## INTRODUCTION.

THE description of the Coasts of South America contained in the following Memoir, is the result of a voyage of Survey, made by order of the Right Honorable the Lords of the Admiralty, in His Majesty's Sloops Adventure and Beagle.

The Eastern Coast of Patagonia, the Western part of the Strait of Magalhaens, the Gulf of Peñas, and other parts of the Western Coast, were surveyed by Captain Stokes of the Beagle. Upon the unfortunate death of that Officer, Captain Fitz Roy succeeded to the Command, and discovered and examined the Otway and Skyring Waters, and surveyed the outer or Sea Coast of Tierra del Fuego,—from Cape Pillar, at the Western Entrance of the Strait of Magalhaens, to Cape San Diego, in Strait Le Maire. The Cockburn and Barbara Channels and some parts of the Strait, and the Interior Sounds and Channels

#### INTRODUCTION.

of the Western Coast, from Cape Tres Montes to the Strait's Western Mouth, were explored by Lieutenants Skyring and Graves, in the Adelaide, a Schooner, that was added to the expedition in consequence of its being found impracticable to survey so intricate a Coast with the Ships; the remainder was surveyed by the Officers of the Adventure, in her decked boat, the Hope.

The differences of Meridians, between the various points of the Survey, were fixed in all practicable cases by triangulation; but where this mode could not be adopted they were ascertained by Chronometric Observations:—the Zero point being the place of the Observatory at Port Famine, the Longitude of which has been fixed at 70° 54' West of Greenwich.

This determination was obtained principally by Chronometers, from Monte Video and Rio de Janeiro, which agreed very closely with the mean result of a considerable number of Lunar distances observed at Rio, Gorriti, Monte Video, San Carlos de Chiloe, and Valparaiso; and severally referred to Port Famine by the Chronometric chain.

#### INTRODUCTION.

Assuming Villegagnon Island, at Rio de Janeiro, to be  $43^{\circ}$  05' 03' West of Greenwich, which is the result obtained by us with fourteen Chronometers from Plymouth, the Longitude of Rat Island at Monte Video will be 56° 9' 30', and of Port Famine 70° 54' 01'. The mean of the Lunar observations above mentioned make the latter 70° 54' 10'. Whence the Zero point of the Survey has been fixed, as above stated, at 70° 54'. Should the Longitude of the station at Rio de Janeiro, at some future time, be more correctly determined, all the meridional differences of this Survey must be corrected by a quantity equal to the excess or defect of what it is here assumed to be.

In this Memoir, references are occasionally made to the works of several Navigators, who have published accounts of the coasts it describes: Of these, the following is a list:---

- An Account of several late Voyages and Discoveries; by Sir John Narborough and others. 1 vol. Octavo, London, 1694.
- A Voyage to the South Seas in the year 1740-1; containing a Narrative of the Loss of His Majesty's Ship the Wager, &c. &c.; by John Bulkeley, and John Cummins, late Gunner and Carpenter of the Wager. Octavo, London, 1743.
- The Narrative of the Honorable John Byron, containing an Account of the Loss of the Wager, &c. &c. Octavo, London, 1768.

viii

- Viage al Estrecho de Magallanes por el Capitan Pedro Sarmiento de Gambóa en los Años de 1579 y 1580 &c. Madrid, Año 1768.
- An Account of the Voyages of Commodore Byron, Captain Wallis, Captain Carteret, and Captain Cook, in H. M. Ships Dolphin, Swallow, and Endeavour; by John Hawkesworth, L.L.D. 3 vols. 4to., Strahan and Cadell, London, 1773.
- Relacion del Último Viage al Estrecho de Magallanes de la fragata de S. M. Santa Maria de la Cabeza en los Años de 1785 y 1786, &c. 4to., Madrid, 1788.
- Descripcion Historial de la Provincia y Archipiélago de Chiloe por el Padre Fray Pedro Gonsalez de Agueros, 1791.
- Apendice a la relacion del Viage al Magallanes de la fragata de guerra Santa Maria de la Cabeza que contiene el de los Paquebotes Santa Casilda y Santa Eulalia para completar el Reconocimiento del Estrecho en los Años 1788 y 1789. 4to., Madrid, 1793.

## SECTION I.

1

## Coast of PATAGONIA, from Port ST. ELENA to Cape VIRGINS.

[In the following Directions all the Bearings, which are not otherwise distinguished, are corrected for Variation. The Latitudes being all South, and the Longitudes West of Greenwich, and the Variation Easterly, the distinguishing letters S. W. and E. have been omitted.]

PORT ST. ELENA.—The plan in the Admiralty Chart, which Port St. Elena. is a copy of the excellent and correct survey by the Officers of the Spanish ships Atrevida and Descubierta, is sufficient for the navigator; there is also a plan in Weddel's Voyage that is equally correct. The harbour may be easily known by some hummocky hills on the north-east projecting point, on the eastern of which is a remarkable stone that appears to have been placed there as a monumental record, but which is a natural production. The best anchorage is at the N. W. corner of the Anchorage. bay, in 6 or 7 fathoms, but not too near to the shore, for when the sea is heavy, the ground-swell breaks for some distance off. In working into the bay the 2 fathom bank must be avoided, for which the low island is a good mark.

The projecting head at the north end of the bay is in	Situation.
Latitude	
Longitude by the mean of 13 chrono-	
meters from Goritti (River Plate) . 65° 17" 25"	
Variation of the compass 19° 10'	
H. W. at full and change 4 o'clock	
rise at springs 17 feet.	

The water that is contained in the wells, the situations of which Bad water. are given from Mr. Weddel's plan, is too brackish to be worth consideration; nor is there any fresh water to be obtained from any Port St. Elenn. part of the harbour. Of fuel, a temporary supply may be procured from the small shrubby tree that is described in the account of Port Desire (see page 6), which is tolerably abundant here. Guanacoes, ostriches, armadillos, and the cavia, or Patagonian Refreshments. hare, are to be procured, as are also wild ducks, partridges, snipes, and rails; but fish seem to be scarce. The guanaco affords an excellent food, but it is difficult to approach them : one that was shot by us, when cleaned and skinned, weighed one hundred and sixty-eight pounds. The Indians sometimes visit this part of the coast, which is used by them principally for burying their dead.

In approaching Port St. Elena from the northward, there are Reef of Cope several rocks near the shore which are very little above the water, and there is a considerable reef in the offing, situated four miles and a quarter S. 78° E. from Cape Raso, and N. 51° E. eight miles from the N. E. trend of the north head of the port. It is a dry rock, and is near the extremity of a ridge which probably projects off from the latter point, for there are two dry rocks in the same line of bearing, one a mile and a half, and the other three miles and one-third from the point, besides several patches which break. The tide sets rather strong along the shore, which is fronted by reefs for two or three miles off; great caution should therefore be used in approaching the coast, as the water is deep, and if becalmed it may be necessary to anchor, which will be in at least 30 fathoms water.

> Should the above reef be as continuous as it appears, there should be good riding in the bay between Cape Raso and Port St. Elena.

Between the south head of Port St. Elena and Cape Two Bays are two bights in the coast, the southernmost of which is considerable, and may probably afford a good anchorage. CAPE Two BAYS is a rounded point; the hill close to the sea on the most projecting part of the cape being in lat. 44° 58'; the small islet of ARCE, to the south-east of the cape, is in lat. 45° 0' 50" and lon. 65° 25' 25'; and RASA ISLAND is in lat. 45° 6' 30', lon. 65° 20′ 11″.

The coast trends westerly round Cape Two Bays and forms the northern part of ST. GEORGE'S GULF.

Cape Two Bays.

Raso.

The southern limit of St. George's gulf, CAPE THREE POINTS, Capes Three Points and is very easily discovered at sea by its very level outline, being a Blanco. long range of table land higher than any part near it, visible from the deck for more than twenty miles; and to the south-east, detached, but near the range, there is a conical hill, which is easily discerned from the northward, but from the north-east is not seen, being concealed by the ranges of land behind it in the south-west. At six miles and a half to the south-east of Cape Three Points is CAPE BLANCO, a low rugged tongue of land, terminated by a rounded but very rugged hillock and two smaller ones; which, when first seen, appear to be islands detached from the coast. The neck of land which forms the communication with the coast is low and sandy, and probably offers, on its south side, shelter from southerly winds.

There are several shoals off this part of the coast, that at low shoals off Cape water would doubtless be dangerous. His Majesty's Ship Adventure passed over two, and had not less than 5 fathoms, but possibly at low water the depth may be considerably less; they are thrown up by the force of the tide, which sweeps round the cape, into and out of St. George's gulf, with great strength.

The north and south ends of the northern shoal bear respectively from Cape Three Points and Cape Blanco east, distant from the former seven miles, and from the latter five miles, consequently it extends in a N. by W. and S. by E. direction for 51 miles; it is scarcely a quarter of a mile wide.

The north end of the southernshoal bears S. 75° E., seven miles from Cape Blanco, and extends in nearly a south direction for two miles. Between these shoals there is a passage two miles wide, and the depth gradually increases to more than 15 fathoms.

Within the outer shoals are two others seen by the Spanjards : they are laid down from the authority of a chart communicated to me by Don Felipe Bauza. The outer northern shoal is probably the one noticed by Commodore Byron, who described it to bear from Cape Blanco W. S. W. J S. 4 leagues, the depth diminishing, as he approached it from the eastward, from 13 to 7 fathoms.\* There is, however, much shoal ground to the north east; for in the year 1829, having approached the land, and being

• Hawke-worth, i. 13.

Bianco.

#### PATAGONIA-EAST COAST.

Shoals off Cape Blanco, fourteen miles from Cape Three Points, bearing S. 38° W. mag. the depth rather suddenly decreased from 40 to 14 fathoms, pebbly bottom, so that the foul-ground extends for fourteen or fifteen miles to the north-east of the cape, the edge of the bank (14 fathoms) being about eight or ten miles within the soundings of 50 fathoms. On approaching it, the quality of the bottom becomes irregular, and changes from oaze to sand, and the shoal patches are pebbly; so that by attention to the soundings and nature of the bottom, these shoals may be easily avoided.

A good mark to avoid them is, not to approach so near to the cape as to see the rugged hillock of Cape Blanco, and to keep the high land of Cape Three Points, which is visible from the deck about twenty miles, on the horizon.

The flood or northerly tide ceased in the offing at  $4^{h}$  15' after the moon's passage, which agrees very well with the establishment of the tide off Penguin Island; but in the neighbourhood of the cape and among the shoals, the tides may be less regular; they produce strong ripplings, and set with considerable strength.

Supposed error in the chart.

Tides.

There is reason to think that the two capes are laid down erroneously in latitude, and that the distance between them should be greater; for by a latitude observed at sea, compared with good bearings of the two capes, the error of the chart would be seven miles too southerly. We had no good opportunity of investigating this point, and the situation assigned to them is taken from the chart communicated to me by Don Felipe Bauza, above referred to.

Coast between Cape Blanco and Port Desire.

The coast line between Cape Blanco and Port Desire has been imperfectly seen; within the distance of three to five miles from the shore, however, there are several small patches of rock, which uncover at half tide, but beyond that belt the coast is free from any known danger, and may be approached by sounding in not less than 14 or 15 fathoms: within that limit the ground is foul. To the northward of Port Desire the land is low, with a shingle beach, excepting for the first three miles, where it is high and cliffy. The north point of entrance of the bay is a steep bluff, which is remarkable in being the only point of that description along the coast to the northward. At three miles N. 28° E. mag.

4

from this bluff there is a ledge of rocks (Surrel's Ledge), a Surrel's Ledge quarter of a mile without which the depth is 13 fathoms. The Tower rock becomes visible after passing this ledge; it opens out when the north bluff bears S. 50° W. mag. A ship bound to Port Desire, or merely wishing to anchor in the bay which fronts it, may procure a good berth in 63 fathoms, at low water, well sheltered from N. 3 W. to S. 50° E. mag. with the

North bluff bearing	<b>r</b>	•	•	N. 48° W.		
Tower rock	•	•	•	N. 82‡ W.	Magne!ic.	Anchorage off Port Desire.
Penguin Island	•	•		S. 50 <sup>1</sup> / <sub>2</sub> W.	)	

This situation being a little to the southward of the fair way of the port, and about one mile and a half from the nearest shore, is quite out of the strength of the tide; the bottom, being strewed with rounded stones, is rather foul for hemp cables, but the holding ground, although of such suspicious quality, seemed to be good; at this place the tide rose from 61 to 91 fathoms, a difference of 161 feet.

PORT DESIRE.—The river of Port Desire has rather a difficult Port Desire entrance, from the strength of the tide and its narrow width, and it is rendered still more confined from several rocky reefs that extend off the north shore to nearly mid-channel. There is good anchorage off the mouth. By waiting, therefore, for low water, all the dangers that exist will be seen, and the vessel easily Directions for dropt in with the tide, should the wind be, as it generally is, westerly. If it be fair, it is advisable for the ship to be in the entrance at slack water; or, if the breeze be strong enough, a little before : as the water is deep on the south shore, there seems to be no real danger that may not be avoided by a careful look out for kelp, which always grows upon, and therefore plainly indicates the existence of rocky ground. The course in is about S. 76° W. mag., and the distance from the entrance to the anchorage is one mile and a half. The anchorage is off the ruins\* Anchorage. on the north shore, and the vessel should be moored: the tide sets in and out regularly.

· Some years since a Spanish colony was founded at Port Desire, but not answering the purpose it was soon afterwards given up. The ruins of the edifices, which are of stone, and the remains of a fruit garden, that at our visit produced quinces and cherries, distinctly point out the spot.

River.

entering.

### PATAGONIA-EAST COAST.

The river was examined for sixteen miles, but is probably Port Desire River. navigable to a much greater distance. Four miles above the ruins there is a small peninsula, connected by a narrow isthmus to the north shore ; by sending a party up, and stationing men with guns on the isthmus, it is very likely that several guanacoes may Refreshments. be shot as they are driven across it; for the peninsula is their favourite place to feed upon. These animals are very abundant, but unless stratagem be used, they are very difficult, from their shyness, to be approached. There are some water holes near the ruins, which Wood and water. generally contain water, but of so brackish a quality as scarcely to be worth notice. The wood, although of very small size, burns well, and is much prized by sealers for that quality; it is a low, shrubby tree, bearing a yellow flower, with a prickle at the extremity of every leaf. The sealers call it piccolo, from the small dimensions of the stem. The roots also are dug up and used for fuel.

Penguin Island

very close without danger, for the tide rather sets off than towards  $T_{ides.}$  the shore. The tide is very rapid, and forms, even in a calm, strong ripplings, which in a breeze must be very dangerous for boats to pass through, and, indeed, not agreeable for vessels of any size. The flood sets to the northward, and during its strength at more than three knots; for we found the ebb to have set us fifteen miles to the south in five hours. Off the island the high water, or the termination of the northerly stream, takes place at about 4<sup>h</sup> or 4<sup>h</sup> 15' after the moon's passage; which is 3½ or 4 hours at least after it is high water at the shore.

The outer side of PENGUIN ISLAND is bold, and may be passed

Sea Bear Bay. SEA BEAR BAY,—is one of the best anchorages that I know of on the coast, but is difficult of access, without a leading and a fresh wind, on account of the strength of the tides, which set to the northward through the narrow channels separating the rocky islets that are strewed between Penguin Island and the main land. The bottom, besides, is not only deep, 23 to 30 fathoms, but is very foul and rocky; and although a ship may be prevented from drifting through by dropping an anchor, yet its loss, from the foulness of the ground, would be almost certain. Direction for entering.

6

without it; but as the sea always breaks upon it, the eye and a Sea Bear Bay. due consideration of the tide are the best guides. This reef extends for some distance to the eastward of the breakers, and therefore the tides, when within it, sets in or out of the bay, but with little strength. Should a ship not be able to enter the bay. there is anchorage off the point between it and the reef, on, I believe, tolerably clean ground. You will have 12 or 13 fathoms off the reef; then the depth shoals for one or two heaves to 7 fathoms, after which it deepens again : you may then haul across the bay, and anchor at about a quarter of a mile within the low Anchorage. rocky point, bearing E. 1 N. or E. by N. by compass, in 4 fathoms low water, avoiding the kelp which projects off from the sandy beaches; this is, however, sufficiently distinct, and for further directions the plan will be the best guide. A small vessel may easily turn in, but I should hesitate taking such a step in one that I could not make quite certain of. When once in, the anchorage is good, and protected at all points, except between N. 41° and N. 78° & E., but from the appearance of the beaches I do not think a heavy sea is ever thrown into it. There is no Wood and wood to be procured of any size, and the few gallons of water, that water. are collected in the wells at the point, so very precarious as to be scarcely worth attention. The passage to the watering holes is over a small rocky bar, which a boat may cross at 3 flood ; it is immediately within the eastern point of the bay : there is a small spring at the north end of the third sandy beach, which a herd of guanacoes was observed to visit every morning, but as the water only trickles down in a very small quantity, it cannot afford more than a temporary supply. Two of the three wells at the point we found to be full of sea water, which had breached over the rocks; the other contained about forty gallons of rather a brackish taste. Besides a good and secure auchorage, this place affords no other advantages; it is convenient for sealing vessels to anchor in whilst employed in their occupation upon Penguin Island.

Sca Bear Bay is in latitude 47° 56' 49", and longitude 65° 44' 00"; Situation, variation 20°; high water at full and change 12<sup>h</sup> 45', and the tide variation, and rises 20 feet.

SPIRINGS BAY is contained between the south head of Sea Bear Spirings Bay. Bay and the point within the Shag Rock ; it forms a considerable

Spirings Bay. bight, but is much exposed, being quite open to the south and cast, and at the conclusion of a south-west gale, when the wind always veers to south and south by east, there is a considerable sea. The shore is skirted for some distance off with many rocks, and the bay altogether is quite unfit for anchorage. The land is of the same height as about Sea Bear Bay, but has more lumps or nodules of rocky hills visible on the outline of its summit.

Off this bay, in the old chart, is laid down a rock called the Eddystone: it would seem that this rock and the Bellaco Rock, discovered by Nodales in 1619, is the same danger; but the whole coast between Cape Blanco and Port St. Julian is much strewed with shoals, which are the more dangerous from the strength of the tides which set between them. In navigating upon this part of the coast, the depth and quality of the soundings is a good guide, and, as a general rule, when the depth is more than 40 fathoms, there exists no *known* danger.

In directing the ship's course by night near this coast, regard should be paid to the tide, which sets with considerable strength, the current running parallel with the shore.

The SHAG ROCK is a whitish mass of rock, perfectly bare, lying about one mile and a half off shore; two miles to the south of it are four small dark coloured rocks; and at three miles S. S. W. from it, there is rather a large rocky islet.

On the land, and at a short distance from the coast, are three hills, which appear, when a little to the southward of Sea Bear Bay, like three round-topped hills, but on reaching more to the southward they extend in length and form into two hills, and, at three leagues to the south of the Shag rock, they appear to form one mass of table land. WATCHMAN'S CAPE is very low, and may be distinguished by its bell-shaped mount : at two leagues from the point is a shoal with kelp upon it, on which the least water is 3 fathoms, but on approaching it the depth gradually deercases : there are also many other shoal patches, but all are buoyed with sea weed ; the ship passed between several in 7 and 9 fathoms.

The ground is very foul and uneven for more than four miles from Watchman's Cape; here the coast trends round to the westward and becomes higher. Being to the southward of the

Eddystone Rock.

Shag Rock.

Watchman's Cape. cape, there appears a mount about two miles from its extreme Walchman's Cape. point resembling Monte Video, in the River Plate, both in shape and colour, but not quite so high ; it is called MONTE VIDEO, and is in latitude 48° 18' 55', and longitude 66° 18' 00'.

The BELLACO ROCK, or San Estevan's (Stephen's) Shoal, Bellaco Rock. which was discovered by the Nodales in 1619, was searched for in vain in the Descubierta and Atrevida's voyage; but Captain Stokes, in the early part of 1828 on his passage down the coast, found it and had an observation of the sun close to it for the latitude. It is in lat. 48° 30' 50", and lon. 66° 9' 25'. It bears S. 13° E., ten miles and a half from the extremity of Watchman's Cape, and S. E. mag. from Monte Video. The rock is a dark mass, about 9 or 10 feet above the water at high tide, and has the appearance of a boat turned bottom up: within half a mile of its south side the Beagle sounded in 12 and 15 fathoms, rocky bottom, and on its cast side, at the same distance, the depth is from 20 to 24 fathoms. The ground around it being foul and uneven, the coast in its neighbourhood should be avoided. Between Watchman's Cape and Port St. Julian the land is of moderate height.

WOOD'S MOUNT is visible from the deck for at least eleven leagues, and is a good mark for PORT ST. JULIAN, being flat- PortSt. Julian. topped and much more elevated than the land about it; the trend of the coast may also be a good mark; but as the land about Port St. Julian is higher than to the southward or northward, and Wood's Mount is so remarkable a feature, no mistake can be made. In a line with the south point of entrance the mount bears N. 86°  $\frac{1}{2}$  W. (W. 16° ½ S. maq.) The north head, Cape Curioso, is a low point jutting out to the northward, formed of cliffs horizontally stratified, of which the upper part is white-brown, and the lower generally black, or with black streaks.

