ENGRAVINGS from SPECIMENS of MORBID PARTS, preserved in the Author's Collection now in the possession of the Medical Schools and selected from the Divisions inscribed, Urethra, Vesicis, Ren, Morbus, et Lena, containing Specimens of every Disease which is attended with Change of Structure or Inflammation. They were engraved by Bougie Catheter, Cautic, Trochar, and Lithotomny Knife, incautiously used. With Observations.
By CHARLES BELL. In Imperial folio. Price 1s. 6d. in Boards.

A PRACTICAL SYNOPSIS of CUTANEOUS DISEASES, according to the Arrangement of Dr. Willan, exhibiting a concise View of the Diagnostic Symptoms, and the Method of Treatment.
By THOMAS BATEMAN, M. D. F. L. S. Physican to the Public Dispensary, and to the Fever Institution. 8vo. Illustrated by a coloured Plate of the Eight Orders. Price 1s. 6d. in Boards.

THE MORBID ANATOMY of the LIVER; being an Inquiry into the Anatomical Character, Symptoms, and Treatment of certain Diseases which impair or destroy the Structure of that Viscus.

Part I. on the Tubeira Circumscripta, and Tubera Diffusa.
By J. R. FARR, M. D. Part I. on Imperial 4to. Illustrated with coloured Engravings. Price 1s. 6d. The Subjects of Tumours and Inflammation of the Liver will occupy a Series of Twelve or Thirteen coloured Engravings, which will contain Three hundred Figures. The whole will be completed either in Four or Six Volumes.

THE MODERN PRACTICE of PHYSIC, exhibiting the Characters, Causes, Symptoms, Prognostications, Morbid Appearances, and Improved Method of treating the Diseases of all Climates. By ROBERT THOMAS, M. D. in 8vo. The 4th edition, revised, and considerably enlarged. Price 1s. 6d. in Boards.

A DICTIONARY of PRACTICAL SURGERY, exhibiting the present State of the Principles and Practice of Surgery; collected from the most authentic and original Sources; comprehending also an Account of the Instruments, Remedies, and Applications employed in Surgery, and the Etymology and Signification of the principal Terms. The Whole illustrated by numerous interesting Cases, and interspersed with a Series of critical Reflections and original Observations.
By SAMUEL COOPER. Member of the Royal College of Surgeons in London, &c. &c. in 8vo. The 3d Edition, with many Corrections, and much important Additional Matter. Price 1s. 6d. in Boards.

OUTLINES of THE ANATOMY of the HUMAN BODY, in its Sound and Diseased State.
By ALEXANDER MONRO, jun. M. D. F. R. E. Professor of Anatomy and Surgery in the University of Edinburgh. In Four Volumes 8vo. Illustrated with 45 Engravings, by Heath, Woolnough, &c. after original Drawings by Michael Angelo, Dr. Peter Camper, Meurs, Fyfe and Syme. Price 2s. 3d. in Boards.

MEDICO-CHIRURGICAL TRANSACTIONS. Published by the Medical and Chirurgical Society of London. In 3 vols. 8vo. Illustrated with Plates. Price 2s. 6d. in Boards.

THE PRINCIPLES of SURGERY: Volume the First.
By JOHN BELL, Surgeon, In 1 large vol. royal 4to. Illustrated by 50 Engravings, many of them accurately coloured from Nature. Price 4s. 6d. Volume the Second, In Two Parts, royal 4to. Illustrated by numerous Engravings, 5s. 6d. Volume the Third. In royal 4to. Illustrated with 37 Engravings. Price 2s. 6d. in Boards.

THE ANATOMY of the HUMAN BODY.
By JOHN and CHARLES BELL, Surgeons.

ENGRAVINGS of the ARTERIES, illustrating the Second Volume of the Anatomy of the Human Body, by JOHN BELL, Surgeon; and serving as an Introduction to the Surgery of the Arteries, by CHARLES BELL, Surgeon. Superbly printed in imperial 8vo. The Third Edition. Price 1s. 6d. in Boards, or with Plates, finely coloured. Price 1s. 6d. in Boards.

THE ANATOMY of the BRAIN; explained in a Series of Engravings, beautifully coloured, with a Dissertation on the Communication between the Ventrices of the Brain.
By CHARLES BELL, Fellow of the Royal College of Surgeons of Edinburgh. In 8vo. in Boards.

A SERIES of ENGRAVINGS, explaining the Course of the NERVES.
By CHARLES BELL. Price 1s. 6d. in Boards.

A SYSTEM of OPERATIVE SURGERY, founded on the Basis of Anatomy.
By CHARLES BELL. In 2 vols. royal 4to. Illustrated with 150 Engravings. Price 1s. 14s. in Boards.

A SYSTEM of DISSECTIONS; explaining the Anatomy of the Human Body; with the Manner of displaying the Parts, the distinguishing the Natural from the Diseased Appearances, and pointing out to the Student the Objects most worthy his Attention, during a Course of Dissections.

A SYSTEM of DISSECTIONS; explaining the Anatomy of the Human Body, the Manner of displaying the Parts, and their Varieties in Disease.

LETTERS concerning the DISEASES of the UKETHRA.
By CHARLES BELL. In 8vo. Price 7s. 6d. in Boards.

OBSERVATIONS on the HYDRAARGYRIA; or that vesicular Disease arising from the Exhibition of Mercury. By the late Sir GEORGE ALLEY, M. D. M. R. A. Fellow of the Royal College of Physicians of Edinburgh. In 1 vol. 4to. Price 1s. 6d. in Boards.
The Medical Guide, for the Use of the Clergy, Heads of Families, Seminaries, and Young Practitioners in Physic, containing the Latest Discoveries in Medicine.

By Richard Reece, M.D.

In the Fourth Edition (Being the Ninth) with considerable Additions. Price 10s. 6d. Boards.

This work is more judicious than the Domestic Medicine of D'Urben, in which his Preceding Volume is eclipsed. Price, 2s. 6d. 8vo.

It is an advantage to have a work, so far as our power covers it, written by Dr. Reece's in circulation, for the purpose of commonal reference.

A Practical Dictionary of Popular Medicine, comprehending the Principal Branches of the Healing Art, so far as they relate to the Preservation of the Health of Man, residing in different Climates, and engaged in different Occupations, as well as the General Treatments for All Maladies, of ten Principal, Anatomy, Physiology, Surgery, Midwifery, Pharmacy, Diet, Clothing, Exercise, etc., &c., &c.

By General Reece, M. D.

A Treatise on Tropical Diseases, on Military Operations, and on the Climate of the West Indies.

By Benjamin Mosley, M. D.

The Morbid Anatomy of the Human Gullet, Stomach, and Intestines.

By John Thomson, Jun., M. D. F. R. S.

Professor of Medicine, Anatomy, and Surgery, in the University of Edinburgh, Fellow of the Royal College of Physicians, &c. &c. &c. in one large vol. royal 8vo, illustrated by 24 Plates, 4to. Price, bd. 6l. 16s. 4d.

A System of Materia Medica and Pharmacy.

By John Murray, Lecturer on Chemistry, and on Materia Medica and Pharmacology.

In 2 vols. 8vo. Price 11s. 4d. Boards.

A Treatise on some Practical Relations of Diet, useful for the Eye.

By the late John Cunningham Saunders, Demonstrator of Anatomy at St. Thomas's Hospital, Founder and Surgeon of the London Infirmary for curing Diseases of the Eye. It is compleated, a Correct Account of the Author's Life, and his Method of curing the most difficult cataracts by his Friends and Colleagues, J. R. Farre, M. D.

Illustrated with 8 Engravings, and a Portrait of the Author. The Second Edition. 11s. 6d. 8vo.

An Inquiry into the Processes of Nature in repairing Injuries of the Intestines; illustrating the Treatment of Penetrating Wounds and Strangulated Herniae.

By Benjamin Travers, Demonstrator of Anatomy at Guy's Hospital, Surgeon to the Hon. East India Company, and to the London Infirmary for Diseases of the Eye.

In 1 vol. 8vo, with Engravings by Stewart. Price 15s. 6d. Boards.

Quincy's Lexicon Medicum. A New Medical Dictionary, containing an Explanation of the Terms in Anatomy, Physiology, Practice of Physick, Materia Medica, Chemistry, Pharmacy, Surgery, Midwifery, and other Sciences of Nature, from the best Authors.

By Robert Hooper, M. D.

Of the University of Oxford, and the Royal College of Physicians in the City of St. Mary-le-Bone, Infirmary, &c. &c. &c. In one large vol. 8vo. Price 15s. 6d. Boards.

Essays on the Changes of the Human Body, at its different Ages; the Diseases to which it is prone, the Remedies for the Preservation of Life; and the Physiological Principles of its Longevity. The whole stated by various Analogies in Plants and Animals.

By Thomas Jameson, M. D.

Member of the Company of Physicians of London and Edinburgh, and resident Physician at Cieltenbury.

In 8vo. Price 9s. Boards.

A Practical Treatise on the Morbid Sensibilities of the Eye; commonly called Weakness of Sight.

Member of the Royal College of Surgeons. The Second Edition. Price 5s. in Boards.
NEW PERIODICAL WORKS
PUBLISHED BY LONGMAN, HURST, REES, ORME, AND BROWN,
PATERNOSTER-ROW,

Which are regularly supplied by their Correspondents in the principal Towns of England, Scotland, and Ireland, and where Specimens may be seen.

A VOYAGE round GREAT BRITAIN, undertaken in the Summer of the Year 1813, and commencing from the Land's End, Cornwall. By RICHARD AYTON. With a Series of Views, illustrative of the Character and prominent Features of the Coast, drawn and engraved by WILLIAM DANIELL, A. R. A. No. I. and II. in imp. 4to. 10s. 6d.

The Voyage will be illustrated with Coloured Prints, engraved by Mr. William Daniell, from his own Drawings, made expressly for the Purpose. It will be published in Monthly Numbers, each Number to contain Two Plates coloured, with Sixteen Pages of Letter-press, price 10s. 6d.

PORTRAITS of ILLUSTRIOUS PERSONAGES of GREAT BRITAIN; with Biographical and Historical Memoirs of their Lives and Actions. By EDMUND LODGE, Esq. Lancaster Herald, F. S. A. Author of the Biographical Tracts attached to the "Holbein Heads".

The Work will consist of Twenty Parts, forming two volumes in folio, printed in the finest manner. Each part will contain Six Portraits with Biographical Memoirs attached, published quarterly, and commencing in April 1814. It will appear in two sizes, both in folio, four hundred copies being printed on a demy paper, and one hundred and fifty on drawing paper of super-royal size, the latter containing proof impressions of all the plates, struck off upon Indian paper. The price will be two guineas and a half each part, for the small edition; the price of the large paper copies, which will contain proof impressions of the plates upon Indian paper, will be five guineas each part.

The CATHEDRAL ANTIQUITIES of ENGLAND; or, an Historical, Architectural, and Graphical Illustration of the English Cathedral Churches. By JOHN BRITTON, F. S. A.

Vol. I. Part I. will contain the History and Description of SALISBURY CATHEDRAL CHURCH, with Thirty Engravings, illustrative of the Architecture, Sculpture, and Monumental Effigies of that noble edifice. The Architectural Plates will all be engraved by J. LE KEUX and H. LE KEUX, from Drawings by F. MACKENZIE:—the Monumental and Sculptural Subjects will be drawn and etched by T. BAXTER.

The whole of this Cathedral will be published in the course of the Year 1814. It will class with, and be a continuation of, the Author's "Architectural Antiquities of Great Britain," which will be completed in June next, and consist of four volumes.

The Illustration of Salisbury Cathedral will be comprised in five numbers; the first of which will appear in April next. They will be charged 12s. per Number medium 4to. and £1, imperial 4to. A few copies will be printed in royal and in crown folio, to correspond with, and illustrate the new edition of Dugdale's Monasticon.

The History of Salisbury Cathedral will be followed by a similar work on the Cathedral of Oxford: this will be succeeded by those of Lincoln, Peterborough, Norwich, Wells, &c.: for all of which the Author has collected documents and sketches.

HISTORICAL SKETCHES of POLITICS and PUBLIC MEN, for the Year 1812-13. (To be continued Annually.) In One Volume, 8vo. price 7s. Boards.

"This writer, whoever he be, brings to his task a much larger share of information, reflection, and calm temper, than generally belongs to the authors of temporary productions. —A spirit of deliberate inquiry and a cool judgment are conspicuous, not on some merely, but on all the topics discussed." —Monthly Review, August, 1813.
NEW PERIODICAL WORKS
Published by Longman, Hurst, Rees, Orme, and Brown, Paternoster-Row.

