a cement for filling up the cracks of vessels for holding water. According to Forster, three trees are supposed to yield sufficient nourishment for one person.

The bread-fruit tree is distributed very extensively over the East Indian continent and islands, as well as the innumerable islands of the South Seas. In 1793 it was introduced to the West Indies, and subsequently to different parts of South America. Much has been said in praise of it by Europeans, and certainly, to the inhabitants of the South Sea Islands, it may be a valuable food, as the acorn was to the inhabitants of Britain, when they were in a certain state of civilization. But whether a civilized and refined people would esteem this fruit for their own use as highly as they do for the use of the semi-barbarians of the South Seas, is a point which may reasonably be doubted.

1936. *Casuarina*. The name under which the tree is described by Rumphius, who probably called it so from the resemblance its foliage bears to the plumage of the *casoar* or *cassowary* of the same country. By the Malays it is called *filao*, and by the South Sea Islanders *club-wood*, on account of the use of it for warlike weapons. *Casuarina equisetifolia* is a large spreading and lofty tree, with leaves, or rather branchlets, hanging down in bunches from twelve to eighteen inches in length, like a long head of hair, or a horse's tail, all jointed from top to bottom. The appearance of the whole tree is very remarkable. It was introduced by the first Lord Byron.

- 13034 Branchlets flaccid round, Scales of cones unarmed villous  
 13035 Dioecious, Branchlets erect furrowed, Scales of cones unarmed smoothish  
 13036 Dioecious, Branchlets ovate round, Scales of cones unarmed ciliated  
 13037 Dioecious, Branchlets flaccid, Scales of cones villous and rough with tubercles  
 13038 Dioecious, Young branches somewhat flaccid, Scales of cones villous, Male sheaths submultifid ciliated  
 13039 Branches erect, Scales of cones mucronate pubescent, in which it chiefly differs from *C. stricta*  
 13040 Monoecious, Branchlets erect square, Scales of cones unarmed smooth

13041 Stem much branched diffuse making globose tufts

13042 Anthers 4-celled, Stigmas entire, Pericarps toothed on the back

#### DIANDRIA.

13043 Fronds thin elliptical-lanceolate caudate at one extremity, at the other serrate, Roots solitary

13044 Fronds nearly ovate compressed, Roots solitary

13045 Fronds obovate nearly plane above hemispherical beneath, Roots solitary

13046 Fronds obovate rotundate compressed, Roots numerous clustered

13047 Fruit small, Leaves 3-lobed

#### TRIANDRIA.

13048 Leaves oblong alternately sinuated

13049 Leaves peltate

13050 Leaves cordate ovate acuminate flat stalked at base

13051 Leaves ovate, Stem erect, Spikes simple

13052 Leaves ovate, Stem erect, Spikes panicled

13053 Leaves obovate, Stem somewhat divided, Flowers capitate

#### and Miscellaneous Particulars.

1397. *Ceratocarpus*. Named from *κερας*, a horn, and *καρπος*, fruit, because the seeds have two horns. Useless weeds.

1398. *Zannichellia*. So called in honor of John Jerome Zannichella, a Venetian apothecary, who died in 1729. He left behind him a few works of little consequence. A plant found abundantly in the marshes of some parts of England.

1399. *Lemna*. Said to have been so called from *λεμνα*, a scale, in allusion to the form of the plants. Theophrastus describes under the same name an aquatic plant. Annual weeds, which float on stagnant water, their flowers are very obscure, and not produced freely in northern climates. *L. trisulca* has dichotomous, filiform, divaricated stems, having a lanceolate leaf at the angle of the branches, but proliferous ones terminating the branches; where these leaves are conjoined, there shoots out a pendant radicle, with a conical papilla at its base. Linnæus observes, that the stems are flattened and proliferous, crossing each other, and thus resembling in the mode of growth the opuntia or Indian fig. The leaves of *L. minor* are very small, of a roundish ovate form, collected into heaps by twos or threes, and forming extensive green plats on stagnant waters; each leaf drops a single radicle. This plant affords nourishment not only to ducks, but to the fresh water polype, to *Phalæna Lemnata*, &c. Its quick and extensive propagation makes it troublesome in some cases, but at the same time it is considered valuable as converting hydrogen gas into air adapted to respiration. *L. polyrhiza* is distinguished by its dropping bundles of thick black fibres from the lower surface of the leaves. The plants sink in the water in the winter season, and either these or new ones appear again in the spring.

1340. *Anguria*. One of the Greek names for the Cucumber. The plant now so called is also a kind of gourd. The species grow freely on light soil, and are propagated by seeds or roots.

1341. *Comptonia*. Named in honor of Henry Compton, Lord Bishop of London, by whom the fine collection of plants attached to the episcopal palace at Fulham was formed. A handsome shrub, which thrives in peat soil, or sandy loam, and is increased by suckers or layers.

1342. *Hernandia*. So called in honor of Francisco Hernandez, a Spanish botanist, and first physician to Philip the second of Spain, by whom he was sent to Mexico for the sake of investigating the natural history of that country. Linnæus is said to have named it in allusion to the large leaves and little flowers of the plant, which may be supposed to represent the great means and small advantages which attended the expedition of Hernandez. This is an upright lofty tree, with an elegant head. The fruit is a nut, sustained and partly enveloped by a yellow persisting calyx. The nuts are very large, and as they move in the wind, produce sound enough to alarm unwary travellers. In our stoves the plants grow freely in loamy soil, and ripened cuttings, with their leaves on, root in sand under a hand-glass.

1343. *Asyris*. A word of unknown meaning. Plants of little beauty and the easiest culture.

History, Use, Propagation, Culture,

1944. *Tragia*. In honor of a German botanist named Jerome Bock, born in 1498, and died in 1554; *Tragus*, which was the name he bore in science, being a Greek translation of his real name, both signifying a goat. He published a history of plants, or *Krauterbuch*, and several other works. Twining plants of no interest.

1945. *Typha*. From *τύφος*, a marsh, in which all the species naturally grow. *T. latifolia* is one of the handsomest aquatics of the reed kind; its leaves are of a bluish color, an inch in width, and three feet long; the flower is very abundant, and a light being applied to it, a flash of fire is produced. Haller says, that the roots are eaten in salads, that cattle eat the leaves, and that the downy seeds serve for stuffing pillows. The leaves are sometimes used by coopers, and introduced between the staves of their casks; they are frequently used for making mats, baskets, chair bottoms, and sometimes for thatch. Rubens, and other

- 13054 Leaves cordate ovate acuminate serrated smoothish, Petioles ciliated, Female sepals hairy entire
- 13055 Leaves hispid ovate-acuminate serrated, Female sepals pinnatifid setose hispid
- 13056 Leaves lanceolate sessile blunt somewhat toothed at end; and stem, which is erect and branched, downy
- 13057 Leaves linear lanceolate stalked blunt mucronate, Stem branched diffuse
- 13058 Leaves deeply 3-lobed toothed, Middle lobe long

- 13059 Leaves linear nearly plane, Sterile and fertile catkins close together
- 13060 Leaves linear plane twice as short as culm, Male and female catkins remote
- 13061 Leaves linear convex below, Sterile and fertile catkins a little distant from each other

- 13062 Leaves triangular at the base their sides concave, Common flower-stalk branched, Stigma linear
- 13063 Leaves triangular at the base their sides plane, Common flower-stalk simple, Stigma linear
- 13064 Lvs. floating plane, Common fl.-stalk simple, Stigma ovate very short, Head of sterile fls. mostly solitary

§ Spikes dioecious.

- 13065 Spike simple dioecious, Fruit ascending ovate shortly acuminate striated rough at the margin upwards
- 13066 Spike simple dioecious, Fruit ovate much acuminate recurvate-deflexed smoothish at the margin

§ 2. Spikes androgynous.

\* 1. Spike simple.

- 13067 Spike simple androgynous, Flowers few, Fruit distant oblongo-lanceolate acuminate reflexed, Stigmas 2
- 13068 Spike simple androgynous male at top, Stigmas 3, Fruit oblong with a short beak horizontal
- 13069 Spike simple androgynous of very few fls. Fruit distant lanceolate subulate patenti-reflexed, Stigmas

\* 2. Spikelets capitata.

- 13070 Spikes androgynous male below collected in globose involucreted heads, Stigm. 2, Fr. lanc. with 2 points
- 13071 Spikes androgynous male above collected in an oblong head, Stigm. 2, Fr. ovate comp. nerved with 2 teeth
- 13072 Spikes androgynous male above collected in an ovate form, Stigm. 2, Fr. ov. acumin. Culm branched at base
- 13073 Spikel. ster. at extrem. collected into a roundish head, Fruit broad rotund. ov. short acum. swell on both sides nearly entire at the point, Culm obt. angular, Leaves channelled
- 13074 Spikes androgynous male above collected into an oval head, Stigm. 2, Fruit ellipt. roundish acuminate bifid

\* 3. Spikelets spiked, many-flowered.

[Culm triang. Lvs. plane

- 13075 Lower spikel. fert. : upp. ones ster. all crowd. Fr. with membr. marg. Bract. membranc. : low. ones subfoli.
- 13076 Inferior and term. spikelets fertile : intermediate ones sterile, Fruit acutely margined, Culms triangular
- 13077 Spike androgynous comp. Spikelets obl. altern. clust. male above, Stigmas 2, Fr. round. ov. edged 2 toothed
- 13078 Spike androgynous comp. Spikelets ovate alternate clustered male below, Stigmas 2, Fr. ovate 2-toothed
- 13079 Spike androg. comp. somew. distich. Spikel. about 5 altern. cum. obl. lanc. male bel. Stig. 2, Fr. ov. edg. bifid
- 13080 Spikel. ster. at the base oval about 5 approxim. Fruit as long as the cal. ovato-acumin. convex on one side, concave on the other, with a membranaceous margin bifid at the point
- 13081 Spike androg. comp. Spikel. 12 altern. ellipt. blunt approxim. male below, Stigmas 2, Fr. ov. lanc. edg. bicuspid
- 13082 Spike androgynous comp. Spikel. about 5 altern. ellipt. blunt somewhat approxim. male below, Stigmas 2, Fruit ovate lanceolate edged bicuspidate
- 13083 Spike androgynous comp. Spikel. numer. collected in 3s or 5s ovate clustered male above, Stigmas 2, Fruit spreading ovate acuminate 2-toothed edged compressed
- 13084 Spikel. ster. at their extremities thrice comp. collected into a cylind. crowded spike, Fruit ovate acuminat. convexo-plane acutang.-diverg. Stem very acute triang. Leaves rather broad
- 13085 Spike androg. comp. Spikel. about 5 obl. male above clust. Stigm. 2, Fr. spread. ov. acum. with 2 points nerv.
- 13086 Spikel. ster. at their extremities crowded into a somewhat ovate head : lower ones with a leafy erect bractea at their base, Fruit roundish ovate convex on one side slightly concave on the other
- 13087 Spikel. ster. at their extremities subcomp. collected into a rather long more or less interrupted spike, Fruit convexo-plano ovato-acuminate acutangul. divergent rough at the margin upward
- 13088 Spike androg. comp. Spikel. 4 altern. obl. male below somewhat approxim. Stigmas 2, Fr. obl. acutish comp.
- 13089 Spike long somew. decompound branched at the base : lower spikelets remote, Fruit erect smooth at edge
- 13090 Spikel. ster. at base 3 or 4 dist. Fr. ov. much attenuat. convexo-plane acutangul. divaricat. rough at margins
- 13091 Spike androg. comp. Spikel. about 4 remote male above, Stigm. 2, Fr. ov. acum. 2-tooth. horiz. ciliat. at base
- 13092 Spikes subternate remote sessile, Bractes long, Fruit bifid at end
- 13093 Spikel. ster. at base dist. Fruit longer than cal. obl.-ovate acuminate convexo-plane subacutang. obtuse at the marg. the point bifid, Bract. very narr. reaching beyond the culm

and Miscellaneous Particulars.

Italian painters after him, have put it into the hand of Christ as a sceptre, when he was saluted as a king in mockery by Herod's soldiers. The plant appears to be a native of every part of the world, in ponds, ditches, and by the sides of rivers and brooks.

1946. *Sparganium*. From *σπαργάνον*, a band, in reference to the long ribbon-like leaves of the plants. *Sparganium ramosum* is the commonest species : it has a strong creeping root, and soon fills up a ditch or pond, if suffered to remain unmolested. It is common not only in Europe, but in Barbary, Siberia, and North America.

1947. *Carex*. From the Latin *carere*, to want. The upper spikes of these plants are constantly without seeds, consisting only of male flowers. This numerous family of plants grow mostly in wet swampy grounds,

History, Use, Propagation, Culture.

in bogs, fens, marshes, or in moist woods, where they yield a very coarse grass scarcely touched by cattle. With the exception of two or three species, they are of little use or beauty. Some unfortunately situated husbandmen have recourse to them as cattle fodder, or as thatch or fuel. In Kent, the leaves of the larger

- 13094 Spikes numerous obl. remotish naked. Fruit acuminate bifid recurved many-nerved longer than glumes  
 13095 Spikel. ster. at base about 5 rather dist. ellipt. Bractees very minute. Caps. broadly ov. acum. conv. on one side and nearly plane on the other subobtusang. with 2 teeth at the extremity  
 13096 Spike androg. comp. Spikelets about 4 male below and close together. Fruit ovate acum. edged 2-tooth.  
 13097 Spike androg. comp. Spikel. about 4 male below and close together. Stigmas 2, Fruit elliptical blunt nerved  
 13098 Spike androg. comp. Spikel. about 5 roundish male below somew. approximated, Stigm. 2, Fr. round. ovate beaked 2-toothed ciliated at edge

\* 4. Spikelets panicled.

- 13099 Spikes androg. narrow. panic. male above obl. blunt. Stig. 2, Fr. ov. acum. with 2 points, Scales ov. mucron.  
 13100 Spike supradecomposed contracted acutish, Spikelets clustered, Fruit spreading gibbous, Culm roundish  
 13101 Spikes androg. narr. panic. male above, Low, branch. remote, Stig. 2 round. ov. beak. 2-tooth. cil. ser. at base  
 13102 Spikel. ster. at extrem. thrice comp. and collect. into a panic. spike, Fr. broad. ov. acum. gib. on both sides  
 13103 Spike decomp. longish, Scales acute, Fruit ovate plano-convex nerved on each side

\* 5. Spikelets racemose.

- 13104 Spikes androg. in threes stalked terminal male below erect, Stigmas 2, Fr. obov. blunt, Scales ov. obtuse  
 13105 Fertile spikes pedunculated ovate pendulous: the terminal one with sterile flowers at the base, Fruit roundish ovate depressed with a short beak bifid at the point

‡ 3. Terminal spikes male: the others androgynous.

- 13106 Male spike solitary stalked: androg. male above about 5 ellipt. remote sessile with a leafy bract, Stigm. 3, Fruit roundish 3-cornered downy

‡ 4. Terminal spike androgynous: the others female.

- 13107 Spike androg. pedunc. obov. male below: female about 3 remote somewhat stalked, Stigm. 3. Fr. ellipt. 3-cornered blunt slightly 2-toothed  
 13108 Spike androg. pedunc. obl. male below: female 2 sessile close obl. Stigm. 2, Fr. oblong narrowed with an undivided mouth as long as ovate scale

‡ 5. Spikes of distinct sexes.

\* 1. Male solitary: female sessile and subsessile.

† 1. Scape sheathed, with membranous bractes.

- 13109 Male spike solit. stalk: fem. twin stalk. about 5-fl. Stigm. 3, Fr. obov.-glob. furrow. beak. obliq. truncate  
 13110 Bractes membran. nearly leafless sheath. Fem. spikes remote few-fl. included in sheath, Lvs. channelled  
 13111 Bractes membranous nearly leafless sheathing, Spikes linear lax erect: male shorter, Leaves flat  
 13112 Male spike sol. stalk: fem. 4 dist. stalk. Stig. 3, Fr. ellipt. 3-corner. stalk smth. short. than obov. cusps. scale  
 13113 Leaves oblong lanceolate with a white scarious margin, Heads oblong, Scape not longer than leaves

† 2. Culm leafy.

- 13114 Fertile spikes sess. roundish approxim. Scales mucron. Fr. obov.-glob. acute pubesc. Culms weak scabrous  
 13115 Female spikes 2-3 ellipt. sess. supported by a foliaceous bract, Fruit somewhat downy with a long beak  
 13116 Male spike solit.: fem. about 2 close ellipt. sess. Stig. 3, Fr. obl. with a short beak downy as long as ov. scale  
 13117 Male spike solit.: fem. about 2 close obl. sess. Stig. 3, Fr. roundish-obov. downy larg. than obl. blunt scale  
 13118 Sheaths short scarcely any equal to the flower-stalks, Fertile spikes oblong approximate, Scales elliptico-oblong, Fruit obovate subtriquetrous acute pubescent  
 13119 Sheaths very short, Female spikes subsessile cylindrical blunt, Glumes elliptical acute, Fruit downy  
 13120 Fertile spikes subsess. obl. Fr. ov. scarcely beaked striated bifid at point, Lvs. very narrow, Culm glabrous  
 13121 Bractees long foliaceous, Fert. spikes roundish oval, Fr. obov. with a long recurved beak bifid at the point  
 13122 Sheaths and peduncles very short, Female spikes roundish, Fruit spreading on each side globose, Beak straight, Culm smooth  
 13123 Bractees foliaceous, Spikes oblongo-ov. distant rotundo-ov. inflated rostrate bifid at point, Culm scabrous  
 \* 2. Male spike solitary: upper female sessile and subsessile; lower stalked.  
 13124 Fertile spikes oblong erect, Scales mucronate, Fruit ovate somewhat inflated subtriquetrous depressed with rather a short beak bifid at the point  
 13125 Sheaths long shorter than peduncle, Spikes cylindrical remote somewhat compound, Fruit 2-nerved  
 13126 Male spike solit.: female twin; lower stalked obl. Stigmas 2, Fruit ellipt. blunt as long as blunt scale  
 13127 Fertile spikes ov.: the lower one pedunculated, Scales obl. Fruit subglob. apiculate with a short bifid beak  
 13128 Male spike solitary: female 3 distant; two lower stalked, Stigmas 3, Fr. oblong compressed 3-cornered hispid at edge, Mouth membranous 2-lobed  
 13129 Fertile spikes 1-3 somewhat drooping, Fruit scarcely longer than the scale lax especially the lower ones ovate with a short beak bifid at the point  
 13130 Male spike sol. obov.: female about 3 close; 2 lower on long stalks, Stigmas 3, Fruit compress. obov. downy beaked 2-toothed at end  
 13131 Male spike sol.: female about 3 distant; two lower remote, Stig. 3, Fr. ov. beaked with a membran. mouth  
 13132 Male spike sol.: fem. 3 rem.: two lower stalked, Stigmas 3, Fr. glob. ovate nerved ventric. shortly beaked  
 13133 Fert. spikes subcylind. with dist. fis. Bract. foliaceous, Fr. subglob. somew. inflated obt. glab. entire at point  
 13134 Male spike sol.: female about 4 remote; 2 lower on a long stalk. the stalks of the others enclosed, Stigm. 3, Fr. globose shining with a short beak 2-toothed at end

and Miscellaneous Particulars.

species are used for tying the vines of hops to the poles; in Italy they are put between the staves of wine casks to make them tight, woven over Florence flasks, or in chair bottoms. The Laplander combs and dresses some species of sedge, as we do flax, and in winter stuffs his shoes and gloves with it, as a defence against the

History, Use, Propagation, Culture.

extreme rigour of his climate. *C. remota* is a very elegant plant. *C. paniculata* grows in bogs in immense tufts, making a firm support for the heaviest bodies. *C. Fraseri* is the handsomest species of the genus, resembling at a short distance when in flower, one of the Liliaceae. *C. riparia* has leaves half an inch wide, and from one to three feet long; in Italy the leaves are used by the glass-makers to bind their wine flasks; by the chair-makers to bottom chairs; and by the coopers to place in the junctures in the heads of casks, in the same manner as the leaves of the Typha are used in the same country, and the stalks of *Scirpus lacustris* in England. *C. arenaria* increases rapidly in loose sand, and is sometimes planted with a view of fixing soils of this description, along with *Elymus* and *Arundo*.

1948. *Cobresia*. Named by Willdenow, after a German nobleman of the name of De Kobres, who is said to have been a great promoter of natural history. The plants resemble *Carex*.

- 13135 Male spike sol. Scales obl. with very long beaks: female cylind. 2; stalk of the lower exserted, Stigm. 3, Fr. ovate inflated 5-nerved beaked
- 13136 Male spike sol.: fem. 2 obl. close; low, stalk. Stigm. 3, Fr. ellipt. glob. shin. bifid at end larg. than ov. scale
- 13137 Male spike sol.: fem. 3-rem.; lower stalk. Stigm. 3, Fr. ov. nerv. memb. at mouth long. than mucron. scale
- 13138 Male spike sol.: fem. 3 few-fl. 2 close sessile; lower rad. on a very long stalk, Stigm. 3, Fr. obov. obl. 3-cornered with a very short beak
- 13139 Sheaths none, Bractees foliaceous auric. at base, Spikes sess. obl. or subcylind. obt. Fruit broadly elliptical
- 13140 Fertile spikes nearly sessile cylindric. filif. acumin. Fr. ovate somewhat acute plane above on each side, Culm acutely angular straight
- 13141 Fert. spikes cylind. very long droop. Fr. ov. short. acum. bif. at extremity closely imbricated, Leaves broad
- 13142 Dignous, Sheaths none, Spikes ovate: upper sessile, Leaves somewhat recurved rigid, Fruit compressed
- \* 3. *Male spike solitary, female all stalked.*
- 13143 Fert. spikes few-fl. lax drooping, Fr. as long as ovate membranac. decid. scales oblongo-ovate acuminate
- 13144 Fert. spikes pedunculated oblongo-cylind. subpendul. Bract. subfoliac. Fruit ov.-ellipt. tumid obt. glabrous
- 13145 Sheaths elongated shorter than the flower-stalk, Fruit elliptical ovate beaked (black) bifid at the point
- 13146 Fert. spikes narrow obl. very few-fl. lax pendul. Bract. substaccaceous, Scales acute longer and broader than the fruit, Fruit ovate somewhat acumin. striated
- 13147 Fert. spikes oblongo-ovate pendulous, Bractees substaccaceous, Scales acute as long as the fruit, Fruit ellipt. rotundate striated shortly mucronate
- 13148 Fertile spikes upon long footstalks cylind. pendul. Bract. very leafy, Scales setaceous, Fruit oblong very much acuminate cloven at the tips striated
- 13149 Male spike sol.: fem. about 4 remote filiform stalked cernuous, Stigm. 3, Fr. dist. altern. obl. beaked bifid
- 13150 Fert. spikes filif. rather slender slightly drooping, Fr. broadly ov. much acumin. cleft at point, Lvs. narrow
- 13151 Male spike solit.: fem. usually twin stalk. filif. Stigm. 3, Fr. lanc. hisp. scabr. 2-toothed long. than obl. scale
- 13152 Fert. spikes slend. filif. nearly erect, Fruit ov.-lanc. nerved slightly recurv. loose. imbric. Lvs. rather broad
- \* 4. *Male spikes more than one.*
- 13153 Fertile spikes subcylindrical drooping, Fruit obovato-globose obtuse rather downy entire at the point
- 13154 Male spikes twin: fem. twin obl. sess. rem. Stigm. 3, Fr. ov. nerved forked ventric. larg. than ov. lanc. scale
- 13155 Male spikes 3: fem. twin on short stalks nodd. cylind. Stigmas 3, Fr. ellipt. ventricose with a short ent. beak
- 13156 Fert. spikes short. peduncul. oblongo-cylind. their cal. subscup. Fr. ov. short. beak. bif. at point very pubes.
- 13157 Lvs. subsessile sublin. thickened, Stigmas 2, Fr. ellipt. with short beak ent. at end as long as rounded scales
- 13158 Fert. spikes long cylind. acum. slender erect when in fruit, Fr. oval swelling subacum. entire at point, Culm acutely angular scabrous
- 13159 Scal. of sterile spike obtuse, Fertile spikes cylind. obtuse, Fruit oblongo-ovate acute bifid at point striated
- 13160 Foliaceous, Scal. of sterile spike acum. Fertile spikes scarcely peduncul. broadly cylindrical acute, Fruit ovate subacum. bifid at the point
- 13161 Fert. spikes cylind. slightly droop. Scal. lanc. Fr. broadly ovate inflat. subulato-rostrate deeply bifid at point
- 13162 Fert. spikes cylind. long near erect. Scal. lanc. Fr. crowd. subglob. inflat. setaceo-rostr. slightly bif. at point
- 13163 Male spikes 2: female 3 obl. remote subsessile, Stigmas 3, Fr. obl. compr. rostr. bifid ciliate serrat. at edge
- 13164 Male spikes 2: female 3 obl. remote subsessile; lower subrad. Stigmas 3, Fr. ovate comp. 2-toothed hairy
- 13165 Bractees long foliac. Fertile spikes short cylind. distant their scal. cuspidate, Fr. ov. with long beak hairy
- 13166 Fert. spikes droop. cylind. all the scal. acum. or mucr. Fr. ov. triang. with rather long acum. beak bif. at point
- 13167 Male spikes twin: fem. 4 dist. stalk. pendul. cylind. Stigm. 2, Fr. round. ellipt. ventric. with very short beak
- 13168 Male spikes 2: fem. 2 rem. on very long stalks erect obl. Stigm. 2, Fruit ellipt. with short beaks ent. at end
- 13169 Male spikes about 4: female 2 erect stalked cylind. Stigmas 3, Fr. obov. obt. shorter than obl. blunt scale
- 13170 Male spikes 3: female 2 cylind. stalked erect, Stigm. 3, Fr. ov. glob. beaked with 2 forks, Beaks hispid

13171 Spikes 3 or 4 alternate male above

13172 Fruit oblong 3-cornered smooth at edge

13173 Leaves entire

13174 Leaves serrated

\*

13175 Culm half round at top and obtuse, Flowers naked, Fruit ovate

13176 Culm round, Flowers naked, Fruit nearly round

and Miscellaneous Particulars.

1940. *Uncinia*. So called from *οὐκνός*, a hook, in allusion to the hooked awn, which in the fruit becomes hardened. Plants with the habit of *Carex*.

1950. *Zea*. The Greek name of corn of some kind. It is derived from *ζωω*, to live, and applied to this nutritive plant with propriety. The word *Maize* is the denomination of the vegetable among the South Americans. *Zea* Curagua is the curious Valparaiso corn, to which a sort of religious reputation is attached, on account of the grains, when roasted, splitting regularly into the form of a cross. Of the well known Indian corn, *Z. Mays*, there are numerous varieties, some of which are sufficiently hardy to thrive in this climate.