Keeping Wood's Mount bearing S. 67° W. by compass will lead you to the south head; which will be easily distinguished when at the distance of six or eight miles, or more, according to the state of the weather.

The land to the southward of Port St. Julian is uniform, flat, and low; it is covered by scrubby bushes, and fronted by a shingle

#### PATAGONIA-BAST COAST.

Goast near Port St. Julian.

beach. At ten or twelve miles south of it, coming from the E.S.E., a small flat-topped hill is seen over the low coast hills.

In lat. 49° 27', the character of the coast changes entirely to a range of steep white clay cliffs, the average height of which was calculated, by angular measurement, to be about three hundred or three hundred and thirty feet. They rise like a wall from the sea, which, at high water, nearly washes their base; but at low water they are fronted by a considerable extent of beach, partly of shingle and partly of mud. Some short rocky ledges, which break at half tide, lie off certain parts of this range, but none of the ledges extend for more than a mile from the shore. This cliffy range occasionally forms projections, but so slight as not to be perceived when passing abreast of them.

Anchorage off the coast.

Anchorages along the coast may be taken up, with the wind off shore, at from a mile to two miles from the beach, in from 9 to 12 and 14 fathoms, oazy bottom. In lat. 49° 55' the range of steep white cliffs begins gradually to diminish in height, and terminates, at nine miles farther to the southward, in a low point, forming the northern side of the entrance of Santa Cruz river. It is called in the chart North Point, and is in lat. 50° 5' 20', and 68° 3'.

Santa Cruz.

SANTA CRUZ.—The appearance of the coast about the entrance of the river of Santa Cruz is very remarkable, and easy to be known, from the manner in which it makes when seen from the northward; and is even more conspicuous when seen from the southward. From the latter direction a coast line of cliffs and downs of considerable height is seen extending to the southward of the entrance as far as the eye can reach, and terminating abruptly to the northward in a high, steep, flat-topped cliff, MOUNT ENTRANCE, of which the upper part descends vertically, the lower slopes off, and appears to be united with some very low land, which will be seen extending (according to the distance off) two or three points of the compass to the northward of it. Mount Entrance is at the south entrance of the river, and is, by angular measurement, three hundred and fifty-six feet high; the low land is on the northern side of the entrance of the river.

The outer part of the bar, on which at low tide there is

fourteen feet water, is nearly four miles S. 63° J E. from Mount Santa Cruz Bar. Entrance, and nine miles from North Point, bearing N. 54° E.

Fourteen miles up the river, on the south bank, is WEDDEL'S Directions BLUFF, a conspicuous headland; and eleven miles farther is another called BEAGLE BLUFF. Weddel's Bluff, open of the south entrance (and in a line with the centre of Sea Lion Island), bearing N. W. by W. 1 W.\* by compass, is the leading mark for the passage over the bar : with this mark on, and at high water, the Beagle crossed the bar in 71 fathoms+; the Beagle Bluff, a little open of the low points of the north side of the river, is also a leading mark to cross the bar.

After passing the bar, which is about a mile broad, there is no impediment to a free course up the river, keeping midway between the narrow points of entrance, until reaching the shoals which project off the east point of Sea Lion Island. The best anchorage seems to be that occupied by the Beagle, on the south side of Sea Lion Island, where the water is shoaler, and the tide not so strong. The plan precludes the necessity of any further notice of the harbour.

At Weddel's Bluff the river divides into two arms; the northern Description of one, which trends under the east fall of Beagle Bluff, was the Rivers. examined by Captain Stokes for twelve miles above its commencement, where it ceased to be navigable, even at high water. Its bed was divided by banks of sand into several little fordable streams, preserving, as far as the inequalities of the land would permit the eye to follow their course, a mean N. W. by N. direction. The stream at this part was quite fresh, but still subject to the regular ebb and flow. On the boat's return she was left dry for six hours, in the middle of the channel, about two miles above Beagle Bluff. At half tide the boats took in their water at this place.

The shore on the south-west side is a range of clay cliffs, of the average height of two hundred and fifty feet, with grassy downs, and intersected with vallies and ravines. On the eastern

- This is the bearing given by Weddel in his account of Santa Cruz.
- + The rise of the tide is considerable; in going out, after crossing the bar, the Beagle anchored, and at low tide the water had fallen twenty-fix feet.

for crossing it.

Description of the Rivers of Santa Ciuz. side, the land, for the most part, is low and level, with a shingle beach; the aspect of the country is dreary, the soil gravelly, and the vegetation scanty, the largest production of that nature being bushes bearing berries, none of which exceed seven or eight feet in height. Many brant geese and ducks were seen, as well as the common sea fowl of these parts, such as penguins, corvorants, gulls, ducks and divers; several ostriches also made their appearance on the beach, and traces of guanacoes were observed.

The south-western arm, which is the most considerable one of the two, was examined for thirty-three miles. It was supposed by Weddel to be of such considerable size and interesting appearance as to be likely to communicate with some branch from the Strait of Magalhaens. The first reach of the arm runs S. W. by W. six miles, with a mean breadth of two miles and a half. one league and a half up, the boat, being anchored for the night in mid-channel in twelve feet, was left dry at low water. At the place of the first observation, on the north side, in lat. 49° 57', and lon. 68° 53', the influence of the tides had altogether ceased, and the water was quite fresh. The stream ran beautifully clear and pure, with the velocity of at least five miles an hour, over a bed of pebbles mixed with dark sand; its mean breadth being three quarters of a mile, and depth in mid channel eight feet. It runs between two nearly parallel ranges of hills, about four miles asunder; beyond this the reaches are short, seldom more than two miles long, forming tortuous courses between S. S. E. and W. by S. The wind blew directly down, and the rapidity of the stream was so great that the boat was obliged to be tracked up the river.\*

By the plan, the examination terminated in lat.  $50^{\circ}$  9', lon.  $69^{\circ}$  21', which is forty-five miles in a due west direction from its mouth, but by the course of the stream fifty-three miles.

Anchorage off the Bar. At an anchorage outside the bar, Mount Entrance bearing N. 82' W. five miles off, and Weddel's Bluff N. 65° W., the Beagle rode out a gale from the S. S. W. and South with a heavy sea without driving. The soundings that are marked in

• The above descriptions of Santa Cruz and the river is taken from the late Commander Stokes's MS. Journal the chart, outside the bar, were taken at low water, whilst the ship Santa Cruz. occupied the above anchorage.

The tides in the offing were observed to flow very regularly six Tides. hours each way, but to turn two hours later than the time of high water in shore. The flood, as before, was observed to run to the northward.

The coast to the south of the river is bounded by a ledge of rocks, which are either dry at half tide, or are then shown by a line of breakers: they extend as far off as three miles. On one occasion the Bcagle anchored among them, and had some difficulty, and not a little risk, in escaping.

Between Coy Inlet and Santa Cruz the coast trends slightly in, and is formed by a succession of cliffs and intervening low beaches. Coy Inlet is conspicuous, as it is the only part of the coast that has the appearance of an inlet between Santa Cruz and Cape Fairweather.

When within seven miles of its latitude ( $50^{\circ}$  57'), as well to the northward as to the southward of it, a ship should keep at the distance of four or five miles off the coast. There can be no inducement to go nearer, as it affords neither fuel nor water; and if incautiously approached much trouble and even danger may ensue, from the ledges of rocks, which project at least three miles, and perhaps more, from the coast.

COV INLET.—There is no account either of Coy Inlet or of the Coy Inlet. Gallegos River in Captain Stokes's Journal: what is here given is taken from the chart, and from what oral information I have received.

Coy Inlet is a shoal salt water inlet, terminating at nineteen miles from the entrance, and fronted by a bar of rocks, leaving a passage only of six feet water on their south side; inside there seems to be little more than three feet water, and, in most parts of the inlet, the banks, which are of mud and sand, are dry at low water; it is useless for any other purpose than to afford shelter to a small boat. The southern side of the inlet is cliffy, and at its termination receives the drains of an extensive flat country.

Thence to Cape Fairweather the coast is similar to the northern part, but more free from rocky ledges, and good anchorage may

be had from two to six miles off shore, in from 7 to 12 and 14 Coast between Coy Inlet and fathoms, muddy bottom; the water shoaling gradually to the The beach is of shingle to high water mark, and then of shore. hard clay as far as one hundred feet beyond the low water limit, where a green muddy bottom commences, and the water gradually deepens. The outer edge of the clay is bounded by a ledge of rocks, on which the sea breaks; it extends for some distance parallel with the coast.

> The flood sets to the N. W. by N., and the ebb S. E. by S., six hours each way; high water at full and change between 9 and 10 o'clock, and the tide rises twenty-four feet.

In lat, 51° 16', about seventeen miles north of the cape, there is a ravine containing abundance of fresh water, which may be obtained, when the wind is off shore, without any difficulty; it is standing water, and being much grown over with plants, may not keep, but for a temporary supply it seemed to be very good.

CAPE FAIRWEATHER is the south extremity of the long range of clay cliffs that extends from Coy Inlet, almost, without a break. The cape resembles very much Cape St. Vincent, on the coast of Spain; it also bears a very great resemblance to Cape Virgins, for which it has frequently been taken, notwithstanding there is more than forty-five miles difference in the latitude of the two This mistake was made in the Adventure as well as headlands. in the Beagle on our first visit, when, no observation for the latitude having been obtained, we were two days at anchor off it before our error was discovered. A similar error was also made by one of the ships belonging to the fleet under the command of Loyasa, in the year 1525 (see Burney's Collection of Voyages, vol. i. p. 131): and the Nodales, in their description of the coast, warn the navigator from mistaking the one for the other, "y venido de mar en fuera à buscar la tierra, facilmente podian hacer de Rio de Gallegos el Cabo de las Virgines;" (and in making the land Cape Virgins may easily be mistaken for the River Gallegos) .-- Voyage of the Nodales, p. 53.

On the old charts of this part of the coast the shore is described to be formed of chalk hills "like the coast of Kent:" the resemblance, certainly, is very great, but instead of chalk they are of

Tides.

Fresh water.

Cape Fairweather.

Cape Fairweather.

clay. They are from three to four hundred feet high, and Cape Fairare horizontally stratified, the strata running for many miles without interruption.

The interior is formed by open plains of undulating country Description of covered with grass and plants, among which is abundance of wild thyme, but entirely destitute of trees: it abounds with guanacoes, which may be procured by laying in wait at the water holes.

Besides the pond above-mentioned, there is no want for fresh Fresh water. water; it may be seen trickling down the face of the cliffs at short intervals.

The entrance of the RIVER GALLEGOS is formed on the north River Gallegos side by the cliffy land of Cape Fairweather, and on the south by a low shore that is not visible at sea for more than four or five leagues, excepting the hills in the interior, called the FRIARS, the CONVENTS, and NORTH HILL. It is fronted by extensive sand banks, most of which may be crossed at high water, but at half ebb they are almost all dry. The entrance is round Directions for the south extremity of the shoals, which bear from the south trend of the cape S. 43° J E., distant ten miles. The passage in is parallel with the coast to the southward of the entrance, taking care not to open the land to the northward of Cape Fairweather's most eastern trend; which, when in the fair way, should bear N. 40° W. mag. The shore on the larboard hand must then be gradually approached, and, in the present state of the knowledge we possess, the ship should be anchored to await low water, in 10 fathoms, at a mile and a half from the shore, so soon as the south point begins to be observed to trend round to the westward; the anchorage there is good, and well sheltered from the prevailing winds.

By anchoring, the passage in will be easily detected, and may be passed before the shoals are again covered, which will be a good guide: 4 fathoms is the depth at low water in the narrowest part of the channel. Anchorage may be taken up on the south side, Anchorage. for to the northward the banks are extensive.

There is also a middle, and as it appears to be the widest may be the best, channel, for crossing the bar. The outer part was not completely examined ; but, no doubt, there is a sufficient depth of water at three quarters flood for any vessel to pass it.

Country.

entering.

River Gallegos The southern channel, however, is preferable from having the land as a guide.

> The river runs in to the westward for thirty miles, and then winds more southerly between two ranges of hills. Its banks are formed of downs, abounding with guanacoes and ostriches. The water is fresh at twenty-five miles from the mouth. In the entrance the time of high water at full and change is 8<sup>h</sup> 50'; the rise of tide, at the springs, is forty-six feet, and the stream runs as much as five miles an hour.

> From the south entrance of the Gallegos River, the coast, towards Cape Virgins, extends in a more easterly direction than it does to the northward of Cape Fairweather; and, for the first half of the distance, is formed by a low shelving coast, that at a few leagues from the shore is not visible, so that a stranger might readily suppose it to be the entrance of the Strait of Magalhaens. There are, however, some marks by which it may be known, even should the latitude not have been ascertained. In clear weather the Friars and the other hills near them would be visible; and in thick weather the soundings off the cape will be an infallible guide; for at the distance of four miles off no more than 4 fathoms will be found, whereas at that distance from Cape Virgins the depth is considerable: the bottom also to the north of Cape Fairweather is of mud, whilst that to the north of Cape Virgins is of gravel or coarse sand; and the latter cape has a long low point of shingle running off it for nearly five miles to the S. W.: and, lastly, if the weather be clear, the distant land of Tierra del Fuego will be visible to the S. S. W.

> At eighteen miles to the southward of Cape Fairweather the cliffs again commence, and continue to Cape Virgins, with only one or two breaks; in one of which, eight miles north of the latter cape, I think a boat may land, if necessary. There is good anchorage along the whole coast between the Gallegos and Cape Virgins, at from two to five miles off shore: but the bottom is rather stony and might injure hempen cables. As the cape is approached, the ground becomes more foul.

#### PATAGONIA-EAST COAST.

## Of the Winds and Weather, Tides, and Variation of the Compass, between Cape BLANCO and Cape VIRGINS.

Our experience of the wind and weather upon this part of the Wind and coast was not sufficient to enable us to form any judgment of the changes that are liable to occur. The prevailing winds, particularly towards the southern portion, are from the south-west, from which quarter the gales are the strongest; but near the land, during the summer season, they veer about between South and W. N. W.; and in the winter, when the sun has northern declination, they hang more commonly to the northward of west. Northerly winds are accompanied by misty or foggy weather, particularly on that portion of the coast between the Rio de la Plata and Port St. Elena.

The marine barometer here is of signal advantage. It is low Marine with a northerly wind, but as soon as the column has fallen to twentynine inches or lower, and ceases to fall, a change of wind from the S. W. may be expected; which commences with, or very soon follows, the ascent of the mercury; the wind then freshens and blows hard, and the weather clears up. The clouds are white, of large size, and of rounded form, and the air becomes elastic, dry. and cold. During the existence of, and for some days preceding, a northerly wind, there is generally a very copious deposition of dew; indeed, the appearance of it is an infallible presage of the change. With northerly winds the air is mild and excessively damp, but when they blow from the opposite quarter it is cold and dry. The wind rarely blows from east, but sometimes obliquely towards the coast from N. E. or S. S. E.

The FLOOD TIDE sets to the northward, parallel with the coast. Tides. Near Cape Virgins the northerly tide ceases at about four hours before the moon's passage; in the Gallegos River it is high water at full and change at 8<sup>h</sup> 50', and rises forty-six feet: at Cape Fairweather at nine o'clock, and rises twenty-eight feet : at Coy Inlet at between nine and ten o'clock : at Santa Cruz about eleven o'clock, but in the offing two hours later: at Sea Bear Bay 12<sup>h</sup> 45', rising twenty feet: Port Desire 12<sup>h</sup> 10', rise eighteen feet and a half: and at Port St. Elena at four o'clock in

weather.

17

barometer.

#### PATAGONIA-EAST COAST.

the afternoon, the rise seventeen feet. In the offing of Port Desire the tides are three and a half or four hours later than they are in shore, which is probably owing to the eddy tide setting out of St. George's Gulf.

Variation.

The VARIATION of the compass gradually increases from the Rio de la Plata, where it is about  $14^{\circ}$ : in lat.  $36^{\circ}\frac{1}{2}$ , lon.  $55^{\circ}\frac{1}{4}$  it is about  $14^{\circ}\frac{1}{2}$ : in lat.  $41^{\circ}$  and lon.  $60^{\circ}$  it is  $16^{\circ}$ : in lat.  $41^{\circ}\frac{3}{4}$  and lon.  $60^{\circ}\frac{3}{4}$  it is  $17^{\circ}$ : at Port St. Elena  $19^{\circ}$  10': at Port Desire  $19^{\circ}$  42': at Sea Bear Bay 20° 47': at Port St. Julian 22° 18': at Santa Cruz 20° 54': at the River Gallegos 21° 47': and at Cape Virgins it may be considered about  $22^{\circ}\frac{1}{2}$ . At the last place, according to Sir John Narborough,\* the variation in the year 1670 was 17°, and Wallis and Carteret,† in the year 1767, found it 24° 30'; so that it has scarcely altered within the last hundred and sixty years.

Narborough's Voyage, p. 60.

† Hawkesworth, vol. i. p. 410.

## SECTION II.

## Strait of MAGALHAENS-Cape VIRGINS to Port FAMINE.

CAPE VIRGINS, a steep cliff, about three hundred feet high, Cape Virgins. (in lat. 52° 18' 35', and lon. 68° 16' 55',\*) is the southern extremity of the Patagonian coast, and the north entrance of the Strait of Magalhaens. There is an appearance of a reef that may extend off the point for half a mile, but not beyond that distance. The Adventure passed at one mile and a half from it, sounding in 8 fathoms, stones; and then, standing to the south, crossed a bank of gravel, sounding regularly in 7 fathoms, until Dungeness Point bore S. W. by W. by compass, when the water deepened. This bank trends off more to the southward and eastward, but I believe its termination is at five miles S. 87° E. from the extremity of Dungeness.

I do not imagine that any part of it is shoal enough to endanger a ship, but near its extremity there are some overfalls, among which the least depth that we found was 5 fathoms at low water.

In rounding Cape Virgins, unless the wind be easterly or southerly, I should recommend a ship to pass within one mile and a half of the cape, and steer S. by E. by compass until Dungeness bears S. W. mag.; then to edge away round the latter point, and afterwards the coast is clear to Cape Possession. In moderate weather ships may anchor any where between Dungeness and Cape Possession. The bottom is of good holding ground, and quite clean. At from three to five miles from the coast, the depth will be from 15 to 20 fathoms.

We know nothing of the Fuegian shore, or south side of the

• By chronometrical observation 68° 17' 46',

Anchorage:

19

entrance. The Beagle, in beating in, made a board for 8 miles to the southward of Dungeness, and had 40 fathoms; but I believe the coast to be of shoal approach, and to be lined by a bank that is connected to the extensive reefs which project from Cape Orange.

Cape Posses-

CAPE POSSESSION is a cliffy headland on the north shore, and will be seen opening round Dungeness, on the magnetic bearing of S. 86° 30' W.; the distance between them is twenty miles: at ten or twelve miles to the west of Dungeness, Mount Aymond will make its appearance, bearing about N. 85° W. mag.

Possession BAY, which extends from Cape Possession to the entrance of the First Narrow, curves in to the northward round the cape and is fronted by an extensive shoal, stretching off for more than four miles from the shore, many parts of which are dry at half tide; on its south side the depth diminishes gradually, and offers good anchorage for vessels entering the strait to await the tide for passing the First Narrow.

On the western side of the bay, there are some remarkable hills of a darker green hue than others near them ; I have called them the DIRECTION HILLS; because, after passing Cape Possession, they afford a good mark for approaching the Narrows, which are not visible until well across the bay; by attention also to their bearings, the shoal that extends off Cape Orange may be avoided. To take up an anchorage on the bank, great attention must be paid to the soundings, which at the edge decrease suddenly; it would not be advisable to anchor in less than 10 or 12 fathoms at high water, for the tide falls 6 or 7 fathoms; but as the stream runs much weaker on approaching the edge of the bank, the nearer to it the better. A good berth for anchoring is to get the northern Direction Hill (which is dark coloured and very conspicuous) to bear S. 56° W., Mount Aymond N. 45° to 50° W., and the highest (easternmost) peaked hillock upon Cape Orange about S.S. E. (compass bearings). When the hill above noticed bears S. 56° W., and Mount Aymond between N. 50° and 60° W.,\* you are in 19 or 20 fathoms, just off the edge of the bank; about half to one mile more to the northward, or north-

Possession Bay.

Direction Hills.

Anchorage.

westward, good anchorage may be selected out of the strength of the tide.

There is, however, a more advanced situation about half a mile to the eastward of the end of the shoal, that may easily be taken up; namely, that where 14 fathoms is marked on the plan, for which the following are the bearings—the

Northern Direction Hill	•		S. 59º W. J	
Mount Aymond	•	•	N. 43• W.	Mag.
Peak of Cape Orange .	•	•	S. 22° E.	

One mile more in advance to the S. W. would still be a better berth, but great care must be taken not to ground on the tail of the shoal. At about half a mile more to the eastward, the situation would be more secure.