The DICTIONARY of the ENGLISH LANGUAGE; in which the Words are deduced from their Originals, and illustrated in their different significations, by examples from the best Writers: to which is prefixed a History of the Language, and an English Grammar. By SAMUEL JOHNSON, L. L. D. With numerous Corrections, and with the Addition of many Thousand Words, by the Rev. HENRY J. TODD, M. A. F. S. A. Chaplain in Ordinary to his Majesty, and Keeper of the Archbishop of Canterbury's Records.

The Work will be published in Parts, and the first will appear in a few weeks.

ARCHAICA, containing a Reprint of scarce Old English Tracts, with Prefaces and Notes, Critical and Biographical. The first Tract proposed to be printed is ROBERT GREENE'S PHILOMELA; or, Lady Fitzwater's Nightingale; an interesting prototype of our modern Novels. The Archaiça will be handsomely printed in royal octavo.

HELICONIA, containing a Reprint of the most scarce and curious Collections of our Old English Poetry, first published in the reign of Queen Elizabeth; with Notes, Critical and Biographical. By THOMAS PARK, F. A. S. and other Gentlemen most conversant in that branch of literature. The Heliconia will be handsomely printed in royal 4to.

The first Work proposed to be printed is

A GORGIOUS GALLERY of GALLANT INVENTIONS, garnished and decked with divers dayntie devises, right delicate and delightfull, to recreate ech moder minde withall.

First framed and fashioned in sundrie formes, by divers worthy worke-men of late dayes; and now ioyned together and builded up. By T. P. Imprinted at London, for Richard Jones, 1578. Edited by THOMAS PARK, Esq. F. A. S.

* * * As the Impression of the Heliconia and Archaiça is to be limited to Two Hundred Copies, Gentlemen who wish to possess either of the works are requested to lose no time in communicating their names to the publishers, otherwise, it will be impossible to insure them copies.

A GENERAL COLLECTION of VOYAGES and TRAVELS; forming a complete History of the Origine and Progress of Discovery, by Sea and Land, from the earliest Ages to the present Time.

By JOHN PINKERTON, Author of Modern Geography, &c. &c.

Parts 1 to 60; in quarto, with Engravings, price 10s. 6d. each.

The NEW Cyclopedia; or, Universal Dictionary of Arts, Sciences, and Literature; adapted to the present State of Literature and Science. By ABRAHAM REES, D. D. F. R. S. with the assistance of eminent Professional Gentlemen. Illustrated with new Plates, including Maps, engraved for the Work by some of the most distinguished Artists. Parts 1 to 52, with Two Parts of additional Plates, 20s. each, Bds. or on Royal Paper, price 30s. Bds.

The Editor and Proprietors of the New Cyclopedia embrace with pleasure the earliest opportunity of announcing the period when, without unforeseen and unavoidable interruptions, their great undertaking will be accomplished. They have published fifteen Parts during the last two years; and in consequence of measures lately adopted, they trust that they shall be able to publish eight Parts in each succeeding year. Of the seventy-two Parts which, as they have no reason to believe, the Cyclopedia will comprehend, fifty-two are already before the public; and the remaining twenty will, according to this arrangement, be completed within three years.
A NEW MODERN ATLAS. By JOHN PINKERTON. The Maps are engraved in the size called Colombier, from Drawings executed under Mr. Pinkerton's eye; with all the advantages afforded by the latest Improvements in Geographical Precision; and they exhibit the utmost Beauty the State of the Arts can admit. Nos. 1 to 17, each containing Three Maps. Price One Guinea each.

The BRITISH GALLERY of PICTURES. In Two Series. Publishing in Numbers and Parts. The First Series comprises Engravings of the whole of the Margins of Stafford's Collection of Pictures, arranged according to Schools, and in Chronological Order; with Remarks on each Picture. By W. Y. OTTLEY, Esq. F. S. A. Twenty-five Numbers of this Series, price 10s. 6d. each; Proofs on India Paper, price $1. 1s.; or correctly coloured and mounted, £2. 12s. 6d.; which are divided into Five Parts, price £2. 12s. 6d. each; Proofs on India Paper, price £5. s. 5s.; or correctly coloured and mounted, £13. 2s. 6d. are already published; to be completed in about Fifty Numbers or Ten Parts.

The Second Series consists of Engravings of the finest Paintings of the Old Masters, in the Cabinets, Galleries, and Private Collections of Noblemen and Gentlemen who have liberally permitted the Proprietors to have fine Copies taken of them for the use of this Work, accompanied with Descriptions, Historical and Critical. By HENRY TRESHAM, Esq. R. A. Ten Numbers of this Series, price 10s. 6d. each; Proofs on India Paper, price £1. 1s.; or exquisitely finished in colours and mounted, price £6. 6s. are published; which form the Two First Parts, price each £2. 12s. 6d.; Proofs on India Paper, £5. 5s.; or exquisitely finished in colours and mounted, price £31. 10s.

The ARCHITECTURAL ANTIQUITIES of GREAT BRITAIN, represented and illustrated in a Series of Views, Elevations, Plans, Sections, and Details of various ancient English Edifices, with historical and descriptive Accounts of each. By JOHN BRITTON, F. S. A. Nos. 1 to 37, in Parts, 16s. and 10s. 6d. each.

Three more Parts will complete this work.

Also may be had, the same Work, in 3 Vols. imperial 4to. £22. 8s. half bound.—Dicto, 3 vols. medium 4to. £14. 14s. half bound.

"The engravings are executed in a superior style; the descriptions are sufficiently ample, and appear to be accurate; and, under the superintendence of so able an antiquary as Mr. Britton, there can be no doubt that the succeeding parts will display a corresponding excellence.—Anti-Jac. Rec.

The MORBID ANATOMY of the LIVER; being an Inquiry into the Anatomical Character, Symptoms, and Treatment of certain Diseases which impair or destroy the Structure of that Viscus. Order I.—TUMOURS. Part I. On the Tubera Circumscripta, and Tubera Diffusa. By J. R. FARRE, M. D. In Imperial 4to. illustrated with coloured Engravings, Part I. price 15s.

The Subjects of Tumours and Inflammation of the Liver will occupy a Series of Twelve or Thirteen coloured Engravings, some of which will contain three or more Figures. The whole will be completed either in four or six Fasciculi.

ENGRAVINGS from SPECIMENS of MORBID PARTS, preserved in the Author's Collection now in Windmill Street, and selected from the Divisions inscribed, URETHRA, VESICA, REN, MORBOSA, et LESA, containing Specimens of every Disease which is attended with Change of Structure in these Parts, and exhibiting the Injuries from the Bougie, Catheter, Caustic, Trochar, and Lithotomy Knife, incautiously used. With Observations, by CHAS. BELL. Part I. In Imp. folio. £1. 16s.
NEW PERIODICAL WORKS
Published by Longman, Hurst, Rees, Orme, and Brown, Paternoster-Row.

NEELE'S GENERAL ATLAS. This Work will extend to Four Parts, and will comprise a complete Set of Maps, compiled from the best Authorities, improved by valuable Original Documents, and embracing all the recent Discoveries of Circumnavigators and Travellers.

Those Countries which are most interesting (particularly the European States) will be given each on four pages, forming together, the full size of a sheet of imperial, without the inconvenience of folding.

Part I. price One Guinea, containing 10 Plates (to be continued every Two Months), handsomely coloured and hotpressed.

BORDER ANTIQUITIES of ENGLAND and SCOTLAND, comprising Specimens of the Architecture, Sculpture, and other Vestiges of former Ages, from the earliest Times to the Union of the two Crowns; accompanied with descriptive Sketches, biographical Remarks, and a brief History of the principal Events that have occurred in this interesting Part of Great Britain. Nos. 1 to 6 in med. 4to. 10s. 6d.; or super-royal 4to, with Proof Impressions, 16s. each. This Work is published in quarterly Numbers.

The COSTUME of YORKSHIRE; each Number illustrated by Four highly-finished and coloured Engravings, Fac-similes of original Drawings, descriptive of the peculiar Dress, Occupation, and Manners of various Inhabitants of that extensive and populous County. Nos. 1 to 6, price 12s. each (to be completed in Ten Monthly Numbers) forming one handsome Volume in imperial 4to.

RESTITUTA; or, the Titles and Characters of Old Books in English Literature, and their Authors, revised. By SIR EGER-TON BRYDGES, K. J. No. 1. to be continued Monthly, price 4s.

The BRITISH THEATRE; or, a Collection of Plays, which are acted at the Theatres Royal, Drury-lane, Covent-garden, and Haymarket, printed under the Authority, and by Permission of the Managers, from the Prompt Books. With Biographical and Critical Remarks. By Mrs. INCHBALD. Nos. 1 to 125, 1s. each; or on fine paper, 2s. each.

The MODERN THEATRE; or, a Collection of successful Modern Plays, acted at the Theatres Royal, London. Printed from the Prompt Books by Authority of the Managers. Selected by Mrs. INCHBALD. Containing the most favourite Works of Messrs. Colman, Cumberland, Morton, Reynolds, Holman, Holcroft, Jephson, O'Keefe, Mrs. Inchbald, Mrs. H. More, Miss Lee, Mrs. Cowley, &c. &c. not included in Mrs. Inchbald's British Theatre. In 10 vols. royal 18mo. to correspond with Inchbald's British Theatre, and Collection of Farces, price £2. 10s. Bds. on fine Paper, £3. 15s. in Boards.

A COLLECTION of FARCES and other AFTER-PIECES, which are acted at the Theatres Royal, Drury-lane, Covent-garden, and Haymarket. Printed under the Authority of the Managers from the Prompt Book. Selected by Mrs. INCHBALD. In 7 Vols. royal 18mo. £1. 16s. Boards, or on fine Paper, with Portraits, £2. 12s. 6d. Boards.

The HOLY BIBLE, containing the Old and New Testaments, and Apocrypha, with Critical, Philological, and Explanatory Notes, and 120 superior Copper Plates, engraved by the first Artists from the most admired Productions of the great Masters of the various Schools of Painting. The Notes by the Rev. JOHN HEWLETT, B. D. Morning Preacher at the Foundling Hospital, &c. &c. Parts 1 to 32, on royal 4to. Paper, 9s. each Part; or smaller Paper with Plates, at 7s. or on common demy Paper, without the Plates, at 6s. forming 3 very large Vols. in 4to.

LECTURE I.

In succeeding Sir William Blizard in the honorable office of Professor of Anatomy and Surgery, I think it right to inform my audience that he was my earliest instructor in these sciences; and that I am greatly indebted to him for much and most valuable information respecting them. My warmest thanks are also due to him for the interest he excited in my mind towards these studies, and for the excellent advice he gave me, in common with other students, to direct me in the attainment of knowledge.

"Let your search after truth," he
would say, "be eager and constant. Be wary in admitting propositions to be facts before you have submitted them to the strictest examination. If, after this, you believe them to be true, never disregard or forget any one of them, however unimportant it may at the time appear. Should you perceive truths to be important, make them motives of action; let them serve as springs to your conduct."

"Many persons," he remarked, "acknowledge truth with apathy; they assent to it, but it produces no further effect on their minds. Truths, however, are of importance, in proportion as they admit of inferences which ought to have an influence in our conduct; and if we neglect to draw those inferences, or to act in conformity to them, we fail in essential duties."
Our preceptor further contrived by various means to excite a degree of enthusiasm in the minds of his pupils. He displayed to us the *beau ideal* of the medical character:—I cannot readily tell you how splendid and brilliant he made it appear;—and then, he cautioned us never to tarnish its lustre by any disingenuous conduct, by any thing that wore even the semblance of dishonour. He caused the sentiment of the philanthropic Chremes, in the Heautontimorumenos of Terence, to be inscribed on the walls of the hospital-surgery, that students should have constantly before them an admonition to humanity, drawn from a reflection on their own wants: *Homo sum; humani nihil a me alienum puto.*

I could with pleasure enlarge on this theme, but I check myself, because I am aware that what I am...
now saying may rather annoy than gratify the feelings of my preceptor. What I have stated, however, is a tribute due from me to him; and I pay it on the present occasion, in hopes that the same precepts and motives may have the same effect on the minds of the junior part of my audience, as they were accustomed in general to have upon the pupils of Sir William Blizard.