1951. *Coin*. A name used by Theophrastus to designate a kind of grass. *C. Lachryna*, commonly called Job's tears, derives its name from the appearance of its shining pearly fruit, which, when suspended on its slender pedicels, resembles in no inconsiderable degree a falling tear. Tropical grasses, which flower and seed plentifully in rich light soil.

History, Use, Propagation, Culture,

1952. *Tripsacum*. So called by Linnæus, from *τριβω*, to bruise or crush, in allusion to the purpose to which its grain may be applied. Forage grasses of the West Indies.

1953. *Heteropogon*. From *heteros*, various, and *πωγων*, a beard; in allusion to the various kinds of awns with which the flowers are furnished.

1954. *Olyra*. A name under which Homer speaks of a grain which was used as the food of horses, and which has been thought analogous to Barley. The plant now so called is a native of America, and has no resemblance to that of the ancients.

1955. *Alnus*. From the Celtic word *al*, near, and *lan*, the edge of a river, in reference to the places where the species grow. *A. glutinosa*, *Aulne*, Fr., *Eller*, Ger., and *Alno*, Ital., is a well known timber tree, which will grow in marshy situations. The timber is applied to a variety of purposes, and in general for all works intended to be constantly under water, for turnery and furniture. The bark is used by dyers and tanners; the sap being of a yellow color and very astringent. There is a variety with cut leaves sold by the nurserymen as an ornamental tree, though it is more curious than showy.

1956. *Betula*. *Betu* is the Celtic word for the Birch. *Bouleau*, Fr., *Birchenbaum*, Ger., and *Betulla*, Ital. *B. pendula* is the most graceful tree of the genus; it grows both in mountainous situations and bogs, from Lapland to the subalpine parts of Italy and Asia. *B. lenta*, the mahogany birch, mountain mahogany, or cherry birch of Canada, abounds in the middle states of Pennsylvania, New York, and the Jerseys; but disappears altogether in the higher latitudes of the northern states. It is thought a very fit tree for planting in the valleys of the mountainous districts of Britain. Its growth is rapid, and the timber is close grained, beautifully variegated, and well adapted for cabinet work. The leaves, which appear early in spring, possess

- 13177 Spikes 3 clustered : male above ; female below  
 13178 Spike solitary : male above ; female below  
 13179 Spike solitary hermaphrodite flexuose, Spikelets somewhat distant

13180 Culm nearly simple, Sheath of leaves bearded at edge, Spike smooth

13181 Culm branched, Panicle terminal

*TETRANDRIA.*

13182 Lvs. roundish cuneiform obt. lobed at margin and serrat. somew. glutin. downy in axils of veins beneath

β Leaves oblong pinnatifid, Segments cut

13183 Leaves oblong blunthigh glutinous, Axils of the veins naked

β Leaves elliptical

13184 Leaves oblong acute downy beneath, Axils of the veins naked, Stipules lanceolate

β Leaves green beneath, Petioles green

13185 Lvs. obl. acute rounded at base, Petioles and veins hairy beneath, Axils of veins naked, Stipules ov.-obl.

13186 Leaves obovate acuminate, Veins and axils of veins beneath hairy, Stipules elliptical blunt

13187 Leaves cordate acuminate entire lucid above

13188 Leaves ovato-deltoid acute doubly serrated glabrous

13189 Leaves ovate acuminate cut serrate smooth, Branches scabrous pendulous

[smooth

13190 Lvs. delt. with long points unequal serrat. quite smooth, Scales of cones with lat. lobes roundish, Petioles

13191 Leaves ovate acute serrated, Scales of cones with lat. lobes rounded, Petioles downy shorter than pedunc.

13192 Leaves ovate narr. at base ent. unequally toothed smooth, Scales of cones ciliated : lateral lobes rounded

13193 Lvs. rhomb. ov. doubly serr. acute downy beneath entire at base, Scales of cones vill. with lin. uneq. lobes

13194 Leaves deltoid ovate small, Scales of female catkin densely woolly on the outside

13195 Leaves ovate acuminate doubly serrate, Veins hairy beneath

13196 Leaves cordate-ovate finely serrated acuminate, Scales of cones with blunt equal lobes and elevated veins

13197 Leaves orbicular crenate

13198 Leaves orbicular obovate serrated beneath with the branches downy, Female catkins cylindrical

13199 Petiole downy, Leaves rhomboid cut-toothed obtuse nearly smooth with tufts of hair in the axilla beneath

13200 Lvs. ovate doubly serr. smooth, Fem. peduncles branched, Scales of cones with equal trunc. nerved lobes

13201 Leaves roundish ovate nearly equally serrate smooth, Female catkins oblong

13202 Lvs. deltoid acute subord. doubly serr. beneath with branches pubesc. Scales of cones with lateral lobes

[rounded

13203 Leaves oblong, Petioles smooth, Anthers sagittate linear

13204 Leaves ovate, Petioles hairy at edge, Anthers ovate sagittate

13205 Leaves opposite oblong : younger downy ; old ones smooth, Fl. axillary solitary

and Miscellaneous Particulars.

a peculiar fragrance, which they retain after being dried in a stove, affording by infusion an agreeable diluent, superior to some of the common teas of commerce.

*B. populifolia* and *papyracea* are elegant rapid growing trees, well deserving culture for their timber. All the species are ornamental, and more or less fragrant ; and *B. pumila* and *nana* are pretty little shrubs. Of the *Betula papyracea* the North American Indians construct their large portable canoes, from which circumstance that species is known by the name of canoe birch. *Betula lenta* is the most interesting of the genus, on account of the excellence of its wood. It is known by the names of mountain mahogany, black birch, cherry birch, and sweet birch. This last appellation it has from the sweet scent the branchlets give when bruised.

1957. *Burus*. An alteration of *ρυξος*, its Greek name. *B. sempervirens*, *Buis*, Fr., *Buchsbaum*, Ger., and *Bosso*, Ital. is one of the most useful of evergreen shrubs ; edgings of the dwarf variety are of universal use in the walled gardens of Europe ; and what is called the tree box is not less valuable as an evergreen shrub, which will grow under the shade and drip of trees. The box is a native of most parts of Europe, from Britain southwards, and is very abundant in different parts of France and Switzerland. It abounds in many countries of Asia, as about Mount Caucasus, in Persia, China, Cochin China, and America. It was formerly very common in England, but has gradually disappeared as agriculture extended. Box-Hill in Surrey, Boxley in Kent, and Boxwell in Gloucestershire, are named from their abounding in this tree. The timber of the box tree is of considerable value. It is sold by weight, and being very hard and smooth, and not apt to warp, is very well adapted to a variety of nice works. It is as extensively employed now as it appears to have been in the days of Evelyn, " for the turner, engraver, carver, mathematical instrument maker, comb and pipe or

History, Use, Propagation, Culture,

flute maker; and the roots for the inlay, and cabinet maker. Of box are made wheels and shivers, pins, pegs for musical instruments, nut-crackers, button-moulds, weavers' shuttles, hollar-sticks, bump-sticks, and dressers for shoemakers, rulers, rolling-pins, pestles, mail-balls, beetles, tops, tables, chessmen, screws, bobbins for bone-lace, spoons, knife-handles, but especially combs.

The English wood is esteemed inferior to that which comes from the Levant, and the American box is said to be preferable to ours, for most purposes; but the English is superior for the purpose of the engraver.

The ancients made combs of box, and musical instruments to be played upon by the mouth. The Romans likewise clipped it into form, for which nothing, says Pliny, is more fit. And Martial mentions clipped box trees in the gardens at Bassus's country-house.

The tree box was second to the yew with us in former times for the purpose of being clipped into the shape of animals, &c.; but the dwarf box stood unrivalled "for bordering up a knot, and was esteemed a marvellous fine ornament to the flower garden."

The branches were in request among our ancestors for decking up houses; they are still seen among other evergreens in churches at Christmas, and in some countries they are borne by attendants at funerals.

Box has been much celebrated as a medicine in the venereal disease, colicks, intermittent fevers, and even madness. According to Dr. Blaine, it is the principal ingredient in Well's Watford Drink, which is given as a preventive to canine madness.

Pliny affirms, that no animal will touch the seed of box. Gmelin relates, that the branches are fatal to the camels that eat them. None of our animals seem to touch this tree. Corsican honey was supposed by the ancients to owe its infamy to the bees feeding on the box.

1958. *Cicca.* A word of unknown meaning. *Cicca disticha* thrives in light loamy soil, and is increased by cuttings with their leaves on, planted in sand, and covered with a hand-glass.

1959. *Morus.* *Moræa* was the Greek name of the Mulberry; it is derived from the Celtic *mor*, which signifies black. *Murier*, Fr., *Maulbeerbaum*, Ger., and *Moro*, Ital. *M. alba* is commonly cultivated in France and other countries for its leaves, to feed silk-worms; though in some parts of Spain and in Persia they are said to prefer the black Mulberry. In China, it appears that both sorts are grown for the same purpose. The most valuable variety of *M. alba* is one grown in Italy, and especially in Lombardy, with vigorous shoots, and much larger leaves than the other. A number of plants of this variety have been lately imported for the purpose of making a plantation in the south of Ireland, with a view to try the growth of silk in that country. In France the white Mulberry is grown as pollard elms are in England; in Lombardy it is grown exactly in the same way as we grow willows for baskets, and in similar soil; in China it is also grown in moist loamy soil, and both there and in the East Indies as low bushes, and the plantation rooted up and renewed every three or four years. In many parts of the continent, when the leaves are wanted for the worms, they are stripped off the young shoots, which are left naked on the tree; in other places the shoots are cut off, which is not so injurious to the tree, while the points of the shoots, as well as the leaves, are eaten by the worms. The plants are sometimes raised by seed, but more commonly by layers; the Italian variety is frequently grafted on seedling stocks of the common sort, in order to preserve it from degenerating. In the East Indies, the plants are raised from cuttings, three or four of which are placed together where they are finally to remain. (*Encyc. of Agr. 884.*)

The fruit of the white Mulberry is white, and less acid than that of the black species. *M. nigra* is naturally a stronger tree than the other; the fruit is of a dark blackish red, and of an agreeable aromatic and acid flavor. It has a place in the *Materia Medica*, as cooling and laxative, allaying thirst, and being grateful in febrile diseases. Young trees, like most others of the Monœcious class, often produce

13206 Leaflets oblong, Racemes lateral

13207 Leaves deeply cordate unequal at the base ovate lobed unequally serrated smoothish

13208 Leaves slightly cordate equal at base ovate or lobed equally serrated smooth

13209 Leaves cordate ovate or lobed unequally toothed scabrous

13210 Leaves cordate ovate acuminate or 3-lobed equally serrate scabrous soft beneath, Fem. spikes cylindrical

13211 Leaves oblong unequal at base, Spines axillary solitary

13212 Leaves opp. ovate-obl. acum. toothed smooth, Fl. dioecious, Male spikes clust. interrupt. : fem. cylindrical

13213 Lvs. altern. obl. narrow, at each end entire, Spikes axill. clustered interruptedly branched, Branches hairy

13214 Lvs. altern. broadly lanc. acum. serrated rugose, Fl. cluster. axill. and lateral monocious, Males 3-androus

13215 Lvs. altern. ovate-lanceolate acuminate serrated scabrous, Fl. clustered lateral, Stem herbaceous

13216 Leaves ovate acute entire, Stem simple ascending

13217 Leaves opposite ovate or somewhat heart-shaped deeply serrated, Heads of fruit globose

13218 Leaves opposite cordate serrate, Fruit-bearing catkins globose

13219 Leaves opposite entire convex oblong, Fruit-bearing catkins globose

13220 Leaves opposite ovate nearly entire, Heads of fruit globose

13221 Leaves opp. ovate blunt-pointed 3-ribbed serrated, Fl.-stalks somewhat corymbose shorter than footstalks

13222 Leaves opposite ovate rugose obtuse, Flower-stalks in the axillæ of the upper leaves

13223 Leaves opposite ovate pointed copiously serrated, Stipulas elliptical entire glauc. Corymbs much branched axillary longer than the footstalks

and Miscellaneous Particulars.

only male blossoms for many years after they are planted, and yet afterwards become fruitful. As the tree increases in age, it increases in fruitfulness; and in full grown trees the fruit is much larger and better flavored than in young ones. In some of the old gardens near London, there are mulberry trees of a great age, which are very healthy and fruitful. Bradley says, that most of these were planted in the times of James I., who attempted unsuccessfully to set up a silk manufacture in England. The fruit of the mulberry, like that of the strawberry and raspberry, is said not to undergo the acetous fermentation in the stomach, and therefore it may be safely eaten by gouty and rheumatic persons. It is a mistake, however, to suppose that these fruits are lighter than others which have not the same antifermenative qualities.

The mulberry is generally propagated by layers, but it may also be increased by seeds, cuttings, or grafting. It is generally grown as a standard in orchards; but will produce fruit sooner as an espalier or wall tree.

*M. rubra* has black shoots, rougher leaves than the black mulberry, and a dark reddish fruit, longer than the common sort, and of a very pleasant taste. The tree is cultivated in China for feeding silk-worms, but not so generally as the white mulberry. *M. indica* is also cultivated for the same purpose. *M. tatarica* bears pale red berries of an insipid taste, but eaten in Russia fresh, conserved, or dried; a wine and a spirit are also made from them, and the leaves are used for feeding silk-worms.

*M. tinctoria* is a tall branching tree, with a fine head, smooth leaves, and awl-shaped solitary spines. The whole plant abounds in a slightly glutinous milk of a sulphureous color. The timber is yellow, and a good deal used in dyeing that color, for which it is chiefly imported into Europe, under the name of Fustick-wood. The berries are sweet and wholesome, but not much eaten, excepting by birds.

All the species of *Morus* are remarkable for putting out their leaves late; so that when they appear, gardeners may safely set out their greenhouse plants, taking it for granted, that all danger from frost is over.

160. *Bahmeria*. Named after George Rudolph Böhmer, a German botanist, and a member of the academy of Wittemberg. He published several works, besides an academical dissertation upon the cellular tissue of vegetables. Plants of little beauty, and easy cultivation and propagation.

161. *Pilea*. So called by Mr. Lindley, from *πῖλας*, a cap; in allusion to the nature of one of the divisions of the perianthium. A neat little creeping plant, which makes a good cover to hide the earth of large pots of tropical plants.

162. *Urtica*. A word formed from *uro*, to burn, in allusion to the stinging properties of most of the species. The English term *Nettle* seems to be the Anglo-Saxon *Netel*, which is itself an alteration of *næd*, a needle, in the same language. *U. dioica* grows all over Europe, in Barbary, Siberia, and Japan, in hedges, neglected fields, gardens, and pastures. This species, *U. urens*, and *pitulifera*, with one or two others, are furnished with stings. The small projecting bristles or prickles with which they are covered are tubular, and stand on a bag filled with a poisonous juice; they are perforated at the point, and when they are gently pressed vertically, the pressure at once forces the poison to ascend the tube, and enables the point to lodge it in the skin. The tops of the tender shoots of *U. dioica* are sometimes used as a pot herb early in spring, and they have even been forced for that purpose. A strong decoction of the plant salted, will coagulate milk very readily and without any disagreeable flavor. The stalk is found to have a texture somewhat like that of hemp, and to be capable of being manufactured into cloth, ropes, and paper. The leaves are the only food of the caterpillars of three of our most beautiful butterflies, *Atalanta*, *Paphia*, and *Urtica*, the principal food of the Io, and the occasional food of the *Comma album*; the caterpillars also of the *urticata* and *verticalis* moths feed on it: a great number of other indiscriminate feeders devour its foliage; and the bases of the leaves in autumn are frequently disfigured by tubercles, which contain small maggots, probably producing *Musca Urtica*. As a remedy for the

History, Use, Propagation, Culture,

sting of the nettle, its own juice, or that of the dock, may be applied. The exotic species are of easy culture.

1963. *Pachysandra*. From *παχυς*, thick, and *ανη ανδρες*, signifying, in botanical language, a stamen; the stamens are very stout. A plant of easy culture in common light soil, and freely increased by suckers from the roots.

1964. *Diotis*. From *δις*, double, and *ωσ αρος*, an ear, on account of the two appendages which exist at the base of the florets. A shrub of no great beauty, which thrives in light soil, and is easily increased by layers or cuttings under a hand-glass.

1965. *Empleurum*. From *εμ*, in, and *πλευρον*, the pleura, or membrane which envelopes the lungs. The seeds of this plant are attached to a sort of coriaceous membrane.

1966. *Aucuba*. The Japanese name of the plant. It is a well known laurel-like evergreen shrub, with leaves mottled with yellow Female flowers only have been produced in the gardens; but according to Kœmpfer,

- 13224 Leaves opposite elliptic-oblong acute serrated towards the point reticulated beneath, Stipulas ovate-entire, Clusters paniced about the length of the footstalks
- 13225 Leaves opposite elliptical acute serrated triple-ribbed their veins hairy, Stipulas roundish permanent, Clusters slightly branched, Stem shrubby shaggy with rusty hairs
- 13226 Leaves opposite elliptical with about 5 ribs, Clusters of flowers nearly simple
- 13227 Leaves ovate acuminate cordate at the base, Clusters of flowers much branched in pairs mostly dioecious
- 13228 Leaves opposite broadly ovate somewhat heart-shaped coarsely serrated, Fls. monœcious : male in twin upright unbranched stalked spikes with winged recept. : fem. in nearly sess. spikes shorter than footst.
- 13229 Leaves opposite ovate obl. acute 3-ribbed serrated thickish reticulated and pale beneath, Corymbs stalked forked longer than the leaves, Flowers tufted
- 13230 Stem petioles and lvs. covered with rigid dense stimuli. Lvs. ov. acum. doubly serrat. Spikes comp. whorled
- 13231 Leaves opposite in three deep pinnatifid segments, Clusters cylindrical in pairs erect
- 13232 Leaves opposite elliptical serrated 3-ribbed rugged, Clusters short dense terminal, Stem simple erect
- 13233 Lvs. chiefly term. opposite ellipt.-lanc. pointed 3-ribbed entire nearly smth. Stem angul. leaf. below, Cluster lateral dioecious
- 13234 Leaves opposite ovato-lanc. serr. heart-shaped at the base, Stem and footstalks hispid, Flowers dioecious, Clusters in pairs somewhat branched about as long as the footstalks
- 13235 Leaves opposite ovato-lanc. entire, Stem much branched, Flowers dioecious
- 13236 Leaves opposite ellipt. 3-ribbed crenate fringed acute at each end entire at the base, Stem divaricated, Flowers aggregate on axillary stalks about the length of the footstalks
- 13237 Leaves long lanc. very rugose : glabrous above ; beneath having a fine white down
- 13238 Stem downy roughish, Lvs. on long stalks ov. acute crenat. downy roughish 3-nerv. Stip. lanc. acute scar.
- 13239 Lvs. alternate ov. serrat. minutely heart-shap. at the base, Clusters axill. forked, Fruit in orbicular corymbs
- 13240 Lvs. alternate ovate somewhat hairy serrated, Stipulas obtuse, Clusters axill. compound spreading shorter than the leaves ; the lower ones male sessile ; upper female stalked.
- 13241 Leaves alternate roundish-ovate pointed toothed 3-ribbed snow white and downy beneath, Clusters axill. repeatedly compound, Fl. fasciculate
- 13242 Leaves alternate heart-shaped toothed prickly as well as the shrubby stem, Calyx of the fruit pulpy
- 13243 Leaves altern. heart-shaped acutely crenate rough above soft and downy beneath, Panicles lateral leafless forked divaricated, Flowers capitate dioecious, Stem arboreous
- 13244 Leaves on long stalks cordate acuminate acutely serrated stinging, Spikes paniced
- 13245 Leaves stalked cordate acuminate serrated stinging, Racemes axillary
- 13246 Leaves cordate entire and 3-lobed coarsely tooth-serrated, Petioles and stem with long strigose prickles
- 13247 Stem with very long stimuli, Leaves pinnatifid with finely toothed segments, Spikes axillary compound
- 13248 Stem downy, Leaves on long stalks ovate-lanceolate acuminate subcrenate rough above soft beneath
- 13249 Stem procumbent, Leaves short oval crenate toothed above, Calyx minutely ciliated
- 13250 Leaves ovate lanceolate acuminate nerved
- 13251 Leaves lanceolate downy, Female flowers woolly
- 13252 Leaves lanceolate ensate crenate smooth, Capsules 1-celled
- 13253 The only species
- 13254 The only species
- 13255 Flowers tetrandrous, Leaves alternate linear lanceolate entire rough
- 13256 A small lactescent tree with alternate entire leaves and spiny branches

and Miscellaneous Particulars.

the fruit is a red oblong drupe, like a laurel berry, with a white sweetish pulp, and a kernel with a bitter taste.

1967. *Littorella*. From *litus*, the shore, in allusion to the places where it grows. A pretty little delicate plant, with long tremulous white stamens.

1968. *Serpicula*. From *serpo*, to creep, on account of the habits of the species.

1969. *Maclura*. Dedicated by Nuttall, to William Maclure, Esq. of the United States, a philosopher, whose devotion to natural history, and particularly to the geology of North America, has scarcely been exceeded by Ramond or Saussure in Europe. A spreading deciduous tree, about twenty or thirty feet high, with a yellow axillary berry the size of an orange, but not so succulent, and said to be as agreeable when fully ripe. It was originally found by Hunter and Dumar, on the banks of the Little Missouri or Washita river, also near Natchitoches and upon the banks of the Arkansas.

History, Use, Propagation, Culture,

1970. *Exocarpus*. So called from *εξω*, outside, and *καρπος*, fruit, because the nut appears to be seated on the outside of the pericarp, on account of the great receptacle on which it is placed.

1971. *Nephtium*. According to Dodoens, *Nephtium* was a name anciently given to the Burdock. The modern plant bears bristly fruit like the involucreum of the Burdock. It is an excellent fruit, known in the islands of the Indian Archipelago by the name of Rambutan; grows in rich light loam, and is struck in pots of sand under a glass.

1972. *Schizandra*. From *σχιζω*, to cut, and *ανδρς*, a stamen; its stamens are split. A handsome plant, which grows in light loam and peat, and ripened cuttings root in sand under a hand-glass.

## PENTANDRIA.

13257 The only species

13258 Leaves alternate pinnated, Racemes erect shorter than leaves

13259 Leaves lanceolate oval acute at each end end, rarely somewhat toothed

13260 Leaves bipinnatifid toothed, Petioles winged

13261 Leaves ovate-lanceolate cordate toothed, Petioles with an appendage

13262 Stem unarmed, Leaves cordate 3-nerved

13263 Stem unarmed, Leaves cuneiform ovate somewhat 3-lobed

13264 Spines ternate, Leaves 3-lobed

13265 Stem unarmed, Fruit oval aculeate, Prickles hooked echinate at base

1. *Triandrous.*

13266 Clusters axillary, Leaves linear-lanceolate cuneate retuse, Stem branched diffuse

13267 Clusters axillary, Leaves linear-lanceolate acute mucronate, Stem branched erect

13268 Clusters axillary, Leaves obovate retuse, Stem square simple

13269 Clusters axillary, Flowers trifid, Leaves obovate emarginate, Stem roundish branched

13270 Clusters axillary stalked roundish, Leaves ovate-lanceolate colored

13271 Clusters sessile, Leaves oblong lanceolate colored

13272 Clusters sessile capitate, Leaves ovate acuminate blunt colored

13273 Clusters in short spikes, Cal. and bract. with hooked bristles, Leaves oblong lanceolate emarginate

13274 Clusters shortly spiked ovate, Leaves ovate lanceolate emarginate

13275 Clusters somewhat spiked axillary solitary, Leaves rhomboid roundish

13276 Clusters spiked, Spikes axillary and terminal, Leaves ovate-lanceolate emarginate

13277 Clusters spiked loosely, Leaves subcordate ovate emarginate shorter than petiole

13278 Clusters somewhat spiked and 3-leaved: axillary in pairs, Leaves rhomboid lanceolate

13279 Clusters spiked, Leaves rhomboid-ovate acute

13280 Clusters somewhat spiked rounded, Leaves elliptical retuse, Stem erect

13281 Clusters axillary branched, Leaves rugose oblong very blunt emarginate

13282 Leaves subrhomboid acute repand bellate, Spikes terminal, Sepals mucronate pungent

13283 Clusters somewhat spiked, Flowers 3-leaved, Leaves ovate retuse, Stem diffuse

13284 Clusters spiked, Flowers 3-leaved, Leaves rhomb.-ov. bluntish retuse, Stem prostrate branched

13285 Clusters spiked terminal, Leaves ovate-oblong, Stem erect somewhat branched

13286 Clusters axillary twin triandrous, Male flowers 3-leaved, Leaves elliptical emarginate wavy at edge

13287 Clusters 3-leaved, Female flowers funnel-shaped, Leaves rhomboid ovate emarginate

13288 Leaves ovate, Spikes interrupted compound, Spikelets inflexed, Stem weak

13289 Spike very short few-fl. Leaves rhomboid lanceolate, Capsules not dehiscent

2. *Pentandrous.*

13290 Leaves oval acute somewhat wavy toothed, Clusters axillary cymose

13291 Raceme decomposed clustered erect, Leaves ovate-lanceolate

13292 Raceme compound erect straight, Leaves ovate concave

13293 Racemes supradecomposed, Branches spreading pubescent, Leaves ovate-lanceolate

13294 Racemes supradecomposed erect, Branches spreading smooth, Leaves oblong acute

13295 Racemes supradecomposed erect clustered, Branches downy, Leaves ovate wavy

13296 Racemes compound erect, Leaves ovate blunt mucronate

13297 Racemes compound nodding, Leaves ovate lanceolate

13298 Racemes compound nodding, Leaves lanceolate

13299 Racemes compound erect clustered, Leaves oblong lanceolate mucronate

13300 Racemes decomposed naked spreading, Leaves lanceolate ovate

13301 Racemes simply spiked, Flowers axillary clustered, Leaves ovate acute

13302 Racemes decomposed pendulous, Leaves lanceolate ovate, Stem nodding

*and Miscellaneous Particulars.*

13273. *Franzeria*. A genus dedicated by Canavilles to Antony Franzer, a botanical physician, whose merits are forgotten. Cuttings root in loam and peat under a hand-glass.

13274. *Xanthium*. From *ξανθος*, yellow, a color which it is asserted by Dioscorides, *lib. 4. cap. 133*, that an infusion of this plant communicates to the hair. Weeds of little beauty and easy culture.

13275. *Amaranthus*. From *α*, privative, and *μαρτυρος*, to wither, because the flowers of most of the species retain their bright colors when dead. Some of the species are very ornamental, and most of them might probably be used as spinage, as some sorts are in the East. *A. polygamus* is used in this way in Guiana and China, and *A. oleraceus*, *tristis*, and *viridis*, in India. *A. melancholicus* and *tricolor* are popular tender

History, Use, Propagation, Culture,

annuals, and *A. sanguineus* and *caudatus* common border flowers; like all the species, they are of easy culture in light rich soil. Most of the species are very prolific in seeds, which preserve their germinating quality several years.