Should the distant land behind Cape Gregory be seen, which Marks for makes with a long blue level strip of land, terminating at its S. W. end with rather a bluff or precipitous fall, it is a good mark for the above anchorage. The fall, or extremity, should be visible in the space between the southernmost and central of the Direction Hills. There is also a conspicuous lump on the same land, which will be seen to the northward of the northern Direction Hill; and the Asses Ears, nearly out of sight, should be seen a little to the eastward of that part of the shore of Possession Bay where the cliffy coast commences.

Another mark for the approach to the bank, which is very good when Mount Aymond bears more westerly than N. 43° W. mag., is, not to lose sight of the Asses Ears. At our anchorage in 6 fathoms, near the dry part of the bank, they were lost sight of by a rise in the land; half a mile to the southward, at the anchorage marked 11 fathoms, one of them reappeared above the land; Mount Aymond at the same time bearing by compass N 41° W. mag. But this rule fails to the westward, or nearer the Narrow, for the bank then trends more southerly, and the Asses Ears are visible at its edge; the west limit of this rule is, as before noticed, when Mount Aymond bears about N. 43° W. mag. There is, also, another remark worth attending to; which is, that, after passing Cape Possession, Mount Aymond assumes the appearance of a round obtusely-peaked hill, with a smaller clevation on each edge of its outline; which appearance is preserved until it bears

e

N. 50° W. mag., and then the easternmost of the minor elevations gradually disappears, while the western one becomes more conspicuous.

Reef off Cape Orange.

To avoid the north shoals, do not get the North Direction Hill to bear more southerly than S. 56° W. mag.; and the mark for avoiding the reefs that extend off CAPE ORANGE, is not to get the same Direction Hill to bear more westerly than W. by S. 1 S. mag. (for W. by S. 1 S. will just pass without the edge) until Mount Aymond bears N. 48° W. maq., or the peak of Cape Orange South mag., when the fair way of the First Narrow will be open, bearing S. W. by S. mag. The north or northwestern side of the First Narrow, is a cliff, of moderate height, and makes like a flat table land. When abreast of Cape Orange, a S. S. W. mag. course must be steered. The tide sets right through; so that in drifting, which with the wind against the tide is the safest and best plan, there is no danger of being thrown upon the shoals.

First Narrow.

The FIRST NARROW was called by Sarmiento, Angostura de Nuestra Señora de Esperanza. He describes it very correctly to be three leagues long, and less than half a league wide, with cliffy shores; the tide running strong; the depth more than 50 fathoms sand and pebbles (callao); and on the north shore there is a beach of shingle.\* In this part, however, as discretion must be the best guide, it will be necessary merely to state the dangers that exist. To Point Deigada the north of POINT DELGADA (meaning thin or slender) the shore is fronted by extensive shoals that dry at half tide, and which, being dry when Sarmiento passed, was called by him POINT ANEGADA (drowned land); these should not be approached. The south shore also, for nearly five miles to the west of Cape Orange, has a shoal off it, but it does not extend to a great distance from the beach; beyond this it is not safe to approach either shore within half a mile, for each is fronted by a bank that dries at low water. The western end of the Narrow on the north shore, Sarmiento's POINT BARRANCA (meaning a cliff) has a considérable reef off it, upon Point Barranca. which there is a very large quantity of kelp.

Directions.

After emerging from the Narrow, the ship should be allowed

Sarmiento, p. 272.

22

to drift with the tide, the course of which is S. S. W., for at least three miles, before hauling up for Cape Gregory, in order to avoid the ripplings which rage furiously on each edge of the bank. I have passed twice through them for the sake of proving the depth. and once anchored within them, which gave me an opportunity Rise and fall of of ascertaining the rise and fall of the tide : but it only altered twelve feet: the stream or current, however, set at three and four knots the whole tide, and there was scarcely five minutes slack water. It is an anchorage that ought not to be taken up without the greatest necessity, for the ripplings break over the deck, and the security of the vessel is very doubtful.

Point Barranca is a flat-topped sand hill, the position of which being given in the chart, its bearing will indicate the situation of the ship: the point on the opposite side Sarmiento called POINT BAXA (low).\*

After reaching thus far, steer W. S. W. by compass, until Anchorage. abreast of some remarkable peaked hillocks on the north shore; where, if necessary, anchorage may be had out of the tide, in from 6 to 10 fathoms; at any part of the northern side of the bay the anchorage is good, upon a clay bottom covered with broken shells: the lead brings up nothing but shells, underneath, however, it is of clay and good holding ground.

It is best to anchor near the shore on account of the tide, which ripples very much all over the centre of the bay.

The peaked hillock above mentioned is certainly Sarmiento's Point Nuestra Señora del Valle; to the eastward of it is St. Jago Bay; and to the westward his Bay of the Eleven Thousand Virgins.+ When abreast of the point, the land and bay to the north of CAPE GREGORY will be easily distinguished; the former Cape Gregory. will be seen first, and resembles an island; for the land of the bay is flat and low: but a very conspicuous hummock will also be seen half way between it and the flat table land, as soon as the land of the cape becomes visible. The hummock is marked on the chart.

The extremity of Cape Gregory bears from the western end of the First Narrow, S. 73° W. (S. 50° 1 W. mag.), distant twenty-

+ Ibid, 968.

the tide.

Anchorage under Cape Gregory. two miles. The anchorage is from two to two miles and a half to the N. N. E. of the cape, abreast of the north end of the sand hills that form the headland, and at about one mile from the shore, in from 13 to 15 fathoms. The bottom is excellent, a soft but tenacious mud, which, nearer the shore, is of a stiffer quality. At low water a sand spit extends off for one-third or nearly half a mile from the shore; close to which there is 7 fathoms water. Care should be taken not to approach too near.

At the anchorage the tide turns to the south-westward, towards the cape, for two and a half or three hours before it begins to run to the westward in the Second Narrow; which should be attended to, for a ship will lose much ground by weighing before an hour or more after the tide has turned.

Situation.

Upon the summit of the land of the cape, four-fifths of a mile to the northward of the extreme point, is a remarkable bush; close to which the observations were made. The bush is in lat.  $52^{\circ} 38' 3"$  S. and lon.  $70^{\circ} 9' 51"$  W. The variation of the compass  $23^{\circ} 34'$  E.

The country abounds with guanacoes and ostriches, and the valley, two miles to the westward of the cape, is frequently the abode of the Patagonian Indians; but their principal residence is upon the low land at the back of Peckett's Harbour and Quoin Hill, where guanacoes are more abundant, and the country more open. Ships coming from the southward also are seen by them at a great distance, so that by the time she reaches Cape Gregory they have already arrived to meet her. They do not, however, see ships coming from the eastward so easily, and we were, on two occasions, two or three days at the anchorage before it was known that we were present.

They are very friendly, and will supply guanaco meat at a small price. They are fond of beads and ornaments, but particularly of knives, and the larger they are the better. Swords are held in high estimation by them, as well as lead for the purpose of arming their *bolas*, an instrument used to entangle the legs of the guanacoes and ostriches.

They also barter their mantles and skins; and are fond of sugar, flour, matté (the Paraguay tea), tobacco, and horse gear, particularly bits. For spirits they are very eager, but are contented

with it in a diluted state. At our last interview they asked for muskets, powder, and ball; the use of which they have learned from two Portuguese seamen, who left an English sealing vessel to reside with them; but these were not given, and it is to be hoped that such weapons will not be put into their hands.

The SECOND NARROW is about ten miles long; and, with a Second Narfavourable tide, which runs five or six knots, is very quickly passed. With an adverse wind a ship will easily reach an anchorage to the north of Elizabeth Island.

The north side of the Second Narrow is very shoal, and ought not to be approached, for the ground is also very foul.\* There are two or three very inviting bights for a ship that is caught with the tide, but it is not advisable to anchor in them: she should rather return to the anchorage off Cape Gregory.

SUSANNAH COVE is where Sarmiento anchored in 8 fathoms. Susannah Cove low water, half a league from the land, good bottom; but, as it was exposed to the strength of the tide, he shifted to another anchorage about half a league west of Cape Gregory, where the anchor was dropped in 8 fathoms, but the vessel tailing on the edge of the shoal in 3 fathoms, he was glad to make his escape.+

The south shore of the Second Narrow, which Narborough called the SWEEPSTAKES FORELAND, is composed of cliffs, and Sweepstakes is, I believe, of bold approach. The projecting head in the centre is Sarmiento's St. Simon's Head, t and the western end he named Cape St. Vincent, from its resemblance to that of To the southward of the eastern point of this head, Spain. Point St. Isidro,? which is a low sandy point, is Fish Cove, Fish Cove, where Bulkely and Cummings anchored their boat: and Sarmiento says "We anchored behind a point before noticed, called Santisidro, in a small bay, of low land and sandy beach, in 10

` 🕈 Sarmiento says, " y sea aviso que toda la Bahía que está come dixe desde la Bahía de San Gregorio y Punta de Nuestra Señora-de-Gracia para tierra, es placel de dos hasta quatro brazas. No se arrime á esta Costa el Navío que por aquí embocare, porque correrá riesgo; ántes surja á media canal, ó á la ménos no surja de doce brazas abaxo, porque en siendo en ocho, á un cumplidor de dos bateles dará en tres y en ménos, y de baxa mar quedará en seco."-Sarmiento, p. 260.

row.

Fish Cove. fathoms, at a quarter of a league from the shore, but upon veering cable the vessel was in 7 fathoms; so that fearing she would be left dry, from the great rise and fall of the tides hereabout, we shifted farther out to 15 fathoms, but the anchor dragged, and we subsequently came to in 9 fathoms, sandy bottom; where, at low water, the depth was 6 fathoms."\*

Oazy Harbour.

Three miles to the westward of Cape Gracia, the western end of the Second Narrow on the north side, is OAZY HARBOUR, so called by Narborough: it is a secure place for small vessels. The entrance is nearly two miles long, and too narrow for large ships, unless the weather be moderate, when they might drop in or out with the tide: the depth inside is from 3 to 10 fathoms. There is neither wood nor water to be got, and therefore no inducement to enter it; a plan of it was made. It is described by Sir J. Narborough, and Cordova calls it Bird Bay (Ensenada de los Páxaros).

Narborough's PECKETT'S HARBOUR, or, as Sarmiento called it, St. Bartholomew's Bay, is eight miles to the west of Cape Gracia, and, although very shoal, offers a good shelter, if required, for small vessels; but the space is very confined; the anchorage without is almost as safe, and much more convenient. The distance between the two points of entrance is nearly two miles, but from the north-east shore to the small island off the south-west point, the whole space is a shoal, upon the greater part of which the sea breaks in a moderate breeze.

The entrance is between the south-west point and the island, and is rather more than one-fifth of a mile wide. Half a mile outside, the anchorage is good in 7 fathoms: shoal ground extends for a quarter of a mile off the point.

Bay north of Elizabeth Island. The bay, which is formed by Peckett's Harbour and Elizabeth Island, is extensive and well sheltered, with an easy depth of water all over, between 5 and 7 fathoms; the nature of the bottom is clay, and offers excellent holding ground. In the centre is a patch of kelp; but it is not known whether the depth is shoaler in that part, or whether it proceeds from the bottom being rocky. The tide is not strong to the westward of the north end of

Tides.

Peckett's Harbour.

Elizabeth Island;\* but runs with considerable velocity in the Tides. deep channel between it and the Second Narrow. To the southward of the island the stream divides into two directions, and very soon loses its strength; one sets down the south side of the island, and the other between the islands of Santa Martha and Magdalena. This is the flood; the ebb sets to the northward. The ebb and flow is regular, high water at the full and change being at about twelve o'clock.

There is good anchorage, out of the strength of tide, at a mile to the north of Point San Silvestre ; it is convenient for a ship to leave with the intention of passing round Elizabeth Island. I conceive this to be the most difficult part of the entrance of the Strait of Magalhaens, for the tide sets across the passage with some strength.

The passage to the west of the island is clear, and without Directions, danger, by keeping in the middle part of the channel; but in passing down the south side of Elizabeth Island the shore should be kept close to, to avoid being thrown upon the islands of Santa Martha and Magdalena,+ although I believe there is plenty of water between them, for Sarmiento anchored there in 15 fathoms; t as well as to clear the shoal that extends off the south-west end of the latter island, & upon which we did not find less water than 5 fathoms upon any part; but the ground being irregular, and much kelp strewed about, it is not safe to trust too much to appearances. On all occasions it is advisable to avoid passing Avoid kelv. through kelp, for although it frequently shoots up from 10 and even 20 fathoms, yet wherever the bottom is rocky, there it is to The presence of this vegetable renders the few be found. dangers that exist in the navigation of the strait of little consequence, for it serves as a buoy to mark the existence of them, and it is only by a careless look out that a ship can be placed in a

<sup>\*</sup> Elizabeth Island was so named by Sir Francis Drake. Sarmiento passed its north-east end, and, considering it a part of the Continent, called it Point San Silvestre. (Sarmiento, p. 255.)

<sup>+</sup> The Islands of Santa Martha and Magdalena, so named by Sarmiento (p. 254), have since been called by other names : ] the former St. Bartholomew, the latter St. George's, also Penguin Island. (See Narborough's Voyage, p. 62.)

<sup>1</sup> Sarmiento, p. 254.

<sup>§</sup> Hawkesworth, v. I. p. 382, and Ultimo Viage, Appendice, p. 23.

dangerous situation. Another advantage in kelp is, that by its drift it shews both the direction and velocity of the tide.

Laredo Bay.

LAREDO BAY offers good anchorage in the centre and towards the north side, and particularly in the north-west corner. Off the south point is a large patch of kelp, among which the ground is shoal and foul.

At Laredo Bay wood may be procured, and there is a fresh water lake of a mile in diameter at about half a mile behind the beach, much frequented by wild ducks.

For the purpose of anchorage only, the bay need not be entered; because a very good and secure birth may be found at from one to two miles off it, in 10 to 13 fathoms, having the south-west extremity of Elizabeth Island on with, or a little open of, the trend of Cape Negro, which is Byron's Porpesse Point.\*

We know scarcely any thing of the south side of St. Philip's

Cape St. Vincent to Cape Monmouth.

Opening bebind Sweep-

stakes Fore-

Coast to the south of Cape

land.

Negro.

Bay, or of the coast between Cape St. Vincent and Cape Monmouth. The latter is a lee shore, and should not be approached when the wind is northerly, for there seems to be no harbour or shelter, and the anchorage must be much exposed.

Two deep inlets were seen behind Sweepstakes Foreland, from the summit of the table land near Cape Gregory, one of which may probably insulate it, but this was not ascertained.

Between Cape Negro and Sandy Point, which is Sarmiento's Catalina Bay, + good anchorage may be had, from one to two miles and a half from the shore. Here the country begins to be thickly wooded, and to assume a very picturesque appearance, particularly in the vicinity of Sandy Point.

Sandy Point. 4

SANDY POINT, Sarmiento's Cape de San Antonio de Padua, projects for more than a mile from the line of coast, and should not be passed within a mile. A shoal projects off it in an east direction (mag.): the mark for its south edge is a single tree, on a remarkable clear part of the country (a park like meadow) near the shore on the south side of the point, in a line with a deep ravine in the mountain behind. One mile and a half from the point, we had no bottom with 18 fathoms.

Anchorage.

To the southward of Sandy Point, as far as Point St. Mary,

• Hawkesworth, i. p. 35

+ Sarmiento, p. 255.

good anchorage may be had at three quarters of a mile from the shore, in 11 and 12 fathoms; sand and shells over clay. At the edge of the kelp, which fronts the shore, there is 5 and 6 fathoms; so that, with the wind off shore, a ship may anchor or sail along it very close to the coast, by keeping outside the kelp. The squalls off the squalls off the land are very strong, sometimes so much so as to lay a ship on her broadside. It is not prudent therefore to carry much sail in coasting this part; and it is necessary to have the quarter boats secured with gripes, because the wind, for a moment, blows with the force of a hurricane. These land squalls are denominated by the sealers "williwaws."

POINT ST. MARY, in lat. 53° 21' 40', is twelve miles and a half Point St. Mary. to the south of Sandy Point, and may be known by the land trending in to the southward of it, forming FRESH WATER BAY. Freshwater It has also a high bank close to the beach, with two patches bare of trees, excepting a few dead stumps. All the points to the northward are low and thickly wooded. As the bay opens, the bluff points at its south end become visible. There is also a remarkable round hill a short distance behind the centre of the bay, and a valley to the south of it, through which a river flows and falls into the bay.

It is convenient for wooding at, but from the river being blocked up by much drift timber, watering is difficult; the proximity, however, of Port Famine renders this of no material consequence.

When the wind is from the northward, a swell is thrown into the bay; but no danger need be apprehended from its being open to the eastward, for the wind seldom blows from that quarter, excepting in the winter, and then rarely with great strength. If it does, the holding ground is good, and with good gear there is no danger.

In standing into the bay from the northward, keep within three Directions for quarters to half a mile from the coast, in 10 or 11 fathoms; and, passing Point St. Mary, steer on towards the bluff points at the south end of the bay, until the south pitch of the Centre Mount bears W. S. W., when you will be clear of the kelp that extends off the north side of the bay; among which I believe there is a sufficiency of water, but the ground is foul: round its edge there is 6 and 7 fathoms. Having the mount bearing as above, steer

high land.

Bay.

entering.

#### STRAIT OF MAGALHAENS.

Anchoring.

for it, or a little to the south of it, and anchor in 9 fathoms, sandy mud over clay, which will be with the following bearings:

Point St. Mary	•	N. 15° W.)
Outer trend	•	N. 9° W.
Centre Mount (south pitch)	•	S. 74° $\frac{1}{2}$ W. $\rangle$ Mag.
Entrance of River .	•	S.35° W.
South bluff	•	8. 21° E.

A good berth may be had much nearer the shore in 6 fathoms, towards which the depth gradually decreases. If the anchorage is used merely as a stopping place, the first is best; for the wind near the shore is apt to flaw and veer about,

Between Freshwater Bay and Point Santa Anna the coast is very bold, and so steep too as to offer no anchorage, excepting in the bay that is formed by the reef off ROCKY POINT; but it is small and inconvenient to weigh from, should the wind be southerly.

Should the day be advanced, it is better to anchor in Freshwater Bay than run the risk of being underway all night; unless it be in the summer, with moonlight and the weather likely to be fine; in this climate, however, the latter is very doubtful, for weather changes so suddenly that no dependance can be placed upon appearances.

Point Santa Anna.

Tides.

Rocky Bay.

POINT SANTA ANNA will appear, on standing down near the coast, to be the termination of the land; it is a long point extending into the sea, having at the extremity a clump of trees. It bears from Cape Valentyn S.  $47\frac{1}{2}^{\circ}$  W. mag. On approaching it, the the distant point of Cape St. Isidro will be seen beyond it; but there can be no doubt on mistake in recognising it.

Along the whole extent of the coast, between Point Santa Anna and Elizabeth Island, the flood sets to the southward and the ebb to the northward, and it is high water about 12 o'clock at full and change. The variation is about 23° west. The strength of the tide is not great, but frequently after a southerly wind there is, in the offing, a current to the northward independant of the tide. In winter the tides occasionally rise very high, and on one occasion, in the month of June, nearly overflowed the whole of the low land on the west side.

Port Famine.

PORT FAMINE,-Standing into Port Famine, pass round Point

Santa Anna, if with a leading wind, at one fifth of a mile, in 17 Port Famine. fathoms; but if the wind is scanty, do not get too near on account of the eddy tide, which sometimes sets towards the point. Steer in for the bottom of the bay, for the summit of Mount St. Philip, keeping it over the centre of the depth of the bay; that is, half way between the rivulet (which will be easily distinguished by a small break in the trees) and the N. W. end of the clear bank on the west side of the bay. This bank being clear of trees, and covered with grass, is very conspicuous. Keep on this course until the mouth of Sedger River is open, and upon shutting in the points of its entrance, shorten sail and anchor in 9, 8, or 7 Anchorage. fathoms, as convenient. The best berth, in the summer, is to anchor over towards the west side in 9 fathoms, with Cape Valentyn in a line with Point Santa Anna; but in the winter season with N. E. winds, the best berth is more in the centre of the bay.

The strongest winds are from the S. W. It blows also hard Winds. sometimes from South, and, occasionally, a fresh gale out of the valley, to the south of Mount St. Philip. Unless a long stay be meditated, it would be sufficient to moor with a kedge to the N. E.; the ground is excellent all over the port, being a stiff tenacious clay. Landing may be almost always effected, excepting in easterly gales, on one side or the other. There is fire wood in Wood and abundance on the beaches, and wells, containing excellent fresh water, were dug by us at the N. W. extremity of the clear part of Point Santa Anna, on the bank above the third, or western-most, small shingle bay. The water of the river, as well as of the ponds, of which there are many upon the flat shore of the western side of the port, is very good for present use, but will not keep, in consequence of its flowing through an immense mass of decomposed vegetable matter; but the water of the wells drain through the ground, and not only keeps well, but is remarkably clear and well tasted. Their situation is marked on the plan, and for some time our traces will not fail to show the road.

Our observatory, the situation of which is indicated by the stem Situation, of a tree 16 inches in diameter, placed upright about eight feet under and three above the ground, banked up by a mound, is in lat. 53° 38' 12" and 70° 54'. High-water at full and change

#### STRAIT OF MAGALHAENS.

Famine.