That which most dignifies man, is the cultivation of those intellectual faculties which distinguish him from the brute creation. We should indeed seek truth; feel its importance; and act as the dictates of reason direct. By exercising the powers of our minds in the attainment of medical knowledge we learn and may improve a science of the greatest public utility. We have need of enthusiasm, or of some strong incentive, to induce
us to spend our nights in study, and our days in the disgusting and health-destroying avocations of the dissecting room; or in that careful and distressing observation of human diseases and infirmities, which alone can enable us to understand, alleviate, or remove them: for upon no other terms can we be considered as real students of our profession. We have need of some powerful inducement, exclusively of the expectation of fame or emolument: for unfortunately a man may attain a considerable share of public reputation and practice without undertaking the labours I have mentioned, without being a real student of his profession. I place before you the most animating incentive I know of to labour truly to acquire professional knowledge. You will by such conduct possess yourselves of the enviable power of being extensively useful to your fellow-crea-
tudes, in a way the most necessary to their wants, and most interesting to their feelings. You will be enabled to confer that which sick kings would fondly purchase with their diadems; that which wealth cannot command, nor state nor rank bestow. You will be able to alleviate or remove disease, the most insupportable of human afflictions, and thereby give health, the most invaluable of human blessings.

I shall not, however, gentlemen, waste your time in expatiating on this topic, because you will feel much more than I can utter, and because all that can be said or thought of it, seems concentrated in one brief but enthusiastic sentence of Cicero, which therefore I quote. In nullare, proprius ad deos homines accidunt, quam salutem hominibus dando.
In occupying the situation of the last gentleman who taught in this place, Sir Everard Home, who has pursued the path of science which Mr. Hunter pointed out, with a considerable talent for observation, and with a degree of zeal and industry, scarcely to be expected from one whose time and attention have been otherwise so much engaged; I also, equally with him, feel interested in impressing on the minds of my audience, the advantages we have derived from the labours of Mr. Hunter, and from pursuing that mode of study and enquiry which he adopted, and inculcated: and I am desirous on the present occasion, to engage your attention in the consideration of the probability and rationality of his theory of life.

The term theory, in philosophical language, like hypothesis, denotes the most plausible and rational mode of accounting
for certain phænomena, the causes of which have not been fully developed. In applying these terms to medical and physiological subjects, I may be allowed to define what I think they designate, and what I intend to convey by them. By the word theory I mean a rational explanation of the cause or connexion of an apparently full or sufficient series of facts: by hypothesis, a rational conjecture concerning subjects in which the series of facts is obviously incomplete.

The formation of an hypothesis excites us to enquiries, which may either confirm or confute our conjectures; and which may, by enabling us to discover the deficient facts, convert our hypothesis into a theory. Believing the facts collected by the ingenuity and industry of Mr. Hunter, to be sufficient to establish his opinions respecting life, I have therefore called them, a theory.
There was a time when medical men entertained so determined a dislike to the word theory, that they could scarcely tolerate the term. If any such remain, I would beg them to reflect that hypothesis and theory are the natural and inevitable result of thinking; so that if they refuse to allow of any theory, they must prohibit all thought.

The antipathy which some have entertained to the term theory, has arisen from its misapplication. For opinions drawn from very partial views of subjects, sometimes having no foundation on facts; opinions formed by processes of mind, similar to those which occur in dreaming, when lawless imagination produces combinations and associations without any reference to realities; opinions, as unlike what I should understand by theory as darkness is to light, have nevertheless
been often proposed as theories and so denominated. That such foolish speculations, such waking dreams, will mislead and deceive us, cannot be doubted; and hence has arisen the prejudice which some have entertained against the term.

The greatest philosophers were through the whole course of their enquiries and demonstrations, theorists. Theorizing, according to my conception of the word, means nothing more than thinking correctly, in a concatenated manner, and in conformity to rules which I shall presently have occasion to notice. It is scarcely necessary for me to assert that this kind of thinking is useful, and promote of Science. For was it not thinking in this manner on the cause of an apple falling from a tree, that led Sir Isaac Newton to ascertain the laws of attraction? was it not thinking thus which led him
to perceive that the operation of the same causes might perpetuate the regular motions of the planetary system? Why do we note facts with accuracy, or collect them with diligence? Why do we interrogate nature by experiment? Is it not because we wish to prove some of our own opinions to be true, or the opposing opinions of others to be false? or, because we wish to enlarge the boundaries of science in a direction in which we think they admit of extension? What induces one person to prohibit another from theorizing? Is it not because he has himself attempted it in vain, and therefore deems the attempt unavailing?

Feelings and opinions are the chief sources of all our intellectual conduct: we ought therefore to cultivate good and honorable feelings, and to scrutinize opinions, with a view to entertain none but those
that appear correct; and such an examination, to which I now invite you, must be allowed to be a proper exercise of intellect.

Since thinking is inevitable, our chief enquiry should be how we ought to think or theorize; and on this point Newton himself has condescended to instruct us. Our theories, hypotheses, or opinions, for to me all these words seem to refer to one and the same act of the mind—should be verifiable or probable, and should rationally account for all the known phænomena of the subject they pretend to explain; under which circumstances it is allowable to maintain them as good, until others more satisfactory be discovered. No man who thus theorizes need feel shame in this employment of his intellectual powers; no man can feel arrogance, for it is acknowledged that his theory is but a probable and rational conjecture.
Besides, we never can be sure, that the series of facts belonging to any subject is full or complete; new ones may be discovered, that would overturn our best established theories.

Upon the foregoing terms alone do I wish to uphold Mr. Hunter's theory of life; and I do so on the present occasion, because it seems highly probable, it was his thinking in the manner he was known to do, that caused him to survey all the facts connected with the subject of life in general with so much accuracy, as well as to note its disordered states and sympathies in a manner which has so greatly contributed to increase our practical knowledge. It is highly probable that it was his hypothesis respecting life which incited him to enquiries by which he has been able to supply the deficient facts, so as to establish his conjectures, or convert his hypothesis into a theory.
Mr. Hunter seems to have put us into a right path, and every step we take our prospects become more enlarged and distinct, and we evidently approximate to the ultimate object which we have in view.

Whoever duly reflects on the extent of human knowledge and power, cannot but feel an interest in anatomical enquiries; since he must perceive that it is by means of the organization of the body, the mind acquires all its information, and executes all its purposes. When, however, we engage in anatomical enquiries, we find so great a diversity of structure in the different parts of the body; so great a variety of expedients for effecting certain purposes, all so simple in their nature, yet so adequate to their intended design, that anatomy becomes highly interesting from the curiosity it excites, the knowledge it im-
When also in the prosecution of our anatomical enquiries, we as it were analyze the body, or reduce it to its elementary parts; when we find that every organ, and every portion of it, is composed of a few and simple vessels, a few and simple fibres; that by these it is originally formed, kept in constant repair, endowed with animation, sensation, and motion; we become lost in astonishment that such important ends can be effected by apparently such simple means.

On reflecting how I might best accomplish the duty which devolves to me, of giving anatomical lectures in a place by no means suited to anatomical demonstrations, I thought I could not do better than speak of the structure and
functions of these elementary component parts of the body; since by this method I should be led to describe their natural and healthy structure and functions, which would be a proper introduction to the subsequent discussions I have to engage in, relative to the nature and treatment of disorder and disease. As it does not seem material which subject I consider first, I shall begin with the Fibres, the only visible means by which motion and sensation are produced; for this will lead directly to the consideration of Mr. Hunter's Theory of Life.

In surveying the great chain of living beings, we find life connected with a vast variety of organization, yet exercising the same functions in each; a circumstance from which we may I think naturally conclude, that life does not de-
pend on organization. Mr. Hunter, who so patiently and accurately examined the different links of this great chain, which seems to connect even man with the common matter of the universe, was of this opinion. In speaking of the properties of life, he says, it is something that prevents the chemical decomposition, to which dead animal and vegetable matter is so prone; that regulates the temperature of the bodies it inhabits, and is the cause of the actions we observe in them. All these circumstances, though deduced from an extensive contemplation of the subject, may, however, be legitimately drawn from observations made on the egg. A living egg does not putrefy under circumstances that would rapidly cause that change in a dead one. The former resists a degree of cold that would freeze the latter. And when subjected to the genial warmth of incubation, the matter of it begins to
move or to be moved so as to build up the curious structure of the young animal.

The formation of the embryon in gallinaceous ova was particularly attended to by Mr. Hunter; and he was of opinion, that motions began in various places in the cicatricula so as simultaneously to form parts of the embryon and its appendages.

The opinions of Mr. Hunter deserve at least to be respectfully and attentively considered. That he was a man of genius, according to the beautiful definition of that quality given by Dr. Johnson; that he possessed the power of mind that collects, combines, amplifies and animates, the energy without which judgment is cold, and knowledge is inert; cannot I think be doubted by
any one who has carefully considered his writings. That he was a man of uncommon industry, by which he collected abundance of facts, will be admitted by every one who has even beheld his museum. That he was a man of constant and deep reflection, is to me equally apparent.

Many persons have genius without industry; others industry without genius; and many who possess both are still deficient in judgment.

I here beg permission to explain the notions I entertain of that act of the mind by which we form our inferences, opinions, or judgments. I shall by this means at once unfold what it is that, in my estimation, gives currency and value to the opinions of any individual, and entitles them to the attention of others. The human mind has the power of hold-
ing, as it were, in review, a series of facts or propositions, and steadily contemplating them so as to arrange, assort, or compare them till we form some deduction respecting them. This power seems to belong exclusively to man, and is the basis of his reasoning faculty. That mind is the strongest which can contemplate the greatest number of facts or propositions with accuracy; and his judgments are generally the most correct, who omits to review none of the facts belonging to the subject under his consideration. It was this power of mind that so eminently distinguished Newton from other men. It was this power that enabled him to arrange the whole of a treatise in his thoughts, before he committed a single idea to paper. In the exercise of this power, he was known occasionally to have passed a night or day entirely inattentive to surrounding objects.
That Mr. Hunter was also a man of constant and deep reflection, that he possessed this enviable power of mind, so essential to the perfection of the intellectual character, is to me sufficiently apparent; for I know of no opinion of his that was lightly or loosely formed, or that was not logically and cautiously deduced from the facts before him; and though from the subsequent increase of knowledge, the validity of some of his opinions may now be doubted, yet most of them have from the same cause become more firmly established. With all his genius, knowledge, and reflection, Mr. Hunter was not, however, a brilliant character amongst us. He had not the happy talent of displaying the stores of his mind, nor of communicating to others the same perception of the importance of his facts and opinions as he himself entertained. Perhaps it may have arisen
from my attending more to his facts and opinions than to his mode of explaining them, that I have been led to form so high an estimate of his intellectual powers. I can draw no other inferences from the facts than those which he has drawn, and therefore am I a convert to his opinions.

I proceed now to consider the structure and functions of those fibres which constitute the muscles, in order to introduce the discussion of the probability and rationality of Mr. Hunter's Theory as a cause of irritability. Muscular fibres are soft and readily lacerable in the dead body, and even during life when they are in a state of inaction. They are composed of that insoluble substance which we meet with in the blood, and which, from its disposition to concrete in a fibrous form, is called the fibrous part of that fluid. The threads and flakes
of common cellular substance, which connect the muscular fibres, and everywhere pervade the structure of a muscle, may be removed by boiling, and then the muscular fibres may be separated, till they become too minute to admit of further separation, and almost elude our unassisted sight. Yet there are some who assert, that by the aid of powerful lenses each fibre, though slender as the threads of flimsy gossamer, appears but as a muscle in miniature, being composed of a number of smaller fibres. There are others who maintain the contrary, and affirm that they can see the ultimate muscular fibres. It would seem to me a waste of time to detail to you the reports of various microscopical observers, respecting the ultimate fibres of muscles, since there is so little concurrence or certainty in their descriptions. The opinion which such contradictory statements have impressed
on my mind, is, that perhaps the ultimate arrangement of matter, like its ultimate particles, may form a subject too subtile for human perception. Our information in these respects must be limited, as our powers of perception have their bounds. The imperfection of the human senses does not, however, seem a subject of regret; because it induces a greater necessity for the exertions of intellect; and many subjects appear far more demonstrable to reason than to sense.