1976. *Luffa*. Its name in Arabic is *lodff*, according to Forskahl. A curious kind of gourd, not often seen on account of its offensive odor. It is cultivated in Arabia and China. It climbs up the Palm trees, covering and elegantly adorning their trunks. The fruit when young is pickled, like the Mango; but Europeans think it has a disagreeable taste, and is not very wholesome. *L. Charantia* has a fruit with a yellowish skin, but very red flesh, and when ripe, it bursts elastically. Culture as in Cucumis.

1977. *Ambrosia*. A poetical name. *Ambrosia* is the name of the food of the heathen divinities, as nectar was their beverage; of the former, the odor was delightful, whence its name has been applied to an herb, the leaves of which, when bruised, emit a grateful scent. Weedy plants of no beauty.

1978. *Securinea*. From *securis*, a hatchet. The name was given by Commerson, because the wood was so hard as to be capable of being manufactured into cutting instruments. It grows and flowers freely in loam and peat, and cuttings strike in sand under a hand-glass.

1979. *Zizania*. One of the Greek names of the rye-grass was *ζίζανιον*; according to Golius, the same plant was called by the Arabs *Zohân*. The modern plant has no relation to the ancient, being a native of America, where it is called Canada rice. This plant has been acclimated in Middlesex and Roes-shire; it grows on the margins of ponds, and is exceedingly prolific of bland farinaceous seeds, which afford a very good meal. It abounds in all the shallow streams of North West America, where its seeds contribute essentially to the support of the wandering tribes of Indians, and feed immense flocks of wild swans, geese, and other water fowl. Finkerton says, this plant seems intended by nature to become the bread corn of the north.

1980. *Pharus*. From *φαρος*, a covering. Brown gave this name to the plants, because their long broad leaves are employed as wrappers for various purposes by the natives of Jamaica. Fine stove grasses.

1981. *Guettarda*. Etienne Guettard was a French botanist, who published in 1747, a catalogue of the plants growing in the vicinity of Estampes. Splendid plants, which grow in loam, peat, and sand; and are increased by cuttings in sand in a moist heat and covered.

1982. *Sagus*. So named in allusion to the nutritive properties of the substance obtained from it. From this palm is produced the Sago of the shops. The wood is full of white pith, like that of elder; the pith is taken out, bruised in a mortar, and then put into a cloth or strainer, held over a trough, and water being poured in, the pith is washed through the cloth into the trough; the water being then drawn off, the sago is taken out and dried for use or transportation. The fruit is eaten by the Japanese, but the tree is chiefly esteemed for its highly nutritive pith.

1983. *Cocos*. Linnæus regards this name as of Greek origin. In that language, *κοκκος* means a kind of fruit, but it does not appear that there was any relation between that and the modern cocoa nut. D'Herbelot

- 13303 Racemes pentandrous terminal compound, Axillæ spiny  
 13304 Clusters densely spiked somewhat whorled, Spikes decomposed erect colored, Lvs. obl. ellipt. red beneath  
 13305 Leaves cordate 5-lobed, Flowers large, Gourd a span long  
 13306 Leaves ovate sessile acuminate serrate ciliated at base  
 13307 Leaves 3-lobed serrated  
 13308 Leaves bipinnatifid smoothish, Petioles with long cilia, Racemes terminal paniced  
 13309 Leaves bipinnatifid hoary beneath : upper pinnatifid, Racemes 3 terminal  
 13310 Leaves smooth bipinnatifid : upper pinnatifid, Racemes terminal solitary, Branches fastigate  
 13311 Leaves bipinnatifid blunt hoary beneath, Racemes terminal solitary, Branches villous  
 13312 Leaves alternate ovate, Flowers axillary clustered

### HEXANDRIA.

- 13313 Panicle effuse, Glumes aristate : male and female mixed  
 13314 Panicle branched, Glumes awnless smooth, Leaves ovate-lanceolate  
 13315 Leaves obovate acute downy beneath, Flowers 7-androus 7-fid  
 13316 Leaves subcordate ovate acute scabrous downy beneath, Flowers hexandrous  
 13317 Branchlets of the spadix smooth  
 13318 Branchlets of the spadix annular  
 13319 Pinnae spinulose, Fruit oblong furrowed

- 13320 Unarmed, Fronds pinnated, Leaflets replicate ensiform  
 13321 Caudex cylindrical prickly upwards, Fronds pinnated prickly  
 13322 Aculeate spiny, Caudex fusiform, Fronds pinnated, Stems and spathes spiny

### and Miscellaneous Particulars.

says, (*Bibl. Or.* 278.) that in India the fruit is called *cozi*, whence the Turkish name *coz*, for a nut : but this requires confirmation. In Malabar it is called *temga*, in the Moluccas *calappa*, and by the Brahmins *medo*. *C. nucifera* is a native of, and cultivated in, most places within the tropics. The trees grow to a great height, with a straight trunk, and, like almost every species of the Palm tribe, without branches. The leaves are from twelve to fifteen feet long : the flowers come out round the top of the trunk in large clusters, inclosed in a sheath, and the nuts succeed them, commonly ten or twelve together.

There are few trees more extensively or variously useful. The leaves are employed as thatch to cover houses, and to make mats either for sitting or lying upon. The leaf, when reduced to fine fibres, is the material of which a beautiful and costly carpeting is fabricated for those in the higher ranks ; the coarse fibres are made into brooms. After these useful materials are taken from this leaf, the stem still remains, which is about the thickness of the ankle, and furnishes firewood.

The wood of this palm, when fresh cut, is spongy ; but becomes hard after being seasoned, and assumes a dark brown color. On the top of the tree a large shoot is produced, which, when boiled, resembles brocoli, but is said to be of a more delicate taste ; and though much liked, is seldom used by the natives, because on cutting it off, the pith is exposed, and the tree dies. Between this cabbage-like shoot and the leaves, there spring several buds, from which, on making an incision, there distils a juice differing little from water, either in the color or consistence. It is the employment of a certain class of men to climb to the top of the trees in the evening, with earthen pots tied to their waists, which they fix there to receive the juice, which is regularly carried away before the sun has had any influence upon it. This liquor is sold at the bazaars by the natives under the name of toddy. It is used for yeast, and forms an excellent substitute. In this state it is drank with avidity, both by the low Europeans and the natives, and is reckoned a cooling and agreeable beverage. After being kept a few hours, it begins to ferment, acquires a sharp taste, and a slight intoxicating quality. By boiling it, a coarse kind of sugar is obtained ; and by distillation, it yields a strong ardent spirit, which being everywhere sold, and at a low price, constitutes one of the most destructive annoyances to our soldiers. The name given to this pernicious drink by Europeans, is Pariah arrack, from the supposition that it is only drank by the Pariahs, or out-casts, that have no rank.

The trees from which the toddy is drawn do not bear any fruit, on account of the destruction of the buds ; but if the buds be left entire, they produce clusters of the cocoa nut. This nut in the husk is as large as a man's head, and when ripe falls with the least wind. If gathered fresh, it is green on the outside ; the husk and the shell are tender. The shell, when divested of the husk, may be about the size of an ostrich's egg, and is lined with a white pulpy substance, which contains about a pint and a half of a liquor like water ; and though the taste be sweet and agreeable, it is different to that of the toddy.

In proportion as the fruit grows old, the shell hardens, and the liquor diminishes, till it is at last entirely absorbed by the white milky substance, which gradually acquires the hardness of the kernel of the almond,

History, Use, Propagation, Culture,

and is almost as easily detached from the shell. The natives use this nut as their victuals; and from it they also express a considerable quantity of the purest and best lamp oil. The substance which remains after this operation, supplies an excellent food for poultry and hogs. Cups and a variety of excellent utensils are made of the shell.

The husk of the cocoa nut is nearly an inch thick, and is, perhaps, the most valuable part of the tree; for it consists of a number of strong fibres, easily separable, which furnish the material for the greatest part of the Indian cordage; but is by no means the only substitute which the country affords for hemp. This the natives work up with much skill.

Plants of the cocoa nut tree are frequent in our stoves, being easily raised from the nuts sold in the shops, planted in rich earth, and on a moist heat; but the plants are seldom allowed room enough to come into flower; though it has been observed, that this is almost the only palm that could be cultivated in this country for perfecting its fruit; all the others being diocious plants. Sweet observes, that they seldom succeed well in our collections; perhaps from being too much exposed to the sun: he is "informed they thrive best in the shade in the West Indies, where cultivators of them plant tall trees near them for that purpose." (*Bot. Cult.* p. 42.) *C. aculeata* has a trunk the thickness of the human body; the pinnae of the fronds are longer than in the cocoa, and prickly like the bark of the trunk. The fruit is as large as a crab, and of the same shape; under a green skin it has a thin sweetish astringent pulp; and within that, a nut full of a white sweet eatable kernel. The nut is said to yield the true palm oil. The outside of the trunk is made into laths, bows, and darts.

1984. *Elate*. This was one of the names given by the Greeks to the membrane which envelops the female flowers of the date; that is to say, to its spathe. Modern authors have applied the word to a kind of Indian palm. The fruit of *E. sylvéstris* resembles a wild plum. The poorer sort of people chew it in the same manner with the *Areca* nut, with the leaf of the betel pepper and quick-lime. The elephants are fond of the fruit-stalks, which are very sweet. In our stoves the plants require a sandy loam, and a strong heat.

13323 Fronds pinnated, Leaflets opposite

13324 Fruit roundish

13325 Fruit ovate

*POLYANDRIA.*

13326 Fruit armed with three spines

13327 Fruit unarmed

13328 Sterile flowers in interrupted leafless spiked whorls

13329 Leaves pinnated capillary : upper pectinate-pinnatifid, Flowers axillary whorled

13330 Leaves lanceolate acuminate sagittate : lobes lanceolate straight, Scape simple

13331 Leaves 3-fid and 3-parted : lobes nearly equal nerved, Scape branched angular, Male fl. solitary terminal

13332 Leaves ovate rounded blunt sagittate : lobes ovate acuminate spreading, Scape paniced

13333 Leaves ovate narrowed at each end, Scape branched below

13334 Leaves lanceolate keeled, Petioles 3-cornered, Scapes simple, Female flowers sessile

13335 Leaves lanceolate linear, Female heads small

13336 Shrubby erect, Lvs. very smooth unequally cordate obsolete toothed, Wing of caps. very large roundish

13337 Shrubby erect, Lvs. unequally cord. subangul. toothletted smooth hairy ben. at the veins, Fan. dichotom.

13338 Leaves angular serrulate crimson beneath, Stem nodose, Wings of caps. unequal rounded

13339 Caulscent, Lvs. unequally cord. cren-tooth. : lower angular, Wings of caps. with obt. ang. one very large

13340 Creeping, Leaves unequally cordate angular toothed, Wings of capsule parallel

13341 Caulscent, Leaves hispid  $\frac{1}{2}$  cordate acuminate unequally toothed, Largest wing of caps. obtusangular

13342 Caulscent erect, Leaves hispid  $\frac{1}{2}$  cordate doubly serrate, Wings of caps. rounded nearly equal

13343 Caulscent, Leaves hispid  $\frac{1}{2}$  cordate doubly serrated, Largest wing of caps. very large obtusangular

13344 Caulscent erect, Lvs. hisp. on each side unequally oblong doubly tooth. Largest wing of caps. obtusangul.

13345 Leaves long acuminate repand spotted with white above red beneath

13346 Leaves blunt obsolete toothletted smoothish, Stipules spatulate unequal ciliated, Wings of caps. blunt

13347 Stemless, Leaves ovate cordate hirsute finely serrulated mottled, Capsules hairy

13348 Leaves nearly equally cordate very blunt crenate downy : upper cucullate, Stipules lanceolate scariose

13349 Leaves acuminate somewhat angular unequally obsolete toothletted smooth on each side, Stip. scariose

13350 Leaves angular unequally serrulate-ciliated hairy beneath at the veins, Stipules scariose lanceol. fringed

13351 Leaves acute crenulate smooth strigose beneath, Cyme distichous, One wing of capsule very large acute

13352 Hirsute, Leaflets lanceolate, Spikes oblong ovate

13353 Thorns none, Stem somewhat angular, Stamens much longer than the calyx

13354 Unarmed, Stems angular, Terminal flowers female : lower male; intermediate hermaphrodite

*and Miscellaneous Particulars.*

1985. *Bactria*. So called by Jacquin, from *βακτρον*, a cane, because the small stem is made into walking-sticks, which are much valued. B. minor produces a fruit of a dark purple color, the size of a common cherry, containing an acid juice, of which the Americans make a sort of wine. It is also eaten raw, but is not pleasant. Canes are made of the stem; they are dark-colored, shining, jointed, and very light; the French call them *Cannes de Tobago*. B. major has a large nut with a solid kernel, which is eaten in Carthage. In our stoves they form handsome plants, and grow freely in sandy loam; like other palms, they are only to be increased by seed.

1986. *Ceratophyllum*. So called from *κερας*, a horn, and *φυλλον*, a leaf, on account of the numerous horned divisions of the leaves. Aquatic weeds of no beauty.

1987. *Myriophyllum*. From *μυριος*, a myriad, and *φυλλον*, a leaf, on account of the infinite number of divisions of its leaves. Aquatics of some beauty, and the easiest culture.

1988. *Sagittaria*. So called from *sagitta*, an arrow, in reference to the arrow-headed form of the leaves. S. sagittifolia is one of the handsomest of British aquatics, and is common in Siberia, China, Japan, and Virginia. The bulb, which fixes itself in the solid earth below the mud, constitutes an article of food among the Chinese, and upon that account they cultivate it extensively. The roots are larger in those countries than with us. All the species are of common culture.

1989. *Begonia*. Named in honor of Michael Begon, a Frenchman, born in 1638; he was an intendant of Marine, and a promoter of botany. These are universally plants remarkable for the neatness of their foliage, and their succulent habit. B. argyrostigma and discolor are the two most beautiful species. They are all cultivated without difficulty either from seeds or cuttings.

1990. *Poterium*. Literally, this word signifies a drinking vessel, and in the same sense, a kind of beverage. A drink was made of it, which was reckoned useful in many complaints; it is also an ingredient in cool tankards. P. sanguisorba is sometimes sown along with clover as an herbage plant; it is now, however, out of

History, Use, Propagation, Culture.

repute. The leaves when bruised smell like cucumbers, and taste something like the parings of that fruit; they are sometimes put into salads. All the species are of the easiest culture.

1991. *Amirola*. A word with an unknown meaning. The Peruvians form the shining black seeds of *Amirola nitida* into rosaries.

1992. *Acidoton*. From *axiduros*, pointed; in allusion to the stinging pointed hairs of the leaves.

1993. *Thelygonum*. A name under which Pliny described a plant which appears to have been *Mercurialis*. It was derived from *θηλυς*, a woman, and *γωνυ*, a knee, because of its joints, which were thought to resemble a woman's knee. *Cynocrambe*, literally interpreted dog-cabbage, was the Greek name of *Mercurialis perennis*.

1994. *Castanea*. A native of the territory of Castanea, a town of Thessaly, near the borders of the river Peneus, where magnificent chestnut trees still are found. The chesnut, *Chátagnier*, Fr., *Castanienbaum*, Ger., *Castagno*, Ital., is, like the walnut, both a timber and a fruit tree; some of the oldest trees in the world are of this species; as that mentioned by Brydone on Etna, and the chesnut at Tortworth, in Gloucestershire. The fruit is generally eaten roasted; abroad, it is not only boiled and roasted, but ground into meal, and puddings, cakes, and bread are made from it. The timber is thought to have been formerly in very general use for house carpentry, though some consider what is generally called chesnut in our old buildings as oak. It is one of the best trees for hop poles, and scarcely any other is now planted in Kent and other hop districts for that purpose. Some excellent fruit-bearing varieties have been lately imported from France; these are increased by grafting or budding in the usual methods, but the plants for coppice woods or timber are best raised from nuts. There is a variety with striped leaves which is very ornamental. The most esteemed of the French kinds are called *Marron*, a word which in old French literally signifies a substance, which it must be confessed the fruit is not unlike.

The American chesnut differs so little from the European, that no specific distinction can be drawn. It is one of the largest and most useful trees of the forests, the wood being extremely durable, and in high esteem for posts and rails to construct fences. The nuts are very delicious. The *Castanea pumila* or Chinquapin nut, is a small tree, or rather shrub, growing to the height of thirty feet in the southern states, but scarcely exceeding seven or eight in cold latitudes. The fruit is very sweet and agreeable to eat.

1995. *Ostrya*. So called from *οστρα*, a scale, in allusion to the scaly catkins of the fruit, which resemble those of the hop, whence the plants are called Hop-Hornbeam. The wood of *Ostrya virginica* is exceedingly hard and heavy, whence it is generally known in America under the name of Iron-wood. In some parts it is called Lever-wood.

1996. *Carpinus*. From the Celtic words *car*, wood, and *pin*, the head; that is to say, wood fit for the yokes of cattle. The wood is white, and of a fine close texture, which makes it peculiarly fit to be wrought into the

- 13355 Unarmed, Stems round striated  
 13356 Unarmed shrubby, Branches round villous, Spikes long loose  
 13357 Spiny shrubby, Spines branched, Branches villous somewhat angular, Spikes oblong loose

- 13366 Scales of cones 3-parted: middle segment oblique ovate lanceolate 1-toothed on one side  
 13367 Scales of cones ovate unequal at base undivided somewhat angular unequally serrated
- 13368 Leaves ovate glabrous obsolete dentate, their margins ciliated
- 13369 Leaves ovate acuminate downy beneath coarsely toothed ciliated at edge
- 13370 Stip. obl. obt. Lvs. roundish-cordate pointed, Invol. of fruit campanulate rather spreading torn at margin
- 13371 Stip. obl. blunt, Cal. of fruit tubul. cylind. contracted at end cut toothed, Leaves roundish cord. acuminate

and Miscellaneous Particulars.

various forms with which the country people of all nations have delighted to ornament their yokes. Our English word Horn-beam has evidently the same meaning. *C. Betulus* is a tree of little merit or beauty, having persistent leaves like the beech; it is well adapted for hedges or separation, where the object is shelter.

197. *Fagus*. From the Greek *φαγος*, which also signifies eatable. We all know that mast was the original food of man. The *Fagus* of Virgil, was the *Quercus Æsculus*. *Hêtre*, Fr., *Büche*, Ger., *Foggio*, Ital. *F. sylvatica* is a handsome tree in every stage of its growth. It seems to thrive best in a chalky clay or loam, rather sheltered. It is one of the handsomest single trees for parks, and is well adapted to form lofty hedges. The timber is brittle, and not of long duration; but it is much used by turners, joiners, and millwrights. The bark is remarkably thin, and has been used for making baskets and band-boxes. The leaves are used in France by the country people, on account of their elastic quality, instead of straw for the pallasse to lay under their mattresses. The mast is readily eaten by swine and deer.

*F. cuprea*, the copper colored, and *F. purpurea*, the purple beech, are two of the most striking of timber trees, from the color of their foliage. They are propagated by grafting, and grow as freely as the common beech.

*Fagus ferruginea* is distinguished by the Americans from the common kind by the name of Red Beech, the wood being of a darker color.

198. *Corylus*. From *κορυς*, a bonnet; to which the enveloping calyx may be very well compared. Our word Hazel is in like manner derived from the Anglo-Saxon *Hæsel*, which signifies an head-dress. *Noisette*, Fr., *Nussbaum*, Ger., and *Avellano*, Ital. *C. avellana* has the specific name from Avellino, a city of the kingdom of Naples, near which, in a valley, it grows to a great extent, and in Swinburne's time, brought in an annual profit of near 12,000. sterling. It is said they were originally imported into Italy from Pontus, and known among the Romans by the appellation of *nux Pontica*, which in process of time, was changed into that of *nux Avellana*, from the place where they had been propagated with the greatest success. The common Hazel-nut is wild in many woods and coppices in Britain, whence the fruit is gathered in plenty and sent to the neighbouring markets. As underwood, the plant is of some value for hoops, fishing-rods, walking-sticks, wifes for fagoting, crate-making, hurdles, wattling-fences, and springles to fasten down thatch. Formerly the roots were used by the cabinet-makers; and where yeast was scarce, they twisted the twigs, steeped them in ale during its fermentation, hung them up to dry, and when they brewed put them into the wort.

There are several varieties of the cultivated filbert. What is called the frizzled filbert is esteemed the best. The plants do not require a rich soil, but one with a dry bottom. They are generally propagated by suckers, and grown as dwarf standards, each plant with a single clean stem, from six feet high down to twelve inches. When allowed to throw up suckers from the root and form a thick bush, they cease to bear fruit in any quantity. The filbert bears principally upon the sides of the upper young branches, and from small shoots which proceed from the bases of side branches cut off the preceding year. Hence the spurring-in method of

## History, Use, Propagation, Culture,

pruning is the most successful in the production of fruit. C. Colurna may be treated in the same manner as the other, but the plants kept at a somewhat greater distance apart.

The nuts of the American Hazel-nut, *Corylus americana*, are very excellent.

1999. *Juglans*. That is to say, *Jovis glans*, the nut of Jove, on account of its excellence, which must have been great indeed, when gods had nothing but oak or beech-mast to eat. *J. regia*, walnut, from *gaul*-nut, the tree being introduced from France, *Noyer*, Fr., *Walnussbaum*, Ger., and *Noce*, Ital., is cultivated both as a fruit and timber-tree. The fruit in a green state, before the stone hardens, is much used for pickling, and also as an adulteration of soy sauce. An oil, which supplies the place of that of almonds, is expressed from the kernel in France. In Spain they strew the gratings of old and hard nuts, first peeled, into their tartes and other meats. The leaves strewed on the ground, and left there, annoy worms; or macerated in warm water, afford a liquor, which from its bitterness may effect their death. The urripe fruit is used in medicine for the same purpose. Pliny says, "the more walnuts one eats, with the more ease will he drive worms out of the stomach." The timber is used in this country for gun-stocks, being lighter in proportion to its strength and elasticity than any other. It is used in cabinet-work in most parts of the continent: the young timber is held to make the finest colored wood, but the old to be finer variegated for ornament. When propagated for timber, the nut is sown; but when fruit is the object, inarching from the branches of fruit-bearing trees is preferable. Budding has also been successfully adopted by Mr. Knight; the buds succeed best when taken from the base of the annual shoots; ordinary-sized buds from the upper parts of such shoots generally fail. Walnut trees that have not been grafted or budded, may be induced to produce blossoms by ringing the bark.

*Juglans nigra*, the black walnut, is a tree of large size, and its nuts are eaten by men and several species of animals. The wood is put to various mechanical and economical uses. *J. cathartica* is known under the name of butter-nut, oil-nut, and white walnut; the nuts are used by the American Indians medicinally. The fruit of *J. oliviformis*, or the Pekan-nut, is delicious; sometimes it is exposed in the fruiterers' shops for sale. The nuts of *J. sulcata*, which is called thick shell-bark hickory, and Springfield and Gloucester nut, are large and well-tasted. The shell-bark hickory, shag-bark, or scaly-bark hickory, *J. alba*, is so called on account of its bark, which is torn lengthwise in long loose strips, as in *J. sulcata*. The wood of *J. tomentosa*, the Mocker-nut, white-heart hickory, or common hickory, is excellent for mechanical purposes, and particularly esteemed as fire-wood; but the nuts are hard, with but little kernel in them. The Americans make very good and durable brooms by slitting into narrow slips the very tough wood of *J. glabra*, which is called pig or hog-nut, also broom hickory.

13372 Cal. of fruit roundish campan. larger than nut, Limb dilated tooth serrated, Lvs. roundish cord. acumin.  
 13373 Stip. lin. lanc. Cal. of fruit camp. tubul. larger than nut 2-parted: seg. cut toothed, Lvs. obl. ovate acumin.  
 13374 Stip. lanc. acum. Cal. of fruit double: outer many-parted; inn. 3-part. Seg. palm. Lvs. roundish ov. cordate

13375 Leaflets about nine oval smooth subserrated nearly equal, Fruit globose  
 13376 Leaflets numerous lanceolate serrated beneath with the petioles downy, Fruit globose dotted rough  
 13377 Leaflets numerous oblong lanceolate serrated soft with down beneath, Petioles viscid, Fruit oblong ovate  
 13378 Leaflets numerous lanceolate serrated, the odd one with a long stalk, Fruit oblong 4-cornered

13379 Leaf. about 9 lanceolate acuminate serrate downy beneath: the odd one sess. Fruit roundish with 4 keels  
 13380 Leaflets 7 obl. lanc. acuminate serrated rough and downy beneath: the odd one sess. Fruit squarish smooth  
 13381 Leaf. 7 obl. lanc. acum. serr. downy beneath and soft: the odd one sess. Fruit ov. Nuts oblique compressed  
 13382 Leaflets about 9 ovate-oblong acum. finely serrated smooth on each side; the odd one with a short stalk  
 13383 Leaflets 7 ovate acuminate serrated smooth on each side with resinous dots beneath, Nuts obcord. smooth  
 13384 Leaflets 7 ovate acuminate serrated smooth on each side with resinous dots beneath, Fruit and nuts oblong

A. *Leaves entire, or little toothed.*

13385 Leaves membranaceous linear lanc. tapering at each end entire smooth with a small point, Nut roundish  
 13386 Leaves coriaceous elliptical-lanceolate entire smooth with a small point, Nut roundish  
 13387 Lv. lanc.-obl. somewhat wavy obt. at the base rather dilated upwards silky beneath, Nut almost globular  
 13388 Lvs. coriac. ellipt.-obl. revol. ent. pointless obt. at base clothed with starry down ben. Fr. stalk. Nut oblong  
 13389 Lvs. coriac. ellipt.-lanc. revol. ent. blunt. with a small point clothed with starry down beneath, Fruit sessile, Nut nearly globose  
 13390 Leaves elliptical oblong acute at each end entire almost sessile downy beneath, Nut nearly globose  
 13391 Leaves obovate entire smooth nearly sessile tapering at the base, Nut roundish even

13392 Leaves obovate entire shining somewhat heart-shaped at the base downy and yellow beneath

B. *Leaves toothed spiny.*

13393 Leaves elliptical coriaceous entire or serrated very downy beneath, Bark even, Nut cylindrical elongated  
 13394 Leaves ovate-oblong acute coriaceous entire or serrated hoary beneath, Bark even, Nut ovate

13395 Leaves ovate-oblong bluntish coriaceous entire or sharply serrated downy beneath, Bark cracked fungous  
 13396 Lvs. ellipt.-obl. rigid smooth on both sides with spread. brist. spin. teeth, Nut ov. Cal. with spread. point. sc.  
 13397 Leaves roundish ellipt. nearly sess. undulated with deep spin. divaricat. teeth densely downy beneath somewhat heart-shaped at the base

and *Miscellaneous Particulars.*

9000. *Quercus*. This name is derived from the Celtic *quer*, fine, and *cuez*, a tree; it was so called, in distinction to other trees, because the holy mistletoe grew upon it: otherwise the common name of the oak in Celtic was *deru*, whence *druids*, and the Greek *δρυς*. Phellos was the Greek name of the cork, *Q. suber*. Gramuntia has derived its name from growing in the wood of Grammont, near Montpellier. *Suber* is generally thought to have been formed from the Latin *sub*, under, because the bark was used by the Roman women as sandals, both for keeping their feet dry, and increasing their stature; but Vossius is of opinion, that it comes from *εὐωαε*, the Greek name of bark of any kind. *Coccifera* has been so called because the little insect, coccus, which affords the well-known kermes dye, is found upon it. *Kermes* itself is an alteration of *germez*, which signifies in Arabic, a little worm; the same people called the red dye *germez*, whence our Norman-English word *cramoisie*. *Robur* is an alteration of *rove*, a Celtic synonym of the oak. *Æglops*, literally goat's-beard, was so called on account of the long truss or beard-like lichens which were frequently found hanging suspended from it.