Tides at Port at 12 o'clock; the ebb sets to the northward, and the flood to the southward; but the rise and fall is very irregular, depending entirely upon the prevalence of the winds; northerly and easterly winds causing high tides, and westerly and south-westerly low tides. The variation is about 23° 30'.

Tides from Cape Virgins to Elizabeth Island.

Of the tides in Possession Bay and the First Narrow, we have had too little experience to enable us to give a very clear account. I shall therefore here confine myself merely to such observations as may be of service to the navigator.

To the south-east of Cape Possession it is high water at 4<sup>h</sup> 56' before the moon's passage; but the stream of tide continues to run in until two hours after the water has ceased to rise : the easterly tide commences at 2<sup>h</sup> 56' before the culmination.

The same is the case as far as, and even in, the First Narrow ; excepting in the times. In the centre of Possession Bay, near the bank, it was high water at 3<sup>h</sup> 51' before the moon's passage, and the tide turned to the eastward at noon, or 0<sup>h</sup> 39' after the passage. This observation was made on the day of full moon. The rise was twenty-eight feet, but, at an anchorage more to the westward, near the south-west end of the bank, it rose thirty-five feet, and ran at the rate of six knots and a quarter. In the First Narrow the eastern tide commences at noon (full and change).

At the anchorage in Gregory Bay the easterly tide commenced twenty minutes earlier than in the First Narrow. In the Second Narrow the tides are two and a half or three hours later before they turn (see p. 24). To the westward of the Second Narrow high and low water take place regularly with the set of the tide, and the former occurs, at full and change, within a few minutes of noon. The rise and fall is inconsiderable; the greatest we experienced was eight feet.

## SECTION III.

## Strait of MAGALHAENS - DAWSON Island - ADMIRALTY Sound, the GABRIEL, COCKBURN, and BARBARA Channels.

USELESS BAY was examined in the hope of its communicating Useless Bay. with the supposed St. Sebastian Channel, of the old charts; but it proved to be terminated by low land, reaching, perhaps, across the country towards Cape St. Espiritu Santo. It is more than 30 miles deep and from 12 to 20 wide, and entirely exposed to the S. W. The north shore affords no shelter, but on the south there is an indentation of the coast line under the hill called Nose Peak, that may possibly afford a sheltered anchorage.

The termination of the flat table ridge, extending to the the N. E. from Point Boqueron, a name of Sarmiento's, meaning -an opening, is abrupt and very precipitous.

This country abounds with guanacoes, and the Indians are probably more dependant on hunting than fishing for their subsistence, for we observed their fires upon the hills, at a distance from the coast.

DAWSON ISLAND, which fronts Useless Bay, and the deep in- Dawson let called Admiralty Sound, is forty-six miles long and about twenty broad. Its northern extremity, Cape Valentyn, is low, but becomes visible in passing down the opposite shore, between Sandy Point, and Freshwater Bay. Mount Graves, however. is seen from a much greater distance. On the western side of the Island there are but two places in which vessels can anchor; viz., Lomas Bay and Port San Antonio, but both being on a lee shore, they are not to be recommended. Lomas Bay is a deep

Lomas Bay.

bight, sufficiently sheltered from S. W., but quite exposed to the north-west and westerly winds, which, during the winter, are the most prevalent.

Lieutenant Graves remarks that Lomas Bay, although only tolerably sheltered from the prevailing winds, would, from its extent (six miles deep) and nature of the bottom, a stiff blue clay, afford good shelter for vessels of any draft or burden. The appearance of the shores also seem to favour such an opinion, for scarcely any drift wood was found thrown up, even in those parts which were most exposed to the surf. Wood is sufficiently plentiful and water very abundant. This Bay appears at certain seasons to be much resorted to by the Indians, for upwards of twenty wigwams were seen near the beach.

Between Lomas Bay and Cape St. Valentyn, there is no landing, even for a boat, excepting at Preservation Cave, which affords only just room enough to beach one of small size.

PORT SAN ANTONIO, which is situated about the centre of the west coast, opposite to San Nicholas Bay, has the appearance of being well sheltered, but during a fortnight that we spent there we experienced so much inconvenience, and even risk, from the violence of the squalls, that we were obliged to secure the vessel with three anchors. We also found some difficulty in leaving it, on account of the baffling winds, as well as the narrow width of the passage, for we went out by the north entrance.

This place received the distinguishing epithet of *Port* from Gordova, and is described by him to be three quarters of a mile wide; instead of which, it is scarcely one third of that width, and deserves the name only of a Cove. It is a very unfit place for a ship, or, indeed, for any vessel to enter, especially when there are so many much better places on the opposite or continental shore.

Anchorage.

The anchorage is formed by a channel within the islands, North Island and San Juan Island, in which, particularly at the north end, are several islets. The anchor may be dropped in from 10 to 15 fathoms, off a small beach in Humming-Bird Cove, which is situated on the inner side, and about half a mile from the south end, of San Juan Island. From the west end of North Island a reef extends off for a quarter of a mile, and to the southward are two small islets, which may be passed on either side. Port San North Island is separated from San Juan Island by a narrow and impassable strait.

The south entrance is, perhaps, the best, although with a northerly wind the northern should be preferred. There is no danger but what is evident; the ground, however, is not very clean until you reach Humming-Bird Cove.

The south entrance is tolerably wide: in entering, haul round the south point of San Juan Island, for near the shore of the eastern side there is a rock under water. Opposite to Humming-Bird Cove, in a small bight, there is a stream of fresh water.

PORT VALDEZ is a deep inlet, fronting W. N. W., and not at Port Valdez. all inviting to enter; from the appearance of the hills, squalls must be very frequent, and blow with the greatest violence; for trees are seen torn up by the roots, in long lines, evidently caused by the destructive force of the wind.

The ebb tide sets to the north through the channel.

The GABRIEL CHANNEL separates Dawson Island from the Gabriel Chan-Tierra del Fuego. It is merely a ravine of the slate formation, into which the water has found its way and insulated the island. It extends precisely in the direction of the strata, with almost parallel shores. It is twenty-five miles long and from half a mile to one mile and a half wide; the narrowest part being in the centre. The north shore is a ridge of slate, rising abruptly to a sharp edge, and then as abruptly descending on the opposite side where it forms a valley; which, had it been a little deeper, would, have been filled by water and have become another channel like the Gabriel.

The south side of the Gabriel Channel is formed by a high mass of mountains, probably the most elevated land in the Tierra del Fuego. Among many of its high peaks are two more conspicuous than the rest, MOUNT SARMIENTO, and MOUNT BUCK- Mount Sar. The first is 6,800 feet high, and, rising from a broad miento. LAND. base, terminates in two peaked summits, bearing from each other N. E. and S. W., and are about a quarter of a mile asunder. From the northward it appears very much like the crater of a Volcano; but when viewed from the westward, the two peaks

nel.

Antonio.

35

Mount Sarmiento.

iento. by Sa respec

are in a line, and its volcanic resemblance ceases. It is noticed by Sarmiento as well as by Cordova, in the Journals of their respective voyages. Sarmiento calls it *Volcan nevado* (the Snowy Volcano.\*)

It is the most remarkable mountain in the strait; but, from the state of the climate and its being clothed with perpetual snows, it is almost always enveloped in condensed vapour. During a low temperature, however, particularly with a N. E. or S. E. wind, when the sky is often cloudless, it is exposed to view, and presents a magnificent appearance. From its great height and situation it served our purpose admirably to connect the points of the survey. It was seen, and bearings of it were taken, from the following distant stations, viz. Elizabeth Island, Port Famine, Cape Holland, Port Gallant, and Mount Skyring, at the south entrance of the Barbara Channel.

Mount Buckland. MOUNT BUCKLAND is, by estimation, about 4,000 feet high. It is a pyramidal block of slate, with a sharp pointed apex, and entirely covered with perpetual snow.

Between these mountains the summit of the range is occupied by an extensive glacier; the constant dissolution of which feeds the innumerable cascades that pour large bodies of water down the rocky precipices overhanging the south shore of the Gabriel Channel.

At the extremity of the channel is FITTON HARBOUR; and on the opposite side of Cape Rowlett are Port Cooke and Brookes Harbour.

Port Cooke.

Brookes Harbour.

Admiralty Sound.

**PORT** COOKE is a very convenient and useful port. It is sheltered by a high wooded island. The anchorage is off the rivulet on the west side, in 9 fathoms.

BROOKES HABBOUR, like Fitton Harbour, is spacious, but not good as a port, for the water is deep and the anchorages, being in coves, are not easy of access without the labour of towing.

ADMIRALTY SOUND extends for forty-three miles to the S. E., into the land of Tierra del Fuego. It is seven miles wide at the entrance and gradually diminishes to three. On its north side the shore is very straight, but the south side has two deep inlets,

Amsworth and Parry Harbours. It terminates in a bay; afford- Admiralty Sound. ing anchorage in from 10 to 15 fathoms, but very much exposed to N. W. winds, which, I should think, from the funnel shape of the Sound, would blow with furious strength. On the north side of the bay is Mount Hope, a lofty insulated mass of rock, but to the south of it lies a considerable track of low land: over which the view was unobstructed for a considerable distance and was bounded by a distant mountain, in the direction of the position of Captain Basil Hall's Volcano, in lat. 54° 48', lon. 68° 00'. If the Volcano exists, it is most probably the above Volcano seen mountain, but we saw nothing to indicate the appearance of its by Capt. Hall. being in an eruptive state. It is placed on the Chart from Captain Hall's authority.

In AINSWORTH HARBOUR there is anchorage at the bottom, on Ainsworth the west side. The mountains at the back of the harbour are Harbour. capped by an enormous glacier that descends into the sea.

PARRY HARBOUR is about five miles deep and three wide; at Parry Harbour. the entrance, on the west side, are two coves, either of which offer a convenient stopping place for a small vessel.

The eastern side of DAWSON ISLAND is very much intersected by deep inlets, particularly Brenton Sound, and its termination, Port Owen, which very nearly communicates with Lomas Bay: the dividing land being low and marshy.

The large central island in Brenton Sound, WICKHAM ISLAND, Wickham Island. is high, and there is a remarkably sharp-peaked hill upon it, which is seen in clear weather from Port Famine.

hich is seen in clear weather from 1 of 1 amount. Non-ENTRY BAY was not examined; it appeared to offer snug Non-entry Bay. anchorage; the depth between the points of entrance was from 9 to 19 fathoms.

Fox BAY. The bottom and south side are shoal, but the Fox Bay. banks are indicated by kelp. A rapid stream of water empties itself into the bay The anchorage in Fox Bay is in from 3 to 5 fathoms. The north head, Steep-Tree Bluff, is of bold approach : within twenty yards of the shore the depth is 9 fathoms.

HARRISS BAY is an indenture of the coast, two miles deep.

WILLES BAY, off which is OFFING ISLAND, by which it may be known, although of small extent, affords excellent anchorage, upon a mud bottom, in 9 or 10 fathoms. The tide rises and falls

Harriss Bay. Willes Bay,

Willes Bay. about six feet. It is high water, at full and change, about 12 o'clock. At the bottom of Willes Bay is Philip Gidley Cove, where a small vessel may lie in perfect security. There are not less than 3 fathoms in the entrance, and inside, in most parts, there is the same depth.

Cape St. Valentyn. CAPE ST. VALENTYN is the northern extremity of Dawson Island. It is low, and has a small hummock near the point. Between the two points which form the cape, there is a slight incurvation of the shore, which would afford shelter to small vessels from any wind to the southward of east or west; but the water is shoal, and the beach, below high water mark, is of large stones. The coast to the south-west is open, and perfectly unsheltered; is is backed by cliffs: the beach is of shingle.

Magdalen Sound, The opening of MAGDALEN SOUND was first noticed by Sar miento.\* Coming from the northward, it appears to be a continuation of the strait, and it is not until after passing Cape San Isidro that the true channel becomes evident. It extends in a southerly direction for twenty miles, and is bounded on either side by high and precipitous hills, particularly on the west shore. The eastern entrance of the sound, Anxious Point, is a low narrow tongue of land, with an island off it. Opposite to it is a steep mountain, called by Sarmiento the Vernal (or summerhouse), from a remarkable lump of rock on its summit.+

Hope Harbour

Under this mountain is HOPE HARBOUR; a convenient stopping place for small vessels bound through the sound. The entrance is narrow, with kelp across it, indicating a rocky bed, on which we had not less than 7 fathoms. Inside it opens into a spacious basin, with good anchorage in 4 fathoms, sheltered from all winds, excepting the squalls off the high land, which must blow with furious violence during a south-westerly gale. This little port is much frequented by Indians, for we found many wigwams on the south side, some of which were occupied by the women and children of a tribe, the men being absent on a fishing excursion.

To the south of Hope Harbour, between the Vernal and Mount Stokes's Inlet. Boqueron, is STOKES'S INLET. It is three miles long, with deep

• Sarmiento, p. 220;

<sup>+</sup> Ibid, 210, and Ultimo Viage, p. 121.

water all over: there is a Cove on its north side, but neither so Stokes's Inlet. good nor so accessible as Hope Harbour. In the entrance of the inlet are three islets (Rees Islets).

MOUNT BOQUERON, the extremity of which is Squally Point, is Mount a very precipitous and lofty mountain, about 3000 feet high, and having on its summit three small but remarkably conspicuous peaks. It is the eastern head of Stokes's Inlet, and forms a part of the western shore of Magdalen Sound. The squalls that blow off this during a south-west gale are most furious, and dangerous unless little sail be carried. On one occasion our decked sailing boat was seven hours in passing it. The sound here is not more than two miles and a half wide. On the opposite shore, within Anxious Point, is an inlet extending to the south-east for two or three miles, but it is narrow and unimportant.

SHOLL BAY is a small bight of the coast line, five miles to the Sholl Bay. south of Squally Point. There is a reef off it, the position of which is pointed out by kelp.

On the opposite shore is KEATS SOUND. It extends to the Keats Sound. south-east for six or eight miles, and is between four and five miles wide.

In the centre of Magdalen Sound, abreast of the above opening, is a rocky islet; and at a short distance to the southward, on the western coast, is a bay and group, called Labyrinth Islands, Labyrinth among which small vessels may find good anchorage.

TRANSITION BAY is deep, and of little importance. Four 'Transition miles farther, at Cape Turn, the shore trends suddenly round. Here Magdalen Sound terminates, and COCKBURN CHANNEL commences.

On the opposite shore, to the south of Keats Sound, there are no objects worth noticing, excepting Mount Sarmiento, which has been already described, page 35, and Pyramid Hill, which was found to be 2500 feet high.

The bottom of Magdalen Sound is six miles wide, but at Cape Turn the channel narrows to two miles, and in one part is not more than one mile and two-thirds wide. The south shore is. much broken, and there are many sounds penetrating deeply into the land, which, in this part, according to Captain Fitzroy's survey of Thieves Sound, is seven miles wide, Eleven miles more

Digitized by Google

Bay.

39

Boqueron.

to the westward, at Courtenay Sound, the width of the peninsula is not more than three miles.

WARP BAY, although exposed to Southerly winds, is a convenient stopping place :- a plan was made of it.

STORMY BAY is a very wild unsheltered place, unfit for any vessel to stop at. At the anchorage the water is deep, 17 to 20 fathoms, and the bottom rocky. The Bay is strewed over with shoals, the existence of which is marked by kelp: these narrow the channel so much as to render the entrance and exit both intricate and difficult for any but a small and handy vessel.

PARK BAY is both very snug and secure, with good anchorage in 12 fathoms, sand and mud. It has the same disadvantage as Stormy Bay, in being on the lee side of the channel, and is, therefore, difficult to leave. There is, however, here more room to beat out, and no dangers to encounter but what are visible. At the N. W. angle of the bay is a narrow isthmus, not more than 500 yards across, separating it from Mercury Sound, which was not examined. It is laid down from an eye sketch.

In working down the channel, the south side should be preferred, as it is a weather shore, and seems to be better provided with coves and harbours to anchor in.

KING AND FITZROY ISLANDS in mid channel, are of bold approach; as are also KIRKE'S ROCKS more to the westward.

The flood tide sets to the southward, or to seaward, but was not found to run with sufficient strength to benefit or impede a vessel beating through. The rise and fall is also inconsiderable, not being more than 6 or at most 8 feet at spring tides.

There are several anchorages among the PROWSE ISLANDS, which are very numerous, and skirt the coast for several miles. Behind them the land trends in and forms a deep sound. The Adelaide Schooner anchored in a bay on the north side of one of the Islands, opposite to Barrow Head, in 6 fathoms; but there are many places of a similar nature, equally convenient and secure. A vessel, in want of anchorage, should hoist a boat out and wait in the offing until one answering the purpose be found. Entering these deep-water bays, a boat should always be hoisted out, and a hawser kept ready to make fast to the shore. It will be frequently necessary to tow up to the head of the har-

Park Bay.

ŝ

bours; for, from the height of the land, the wind generally fails, or becomes baffling.

The distance across the channel, between Prowse Islands and Barrow Head, is scarcely one mile and a half.

DYNELEY SOUND extends for more than nine miles in a north- Dynely Sound. west direction into the interior of Clarence Island. On the west side of its entrance is a group of islands, affording several anchorages, which the chart will point out. One of them, Eliza Bay, offers shelter and security from all winds. The bottom of Dynely Sound was not examined.

MELVILLE Sound, which forms the embouchure of the Bar- Melville bara and Cockburn channels, is very extensive, and is completely filled with islands. Some of them are of large size, and all are of the most rugged and desolate character. The offing is strewed with clusters of rocks: of these the East and West East and West Furies are the most remarkable, as well as the most important; for the passage into the Cockburn Channel lies between them. The former are very near the land of Cape Schomberg. The West Furies bear from the Tower Rock, off Cape Noir, N. 84º E. twenty-five miles; and S. 30° W. eleven miles from Mount Skyring. The Tussac Rocks, which are two in number, bear Tussac Rocks. from the West Furies N. 73° E., four and a half miles; and in a line between the East and West Furies, three miles from the latter, and two from the former, is a rock standing alone. It bears from Mount Skyring S. 12° W. twelve miles and a half. To avoid it, in entering with a westerly wind, pass near the West Furies, and steer for the Tussac Rocks.

After passing these, there are no dangers, that we know of, in the entrance of the Cockburn Channel. A reference to the plan will shew every thing else that need be noted.

Mount Skyring is a very prominent object. It rises to a peak Mount to the height of 3,000 feet; and, being visible for a considerable Skyring. distance, was useful in connecting the triangulation of the strait with that of the outer coast. It was seen from Field Bay, at the north end of the Barbara Channel; and, from its summit, Captain Fitzroy obtained a bearing of Mount Sarmiento. Its summit is in lat. 54° 24' 44" and long. 72° 7' 40". The variation Situation. is 25°.

Sound.

Furies.

#### STRAIT OF MAGALHAENS.

South entrance of the Barbara Channel. The southern entrance of the Barbara Channel is so very much occupied by islands and rocks, that no direct channel can be perceived. The chart must be referred to as the best guide for its navigation. For small vessels there is neither danger nor difficulty; there are numerous anchorages that they might reach without trouble, and that would afford perfect security.

The land hereabouts is also described in Captain Fitzroy's published views of the sea coast of Tierra del Fuego, which contain excellent views of the land from Cape Pillar to its eastern extremity at Cape Diego. Section VII. contains the description of the coast, and references are therein made to the views of the land in Captain Fitzroy's work.\*

Among MAGILL'S ISLANDS there are several coves and anchor-

ages. Tom's HARBOUR is good and well sheltered, excepting

from the violent squalls off the high land, which are so frequent

For Sealing vessels, however, it is more safe and secure than Fury Harbour, the place they usually frequent. Every thing that Fuegian Harbours afford is to be obtained in it. NORTH

FURY HARBOUR, on the south-east side of the central Island

of Magill's group, is a very wild anchorage, (see Section VII.). From its contiguity to the East and West Furies, and the Tussac

Byn**ce** Island and Hewett Bay.

Browns Bay:

North Anchorage.

-

Rocks, on which seals are found, it is much frequented by sealing vessels. BYNOE ISLAND affords an anchorage on its north-east side; and HEWETT BAY, of which a plan was made, is a good stop-

and HEWETT BAY, of which a plan was made, is a good stopping place either for entering or quitting the channel. BROWNS BAY is more extensive, but also affords good shelter

in a small cove at the north entrance, in 8 fathoms sand, among some kelp.

NORTH ANCHORAGE, for a small vessel, is tolerably secure, but not to be recommended.

• Views of parts of the sea coast of Tierra del Fuego, taken on board His Majesty's surveying vessel Beagle, 1829 and 1830.

+ In the winter of 1826-27, the Prince of Saxe Coburg scaler was wrecked in Fury Harbour, and the crew saved by the Beagle's boats.

See

Between Hewett Bay and North Anchorage, the channel is Channel bestrewed with many rocks and shoals, some of which, although Bay and North covered with kelp, only shew at half-tide. Much caution is therefore necessary, and all patches of kelp should be carefully avoided.