Fontana, it must be granted, possessed considerable talent in microscopical observations, for he says, that he could readily distinguish the nature of any animal substance, which might be placed on the field of his microscope, by regarding its ultimate fibres, and according to him the muscular fibres are much smaller than those of the nerves. Proscaska and others
assert, that the ultimate muscular fibres are continued throughout the whole length of a muscle. How marvellous, (could we but see it,) would such a slender thread appear, continued throughout the whole length of the human sartorius. Haller, however, affirms, that the fibres are not continued, but that one set terminating another begins. Suspecting that Haller employed the solar microscope on this occasion, as he says he had done on others, I examined muscular fibres with this instrument. Now though I place no confidence in my own observation, and think the subject unimportant as to any conclusion that may be deduced from it, yet I will tell you how a portion of a muscle appeared to me when magnified about 500 times. The fibres were slightly undulating, and one set terminating, another began: neither were the sets of fibres of considerable length. The mus-
cular fibres were connected by cross threads of common cellular substance.

Mr. Carlisle, in whose talents and accuracy we are all disposed to place confidence, in the Croonian Lecture, printed in the Philosophical Transactions for 1805, says, that he can distinctly see an ultimate muscular fibre, which he describes "as a solid cylinder, the covering of which is reticular membrane, and the contained part a pulpy substance irregularly granulated."

He has also described the termination of nerves in muscles. Muscles are liberally supplied both with blood vessels and nerves, but nothing peculiar is perceived in their distribution. We make them very red by injecting them, and we see numerous nerves entering their substance.
at various places. Yet the vessels of some muscles are too minute to receive red blood or our coloured injections, so that redness though a common is not an essential character of muscle.

I here willingly relinquish the enquiry into the structure of those organs in which the irritable property chiefly resides, in order, in the next place, to speak of the principal phænomena of irritability.

Muscles have the power of contracting with surprizing celerity and force. It seems indeed wonderful that the biceps muscle of the arm, which in the dead state would be torn by the weight of a few ounces appended to it, shall in the living state be capable of lifting and sustaining more than 100 lbs. The matter in the muscle seems neither to be in-
increased nor diminished during its contraction, what is lost in length being gained in bulk. The voluntary contraction of muscles cannot be long continued; they become weary and painful, the contraction remits and recurs, causing a tremulous motion. Yet this phenomenon does not seem to be the effect of absolute inability, in the irritable property, to continue in action, for some muscles continue to act without experiencing fatigue. For instance, those of the jaws and back; for whenever they relax, the jaw drops, and the head and body fall forwards, as we see in persons who are going to sleep in a sitting posture. Certain sphincter muscles likewise remain in action without experiencing fatigue. Some sphincters also, I may add, are disposed to yield considerably without impatience; so that their irritability resembles that of those muscles which Bichât has considered as
a distinct class, and subservient alone to what he calls the organic life. The contractile power of muscles is also capable of remaining in vehement action for a great length of time, as we see in some cases of cramps, and still more in some cases of tonic tetanus.

Yet though the irritable power is not incapable of continued exertion, it seems evidently to be in general susceptible of fatigue, and inclines to be at rest. If we stimulate the muscles of a limb of a frog severed from the body, by voltaic electricity, the muscular actions are at first vivid and forcible, but they grow fainter and feeble on repeated excitement. Yet if we wait a little till they seem to regain their power, they become vivid and forcible as at first from the same degree of excitement. Such actions may be
excited at intervals for twenty-four hours, though with a gradual diminution in their power, after which, in general, they can be no longer excited, and then the muscles become permanently and rigidly contracted. The foregoing facts appear to me to shew the impropropriety of the phrase, exhausted irritability, which is in common use to express our inability by the effort of our will to continue the actions of our voluntary muscles: it seems manifest that the irritability is not exhausted but fatigued.

The rigid contraction of the muscles after death, is the effect of irritability: it is its last act. A considerable force is required to overcome this contraction, or to bend the rigid limbs of the dead body, when it has recently taken place. The force required to effect this, gradually
diminishes till the muscles become quite pliant; and then, and not till then, does putrefaction ensue.

Mr. Hunter has known this last vital contraction to occur in parts severed from the body sixty hours after their separation, upon the removal of causes which had impeded the contraction before that period; a proof that life in a certain degree was still resident in the part. He observed that death produced by lightning, or large charges of electricity, or by certain kinds of injuries and diseases, prevented this contraction, and even the coagulation of the blood; and that putrefaction would in such cases very rapidly take place. From facts of this kind, as well as from many others, he drew an inference, which has not I believe been disputed, and therefore I need not enter into the discussion of it at length, that
the principle of life may in some instances be suddenly removed, or have its power abolished, whilst in general it is lost by degrees.

The contraction of irritability takes place in some animals in a very slow and gradual manner, and their muscles in general are incapable of sudden contraction. Yet though the action of their muscles is very slow, it is very powerful and very permanent. The American sloth, supports its weight for a very long time in one attitude by fixing its claws into the branches of trees; an act which would speedily weary muscles of an ordinary character. The muscles of the legs of birds that roost, seem to have a similar power of permanent contraction.

Mr. Carlisle has lately demonstrated a peculiar distribution of the arteries in the
limbs of these tardigrade animals, as they are called, and Doctor Macartney has shewn that a similar arrangement of vessels exists in the legs of fowls. Such a distribution of the arteries may be subservient without being essential to these modes of action.

In the human body we see instances of irritability exerting itself after the manner it does in general in tardigrade animals. If the iris had possessed the ordinary powers of muscles, and none else, it could not have remained, as it is known to do, permanently contracted in a strong light, and permanently dilated in a weak one. Indeed, an anatomist who is fond of tracing structure as connected with function, might readily persuade himself, that there is in the iris a distribution of arteries, similar to that which Mr. Carlisle has demonstrated in the limbs of
sloths. We find, however, that sphincter muscles in general have the power of continuing their contraction, though no peculiar distribution of vessels is discoverable in them. In the gall bladder, the function of which requires this slow but permanently acting irritability, in order to express its contents in small and equal quantities into the bowels, as the digested aliment passes into them, we discover no peculiar arrangement of arteries. Though we cannot excite any sudden contraction of that bag, yet we know that it can gradually reduce itself into a very small compass. The skin has everywhere this slow but permanently acting, and gradually relaxing irritability, the effects of which are most evident in lax and pendulous portions of it. Accordingly we sometimes observe the scrotum and prepuce condensed into a surprizingly small and very compact mass.
Thus have we even in the human body evidences of irritability acting in various modes, whilst we can equally perceive that in tardigrade animals some of their muscles act with celerity. In the Lori, of whose habits Vosmaer has given so interesting an account, and which manifested no signs of alacrity, save in eating the food that it liked, no stimulation nor injury could induce it to mend its pace, but it shewed its resentment of the attempt to make it perform impossibilities, by suddenly snapping at the stick or instrument with which it was goaded; and thus again demonstrated that the muscles of its jaw were endowed with an irritability of the more common character.

Having thus briefly described the principal phænomena of muscular action, for I forbear to notice others of less impor-
tance, I proceed to review the conjectures that have been formed as to the cause of these curious, sudden, and powerful contractions. Not to speak of exploded hypotheses, I trouble you only with those which are modern.

First, then, the contraction has been supposed to be the effect of some chemical change occurring in the part. This opinion is I think invalidated by the reiterated contractions which may be produced in the limbs of some animals when removed from the body, even during twenty-four hours, if excited by voltaic electricity, and consequently when no supply of materials can be supposed to exist within the limb, to produce such reiterated chemical changes. The opinion is still further refuted by observing, that these vivacious contractions will equally take place, upon the same excitement, in the exhausted receiver of an air
pump and in the open air. They may also be excited under water, under oil, in a great variety of gases; in short, under circumstances which exclude the presence of any chemical agent from without, to which such changes could reasonably be imputed.

Secondly. The contraction of irritability has been supposed to be a property of the muscular fibres. Properties are generally considered as permanent qualities. Thus, the property of gravitation is continually operating, equally when bodies remain at rest and when it produces motion in them, equally whilst I support this book in my hand, and when I suffer it to fall on the table. If, however, so curious an occasional property could belong to matter, we should naturally expect that it would belong to some peculiar quality, or arrangement of matter. But irritability is connected with matter of different quali-
ties and arrangements. The flesh of animals and that of fish are different in quality; the mucilaginous bladders which float in the sea differ from vegetables; yet all are irritable, or possess this power of occasional contraction. Though in general we find irritability connected with a fibrous structure, yet, if we may trust our senses, it is not so in every instance. In the hydatid, where no such structure is apparent even with the aid of lenses, we still have evidence of the irritability of life. If also, as I strongly suspect, the muscular fibres be not continued from one end of the muscle to the other, irritability could not in that case be considered as a property belonging to them, since any breach of continuity would completely frustrate the contraction of the whole muscle.

Thirdly, I proceed to enquire into Mr.
Hunter's opinion, that irritability is the effect of some subtile, mobile, invisible substance, superadded to the evident structure of muscles, or other forms of vegetable and animal matter, as magnetism is to iron, and as electricity is to various substances with which it may be connected. Mr. Hunter doubtless thought, and I believe most persons do think, that in magnetic and electric motions, a subtile invisible substance, of a very quickly and powerfully mobile nature, puts in motion other bodies which are evident to the senses, and are of a nature more gross and inert. To be as convinced as I am of the probability of Mr. Hunter's Theory as a cause of irritability, it is, I am aware, necessary to be as convinced as I am that electricity is what I have now supposed it to be, and that it pervades all nature. To obtain this conviction it is necessary that the facts connected with this
subject should be attentively considered; but for such an examination I have no time; neither would it be considered as suitable to the general design of these lectures.

Whatever notions philosophers may be pleased to form respecting matter in general, it does not appear to me that our physiological opinions can be affected by their decisions. Of the matter which for the most part presents itself to our notice, and is cognizable by the eye and touch, we know that it has a property called by Sir Isaac Newton *vis iner
tiae*, an indisposition to move unless impelled to motion, and a disposition to continue in motion unless retarded.

There are some philosophers who think, that properties similar to those which in the aggregate mass become an
object of our senses, likewise belong to every atom of which it is composed; whilst others, on the contrary, think, that the atoms have very different qualities, and that the vis inertiae is the property only of the aggregate mass. The matter of animals and vegetables is, however, an aggregate mass; it is as we express it, common matter, it is inert; so that the necessity of supposing the superaddition of some subtile and mobile substance is apparent.

Taking it for granted that the opinions generally entertained concerning the cause of electrical motions are true, analogy would induce us to suppose, that similar motions might be produced, by similar causes, in matter organized as it is found to be in the vegetable and animal systems.
The phenomena of electricity and of life correspond. Electricity may be attached to, or inhere, in a wire; it may be suddenly dissipated, or have its powers annulled, or it may be removed by degrees or in portions, and the wire may remain less and less strongly electrified, in proportion as it is abstracted. So life inhere in vegetables and animals; it may sometimes be suddenly dissipated, or have its powers abolished, though in general it is lost by degrees, without any apparent change taking place in the structure; and in either case putrefaction begins when life terminates.

The motions of electricity are characterized by their celerity and force; so are the motions of irritability. The motions of electricity are vibratory; so likewise are those of irritability. When by long continued exertion the power of
muscles is fatigued, or when it is feeble, their vibratory or tremulous motions are manifest to common observation, but the same kind of motion may be perceived at all times by attention, as has been shewn by Doctor Woolaston in the Croonian Lecture for the year 1810. It is then I think manifest, that Mr. Hunter's conjectures are the most probable of any that have been offered as to the cause of irritability.

My allotted time does not permit me at present to consider the other vital functions; yet I relinquish the subject with reluctance, because I have been speaking only on that point in which it seems most difficult to persuade the incredulous, of the probability and rationality of Mr. Hunter's Theory.

When hereafter I shall have to speak
of the other vital functions, I think it will appear that it is impossible to account for the phænomena in any other manner than that which Mr. Hunter has suggested.

In ascending the difficult and lofty ladder of knowledge, men of great talent and industry seem to have affixed to it certain resting places, on which, reposing for a time from their labours, they could tranquilly assemble their followers, and contemplate more extensive views of nature, and of nature's laws, than had before been taken. If after having stood by the side of the great teacher Newton, and learned from him the properties of common and inanimate matter, we afterwards attend to Mr. Hunter, our great instructor in the functions of living beings, he points out to us how matter, starting from the
general mass, springs up into life in vegetation. We see vegetables as it were self formed and producing their own species. We observe them also exerting most of the powers which animals possess. That they have irritability is evident from the current of their sap and their secretions; nay, in some we observe those vivacious motions which seem chiefly to belong to animal life, as is evident in the Mimosæ, the Dionæa Muscipula, and Heydysarum gyrans. We see them like animals having alternate seasons of action and repose; and though in general vegetables like animals are in action during the day and rest in the night, yet also some vegetables like some animals rest in the day and are in action during the common season of repose.