The oak is a genus of trees familiar to man in the temperate zones of both hemispheres. *Q. Robur*, now valued for its timber and bark, and formerly for its acorns, is familiar to every Briton. There are two distinct varieties or subspecies; *Q. sessiliflora* and *pedunculata*, and another *Q. pubescens*. *Q. pedunculata* is thought to be the common oak of England, being much more frequent in natural woods than the others. The timber of this variety is said to be whitish and hard, while that of the sessile-fruited is reddish and brittle. The bark of this and all the hardy species of oak is or may be used by the tanner. Oak saw-dust is the principal indigenous vegetable used in dyeing fustian; and different shades of drab and brown are also made from it. Oak-apples are used in dyeing as a substitute for galls; the black got from them by the addition of coppers is more beautiful than that from galls, but not so durable. These galls are occasioned by an insect of the *Cynips* kind, which deposits its eggs in the substance of the leaf. When the bark of the oak has performed its office to the tanner, it is employed by the gardener to produce heat by its fermentation. Oak leaves are also used for the same purpose. When a great proportion of the island was in forest, acorns were of importance for feeding swine; they are still valued for this purpose in districts where the oak abounds, as in Hampshire and Northamptonshire. *Q. cerris* is a very handsome tree, and the timber is considered nearly as valuable as that of the common oak. The Lucombe (from the name of the nurseryman who raised it) and Fulham (from the name of the nursery where it was first originated) varieties are nearly evergreens; they retain their verdure till Christmas, and remain on the tree in a brown or withered state till April or May following.

*Q. coccinea* is one of the handsomest of the American oaks; the leaves, which are six inches long, change in

History, Use, Propagation, Culture,

autumn to a beautiful scarlet color, and unless hard frost comes on early, they do not fall off the tree till near Christmas. *Q. rubra* bears a near resemblance to the last species. *Q. tinctoria*, *Quercitron*, Fr., has been recommended to be cultivated on account of its bark, which affords a valuable yellow dye. (*Caled. Hort. Mem.* iii. 378.

*Q. suber* is cultivated in Spain, Portugal, and the south of France, for its cork-bark. The exterior bark is the cork, which is taken from the tree every eight or ten years; but there is an interior bark which is left on to protect the tree, so that stripping off the outer bark is so far from injuring the trees, that it is necessary to their continuation. Trees that are never barked are said to die at the age of fifty or sixty years. The bark is taken off for the first time when the tree is about fifteen years old; it soon grows again, and may be rebarked three times, the bark improving every time till the tree attains the age of thirty years. It is taken off in sheets or tables, much in the same way as oak or larch bark is taken from the standing trees in this country. After being detached, it is flattened by presenting the convex side to the heat, or by pressure. In either case it is charred on both surfaces to close the transverse pores, previously to its being sold. The carbonized surface produced by this charring, may be seen in bungs and taps; but not in corks, which being cut in the lengthway of the wood, the charring is taken off in the rounding.

13398 Leaves elliptic. with deep point. serratures downy beneath, Fruit racemose, Cal. hemispherical, Nut obl.  
 13399 Lvs. on short stalks obov. acutely and coarsely toothed at base glaucous ben. Cup hemispheric. Acorn ov.

C. *Leaves sinuated.*

13400 Leaves oblong mucronate-toothed smooth on each side  
 13401 Leaves oblong coarsely mucronate-toothed smooth on each side cuneate at base, Branchlets hairy  
 13402 Lvs. on long stalks obov. ac. somew. downy ben. with near. eq. serrat. Cal. of fr. contract. at base, Nut ov.  
 13403 Lvs. nearly sess. obovate downy and white beneath with very broad unequal teeth, Fruit in pairs on long  
 bristle-pointed stalks, Calyx hemispherical, Nut oblong ovate  
 13404 Lvs. on shortish stalks obovate acute downy and white beneath with nearly equal dilated short blunt serr.  
 Cal. hemispherical with rugged scales, Nut oblong ovate  
 13405 Lvs. wedge-shaped smooth tapering at the base dilated and obscurely 3-lobed at the end : the middle lobe  
 largest, Calyx nearly hemispherical, Nut roundish  
 13406 Lvs. obl. wedge-shaped smooth somew. sinuated 3-lobed at extrem. Lobes divaricated pointed : the middle  
 one largest, Forks of the vein downy beneath  
 13407 Lvs. on long footst. obl. lanc. pointed somewhat downy ben. with numerous nearly equal dilated serratures,  
 Cal. hemispherical, Nut round ovate  
 13408 Lvs. wedge-shaped somew. cord. dilated very slightly 3-lobed at the end, smooth above rusty beneath, Cal.  
 hemispherical with membranous scales, Nut round ovate  
 13409 Lvs. wedge-shaped with 3 terminal bristly-pointed lobes : the midd. one longest downy beneath, Cal. of the  
 fruit flattish, Nut nearly round  
 13410 Leaves oblong sinuated downy beneath : lobes blunt ; upper dilated 2-lobed, Cups hemispherical

13411 Leaves evergreen oblong-lanceolate undivided 3-lobed or sinuated smooth on both sides, Lobes pointed  
 13412 Lvs. downy ben. sinuat. with 3 or more somew. falc. brist.-point. lobes : term. one elong. jagg. Cal. hemisph.  
 [undern. Nut globose  
 13413 Lvs. downy ben. obov. obl. dilat. wide. sinuat. Lobes short obt. slight. toothed bristle-point. Cal. of fruit flat  
 13414 Leaves downy beneath oblong pinnatifid lobed bristle-pointed, Calyx turbinate, Nut ovate  
 13415 Lvs. smooth obl. sinuat. on long stalks, Lobes ac. sharply tooth. bristle-point. Cal. of fr. flat undern. Nut ov.  
 13416 Lvs. on long stalks ovate lanc. or obl. entire or unequally lobed, Cup hemispherical, Acorn nearly globose  
 13417 Lvs. smooth obl. deeply and widely sinuated on long stalks, Cal. of the fruit turbinate  $\frac{1}{2}$  as long as the nut  
 13418 Lvs. smth. obl. wedge-shap. at base deeply and widely sinuat. on short stalks, Cal. of fr. turbin.  $\frac{1}{2}$  as long as nut  
 13419 Lvs. smooth obl. deeply and widely sinuated on long stalks, Forks of the veins densely warty beneath, Cal.  
 of the fruit flattened, Nut nearly globose  
 13420 Lvs. obl. lyr. downy ben. : term. lobe very large 3-cleft sinuat. Cal. of fr. hemisph. scaly fring. with bristles  
 13421 Leaves obovate cuneiform 3-5-lobed, Lobes setaceous mucronate downy beneath [elong. spread. scales  
 13422 Lvs. ov. obl. with bristle-pointed tooth-like lobes hoary ben. Cal. of fr. very large hemispherical with lanc.  
 13423 Lvs. obl. deeply pinnatif. glaucous ben. Lobes lin. obl. obt. ent. dilated upw. Fr. stalked, Cal. depress. warty  
 $\beta$  Leaves slightly lobed green on each side [hemispherical  
 13424 Lvs. ov. obl. sinuat. smooth paler ben. : segm. bluntish somew. angular at base, Fruit nearly sess. Cal. scaly  
 13425 Lvs. decidu. oblong smooth dilated upwards stalked, Lobes obtuse, Stalks of fruit elongated, Nut oblong

13426 Leaves oblong subsessile smooth sinuated : lobes round, Fruit oblong stalked [Fruit nearly sessile  
 13427 Lvs. obl. obov. stalked sinuat. downy ben. : lobes obt. angul. wavy somew. heart-shap. and unequal at base,  
 13428 Leaves subsessile smooth oblong ovate pinnatifid sinuated blunt, Branches ascending  
 13429 Leaves softly villous deeply pinnatifid : segm. oblong blunt sinuated, Cups warty [hemisph. bristly  
 13430 Lvs. on very short stalks obl. deeply and uneq. pinnatif. hairy ben. Stip. longer than footst. Cal. of the fruit

13431 Lvs. on longish stalks ovate obl. slightly but copiously sinuated downy and hoary ben. : lobes short ovate  
 acute entire, Stipules shorter than the footstalks, Cal. of the fruit hemispherical bristly

and Miscellaneous Particulars.

The uses of cork in Britain are well known. It was used as sandals by the Greeks, whence our cork soles, and probably the Venetian choppings (*cioppini*, Ital.), or shoes so high heeled, as to raise the women above the men. The poor people in Spain lay broad planks of it by their bed-side to tread on, as great persons use Turkey and Persian carpets to defend them from the floor; and sometimes they line the walls and insides of their houses built of stone with this bark, which renders them very warm, and corrects the moisture of the air. Both in Spain and Barbary bee-hives are made of cork; for this purpose, they roll the bark into a cylinder of five or six feet long, and six inches in diameter, boring holes for the entrance and exit of the bees, as in the Polish hives. (*Encyc. of Gard.* 1738.)

*Q. coccifera*, *Cusaja*, Span., has prickly leaves like those of the holly, or *Q. ilex*, from this species is collected the kermes or scarlet grain, a little red gall, occasioned by the puncture of the *Coccus ilicis*. With these galls scarlet color was dyed, till the discovery of America, when another species of *Coccus*, the cochinillifer, was found in the Mexican woods upon the Cactus.

*Q. phellos* is remarkable for the form of the leaves, which differ in character from those of the rest of the species. *Q. ilex*, the holly, or holm oak, *Chêne verd*, Fr., *Elíce*, Ital., and *Enzina*, Span., is a handsome evergreen tree, and the timber is supposed equal to that of the common oak. *Q. gramuntia* is thought by some

History, Use, Propagation, Culture,

to be only a variety of this species. The acorns of *Q. esculus* are sweet, and, it is said, are frequently eaten by the poor in the south of France: the tree very much resembles the common English oak.

The willow oak grows to the height of about fifty or sixty feet. The *Q. virens*, or live oak, grows to the height of forty or fifty feet, spreading its branches, when in open places, extremely wide; it yields the finest and most durable ship-timber of any species known; for which reason it is considered one of the most valuable trees in America. The laurel-oak, or, as it is sometimes called, swamp willow oak, is about fifty or sixty feet high; its wood, according to the elder Michaux, is very valuable, and almost preferable to that of *Q. virens*. The water oak, *Q. aquatica*, is about forty feet high when full grown: its wood is but little valued. Its leaves vary according to the soil and age, *ad infinitum*. There is scarcely one tree found having leaves like the other; and the same tree is almost as variable in its different branches. The downy black oak, *Q. triloba*, is from twenty to forty feet high, according to Michaux, of very rapid growth, and extremely well calculated for inclosing land. The barren oak, or black jack of the Virginians, *Q. nigra*, is of low growth, especially in the more northern states; it bears very abundantly, and furnishes a fine meat for hogs; the wood is small, but excellent for fuel. The black oak, or Quercitron, *Q. tinctoria*, is one of the largest trees of the American forest, and highly valuable on account of its timber as well as bark, which is very superior for tanning to any other oak. *Q. falcata* is a very large tree, commonly called Spanish oak. The wood of the upland white oak, or iron oak, is of great value in ship-building. The fruit of the *Q. Prinus*, known by the name of the chesnut white oak, swamp chesnut oak, and, in the southern states of North America, white oak, is large, and of a sweet taste. The bark of the rock chesnut oak, *Q. montana*, is excellent for tanning. The yellow oak, *Q. castanea*, is a large and beautiful tree with eatable acorns.

2001. *Liquidambar*. From this tree flows a strong balsamic substance, which has been compared to ambergris, and named from *Ambar*, amber, and *liquidum*, fluid. *L. styraciflua*, in its general form and leaves, bears a considerable resemblance to the lesser Maple, (*Acer campestre*) as the wood is good timber and beautifully variegated. Between the wood and the bark issues a fragrant gum, which trickles from the wounded trees, and by the heat of the sun congeals into transparent drops, which the Indians chew as a preservative to their teeth. It smells like the balsam of Tolu. The species are propagated by layers, or from seeds.

The sweet gum-tree, or *Liquidambar styraciflua*, is sometimes found of an immense size, particularly in the southern states; its wood is of an exquisite hard texture and fine grain, and furniture made of it has a handsome appearance.

2002. *Platanus*. From *πλατανος*, ample, broad, in allusion to the shadow afforded by the foliage. The species are trees of peculiar grace and elegance, and from that circumstance, and the classical associations attached to them, they are eminently adapted for pleasure grounds. The chenar, or eastern plane, is very much employed

- 13432 Leaves oblong sinuate serrated downy beneath, Bark fungous  
 13433 Lvs. obl. smooth glaucous ben. deeply and unequally pinnatif. Fruit ellipt.-ovate, Cal. cup-shaped fringed  
 13434 Lvs. obl. deeply sinuated smooth much contracted in the middle: lobes acute; the upper ones dilated angular and abrupt, Calyx of the fruit globose muricated nearly covering the nut  
 13435 Leaves palmate-lobed, Recesses at the base of the veins villous  
 13436 Leaves palmate-lobed, Recesses at the base of the veins smooth  
 13437 Leaves 5-lobed palmate cuneate at base, Segm. lanceolate sinuated, Stipules nearly entire  
 13438 Leaves 3-5-lobed toothed cuneate at the base smoothish  
 13439 Leaves cordate 5-lobed remotely toothed truncate at base  
 13440 Leaves 5 angular obsoletely lobed toothed cuneate at base downy beneath

13441 The only species

- 13442 Fronds forked: segments ensiform narrow, Stems round  
 13443 Fronds forked: segments lanceolate, Stems channelled  
 13444 Fronds flabelliform 3-5-parted

- 13445 Stemless, Leaves pedate entire, Spadix as long as spathe [contracted in the middle  
 13446 Stemless, Lvs. pell.-cordate sagittate colored in the disk, Spadix shorter than the hooded spathe, which is  
 13447 Stemless, Lvs. pell.-cordate sagittate sagittate, Spadix longer than the cylindrical spathe sagittate at end  
 13448 Stemless, Leaves pedate-cordate, Spadix shorter than ovate-lanceolate spathe  
 13449 Stemless, Leaves sagittate acuminate, Spadix shorter than ovate-cucullate spathe  
 13450 Stemless, Leaves pinnatifid  
 13451 Caulicent suberect, Leaves oblong cuspidate, Spadix shorter than oblong spathe  
 13452 Caulicent rooting, Leaves cordate sagittate, Spadix as long as the cucullate ovate spathe  
 13453 Caulicent erect, Leaves sagittate, Spadix shorter than the cucullate ovate spathe  
 13454 Caulicent rooting, Leaves ternate, Petioles naked, Spadix as long as the cucullate ovate spathe  
 13455 Caules. root. Lvs. tern.: lat. leaflets eared at base on outside, Petiol. winged bel. Spad. shorter than spathe  
 13456 Caulicent rooting, Leaves cordate sinuate  
 13457 Caulicent, Leaves cordate with rounded lobes, Spadix as long as cymbiform spathe  
 13458 Caulicent suberect, Leaves oblong acuminate cuspidate cordate at base finely spotted with clear white  
 13459 Caulicent scandent, Leaves ovate oblong acuminate, Spadix longer than cucullate spathe  
 13460 Caules. erect, Lvs. cord. sagittate, Spadix shorter than spathe, which is cucullate and contracted in middle

and Miscellaneous Particulars.

in the gardens of Persia and India; it was highly esteemed by the Greeks and Romans, and was planted near their houses in the form of avenues and groves. Groves of these trees are still equally revered in India, and are commonly found near the native temples and burial places of the princes. The timber is considered of similar quality to that of sycamore. All the species are of easy culture by layers, and they will also grow by cuttings.

The *Platanus occidentalis* is known in America by the name of the button-wood, water beech, sycamore, and plane-tree; in Canada it is called cotton-tree. It is, perhaps, the largest tree in North America; on the fertile banks of the Ohio and Mississippi there are trees measuring from ten to sixteen feet in diameter.

2003. *Saisburia*. So called in honor of Richard Anthony Salisbury, F. R. S., a modern distinguished botanist. A large tree remarkable for its fan-shaped leaves, cloven like some of the *Adiantum* species. The fruit is a pale brown drupe of a globular form; it has never been produced in this country, though there are trees of a considerable size. The fruit is yellow when ripe, with a fleshy, juicy, white pulp, adhering closely to the drupe, which is like that of an apricot. The kernel is white, rather firm, sweet, with a mixture of austerity or bitterness when raw, but agreeable when roasted. Dr. Abel says, he saw the fruit exposed in the markets in China, but could not find out to what purpose it was applied.

2004. *Carludovica*. Named by the authors of the *Flora Peruviana*, in honor of Charles IV., king of Spain, and Luiza, his queen; both of whom were noble patrons of botany, and deserving of a finer genus to commemorate their virtues. The species are low palm-like herbs, of little beauty, but of great botanical interest.

2005. *Caladium*. A name originally employed by Rumphius, to designate some species of *Arum*, and revived by Ventenat. Its meaning is unknown. The species have the appearance of *Arca*, and are only cultivated for their singularly spotted stems, or neat green leaves, which are rarely disfigured by any of the accidents to which other stove plants are liable. The species are plants of the same general appearance as *Arum*. *C. sagittifolium*, *Chou-de-Bresil*, Fr., and *Esbare Arum*, Ger., bears a near resemblance to *Arum Colocasia*, and is carefully cultivated in the West Indies for the leaves, which are boiled and eaten as coleworts, being extremely pleasing to the taste. The roots are also eaten there, but they are in less esteem than the leaves. This is generally supposed to be the species of the *Arum* family the most universally cultivated. It is found in the East and West Indies, China, Japan, New Zealand, and the South Sea Islands. The root is extremely acrid, and when eaten raw, will excoriate the mouth; but baked in hot ashes, it loses its acrimonious quality, and becomes mild and well tasted; it is, however, heavy on a weak stomach, and is apt to occasion costiveness. The leaves, which are very soft, glaucous, and covered with a very fine silky nap, are used in many places instead of plates and dishes.

History, Use, Propagation, Culture,

2006. *Arum*. Formerly *aron*; supposed to be an ancient Egyptian word by which the *A. colocasia* was known. The last mentioned name is an alteration of its Arabic denomination *qalqas*, according to Forskahl. Perennial herbaceous plants, mostly natives of hot climates. The roots are fleshy, hot, and acrid, but in many species eatable; they are generally without stems, and altogether, with the *Caladiums*, form a very singular family. *A. Dracunculus*, *Serpentaire*, Fr., *Drachenwarz*, Ger., and *Dracunculo*, Ital., is a very remarkable plant; the stalks of the leaves being spotted with brown and purple, like the belly of a snake. The flower, which, like others of the genus, has a very singular appearance, smells so strongly of carrion, that few persons can endure it. It might be used in medicine and domestic economy for the same purposes as *A. maculatum*. *A. Colocasia* has a tuberous thick large oblong root, and leaves resembling those of the water-lily. In Egypt and the Levant, this plant is esteemed a wholesome food, though not very delicate. The roots and petioles are boiled, and the leaves when young are sometimes eaten raw. *A. trilobatum*, and various others, are similarly used in the West Indies. There and in Europe the culture of all the species is of the simplest kind.

*A. maculatum*, *Gouet*, Fr., *Aronswartzel*, Ger., and *Aro*, Ital., has a tuberous whitish root about the size of a large nutmeg, which is used both as food and medicine. On tasting them, they seem to be merely mucilaginous and insipid, but they soon affect the tongue with a pungency as if pricked by needles; this uneasy sensation may be alleviated by milk, butter, or oil. The acrimony is lost in drying, and the roots become farinaceous, insipid, and fit for boiling or baking. In the Isle of Portland, where the plant is very abundant, the roots are generally eaten by the country people; they are macerated, steeped, and the powder so obtained is dried and sent to London, and sold under the name of Portland sago. Medicinally, the root in its recent state is stimulant, diaphoretic, and expectorant. Though retained in the *Materia Medica*, it is seldom used. The berries which succeed the flower are devoured by birds; and Mr. Curtis thinks, that even the roots are eaten by them, particularly pheasants. Dried and powdered, they are used by the French as a wash for the skin, under the name of cypress powder.

2007. *Caryota*. The Greeks gave this name to a kind of cultivated date. Pliny says, it was so called,

- 13461 Leaves pedate entire, Spadix cylindrical shorter than ovate flat spathe, which is hairy inside
- 13462 Leaves pedate entire, Spadix lanceolate shorter than the ovate flat smooth spathe
- 13463 Leaves pedate entire, Spadix subulate longer than the oblong convolute spathe
- 13464 Leaves pedate entire, Spadix shorter than lanceolate spathe
- 13465 Stemless, Leaves ternate entire, Spadix clavate shorter than ovate acuminate flat stalked spathe
- 13466 Stemless, Leaves ternate ovate twice as short as spadix
- 13467 Stemless, Leaves ternate, Spadix longer than spathe
- 13468 Stemless, Leaves peltate ovate repand emarginate at base
- 13469 Stemless, Leaves peltate cordate repand 2-parted at base
- 13470 Stemless, Leaves cordate hastate, Spadix subulate longer than the reflexed ovate-lanceolate spathe
- 13471 Stemless, Leaves sagittate 3-lobed, Flowers sessile
- 13472 Leaves all radical hastato-agitate : lobes deflexed, Spadix club-shaped obtuse shorter than the spathe
- 13473 Leaves hastate 3-parted, Spathe stalked 2-colored longer than spadix : the end lanceolate and deflexed
- 13474 Stemless, Lvs. veiny with white hastate sagit. : lobes auricled diyaricating, Spad. clav. shorter than spathe
- 13475 Stemless, Lvs. hastate sagittate mucronate : lobes deflex. Petioles dotted, Spad. cylind. shorter than spathe
- 13476 Stemless, Leaves hastate cordate acute : angles obtuse [cucullate spathe
- 13477 Stemless, Lvs. hast. sagittate mucron. : lobes deflexed oblong obtuse, Spadix cylind. incurved shorter than
- 13478 Stemless, Leaves linear-lanceolate, Spadix subulate longer than lanceolate spathe
- 13479 Caulescens erect, Leaves peltate cordate : auricles cucullate
- 13480 Caulescens suberect, Leaves ovate bifid at base rounded, Spadices axillary
- 13481 Caulescens, Leaves peltate cordate acute cut out at the base with a wide recess
- 13482 Leaves sagittate acute rounded at base
- 13483 Leaves peltate cordate sagittate, Spathe roundish oblong acute, Spadix obtuse much shorter than spathe
- 13484 Leaves lanceolate acute entire, Edge of petiole sheathing, Spathe cucullate
- 13485 Leaves peltate cordate
- 13486 Caulescens rooting, Leaves cordate oblong acuminate, Petioles round
- 13487 Caulescens creeping, Leaves cordate lanceolate, Petioles with a membranous edge
- 13488 Stemless, Leaves decomposed bulbiferous, Spadix oblong ovate shorter than the obtuse veiny spathe
- 13489 Stemless, Leaves linear lanceolate, Spadix lanceolate shorter than the oblong lanc. spirally twisted spathe
- 13490 Steml. Lvs. ov. ent. or 3-lob. Spathe ureocel. at base : reflex. and taper-point. at end, Spadix length of spathe
  
- 13491 Unarmed fronds bipinnate, Leaflets cuneiform obliquely bitten off
- 13492 Fronds bipinnate, Petioles nodding, Fruit 1-seeded

MONADELPHIA.

13493 Frond pinnate, Female flowers terminal capitate : male lateral with dichotomous peduncles

- 13494 Fronds pinnate, Leaflets plaited terminal bitten off, Stems and spadices smooth
- 13495 Fronds pinnate, Leaflets cuneiform truncate, Fruit globose ovate acute
- 13496 Fronds pinnate, Leaflets linear acute, Fruit oblong incurved

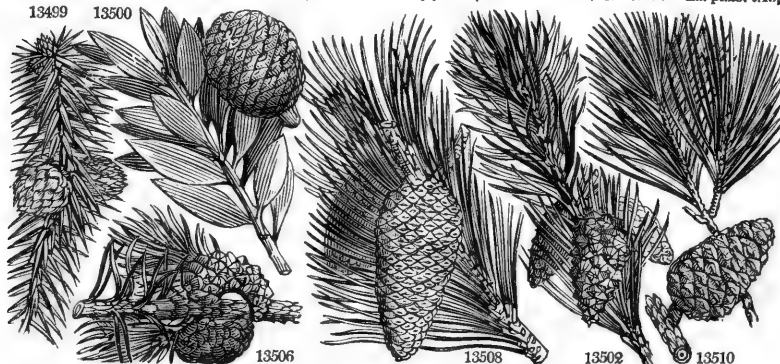

and Miscellaneous Particulars.

because a wine was prepared from it which soon got into the head, *waga*, head. *C. urens*, a fine species of palm, produces flowers in long pendulous spikes, which are succeeded by strings of succulent globular berries, dark red when ripe, with a thin skin, soft pulp, and very sharp and acrid to the taste. In Ceylon, it yields a sort of liquor, sweet, wholesome, and no stronger than water. It is taken from the tree twice or thrice a day, and an ordinary tree will yield three or four gallons. They boil this liquor, and thus make a kind of brown sugar of it, called Jaggory. The fruit is not eatable. When the tree has come to maturity, there comes out a bud from the top; this bud they cut and prepare by putting salt, pepper, lemons, garlick, leaves, &c. over it, which keep it from ripening. They daily cut off a thin slice from the end, and the liquor drops into a vessel, which they set to catch it. The buds, like those of the Cocoa and Betel-nut, are excellent in taste, resembling walnuts or almonds. *C. mitis* is a very beautiful palm, with fronds four feet long and a branched spike of flowers, succeeded by berries, round, coriaceous, smooth, black, the size of a musket bullet, but not eatable. Both species grow freely in sandy loam.