The tide, to the northward of North Anchorage, which, to Tide. the southward, was not of sufficient consequence to interfere with the navigation of the channels, is so much felt as to impede vessels turning to windward against it.

The country here has a more agreeable appearance; being Appearance better wooded with beech and cypress trees; but the latter are and produc-tions of the stunted, and do not attain a greater height than fifteen or country. eighteen feet. They are very serviceable for boat-hook spars, boat's masts. &c. The wood, when seasoned, works up well.

BEDFORD BAY is a good anchorage. It is situated on the Belford Bay. north-west side of the narrow part of the channel. Its depth is from 20 to 8 fathoms good holding ground, and perfectly sheltered from the prevailing winds. At its entrance are several patches of kelp, the easternmost of which has 4 fathoms on it. A plan was made, including the narrow channel; which, as it is a place likely to be frequented by vessels navigating the strait, will be of service.

Here, as well as throughout the Barbara Channel, the flood Tide. tide sets to the southward (Lieutenant Graves, M.S.).

NUTLAND BAY, having 8 and 15 fathoms over a sand and mud Nutland Bay. bottom, may be known by two small islands, Hill's Islands, which lie one mile N. N. E. from the anchorage.

Between Bedford and Nutland Bays, and, indeed, as far the Shag narrows, the channel is open, and may be navigated without impediment. There are many bays and inlets not here described or noticed, that may be occupied, but almost all require to be examined. They all trend far enough into the land to afford good shelter, but in many the bottom is foul and rocky, and the water too deep for anchorage.

The western coast, being the windward shore, should, of course, be preferred.

FIELD'S BAY is too exposed to southerly winds to be re- Field Bay. commended as a stopping place, unless the wind be northerly.

tween Hewett Anchorage-

43

Nutland Bay is a more convenient place to start from with a view of passing the Narrows.

Broderip Bay.

To the north of Nutland Bay is BRODERIP BAY; at the bottom, or northern part of it, are some good coves; but the most convenient of them is at the eastern extreme, it is called on the chart DINNER COVE. It extends to the north for about a furlong, and affords good anchorage in 10 fathoms, sufficiently well sheltered and distant from high land to be free from the mountain squalls, or willi-waws.

Icy Sound.

Round Dinner Cove is Icy Sound, a deep inlet with a glacier of considerable extent at the bottom, from which large masses of ice are constantly falling, and, drifting out, occupy the waters of the inlet. The water is deep, and the anchorage not good when there Dean Harbour. are so many better places. DEAN HARBOUR is a considerable inlet trending in under the same glacier, which extends from the head of Smyth Harbour, to a considerable distance in the southwest If of a favourable depth it might afford good anchorage. We did not enter it.

Shag Narrows.

The only navigable communication that exists between the Barbara Channel and the Strait, is that called the SHAG NARROWS, on the western side of Cayetano Island. The width of the opening is at least one mile and three quarters, but the eastern portion is so filled with rocky islets and shoals, that the actual breadth of the only navigable part at the northern end, is about 100 yards; and the widest part at the south end, scarcely half a mile. -The whole length of the passage being rather less than two It is formed on the west side by a projecting point of high miles. land, that gradually trends round to the westward; and on the opposite side by three islands, the northernmost of which is Wet Island: on the southernmost is MOUNT WOODCOCK, one of our stations for the Triangulation.

Mount Woodcock.

> Between Wet Island, where the Narrows on the north side commence, and the western shore, the width is not more than 100 to 150 yards, and perhaps 300 yards long. Through this the tide sets as much as seven miles an hour: the sides of the rocks are steep to; so, that I apprehend no accident can happen to a ship in passing them, notwithstanding the want of room for manœuvring. At the south end of Wet Island, the stream of tide

divides,-one sets to the eastward, round Wet Island, whilst the Shag Narrows. principal runs through the Shag Narrows. And in the same manner, a part of the southern tide, which is the flood, after passing Wet Island, runs to the south-east, round the eastern side of Mount Woodcock.

All the space to the Eastward of Mount Woodcock is so strewed with islands and rocks, that the passage must be difficult if not dangerous.

To avoid the danger of being thrown out of the Narrows, it is Directions. only necessary to keep the western shore on board: where there are no indentations, the tide will carry a vessel along with safety. At the north end of the Narrows, on the west side, is a shelving point, on which there are 5 fathoms;-here there is an eddy, but as soon as the vessel is once within the Narrows, (within Wet Island), the mid channel may be kept. In shooting this passage, it would be better to furl the sails and tow through, for if the wind be strong, the eddics and violent squalls would be very inconvenient, from their baffling, and laying the vessel upon her beam ends; which frequently happens, even though every sail be furled. It will be necessary to have a couple of boats out, ready, either to tow the ship's head round, or to prevent her being thrown by the tide into the channel to the south of Wet Island.

If anchorage be desirable after passing the Narrows, there is Anchorages none to be recommended, until the coves between Smyth Harbour and Cape Beaufort be reached.

Of these, DIGHTON COVE is preferable. The anchorage is off Dighton Cove. the sandy beach, in 20 fathoms.

WARRINGTON COVE, the next to the north, also offers good Warrington Cove. shelter and anchorage, but both are exposed to easterly winds.

The tide in the Shag Narrows, at full and change, commences to set to the Southward at 12 o'clock. In the Barbara Channel the flood tide was found by Lieutenants Skyring and Graves, to set to seaward, or to the southward; as was also the case in Cockburn Channel. Our experience of the tides hereabouts was not sufficient to justify our making any further observation upon

SMYTH HARBOUR is about four miles deep, and half to one bour.

Smyth Har

Tides.

Smyth Harbour. mile wide, surrounded by high land, and trending in a westerly direction. The water is deep, excepting in EARLE COVE, on the north side, where vessels might lie, if necessary; but I should think it a very wild place in bad weather.

The hills at the head are capped by glaciers that communicate with those at the head of Icy Sound. It seems possible that all the mountains between this and Whale Sound are entirely covered with a coating of Ice.

Shoal off Cape Beaufort.

Prevailing Winds. Half a mile south-east from CAPE BEAUFORT is a shoal, so thickly covered with kelp as to be easily seen in passing or approaching it ;---there are not more than two feet of water over its shoalest part.

To pass through the Barbara Channel, from the north, it would be advisable to stay at Port Gallant until a favourable opportunity offers; for, with a south-west wind it would neither be safe nor practicable to pass the Shag Narrows.

The north-west wind prevails more than any other in the western portion of the Strait, in consequence of the reaches trending in that bearing. It seems to be a general rule hereabouts that the wind either blows up or down them.

Between Cape Froward and the western entrance of the strait, the wind is generally from north-west, although at sea, or in the Cockburn or Barbara Channels, it may be in the south or southwestern boards.

## SECTION IV.

## Strait of MAGALHAENS-From Port FAMINE to Cape FROWARD, the North Coast of CLARENCE Island, and from Cape FROWARD to the JEROME Channel.

The Sedger River, which is fronted by a bar that dries at low Sedger River. water, can be entered by boats at half tide, and is navigable for three or four miles ; after which its bed is so filled up by stumps of trees, that it is difficult to penetrate farther. The water is fresh at half a mile from the entrance, but to ensure its being perfectly good it would be better to fill the casks at low tide. The low land near the mouth, as well as the beach of Port Famine, is covered with drift timber of large size, which we found very useful, and serviceable for repairing our boats.

The river was called by Sarmiento, Rio de San Juan\*. In Narborough's voyage it is called Segars River, and his boat is described to have gone up it for nine (?) miles; but was there stopped from going farther by " reason of the trunk-timber and shoaliness of the water."+ Byron describes the river, which he calls the Sedger, in glowing terms, but gives rather a more flattering account of the timber growing on its banks than it deserves.<sup>±</sup>

Voces Bay, or the Playa-de-las-Voces of Sarmiento,? is to the Voces Bay. southward of the south point of Port Famine, where the Sedger River falls into the sea. A ship may anchor in from 7 to 10 fathoms, off the Second River, but the shelter is not so good as in

> • Sarmiento, p. 223. + Narborough, p. 122.

† Hawkesworth, vol. i. p. 38.

§ Sarmiento, p. 222.

The Second River has a shoal entrance, but ex-Port Famine. tends for some distance up the valley.

Between this bay and CAPE SAN ISIDRO\* (Point Shut-up of Byron+) the water is too deep for anchorage, even close to the beach. The cape is the termination of the ridge, whose summit is MOUNT TARN, the most conspicuous mountain of this part of the Mount Tarn. strait. It is 2602 feet high by barometrical measurement. It is readily distinguished from abreast of Elizabeth Island, whence it appears to be the most projecting part of the continental When viewed from the northward its shape is peaked, and shore. during the summer it has generally some patches of snow a little below its summit; but in the winter months its sides are covered with snow for two-thirds down. From abreast, and to the southward, of Port Famine, it has rather a saddle-shaped appearance : its summit being a sharp ridge, extending very nearly for one mile, north-west and south-east, with a precipitous descent on the north-east, and a steep slope on the south-west, sides. The highest peak near its north-east end is in lat, 53° 45' 06', and lon, 70° 58' 26".

> There is a low, but conspicuous rounded hillock covered with trees at the extremity of Cape San Isidro; and a rocky patch extends off it for two cables length, with a rock at its extremity that is awash at high water. It is coverd with kelp.

Engle Bay.

EAGLE BAY, (Valcarcel Bay of Cordovat) is about three quarters of a mile deep; and its points one mile apart, bearing N. E. and S. W. The anchorage is at the head, in from 20 to 12 fathoms. There are two streams of water; but, being very much impregnated with decomposed vegetable matter, cannot be preserved long. The woods here abound with Winters Bark. of which there are many very large trees. A small reef extends for about a cable's length off the S. W. point of the bay, on which is an islet. Eagle Bay is not useful for any but a small vessel, that can be towed in, and then it will be necessary to steady her by warps, to the shore. The squalls, or willi-waws, at times, are very violent.

> + Hawkesworth, vol. i. p. 62. · Sarmiento, p. 220. † Ultimo Viage, p. 116.

Cape San

Isidro.

GUN BAY, the next to the westward, although small, affords Gun Bay. anchorage for a single vessel near the shore, at its S. W. part, in from 8 to 9 fathoms. Its points bear S. 57° W., and N. 67° E., and are distant more than three-quarters of a mile. Two rivulets discharge themselves into it, from which water is easily procured. The bottom is a stiff clay, and good holding ground. A round hill of moderate elevation, and thickly wooded, separates it from INDIAN BAY, the points of which bear S. 69º W., Indian Bay and N. 69° E., and are distant more than one mile and a quarter. From the east point the shore runs due west, curving round at the bottom towards an islet covered with trees; between which and the shore there is only sufficient depth for a boat to pass. A rock about twelve feet high lies to the S. E., on either side of which is an anchorage, sufficiently sheltered from the prevailing winds, over a good bottom, in from 7 to 9 fathoms. The north side of the bay is shoal, caused, probably, by the alluvial deposit from a river nearly in the centre. A patch of kelp extends off the S. E. point for two cables length, but has 9 fathoms over it at the centre.

Neither Gun nor Indian Bays are noticed in Cordova's description of the strait, although they are quite equal to any other in the neighbourhood for stopping places.

BOUCHAGE BAY, which is Cordova's Cantin Bay,\* is small, Bouchage Bay and the water very deep; except near the bottom, where anchorage may be obtained in 8 fathoms, clay. It is separated from BOURNAND BAY, (Gil Bay of Cordova+) by CAPE RE- Bournand Bay MARQUABLE, of Bougainville, which is a precipitous, roundtopped, bluff projection, wooded to the summit. At two cables length from the base no bottom was found with 20 fathoms of line; but, at the distance of fifty yards the depth was 20 fathoms. Bournand Bay is more snug and convenient than its northern neighbour, Bouchage Bay, being sheltered from the southerly winds by Nassau Island. At the S. W. end of a stony beach at the bottom, is a rivulet of good water : off which there is good anchorage in 8 fathoms stiff mud.

BOUGAINVILLE BAY, (Cordova's Texada Bay‡) forms a basin, Bougainville

- Ultimo Viage, 117. † Ibid, L c.
  - н
- 1 Ibid, p. 117, l. c.

or wet dock, in which a vessel might careen with perfect se-Bougainville curity. It is, from its small size, great depth of water, and the height of the land, rather difficult of access: which renders it almost always necessary to tow in. On entering, the anchor should be dropped in 12 fathoms, and the vessel steadied by warps to the trees, at the sides and bottom of the cove. It is completely sheltered from all winds, and an excellent place for a vessel to remain at, particularly if the object be to procure timber: which grows here to a great size, and is both readily cut down and easily embarked. A rivulet at the bottom affords a moderate supply of water; but, if more be required, the neighbouring bays will afford an abundance\*

> In the passage between Nassau Island and the main, the least water is 7 fathoms, over a stiff clay bottom ; gradually deepening on each side. But the winds being baffling, and the tides irregular and rippling in many parts, a vessel should not attempt it but from necessity.

Nassau Island.

St. Nicholas Bay.

NASSAU ISLAND'S south extremity is Sarmiento's Point, Santa Brigida+

ST. NICHOLAS BAY, so named by the Nodales in 1618, (but previously, by Sarmiento, Bahia de Santa Brigida y Santa Agueda,<sup>†</sup> and French Bay by De Gennes), is not only of larger size than any of the bays to the south of Cape San Isidro, but is the best anchorage that exists between that cape and Cape Froward; as well from its being more easily entered and left, as from the moderate depth of water, and extent of the anchoring ground. Its points bear from each other, S. 58° W., and N. 58° E., and are distant two miles. Nearly in the centre is a small islet covered with trees; between which and the shore is a passage with 9 fathoms water, stiff clay. The shore is, however, fronted for its whole length by a shoal bank, which very much reduces the apparent extent of the bay. This bank stretches off to the distance of a quarter of a mile from the shore, the edge of which

• It was here that M. de Bougainville cut timber for the French Colony, at the Ralkland Islands, To Sealing vessels it is known by the name of Jack's Harbour.

Bay.

<sup>#</sup> Sarmiento, p. 219. This island is called by Cordova, fais de Córdova y Ramos.

<sup>-</sup>U timo Viage, p. 117.

<sup>1</sup> Samiento, p. 220.

is steep to, and is generally distinguished by the ripple, which, St. Nicholas with a moderate breeze, breaks at half-tide. The Beagle anchored in the bay, at three cables length to the N. E. of the small central islet; in 12 fathoms, pebbly bottom; but the best berth is one-quarter to one-third of a mile to the S. W. of the islet, in 10 or 11 fathoms, muddy bottom. Captain Stokes recommends in his journal, in coming in, to keep sail upon the ship, in order to shoot into a good berth, on account of the high land of No-DALES PEAK becalming the sails; and, to avoid the drift of the stream of the river setting the ship over to the eastern side of the bay. I do not, however, think that the stream of the river can affect a ship in any position between the islet and the peak. In taking up an anchorage, much care is necessary to avoid touching the bank. Less than 10 fathoms is not safe, but in that depth the security is perfect, and the berth very easy to leave. In passing through the strait, this bay is very useful to stop at, as well from the facility of entering and leaving it, as for its proximity to Cape Froward. The islet is in lat. 53° 50' 38', and lon. 71° 03' 13'.

In the middle of the bay is DE GENNES RIVER, (Rio del De Gennes Valle Grande of Sarmiento\*) which is of larger size than the Sedger River; it is one hundred yards across, and apparently extends in a winding direction up the valley for some distance. From its entrance being fronted by a shoal or bank, the form of which must be constantly shifting; and its being strewed with trees that drift out of the river during the winter freshes, it is far from being an eligible place for procuring water.

From Glascott Point, the southern head of the bay, a mountainous and high range of hills runs back for some distance. On its summit are several sharp peaks; the most conspicuous of which is Nodales Peak.

From Glascott Point the coast extends in nearly a straight line Coast between to Cape Froward, a distance of seven miles, the land at the back continuing mountainous and woody. A point, formed by Froward. a beach of shingle, covered with trees to within twenty yards of the water's edge, and distant nearly three miles from Cape Fro-

St. Nicholas Bay and Cape

River.

æ

#### STRAIT OF MAGALHAENS.

Anchorage to the eastward of Cape Froward.

ward, is the only projection. Between this and the entrance of a rivulet, which waters the only valley that exists in this space, an anchorage at a quarter of a mile from the shore, in 11 fathoms, might be occupied during a westerly wind; but with the wind more southerly it would be too much exposed to be safe. The Beagle anchored here at two cables length off the sandy beach, in 11 fathoms.

Cape Froward.

. CAPE FROWARD, the southern extremity of the continent of South America, rises abruptly from the sea. At its base is a small rock, on which Bougainville landed, as did Lieutenant Graves, for the purpose of obtaining a set of bearings. The hill that rises immediately above the Cape, was called by Sarmiento, the Morro of Santa Agueda.\* Cape Froward is in lat. 53° 53′ 43′, lon. 71° 14′ 31″. The ebb tide sets to the northward, and the flood to the southward, but with very little strength. It is high-water at full and change at one, p. m.,

The North Coast of CLARENCE ISLAND extends from the en-

trance of Magdalen Sound to that of the Barbara Channel: the

whole length of which is indented by sounds stretching deeply

North Const of Clarence Island.

Port of Beau-

0

into the island. Bougainville's PORT OF BEAUBASIN, (the Bahia Darsena of Cordova+), is sufficiently pointed out by the small rocky islet called PERIAGUA,<sup>‡</sup> and the mountain of the VERNAL, described in page 38. The outer part of the port decreases in width gradually to the entrance of the Harbour, which is formed by two projecting points, a very short distance apart, and is very shoal, the deepest water being only 2½ fathoms. Inside, in the basin, there are 5 fathoms. It is a very snug place when once in, but possesses no advantage, since it is on the wrong side of the strait for vessels bound through to the westward; for the northerly or easterly wind, which would be favourable to proceed, would prevent a vessel sailing out of it.

Bays west of the Vernal. INMAN BAY, HAWKINS BAY, STAPLES INLET, and SHOLL HARBOUR, are all deep inlets, surrounded by high precipitous land.

To the westward of Greenough Peninsula, is LYELL SOUND.

Sarmiento, p. 218.
 † Ultimo Viage, p. 121.
 Ibid, p. 122.

It is nine miles deep, and is separated at the bottom from Sholl Lyell Sound. Harbour by a ridge of hills about one mile and a half wide.

In the entrance of Lyell Sound, are two conspicuous islands, one of which is very small. They are called Dos HERMANAS, and bear from Cape Froward S. 48°, W. five miles and a half.

KEMPE HARBOUR, one mile and a half within the entrance, Kempe Haron the west side, of Lyell Sound, is rather difficult of access, but perfectly secure, and would hold six ships. Stokes Creek, on the same side, more to the southward, also offers good anchorage; but from its being out of the way, can be of no utility.

CASCADE HARBOUR, and MAZZAREDO BAY, are of less size, Cascade Harand therefore more attainable, but of the same character with zaredo Bay. Lyell Sound: viz., deep water, surrounded by high land. The former is known by the cascade which M. de Bougainville describes. from which it derives its name. On the head land that separates these harbours from Lyell Sound, is a sugar-loaf hill, Bougainville's the position of which is well determined, in lat. 53° 57' 32' lon. Sugar Loaf. 71º 24' 13'.

HIDDEN HARBOUR has a narrow entrance; but, if required, Hidden Haroffers good shelter.

SAN PEDRO SOUND is the most extensive inlet that we know in Clarence Island. It extends, in a southerly direction, for nearly thirteen miles, and has three other inlets branching off into the land, two to the westward, and one to the eastward. There is a good, although a small, anchorage on its west side, one mile and a half within the entrance, called MURRAY Murray Cove. Cove; and another close to it, which is even more sheltered.

FRESHWATER COVE, the Caleta de agua dulce of Sarmiento,\* is a confined and indifferent place for a ship.

BELL BAY, (the Bahia de la Campana of Sarmiento+), has a Bell Bay. very convenient anchorage, BRADLEY COVE on its west side, Bradley Cove. bearing S. 79° W. from Point Taylor, the eastern head of the Bay. It will be readily distinguished by a small, green, round hillock that forms its north head. The anchorage is in 17 fathoms, and the vessel hauls in, by stern-fasts or a kedge, into

San Pedro Sound.

Freshwater Cove.

<sup>·</sup> Sarmiento, p. 217.

#### STRAIT OF MAGALHAENS.

- Pond Bay. 9 fathoms, in perfect security. POND BAY, to the northward, has good shelter, but it is not of such easy access; for it would be necessary to tow both into and out of it.
- Mount Pond.

Bay.

MOUNT POND, a peaked hill over the harbour, is a conspicuous mountain, and is visible from the eastward as soon as it opens round Cape Froward. It has two summits, one of which, only, is visible from the eastward.