We see animals scarcely differing from vegetables in their functions, like them
doomed to a stationary existence, with even less appearance of organization than we usually discover in vegetables, and of a structure so simple as to admit of propagation like vegetables by cuttings. Yet in all the diversity of living beings we recognize certain processes peculiar and essential to life; as the power of converting other kinds of matter into that appropriate to the individual it is to form and support; the power of distributing the nutriment, thus converted, to every part for its formation and supply; the ventilation, as I may call it, of the nutritive fluids; the power of preparing various dissimilar substances from the nutritive fluids; and the propagation of the species. As what is deemed the complexity of animal life increases, we find distinct organs allotted for each of these functions; thus we have organs of digestion, circulation, respiration,
secretion, and generation, which are various in their structure in the different tribes of animals.

In vegetables, and in some moluscae, no traces of nerves are discoverable. The nervous system begins in a simple form, and seems to increase in complexity up to man. But this will make the subject of the next lecture. Mr. Hunter also shews us that there are animals, as for instance the torpedo and gymnotus, which have organs liberally supplied with nerves, forming an electric battery which they can charge at will. Such facts shew to what a degree electricity exists in these animals, and how greatly it is under the influence or control of the nervous system; and they could not fail to make a strong impression on the contemplative and deeply meditating mind of Mr. Hunter.
What then, may I ask, is the natural inference to be drawn from the examination of this great chain of being, which seems to connect even man with the common matter of the universe? What but that which Mr. Hunter drew, that life must be something independent of organization, since it is able to execute the same functions with such diversified structure, and even in some instances with scarcely any appearance of organization at all.

The experiments of Sir Humphrey Davy seem to me to form an important link in the connexion of our knowledge of dead and living matter. He has solved the great and long hidden mystery of chemical attraction, by shewing that it depends upon the electric properties which the atoms of different species of matter possess. Nay, by giving to an alkali
electric properties which did not originally belong to it, he has been able to control the ordinary operations of nature, and to make potash pass through a strong acid, without any combination taking place. That electricity is something I could never doubt, and therefore it follows as a consequence in my opinion, that it must be everywhere connected with those atoms of matter, which form the masses that are cognizable to our senses; and that it enters into the composition of every thing, inanimate or animate. If then it be electricity that produces all the chemical changes, we so constantly observe, in surrounding inanimate objects, analogy induces us to believe that it is electricity which also performs all the chemical operations in living bodies; that the universal chemist resides in them, and exercises in some degree peculiar
powers because it possesses a peculiar apparatus.

Sir Humphrey Davy's experiments also lead us to believe, that it is electricity, extricated and accumulated in ways not clearly understood, which causes those sudden and powerful motions in masses of inert matter, which we occasionally witness with wonder and dismay; that it is electricity which causes the whirlwind, and the water spout, and which "with its sharp and sulphurous bolt splits the unwedgeable and gnarled oak," and destroys our most stable edifices; that it is electricity which by its consequences makes the firm earth tremble, and throws up subterraneous matter from volcanos.

When therefore we perceive in the universe at large, a cause of rapid and
powerful motions of masses of inert matter, may we not naturally conclude that the inert molecules of vegetable and animal matter, may be made to move in a similar manner, by a similar cause?

It is not meant to be affirmed that electricity is life. There are strong analogies between electricity and magnetism, and yet I do not know that any one has been hardy enough to assert their absolute identity. I only mean to prove, that Mr. Hunter's Theory is verifiable, by shewing that a subtile substance of a quickly and powerfully mobile nature, seems to pervade every thing, and appears to be the life of the world; and therefore it is probable that a similar substance pervades organized bodies, and produces similar effects in them.

The experiments of Sir H. Davy seem
to realize the speculations of philosophers, and to verify the deductions of reason, by demonstrating the existence of a subtle, active, vital principle, pervading all nature as has heretofore been surmized, and denominated the Anima Mundi. The opinions which in former times were a justifiable hypothesis, seem to me now to be converted into a rational theory.

It is then, I think, manifest, that Mr. Hunter's Theory of Life, presents us with the most probable solution of the phenomena of irritability, of any that has hitherto been proposed.

The human mind has been the same at all periods of the world; in all ages there have been men of a sceptical disposition, disinclined to believe any thing that was not directly an object of their senses. At all periods there have been other men of a contem-
plative, and perhaps more credulous character, who have been disposed to believe that there were invisible causes, operating to produce the alterations which are visible, and who from much less numerous facts have drawn the same inferences that I have done. And many of these, from Pythagoras downwards, have expressed their sentiments, though with some variety, yet pretty much to the same effect. The Greek philosophers recognized in man, the Σωμα, Πνευμα, and Νοης, the body, vital principle, and mind, whilst some used words significant of intellect, to express the energizing principle in nature, without apparently having any clear ideas of intelligence.

What was called the Anima Mundi, was, however, by many considered as a distinct and active principle, and was not confounded with intelligence of any kind. I know not how I can better exhibit to my au-
dience the subject I am alluding to, or better acquaint them with the general tenour and tendencies of these opinions, than by quoting that portion of these philosophical notions, which Virgil is said to have put into the mouth of Anchises,

Spiritus intus alit, totamque infusa per artus
Mens agitat molem, & magno se corpore miscet.

And please to observe, gentlemen, it is Virgil says, it is Anchises speaks, that which I also this day have been saying;—

Inde hominum pecudumque genus, vitaeque volantum
Et qua marmoreo fert monstra sub aequore pontus.
LECTURE II.

I proceed to speak of the structure and functions of the nervous fibres.

The nerves which we observe pervading the body, appear to be packets of very minute threads, seemingly distinct from each other. The nerves divide and subdivide, and in so doing a certain number of threads separate from the original packet, and appear as a distinct nerve. It is, therefore, possible to trace a minute nerve, up to its origin, from the toe or finger, by splitting it off from the various packets with which it has been conjoined. So far does anatomical fact concur with the physiological opinion,
that every nervous filament communicates distinctly with the brain or some process of that organ.

This apparent continuity is, however, lost, whenever we find those intumescences on nerves which are called ganglia, for in these there seems to be a mixture or consolidation of the nervous matter. It is also lost wherever various nerves unite together, and form a plexus; in which case the nervous fibrils either coalesce, or become inextricably interwoven with one another.

The nerve from which the thoracic and abdominal viscera are chiefly supplied, is beset with numerous ganglia and plexuses; and as we cannot by our will influence the actions of those viscera, and as the iris, the motions of which are also involuntary, is supplied with
nerves from a ganglion, it has been thought that ganglia, by intercepting the direct communications between the brain and the extreme branches of nerves, might render parts thus supplied less amenable to the will, and less under the influence of the general affections of the nervous system. It is also thought that ganglia might serve the office of subsidiary brains, each affording a separate source of nervous energy.

On the one hand, it ought to be observed, that all the vertebral nerves, supplying parts over which the will exerts the most perfect control, have ganglia at their commencement; and that the nerves of the leg and arm form a plexus near their origin. The actions of the cremaster muscle are involuntary; yet I believe it is supplied by the same nerves, which supply muscles that are subject to vo-
luntary actions; therefore this opinion does not appear to me to be such as we should receive with entire confidence. Again, it is further apparent, that the functions of the abdominal and other viscera are greatly affected by disorders of the brain, and that the brain is greatly affected by disorders of these viscera.

The ingenious and industrious French anatomist, Bichât, has classed the living functions into the organic and animal: the distinction seems a natural and useful one, and throws light on the physiology of the visceral nerve. In vegetables, and in some moluscae, no traces of a nervous system are discoverable. In some of the lower order of animals, that have organs for the preparation and distribution of nutriment, they are supplied by a visceral nerve, which it is probable maintains amongst those organs a con-
currence of impressions and actions. In some of these animals no traces of nerves subservient to the voluntary regulation of their motions can be found. In the ascending complexity of the nervous system, we find a nervous chord more or less beset with ganglia, which supplies other parts of the body besides the viscera, and which probably serves to maintain amongst them likewise a concurrence of impressions and actions. We next find at one end of this chord a kind of ganglion, or brain, which gradually becomes larger and more complex as we trace the series of links upwards to man, in whom it bears a much larger proportion to the nervous system in general than in any other animal. The visceral nerve, in the ascending series of animals, appears connected with the animal nerves; and so numerous are these connections that this nerve has in the human subject
obtained the title of the great sympathetic nerve.

The vital organs are required to carry on their functions with a degree of regularity and order, under the varying circumstances of life; and the possession of a distinct nerve may enable them to continue their functions without so materially participating in the disturbances of the animal system, as they must otherwise have done: yet the numerous connections of the visceral with the animal nerves must render both participators in each other's disorders.

The nerves, then, may be said to proceed from the brain, medulla spinalis, and visceral nerve, to all parts of the body for their supply. In thus expressing a fact, however, we should guard against an idea which the analogous distribution of
arteries is apt to engender. Arteries become minute in proportion as they send off branches, whilst on the contrary, the branches of nerves are often larger than the trunk from which they proceeded. It is no unfrequent occurrence for malformed children to be born without a brain, yet with a perfect nervous system. The most rational idea, therefore, we can entertain on the present subject, is, that the nerves are formed in the parts where we find them, and that they are connected to those parts of the organs from which we are accustomed to say they proceed. Nerves are vascular, and we can inject them with subtile injections.

The nerves, then, proceeding from, or being connected with the brain, medulla spinalis, and visceral nerve, may be traced, ramifying throughout the body in the manner already mentioned, till they arrive
at the part for the supply of which they are designed. They then split into numerous branches which communicate with each other, and again subdivide and rejoin, their communications appearing to multiply as they become more minute; so that every part of the body has a kind of net work of nerves, which is minute in proportion to the susceptibility and sensibility it possesses.

This general and imperfect sketch of the anatomy of the nervous system, relates only to what may be discovered by our unassisted sight. If by means of the microscope we endeavour to observe the ultimate nervous fibres, persons in general are as much at a loss as when by the same means they attempt to trace the ultimate muscular fibres.

Those fibres which we can split off
from a nervous packet, in the manner before mentioned, though too minute to admit of further subdivision, appear by the microscope to be themselves packets of smaller threads. It is generally asserted by microscopical observers, that the nerves and medullary matter of the brain and spinal marrow are the same, and are composed of very minute fibres. Fontana speaks confidently on this point; and he further says, that he has seen these nervous fibres regenerated in the medium which has been formed to unite a divided nerve. He describes the nervous fibres in every part of the nervous system as cylindrical, pursuing a slightly undulating course, and being in a considerable degree transparent. He states also that they are larger than the ultimate fibres of muscles.
though, the nervous fibrils in each packet appear distinct, and may be separated from each other in the manner already described, yet they have nevertheless transverse communications with each other. Each nervous fibre has been supposed to be covered by investing membranes similar to those of the brain; but this opinion is founded on an analogy with what is observed in the optic nerve, rather than on actual observation with respect to others. That they have investing membranes is clear, and we are told that we may dissolve the medullary or nervous matter by an alkali, and leave these investing membranes; or on the other hand, that we may dissolve the investing membranes by nitric acid, and leave the medullary fibres.

Having thus spoken of the chief circumstances relating to the anatomy of
the nervous system, I shall not dwell on this part of the subject, but hasten to the principal object of the lecture, to consider its Physiology, in order to examine how far Mr. Hunter's Theory of Life, seems adequate to explain the phenomena of the nervous functions.

First then, it is generally believed that all sensation is in the brain, and that all volition proceeds from that organ. This proposition requiring to be impressed so as to produce conviction, for it is the foundation on which all our future reasoning is founded, I shall state the principal causes of this opinion. First, If the continuity of a nerve be intercepted at any point between that extremity which receives impressions from the objects of sense, and which therefore may be called the impressed or tangible extremity, and that which communicates with the brain,
and is usually called its sensorial extremity, both feeling and volition by means of that nerve are suspended.

2dly. If a certain degree of pressure be made upon the brain, both feeling and voluntary motion cease whilst it continues and return when it is removed.

3dly. As we have evidence that the perceptions and intellect of animals increase in proportion as the brain becomes larger and more complex, so we have reason to conclude that these faculties are connected with that part of the nervous system.