2008. *Nipa*. The name given to this fine palm in the Moluccas.  
 2009. *Areca*. The name which this palm bears in Malabar is, when it is an old tree, *Areec* ; when young it is called *Paynga*. A. Catechu produces the nut which is cut in slices, wrapped in the aromatic leaves of the betel-pepper, and chewed as we do tobacco. These leaves are previously covered with a thin layer of shell-lime (Ehunam), to preserve the flavor longer in the mouth. In most parts of the East Indies the natives are continually chewing it, swallowing their saliva tinged with the juice, and spitting out the rest. The inside of their mouths appears as red as blood, and it gives their teeth a dark color : but it preserves the teeth, sweetens the breath, and is a stomachic and diuretic. This palm is very generally cultivated in the East Indies.

*A. oleracea* is the highest of the American palms, and is very distinct from the East Indian *Areca*. The sheaths of the leaves are very close, and form the green top of the trunk a foot and a half in length. The

History, Use, Propagation, Culture,

inhabitants cut off this top, take out the white heart of two or three inches in diameter, consisting of the leaves closely folded together, and eat it, either raw with pepper and salt, or fried with butter like the artichoke.

2010. *Belis*. Named by R. A. Salisbury, in the Transactions of the Linnean Society, from *ελος*, a javelin, on account of the form and texture of the leaves, which are not unlike a javelin head. *B. lanceolata* is a beautiful evergreen shrub, with distichous neat leaves, easily cultivated in any good conservatory.

2011. *Agathis*. From *αγαθης*, a cluster, because the flowers are collected in clusters. This genus is formed of the Dammar Pines, of which the *A. australis*, or New Zealand Cowdie Pine, is one of the finest trees in the world, often growing perfectly straight to the height of 100 feet or more, and yielding one of the best descriptions of wood for masts.

2012. *Pinus*. This name is of Celtic origin, and is the same in all the dialects of that tongue. *Pin* or *pen*, a rock or mountain, has given rise to *pin*, in Armorian; *pinige*, in Erse; *pinna*, in Welsh; *pinus*, in Anglo-Saxon; *pine*, in English; *pynbaum*, in German; all signifying the fir-tree: hence also the Apennines (*Alpes pennines*), Pennafiel, Pennafior, &c. towns of Spain embosomed in mountains. The fruit of *P. Pinea* was formerly called Nux pinea, the pine nut. *Pinaster* is Pliny's name for the wild pine. *Cembra* is an alteration of the word *cembro* or *cirmoto*, the name given by the inhabitants of Trentin and Valteline to the plant. *Tæda* is derived from the Greek *ταει δαδος*, which signifies a torch, for which the wood of *P. tæda* is particularly adapted. *Strobus* is a name employed by Pliny for an eastern tree, which was used to perfume apartments. The moderns have applied it to a noble North American species.

The trees which compose this genus are not less remarkable for their grandeur and beauty, than for their valuable timber. They are all evergreens, and of lofty and erect growth. The trunk of the Scotch pine is more generally employed and more universally applicable as timber than any other tree in the temperate zone of the northern hemisphere. *P. sylvestris*, *Pin*, Fr., *Keifer* or *Föhre*, Ger., and *Pinea*, Ital., is erroneously called a fir; and has the term Scotch applied to it, because it is the only species of the genus indigenous to Britain, and there only in the northern parts of Scotland. It is also indigenous in the Alps, in the north of Germany, Russia, and abundantly so in Sweden and Norway. The finest pine woods in Britain, are at Invercauld in Inverness-shire, and Gordon Castle in Aberdeenshire. The timber of the Scotch pine is the red or yellow deal of the north of Europe, and is the most durable and valuable of any of the genus, unless we except, in point of durability, the larch. That grown in cold elevated situations in the highlands of Scotland, is found to be not inferior in quality to any imported from Norway; but that which has been planted in the low districts, is greatly inferior in point of durability, and can seldom be used in house carpentry and joinery. The tree is of great value as a nurse plant to others less hardy. The trunk of the tree produces resin by incision, and the roots tar by distillation. Several varieties of the wild pine have been noticed by botanists. According to Sang, the variety commonly cultivated is least worth the trouble. "The *P. sylvestris*, var. *montana*," he says, "is the variety which yields the red wood: even young trees of this sort are said to become red in their wood and full of resin very soon. The late Mr. Don, of Forfar, exhibited specimens of cones of each variety to the Highland Society of Scotland, and likewise to the Caledonian Horticultural Society. The variety preferred by Don, is distinguished by the disposition of its branches, which are remarkable for their horizontal direction, and for a tendency to bend downwards close to the trunk. The leaves are broader and shorter than in the common kind, and are distinguishable at a distance by their much lighter and beautiful glaucous appearance.

- 13497 Fronds pinnated, Stems hirsute, Spadixes branched spiny, Spines incurved  
 13498 Fronds pinnated, Leaflets plaited bitten off, Stems and spadixes branched smooth, Fruit roundish gibbous
- 13499 Leaves solitary lanceolate flat spreading, Cones round, Scales acuminate
- 13500 Leaves elliptical lanceolate striated
- 13501 Leaves ovate oblong smooth not striated

- 13502 Leaves in pairs rigid, Cones conico-ovate acute as long as the leaves, generally in pairs  
 13503 Leaves in pairs, Trunk ascending, Cones ovate erect  
 13504 Lvs. twin very long of two forms, Cones ovate, Scales narrowed at base very thickened at end not angular  
 13505 Leaves twin short acute, Cones ovate conical, Prickles of scales long subulate incurved : lower reflexed  
 13506 Leaves twin divaricating oblique, Cones recurved twisted, Crest of anthers dilated  
 13507 Leaves double or triple rigid, Cones oblong generally in pairs rounded at base  
 13508 Leaves twin roughish at edge, Cones oblong conical shorter than leaf narrowed at base, Scales echinate  
 13509 Leaves twin : the first ciliated, Cones ovate blunt somewhat unarmed longer than leaf, Nuts hard  
 13510 Leaves twin very fine, Cones ovate-conical very smooth solitary stalked  
 13511 Leaves twin, Cones ovate-conical rounded at base somewhat shorter than leaf, Scales blunt  
 13512 Leaves twin, Cones oblong-conical the length of leaves solitary rounded at base, Scales echinate  
 13513 Leaves twin, Cones ovate-conical rounded at base solitary half as short as leaves, Scales unarmed  
 13514 Leaves twin or ternate, Cones ovate-conical subsolitary, Prickles of scales incurved  
 13515 Leaves long, Cones deflexed : spines inflexed, Sheath of leaves long  
 13516 Leaves in 5s very long slender lax toothletted, Cones cylindrical smooth pendulous longer than leaves  
 13517 Leaves 3 very long, Cones roundish ovate mucronate  
 13518 Leaves 3, Cones ovate clustered, Spines of scales reflexed, Sheath of scales short

and Miscellaneous Particulars.

The bark of the trunk is smoother than in the common kind. The cones are thicker, and not so much pointed. The plant is more hardy than the common sort, grows freely in almost any soil or situation, and quickly arrives at a considerable size."

*P. laricio* is said to be nearly allied to the Scotch pine, but a much handsomer and finer tree. Professor Thouin considered it equally hardy with *P. sylvestris*; its wood is more weighty and resinous, and consequently more compact, stronger, and flexible. It grows wild on the summits of the highest mountains in Corsica. *P. resinosa*, the red Canadian pine, is not unlike the Scotch pine, but rather redder in the bark. The timber of this tree is frequently imported as masts, and is considered valuable. Grown on a damp and fertile soil, it is much less durable than from elevated situations; it is equally hardy with *P. sylvestris*. *P. pinaster* is a grand and picturesque tree, and is a great favorite with the Roman and Florentine painters. The timber is of less value than that of any of the others that have been mentioned; in Switzerland it is cut into shingles for covering their houses. It is highly deserving of culture as an ornamental tree, but not for timber.

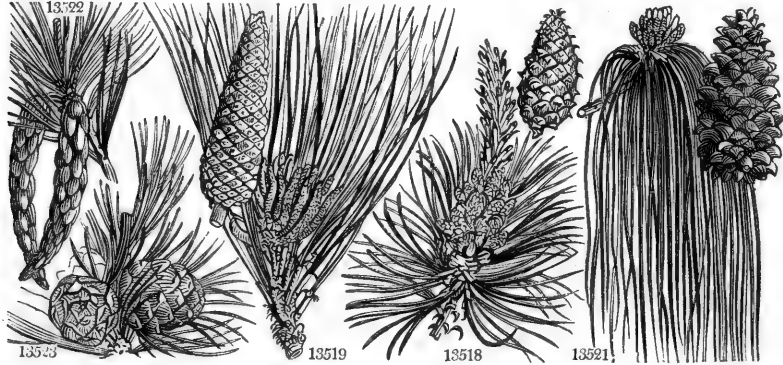

*P. pinea* is very common in the south of Italy; there is an immense forest of them at Ravenna, and they are much planted in the gardens of the villas of Rome and Florence. The seeds of this and the last species are eaten throughout Italy, both by the poor and rich. They are as sweet as almonds, but with a slight flavor of turpentine. The wood is not so resinous as that of most of the other sorts, and the tree can only be considered as deserving culture for its pictorial effect. *P. cembra*, the Tannenbaum of Lord Byron (Childe Harold), and the Apherousli pine of Harte (Essays), grows higher up the Alps than other pines, and is even found at elevations where the larch will not grow. The wood is very soft, and having scarcely any grain, is very fit for the carver. The peasants of the Tyrol, where this tree abounds, make various sorts of carved works with the wood, which they dispose of in Switzerland among the common people, who are fond of the resinous smell which it exhales.

*P. taeda* has longer leaves than the wild pine, and larger cones than *P. pinea*; the timber is like that of the Scotch pine, but has more resin. There are a number of these trees at Wolburn Abbey, which grow as freely as the Scotch pine, and the timber, as far as it has been tried, is superior.

*P. palustris* is remarkable for the length of its leaves, which often exceed a foot, and hang down in tufts at the end of the branches, having a singular appearance. It grows in a warmer climate than most other pines; produces a valuable timber in America, but has been but little cultivated in this country. *P. strobus* forms the connecting link between the pine and the larch tribe, and is the tallest tree of the genus. The bark is smooth and elegant, and the leaves numerous, soft, and of a bluish green. The timber is imported in vast quantities under the name of white pine; it is much used in house carpentry, but is considered less durable than the red deal of Norway (*P. sylvestris*), or the pitch pine of Canada (*P. resinosa*). The tree seems to be of so delicate a habit, as to prevent our expecting it ever to become very large or valuable in Britain. It has been a good deal cultivated, having formerly been supposed the most valuable tree of the genus, next to the common pine.

The *Pinus canariensis* seems never to have been well described or understood. Some have taken it for the *Pinus Larix*, others for the *Pinus taeda*, whilst others had confounded it with the *Pinus maritima*. Von Buch, and the late Christian Smith, named it in their catalogue of the vegetation of Teneriff, *Pinus canariensis*, and they state, that it inhabits that island from the edge of the sea to an elevation of 6700 Parisian feet above the level of the sea; but that the region where it is most abundant may be reckoned at from 4080

History, Use, Propagation, Culture.

to 5900 feet, where snow falls for about a month. The temperature of the zone M. Decandolle estimates to be similar to that of Scotland, or to the north of France, or of Germany. The wood is resinous, highly inflammable, and is excellent for constructing buildings, being known to continue sound for ages.

The *Pinus inops*, Jersey pine, pitch or scrub pine, is of middle size, straggling growth, and full of resin. Its branches are tougher than those of any other pine, and might be used for many purposes if its wood were not subject to so early a decay. The pitch pine, *P. resinosa*, is generally known in its native country by the name of Norway pine; sometimes, particularly among the Canadian French, red pine. It grows in close forests, is very tall, and its bark remarkably smooth and red: the timber is very heavy; for which reason it is rejected for masts, though its shape and size appear to recommend it for that purpose. The scrub pine, *P. Banksiana*, is a small straggling tree, which in some instances, when growing among barren rocks, does not rise above five or eight feet high, though it will grow to a considerable size when by accident or culture it is brought on good soil: trees of this species now in England exude a great quantity of resin from their branches. The yellow pine, *P. variabilis*, is most in use for building houses as well as shipping. *P. taeda*, the loblolly or Oldfield pine, is found in large tracts in the southern states of North America: all the woods seem to be filled with its seeds; for when any piece of cleared land is neglected for any space of time, it will be covered with these pines. It is difficult, and in some cases almost impracticable, to recover lands so run over, as the ground appears to have lost all fertile properties for other vegetation. The long leaved, yellow, pitch, or brown pine, *P. palustris*, is a beautiful as well as very useful tree. The white or Weymouth pine grows in the state of Vermont to an enormous size; it is the best timber in America for masts.

2013. *Abies*. According to Bulet, this name is derived from one of the dialects of the Celtic, *abetoa*, whence *abete*, Italian, *abeto*, Spanish, &c. Hesychius, the Greek grammarian, calls it *αβιν*.

*Abies communis*, *Sapin*, Fr., *Fichtenbaum*, Ger., and *Abiete*, Ital., is one of the tallest of European firs, with a very straight but not thick trunk. It is a native of the north of Germany and Russia, and particularly abundant in Norway; its timber being the white deal, and, at an earlier age, the long spars imported from that country and the Baltic. The timber is inferior to that of the common pine in durability and bulk; and being often knotty, is not proportionally strong for horizontal bearings with that timber. White Norway deal, however, is used for a great variety of purposes in building; and the entire trees are more prized than any other for masts for small craft, for spars both for marine purposes and on land. What constitutes the value of this fir is, that its timber is equally durable at any age, like that of the larch; and what renders it peculiarly adapted for masts, spars, scaffolding, poles, &c. is its habit, almost in every case, whether standing single or detached, of growing perfectly erect and straight. The tree may be cut for rods, stakes, and scythes, or other implement handles, when the trunk at the base is not more than two inches in diameter, and the bark being kept on it, it will prove almost as durable as the larch. Pontey says, that poles of spruce are so far inferior to those of larch, that they are more apt to crack when exposed whole to the influence of the sun and air: but in all other respects they are nearly equal to it, and in straightness surpass it. The tree is peculiarly valuable as a nurse, from being evergreen and closely covered with branches, by which radiated heat is retained; from its conical shape and rigid stem, by which it does not suffocate or whip the adjoining trees; from its being valuable at whatever age it is thinned out; and from its being an excellent shelter for the most valuable game. It will not, however, grow in elevated situations, where the common pine and larch will flourish. It is also an excellent hedge plant for shelter, but is deficient in point of defence and durability. By incision, it yields a resin, from which, by various preparations, turpentine and Burgundy pitch are formed. The tops or sprouts give the flavor to what is called spruce beer.

*A. álba*, *rubra*, and *nigra*, are American firs of the spruce kind, resembling in their general properties those of Europe. The black spruce is reckoned the most durable: in America it is used for knees for ship-building, where neither oak nor larch can be easily obtained. These knees are not prepared from two diverging branches, as in the oak, but from a portion of the base of the trunk connected with one of the largest diverging roots. The timber of the red spruce is universally preferred throughout the United States for sail yards, and, indeed, imported for this purpose into Liverpool from Nova Scotia, where it is also used for constructing casks for salted fish. It is chiefly from the decoction in water of young shoots of the black spruce, and not exclusively from those of the white species, as supposed by Lambert, that the celebrated beer is prepared by fermentation, with a due proportion of sugar and molasses. The essence of spruce of the dealers is prepared by evaporating this decoction to the consistence of honey.

*A. picca* displays a more stable and majestic form than any of the firs. The upper surface of the leaves is of a fine vivid green, and their under surface has two white lines running lengthwise on each side of the

- 13519 Leaves 3 very long, Cones subcylindrical muricated, Stipules pinnatifid ragged persistent  
 13520 Lvs. very fine and slender of a bright glaucous green, Cones oblong pendulous, Scales obtuse spreading  
 13521 Leaves 3 very fine very long, Sheath long, Stipules entire deciduous, Crest of anthers convex entire  
 13522 Leaves quinate, Cones cylindrical longer than leaf lax  
 13523 Leaves quinate, Cones ovate obtuse, Scales appressed, Nuts hard

- 13524 Leaves solitary glaucous beneath emarginate, Cones ovate obl. erect, Bractes oblong reflexed emarginate  
 13525 Leaves solitary flat emarginate pectinate, Scales of cone very blunt appressed  
 13526 Leaves solitary flat emarginate subpectinate suberect above, Scales of the cone in fl. acuminate reflexed  
 13527 Leaves solitary flat toothed somewhat dichous, Cones ovate terminal scarcely longer than leaf  
 13528 Leaves solitary 4-cornered, Cones ovate cylindrical, Scales rhomboid  
 13529 This is a stunted variety of *Abies communis*  
 13530 Leaves solitary 4-cornered, Cones cylindrical, Scales rhomboid flattened repand at end eroded  
 13531 Leaves solitary 4-cornered incurved, Cones subcylindrical lax, Scales obovate entire

and Miscellaneous Particulars.

midrib, giving the leaves that silvery look which has given rise to the name. The timber is reckoned much inferior in value to that of the common pine, or of the white spruce. It should not be cut till after forty or fifty years growth; at this age, if it has grown in a sheltered rocky steep or dell, it will be found to have produced a great bulk of timber. It is more prolific in resinous matter than any other tree of the fir kind.

A. balsamea is a tree of more delicate habits than the silver fir; its timber is of little value, and the balm or resin procured from it possesses no medical properties superior to those of common turpentine. During summer, the tree sends out a pleasing terbinthinate odor.

A. canadensis is a drooping low evergreen tree, elegant in appearance, and valuable as growing under the shade or drip of other trees.

All the species of the pine, fir, and larch families, with the exception of one or two, as yet rare in this country, are raised from seeds. The cones are gathered in the winter season, and exposed to the sun, or to a gentle heat on a kiln, in order to facilitate the separation of the seeds. The cones of the cedar should be kept for a year at least after they are taken from the tree, before the seed be attempted to be taken out. This is necessary on account of the soft nature of the seeds, and the great quantity of resinous matter which the cones contain when growing, and which is discharged by keeping. Cedar cones are generally imported from the Levant, and the seeds retain their vegetative powers for many years. The cones of the Scotch pine, spruce, and larch, are the principal kinds which are opened by kiln heat. The cones of the Weymouth pine, silver fir, and balm of Gilead fir, give out their seeds with very little trouble. April is the best season for sowing all the species. The soil should be soft and rich, well mellowed by the preceding winter's frost and snow, carefully dug and raked with a long toothed rake as finely as possible. The rarer sorts are generally sown in pots, but the more common in beds. The manner of sowing is by first drawing off the surface of the bed to the depth of half an inch; then drawing a light roller along it to render the surface perfectly even; next depositing the seed; and afterwards replacing the earth drawn off with a spade as evenly as possible. This is what is technically called bedding in, and is one of the nicest operations of nursery culture. The seed of the Scotch pine and Pinaster require a covering of half an inch in depth; those of the Weymouth pine, three quarters of an inch; and those of the stone pine, an inch and a quarter. The Cedar is generally sown in broad pots, or boxes of light sandy loam, and covered half an inch. The seeds of the larch require a covering of only a quarter of an inch; those of the spruce fir, an inch; those of the silver fir and balm of Gilead fir, from half to three quarters of an inch. The seeds of the American spruce fir are smaller than those of any of the preceding kinds, and therefore require a lighter covering than any of them; one-fifth of an inch is quite sufficient. The strictest attention is required, both in regard to quality of soil, and thickness of covering the seed; for though resinous trees are extremely hardy when grown up, yet they are all very tender in infancy. In sowing the seed, a considerable loss will be sustained by the suffocation of young plants if it is deposited too thick, and by the want of plants if too thin. The judicious gardener will be regulated by the goodness of the seed, and the size of the foliage of the different species. The raising regular crops of the pine family is reckoned a master piece of nursery culture in the open ground; and as it has been most extensively practised in the Scotch nurseries, it is generally considered as best understood there. (See *Song-Plant. Kal.*)

The pine, fir, and larch families benefit less by transplanting in the nursery than the non-resinous trees. And in general, where circumstances admit, the better plan is to remove them at once from the seed-bed at two years old, to where they are finally to remain. The more delicate species, including the cedar and most of the pines, are best transplanted into pots, unless they can be placed at once where they are to remain. The more common pines and firs are transplanted at two years of age into nursery lines, about the middle of April for all the tribe, excepting the larch, which, being deciduous, should be transplanted in February. No description of tree-plants receive so much injury as this tribe from the loss of roots, from the roots being exposed to the air by being kept long out of the soil, or from compression and exclusion of air and moisture by being kept in close bundles, or thick layers. They should, therefore, be finally planted as soon as possible after removal from the nursery; and, indeed, whenever it is practicable, no more should be taken up in one day than can be planted that day or the next. Nor are any plants more easily deprived of the vital principle, by packing and carriage either by sea or land; though, being all evergreens, excepting the larch, they do not readily show it. This has been stated to us by experienced planters in Wales and different parts of England, as the reason why so few trees are finally produced from the immense numbers of Scotch pine and larch fir annually sent to the south by the Scotch nurserymen.

*Abies Balsamea* forms an elegant tree forty or fifty feet high. It grows in high and cold situations in the northern states of North America, where it is called balsam of Gilead fir, fir balsam, and American silver fir.

History, Use, Propagation, Culture,

The hemlock spruce is a very elegant tree, and grows in some situations to an enormous size: its bark is a fine substitute for oak-bark in tanning.

2014. *Larix*. This has also for its root the Celtic word *lar*, which signifies fat, in allusion to the abundance of resin afforded by the plant. Even Dioscorides remarks, that *Larix* is the Gallic name for resin. The authors of the Dictionary of Trevoux make the word *Cedrus* come from *κωδών*, sweet-scented, on account of the balsamic odor exhaled by the wood when burned.

*L. Cedrus*, *Cèdre*, Fr., *Cederbaum*, Ger., and *Cedro*, Ital., is unquestionably the most celebrated tree of the genus, and not less remarkable for the irregular grandeur of its form. The general character of its shoot, even when the tree is young, is singularly bold and picturesque, and quite different from that of every other species of the tribe. It is a native of the coldest parts of the mountains of Libanus, Amanus, and Taurus; but it is not now to be found in those places in great numbers. Maundrell, in his journey from Aleppo to Jerusalem, in 1696, could reckon only sixteen large trees, though many small ones; one of the largest was twelve yards six inches in the spread of its boughs. The forest of Libanus never seems to have recovered the havoc made by Solomon's forty score thousand hewers: so that we have now, as Professor Martyn observes, probably more cedars in England than there are in Palestine.

From the branching head of this tree, and its aversion to pruning, it is not likely ever to become valuable as timber in this country. When planted for that purpose, it should, as Sang recommends, be sown in groves, and thus by proximity drawn up with few branches. Much has been said of cedar timber, which borders on the miraculous; as far as experience has gone, it is greatly inferior to that of the common larch, or the wild pine. The great use of the cedar is to plant singly on lawns, or in the margin of plantations, where one or two specimens will give force and character to the duller front of round-headed trees.

*L. Communis*, *Mélez*, Fr., *Lerchenbaum*, Ger., and *Laricio*, Ital., is a deciduous tree, and there are two or three species or varieties not yet distinctly ascertained. There is a variety with red and another with white flowers; one with cinerous bark, called the Russian larch, and one with pendulous branches. *L. pendula* and *L. microcarpa* are considered species or subspecies; the timber of both is said to be harder than that of the common white larch; but these trees have never yet had a fair trial in this country. As there are a few large specimens at Dunkeld and Athol, seeds will probably soon be obtained, and from their progeny a practical estimate may be formed of their merits in this country. The red larch trees on the Athol estates do not contain one-third as many cubic feet of timber as the white larch of the same age. The wood is so ponderous that it will scarcely swim on water. (*Hort. Trans.* iv. 416.) The timber of the white larch has been as much extolled as that of the cedar, and with much more reason. The rapidity of its growth is not less remarkable than the durability of the timber. Both have been experimentally proved in the Highlands of Scotland. It is stated by the Duke of Athol, that on mountainous tracts there, at an elevation of 1500 or 1600 feet, the larch, at eighty years of age, has arrived at a size to produce six loads (300 cubic feet) of timber; appearing in durability and every other quality to be likely to answer every purpose both of civil and naval architecture. (*Hort. Trans.* iv. 416.) The tree will arrive at a timber size in almost any situation or soil. Sang, a forest manager of extensive practice, has paid great attention to this tree. "It bears," he says, "the ascendancy over the Scotch pine in the following important circumstances: that it brings double the price, at least, per measurable foot; that it will arrive at a useful timber size in one-half, or a third part of the time, in general, which the pine requires; and, above all, that the timber of the larch, at thirty or forty years old,

13532 Leaves solitary subulate, Cones oblong blunt, Scales rounded somewhat 2-lobed entire at edge  
 13533 Leaves solitary 4-cornered erect straight, Cones ovate, Scales elliptical wavy at edge erect

13534 Leaves fascicled deciduous, Cones ovate-oblong, Edges of scales reflexed lacerated, Bractes panduriform  
 13535 Leaves fascicled deciduous, Cones oblong, Edges of scales inflexed, Bractes panduriform sharply acumin.  
 13536 Leaves fascicled deciduous, Cones roundish few-fl. Scales reflexed, Bractes panduriform bluntly acuminate  
 13537 Leaves fascicled rigid evergreen acute, Cones roundish, Scales truncate appressed

13538 Leaves distichous spreading

13539 Leaves solitary lanceolate remote  
 13540 Leaves whorled linear falcate  
 13541 Leaves lanceolate, Branches whorled  
 13542 Leaves solitary linear cuspidate remote

13543 Branches quadrang. Lvs. imbric. in 4 rows blunt appr. convex, Cones glob. Scales unarm. Branches straight

13544 Branches quadrang. Lvs. imbric. in 4 rows appr. glauc. keel. Cones subglob. Sc. mucron. Branches pendulous  
 13545 Branches compressed, Leaves imbricated 4 ways ovate warded at base  
 13546 Leaves linear much spreading decussate  
 13547 Leaves linear crossing appressed, Branches very slender

13548 Branches 2-edged, Leaves imbricated in 4 rows ovate rhomboid appressed naked warded, Cones obovate  
 13549 Branches 2-edged, Lvs. imbric. in 4 rows ovate rhomboid appressed furrowed in middle, Cones elliptical

and Miscellaneous Particulars.

when it has been planted in a soil and climate adapted to the production of perfect timber, is in every respect superior in quality to that of the pine at 100 years old. In short, it is probable, that the larch will supersede the Scotch pine in most situations in this island, at no very distant period."

The chief objections to the timber of the larch are its liability to warp and twist; but this Montearth and others have proved may be effectually prevented by barking the trees in spring while growing, and not cutting them down till the following autumn, or even for a year afterwards. This is also said to prevent the timber from being attacked by the dry rot. The bark of the larch is more than half as valuable as that of the oak in tanning; turpentine is extracted from it in the Tyrol by incision; but that being always injurious to the timber, can never be recommended for adoption in this country. (See *Encyc. of Gard.* 7053. *Montearth's Forester's Guide*, 2d edit. p. 234.)

