On sea-weed.

Some of your correspondents have noticed the properties of the Alga marine, and the modes of using it, but not so fully perhaps as might have been expected.

The Alga marine is a seaweed which is designated by the farmers on the coasts of Brittany and Ireland, where the Gatte is the vernacular language. It is a plant which is not stationary, but is always on the move, and is sometimes thrown up or torn away, as the sea-weed is, by the force of boulting waters. Strange to say, the same species may be scattered in several places, while on another part of the coast it may be entirely absent, without even a modest doubt of the correctness of their judgment, that all marine plants, so called, are not stationary, and that they are subject to the climate and organisation; they considered them to be other remains of animal matter or the receptacles of animals, which are now reconverted into marine plants, are. La Plata species exhibit plainly the mycelial base. I have also U. rubigo vera from Ohio with the European characters.