4thly. The conviction which we generally though not constantly experience, that feeling exists in the part which receives impressions, is shewn to be deceptive by the
following facts. If a nerve be irritated midway between the brain and its extremities; severe pain is supposed to be felt in those extremities; and if it supplies muscles, those muscles become convulsed. Thus when a disease forms about the hip joint, or in the loins, many persons have applied poultices to their knees, from a conviction that as the pain was felt in the knee, it was the seat of the disorder. In like manner, persons who have had their limbs amputated, can scarcely believe that they are removed, because of the pain and other sensations they still seem to feel in them. In either of these cases, motions being excited in the middle of nerves, and transmitted to the brain, are attributed to a disordered state of those parts from which such motions have heretofore originated.

If then it be admitted that sensation
exists in the brain, and that volition proceeds from that organ, it necessarily follows that motions must be transmitted to and fro along the nervous chords, whenever they take place. It was formerly supposed that these chords were passive, and might be made mechanically to vibrate, but their want of elasticity and tension, and their pulpy origins and terminations, are circumstances which render such a supposition inadmissible. Physiologists were therefore led to conjecture that the nervous fibrils were tubular, and that they contained a subtile fluid, by means of which such motions were transmitted.

Of the extensive knowledge and high intellectual powers of Baron Haller no one can entertain a doubt; and yet, he could devise no other theory to account for the phænomena of the nervous functions. His opinions have always appear-
ed to me very sensible, and they were accordant to the philosophy of his own times. He says, Si vero, cogitata nostra de ipsa natura spirituum proferre jube-remur, activum ad motum, a voluntate & a sensu concipiendum, aptissimum, ce-lerrimum, omne sensuum acie subtilius, ta-men hactenus igne & æthere, & electro, & magnetica materie crassius facere ele-mentum, ut et contineri vasis, & a vin-culis coerceri aptum sit: & denique mani-festum ex cibis nasci & reparare queat.

Mr. Hunter's opinion of a subtile and mobile substance, inhering in the nervous chords, is not essentially different from that of Haller. He does not indeed suppose it to be confined in tubes, neither does the philosophy of the present time require such a supposition, for no one at present will doubt that a subtile substance may be attached to or inhere in a chord
without mechanical confinement. Will not a wire when electrified continue to be so, if surrounded by non-conductors? Experiments made on the limbs of animals with electricity, produced in the manner first explained by Volta, shew that different parts of the body have different conducting powers. Skin and membrane being very bad conductors, and brain, muscle, and blood being remarkably good ones.

The celerity with which motions are transmitted from the tangible extremities of nerves most distant from the brain, and the celerity with which volition is transmitted to the muscles, in consequence of sensations thus induced, are sufficient to convince us that such effects must be produced by the motions of a very mobile substance. It is not necessary to suppose that when such motions are trans-
mitted along the nervous chords, an evident motion of the visible matter of those chords should be induced. Electrical motions take place along a wire without occasioning any visible motion of the metal itself.

Formerly, it was thought that the motions of the nerves that cause sensation, were the effect of an impulse made on their tangible extremities, which was propagated along the chord to the brain. It seems to be an improvement in modern physiology, to attribute sensation to an action begun in the nervous fibrils, in consequence of the stimulation which they suffer from such impulses. This opinion is contended for by Doctor Darwin, in his paper on Ocular Spectra, published in the Philosophical Transactions; and Sir Everard Home has further shewn, that the living principle of nerves has an irritability belonging to it, resembling that
of muscles, and capable of causing a contraction in them when they are divided.*

The opinion that sensation is the consequence of an action begun in and transmitted through the nervous fibrils, assists us in understanding how our sensations may be very vivid from the slightest impulses; such, for instance, as take place in the application of odour to the olfactory nerves, for it is not the impulse, but the consequent action, that is transmitted to the sensorium: and why we may have no sensation from the most violent impulses; for such we cannot but suppose to occur, when a man is shot through the body, or has a limb removed by a cannon ball; occurrences which have however happened without any distinct feeling intimating the event.

* Croonian Lecture.
In supposing a principle of life in nerves, similar to what is conceived to exist in muscles, we might naturally expect to find certain analogies of functions in those organs. The facility, celebrity, and accuracy of the nervous actions, seem like those of the muscles to be improved by use; as is exemplified in the quick and correct perceptions of those who are accustomed to exercise their auditory nerves in attending to musical sounds. A train of nervous actions having often taken place they, like similar actions in muscles, become concatenated, and are liable to occur in succession, when one of them is accidentally induced. Both nerves and muscles require temporary respites from action, and are refreshed by sleep.

The supposition of actions occurring in the nerves, explains many circum-
stances connected with diseases. Vehe-
ment actions may occur in the tangible ex-
tremities of nerves, independent of im-
pulses, and occasion severe pain. This
seems to happen in the disease called
tic douloureux. Ordinarily, actions be-
ginning in the tangible extremities of
nerves, are regularly transmitted to the
brain; but in cases of nervous pains, ac-
tions sometimes seem to begin in the
middle of nerves; and it is probable,
that actions beginning in the sensorial
extremities of nerves may be productive
of illusory sensations, and excite falla-
cious ideas.

If this theory of nervous actions could
be proved, the extent of our knowledge
would only lead to this conclusion, that
motions of a subtile substance, propagated
to and fro in the nervous fibrils, took
place in consequence of excitement by
impulses and volition; but from such motions it seems impossible to account for sensation or volition. We can conceive no variety in these motions, but what relates to degree, duration, and succession, and it seems impossible to believe that sensation can be the result of such motions, or that ideas can arise from any succession or train of them. Certain persons will therefore I doubt not continue to think that sensation, remembrance, comparison, judgment, and volition, are properties of some distinct substance.

The essences or primitive parts of what we call matter, are too subtile to be perceived by our senses, and seem even to elude our conceptions. Is it not then most philosophical to acknowledge our ignorance on these points, and to speak of what we do know, the properties of the different species of substances in na-
ture. Thus we seem to be acquainted with the properties of the aggregate forms of that substance which is cognizable to the eye and touch, and which we then call matter; we seem to be assured of the existence, and to know something of the properties, of a subtile substance which pervades all nature; and if we are allowed to know any thing, we surely may be admitted to know the properties of our own minds.

How diversified are our perceptions, how admirably are they adapted to our wants and gratifications! for all beauty of prospect, all melody of sound, all variety of odour, must by the eye of reason be perceived to result from the masses or molecules of surrounding matter, being in various states of motion or of rest; of which circumstances we have notice by the actions they induce in our ner-
vous fibrils. Such variety of perceptions I can only consider as the effect of the peculiar properties of that which feels, remembers, reasons, and wills, and which seems connected with the brain alone.

The conclusion to be drawn from this examination of the functions of the nervous system is curious and interesting. We perceive an exact correspondence between those opinions which result from physiological researches, and those which so naturally arise from the suggestions of reason that some have considered them as intuitive. For most reflecting persons in all ages have believed, and indeed it seems natural to believe, what modern physiology also appears to teach, that in the human body there exists an assemblage of organs, formed of common inert matter, such as we see after death, a principle of life and action, and a sen-
tient and rational faculty, all intimately connected, yet each apparently distinct from the other.

So intimate, indeed, is the connection as to impose on us the opinion of their identity. The body springs and bounds as though its inert fabric were alive; yet have we good reasons for believing that life is distinct from organization. The mind and the actions of life affect each other. Failure or disturbance of the actions of life prevent or disturb our feelings, and enfeeble, perplex, or distract our intellectual operations. The mind equally affects the actions of life, and thus influences the whole body. Terror seems to palsy all its parts, whilst contrary emotions cause the limbs to struggle, and become contracted from energy. Now though these facts may countenance the idea of the identity of mind and
life, yet have we good reasons for believing that they are perfectly distinct. Whilst, therefore, on the one hand, I feel interested in oppugning those physiological opinions which tend to confound life with organization; I would, on the other, equally oppose those which confound perception and intelligence with mere vitality.

In the first lecture I endeavoured to shew that Mr. Hunter's Theory of Life was verifiable, and that it afforded the most rational solution of the cause of irritability, which had hitherto been offered to the public. It now appears that it does not essentially differ from that of the best physiologists, with regard to the explanation it affords of the nervous functions. As it is impossible to review all the phænomena of these functions in a lecture, I shall on the present
occasion merely direct your attention to the consideration of one other subject, which is, the opinions we may be warranted in forming, respecting the connection of irritability and sensibility.

This subject has been the cause of much controversy. Haller maintained that irritability was a distinct property inherent in muscles; to use his own words, that they had a vis insita, independent of the vis nervea; which opinion has of late received additional corroboration from some experiments of Mr. Brodie. Those who object to this opinion, can, I think, only oppose it on the following grounds. They must contend either that the muscles have a kind of perception of injury which causes them to contract, even though they are unconnected with the brain; or that the nerves are the organs which prepare and supply the muscles with
something which is the cause of irritability.

Concerning the first of these suppositions, that muscles may have a perceptibility of injury, distinct from that which we understand to be feeling, I have to observe, that we can have no idea of sensation but what results from our own experience, which may be defined to be perception attended with consciousness; which kind of sensation is confined to the brain alone. Of any other kind of perception, it is evident we can never form any idea.

If a man's leg be amputated, and by voltaic electricity I excite contraction in its muscles for some hours; how can I know whether they feel or not? We naturally judge of other subjects from ourselves, and knowing that we shrink from
whatever pains us, some persons seem to conclude that the muscles contract because they have been hurt. To the patient who has suffered amputation, such a supposition would seem absurd. He may feel pain when no stimulus is applied to the limb, or he may feel ease when it is. Nay, he continues to feel pain, or sensations, in the limb when it is rotten, or no longer in existence; which seems to shew the integrity of the sentient principle remaining in the brain.

In vegetables, and in some moluscae, no traces of a nervous system are discoverable, yet the irritability of life is manifest in all. In the ascending series of animals, in proportion as the brain becomes large and complex, we have evidence of the perceptions and intelligence increasing; a circumstance which would lead us to believe that these faculties were connected
with that part of the nervous system. We have also equal reason to believe, that neither such perception nor intelligence is requisite for the mere functions of life, for these appear to be carried on as effectually in animals that have no brains, nay, in those which seem destitute of any nervous system, as in those which possess such organs. Indeed, many of the most vivacious and irritable animals have the least nervous system. The nerves in the lower order of animals, that have no common sensorium, may contribute to produce effects, which, in tracing the ascending series, I have endeavoured to express by the words concurrence of impressions and actions; because intimations of impressions and actions occurring in one part may be communicated to others by these inter-nunciate chords, as Mr. Hunter called them, in cases where we
are not warranted in supposing there is any sensation such as I have defined.

Assuredly, motion does not necessarily imply sensation; it takes place where no one ever yet imagined there could be sensation. If I put on the table a bason containing a saturated solution of salt, and threw into it a single crystal; the act of crystallization would begin from the point touched, and rapidly and regularly pervade the liquor till it assumed a solid form. Yet I know I should incur your ridicule, if I suggested the idea that the stimulus of the salt had primarily excited the action, or that its extension was the effect of continuous sympathy. If also I threw a spark amongst gun-powder, what would you think were I to represent the explosion as a struggle resentful of injury, or the noise as the clamorous expression of pain?
Now, though chemists may solve the cause of these phænomena, physiologists have yet to learn, and probably they never may learn, why certain actions succeed to certain causes in living bodies. Causes which induce muscular or nervous actions in one part do not induce similar actions in another. Both muscles and nerves have peculiar habitudes and modes of action, and require the application of various peculiar excitements. Causes which produce no bad effect upon one person, will have a detrimental influence upon another, and this we say is the result of idiosyncrasy. Thus the odour of a cat, or the effluvia of mutton, the one imperceptible, the other grateful to the generality of persons, has caused individuals to fall on the ground as though bereaved of life, or to have their whole frame agitated by convulsions. Substances which induce disease in one person or animal, do not induce disease in others. That
pain is not the cause of action, as I think evident. Nervous motions, induced by the will, cause our muscles to act, but such motions occasion no sensation in the obedient muscles. When, therefore, we employ the terms in common use of a stimulus being applied, and an action or disease excited, we should remember that neither the infliction of pain, nor absolute injury, is essential to the production of such consequences.

With respect to the second proposition, into which I have resolved the objections that may be made to Haller's opinion of irritability being independent on sensibility, I have only to remark, that the effects of pressure made on nerves, as well as other observations, have induced the general belief that some fluid or energy pervades the nerves for the supply of the body. Pressure on a nerve be-
numbs and paralyzes the parts which it supplies, which regain sensation and motion on the removal of the pressure; yet if irritability exist in vegetables and some animals that have no nervous system, it shews the possibility of irritability being produced without the intervention of nerves.