Like all other trees, and especially the resinous tribe, the timber of the larch is much affected by climate and soil. A certain elevation of surface, coldness of climate, and inferiority of soil, is absolutely necessary to produce the timber in perfection. Sang has known it in many places make the most rapid progress for thirty or thirty-five years, and though there was no external signs of disorder, yet when it was felled, the wood had begun to rot in the hearts of the trees, and some were quite hollow a good way upwards. (*Plant. Kal.* 59.)

*Larix pendula*, black larch, *Tamarack* or *Hackmatack* of the Americans, is a beautiful tree, resembling the European larch in appearance, as well as in the excellent qualities of its wood and bark.

2015. *Schubertia*. Named in honor of M. Schubert, a Polish botanist. The deciduous cypress grows in extensive swamps, and on the banks of large rivers, from Indian river, Delaware, to Florida, and on the Mississippi; it is one of the largest trees of the new continent, and one of the most valuable timbers that country produces; it grows to a considerable height, in this country, though the extremities of the young shoots are almost every autumn destroyed by frost. The finest specimens are at Sion-house and Biekenheim.

2016. *Podocarpus*. From *πυρ ποδος*, a foot, and *καρπος*, fruit; in allusion to the stalk of the fruit. The species are increased by ripened cuttings in sand under a hand-glass.

2017. *Cupressus*. In Greek *κυπαρισσος*, from the isle of Cyprus, where this tree is very abundant. *Cupressus sempervirens* is a common timber tree in some parts of the Levant. It was employed by the Moors round their palaces, and both by the ancient and modern Romans in their villas and gardens. The timber of this tree is said to resist the worm, and to be of great durability. The doors of St. Peter's church at Rome were formed of this material, and have lasted eleven hundred years. The Greeks made their coffins of it; and the mummy chests of Egypt are many of them of this wood. In Crete, Malta, and other places, it is used for the common purposes of building, and when imported into this country it is employed by the cabinet-maker and turner. Near buildings, where the prevailing architectural lines are horizontal, it forms very suitable combinations; it is also considered an appropriate tree for burial places. *C. Thuyoides* is an abundant tree in the swamps of New Jersey and Pennsylvania. It is used for fencing and house-building, and is in the highest esteem for shingles and pipe staves. *C. lusitanica* is a native both of Goa and Japan, and the handsomest tree of the genus. It is easily distinguished from all the evergreens of the Coniferæ by its abundance of very long dichotomous pendent branchlets. The culture of the hardy species of this genus, and also of *Thuja*, is the same as that of *Pinus*.

2018. *Thuja*. An alteration of *thya*, its real name; from *θυσ*, to sacrifice. Its wood, which gives out when burnt an agreeable perfume, was used in sacrifices. *Thuja occidentalis*, *Cédre blanc*, Fr., is a well known

History, Use, Propagation, Culture,

popular evergreen, which, though it seldom rises above the height of a shrub here, yet in Upper Canada attains the height of a timber tree, and the wood is considered more durable than any other. The trunk is sawn up into planks and boards for houses and boat-building, and the branches used for posts and fencing. The smaller branches and spray form besoms, and the leaves, made into a salve, are used by the Indians to cure the rheumatism. In England, the timber has been chiefly employed by the turner and cabinet-maker. In its native country the *Arbor-vitæ* succeeds best in soils where the roots have abundance of moisture. It grows tallest in swamps and marshes; in very dry places it never comes to any degree of perfection. The first tree of this species sent to Europe, was planted in the royal garden of Pontainbleau, in the reign of Francis the first. *T. orientalis* is a shrub resembling the other in general appearance. Both these species are readily increased by seeds, cuttings, or layers.

9019. *Trichosanthes*. From *τριχ*, hair, and *ανθος*, a flower. The limb of the flower is divided into ten parts, of which the five outer are reversed and acute, the five interior ciliated. *T. Anguina* is a popular annual, with the habit of the common cucumber. The flowers are cut into many small threads, and the fruit is taper, and nearly a foot long. *T. cucumerina* has smooth fruit of a red or orange color, the size of a pear. In the popular medicine of Malabar, the seeds are used for disorders of the stomach and bowels. Culture as for the common gourd.

9020. *Momordica*. From *mordeo*, *momordi*, to chew; its seeds have an irregular rugose surface, and the appearance of having been chewed. *M. elaterium* has a large fleshy perennial root, somewhat like that of Bryony. The stems are thick, rough, trailing, branching, with rough leaves on long footstalks. The fruit is an inch and a half in length, swelling like a cucumber, of a grey color like the leaves, and covered with short prickles. When fully ripe, it cuts the peduncles, and casts out the seed and juice with great force and to a considerable distance through the hole in the base, where the footstalk is inserted. For medicinal use, the fruit is gathered in September, just before it is ripe, and the clear juice which runs from it and that obtained by the expression of the fruit are inspissated, and form the elaterium of the shops. This fruit is a very violent cathartic. It was much employed by the ancients, who regarded every part of the plant as purgative; but Dr. Clutterbuck has proved that this is an error. (*Thomson's Lond. Disp.* 388.)

*M. balsamina* has a fleshy ovate fruit, remotely tubercled in longitudinal rows, smooth in the other parts, red when ripe, bursting irregularly, and dispersing the seeds with a spring. This fruit in Syria is famous for curing wounds. They cut it open when unripe, and infuse it in sweet oil, exposed to the sun for some days, until the oil is become red. It may then be applied to a fresh wound dropped on cotton. *M. operculata* has a green fruit, the top of which falls off when it is ripe like a lid; within it has no pulp, but is dry, and filled with netted fibres, very much interwoven.

9021. *Cucurbita*. A Latin word signifying a vessel. It is said to be derived from the Celtic *cuce*, a hollow thing. *C. lagenaria* has a fruit shaped like a bottle, with a large roundish belly, and a neck very smooth; when ripe of a pale yellow color, some near six feet long and eighteen inches round; the rind becoming hard, and being dried contains water; seeds quadrangular oblong, cut off and emarginate at top, three-cornered and beaked at bottom; edge keeled with a double raised line, smoothish, of a pale bay color. The Arabians call the bottle gourd *Charrah*. The poor people eat it boiled, with vinegar, or fill the shell with rice and meat, and thus make a kind of pudding of it. It grows in all parts of Egypt and in Arabia, wherever the mountains are covered with rich soil. In Jamaica, the shells are generally used for water cups, and frequently serve for bottles among the negroes and poorer sort of white people in the country. A decoction of the leaves

13590 Branches compressed, Lvs. imbricated in 4 rows lanc. acute appressed warted under end, Cones 4-cornered  
 13591 Branches round, Leaves imbricated in 4 rows oblong appressed smooth, Cones 4-cornered roundish

13592 Fruit rounded oblong incurved, Leaves cordate repand mucronate toothletted  
 13593 Fruit ovate acute, Leaves roundish cordate angular repand  
 13594 Fruit oblong acute, Leaves 5-lobed palmated entire

13595 Fruit roundish ovate narrowed at each end angul. warted, Bract cordate toothed above midd. of pedunc.  
 13596 Fruit oblong acuminate angular warted, Bract cordate entire below the middle of the peduncle  
 13597 Fruit elliptical angular warted beaked, Beak deciduous forming a lid  
 13598 Fruit cylindrical oblong, Furrows chain-like, Bract cordate entire at the base of the peduncle  
 13599 Fruit elliptical hispid, Leaves cordate hispid blunt toothed, Stem without tendrils

13600 Leaves cordate angular 5-lobed toothletted downy, Fruit obovate striped with lines lengthwise  
 13601 Leaves cordate roundish obtuse downy toothletted with 2 glands at base beneath, Fruit woody clavate  
 13602 Leaves subcordate about 3-lobed cuspidate finely toothletted rough, Fruit globose smooth  
 13603 Leaves cordate obtuse about 5-lobed toothletted, Fruit roundish or oblong smooth  
 13604 Leaves cordate deeply 5-lobed: the middle lobe narrowed at base, Fruit roundish elliptical warted  
 13605 Leaves cordate deeply 5-lobed: middle lobe narrowed at base toothletted, Fruit clav. ellipt. somew. warted  
 13606 Leaves cordate obtuse about 5-lobed toothletted, Fruit depressed umbonate tumid at edge  
 13607 Leaves 5-lobed, Lobes sinuate pinnatifid blunt, Fruit elliptical smooth

13608 Leaves multifid, Fruit globose smooth  
 13609 Leaves cordate 5-lobed toothletted blunt, Fruit globose spiny muricated  
 13610 Leaves palmate sinuated, Fruit round echinate  
 13611 Fruit oval echinate, Leaves palmate sinuated, Stem angular

and Miscellaneous Particulars.

is recommended much in purging clysters; and the pulp of the fruit is often employed in resolute poultices: it is bitter and purgative, and may be used instead of Coloquintida.

C. pepo, *Patison*, Fr., has hispid branchy tendrils stems, which in good soil will extend forty or fifty feet in a season, and cover an eighth part of an acre. The fruit is oblong, ovate, varying in form and size; some not less than four feet in circumference. In some parts of England the pompon (corruptly pumpkin) is sometimes planted by cottagers on dunghills, and suffered to trail at length over the grass of an orchard. When the fruit is ripe, they cut a hole on one side, and having taken out the seeds, fill the void space with sliced apples, adding a little sugar and spice, and then, having baked the whole, eat it with butter, under the name of pumpkin pie. On the continent the fruit, both unripe and ripe, is used in soups, stews, and fried in oil or butter. The tender tops of the shoots boiled as greens are much more delicate than the fruit. C. aurantia is more tender than the common pompon. The fruit is small, round, of a bright yellow when ripe, and may be used like those of the other species. C. verrucosa has a small round fruit, with a woody rind. In America it is gathered when half grown, and boiled to eat as a substitute for greens; but for this purpose this and most of the species are inferior to the succade Gourd.

C. melopepo, *Potiron*, Fr., *Pfebin Kürbiss*, Ger., and *Popone*, Ital., has a large fruit, reddish yellow or yellowish-white within and without, roundish, but often flatted at top and bottom; torulose, and sometimes warted. It is cultivated in America as a culinary vegetable. C. Citrullus, *Pastèque*, Fr., *Wassermelone*, Ger., and *Cocomero*, Ital., is readily distinguished from all the other species by its deeply cut leaves. The fruit is roundish, large, smooth, often a foot and a half in length, with a white icy flesh, streaked with dark red and black seeds. It is much cultivated in the warm countries of Europe, and also in Asia, Africa, and America, for its cooling quality. It serves the Egyptians for meat, drink, and physic. It is eaten in abundance during the season, which is from the beginning of May until the overflowing of the Nile; that is, to the end of July or beginning of August. It is the only medicine the common people use in ardent fevers. For this purpose they have a variety that is softer and more juicy than the common sort; when this is very ripe, or almost putrid, they collect the juice, and mix it with rose-water and a little sugar. This fruit should be eaten by Europeans with great caution; when taken in the heat of the day, whilst the body is warm, colics and other bad consequences often ensue, and it is well known that persons are much troubled with worms at the time this fruit is in season.

The Succade Gourd, a variety of C. ovifera, has an elliptical oblong pale-yellow fruit, by far the best for culinary purposes of any species of Cucurbit. When very young, it is good fried with butter; when about half grown, it is excellent either boiled as a substitute for greens, or stewed in slices with rich sauce; when full grown, it is used for pies. Sabine, who has cultivated most species of Cucurbita, considers the vegetable marrow without a rival. (*Hort. Trans.* vol. ii. 255.)

All the species may be raised on a hot-bed in April, and transferred to the open garden at the end of May, under a warm aspect and in a rich soil; or they may be sown in a trench filled with hot dung, where they are finally to remain. Their after culture is of the easiest description.

It is not very generally known, that the tender tops of all the species of the Cucurbita and Cucumis families, whose fruit may be eaten, when boiled form a very tender substitute for greens.

2322. *Cucumis*. A word with the same derivation as the last. C. Colocynthis has fruit the size and color of orange; the pulp light, spongy, and white, and most intolerably bitter. When ripe, it is peeled and dried in a stove, and in this state it is imported from the Mediterranean under the name of colocuintida. Medicinally, it

History, Use, Propagation, Culture,

is a very powerful drastic cathartic, requiring to be employed with caution, on account of its violent effects. When given alone, even in moderate doses, it purges vehemently, producing violent gripings, bloody ejections, and not unfrequently convulsions and inflammations of the bowels. (*Thom. Lond. Disp. 271.*)

C. sativus and Melo (*μᾶλορ*, an apple) are too well known to require farther notice in a work of this description. C. anguria has hispid angular stems, and small flowers like those of Bryonia. The fruit is of the size and shape of a pullet's egg, of a dark-green color, and prickly like a hedgehog. It is eaten green, or with other herbs in soups in the West India Islands, and is esteemed an agreeable and wholesome ingredient. C. propehtarum has a striped fruit smaller than a melon; the odor nauseous, and the taste as bitter as Coloquintida. The fruit of C. acutangulus is very insipid, but in India is eaten boiled and pickled. C. Chate has a roundish fruit almost like that of the melon; the taste is somewhat sweet and cool, but not so cool as the water melon. In Egypt it is eaten as the most pleasant fruit they have, and that from which delicate persons have least to apprehend. The culture of all the species is similar to that of the common cucumber.

2023. *Sicyos*. Σικκος was one of the Greek names of the cucumber, from σικκος, unpleasant. The species are trailing plants like those of Cucumis, but with much smaller fruits.

2024. *Bryonia*. From βρυον, to push or grow rapidly, in allusion to the manner of its growth. B. alba and dioica, differ in little else besides the color of the berries, and by some are considered one species. Goats are

- 13572 Leaves roundish angular, Fruit with 10 acute angles  
 13573 Angles of leaves rounded, Fruit torulose  
 13574 Angles of leaves rounded, Fruit spherical with a retuse nipple  
 13575 Hirsute, Angles of leaves entire toothed, Fruit fusiform narrowed at each end hairy  
 13576 Leaves cordate subangular acutish finely toothed scabrous, Fruit elliptical blunt downy  
 13577 Angles of leaves straight, Fruit oblong rough  
 13578 Leaves angular somewhat lobed, Fruit cylindrical furrowed curved  
 13579 Leaves lobed, Fruit cylindrical very long smooth doubled up  
 13580 Leaves cordate entire toothletted, Fruit globose smooth
- 13581 Leaves cordate with an obtuse angle, 5-angular toothletted smooth  
 13582 Leaves roundish-cordate with a recess 5-lobed toothed hairy viscid
- 13583 Leaves cordate angular toothed rough with callous dots above and hairs beneath, Fl. in umbels  
 13584 Leaves 3-lobed smooth above rough beneath  
 13585 Leaves cordate angular above and the veins beneath covered with callous dots, Tendrils simple  
 13586 Leaves cordate angular entire smooth with callous dots above and 5 glands at the base beneath  
 13587 Leaves 3-lobed rough toothed, Lateral lobes angular somewhat 2-lobed, Fl. axillary somewhat umbellate  
 13588 Lvs. 3-lobed toothed hispid on each side, Lat. lobes dilated angular: middle elong. Stem muricato-hispid  
 13589 Leaves somewhat 3-lobed hairy narrowed at base  
 13590 Leaves cordate palmate 5-lobed toothed with callous dots, Fl. racemose dioecious  
 13591 Leaves cordate 5-lobed toothed rough with callous dots, Flowers racemose  
 13592 Leaves cordate 5-lobed apiculate hairy, Peduncles in umbels  
 13593 Leaves cordate 5-lobed entire with callous asperities on each side  
 13594 Leaves 5-lobed toothletted scabrous above, Peduncles 1-flowered  
 13595 Leaves 5-lobed somewhat toothletted, Lobes obtuse, Petioles and stem hispid  
 13596 Leaves palmate smooth 5-parted: segments lanceolate repand serrated  
 13597 Leaves 5-parted palmate, Segm. oblong lanc. acuminate serrated, Petioles muricated, Peduncles 1-flowered  
 13598 Upper leaves 5-parted palmate, Segments oblong cut-toothed: lower cordate angular toothed  
 13599 Lvs. 5-parted palmate, Segm. pinnatifid linear revolute at edge rough, Flowers in umbels, Berries acute
- 13600 Procumbent herbaceous
- 13601 Leaves sessile oblong blunt narrowed at base serrulate, Stem herbaceous  
 13602 Leaves petiolate lanceolate narrowed at each end entire, Stem shrubby  
 13603 Leaves stalked rhomboid acuminate entire, Stem arborescent

- 13604 Leaves obovate bluntish, Flowers twin axillary stalked, Stem branched round erect  
 13605 Leaves lanceolate cuneate blunt mucronate, Flowers solitary stalked axillary, Stem shrubby branched  
 13606 Leaves ovate-oblong blunt mucronate, Flowers axillary in threes, Branches compressed 3-cornered  
 13607 Leaves elliptical ovate blunt narrowed at base, Fls. axillary aggregate dioecious, Branches square compr.  
 13608 Leaves simple orbicular-ovate lucid, Flowers axillary: male turbinate nodding  
 13609 Leaves oblong obtuse netted with red veins beneath, Flowers racemose and fasciculate  
 13610 Leaves elliptical acute at each end, Stipules ovate acute as long as petiole, Flowers fascicled  
 13611 Lvs. pinn. flower-bearing: leaflets oblong attenuated at base and narrower on one side, Fls. axill. aggreg.  
 13612 Lvs. ovate acute, Fls. axill. somew. umbelled, Pedunc. filiform with 2 bractes at base, Branchlets compr.  
 13613 Leaves lanceolate acute, Flowers terminal about 3, Branches pinnaeform 2-edged  
 13614 Lvs. pinn. fl. bearing: leaf. elliptical obtuse, Pedunc. axill. lower usually twin and male; upp. solit. fem.  
 13615 Lvs. pinn. fl. bearing: leaflets linear obtuse mucronate, Flowers axillary solitary; the female uppermost  
 13616 Leaves pinnate fl. bearing: leaflets linear sharpish, Flowers axillary clustered, Petioles round downy

and Miscellaneous Particulars.

the only quadrupeds said to eat this plant. The root grows to a vast size. Gerarde says, "the queene's chiefe chirurgeon, Master William Goodorous, shewed me a roote heereof, that waied halfe an hundred waighte, and of the bignesse of a childe of a yeere old." To this Linnaeus ascribes the quickness of its growth, though it springs late. The roots have been formerly by impostors brought into an human shape, carried about the country, and shewn for mandrakes to the common people. The method which these people practised, was to open the earth round a young thriving Bryony plant, being careful not to disturb the lower fibres of the root; to fix a mould such as is used by those who make plaster figures close to the root, fastening it with wire to keep it in its proper situation, and then to fill in the earth about the root, leaving it to grow to the shape of the mould, which is effected in one summer. This root is a famous hydragogue, and highly purgative and acrid.

2025. *Andrachne*. The Greek name of the Purslane. The modern plant bears some analogy to that of the Greeks, in its thick and fleshy leaf. Plants of little beauty, and the easiest culture.

2026. *Stillingia*. Named after Dr. Benjamin Stillingfleet, an English botanist. *S. Sebifera* is the tallow-tree of China. An oil is expressed from the kernel, which hardens by cold to the consistence of common tallow, and by boiling becomes as hard as bees' wax. *Stillingia sylvatica* is considered a specific in cases of syphilis.

2027. *Phyllanthus*. From *φυλλον*, a leaf, and *ανθος*, a flower, because the flowers grow upon the edges of the

History, Use, Propagation, Culture,

leaves. Many of the species of this genus are remarkable for the neatness of their foliage and general aspect. The abolished genus *Xylophylia*, which is now included in *Phyllanthus*, is very generally cultivated on account of the pretty and at the same time singular appearance of its leafless leaf-like branches, covered over at the edges with multitudes of pink flowers. All the species require common stove culture.

2028. *Aleurites*. From *αλευας*, flour, all the parts of the plant seeming to be dusted with a farinaceous substance. A handsome plant of easy culture, and ripe cuttings with their leaves untouched, root in sand under a hand-glass.

2029. *Omphalea*. A curtailment of *Omphalandra*, a name under which Dr. Patrick Browne, in his History of Jamaica, first described the plant. He formed it from *ομφαλος*, a navel, and *ανθη*, a stamen; because the male organs are collected in a fleshy navel-like mass occupying the centre of the flowers. It grows freely in light loamy soil, and cuttings, with their leaves uninjured, root in sand under a hand-glass.

2030. *Hippomane*. From *ιππος*, a horse, and *μανια*, madness; the name was given by the Greeks to a plant which grew in Arcadia, and which possessed the dangerous property of making horses furious. This Hippomane must not, however, be confounded with that of Virgil (third Georgic), which is an animal substance.

The Manchineel-tree grows to a vast size on the sea coast of the Caribbee Islands and neighbouring continent. The leaves are ovate, serrated, acute, and very shining. The fruit fall off from the tree spontaneously, and pave all the ground with their numbers. They are highly poisonous, and are said to be eaten by the sea-crabs, which collect about the trees in vast numbers. But this is supposed by Jacquin to be a vulgar error. The whole tree abounds with a white milk, which is highly poisonous, and so very caustic, that a single drop placed upon the skin instantly causes the sensation of a hot iron, and in a short space raises a blister. It is a common belief that to sleep beneath the branches is death; but Jacquin and his companions reposed under it for three hours at a time without inconvenience. The wood is a most beautiful material for furniture, being finely variegated with brown and white, and susceptible of a high polish. The workmen who fell the trees, first kindle a fire around the stem, by which means the juice becomes so much inspissated as not to follow the blows of their axes. Whole woods on the sea-coast of Martinique have been burnt, in order to clear the country of such a dangerous pest.

- 13617 Leaves pinnate lanceolate acuminate subrenate coriaceous, Flowers stalked  
 13618 Leaves pinnate linear-lanceolate lined crenate, Flowers stalked hermaphrodite  
 13619 Leaves scattered linear-lanceolate subfalcate crenate, Flowers subsessile  
 13620 Leaves 3-lobed  
 13621 Leaves oblong blunt very smooth, Flowers triandrous, Stem arborescent  
 13622 Leaves ovato-serrated  
 13623 Leaves oblong acuminate serrulate, Petioles with 2 glands at the end  
 13624 Leaves lanceolate entire smooth variegated stalked  
 13625 Leaves linear entire stalked downy beneath  
 13626 Leaves elliptical entire bluntnish hoary downy beneath stalked, Spikes terminal few-flowered  
 13627 Leaves ovate lanceolate plaited serrated scabrous  
 13628 Leaves ovate bluntnish entire smooth, Fruit stalked  
 13629 Leaves ovate rhomboid repand entire at base hoary on each side, Pedunc. terminal about 3-fl.  
 13630 Leaves ovate serrated at end hoary downy beneath, Stipules ciliated, Spikes terminal subcapitate bracteate  
 13631 Leaves ovate acuminate serrated smooth with 2 glands at base, Petioles shorter than leaf, Racemes term.  
 13632 Leaves ovate acuminate entire smooth silvery with scales ben. Racemes comp. axillary, Stem arborescent  
 13633 Leaves cordate ovate attenuate somewhat toothletted warted and green above, silvery and shining beneath  
 13634 Leaves cordate acuminate serrulate rough above downy beneath with 4 glands at the base  
 13635 Lvs. round-cord. acum. ent. glandular-ciliated downy beneath, A fascicle of stalked glands at base of lvs.  
 13636 Leaves oblong subcordate serrulate scabrous downy beneath with 2 glands at the base, Raceme terminal  
 13637 Leaves ovate acute subcordate entire scabrous above downy beneath  
 13638 Leaves subcordate angular blunt repand scabrous downy beneath  
 13639 Leaves obl.-lanc. subcordate scabrous downy beneath and with 2 glands at base, Branches densely downy  
 13640 Leaves 3-5-lobed serrated with hairy petioles, Stem herbaceous  
 13641 Leaves oblong-lanceolate obtuse at base variegated and stained with red, Spikes axillary suberect  
 13642 Downy, Leaves cordate roundish blunt repand greenish above hoary beneath  
 13643 Leaves palmate 7-lobed hispid beneath stinging: lobes pinnatifid, Petiole with 1 gland at end  
 13644 Lvs. cord. 5-lobed serrated fringed with glands, Branched glandular hairs in axilla of leaves and petioles  
 13645 Leaves ovate acuminate entire very smooth, Racemes subcymose  
 13646 Leaves oblong subpanduriform acuminate entire angular at base with 2 teeth on each side  
 13647 Leaves cordate angular  
 13648 Leaves palmate 11-lobed smooth: lobes pinnatifid cuneate, Stipules setaceous multifid

and Miscellaneous Particulars.

2031. *Sapitum*. A name under which Pliny indicates a sort of pine, so named from the abundance of resin which it produces; from *saps*, fat or greasy in Celtic. The Americans employ the juice of *Sapitum acuparium* as bird-lime, for catching parrots and other birds. For this purpose they cut off a limb of the tree, and the next day collect the sap which has flowed out and become inspissated. They call it *Mangle castivo*. The juice is also burned in lamps. Cuttings root freely in sand under a hand-glass.

2032. *Croton*. The Greek name of a certain insect called *ricinus* by the Latins, which the fruit of *Croton* resembles.

*Croton Tiglium* affords an oil used in medicine, which is so powerfully irritating, that a small drop placed upon the tongue, has the effect of exciting an irritation along the whole intestinal canal, which does not soon subside. It is usually employed in mixture with oil of almonds, in order to weaken its too violent powers. *C. lineare* in its general appearance resembles rosemary, and is called wild rosemary in Jamaica. *C. tinctorium* is used to dye both silk and wool of an elegant blue color, and the juice is used to color wines and jellies. The substance for this purpose is called Turnsol, and is made of the juice which is lodged between the calyx and the seeds: this, if rubbed on cloths, appears at first of a lively green, but soon changes to a blueish purple; if these cloths are put into water, and afterwards wrung, they will dye the water of a claret color; the rags thus dyed are brought to England, and sold in the druggists' shops by the name of Turnsol.

*C. Eleuteria* furnishes the Cascarilla bark, which is chiefly imported from Eleutheria, one of the Bahama Islands. It consists of pieces of about six or eight inches long, scarcely one-tenth of an inch thick, quilled, and covered with a thin whitish epidermis. It has a pleasant spicy odor, and a bitter warm aromatic taste. It is very inflammable, and is easily distinguished from all other barks by emitting, when burnt and extinguished, a fragrant smell resembling that of musk. Medically, this bark is a valuable carminative and tonic, and is an excellent adjunct to the Cinchona bark in fevers. *C. lacciferum*, a plant not yet in gardens, is one among several species on which the gum lac is said to be produced. Some of the spines we are in possession of, are much admired for their variegated leaves; all of them are freely propagated by cuttings with the leaves on, planted in sand, and plunged in moist heat under a hand-glass.