Between Cape Inglefield and Point Elvira, is ST. SIMON'S St. Simon's BAY.\* It is studded with islands and rocks, and at the bottom has two communications with the Barbara Channel, separated from each other by Burgess Island; the easternmost of which, called Tom's Narrows, is the most extensive: but this, from the irregularity and force of the tides, is not to be preferred to the more direct one of the Shag Narrows, on the western side of Cayetano Island; (see page 44) for there is no good anchorage in St. Michael's Channel, which leads to it, and it is bounded by a steep and precipitous coast. The Gonsalez Narrows,† on the west side of Burgess Island, is not more than thirty yards across; and, from the force of the tide, and the fall of the rapid, would be dangerous even for a boat to pass. The only good anchorage in St. Simon's Bay is MILLAR's Millar's Cove. COVE; it is about three miles within Point Elvira, and has three rocky islets off its entrance. A conspicuous mount forms the summit of the eastern head. The anchorage is in 5 fathoms, a good bottom, and entirely sheltered. Wood and water are plentiful.

- Immediately round the east head of Millar's Cove, is PORT Port Langara; LANGARA.1 It is rather more than a mile long, and two-thirds of a mile wide, and trends in a W. N. W. direction. The water is deep, excepting at the head, and in a cove on the north shore; in either of which there is good anchorage. At the former the depth is 8 fathoms and, in the cove, 5 fathoms, On the eastern side of the bay, are SHIPTON and MELLERSH Coves. Both are surrounded by high land; and the water being very deep, neither of them afford anchorage. Off the head, that divides them, are the CASTRO ISLANDS; on the north side of the largest
  - \* Sarmiento, p. 213. † Ultimo Viage, p. 133. 1 Ibid, p. 182.

is a very convenient cove, with a moderate depth of water. Castellano The CASTELLANO ISLANDS consist of five principal ones; they Isles. are situated in the centre of the bay, and have no anchorage among them.

The coast from Cape Froward to Jerome Channel, a distance of forty miles, is very slightly indented. The anchorages. therefore, are few in number, but they are of easier access, and, altogether, more convenient than those of the southern shore. Taking them in succession, SNUG BAY#, five miles Snug Bay. N. W. of Cape Froward, is a slight indentation of the coast at the embouchure of a small rivulet; the deposits from which have thrown up a bank near the shore, on which anchorage may be had in 8 and 9 fathoms. The best anchorage is half a mile to the E. S. E. of the island, in 9 fathoms, black sand, the rivulet mouth bearing N. N. W. three-quarters of a mile. It is much exposed, being open from W. S. W., by South, to S. E.

Byron, who anchored in it, describes it as being fit for his purpose.+ It is certainly a convenient stopping place in fine weather.

WOOD'S BAY, situated under the lee of Cape Holland, is a Wood's Bay. convenient stopping place for ships, but only small vessels should anchor inside the cove. The anchorage is very good Anchorage to to the eastward of the river's mouth, at half a mile from the the eastward of the river. shore, in 17 and 13 fathoms water. Small vessels may enter the cove, by luffing round the kelp patches that extend off the south point of the bay, on which there is 21 fathoms.

Entering Wood's Bay, steer for the gap, or low land behind Directions for the cape; and, as you near the south point, keep midway be- bay. tween it and the river's mouth; or, for a leading mark, keep a hillock, or conspicuous clump of trees at the bottom of the bay, in a line with a remarkable peak, one or two miles behind, bearing, by compass, N. 52° W. Anchor in 17 fathoms, immediately that you are in a line between the two points. Small vessels may go further, into 12 fathoms. The west side of the Cove may be approached pretty near, and the depth will not be

+ Hawkesworth vol. i. p. 63.

#### STRAIT OF MAGALHAENS.

less than 5 fathoms, excepting upon the two fathoms patch that Wood's Bay. stretches off the east point, the extent of which is sufficiently shewn by the kelp; but on the castern side the bank shoals suddenly, and must be avoided, for there are 13 fathoms close to its edge, upon which there is not more than two feet water. The south point of Wood's Bay is in lat. 53° 48' 33', and lon. 71° 35' 41'.

Cape Holland.

CAPE HOLLAND is a bold, high, and, although slightly projecting, yet a very conspicuous headland. It is precipitous, and descends to the sea in steps, plentifully covered with shrubs. It is fourteen miles to the westward of Cape Froward.

Cape Coventry.

Near CAPE COVENTRY, and in Andrews Bay, anchorage may be had near the shore, if the weather be fine. To the westward of the former, at half a mile from the shore, there are 13 fathoms.

Cordes Bay.

Miguel.

CORDES BAY, four miles to the eastward of Cape Gallant, may be known by the small bright green islet (Muscle Island,) that lies in the entrance; also by a three-peaked mountain, about 1,500 or 2,000 feet high, standing detached from the surrounding hills, at the bottom of the bay. The western entrance, which lies between west point and the reef off Muscle Island, is two-thirds of a mile wide; within it, is a bay one mile deep, but much contracted by shoals covered with kelp; between them, however, the anchorage is very good and well sheltered. The bottom is of sand, and the depth 5 and 7 fathoms. At the ex-Port San tremity of the bay is a large lagoon, PORT SAN MIGUEL, trending in a north-east direction for two miles, and two-thirds of a mile across; the entrance is both narrow and shoal, and not safe for a vessel drawing more than six feet. Inside the lagoon the depth is from 3 to 13 fathoms. With Fortescue Bay and Port Gallant so near, the probability is that it will never be much used: but in turning to the westward it would be better to anchor here, than lose ground by returning to Wood's Bay. By entering the western channel and steering clear of the kelp, a safe and commodious anchorage may easily be reached.

Fortescue Bay.

FORTESCUE BAY is the first best anchorage to the westward of St. Nicholas Bay .- It is spacious, well sheltered, easy of access, and of moderate depth. The best berth is to the southeast of the small islet, outside of Wigwam Point, in 7 or 8

#### CAPE FROWARD TO THE JEROME CHANNEL!

Having the entrance of PORT GALLANT open, small Port Gallant. fathoms. vessels may sail into the port, but the channel is rather narrow. The banks on the western side, off Wigwam Point, are distinguished by the kelp. When within, the shelter is perfect; but Fortescue Bay is quite sufficiently sheltered, and much more convenient to leave. In this part of the strait, as the channel becomes narrowed by the islands, the tides are much felt. There are two good anchorages before reaching the entrance of the Jerome Channel; namely, ELIZABETH BAY and YORK ROADS, off Batchelors River,-They are, however, only fit for stopping places. There are no anchorages among the islands that can be recommended, excepting in the strait that separates the group of Charles's Islands, in which there is security and a convenient depth. When the wind blows fresh there is a hollow sea between Charles's Islands and the north shore, which very much impedes ships beating to the westward.

At a short distance to the E. S. E. of Passage Point, is a Elizabeth Bay. shoal, with two fathoms upon it.\* Elizabeth Bay has a sandy beach, and a rivulet emptying itself into it. Cordova recommends the best anchorage to be in 15 fathoms, Passage Point bearing E.S.E., distant half a mile, about three cables length from the river: and to the north-west of a bank on which there is much kelp.

Captain Fitz Roy describes the anchorage of YORK ROADS, or York Roads. BATCHELORS BAY, to be good and convenient: " half a mile off. a woody point, (just to the westward of the river) bearing N. 6° E. and the mouth of the river N. E., three quarters of a mile. is a good berth; because there is plenty of room to weigh from and space to drive should the anchor drag; the bottom is good. in 10 or 12 fathoms, but not in a less depth. The shore is a flat shingle beach for two miles, the only one in this part of the strait."† Cordova recommends the following as the best anchorage, at half a mile from the beach, the river bearing N. 5° E., and the west point of the bay N. 27° W.<sup>±</sup>

The set and change of the tide here are very uncertain on account of the meeting of the Jerome Channel tides with those of

Ulumo Viege, p. 136

Tides off York

the strait, which occasions many ripplings; and it would require a better experience than we possess, to give a correct explanation. Captain Fitz Roy, says, that "the tide along shore, near Batchelor River, changed an hour later than in the offing. At Batchelor Bay, by the beach, during the first half or one third of the tide that ran to the south-east, the water fell; and during the latter half or two thirds, it rose. In the offing it ran very strong." The establishment of the tide, at the entrance of the river, by an observation made by Captain Fitz Roy with the moon eight days old, would be, at full and change, at 1<sup>h</sup> 46'. By an observation made by Captain Stokes, two years previous, it was found to be 2<sup>h</sup> 13'; the tide at the anchorage ran three knots.

Batchelor River. BATCHELOR RIVER is accessible to boats only; and in going into or out of its entrance they must be very careful to follow exactly the course of the stream, for a bar lies outside: large boats cannot enter at half tide.\*

To the following islands in the centre of the strait, that form the south limit of English Reach, I have restored the names that were originally given by Sir John Narborough.

Secretary Wren's Island. abruptly on all sides, and forming two summits. Near it are some rocks, and to the south-east is a group of small rocks; and, at a mile to the E. S. E., are two rocks above water, called Canoas. The islet has no name on Cordova's chart.

Charles Islands. CHARLES ISLANDS,<sup>+</sup> besides some smaller islets, consists of three principal islands; and in the centre there is a very good port, having good anchorage within the islets, in 13 fathoms. It has an outlet to the north-west, and one to the south-west, also a narrow point communicates with the strait to the south-east.

Opposite to Cape Gallant, on the eastern island, near its north-west end is a conspicuous white rock, called WALLIS'S MARK. Next to the westward in succession are MONMOUTH and JAMES ISLANDS, (called by Cordova, Isla de los Infantes,) then CORDOVA ISLET, and RUPERT ISLAND, and to the westward of these the island of CARLOS III. so named by Cordova. The

Island of Carlos III.

· Fitz Roy M.S.

† Island de los Principes of Cordova .- Ultimo Viage, p. 138.

last is separated from Ulloa Peninsula by St. David's Sound, Carlos III. which is navigable throughout.

To the northward of Whale Point, the eastern extremity of Carlos III. Island, is a cove with an anchorage, in 15 fathoms, close to the shore, on a steep bank, but bad ground; the Beagle and Adelaide both dragged off the bank, from the violence of the squalls off the high land. From the north point of the cove to Rupert's Island, is a rocky ledge, (Lucky Ledge), over which the tide sets with considerable strength. The Beagle. having dragged her anchor in the cove, was brought up by its hooking a rock on the ledge, but it was found broken on being hove up. Whilst there, the tides set past her in a north and south direction, at the rate of three knots an hour.

To the westward of Cape Middleton, of Narborough, is Muscle Bay. Muscle Bay,\* having deep water, and of uninviting character. Cordova describes it to be a mile wide, with unequal soundings, from 12 to 40 fathoms, stones. The bay is not to be recommended, although it appears to be well sheltered. There is an anchorage in from 15 to 30 fathoms in Bonet Bay of Cordova, Bonet Bay. close to Carlos III. Island. It lies under the S. E. side of some islands opposite to Batchelor River. At a short mile to the eastward of Cape Crosstide, the N. W. end of Carlos III. Island, is TILLY BAY, but it has nothing to recommend it, particularly Tilly Bay. when the much better anchorage off Batchelor River is so close at hand.

CHOISEUL BAY, and NASH HARBOUR, on the Fuegian Coast, Choiseul Bay are not in the least inviting; the former, Captain Fitz Roy de- and Nash Har scribes to be a large, deceiving, harbour-like bay, full of islets and patches of kelp, under which, of course, there are rocks. Between the islets, the water is deep and unfit for anchorage.

NASH HARBOUR is equally unserviceable.+

WHALE SOUND, also on the Fuegian shore, at the back of whale Sound. Ulloa Peninsula, is a large inlet, trending eight miles into the land, and terminating in a valley bounded on each side by high mountains. There is anchorage only in one place, the west side of Last Harbour; and, although this harbour appears large, the anchorage is small, and close to the shore.

• Roxas Bay of Cordova. - Ultimo Viage, p. 138. + Fitz Roy M.S.

hour.

St. David's Sound, ST. DAVID'S SOUND separates Carlos III. Island from Ulloa Peninsula. At its north end the water is deep, but where it begins to narrow, there are soundings in it, on which anchorage might be found, if there was a necessity; but I cannot imagine such an occasion will ever happen:—should it, the chart will be a sufficient guide.

# SECTION V.

## Strait of MAGALHAENS-JEROME Channel-OTWAY and SKYRING Waters-CROOKED and LONG Reaches.

The JEROME CHANNEL was only slightly examined by Jerome Chan-Cordova's officers; for, their object being merely to confirm or disprove Sarmiento's statement of the insularity of the land between it and the Gulf of Xaultegua, now called Croker Peninsula,\* the Lago de la Botella was alone explored by them. The continuation of the Jerome, named in the old charts Indian Sound, having never been traced; and, therefore, being an object of great interest, it was investigated by Captain Fitz Roy as carefully as could be done in the middle of winter in an open boat. The period of his absence from the ship, however, thirtytwo days not being sufficient to complete the service, the western shores of the Skyring Water were not visited; and as a further examination of it will, probably, be one of the objects of the voyage he is now preparing for, a brief description will be sufficient.

. The Jerome Channel is narrow, but throughout, free from Description. danger. The western shore is high and steep, and covered with trees: the eastern shore is lower and less wooded. In midchannel, near its western end, are two islets which have no place in the Spanish Chart; unless the Teran Isles+ be intended to represent them ;---if so, they are badly placed. The Spanish Chart makes the channel six miles too long.

Sarmiento describes it to be an island by the Indian name of Cayrayxayiisgus. See Sarmiento, p. 208.

+ Ultimo Viage, appendice 36.

nel.

#### STRAIT OF MAGALHAENS.

Coves on the west shore.

Bays on the east shore.

Cutter Cove

On the west side of the Jerome are two Coves, WOOD COVE and SEAL COVE, that may be used with advantage by small vessels. On the the eastern shore, the bights, THREE ISLAND BAY (Cordova's Real Cove\*) and CORONILLA<sup>†</sup> Cove appeared to be commodious. Arauz Bay is open and exposed to the N. W.

Where the Lago de la Botella joins the Jerome, the latter winds round to the north-east. On its eastern side, behind the False Corona Isles, is CUTTER COVE, affording anchorage for a small vessel; a plan was made of it. Opposite is Nuñez Creek, with deep water.

- Corona Isles. Abreast of the CORONA ISLES, one of which, the Sugar Loaf, is about 200 feet high, is SULIVAN SOUND, penetrating for five miles into the land on the western side of the channel; and, at a league to the northward of the Sugar Loaf, is another opening Bending Cove. to the westward; on the north shore of which, is BENDING COVE; which with Cutter Cove are the only stopping places between
  - which, with Cutter Cove, are the only stopping places between Cape Forty-Five and Child's Bluff.
- Otway Water. Between Child's Bluff and Point Stokes, the OTWAY WATER commences. On the west shore it affords several commodious anchorages. Off Point Villiers, lat. 53° 09', at a quarter of a mile from the shore, there are from 10 to 30 fathoms; and this depth decreases in advancing more northerly. There is anchorage all across the north-east part of the Water, in from 5 to 20 fathoms, the bottom of sandy-mud.

Inglefield and Vivian Isles.

Inglefield and Vivian Islands, at the west end of the Water, are low but thickly wooded. An isthmus, 6 to 10 miles across, separates the Otway Water from the Strait near Elizabeth Island. From an elevated station on the north side of Fitz Roy Island, this narrow neck appeared to be low and much occupied by lagoons. The south shore of Otway Water is formed by high land, with three deep openings that were not examined. BRUNSWICK PENINSULA, a mass of high mountainous land, is the most southern extremity of the Continent.

In lat. 52° 40' and lon.  $71\frac{1}{2}^{\circ}$  W. is the east entrance of Firz Roy CHANNEL; it forms a communication between the Otway

• Ultimo Viage, Appendice, p. 34, +

Brunswick Peninsula. and the Skyring Waters, and takes a winding course to the Pitz Roy N. W. for eleven miles, which is easily navigated. A strong Channel. tide running during the neaps at the rate of 5 or 6 miles an hour, in the entrance, and of 2 or 3 in other parts, sets through it, six hours each way. The rise and fall, however, were scarcely distinguishable.

SKYRING WATER is ten leagues long from east to west. Its SkyringWater. shores are low. At the western extremity two openings were observed to wind under a high castellated-topped mountain (Dynevor Castle,) which were supposed by Captain Fitz Roy to communicate with some of the sounds of the western coast. Through Euston opening, the southern one, no land was visible in the distance; but on a subsequent examination of the termination of the Ancon sin Salida of Sarmiento, by Captain Skyring, no communication was detected.

### Of the TIDES in the JEROME and INTERIOR WATERS.

The tide was found to set through the Jerome Channel with Tides. great regularity, six hours each way. The Spanish account, however, says, "The current is always in the direction of the channel, but rarely sets to the N. W., particularly in mid-channel and the western shore; on the opposite side, however, the tide sets six hours each way to the N. W. and S. E."\*

The following observations were made by Captain Fitz Roy for the time of high-water at full and change, at various parts of the Jerome and its interior waters, viz.:—In the entrance of the Jerome, near Arauz Bay, at 1 o'clock; near Bending Cove, at 3 o'clock; at Cutter Cove, at 4 o'clock; on the south shore of Fanny Bay, at Gidley Island, as also at Martin Point, at 5 o'clock; at Inglefield Island, at 4 o'clock; and, at the same hour at the eastern entrance of Fitzroy Channel; but at the western end of it at 1<sup>h</sup> 15'. The variation of the compass was found to be at the

Crooked Reach

THE PORTION of the strait comprised between the western extremity of Ulloa Peninsula and the entrance of the Jerome is called CROOKED REACH. In the navigation of this part Wallis and Carteret suffered extreme anxiety: and no one that has read their journals would willingly run the risk of anchoring in any port or bay on its southern shore. The chart will shew several inlets deep enough to induce any navigator to trust to them: and, probably, for small vessels, many sheltered nooks might be found, but they have all very deep water, and when the wind blows strong down to Long Reach, they are exposed to a heavy sea, and a furious wind. The anchorage of BORJA BAY Boria Bay. within the Ortiz Islands (the Island Bay of Byron) is so much preferable, that it alone is to be recommended. Both Captain Stokes and Captain Fitz Roy speak highly of it in their journals: it is snug and well sheltered, and tolerably easy of access, but in a gale, like its neighbours, the anchorage is much incommoded by the williwaws, which "drive the ship from one side to the other, as if she were a light chip upon the water."\* Captain Fitz Roy says, "let me recommend Borja Bay as an excellent, although small, anchorage; wood and water are plentiful; under the coarse upper sand is a stiff clay, like pipe-clay. Avoid the islet off its west side as you go in or out."+

> As this is an anchorage that may be much used, Captain Stokes' account of it is also subjoined.

Description.

"BURJA BAY is situated on the northern shore of Crooked Reach, two miles to the eastward of Cape Quod. Its position is pointed out as well by the islet off its west point, as by its situation with respect to El Morrion, the helmet-shaped point previously called by the English, ST. DAVID'S HEAD. The entrance to the bay is to the eastward of the largest islet, and presents no dangers; all the islets and shores of the bay may be approached to half a cable's length, even to the edge of the kelp. The only difficulty that impedes getting into the bay arises from the baffling

· Fitz Roy M. S.

winds and violent gusts that occasionally come off the mountains Boria Bay. and down the deep ravines which form the surrounding coast, and the utmost vigilance must be exercised in beating in under sail to guard against their effects. The anchorage is perfectly sheltered from the prevailing winds, the westerly and southwesterly gales, and is open only to south-easterly winds, which very rarely blow here, and still more rarely with violence; and as the holding ground is good (small stones and sand) and the depth of water moderate (14 to 16 fathoms), and any fetch of sea prevented by the narrowness of the strait in this part, the greatest breadth being only three miles, it may be pronounced a very good and secure harbour. The best plan is to anchor with the bower, and steadied to the shore by a hawser or a kedge. No surf or swell obstructs landing any where; good water and plenty of wood are easy to be embarked; the trees, a species of beech, are of a considerable size. The shores are rocky, and the beach plentifully stocked, as indeed are all parts of the strait to the eastward, with barberries and wild celery.\*

Byron anchored in Borja Bay, as did also Carteret in the Swallow.+ The former gives a plan of it, and calls it Island Bay. He attempted to anchor in it, but was prevented by the strength of the tide. ±

Captain Stokes describes the MORRION, or St. DAVID'S El Morrion, or HEAD, to be a lofty granitic rock, of which the outer face is St. David's Head. perpendicular and bare, and of a light grey colour, distinguishable from a considerable distance both from the east and the north-west, and forming an excellent leading mark to assure the navigator of his position.

Narborough thus describes CAPE QUOD. "It is a steep up cape, of a rocky greyish face, and of a good height before one comes to it: it shews like a great building of a castle; it points off with a Race from the other mountains, so much into the channel of the strait, that it makes shutting in against the south land, and maketh an elbow in the streight."?

· Stokes M. S.

K

#### STRAIT OF MAGALHEANS.

Current near Cape Quod.

Snowy Sound.

Abreast of Cape Quod Captain Stokes tried and found the current setting to the eastward at one knot and a half an hour.

Between Boria Bay and Cape Quod are two coves, too small to be of any use when Borja Bay is so much superior.

SNOWY SOUND, a deep inlet, unimportant to the navigator, and not worth any persons while to enter, excepting for anchorage in a cove at about a mile, and in another at two miles, within its western head. It extends in for ten miles, and terminates in two inlets, surrounded by high, perpendicular, black rocks. Snowv Sound was formerly considered to be a channel communicating with Whale Sound, and insulating Ulloa Peninsula: but this is disproved by Captain Fitz Roy's careful examination of it.