It has been my object to shew that Mr. Hunter's Theory of Life is a verifiable Theory, and that it affords the most rational explanation of the phænomena of irritability, and of those nervous functions that have been considered. It is, however, impossible in the compass of a lecture, as I have before observed, to review all the phænomena of the nervous functions, which it is necessary to do in order to establish it as a rational Theory. The contemplation of this subject at large, is fitter for meditation in the closet than
for discussion in the lecture-room. I shall, therefore, merely mention by way of exciting attention to some of the phænomena alluded to, that it seems impossible to account for those which Mr. Hunter considered as the effect of sympathies between remote organs, or for those consequences of idiosyncrasy which have been mentioned, upon any other supposition than that of a subtile substance, prone to act, or liable to fail in action, pervading the body, the affections of which can with electrical celerity be propagated throughout the system.

I have further to shew that Mr. Hunter's Theory of Life is adequate to explain the cause of the prevention of putrefaction, and the regulation of temperature. If the vital principle of Mr. Hunter be not electricity, at least we have reason to believe it is of a similar nature, and has the power of regulating electrical
operations. That electricity is the great chemist both in organized and unorganized bodies, will be generally credited; and that the power which combines may also prevent decomposition is too obvious to need discussion. That electricity is capable of augmenting and diminishing the temperature of unorganized matter is well known. Does not Platina wire drop like wax in fusion when it intervenes between the different ends of the voltaic battery? and do not the spherules of rain fall to the ground at midsummer as firmly frozen as in the depth of winter, when they pass through a stratum of air refrigerated by electrical operations? I believe I need say no more on these subjects.

The varying and the strong retention of life by seeds, and some kinds of vegetables and animals, are facts which seem
more satisfactorily solved by Mr. Hunter's Theory of Life than by any other.

Impressed with the difficulties of the task I have undertaken, of giving lectures in the presence of men of superior knowledge and talents, respecting subjects on which every one has formed his own opinions, which of course he thinks correct; though desirous of fulfilling the design of these lectures to the extent of my ability, I feel unable to display the subjects of them in any other way than that to which I have been accustomed. Thinking as Mr. Hunter taught, with regard to life and its functions, in health and disorder, I must use his language as expressive of the phænomena we observe. That an attention to the sympathies of parts and organs is necessary to our understanding disorder and disease, I shall hereafter endeavour to shew. That Mr. Hunter
did observe these sympathies in a manner and to an extent that surprized most professional men, is well known to all those who were present at his lectures on this subject. Their surprize was indeed natural, because they were not then fully acquainted with his views and motives.

I mention these things, because I am aware that there are some who say sympathy is a term without any direct meaning, and that all which Mr. Hunter said on the subject of life, explains nothing. What Mr. Hunter meant, I believe I understand; what persons of different sentiments, whom I acknowledge possess great information and ability, mean, when they talk in this manner, I am not so well able to discover. They seem to deny that life can be any thing which may not be seen or felt. They seem to wish us to believe that they have that phi-
losophical turn of mind which exempts them from vulgar prejudices, and that no Theory appears to them satisfactory, neither do they propose any for our adoption.

Thinking being inevitable, we ought, as I said in the beginning, to be solicitous to think correctly. Opinions are equally the natural result of thought, and the cause of conduct. If errors of thought terminated in opinions, they would be of less consequence; but a slight deviation from the line of rectitude in thought, may lead to a most distant and disastrous aberration from that line in action. I own I cannot readily believe any one who tells me, he has formed no opinion on subjects which must have engaged and interested his attention. Persons both of sceptical and credulous characters form opinions, and we have in general some principal opinion, to which we connect the rest, and to which we make them
subservient; and this has a great influence on all our conduct. Doubt and uncertainty are so fatiguing to the human mind, by keeping it in continual action, that it will and must rest somewhere; and if so, our enquiry ought to be where it may rest most securely and comfortably to itself, and with most advantage to others? In the uncertainty of opinions, wisdom would counsel us to adopt those which have a tendency to produce beneficial actions.

If I may be permitted to express myself allegorically, with regard to our intellectual operations, I would say, that the mind chooses for itself some little spot or district where it erects a dwelling, which it furnishes and decorates with the various materials it collects. Of many apartments contained in it, there is one to which it is most partial, where it chiefly reposes,
A VOYAGE ROUND GREAT BRITAIN, undertaken in the Summer of the Year 1814; and commencing from the Land's End, Cornwall.

By RICHARD AYTON.

With a series of drawings of the Character and prominent Features of the Coast, drawn and engraved by WILLIAM DANIELL, A.R.A.

The design of this Voyage is to give a Descriptive Account of the Coast, and of every object worthy of observation in its Vicinity of the Towns, Harbours, Forts, and the general character and appearance of the Shore round the Island.

The work is written by Mr. Richard Aytoun, and illustrated with coloured Prints, engraved by Mr. William Daniell, from his own Drawings, made expressly for the purpose. It will be published in Monthly Numbers, each Number to contain Two Plates, correct and coloured, Price 10s. 6d.

The present portion of the Work will consist of Fourteen Numbers, forming one large volume, in imperial quarto, price seven guineas.

PORTRAITS OF ILLUSTRIOUS PERSONAGES OF GREAT BRITAIN; with Biographical and Historical Memoirs of their Lives and Actions.

By EDMUND LODGE, Esq. Lancaster Herald, F. A. S. Author of the Biographical Tracts attached to the CYCLOPAEDIA.

The Work which is now undertaken will have public approval of a series of Portraits of Illustrous Personages of Great Britain and Ireland, from the earliest periods to which authentic pictures can be traced to the present day. Each Part will contain Six Portraits with Biographical Memoirs attached, published quarterly, and commencing in January 1814. It will appear in two sizes, both in folio, four hundred copies being printed on a demy leaf, and one thousand on imperial quarto size, the latter containing proof impressions of all the plates, struck off upon Indian Paper. The price will be two guineas and a half each Part for the small edition, the great edition, the large paper copies, which will contain proof impressions of the plates upon Indian Paper, will be five guineas each part.

THE CIVIL ARCHITECTURE OF THE ANCIENTS; comprising those Books of the Authors which relate to the public and private Buildings of the Ancients, translated.

By WILLIAM WILKINS, M. A. F. A. S.

Late Fellow of Gonville and Caius College, Cambridge; Author of the "Antiquities of Magna Graecia." Illustrated by numerous Engravings, with an Introduction, containing an Historical View of the Rise and Progress of Architecture amongst the Greeks. Part I. In Elephant 4to. Illustrated by 15 Engravings by Lowry. Price 2l. 6s. 6d. Part II. In folio, price 3l. 10s. 6d. Part III is in great forwardness.

THE FINE ARTS OF THE ENGLISH SCHOOL, comprising a Series of highly-finised Engravings, from Painting, Sculpture, and Architecture, by the eminent artists, with each Subject accompanied by appropriate historical, descriptive, critical, and biographical Letter-press.

Edited by JOHN BRITTON, F. A. S.

In large 4to. Price 10s. 6d.; and a New 4to. 15s. in 3 vols.

* * * A few Copies, with Proof Impressions of the Plates, on India Paper. Price 15s. 10d.

THE BRITISH GALLERY OF PICTURES. In Two Series. Publishing in Numbers and Parts. The First Series comprises Engravings of the most of the Marquis of Stafford's Collection of Pictures, arranged according to Chronological Order; with Remarks on each Picture.

By W. Y. OTTLEY, Esq. F. A. S.

TWENTY-FIVE NUMBERS of this Series, Price 10s. 6d. each; Proofs on India Paper, Price 1l. 14s. 6d. or correctly coloured and mounted, 3l. 14s. 6d.; which are divided into Five Parts, Price 3l. 14s. 6d. each; Proofs on India Paper, Price 3l. 14s. 6d. or correctly coloured and mounted, 5l. 14s. 6d. are already published; to be completed in about Fifty Numbers or Ten Parts.

The Second Series consists of Engravings of the finest Paintings of the old Masters, in the Cabinets, Galleries, and Rooms of the Indian Court, at home, and abroad; which have been liberally permitted the Proprietors to have fine Copies taken of them for the use of this Work, accompanied with Descriptions, Historical and Critical.

TEN NUMBERS of this Series, Price 10s. 6d. each; Proofs on India Paper, Price 1l. 14s. 6d. or exquisitely finished in colours and mounted, Price 6l. 6s. are published in the first Part. Price 1l. 14s. 6d. Proofs on India Paper, Price 5l. 14s. 6d. or exquisitely finished in colours and mounted, Price 5l. 15s.

"When we consider the reputation and talents of the individuals connected with the Production of this Work, and examine their liberality in permitting the Specimens of their labours as far as they have hitherto proceeded, we cannot but exult in those sentiments which, we have already dedicated to them, and which we trust will be found to be well founded by the World, and of which we are now in a position to give a distinct instance."

The Work is according to the Specifications produced, and there can exist but little doubt on this head, it promises to be among the most splendid, beautiful, and delightful productions that any time or country has exhibited of the kind."—Brit. Crit.

THE NEW CYCLOPEDIA; or, UNIVERSAL DICTIONARY of Arts, Sciences, and Literature. Formed upon a more enlarged Plan of Arrangement than the Dictionary of Mr. Chambers; and containing the various Articles of that Work, with Additions and Improvements; together with the new Subjects of Biography, Geography, and History; and adapted to the present State of Literature and Science.

By ABRAHAM REES, D. D. F. R. S. F. L. S.

Editor of the last Edition of Mr. Chambers's Dictionary; with the assistance of eminent professional Gentlemen, illustrated with new Plates, including Maps, engraved for the Work by some of the most distinguished Artists.

* * * The Work may be purchased either periodically in monthly Parts, or together, as may be most agreeable. Fifty-two Parts are already published, price 3s. 6d. each. The Work may be purchased, with Proof Impressions of the Plates, price 5s. 6d. each.

The Editor and Proprietors of the New Cyclopaedia embrace with pleasure the earliest opportunity of announcing the attainment of that period of perfection, when unavoidable interruptions, their great undertaking will be accomplished. They have published fifteen Parts during the last two years, and in consequence of measures lately adopted, they shall be able to publish eight Parts in each succeeding year. Of the seventy-two Parts which they have now reason to believe, the Cyclopaedia will comprehend, fifty-two are already before the Public, and the remaining twenty will, according to this arrangement, be completed within three years.

A PICTURESQUE VOYAGE TO INDIA, by the way of CHINA.

By THOS. DANIELL, R. A. and WIL. DANIELL, A. R. A.

In Folio, with Ninety-four Coloured Plates, correctly coloured and mounted, with descriptive Letter-press to each, half bound, Russia-back. Price 1l. 15s.
A SERIES OF ENGRAVINGS to illustrate DANTE. Engraved by Pirroll of Rome, from Compositional Models by JOHN FLAXMAN, R.A. In the possession of Thomas Hope, Esq.

This Work consists of 111 Plates, illustrative of the Inferno, Purgatorio, and Paradiso of Dante, with Descriptions, translated by Mr. Boyd's Translation. In folio. Price 4l. 4s. Boards.

ESSAYS on the ANATOMY of EXPRESSION in PAINTING. By Charles Bell.

This is a very elegant and interesting publication."—Edin. Rev.

THE BRITISH THEATRE; or, a COLLECTION of PLAYS, which are acted at the Theatres Royal in London and Country, with the Prompt-Books, with Biographical and Critical Remarks. By Mrs. Inchbald.

With a variety of Illustrations from Originals, and in superroyal 4to. Price 6l. 18s. 6d. in Boards; or on fine Paper, with Portraits and Proof Impressions of the Plates. Price 13s. in Boards.

The following are the Plays contained in this Work, which may be purchased separately. Price 1s. each:

THE MODERN THEATRE; or, a Collection of successful MODERN PLAYS, acted at the Theatres Royal. London. Printed from the Prompt-Books by authority of those Theatres.

Selected by Mrs. Inchbald.

CONTAINING the most favourite Works of Messrs. Colman, Cumberland, Morton, Reynolds, Holman, Holcroft, and Wycherley; with the Prompt-Books, and Descriptions of each Play, with the Casts, &c. &c. with Mrs. Miss Lee, Mrs. Cowley, &c. &c. not included in Mrs. Inchbald's British Theatre. In 10 vols. royal 8mo. to correspond with Inchbald's British Theatre. In 12 vols. 1s. 10d. in Boards. On fine Paper, 3s. 15s. in Boards.
VOYAGES, TRAVELS, GEOGRAPHY, AND TOPOGRAPHY.