2033. *Jatropha*. From *ιατροφα*, a remedy, and *φαγη*, to eat. The *J. Manihot* (*Mandioka*, Brazilian) or *Cassa-*

History, Use, Propagation, Culture,

root, yields an excellent nutritious article of food when the juice has been expressed, which is a strong poison. *J. gossypifolia* is considered a beneficial plant in the West Indies, on account of the seeds, which are much relished by and very nourishing to poultry. *J. Manihot*, the Cassava of the West Indies, and the *Mandioca* and *Tapioca* of Brazil, formerly supplied the greater part of the nourishment of the natives of South America, and is now very generally cultivated there and in the West Indies. It yields an agreeable wholesome food; is of rapid growth, the roots arriving to perfection in about eight months, and it will thrive in any soil or situation. The juice of the root is sweetish, and when swallowed, or when the root is eaten without preparation, it brings on convulsions, and occasions violent retching and purging. It acts only on the nervous system; it produces no inflammation on the stomach; but the stomach of a man or other animal poisoned by it, appears to be contracted one half. A little mint-water and salt of wormwood, timely administered, will prevent all bad consequences. In preparing the roots for use as food, they are washed, scraped, and grated to a pulp; this pulp is then pressed, and when dried is a powder resembling starch or flower fit for use. It is generally baked as bread, and bears a considerable resemblance to that made from wheat flour. The roots entire, or in a powdered state, form an article of considerable export from different parts of Brazil. All the species thrive well in our stoves, and are increased by cuttings, which Sweet states, succeed best when stuck in the tan in a good heat.

2034. *Ricinus*. A name with the same derivation as *Croton*, No. 2032, which see. *R. communis*, though an annual and herbaceous plant in our gardens, becomes a tree in Africa of several years' standing. In Candia it continues many years, and, according to Belon, requires a ladder to come at the seeds. The seeds furnish the well known Castor-oil of medicine. This oil is obtained both by coction and expression. The former method is performed by tying up the seeds, previously decorticated and bruised, in a bag, which is suspended in boiling water, till all the oil is extracted and rises to the surface, when it is skimmed off. Oil so obtained is apt to become rancid, and, therefore, the better mode is to subject the seeds to the press, in the same manner as is done with almonds to procure almond oil. (See *Amygdalus*.) The oil obtained is equal to one fourth of the weight of the seeds employed. It is often adulterated with olive oil, linseed oil, and poppy oil. The great value of castor oil as a purgative is the mildness and rapidity with which it operates. It is peculiarly adapted for infants,

- 13649 Leaves undivided 3-5-lobed palmate entire glaucous beneath  
 13650 Leaves 5-lobed cordate toothed hispid stinging

 13678 Male spikes axillary female at base, Invol. O, Leaves ovate cordate acuminate serrated  
 13679 Spikes axillary erect, Female involcs. cordate toothed very large, Leaves ovate-lanceolate serrated smooth  
 13680 Flowers dioecious spiked, Spikes axill. Invol. of females cordate cut, Leaves obl. lanceolate serrated smooth

- 13681 Leaves 3-lobed serrated : lobes oblong serrated, Bractes 3-lobed ciliated, Petioles shorter than peduncle

and Miscellaneous Particulars.

women in childbed, and persons bed-ridden. Sown in pots on heat early in the season, and transplanted as soon as the frosts are over into a mass of light rich soil, the plant makes one of the most magnificent of border annuals, often attaining the height of ten or twelve feet.

2035. *Hura*. Its American name. *H. crepitans* is a rapid growing tree. From the quickness of its vegetation, its parts are of so loose a texture, that a loud clap of thunder, or a sudden gust of wind, frequently causes the largest boughs to snap asunder. The wood is only fit for joists and spars : the sap of the leaves and bark is corrosive, and the seeds when roasted purge both upwards and downwards. The species are propagated by large ripened cuttings, planted in sand, plunged in heat, and covered with a hand-glass. Its fruit when ripe bursts with a loud crack, whence the specific name of crepitans ; they are of a very elegant form, resembling a depressed sphere with many rounded ribs, arranged with the utmost symmetry.

2036. *Sterculia*. *Sterculius* was the god of the privy, from *stercus*, excrement. It has been well observed by a French author, that the Romans, in the madness of paganism, finished by deifying the most immodest objects and the most disgusting actions. They had the gods *Sterculius*, *Crepitus*, *Priapus* ; and the goddesses *Caca*, *Pertunda*, &c. &c. The flowers of one species and the leaves of the other are highly fetid. The species are lofty trees with large leaves, and some of them very showy flowers : they all thrive in light loamy soil ; and ripened cuttings, with their leaves on, root in sand, plunged in moist heat, and covered with a hand-glass. The famous Cola nut of Guinea is the produce of *S. acuminata*.

2037. *Heritiera*. Named in honor of Charles Louis L'Heritier de Brutelle, a distinguished French botanist, who was unfortunately assassinated in a street of Paris in 1800. He published many works, which will always have a high reputation for the excellence of their text, and the magnificence of their illustrations. A fine tree, which may be treated like *Sterculia*.

2038. *Acalypha*. A Greek name for the nettle, which this genus much resembles. It is compounded of  $\alpha$ , privative,  $\alpha\lambda\alpha\sigma$ , beautiful, and  $\alpha\pi\eta$ , touch. Plants of no beauty and the easiest culture.

2039. *Dalechampia*. So called after James Dalechamp, a French botanist, born in 1513, died in 1588. He left a General History of Plants, and some commentaries upon Pliny. May be treated as *Plukenetia*.

2040. *PLUKENETIA*. *W.* PLUKENETIA. *Euphorbiaceae*. Sp. 1—5.  
13682 volūbilis *W.* twining  $\frac{1}{2}$  □ un 6 jl. au G W. Indies 1739. C p. 1 Plu. ic. 220. t. 226

*History, Use, Propagation, Culture,*

2040. *Plukenetia*. Named after Leonard Plukenet, an English botanist, who published some valuable works, with an immense number of copperplates, of singular merit for their time. The names of two of these works are so singular as to deserve explanation. One was called *Amaltheum botanicum*. This word in Greek, *Ἀμαλθεύμα*, was the name of the goat which suckled Jupiter. As its milk was exquisite and abundant, the word came to signify, among the ancients, the symbol of richness and abundance. The famous library of Atticus was called *Amaltheum*, on account of the number and variety of the books which it contained. In

CLASS XXII. — DICECIA.

*Male and female flowers upon different plants.*

To this class many of the observations made upon the last are equally applicable. Like it, the genera would have been more conveniently distributed among previous classes. The genera it contains are chiefly trees, and many of them form the most valuable portion of the forests of all parts of the world.

In Monandria is found the celebrated *Pandanus* or screw pine, which, with its strange spiral branches, constitutes one of the most singular features of the vegetation of the Isle of France. *Diandria* contains the valuable *Salix*; *Pentandria*, the hop, the hemp, and the spinage. The black Bryony, and various palms have a station in *Hexandria*; the poplar in *Octandria*; the Papaw and the Bonduc tree in *Decandria*. *Monadelphia* is richly endowed with valuable trees, such as the yew, the Norfolk Island pine, the juniper, the nutmeg; and it also contains the wonderful pitcher-plant of China.

Order 2. DIANDRIA.

Stamens 2.

2042. *Salix*. Barren fl. Scales of the catkin single-flowered, imbricated, with a nectariferous gland at its base. Perianth. O. Stam. 1-5. Fertile fl. Scales of the catkin single-flowered. Perianth. O. Stigmas 2, often cleft. Caps. 1-celled, 2-valved, many-seeded. Seeds comose.

2043. *Cecropia*. Male. Spatha falling off. Catkin cylindrical. Cal. turbinate 4-cornered scales. Cor. O. Female, as in the male. Style 1. Stigma torn. Ovaries imbricated. Berry 1-seeded.

2044. *Borya*. Male. Cal. 4-leaved. Cor. O. Stamens 2-3. Female. Stigma capitate. Berry 1-seeded.

Order 3. TRIANDRIA.

Stamens 3.

2045. *Empetrum*. Barren fl. Cal. tripartite. Cor. of 3 petals (7 in E. B.). Stam. 3 (9 in E. B.), upon long filaments. Fertile fl. Cal. tripartite. Cor. of 3 petals. Style very short. Stigma with 6-9 rays. Berry superior, globose, with 6-9 seeds.

2046. *Willenovia*. Male. Cal. of many glumes. Petals 6. Nectary fleshy, 6-parted, surrounding the corolla. Female. Ovary superior. Style 1. Stigmas 2-3. Drupe 1-seeded.

2047. *Restio*. Spike imbricated. Cal. 6 equal glumes. Cor. O. Female. Styles 2-3. Nut stony, 1-celled, 1-seeded.

2048. *Etegia*. Cal. 6 unequal glumes. Female. Styles 3. Caps. 6-celled. Seeds solitary.

13682 Angles of capsules compressed keeled

*and Miscellaneous Particulars.*

this sense Plukenet applied it to a work in which a great variety of curious plants was assembled. The other work was called *Almagestum*. This also came originally from the Greek. Claudius Ptolomæus, an astronomer and mathematician, published about the middle of the second century a work on astronomy, called *Σύστημα κόσμου*, which may be Englished "Great work." Ishac ben Honain translated it into Arabic at the beginning of the ninth century, by order of the Caliph Mahmoud; to its title he added the Arabic article *Al*, and so formed the word *Al-magesti* or *Almagesti*.

2049. *Phœnix*. Cal. 3-parted. Petals 3. Ovary 1. Drupe ovate-oblong.  
 2050. *Stilago*. Male. Cal. tubular, 3-4-toothed. Cor. O. Stamens 2-3. Female, an annular disk at the base of the ovary. Stigmas 2, one bifid. Drupe 1-seeded.  
 2051. *Oxyris*. Male. Cal. 3-fid. Cor. O. Female. Style 1. Stigma roundish. Berry 1-celled.

## Order 4. TETRANDRIA.

Stamens 4.

2052. *Aulax*. Male. Flowers racemose. Cal. O. Petals 4, stamiferous. Female. Stigma oblique. Nut exserted, ventricose, bearded.  
 2053. *Leucadendron*. Male. Flowers capitate. Cal. O. Petals 4, stamiferous. Female. Stigma oblique. Nut or samara 1-seeded, included in the scales of the cone.  
 2054. *Viscum*. Barren fl. Cal. O. Petals 4, dilated at the base, connate, resembling a cal. Anthers sessile, adnate with the petals. Fertile fl. Cal. submarginate. Petals 4, dilated at the base. Style 1. Drupe inferior, 1-seeded.  
 2055. *Myrica*. Barren fl. Scales of the catkin concave. Perianth. O. Fertile fl. Scales of the catkin concave. Perianth. O. Styles 2. Drupe 1-celled, 1-seeded.  
 2056. *Nageia*. Cal. 4-leaved. Cor. O. Style bifid. Drupe 1-seeded.  
 2057. *Shepherdia*. Male flowers in a catkin, 8-androus. Female racemose at the ends of the branches. Limb of calyx flat, regular, 4-parted. Disk with 8 glands. Fruit of Hippophae.  
 2058. *Hippophae*. Male flowers in a catkin, tetrandrous. Female solitary in the axillæ of the leaves. Calyx tubular, bifid at end, closed. Disk O. Fruit formed of a berried calyx and akenium.  
 2059. *Broussonetia*. Male. A cylindrical catkin. Cal. 4-parted. Female. A globose catkin. Cal. tubular, 3-4-toothed. Ovaries becoming fleshy, clavate, prominent. Style lateral. Seed 1, covered by the calyx.  
 2060. *Schafferia*. Cal. 4-leaved. Petals 4 or O. Berry 2-celled. Seeds solitary.  
 2061. *Brucea*. Male. Cal. 4-parted. Petals 4. Disk 4-lobed. Female. Pericarps 4, 1-seeded.  
 2062. *Anthospermum*. Male. Cal. 4-toothed. Cor. with a short tube, and 4-parted limb. Female. Ovary inferior. Styles 2, reflexed. Fruit bipartible.  
 2063. *Trophis*. Male. Cal. O. Petals 4. Female. Cal. O. Cor. O. Style 2-parted. Berry 1-seeded.  
 2064. *Montinia*. Male. Cal. 4-toothed. Petals 4. Female. Style bifid. Stigmas reniform. Capsule inferior, 2-celled, many-seeded.

## Order 5. PENTANDRIA.

Stamens 5.

2065. *Pistacia*. Male. Cal. 5-fid. Cor. O. Female. Cal. 3-fid. Cor. O. Styles 5. Drupe 1-seeded.  
 2066. *Xanthoxylum*. Male. Cal. 5-parted. Cor. O. Stamens 3-5. Female. Ovaries 5. Caps. 3-5, one-seeded.  
 2067. *Picramnia*. Male. Cal. 3-5-parted. Petals 3-5. Stamens 3-5. Female. Styles 2. Berry 2-celled, 2-seeded.  
 2068. *Antidesma*. Male. Cal. 5-leaved. Cor. O. Anthers bifid. Female. Stigmas 5. Berry cylindrical, 1-seeded.  
 2069. *Iresine*. Male. Cal. 2-leaved. Petals 5. Scales 5-7. Female. Stigmas 2, sessile. Caps. with downy seeds.  
 2070. *Spinacia*. Male. Cal. 5-parted. Cor. O. Female. Styles 4. Seed 1, within the indurated calyx.  
 2071. *Fluggæa*. Male. Cal. 5-leaved. Cor. O. Rudiment of an ovary. Female. Style 2-parted. Stigmas recurved, bifid. Berry 4-seeded. Seeds with an arillus.  
 2072. *Acnida*. Male. Cal. 5-parted. Cor. O. Female. Cal. 3-parted. Styles O. Stigmas 3, sessile. Caps 1-seeded.

2074. *Cannabis*. Male. Cal. 5-parted. Female. Cal. 5-leaved, entire, opening at the side. Styles 2. Nut 2-valved within the closed calyx.

2074. *Humulus*. Barren fl. Perianth. single, of 5 leaves. Anthers with 2 pores at the extremity. Fertile fl. Scales of the catkin large, persistent, concave, entire, single-flowered. Perianth. O. Styles 2. Seed 1.

2075. *Modecca*. Cal. 5-fid. Petals 5, inserted in the calyx. Scales 5-10, rarely O. Male. Stamens 5. Anthers erect. Female. Caps. stalked, 1-celled, 3-valved, many-seeded.

## Order 6. HEXANDRIA.

Stamens 6.

2076. *Xerotes*. Cor. 6-parted, somewhat colored. Male. Stamens 6. Anthers peltate. Female. Stamens abortive. Ovary 3-celled, with 1-seeded cells. Caps. cartilaginous, 3-celled, 3-valved. Seeds peltate.

2077. *Elais*. Cal. 6-leaved. Cor. 6-fid. Style 1. Stigmas 3. Drupe 1-seeded, fibrous. Nut 3-valved.

2078. *Chamaedorea*. Cal. 3-parted. Cor. 3-parted. Stamens 6. Rudiment of a style. Female. Scales 3. Styles 3. Drupe succulent, 1-seeded.

2079. *Borassus*. Cal. 3-leaved. Cor. hypocrateriform, with a 3-parted limb. Female. Cal. 8-9-leaved, imbricated. Cor. O. Style O. Drupe with 3 stones.

2080. *Mauritia*. Cal. cyathiform, somewhat 3-toothed. Petals 3. Drupe 1-seeded, tessellated.

2081. *Smilax*. Cal. 5-leaved. Cor. O. Styles 3. Berry 3-celled. Seeds 2.

2082. *Tamus*. Cal. 6-parted. Cor. O. Styles 3-fid. Berry 3-celled, inferior. Seeds 2.

2083. *Testudinaria*. Perianth. 6-parted, spreading; segments linear, nearly equal. Male. Stamens 6, inserted in the base of the segments. Female. Styles 3, united. Capsule membranous. Seeds winged.

2084. *Rajania*. Cal. 6-parted. Cor. O. Styles 5. Samarae 1-seeded.

2085. *Dioscorea*. Cal. 6-parted. Cor. O. Styles 3. Capsule 3-celled, compressed. Seeds 2, membranous. Leaves generally alternate.

2086. *Maba*. Cal. 3-fid. Cor. tubular, trifold. Drupe 2-celled. Cells 2-seeded.

## Order 7. OCTANDRIA.

Stamens 8.

2087. *Populus*. Barren fl. Scales of the catkin lacerated. Anthers 8-30, arising from a turbinate, oblique, entire, single perianth. Fertile fl. Scales of the catkin lacerated. Perianth. turbinate, entire. Stigmas 4. Caps. superior, 2-celled, 2-valved, many-seeded. Seeds comose.

## Order 8. ENNEANDRIA.

Stamens 9.

2088. *Mercurialis*. Barren fl. Perianth. single, tripartite. Stam. 9-12. Anthers globose, 2-lobed. Fertile fl. Perianth. single, tripartite. Styles 2. Caps. 2-celled. Cells 1-seeded.

2089. *Hydrocharis*. Barren fl. Cal. tripartite. Petals 3, "the three interior filaments beaked." *Sm.* Fertile fl. Cal. tripartite. Petals 3. Styles 6, each with 2 stigmas. Caps. inferior, coriaceous, roundish, six-celled, many-seeded.

2090. *Triplaris*. Cal. 3-parted. Petals 3. Stamens 9. Styles 3. Capsule 1-seeded, 3-valved.

## Order 9. DECANDRIA.

Stamens 10.

2091. *Coriaria*. Cal. 5-parted. Cor. O. Scales 5. Anthers 2-parted. Styles 5. Caps. 5, 1-seeded, covered by the enlarged scales.

2092. *Kiggelaria*. Cal. 5-parted. Petals 5; glands 5, 3-lobed. Anthers perforated. Styles 5. Capsule one-celled, 5-valved, many-seeded.

2093. *Schinus*. Cal. 5-fid. Petals 5. Berry 3-coccous.

2094. *Gymnocladus*. Cal. 5-toothed. Petals 5. Style 1. Legumen 1-celled, pulpy inside.

2095. *Carica*. Male. Cal. hardly any. Cor. 5-fid, funnel-shaped. Filam. in the tube of the cor. Female. Cal. 5-toothed. Petals 5. Stigmas 5. Berry furrowed, 1-celled, many-seeded.

## Order 10. DODECANDRIA.

Stamens 12.

2096. *Stratiotes*. Male. Spathe 2-leaved. Cal. 3-parted. Petals 3. Stamens 11-13, perfect, 20 abortive. Ovary inferior, 6-angular. Styles 6, 2-parted. Berry 6-celled, many-seeded.

2097. *Hyænanche*. Cal. 5-7-leaved. Cor. O. Stamens 10-20. Style 1. Stigmas 3. Caps. 3-celled, 3-coccous. Cells 2-seeded.

2098. *Euclea*. Cal. 5-toothed. Cor. 5-parted. Stamens 15. Ovary superior. Styles 2. Caps. berried, 3-horned, 3-celled. Seeds solitary, with an arillus.

2099. *Datisca*. Male. Cal. 5-leaved. Cor. O. Anthers sessile. Female. Cal. 2-toothed. Styles 3. Capsule 3-angular, 3-horned, 1-celled, pervious, inferior.

2100. *Menispermum*. Male. Cal. 2-leaved. Petals 4 or 6 on the outside, 8 inside. Stamens 16. Female. Stamens 8, sterile. Ovaries 2-3. Berries 2, 1-seeded.

2101. *Coccolus*. Sepals and petals ternate, usually in two, rarely in three rows. Male. Stamens 6, distinct, opposite the petals. Female. Drupes berried, 1-6, generally oblique, reniform, somewhat compressed, 1-seeded. Cotyledons distinct.

## Order 11. ICOSANDRIA.

Stamens numerous, inserted in the calyx.

2102. *Flacourtia*. Cal. 5-parted. Cor. O. Stamens 50-100. Stigma stellate, sessile. Berry many-celled, with 2-seeded cells.

2103. *Peumus*. Male. Cal. campanulate, 5-fid. Petals 5, inserted in the calyx, reflexed. Stamens about 46, glandular. Female. Scales 5, subsagittate. Ovaries 2-9. Style O. Drupes oval, acuminate.

2104. *Geonium*. Cal. 5-leaved. Cor. O. Stamens 12. Stigmas 3, lacerated. Caps. 3-celled, 3-valved, 3-seeded.

2105. *Rottlera*. Male. Cal. 2-parted. Cor. O. Stamens 30-40. Female. Cal. 4-toothed. Styles 3. Caps. 3-celled, triccoccus, 3-seeded.

Order 12. POLYANDRIA.  Stamens numerous, inserted under the ovarium.

2106. *Cliffortia*. Cal. 3-leaved. Cor. O. Stamens about 30. Styles 3. Caps. 3-celled. Seed 1.  
 2107. *Cycas*. Male. Catkin imbricated. Cal. a spatulate scale. Cor. O. Anthers globose, sessile, on a scale. Female. Spadix compressed, 2-sided. Cal. O. Cor. O. Style 1. Drupe 1-seeded.  
 2108. *Zamia*. Catkin like a cone. Male. Calyx an obovate scale. Cor. O. Anthers globose, opening by a slit, sessile on the scale. Female. Cal. peltate scales. Ovaries 2. Style O. Berries 2, 1-seeded.

 Order 13. MONADELPHIA.  Stamens united into one body.

2109. *Latania*. Spadix many-leaved. Calyx 3-leaved. Petals 3. Stamens 15-16. Drupe coated, with three stones.  
 2110. *Leptocarpus*. Cal. 6-leaved, glumaceous. Cor. O. Stamens 3. Ovary superior. Style 1. Stigmas 2 or 3. Utricle or nut crustaceous, crowned by the base of the style.  
 2111. *Ruscus*. Cal. 6-leaved. Cor. O. Male. Rudiment of ovary ovate, perforated at end. Female. Style 1. Berry 3-celled. Seeds 2.  
 2112. *Aracaria*. Male. Catkin imbricated. Cal. a woody scale. Anthers 10-12, united in a scale. Female. Catkin cone-shaped. Cal. a lanceolate 2-flowered scale. Style O. Stigma 2-valved. Nut coriaceous, cuneiform, winged at end.  
 2113. *Juniperus*. Barren fl. Scales of the catkin subpeltate. Perianth. O. Stam. 4-8, 1-celled. Fertile fl. Scales of the catkin few, united at length, fleshy, and surrounding the 3-seeded berry.  
 2114. *Taxus*. Barren fl. Perianth, single at the base. Stam. numerous. Anthers peltate, 6-8-celled. Cells opening beneath. Fertile fl. Perianth, single, urceolate, scaly. Style O. Drupe fleshy, perforated at the extremity.  
 2115. *Ephedra*. Male. A catkin. Cal. 2-fid. Stamens 7. Anthers 4 inferior, 2 superior. Female. Cal. 2-parted, quintuple. Ovaries 2. Seeds 2, covered by the berried calyx.  
 2116. *Cissampelos*. Male. Cal. 4-leaved. Cor. O. Disk rotate. Stamens 5. Filaments connate. Female. Cal. 1-leaved, ligulate, roundish. Styles 3. Berry 1-seeded.  
 2117. *Excoecaria*. Male. Catkin cylindrical. Cal. a scale. Filament 3-parted. Female. Calyx 3 scales. Caps. 3-coccous.  
 2118. *Adelia*. Male. Cal. 3-parted. Cor. O. Stamens OO. Female. Cal. 5-parted. Styles 3, torn. Capsule 3-coccous.  
 2119. *Loureira*. Male. Cal. 5-parted. Cor. tubular, campanulate, 5-fid. Stamens 8-13, cohering at base. Female. Stigmas 3-4. Capsule dicoccous, 2-celled, with 1-seeded cells.  
 2120. *Myrsitica*. Male. Cal. O. Cor. campanulate, trifiid. Filament columnar. Anthers 6-10, connate. Female. Style 1. Stigmas 2. Drupe with an arilled 1-seeded nut. Seed large, veiny, variegated in the inside.  
 2121. *Nepenthes*. Cal. 4-parted, spreading, colored inside. Cor. O. Filament columnar. Anthers 15-17, connate. Stigma peltate, sessile. Caps. 4-celled, many-seeded.  
 2122. *Cluytia*. Male. Cal. 5-leaved. Petals 5. Disk glandular. Stamens 5, inserted into the rudiment of an ovarium. Female. Styles 3. Capsule 3-celled. Seed 1.