THE FOLLOWING DESCRIPTIONS OF the BAYS between CAPE QUOD and CAPE NOTCH. are taken principally from the Anpendix to Cordova's Voyage to the Strait.

BARCELO BAY, the first to the west of Cape Quod, seems to be Barcelo Bay. large and incommodious; and strewed with small islets.

> OSSORNO BAY follows, and, according to Cordova, has very deep water all over; there being 40 fathoms within a cable's length of the beach, excepting on the west side, where there is a rocky ledge with from 10 to 20 fathoms.

Next, to the westward, is LANGARA BAY. It trends in for Langara Bay. about a mile to the north-east, and has 10 to 12 fathoms stony bottom. It is more sheltered than the two former bays.

POSADAS BAY is, most probably, Wallis's Lion Cove. Posadas Bay, Its or Lion Cove western point is formed by a high, rounded, and precipitous headland, resembling, in Captain Wallis's idea, a lion's head; and although Cordova could not discover the likeness, yet it is sufficiently descriptive to point out the bay, were the anchorage worth occupying, which it is not. Wallis describes it to have deep water close to the shore; his ship was anchored in 40. fathoms.\*

Arce Bay.

ARCE BAY. Cordova describes it to have anchorage in from 6 to 17 fathoms, stones. It divides at the bottom into two arms,

· Hawkesworth, vol. i. p 399.

**Ossorno Bay.** 

each being half a mile deep. The outer points bear from each other W. N. W. and E. S. E., half a mile across.

FLORES BAY is, probably, Wallis's Good Luck Bay. Cordova Flores Bay. describes it to be very small and exposed, with from 6 to 20 fathoms, stones and gravel. At the bottom is a rivulet of very good water.

VILLENA COVE has from 15 to 20 fathoms, and is very open Villena Cove. and exposed.

Then follows GUIRIOR BAY. It is large, and open to the Guirior Bay. south, and probably affords good anchorage in coves. Cordova describes it to extend for more than a league to the north, the mouth being two miles wide. Its west point is Cape Notch, which will serve to recognize it. Near the entrance is an island and several rocks; and within them, on the west side, are two coves, with from 15 to 30 fathoms, stones. Beyond them is the port, which has a narrow entrance. A river falls from a considerable height into it, and, by the rapidity of the current has formed a channel of oaze in the direction of the entrance, in which there is good anchorage in from 20 to 26 fathoms: on Anchorage. either side of the channel the bottom is stony. The port is too difficult to reach to make it an object of any value. Should, however, a strong gale from south or south-west oblige a ship to Directions for run in, she should avoid passing too near the west side of the entering the narrow: for a reef extends off it for nearly a cable's length. There is also a bank outside the narrow, but it is pointed out by kelp.

From the above description of the bays between Capes Quod and Notch, occupying a space of twelve miles and a half, and the anchorages from the view we had of them in passing, none seem to be convenient, or very safe. The best port for shelter, for a ship, is Swallow Harbour, on the opposite shore : but small vessels may find many places, that a ship dare not approach, where every convenience may be had; for if the water be too deep for anchorage, they may be secured to the shore at the bottom of the coves, where neither the swell nor the wind can reach them.

SWALLOW HARBOUR is one mile and a quarter to the westward of Snowy Sound. It is a better anchorage for ships than bour.

port.

Remarks upon between Capes Quod and Notch.

#### STRAIT OF MAGALHAENS.

bour.

Swallow Har- any in the neighbourhood. The plan of it is a sufficient guide, the dangers being well buoyed and pointed out by kelp. It was first used by Captain Carteret in the Swallow; and Cordova gives a short description of it.

Wallis's account of the harbour.

Cordova's account.

The auchorage is under the east side of the island which separates the harbour from Cordova's Condesa Bay, and which forms its west side. Wallis describes the harbour to be "sheltered from all winds, and excellent in every respect. There are two channels into it, which are both narrow, but not dangerous, as the rocks are easily discovered by the weeds that grow upon them."\* Cordova's account of it runs' thus-" To the westward of Snowy Sound are two bays, formed in a bight by an island. The eastern, Swallow Harbour, has in its mouth three islands and a rock; besides being strewed with kelp, which serves to point out the dangers in entering. Within, it is very well sheltered from all winds. The depth is from 40 to 16 fathoms, stones, and in some This bay is to the south of Cape Notch; and to reparts oaze. cognize it, there is a cascade falling down the centre of a mountain at the bottom of the port, to the westward of which are two higher mountains; the summit of the eastern being peaked, and the western one rounded.

#### Condesa Bay.

Rock off the entrance of Swallow Harbour.

Stewarts Bay.

The bay, to the westward of the island, is CONDESA BAY. It is full of islets and rocks, and the channel behind the island, communicating with Swallow Bay, is very narrow."+

At about a cable's length off the west point of the entrance of Swallow Harbour, Captain Fitz Roy saw a rock just awash. This danger should be carefully avoided.

STEWARTS BAY is less than a league from Swallow Bay. Of this place Captain Stokes makes the following remarks. "Stewarts Bay afforded us a quiet resting place for the night, but it is by no means to be recommended as an anchorage; for though it is sufficiently sheltered from wind and sea, yet the rocks, in different parts of it, render the passage in or out very hazardous: every danger in it is pointed out by rock weed, but it is so much straitened as to require the utmost vigilance. A plan of it was

Hawkesworth, vol. i. p. 401.

+ Ultimo Viage, p. 146.

made and connected with the coast by bearings and angles to Stewart Bay. Cape Notch, and to other fixed points. The description of the place by Cordova cannot be improved."\*

The account in Cordova is as follows :----

" Stewart Bay (La Bahia de Stuardo) follows Condesa Bay. It has an islet besides several patches of kelp, an indication of the many rocks that exist.--Even the best channel is narrow and tortuous; the depth from 12 to 16 fathoms, stones. At the bottom is an islet, forming two narrow channels leading into a port or basin, two cables length wide: the eastern channel is the deeper and has 15 to 20 fathoms. Inside the Basin, on the east side, the depth is 6 and 9 fathoms, mud. A reef extends for half a cable's length to the westward of the south end of the islet. It would be difficult and dangerous to enter this small basin."+

Then follows a deep and extensive channel, of which we know only that it extends to the south for five or six miles, and, perhaps, is very similar in its termination to Snowy Sound. It is Sarmiento's SNOWY CHANNEL. (Ensenada de Mucho-Nieve.)<sup>‡</sup> Snowy

At this part of the strait, the breadth is about two miles and a Channel. half; but, at Cape Quod, it scarcely exceeds one mile and a quarter. The shores are certainly much less verdant than to the eastward of Cape Quod; but not so dismal as Cordova's account would make them appear to be; for, he says: "As soon as Cape Quod is passed, the strait assumes the most horrible appearance, (con el aspecto mas horrible,) having high mountains on both sides, separated by ravines entirely destitute of trees, from the mid-height upwards." To us it appeared that the hills were certainly much more bare of vegetation above, but below were not deficient; the trees and shrubs, however, are of small size. For the purposes of fuel abundance of wood is to be obtained. In the winter months the hills are covered with snow, Appearance of from the summit to the base; but in the month of April, when the Adventure passed through, no snow was visible about them.

the Coast.

\* Stokes M. S.

+ Cordova, p. 147.

t Sarmiento, p. 207.

Appearance of the coast.

Captain Stokes remarks, that, the mountains in this part (Cape Notch) spire up into peaks of great height, connected by singularly sharp saw-like ridges, as bare of vegetation as if they had been rendered so by the hand of art. About their bases there are generally some green patches of jungle, but upon the whole nothing can be more steril and repulsive than this portion of the strait. This account of Captain Stokes agrees with Cordova's; but upon examining the coves, we found them so thickly wooded with shrubs and jungle, and small trees, that it was difficult to penetrate beyond a few yards from the beach.

Cape Notch.

CAPE NOTCH is a projecting point of grey coloured rock, about 650 feet high, having a deep cleft in its summit. It is a conspicuous headland, and cannot be mistaken.

Playa Parda Cove. The next place to the westward of Cape Notch, that can be recommended for an anchorage, is PLAYA PARDA COVE, which is well sheltered, and, for chain cables, has a good bottom, being of sandy-mud, strewed with stones; it is half a mile wide at the entrance, and about a quarter deep. Round the west side of Middle-point, is a channel, a quarter of a mile long and 150 yards wide, with 6 and 7 fathoms water, communicating with a very excellent little harbour for a small vessel, of about a quarter of a mile in diameter.

Playa Parda Cove is easily known by SHELTER ISLAND, that fronts the inlet of Playa Parda. The inlet is one mile and a half long, and half a mile broad, but with very deep water all over. By luffing round the island, a ship will fetch the anchorage in the cove; and, although sail should not be reduced too soon, yet the squalls, if the weather be bad, blow down the inlet of Playa Parda with great violence. Anchor a little within, and half-way between the points of entrance, at about one cable and a half from the middle point, in  $5\frac{1}{4}$  and 6 fathoms.

Glacier Bay.

Anchorage in Plava Parda

Cove.

Of GLACIER BAY, remarkable for a Glacier at the bottom, and of another bay to the eastward of it, we know nothing: the former may possess good shelter and, perhaps, anchorage; but the latter is too full of islands to be recommended. Between Glacier Bay and Playa Parda, the shore is bold but straight, excepting a small cove about two miles from Playa Parda, which seemed likely to afford shelter for small vessels. Off the Cove between west inner point is a reef, but within it there seemed to be a basin half a mile deep. Eye sketches of these three indentations were Parda. made as we passed by.

To the westward of Snowy Channel are several inlets affording, apparently, good shelter, but those we examined were found to have very deep water.

Opposite to Plava Parda is a deep opening which has more Abra the appearance of a channel, leading through the Tierra del Fuego, than any opening to the west of the Barbara. It is evidently the inlet noticed by Sarmiento, and thus described by him :--- " a great bay (Ensenada) which trends into the land in a W. S. W. direction for more than two leagues, and has an island at its mouth ;---we called it the ABRA (opening), because we did not see its termination. On the opposite shore there is another port and grey beach (Puerto y Playa Parda), which has an island that shelters it. Within the ABRA the land is low and hummocky ;-half a league beyond (i.e. to the eastward of) the Abra is a cove; and on the opposite shore, a league across. is another Cove which forms a port, which the Indians call PELEPELGUA, and the Cove they call EXEAQUIL.\*" The Cove PELEPELGUA, may probably be Glacier Bay, and EXEAQUIL must of course be one of the coves to the eastward of the ABRA.

To us, the opening of the-Abra seemed to be one mile and a half wide, with an island in the entrance. Within, it appeared to take, first, a south, then a S. W. course, and afterwards to trend round a projecting, low, hummocky point of the east shore, and wind under the base of a high precipitous ridge on the opposite or west shore, towards the S. E., beyond which, its course could not be observed.

On the seaward coast there is a deep opening behind Otway Bay, which, probably, may communicate with it.

The weather here is generally so thick, that, although the weather distance across be only two to three miles, yet one shore is frequently concealed from the other, by the mist: on which account Captain Stokes found it impossible to form any plan of this part of

\* Sarmiento, p. 206,

Glacier Bay and Plava

#### STRAIT OF MAGALHAENS.

the strait, on his passage through it. Captain Stokes, in leaving Weather. Stewart's Bay, says, "we continued our progress to the westward, having westerly and S. W. winds, with thick weather and drizling rain. The coasts on both sides were very rarely visible to us, by reason of the thick mist by which they were capped. It is, however, a bold coast on each side, otherwise the strait would be utterly unnavigable in such weather."

Marian's Core.

MARIAN'S COVE, one mile and a half to the west of Playa Parda, is a convenient anchorage; at the entrance it is about onethird of a mile wide, and more than half a mile deep; a plan was made of it, which will be a sufficient guide. Captain Stokes, observes, that it affords shelter from the prevailing winds; the anchorage is 22 fathoms, good holding ground; but less water may be obtained, if required, there being 8 fathoms within sixty yards of the beach, at the bottom of the bay. In entering, the west side should be kept aboard.

This cove is about midway between Cape l'Etoile and Playa Parda; and is a very advantageous place to stop at.

Bay opposite to Cape l'Etoile.

Opposite to Cape l'Etoile, is a Bay with anchorage in 17 fathoms, in a well sheltered situation. From Cape l'Etoile to the entrance of the Gulf of Xaultegua, the shore is straight and precipitous, and the hills are barren and rocky. On the opposite shore there are a few inlets, but the most useful one for the navigator is HALF PORT BAY, rather more than a league to the east Half Port Bay. of Cape Monday. It is immediately round the south side of a deep inlet. It is merely a slight indentation of the coast.

The Beagle anchored here on two or three occasions, and found it to be an excellent stopping place; the anchorage is within two-thirds of a cable's length of the west point, in 16 fathoms, muddy bottom. The situation of this cove was ascertained by observation to be in lat. 53° 11' 36" and lon. 73° 14' 57' W. (or 2° 20' 56' west of Port Famine.) There is a plan of this bay.

"The land on the S. W. side of the anchorage is high and thickly wooded from its summit to the water's edge. On the the eastern side it is lower, the vegetation more scanty and the trees crooked and stunted, and pressed down to the N. E. by the prevailing winds. S. W. by W. from the anchorage, is a re-

markable cleft in the summit of the highland, from which a Half Port Bay. narrow stripe cleared of jungle descends to the water's edge, apparently formed by the descent of a torrent or of large masses of the rock.\* The anchorage is well sheltered from prevailing breezes, and the holding ground is good: water and fuel are abundant."-Stokes' MSS.

There is an anchorage under Cape Monday for small vessels, in which Byron anchored, + and rode out a heavy gale of wind. With the exception of a shoal in midway of the entrance, on which there is 4 fathoms, it seems to offer good shelter from the prevailing winds. On the west side of Cape Monday is Cordova's MEDAL BAY (Puerto de la Medalla), of which a very full but florid description is given in the appendix of that voyage.<sup>±</sup>

It has, according to the description, an island in the entrance which forms two channels, the easternmost of which is only deep enough for boats, but the western is 25 fathoms wide; it is strewed half way across with kelp; but between the kelp and the island is a good and clear passage with 6 fathoms, sandy bottom. In the kelp there is not less than 4 fathoms, and inside it the depth is 9, 8, and 7 fathoms, sandy bottom. To enter this port there are no dangers that are not visible, and those are easily avoided: they consist only of the islet in its entrance, and some patches of kelp, over which, however, there is plenty of water.

The GULF OF XAULTEGUA, improperly called Bulkeley's Gulf of Xaul-Channel, is a deep opening, trending into the land in an easterly tegen. direction for twenty-eight miles, and approaching within two miles of some of the inlets on the north-west side of Indian Sound. The entrance is about four miles across, but afterwards expands to a width of nearly fifteen miles. At the entrance is St. Ann's Island, between which and the south point, is a navigable channel, half a mile wide. St. Anne's Island is about two miles long, and extends in a W. N. W. and E. S. E. direction; off its N. W. end is an islet, and there is another close to its S. W. extremity.

The land forming the north side of the strait, between the Gulf

L

<sup>·</sup> More probably by the effect of a gust of wind, which to the eastward, particularly in the Gabriel Channel, is very common.

<sup>+</sup> Hawkesworth, vol. i. p. 73, 1 Ultimo Viage, Appendice, p. 49.

#### STRAIT OF MAGALHAENS.

Gulf of Xaul- of Xaultegua\* and the Jerome Channel, is called Croker Penin-

The plan that was made of the gulf is little more than eye sketch. Captain Fitz Roy, who passed through it in a boat, and examined it to its termination, says: "If ever an accurate survey be made of the gulf, it must be when all other gulfs in the world have been examined, for it is utterly useless; and from the appearance of its shores I do not think there is any anchorage in it. Therefore, should a ship be so unfortunate cs to make a mistake and get into it, she must keep under weigh until she gets out again. There is no thoroughfare."—Fitz Roy's Journal.

Little has been said of the tides in this part of the strait, and, indeed, as to their rise and fall they are really of no importance, being little more than four feet. It is high water, at full and change, in all part within a few minutes of noon. The current sets constantly to the eastward with more or less strength.

Between Capes Notch and Quod, the current set us two miles to the eastward in three hours and a half; and from Cape Quod to Port Gallant, we found the current had favoured us six miles in three hours and a half. The ebb tide sets to the eastward.

• The name of Xaultegua is from Sarmlento, who very correctly describes it.— Sarmiento, page 208.

Tides.

74

## SECTION VI.

### Strait of MAGALHAENS-SEA Reach, including Capes VICTORY, PILLAR, and the EVANGELISTS.

Between Elizabeth Island and the western end of Long Reach Heavy swell there is very little swell. In a heavy gale, or, perhaps, even a in Sea Reach. strong breeze, a short sea may be experienced in the wider part of the strait, particularly near, and to the westward of Cape Froward; but nothing to be compared to the confused, breaking swell that runs in the SEA, or WESTERN REACH. It was felt by the Beagle when beating to the westward, immediately on reaching Cape Providence. There seems to be no danger for vessels beating through the strait hereabouts, the shore being bold to. Byron passed a night, and a very tempestuous one, here; as did also the Beagle, the latter not being able to find anchorage before night. Captain Stokes, upon this occasion, writes: "We continued beating to windward, the wind squally and weather rainy. The coast on both sides is bold. Our boards were directed during the night, which was very dark, by the sight of Cape Upright when on one shore, and of Cape Providence when on the other. We commonly tacked at the distance of a mile from either shore."

A league to the westward of Cape Monday is an inlet, which Puerto Anwe suppose to be Sarmiento's PUERTO ANGOSTO. Upon its west head is a conspicuous round mount, and to the north, between the mount and a projecting point, is a confined but very snug and commodious cove for a small vessel, in 17 fa- Anchorage thoms, at a quarter of a mile within the head.

In consulting the appendix to Cordova's voyage, it would seem that this projection is an island, insulated by the inlet here

gosto.

near it.

called Puerto Angosto. The description runs thus :--- " A bay Puerto Angesto.

formed in the Tierra del Fuego, between Cape San Ildefonso (Upright), and en island in the eastern part of its mouth. The figure of the island is triangular, and its N. E. point lies in the line of bearing of Capes Lunes (Monday), and San Ildefonso (Upright). At the east end of the island is an inlet running to the south-west, one mile and a third wide and a league long, to the bottom of the bay; the south-east side of the island being one mile and a half long. To the westward, the distance between the shore and the island is much more, and the direction of the second channel is N. 1 W. The bay, whose greatest breadth is two leagues, has at its bottom, and towards the S. E. part, the mouth of an inlet, the course of which disappears behind the mountains, in a S. 1 E. direction. There appeared to be a good anchorage between the island and the eastern shore, but we had no bottom with 30 fathoms."\*

There seems to be no doubt that the island above described is the projecting point four miles to the west of Cape Monday, and that Sarmiento's Puerto Angosto insulates it; but the Spanish chart is so vague, and our own so imperfect in this part, that I prefer leaving it to future examination, rather than invent an island; although, from the Spanish account, there seems no reason to doubt its existence.

Upright Bay.

Of UPRIGHT BAY we know little. The Adelaide rode out a gale from the eastward with her stern in the surf of the beach, and the Beagle anchored under the east side of the cape, at about half a mile S. W. of the rocky islet, and, for shelter from westerly winds, found it to be very good. Of this Captain Stokes says :--- "We anchored at a cable's length off a small patch of light-coloured shingle beach, situated at the west side of the bay, in 22 fathoms, sandy bottom. The anchorage, though affording excellent shelter from the prevailing winds, is bad with a southerly one; for the steepness of the bottom requiring a vessel to anchor close to the shore, sufficient scope is not left for veering cable. There is a plan of the bay in Hawkesworth from Byron's account, who anchored in the south-

• Ultimo Viage, Appendice, p. 62.

#### SEA REACH.

ern part of the bay, perhaps under the lee of the islands to the S. E. of the cape.

CAPE UPRIGHT bears due south five miles from Cape Provi- Cape Upright. dence. It has a rocky islet a quarter of a mile off its east extremity, surrounded by kelp, which also extends for some distance from the cape towards the islet, at the end of which there are 7 fathoms.

CAPE PROVIDENCE is a rugged rocky mountain, higher than Cape Provithe adjacent coast; it is deeply cleft at the top, and, when bearing about north, the western portion of its summit appears arched, the eastern lower and peaked. When the cape bears E. by S. (mag.) distant about one league and a half, a little round rocky islet will be seen open of it, about one quarter of a point of the compass more southerly."-Stokes' MSS.

There are some anchorages on the right, to the N. E. of Cape Anchorages Providence, according to a plan given in Hawkesworth's Collection of Voyages, but they are too much out of the way, as well as very open and exposed to southerly winds, to be of use, or to offer any security to vessels bound through the strait.

