Roasted Forest Trees. Having cut down a considerable number of trees in the spring of 1890 on the sides of the forest road near my residence, it occurred to me that the trees might be roasted and their fallings used for fuel. It is not necessary for the trees to be cut down, as they can be roasted on the place where they are standing. The trees are felled, the bark is removed, and the wood is roasted by means of a fire, the heat of which is sufficient to dry the timber. The roasted wood is then loaded into wagons and transported to the nearest market.

Fertilization of Plants. I do not know whether any orchards in the vicinity of the town have been fertilized, but I have observed that the trees in the orchard near my residence, which has been fertilized with manure, are much more fruitful than those in the orchard next door, which has not been fertilized. The trees in the fertilized orchard were much larger and more vigorous than those in the non-fertilized orchard.

THE GOHILLA.

Our African expert friends are skeptical of your statement that "the gohilla is a bird" and that "its short and slender legs are not able to furnish the necessary support to the body, so that it is always in the air, making frequent and rapid vertical jumps." They are not convinced by your description of the gohilla as "a small, slender, reddish-brown bird" and your mention of its "short, slender, reddish-brown legs." They believe that the gohilla is not a bird but is a small, slender, reddish-brown mammal with short, slender, reddish-brown legs.

They also argue that the gohilla is not a bird because it does not have the necessary anatomical adaptations for flight, such as a powerful breast muscle, a large wingspan, and a lightweight body. They believe that the gohilla is actually a small, slender, reddish-brown mammal that is adapted for jumping rather than flying.

It is true that the gohilla is a small, slender, reddish-brown mammal with short, slender, reddish-brown legs. However, it is also true that it is capable of making frequent and rapid vertical jumps. Therefore, it is both a bird and a small, slender, reddish-brown mammal with short, slender, reddish-brown legs.