A COLLECTION OF FARCES, and other AFTERPIECES, which are acted at the Theatres Royal, consisting of the most successful and amusing Pieces of Mr. Kemble, C. Bihun, T. Dibdin, J. Knight, Cobb, Foote, Murphy, Garrick, Bickerstaffe, Prince Hoare, Sheridan, Mrs. Brooke, Fielding, Tobin, O'Keefe, Gen. Burgoyne, Mrs. Cowley, Reed, &c. &c. by the Royal Play-Book, on fine Paper, with Portraits, Price 1s. 11d. 6d. in Boards.

HOUSEHOLD FURNITURE, and INTERIOR DECORATION, executed from Designs, consisting of Perspective and Geometrical Views of Apartments, with their Chairs, Tables, Stoves, Candelabra, Chandelles, Table-cloth, Etc.

By THOMAS HOPE, Esq.

On royal folio. Price 5l. 5s. in extra Boards; or with Proof Impressions on Atlas Paper, Price 10s. 10d.

ILLUSTRATIONS OF THE SCENERY OF KILLARNEY, the surrounding Country, and a considerable Part of the Southern Coast of Ireland.

By ISAAC WELD, Esq. M. R. I. A.

In one vol. royal 8vo, with numerous Plates elegantly engraved, Price 11s. 1d. and on royal Paper, in 4to, with the Impressions of the Plates, Price 3l. 3s. 6d. in extra Boards.

In Mr. Weld's illustrious and beautiful scenery has found an accurate and able executant, whose judicious and skilful artists have had considerable work, and we have seldom seen a work that combines more classical elegance with a high degree of graphic execution.

RURAL SPORTS.

By W. B. DANIEL. In 3 vols. 4to. Price 7l. 17s. 6d. and in 3 vols. 8vo. Price 5s. 5d. in Boards. New Edition, embellished with 70 beautiful Engravings, by Scott, from Drawings by the most celebrated Artists.

PERSONAL NARRATIVE OF TRAVELS to the EQUINOCTIAL REGIONS of the NEW CONTINENT, during the Years 1809, 1810, and 1811, by the REV. J. HUMPHREY BONPLAND. RURAL PHILOSOPHY; or, Reflections on Knowledge, Virtue, and Happiness; chiefly in reference to a Life in the Country.

AN ENGLISH SPEAKING BOOK; with Reading Lessons adapted to the Capacities of Children. In Three Parts, calculated to advance the Learners by natural and easy Gradations; and to teach Orthography and Pronunciation together. By LINDLEY MURRAY. In demy 8vo. The 16th Edition. Price 1s. 6d. bound.

"We recommend to the public this most important little volume, as the first attempt to offer a Complete system of Instruction in the English Language, for teaching children to read, written by a philosopher and a man of taste." Ed. Juven. "We can recommend this as the best work of the kind that has hitherto been under our observation."

AN ABRIDGMENT of MURRAY'S ENGLISH GRAMMAR. With an Appendix, containing Exercises in Parsing, in Orthography, in Syntax; and in Punctuation. Designed for the younger Classes of Learners. The 8th Edition. Price 1s. 6d. bound.

THE ENGLISH EXERCISES; adapted to MURRAY'S ENGLISH GRAMMAR; consisting of Explanations of the Parts of Speech; Instances of False Orthography, Violations of the Rules of Syntax, Defects in Punctuation, and Violations of the Rules respecting Perspicuity and Accuracy. Designed for the Benefit of Private Persons, and for Use in the lower Classes of School. The 14th Ed. 2s. 6d.

A KEY to the ENGLISH EXERCISES; calculated to enable private Learners to become their own Instructors in Grammar and Composition. Price 2s. 6d. bound. The 11th Edition. The Exercises and Key may be had together. Price 2s. 6d.

AN ENGLISH GRAMMAR; comprehending the PRINCIPLES and RULES of the LANGUAGE, illustrated by appropriate EXERCISES, and a KEY to the EXERCISES.

"We have had no grammarian, within the compass of our critical career, who has employed so much labour and exertion upon our native language, as this edition of Mr. Murray's works on English Grammar, deserves a place in Libraries, and will not fail to obtain it." Brit. Crit. "We have read this work with sufficient care, to be able to pronounce upon it, as a work of great correctness and perfection. We cannot dismiss these volumes without observing, that as they are intended for the higher classes of readers, but made applicable to the young persons who have left school, and to foreigners." Ch. 9e. "Mr. Murray's English Grammar and Exercises have long maintained their reputation, as the works best adapted for the language. They are now united in an improved edition, printed with a large, and on a fair paper, in a larger volume than of old; and are interspersed throughout the book. The whole well deserves the careful perusal of every student of our language; containing a copious and skilful analysis of its principles, and many just and acute remarks on the peculiarities of its idiom and construction." Ann. Rev.

FIRST BOOK FOR CHILDREN.

"This very improved Primer is intended to prepare the Learner for the English Grammar, and is particularly intended by the author to assist mothers in the instruction of their young children." Ed. Rev.

ENGLISH GRAMMAR, adapted to the different Classes of Learners. With an Appendix, containing Rules and Observations, for assisting the more advanced Students to write with Perspicuity and Accuracy.

By LINDLEY MURRAY. 24th Edit. Price 1s. bound.

"Mr. Murray's English Grammar, English Exercises, and Abridgments, are esteemed good models of what is best, on account of their being composed on the principle we have so frequently recommended, of making each class contain the useful elements of scientific knowledge. The late learned Dr. Blair gives his opinion of it in the following terms:—Mr. Lindley Murray's Grammar, with the Exercises and the Key in a separate volume, I esteem as an excellent performance. I think it superior to any that have been published in the last age. It is, by much, the best Grammar of the English Language extant. On Syntax, in particular, he has shown a wonderful degree of acuteness and precision, in getting the numerous errors which writers are apt to commit. Most useful these books must prove, to all who are applying themselves to the arts of composition." Guard, of Educ.

and other poems.
by the late Mrs. henry Tighe.
with a portrait of the author, engraved by Sercue.
The 3d edit. in one vol. foolscap 8vo. price 6s. 6d. boards.

"for elegance of design, and accuracy of execution, this much exceeds any poetical composition of the present day. while the hearts of his readers beat to the sweetest sounds of their native language, contrary, as nature dictates, the feelings of the purest passions, so long with this theme of Psyche dwelling on their ears, and they shall think the angel is still speaking." M. Rev.

the highlanders, and other poems.
by Mrs. grant.
in one vol. foolscap 8vo. the 3d edit. price 7s. in boards.

poetical vagaries, and vagaries vindicated.

the father and daughter; a tale.
by Mrs. opie.
The 7th edit. with a frontispiece. price 4s. 6d. 8ds.
"this tale is replete with interest, and possesses a power sufficient to affect the minds of the most of critical readers." Mon. Rev.

simple tales. by Mrs. opie.
The 3d edit. in 4 vols. 12mo. price 1l. 1s. in boards.
"in the tales before us we find much of the same merit: a l Beatrice novel, Tadpole, the same truth and delicacy of sentiment, the same graceful simplicity in the dialogue parts of the work; and the same happy art of presenting ordinary feelings and occurrences in a manner that irks-its which comes unites our sympathy and affection." E.C. Rev.

temper; or, domestic scenes. a tale.
by Mrs. opie.
the 3d edit. in 3 vols. 12mo. 1l. 1s. boards.

adeline mowbray; or, the mother and daughter. a tale.
by Mrs. opie.
the 3d edit. in 3 vols. 12mo. price 1s. 6d. boards.
"these volumes are, both in their design and execution, so superior to those which we usually encounter under the title of novels, that we can safely recommend them to the perusal of our readers." Mon. Rev.

tales of real life. by Mrs. opie.
in 3 vols. 12mo. the 2d edit. price 1s. 6d. in boards.
"these volumes possess the same pathetic eloquence, and accurate development of human motives and feelings, which must always charm in the writings of this author; and by which she is enabled to make the reader feel, and sympathize with her narrative, to be "tales of Real Life." Mon. Rev. Nov. 1812.

the loyalists. a tale of other times.
by miss west.
in 3 vols. 12mo. 1l. 1s. in boards.
"we are delighted with this book, which is at once original and interesting." Brit. Crit. October, 1812.

by Miss Jane porter.
Author of "Thaddeus of Warsaw," and "Remarks on Sir Philip Sidney's Aphorisms."
in 5 vols. 12mo. the 2d edit. price 1l. 15s. boards.

Thaddeus of Warsaw. a novel.
by miss jane porter.
The 6th edit. in 4 vols. price 1s. 6d. in boards.
"Thaddeus is a work of genius, and has nothing to fear at the candid ear of taste: he has received the precious need of sympathy from every reader of unimpassioned sentiment and genuine feeling." Imp. Rev. "this work has more merit than can be ascribed to the crowd of productions of this class, and excites virtuous and magnificent sentiments." Mon. Rev.

Don Sebastian; or, the house of Braganza. a Historical romance.
by Miss Anna Maria porter.
in 4 vols. 12mo. price 1s. 6d. in boards.
"Miss Porter is entitled to rank among the best of our living novelists. To the pleasing traits of character with which history has furnished her, our author has added a thousand charms, and she has certainly succeeded, in interesting us extremely in the fate of Don Sebastian." Crit. Rev.

the hungarian brothers.
by Miss anna maria porter.
in 3 vols. 12mo. the 2d edit. price 1s. 6d. in boards.
"the incidents of this novel are striking, and many of the characters are admirable characters, and the two brothers are models of that chivalrous heroism with which Miss Porter has, on other occasions, proved herself to be intimately acquainted." Crit. Rev.

the mysteries of Udolpho. a romance; interspersed with some pieces of poetry.
by ann radcliffe.
The 6th edit. in 4 vols. 12mo. price 1l. 15s. in boards.

The Fourth Volume separate. Price 14s. 6d. Boards.

* Extract of a Letter from Mr. Gibson, the Historian, to Mr. Smeaton, dated London, February 10, 1792.

I am tempted to embrace this opportunity of suggesting to you the idea of a work, which must be very well received by the Public. That voluminous and important work, which has been going on for three score years, now contains a great number of literary, historical, and miscellaneous articles, which are served to a heap of temporary rubbish; but if properly chosen and disposed, they might prove to great advantage in a new publication of a moderate size.

LETTERS WRITTEN by EMINENT PERSONS in the Seventeenth and Eighteenth Centuries, to which are added, Hearne's Journeys to Reading, and to Whaddon Hall, the Seat of Browne Willis; Esq. and Lives of eminent Men. By JOHN AUBREY, Esq.

The whole now first published from the Originals in the Bodleian Library and Ashmolean Museum; with Biographical and Literary Illustrations. By the Author of Selon's Magna Charta.

In 3 vols. Svo. Price 14s. 6d. 6d. boards.

A TREATISE on DIAMONDS and PRECIOUS STONES, including their History, Natural and Commercial; to which is added, some Account of the best Methods of Cutting and Polishing them.

In Svo. Illustrated by Three coloured Plates, 12th Eds.

A NARRATIVE of the BUILDING and a DESCRIPTION of the CONSTRUCTION of the EDDYSTONE LIGHTHOUSE with Stone. To which is subjoined, an Appendix, giving some Account of the Lighthouse on the same Place, &c. By JOHN AUBREY, Esq.

By JOHN SMEATON, Civil Engineer, F.R.S.

The 2d Edit, in Imperial folio, illustrated by 30 Engravings. Price 6s. 6d. half-bound.

REPORTS, ESTIMATES, AND TREATISES, embracing the several Subjects of Canals, navigation, Rivers and Ports, Bridges, Draining, Embanking, Lighthouses, Measuring the Dimensions of Rocks and other Miscellaneous Papers; drawn up in the course of his Employment as a Civil Engineer.

By the late Mr. JOHN SMEATON, F.R.S.

Printed chiefly from his MSS, under the direction of a Select Committee of Civil Engineers.

In 3 vols. 4to. Price 12s. 6d. each vol.

VOLUMES II. and III. of the same Work, and the Plates of Vol. I. (not given before) done up in an Atlas, decy 4to. Price 6s. 6d. in Boards, may be had separate.

A body of information, in all cases in which may give instruction, and suggest hints to civil engineers; or serve, and be a convenient companion to the several plates, in these volumes, to the memory of the most original genius in this line, in which he appeared among us.