History, Use, Propagation, Culture,

2041. *Pandanus*. The Malay name of the genus is *Pandang*, which is said to signify, being interpreted, something to be regarded, and to have been so named on account of the beauty of the tree, and its exquisite odor. *P. odoratissimus* is a large spreading branching bush, with stem-clasping imbricated leaves, bearing some resemblance to those of the pine-apple; from three to five feet long, and placed in three spiral rows round the extremities of the branches. It grows in all soils and situations in the warmer parts of Asia, and is much employed there for hedges. It grows readily from branches, whence it is rare to find the full-grown ripe fruit. The tender white leaves of the flowers, chiefly those of the male, yield that most delightful fragrance, for which they are so generally esteemed, and for which the plant is cultivated in Japan. Of all the perfumes, it is by far the richest and most powerful. The lower pulpy part of the drupe is sometimes eaten by the natives in times of scarcity and famine. The tender white base of the leaves is also eaten raw or boiled, at such melancholy times. The taste of the pulpy part of the drupe is very disagreeable. The roots are composed of tough fibres, which basket-makers use to tie their work with; they are so soft and spongy as to serve the natives for corks. The leaves are composed of longitudinal, tough, useful fibres. In the South Sea Islands, where the *Pandanus* is also a native, this or some other species or variety is used for making mats. The leaves are beautifully white and glossy. In the Sandwich islands these mats are handsomely worked in

## MONANDRIA.

- 13683 Leaves at back and edges spiny-toothed, Fruit globose solitary  
 13684 Leaves at back and edges spiny-toothed, Fruit globose, Branches ternate dichotomous  
 13685 Stem without stolones, Clust. of drupes with from 9 to 20 cells obtuse depressed and tessellate at end  
 13686 Leaves at back and edges spiny-toothed, Fruit globose aggregated  
 13687 Leaves quite entire  
 13688 Leaves at edge and back serrate-spiny, Branches of stem erect  
 13689 Leaves and edges spiny-toothed, Spines distant, Drupe oblong solitary, Fruits fasciated

## DIANDRIA.

## § 1. Leaves smooth-serrated.

- 13690 Leaves lin. obl. serr. smooth rather unequally sloping at base, Catkins accompanying the leaves triandrous, Ovary stalked ovate compressed smooth, Stigma nearly sessile  
 13691 Leaves lanceolate tapering toward each end serrat. smooth Footst. decurr. Catk. accompanying the leaves triandrous, Ovary stalked oblong constricted smooth  
 13692 Leaves lanceolate tapering at each end serrated glaucous beneath, Catkins accompanying the leaves triandrous polygamous, Ovary stalked oblong lanceolate smooth, Stigmas sessile  
 13693 Leaves lanceolate pointed obtuse at the base smooth wavy and serrated, Footstalks decurrent, Catkins accompanying the leaves triandrous, Ovary stalked elliptic oblong, Style elongated  
 13694 Leaves elliptical roundish at the base serrated pointed glaucous white beneath, Catkins accompanying the leaves triandrous, Ovary stalked ovate smooth, Stigmas sessile  
 13695 Leaves ovate unequal at the base serrated smooth, Catkins accompanying the leaves triandrous, Ovary stalked ovate compressed smooth, Stigmas nearly sessile, Young branches furrowed  
 13696 Lvs. lanc. serrate quite smooth, Petioles somew. glandular, Ovary narrowed stalked, Branches varnished  
 13697 Leaves lanceolate acuminate serrated smooth, Ovaries pedicellate subulate smooth  
 13698 Lvs. lin. pointed finely serrat. smooth, Stam. about 6, Ovary stalked round-ovate smooth, Stigmas sessile  
 13699 Leaves elliptic-lanceolate pointed finely serrated smooth glaucous beneath, Catkins following the leaves, Stamens about 6 deflexed, Ovary stalked ovate smooth, Style elongated  
 13700 Leaves ovato-lanc. pointed serrated green on both sides smooth with a downy rib and footst. Catkins accompanying the leaves vill. Stam. about 5 bearded at base, Ovary stalked ov. lanc. smooth, Stigm. divid.  
 13701 Leaves elliptic-lanceolate or ovate pointed crenate glandular smooth, Footstalks glandular at the top, Catkins following the leaves, Stam. 5 or more hairy, Ovary ovate smooth nearly sessile  
 13702 Leaves ellipt. lanc. acute cren. smooth glaucous beneath, Catkins before leaves, Ovary stalked lanc. downy  
 13703 Leaves elliptical lanceolate with wavy serratures smooth glaucous beneath, Stipules somewhat lunate glandular on the inside, Ovary stalked silky, Style longer than the stigma  
 13704 Leaves obovate bluntish serrated smooth glaucous beneath, Catkins dense with fringed scales, Ovary stalked awl-shaped nearly smooth, Style longer than the stigmas  
 13705 Leaves elliptical acute at each end smooth serrat. green on both sides : midrib footstalks as well as young foliage downy, Catkins before the leaves, Ovary ovato-lanceolate long stalked smooth  
 13706 Leaves elliptical acute serrated smooth obtuse at base glaucous beneath : midrib footstalk as well as young foliage hairy, Ovary oblong downy  
 13707 Leaves elliptical acute tooth-serrated smoothish glaucous beneath, Ovary lanceolate silky  
 13708 Lvs. ellipt. acute serrat. smoothish glaucous ben. Stip. small or none, Catk. hairy, Caps. sess. very smooth  
 13709 Leaves oblong elliptical acute serrated smooth glaucous beneath, Footstalks elongated downy, Stipules ovate toothed permanent, Catkins before the leaves, Ovary lanceolate smooth  
 13710 Lvs. ovate acute serrated undulate crackling smooth heart-shaped at the base glaucous beneath, Stipules unequally heart-shaped longer than the broad footstalks, Catkins very woolly, Ovary lanc. smooth  
 13711 Lvs. ovate acute serrated smooth glaucous beneath, Footstalks very short smooth, Stipules ovate serrated permanent, Catkins accompanying the leaves, Ovary lanceolate nearly sessile

## and Miscellaneous Particulars.

a variety of patterns, and stained of different colors. The branches being of a soft spongy juicy nature, cattle will eat them very well when cut into small pieces. They call it Wharra tree at Otaheite. (*Hawkesw. Voy. ii. 217.*)

3042. *Saltz.* From the Celtic *sal*, near, and *lis*, water. Our common name osier, seems to be a slight alteration of the Greek *ασια*, which means the same thing. This is a numerous and difficult genus of trees and shrubs, with one or two exceptions limited in their range to the temperate regions of Europe and America. Many of the species are distinguished by such delicate shades, that only the most acute botanists can recognize them. Soil, situation, and climate produce so considerable a change in their appearance, as to render it difficult to determine what are species and what varieties. Those species which attain a timber size, are chiefly valued for the rapidity of their growth; they produce a great bulk of trunk and lop in a short time, and the bark of most of the species has recently been used in tanning; being, at an average of sorts, about half as valuable as that of the oak. *S. alba* is considered the most valuable timber tree of the genus; it has a branching stem, and tapering flame-shaped head. It may be seen pollarded by way-sides in most parts of Europe, in which state it is very productive of poles, fence wood, crate ware, fuel, and bark for the tanner, which is considered nearly as good as that of the oak. A variety of this species, called by Pontey, the red

History, Use, Propagation, Culture,

twigged upland willow, and the *S. Russelliana*, are considered the two next best species of the tree kind, and indeed, greatly resemble each other.

The best willows for hoops and basket work are *S. viminalis*, *stipularis*, *rubra*, *Forbyana*, *triandra*, *mollissima*, and *vitellina*. *S. triandra* is the most common, and is grown both for basket work and hoops. *S. Forbyana* is the best for the finer sorts of basket work. *S. stipularis* is the species commonly cultivated in Holland for hoops and rods. *S. purpurea* is one of the toughest of willows, and the extreme bitterness of the leaves and twigs renders it valuable for the tanner, for withs and basket work, not being liable to be eaten by vermin, and for hedges which cattle will not browse on. In bands for thatching, Linnæus says, it lasts above

- 13712 Lvs oval-obl. acute with distant wavy serratures smooth glauc. ben. Stipules  $\frac{1}{2}$  heart-shaped deeply toothed, Catkins villous before the leaves, Ovary stalked ovate pointed silky, Style elongated, Stigma cloven
- 13713 Leaves ovato-lanceolate smooth bluntly serrated glaucous beneath, Catkins before the leaves, Scales short rounded hairy, Ovary awl-shaped silky on a stalk thrice the length of the scale
- 13714 Lvs. lanc. acute very long gradually tapering at base finely serrated quite smooth scarcely paler beneath, Stip.  $\frac{1}{2}$  heart-shap. Catkins before lvs. erect smooth, Ovary stalk. ov. smooth, Style divid. Stigm. 2-lobed
- 13715 Leaves lanceolate serrated smooth glaucous beneath somewhat unequal at base, Stipules lunate toothed, Catkins lax, Ovary stalked ovate silky, Stigmas sessile divide
- 13716 Lvs. ovato-lanc. bluntly serr. smooth ac. glauc. ben. gland. at base, Stip. ov. with gland. serrat. Catk. wool. Ovary lanceolate smooth its stalk longer than the scale, Style the length of the divided stigmas
- 13717 Lvs. ovato-lanc. serrat. smooth paler ben. heart-shaped at the base, Stip. rounded finely toothed, Catk. accomp. lvs. mostly triand. Sc. lanc. woolly, Ovary stalked lanc. smooth, Style length of divided stigm.
- 13718 Lvs. ellipt. lanc. rigid smooth sharply serrat. two lowest serratures elongated, Footst. hairy, Stip. dilated round. with glandul. serrat. Catk. accomp. lvs. mostly triand. Sc. woolly, Ovary lanc. smth. on long stalk
- 13719 Lvs. ov taper-point. smooth shining with glandul. serrat. mostly crowded at stip. tooth. Catk. accomp. lvs. mostly triand. Scales hairy at base obt. serr. and smooth at end, Ovary stalked lanc. awl-shaped smooth, Style divided, Stigma obtuse
- 13720 Leaves lanceolate pointed smooth green on both sides with gland. serr. Catkins accomp. lvs. Nect. double rather large: its lobes lanceolate smooth toothed at the summit; the terminal flowers triandrous
- 13721 Lvs. lanc. acum. uneq. and bluntly serrated smooth somew. glauc. ben. Branches dark purple with a bloom
- 13722 Leaves lanc. acute with cartilaginous serrat. smooth above glaucous and somew. silky ben. Stip. small and deciduous smooth on their inside. Ovary sessile ovato-lanceolate smooth, Stigmas nearly sessile 2-lobed
- 13723 Leaves ovato-lanc. pointed serrated throughout very smooth, Footstalks glandular, Ovary ovate nearly sessile, Male flowers with an abortive ovary
- 13724 Leaves broadly lanc. pointed smooth with glandular serrat. glaucous beneath, Footstalks slightly hairy without glands, Catkins before the leaves, Ovary sessile ovate smooth, Style elongated
- 13725 Triandrous, Stamens reflexed, Leaves about four inches long and one broad smooth and green beneath
- 13726 Leaves lanceolate taper-pointed sharply serrated smooth glaucous beneath, Stipules  $\frac{1}{2}$  ovate taper-pointed revolute, Catkins naked accompanying the leaves, Ovary ovate sessile smooth, Branches pendulous
- 13727 Decumb. Stam. 1, Leaves ovobovato-lanc. serrated smooth narrow at base, Stigm. very short ov. nearly sess.
- 13728 Lvs. downy serrulate acum. glaucous beneath, when old becoming smoother, Catkins before lvs. Style long
- 13729 Erect, Stamen 1, Leaves mostly opposite oblong lanc. pointed slightly serrated smooth linear at base, Style nearly as long as divided stigmas
- 13730 Erect, Stam. 1, Lvs. obov. lanc. ac. serrat. smth. round. at base, Stip. none, Stig. very short ov. notched obt.
- 13731 Branches downy, Leaves elliptical acute glaucous beneath: the young ones downy
- 13732 Stam. combined below, Leaves linear lanc. elongated acute smooth with shallow serrat. green on both sides
- 13733 Erect, Stamen 1, Leaves alternate with small stipules lanceolate acute with shallow serratures smooth rounded at base glaucous beneath, Style nearly as long as the linear divided stigmas
- 13734 Stamens combined below, Leaves elliptical slightly serrated quite smooth glaucous beneath
- 13735 Leaves elliptic-oblong toothed waved thin and crackling very smooth, Stipules heart-shaped about the length of the footstalk, Catkins very woolly, Ovary lanceolate smooth on a short stalk
- 13736 Leaves linear lanceolate acute very finely serrated smooth shining and green on both sides, Stipules none, Catkins accompanying leaves cylindrical villous, Scales ovate acute, Stam. 3 to 5 bearded half way up
- 13737 Leaves very long linear-lanc. closely serrated tapering gradually and somewhat falcate upwards acute at the base smooth on both sides: the young ones silky, Stipules crescent-shaped toothed deflexed
- 13738 Leaves elliptical nearly orbicular smooth somewhat serrated in the middle rather glauc. beneath, Catk. after the leaves, Capsules ovato-lanceolate stalked downy
- 13739 Leaves ovate serrated naked smooth and even above glaucous beneath, Branches rather downy, Capsules ovate silky, Style as long as the stigmas
- 13740 Leaves elliptical serrated smooth veiny polished on both sides, Young branches hairy, Ovary awl-shaped clothed with silky hairs, Style as long as the cloven stigmas
- 13741 Leaves obovate-elliptical smooth rather acute serrated in the middle shining above somewhat glaucous beneath, Ovary lanceolate silky, Young branches smooth
- 13742 Lvs. ov. serrat. nak. reticul. with promin. veins above rather glauc. ben. Ovary ellipt. silky, Style very short
- 13743 Somew. erect straggling, Branches polished, Lvs. obl. lanc. acute at each end serrul. in midd. very smooth
- 13744 Leaves obovate lanceolate acute smooth subserrated glaucous beneath, Stipules small, Ovaries ovate silky
- 13745 Leaves ovate serrated smooth even above glaucous and silky beneath, Ovary ovate silky, Style as long as the stigmas, Stems decumbent
- 13746 Leaves ovate finely toothed smooth minutely veined folded so as to form a keel, Ovary ovate downy
- 13747 Lvs. ov. ellipt. ac. serrat. smooth tapering at base glauc. ben.: lower serrat. glandular, Caps. ov. lanc. smth.
- 13748 Leaves oblong acute serrulate whole colored beneath, when old quite smooth

and Miscellaneous Particulars.

a century in Scania. Few of the willow species can be considered ornamental, though the male plants of *S. pentandra* and *amygdalina* produce numerous showy catkins of a bright yellow color, and very odoriferous. The leaves of *S. pentandra* are also fragrant, exuding a copious yellow resin from their serrated edges. The down of the seeds of this and other species, mixed with the third part of cotton, has been found a useful adulteration, especially for stuffing cushions and forming candle-wicks. Goldfinches and other birds line their nests with this material.

The weeping-willow is generally admired; it grows wild on the coast of Persia, and is common in China. It is sometimes said to have been introduced by Pope, but the celebrated specimen of that tree which stood in

*History, Use, Propagation, Culture,*

the poet's garden at Twickenham, was a cutting from some rods employed in a package which came from Spain. Pope being present when the package was opened, observed that the pieces of stick appeared as if they had some vegetation, and added, perhaps they may produce something which we have not in England. Under this idea he planted it in his garden, and it produced the willow tree that has given birth to so many others; not as the parent tree of all the willows in the country, but as an admired and celebrated specimen. *S. herbacea* is not properly an herbaceous plant, but possesses the Linnæan character of a tree, and is the smallest yet

13749 Lvs. lanc. acut. serrul. smooth glauc. ben. Catkins appearing with lvs. Caps. ov. lanc. smooth, Styles twin  
 13750 Lvs. obl. lanc. acute crenul.-serr. glaucous beneath, Stipules obsolete, Scales short round with long hairs  
 13751 Lvs. orbicul. somew. retuse serrated shining on each side, Fem. catkins about 5-fl. Caps. ov. lanc. smooth  
 13752 Lvs. obl. and ovate acute toothletted glaucous beneath, Stipules large toothed, Catkins short, Styles long  
 13753 Leaves lanc. acute obscurely serrated smooth and shining on both sides reticulated with veins beneath,  
 Ovary lanceolate hairy, Style elongated, Stigmas deeply divided

§ 2. *Leaves smooth entire.*

[lanceolate smooth ovary

13754 Leaves obovato-lanc. ent. emarg. smooth shining above, Catk. cylind. many-fl. Scales shorter than ovato-  
 13755 Leaves obovate entire smooth shining above, Fem. catk. obl. of few-fl. Scales length of obl. smooth ovary  
 13756 Lvs. ov. or ovato-lanc. acute ent. smooth shin. above, Catk. obl. of few-fls. Caps. ellipt. smooth, Stigm. sess.  
 13757 Lvs. orbicular somewhat ellipt. obt. entire coriaceous smooth with reticulated veins glaucous beneath,  
 Stigmas nearly sessile, Capsule shaggy

13758 Lvs. ovate entire bluntnish smooth glaucous beneath, Ovary ovato-lanc. smooth its stalk longer than scale  
 13759 Leaves ovob. lanc. acute entire glandular at edge smooth glaucous ben.: young ones silky, Stipules none  
 13760 Stem depressed, Leaves spatulate obovate obtuse entire smooth shining above gland. at margin beneath,  
 Stip. none, Catk. lax, Scales obl. fringed, Ovary stalked ovate smooth, Style deeply divid. Stigm. 2-lobed  
 13761 Stem depressed, Leaves oval rather acute entire reticulated with veins heart-shaped at the base smooth  
 above pale rib with a hairy rib and margin beneath, Stipules  $\frac{1}{2}$  heart-shaped  
 13762 Stem erect, Branches smooth, Lvs. obov. lanc. acute entire smooth, Stip. none, Catk. stalked very smooth,  
 Scales oblong scarcely hairy, Ovary ovate obl. smooth its stalk twice as long as scale, Stigm. sess. divided

§ 3. *Leaves villous.*

[ovate woolly

13763 Leaves nearly entire ellipt.-lanc. even and nearly smooth above woolly ben. Footst. decurrent, Ovary sess.  
 13764 Leaves oblong lanceolate entire obtuse silky on each side, Caps. ovate oblong villous sessile  
 13765 Leaves roundish ovate acute entire shaggy on both sides hoary beneath, Capsules sessile smooth, Style  
 four times as long as the blunt divided stigmas  
 13766 Leaves lanceolate entire bluntnish clothed on both sides with long silky hairs, Ovary sessile very woolly,  
 Style about the length of the deeply separated cloven blunt stigmas

13767 Leaves nearly entire ovate acute reticulated and somew. downy above veiny and densely woolly beneath,  
 Ovary sessile very woolly, Style about the length of the deeply separated linear divided stigmas

13768 Stem erect, Lower leaves entire: upper more or less serrated obovate lanc. reticulated with veins glaucous  
 and downy ben. Stip. half heart-shaped serr. Ovary lanc. stalked silky, Style as long as blunt stigmas

13769 Leaves ovate acute serrulate smooth above hairy beneath, Stipules minute, Catkins long

13770 Leaves elliptical acute waved and slightly serrated nearly smooth glaucous beneath, Footstalks dilated at  
 the base, Catkins before the leaves, Ovary stalked lanceolate silky

13771 Leaves lanceolate sharpish nearly entire downy revolute veiny and rugose beneath, Stipules lanc. decid.  
 Scales of the catk. oblong fringed, Ovary ovato-lanceolate silky stalked, Style short, Stigmas divided

13772 Leaves elliptical entire tapering at each end polished: the veins beneath as well as the margin hairy, Ovary  
 elliptical downy, Style elongated

13773 Leaves entire elliptical somewhat revolute with a recurved point rather downy above silky and shining  
 beneath as well as the branches, Ovary stalked ovato-lanceolate silky, Style shorter than the stigmas

13774 Leaves elliptical entire recurved acute above downy beneath silky, Ovary ovate lanceolate villous

13775 Leaves brown above downy with short hairs hoary beneath acute nearly entire

13776 Leaves obtuse brown smooth and opaque above silky beneath [ovate downy, Stem depressed

13777 Lvs. ellipt.-lanc. straight somew. point. nearly ent. almost naked above glauc. and silky ben. Ovary stalked

13778 Leaves ellipt.-obl. acute straight flat with a few glandular teeth glaucous and silky beneath, Footstalks  
 slender, Stem erect much branched, Stipules none

13779 Leaves elliptical acute convex rarely toothed glaucous rugged and silky beneath, Stem prost. Branches  
 elongated straight, Ovary stalked ovate silky, Style shorter than the stigm.

13780 Leaves elliptical acute finely downy on both sides glaucous beneath slightly serrated towards the point,  
 Stipules very small, Catkins rather before the leaves ovate hairy

13781 Leaves elliptical entire acute at each end reticulated with veins glaucous beneath most hairy at margin,  
 Ovary somewhat stalked ovato-lanceolate villous, Style the length of the deeply divided stigm.

13782 Leaves elliptical heart-shaped pointed finely notched downy on both sides, Stipules half heart-shaped  
 flat-toothed nearly smooth, Branches hairy

13783 Leaves elliptical acute slightly-toothed smooth, Young branches very smooth, Catkins ovate short erect,  
 Ovary stalked ovate silky, Stigmas ovate obtuse nearly sessile

13784 Lvs. ellipt. nearly ent. with recurv. points glaucous and silky ben. Stem decumbent, Stipules ovate entire

13785 Lvs. ellipt.-obl. somew. serrat. with recurv. points glauc. and silky ben. Stem ascend. Stipules ovate serrated

13786 Leaves lanc. pointed straight somewhat elliptical entire convex smooth above glaucous and silky beneath,  
 Catkins oval erect, Ovary stalked lanceolate, Style the length of the stigma

13787 Leaves linear-lanceolate pointed straight entire silky beneath, Stem erect, Stipules upright flat, Catkins  
 recurved, Ovary stalked lanceolate silky

and Miscellaneous Particulars.

known; being only from one to three inches in height. *S. retusa* is nearly as little as *S. herbacea*. *S. vitellina* with its brilliant yellow bark, planted in shrubberies, contrasts well with evergreens and the purple twigged dogwood.

Almost all the willows are of the easiest propagation and culture. Plantations for basket-work or hoops should be made on deep loamy soil on the banks of rivers, within reach of water, but by no means saturated with it. Few willows are either bog or marsh plants. The cultivated species require as much attention as

History, Use, Propagation, Culture,

young trees in a nursery, otherwise they will soon become stunted and of irregular growth. Excellent directions for their culture may be found in Sang's Planter's Kalender.

2043. *Cecropia*. From *zízeçayá*, to cry out, a sort of translation of the English word trumpet-wood. This tree has the trunk and branches hollow every where, and sloped from space to space with membranaceous septas, and answering to so many annual marks in the surface. The leaves are large, peltate, lobed like those of *Carica* *Papaya*, and placed at the ends of the branches. The fruits rise four, five or more, from the very top of a common peduncle, and shoot into so many oblong cylindrical berries, composed of a row of little acini, something like our raspberry, which they resemble in flavor when ripe, and are agreeable to most European palates on that account. The wood of this tree, when dry, is very apt to take fire by attrition. The native Indians have taken the hint, and always kindle their fires in the woods by rubbing a piece of it against some

- 13788 Leaves linear-lanceolate with small glandular teeth entire at the base clothed with close-pressed hairs above downy and rugged with veins beneath, Ovary ovate smooth  
 13789 Leaves linear very narrow without stipules nearly entire ovate at the base hoary above silky beneath  
 13790 Leaves lanceolate pointed serr. smooth above glauc. and silky beneath, Stipules linear deflex. deciduous, Catk. before the leaves, Scales hairy, Ovary stalked oblong silky, Stigm. nearly sessile  
 13791 Leaves lanceolate-obovate with a recurved point serrated at the end clothed with depressed hairs above rugged veiny and downy beneath, Stipules lanceolate  
 13792 Leaves obovate lanceolate obtuse mucronate with a hooked point subserrate green above hoary beneath  
 13793 Leaves obovate with a recurved point with wavy serrat. at end green and downy above hoary and shaggy with rugged veins beneath, Stip.  $\frac{1}{2}$  heart-shaped toothed, Caps. lanceolate stalked, Stigm. nearly sessile  
 13794 Lvs. slightly serrat. obov. ellipt. downy flat rather glauc. ben. Stipules rounded tooth. Stigm. nearly sess.  
 13795 Lvs. obov. lanc. flat rather rigid minute. indent. ac. undern. glauc. and hairy, Stip. small notch. Catk. ellipt.  
 13796 Lvs. ellipt. almost circular slightly tooth. downy with rectang. veins ben. Style as long as notched stigmas  
 13797 Leaves entire elliptical acute even downy on both sides somewhat withered at the point, Stipules obsol. Ovary lanceolate silky on a long hairy stalk, Stigmas nearly sessile  
 13798 Leaves ovate pointed serrated waved downy beneath, Stipules somewhat crescent-shaped, Ovary ovate downy on a long hairy stalk, Stigmas undivided nearly sessile  
 13799 Leaves nearly entire lanceolate acute shaggy above densely silky beneath, Stigmas capillary deeply divided, Style as long as the ovary  
 13800 Leaves lanc. oblong pointed waved slightly downy beneath, Stipules kidney-shaped, Ovary ovate silky, Style the length of the linear stigmas  
 13801 Leaves oblong lanceolate acute distantly serrated smooth above flat and downy beneath, Stipules lunate somewhat toothed, Ovary stalked lanceolate silky, Style elongated, Stigm. deeply cloven  
 13802 Leaves linear inclining to lanceolate very long pointed entire somewhat wavy silky beneath, Branches straight and slender, Ovary sessile, Style as long as the undivided linear stigmas  
 13803 Leaves lanceolate pointed obsoletely crenate whitish and silky beneath, Stipules crescent-shaped minute, Stigmas linear deeply divided about the length of the style  
 13804 Leaves lanc. pointed obscurely crenate downy beneath, Stipules half heart-shaped very large, Nectary cylindrical, Stigmas linear undivided longer than the style  
 13805 Leaves linear lanceolate pointed revol. obscurely toothed downy above snow-white and cottony beneath, Stip. lanc. about the length of the footstalk, Scales of the catk. with hairs as long as the stamens  
 13806 Lvs. obl. lanc. ac. at each end nearly ent. without stipul. smooth. above downy ben. Ovary ovate lanc. silky  
 13807 Leaves elliptic-lanceolate acute serrated permanently silky on both sides: the lowest serratures glandular, Stamens hairy, Stigmas deeply cloven  
 13808 Lvs. lanc. taper-point. serrat. : under-side at length almost naked; lowest serrat.gland. Stigm. deeply cloven  
 13809 Lvs. obovate serrated flat even silky on both sides, Stipules hairy, Branches minutely downy, Ovary stalked awl-shaped silky, Style as long as the undivided stigmas  
 13810 Leaves elliptic obl. acute finely notched slightly downy paler beneath, Stipulas half-ovate nearly smooth, Branches minutely downy, Ovary stalked smooth, Style as long as the cloven stigmas  
 13811 Leaves elliptical obovate acute notched slightly downy glaucous beneath, Stipules vaulted, Branches minutely downy, Ovary stalked silky, Style longer than the thick undivided stigmas  
 13812 Lvs. obl. acute entire silky on each side hoary ben. Ovaries long-pointed lax, Scales very blunt smooth  
 13813 Lvs. lanc. acum. toothl. at end smooth above rugose and soft beneath, Caps. downy lanc. Stigmas sessile  
 13814 Leaves 9-lobed: lobes oblong bluntish hispid and rough above white and downy beneath  
 13815 Leaves oblong lanceolate obtuse sessile coriaceous revolute at edge dotted beneath  
 13816 Leaves ovate-lanceolate acute subsessile somewhat membranous  
 13817 Leaves ovate-lanceolate narrowed at each end stalked membranous serrulated  
 13818 Leaves  $2\frac{1}{2}$  inches long 1 broad serrated  
 13819 Leaves acute serrulate very smooth shining opposite and alternate  
 13820 Leaves alternate tapered into a short stalk retuse emarginate mucronulate very smooth glaucous

## TRIANDRIA.

- 13821 Erect, Branches downy, Leaves linear revolute at edge roughish above  
 13822 Procumbent, Leaves linear oblong

## and Miscellaneous Particulars.

harder wood. The bark is strong and fibrous, and is frequently used for all sorts of cordage. The trunk is very light, and for that reason much used for bark-logs and fishing-floats. The smaller branches, when cleaned of the septums, serve for wind instruments. Both trunk and branches yield a great quantity of fixed salt, which is much used among the French, to despumate and granulate their sugars. The fruit is much fed upon by pigeons and other birds, and thus the tree is much spread and propagated. (*Browne.*) It may be increased like *Brosimum*.

2044. *Borya*. Named in honor of M. Bory de St. Vincent, a distinguished French traveller and naturalist, known out of the scientific world by the violence of his liberal opinions. Small bushes of North America, of little beauty. Sir James Smith has altered the name to *Bigelovia*.

2045. *Empetrum*. So called from the places of its natural growth, *in*, in, and *πετρας*, a stone. *E. nigrum* is