The distance from Cape Providence to CAPE TAMAR, is nine Cape Tamar. miles and a half; in this space the land arches inwards, and forms a bay about a league and a half deep. Captain Stokes describes the coast to the east of Cape Tamar to be formed into two large bights by the land of Cape Providence. On the western side of the latter are several islands, of which two are conspicuous; they are round and of a good height, and well wooded; at a distance their form is conical, the eastern being the lowest. Between them is a passage to two good anchorages, which Lieutenant Skyring, who examined them, considered even more sheltered than Tamar Harbour.

Four miles to the eastward of Cape Tamar is ROUND ISLAND, Anchorage to the N. W. of which is a well sheltered anchorage, but with deep near Round Island. water. In standing in, pass midway between Round Island and an island to the westward, which lies close to the shore, and haul round the latter to the mouth of a cove, in the entrance of which, near the south shore, there are 23 fathoms, sand. shore, to the N. and N. E. of Round Island, is very rocky. On the east side of the promontory of Cape Tamar, is the use-

dence.

Tamar Har-

78

- bour.
- Directions.

Directions

two miles wide, and rather more than half a mile deep. Its entrance is not exactly free from danger, but, with attention to the following directions, none need be apprehended. There is a sunken rock between a group of rocky islets, one-third over on the western side, and a patch of kelp, one-third towards the eastern side of the bay. With a westerly wind it would be advisable to give the outer rock a berth of two cables' length to avoid this danger, on which there are only 9 feet of water, and upon which the Beagle struck.

Leading mark for sunken rock. "An excellent leading-mark for this shoal, is a whitened portion of bare rock, looking like a tombstone, about one-third of the way up the green side of the mountainous land that forms the coast of the bay. This stone bears N. 76° W. (by compass) from the rocks to be rounded on entering the anchorage."\*

The least water found among the kelp on the east side of the channel was 4½ fathoms, and near and within the edge towards the rocky islets there are 7 fathoms; so that with the lead in hand, and a look out for kelp, which should not unnecessarily be entered, there is no real danger to be apprehended. The Beagle anchored at about one-third of a mile from the back of the bay. The plan will shew what is further necessary to be known of the anchorage.

High water at full and change.

Tides.

High water at full and change takes place in Tamar Harbour at 3<sup>b</sup> 5', and the perpendicular rise and fall is five feet.

The flood tide on this part of the northern shore of the strait sets to the eastward, and rarely exceeds half a mile an hour. At this pait the strait is seven miles wide; at Cape Phillip, to the westward, the breadth increases to five leagues; but at Cape Parker it narrows again four leagues, which breadth it keeps to the end.

Tamar Island.

To the westward of Cape Tamar is TAMAR ISLAND. It is high, and is separated from the land of the cape by a deep channel from half to one mile wide. Half a mile off its S. W. end is a rock.

Between Capes Tamar and Phillip, a space of four leagues,

\* Stokes' MSS.

#### SEA REACH.

there is a deep bight, with two openings ; the easternmost, in which are GLACIER and ICY SOUNDS, extends to the N. E. for ten miles Glacier and Icy Sounds. from the mouth; and the westernmost is the commencement of Smyth's Channel. The rocks, called the Straglers, extend to a Straglers. considerable distance to the S. W., as far as three miles within the line of bearing between Cape Phillip and Tamar Island.

Under the lee (the N. E.) of CAPE PHILLIP is SHOLL'S BAY, Sholl's Bay, in which the Beagle anchored in 1827. Of this place Captain Stokes writes :-- "We found, there, an excellent anchorage in 15 fathoms. It is valuable for vessels working through the strait to the westward, inasmuch as, from the discontinuous nature of the northern shore, (which here is formed into deep bays,) this place will be much more easily recognized than the anchorages on the opposite coast; besides the winds hang here, in general, somewhat to the northward of west, hence a better startingplace for the westward is obtained. Here, as in every anchor- Productions. age on the strait, water and fuel are easily procured; but nothing more, unless we except the wild berries, (Berberis, sp.) celery, muscles, and limpets; the wild goose abounds here, but its nauscous, filthy taste, renders it uncatable. No inhabitants, no quadrupeds."\*

Of the coast of the strait on the south side, between Cape Coast between Upright and Valentine Bay, we know very little; there are and Valentine several deep bights and spacious bays, which may contain anchor- Bay. age, but, in general, they are not found in the large harbours, which are mostly deep, precipitous chasms or ravines in the rock. The smaller coves, or where the land shelves down to the sea. are more likely to afford anchorages.

In the appendix to Cordova's work are descriptions of some Anchorages anchorages, which it may be useful to mention here: it says, right. "In rounding Cape (Ildefonso) Upright we found ourselves in a bay, not very deep, two miles across, divided in its centre by many islets and rocks extending to the north; the outer or northernmost of which bears west from the extremity of the cape-One mile N. W. 1 N. from the northernmost islet is a round rock, which is of dangerous approach."

· Stokes' MSS.

Anchorages to the west of Cape Upright. To the westward of this bay is another, three miles wide, and about as deep; the whole of it, particularly towards the eastern part, is full of islets, and at the bottom is a narrow canal trending to the S.S.E. At the western end of this bay, called by Wallis the Bay of Islands, from the number it contained, commences a third, which, with the two preceding, make the great bay, called by the Indians, according to Sarmiento, ALQUILQUA. It is contained between Cape Upright and a bold projecting point, ten miles to the W. N. W., called Point Echinique. The country is there described to be poor, and the vegetation scanty.

Cuaviguilgua and Port Uriarte.

Puchachailgua. The eastern point of the Third Bay has a string of islets extending a mile to the north; and to the south-west are several others.\* And on its east side is a bay called CUAVIGUILGUA; and a little beyond it, at the bottom of the bay, is PORT URIARTE, the mouth of which is two cables' length across.

Port Uriarte was carefully sounded, but the bottom is generally bad and stony, with 5, 8, 14, to 18 fathoms. The harbour is surrounded by high mountains, rising vertically, and with only a few stunted trees on the shores. Its greatest extent, which is from north to south, is half a mile; the mouth is not visible until close to it: its bearing from Cape Providence is S. 42° 30' W. There is no danger in entering it but what is visible; but it is not recommended as a good harbour from the foul ground all over it. A little to the eastward also of Point Echenique is CAPE SANTA CASILDA—a low point.<sup>†</sup>

To the west of Point Echenique is a harbour two miles and one-third wide, the points of entrance bearing N. W. and S. E. There is an island in the centre forming two channels, but with very deep water, no ground being found within 55 fathoms. At the bottom is a canal trending to the S. S. W., and disappearing between the mountains. On the eastern side of the island the channel is at first a mile wide, but afterwards narrows gradually: the western channel is scarcely two cables' length across. The shores are high precipitous mountains. The Indians, according to Sarmiento, call the place PUCHACHAILGUA.

· Ultimo Viage, Appendice, p. 56 and 57.

† Ib, p. 61.

**80** 

The CANAL DE LA TEMPESTAD (or STORMY CHANNEL), from Canal de la the description, is not to be recommended. The water is very Tempestal. deep all over, and the place affords no security for vessels of any description.\* To the westward is a better harbour, which the Spanish officers thought to be Sarmiento's PORT SANTA MONICA. Port Santa It bears S. S. W. from Cape Tamar, and it is fourteen miles to the westward of Cape Upright, but not more than 3 leagues according to Sarmiento's account.+

Two thirds of a mile to the westward, is a point with two islets off it, round which is PORT CHURRUCA, a deep and spacious Port Churruca. bay, two miles wide, the points bearing E. S. E. and W. N. W., containing two ports and some coves, but with very deep water, and therefore useless, for it would be necessary to make fast to the rocks to secure a vessel.

To the westward of this we have laid down a useful cove, Darby Core. DARBY COVE, in which small vessels may obtain good shelter.

. From Darby Cove the coast extends to the N. 65° W. for seven miles, having in the interval several indentations, but all with deep water; at POINT FELIX the land trends deeply in to the south-west, and forms a bay five miles wide and two and a At its western side is VALENTINE HARBOUR, in Valentino which the Beagle anchored, of which there is no written description in Captain Stokes' Journal: the plan, however, will shew the nature of the anchorage, which seems to be commodious and secure, and of easy approach. On hauling round the island, there are some islets half a mile off, which must be avoided, but otherwise there seems to be no dangers.

The anchorage, as a stopping place, is in from 20 to 26 fathoms, sand, at nearly a quarter of a mile from either shore : a more sheltered situation may be obtained to the south-west.

The latitude of the mount (marked in the plan) is 52° 55′ 05″, and Ion. 74° 15'. Variation of the compass 24° 10'.

CAPE CUEVAS, the extremity of an island that is close to the Cape Cuevas. shore, is in lat. 52° 53' 19', and lon. 74° 17' 30'. Between it and Cape Valentine the coast forms a bay with islands in it. the westward, also, of the cape, the coast is broken, and forms

#### STRAIT OF MAGALHAENS.

some sinuosities. A league N. W.  $\frac{1}{2}$  W. from Cape Cuevas, is Truxillo Bay. the east part of TRUXILLO BAY, which was not examined.

The Spanish account describes it to be one mile and threequarters wide, in the direction of N. W. and S. E., and half a mile deep. At the bottom there is a port with an entrance half a mile across, bearing nearly North and South. It is a well-sheltered port, trending W. S. W. for one mile and a quarter, with two'small basins at the bottom. The depth is very great, but close to the west shore there are 8, 10 to 13 fathoms, on sand and coral. Near the mouth the depth is great, and generally of stones. There are several banks buoyed by sea weed, but in none was there less than 7 fathoms water.\*

There is plenty of wood and water in Truxillo Bay, but nobody will visit it in preference to TUESDAY BAY, or, rather, Tuesday Cove. the more convenient anchorage of TUESDAY COVE, situated three-quarters of a mile south of Cape Cortado. The anchorage is in 12 to 14 fathoms. Tuesday Bay is larger, and, therefore, more exposed to the squalls; but for a ship, perhaps, might be more convenient.

On the north shore of the strait, opposite to Cape Cortado, is Cape Parker. CAPE PARKER, a remarkable projection with three hummocks on the summit of the high land which rises over it. To the eastward the coast trends deeply in to the north, forming a bay, the eastern head of which, Cape Phillip, bears S. 97° E. nine miles. There appeared to be several islands in the bay, and at the bottom a narrow opening, perhaps a channel, leading to the north.

> On the west side of the bay the coast is indented, and affords some anchorages, but the approach is not clear. The first bay, however, to the eastward of the S. E. trend of the cape seems to afford a good stopping-place; but it is fronted by a considerable shoal, with two rocky islets, the depth is from 7 to 22 fathoms.

> The land of CAPE PARKER will probably turn out to be an island. To the westward of it commences a range of islands, rocks, and shoals, fronting a broken coast that should never be approached but for the purpose of discovery or scal-fishery.

#### SEA REACH.

The easternmost island is WESTMINSTER HALL,\* a high, rocky Westminster island; and there are two or three other conspicuous points such as the CUPOLA and OBSERVATION MOUNT, that might be noticed. The Beagle ran in amongst the breakers, and anchored near the latter, for the purpose of ascertaining its position, and obtaining bearings for the survey.

SIR JOHN NARBOROUGH'S ISLANDS consist of 8 or 10 principal Sir John Narislands, and, perhaps, hundreds of smaller ones. Behind them lands. there seemed to be a channel, and amongst them are several anchorages, but none to be recommended, especially when on the south coast there are two or three much better, much safer, and of much easier access.

It is a dangerous coast, as well from the immense number of rocks, upon which the sea breaches very high, as from the tides, which near the edge of the line of shoals set frequently in amongst them.

A league to the westward of Cape Cortado, is SKYRING Skyring Har-HARBOUR; its entrance is one mile and a quarter wide, and afterwards half a mile, and trends to the S. W. by W. for one mile and a half, and then terminates in a cove extending half a mile to the S. E. with 10 fathoms in it. There are some islands in it, and anchorage might be obtained in 27 fathoms.

At three miles and a half from the west point of Skyring Harbour is the east head of the HARBOUR OF MERCY, (Puerto Harbour of de la Misericordia of Sarmiento†, Separation Harbour of Wal-Mercy. lis and Carteret, ±) one of the best anchorages of the western part of the strait, and being only four miles within Cape Pillar, is very conveniently placed for a ship to anchor at to await a favourable opportunity for leaving the strait. The plan will be a sufficient guide; for there is no danger in entering. The depth is moderate, 12 to 14 fathoms, and the holding-ground excellent, being a black clay. A ship may select her position; but the one off the first bight round the point being equally well sheltered, and much more convenient for many purposes, is the best berth.

The observations for latitude and longitude were made upon

Hall.

borough's Is-

bour.

<sup>•</sup> Narborough, p. 77. † Sarmiento, p. 182. † Chart of the Strait of Magalhaens in Hawkesworth, vol. i.

Harbour of Mercy. the largest of Observation Islets, the summit of which was found to be in lat.  $52^{\circ}$  44' 57", and lon.  $74^{\circ}$  35' 31"; the variation is 23° 48'.

Three miles to the westward of the largest Observation Islet, is Cape Pillar, upon which Captain Stokes landed, on 25th February, 1827, but not without considerable difficulty, owing to the great swell that then, and indeed always, prevails near it. Here he observed the latitude. Captain Fitz Roy also landed in a cove under the cape in 1829, with his instruments, to obtain bearings from its summit; but the difficulty of the ascent was so great that he did not risk the destruction of them.

Situation of Cape Pillar.

The extremity of Cape Pillar is in lat.  $52^{\circ} 42' 53''$ , and longitude 74° 39' 31', and Cape Victory in  $52^{\circ} 16' 10''$ , and 74° 50' 55". These points form the western entrance of the strait.

Evangelists.

"THE EVANGELISTS, as they were named by the early Spanish navigators, but THE ISLES OF DIRECTION by Narborough, from their forming a capital leading-mark for the western mouth of the strait, are a group of rocky islets, consisting of four principal ones, and some detached rocks and breakers. The islands are very rugged and barren, and suited only to afford a restingplace or breeding-haunt of seals and oceanic birds. There is landing on one of the islands, and anchorage round them, if necessary. The largest and highest may be seen in tolerably clear weather, from a brig's deck, at the distance of seven or eight leagues.\* The southernmost, from its shape called the Sugar Loaf, is in latitude 52° 24' 18" and longitude 75° 02' 56". From the Sugar Loaf, the extremity of Cape Pillar bears N. 38°, W. twenty-three miles and a half, and from Cape Victory, according to Captain Stokes's survey, S. 42° W. 11 miles."-Stokes' MSS.

The tides here are very variable, and sometimes set to the E. N. E. towards the rocks that front Cape Victory and Sir John Narborough's Islands.

\* We saw them iwenty-two miles off, from the Adventure's deck .- P. P. K.

### SECTION VII.

Of the SEA, or OUTER COAST, of TIERRA DEL FUEGO, from Cape PILLAR to Cape DIEGO in Strait LE MAIRE, by Captain Robert Fitz Roy, R.N.

[ In this Section references (printed in Italics ) are made to a work published by Captain Fitz Roy, entitled "Views of the Coast, taken on board His Majesty's Surveying Vessel, Beagle, 1829 and 1830."]

The western entrance to the Strait of Magalhaens is easily known by the wide opening between Sir John Narborough's Islands and Cape Pillar. The EVANGELISTS shew themselves distinctly at six miles distance; they are four barren rocks, about one hundred feet above the sea.--(See page 84.)

On the north side of the strait, near Cape Victory, is a remarkable height, called DIANA's PEAK.-(See Sketch 1.)

WESTMINSTER HALL is remarkable, but the land about Cape Pillar cannot be mistaken, after a glance at the chart (and the Views, Nos. 2 and 3).

In making the land and approaching the strait, a ship should Approach to keep well to the northward of Cape Pillar, and should, indeed, close the Evangelists, unless the wind has southing, because there is a strong current which sets across the entrance of the strait, directly towards the dangerous cluster of rocks called the Apostles and Judges. It follows the trend of the coast, and would set a ship many miles to the southward of Cape Pillar if she stood in for it without making proper allowance. It runs from one to two miles an hour, according to the winds that are or have been prevalent.

When fairly within the strait, a ship should close the southern

Western entrance of the Strait of Magalhaens. Evangelists.

Diana's Peak.

Westminster Hall.

Cape Pillar. Directions.

First anchorage. shore. If intending to anchor, the first anchorage is the HAR-BOUR OF MERCY, four miles from Cape Pillar, its place is shewn by five small islands, round which you pass and haul in to the anchorage.—(See page 83.)

Close to Cape Pillar are two small rocks, called the Launches: they are not more than three cables' length from the shore.

The cape and the shore on each side is steep to. Off the cape, at two miles distance, are 60 and 70 fathoms, fine sand.

Apostle and Judgo Rocks

Dislocation Harbour.

Law and Shoulder Peaks.

Direction for Entering Dis, location Harbour.

Proceeding along the outer, or south-west coast, the APOSTLE (view No. 6) and JUDGE Rocks show themselves; they are some feet, from five to fifty, above the water, but many breakers shew near them, and indicate an extensive reef. The outer rock is four miles from the land. Eleven miles from Cape Pillar is DISLOCATION HARBOUR (view No. 5), a place of refuge for an embayed or distressed ship, but unfit for any other purpose; its entrance is rendered difficult, to the eye, by rocks, on which the sea breaks violently; and by two rocks under water, on which the sea does not always break, but whose place is accurately shewn in the plan of the harbour. (For the appearance of this part of the coast look at the Sketches Nos. 5, 6, and 7.) The place of Dislocation Harbour is pointed out by the heights, called LAW and SHOULDER Peaks, they are the most remarkable on that part of the coast, and immediately over the harbour.

To find the entrance, steer for the peaks, look out for the weather and lee rocks, both several feet above water, the sca breaking violently on them, and when within four miles of the shore you will distinctly see the opening from the mast-head. In going in, avoid the two rocks at the entrance, and anchor in the innermost part; only a small ship can get out again without a fair wind. The prevailing winds send in a swell, but the place is quite secure. Water may be obtained very easily, the boats can lie in a stream which runs from the mountains, and fill along-side. Wood is plentiful. Four small vessels may lie in security; the bottom is very even, from 15 to 25 fathoms, fine white sand.

The entrance is narrow, exposed to the prevailing wind and swell, which might, for days together, prevent a vessel from getting out to sea. Two miles from Dislocation Harbour, is CAPE

## CAPE PILLAR TO MELVILLE SOUND.

DESEADO, the highest land hereabout, and remarkable; a rocky Cape Deseado, islet lies one mile off shore.

From Cape Deseado the coast runs high and unbroken for Coast to the about two miles, then there is an opening, not examined.

Several islands succeed for a space of two miles, after which you open BARRISTER BAY, an exposed place, full of islets, rocks, and breakers, and unfit for any vessel.

CAPE SUNDAY is the next headland; it is high and prominent Cape Sunday. (see No. 7). Two islets and two dangerous rocks lie off it, they are shewn in the chart.

This cape is on one of a cluster called the WEEK ISLANDS. At Week Islands. their south side is a roadstead, with good holding in 18 or 20 fathoms, coarse gravel and sand, with patches of rock. It is exposed to southerly winds and to those from the west, therefore I should not advise a vessel to anchor there. Between the islands Anchorage is a snug berth for a small vessel, quite secure, but difficult of access. The Beagle lay at anchor there one week, in 24 fathoms, good holding ground.

The eye must be the chief guide in entering most of these places; they are of one description-inlets between high land, having, generally, deep water, with kelp buoying the rocky places. Flaws of wind and violent gusts off the high land render the approach to them difficult, and, to a large ship, impracticable.

There are, however, anchorages on this coast fit for a fleet, which will be mentioned in their order.

Six miles south of the Week Islands are the LANDFALL Landfall Isles. ISLANDS, (Nos. 9, 10, and 11,) so named by Captain Cook, from seeing them first when he visited this coast.

CAPE INMAN is a very remarkable head-land at their western Cape Inman. extremity.- (See Nos. 7, 8, and 9.)

Digitized by Google

Behind the island, of which it forms the most conspicuous part, is LATITUDE BAV, an anchorage decidedly good, though Latitude Bay. somewhat exposed to a swell thrown in by heavy north-west

The Beagle rode out a heavy gale from that quarter, though having anchored too far in, she was exposed to rollers. The plan shews the best anchorage, (and the sketch annexed how to find it, see No. 11).

east of Cape Deseado.

among them.

87

#### TIERRA DEL FUEGO.

Anchorage between the Landfall Islands. Between the islands is a snug berth for a vessel not drawing more than twelve feet, in perfect security, smooth water; and a vessel should not moor in less than ten fathoms, as close to the west shore as possible, with an anchor to the eastward, in the event of the wind blowing from that quarter. Water and wood are plentiful, as is the case in every Fuegian harbour.

Otway Bay.

Behind, or to the eastward of the Landfall Islands, is OTWAY BAY, an extensive space of water, surrounded by broken land, islets and rocks. Many of the latter are scattered about, and render it unfit for any vessel. It is probable that passages lead hence to the Straits of Magalhaens, as deep inlets run in that direction as far as the eye can reach, from the Landfall Islands: they were not explored for want of time.\*

Off CAPE INMAN are several detached rocks, on which the sea breaks violently, and gives them a formidable appearance. The outermost one is not two miles from the shore, and shews itself plainly.

Cape Schetky. CAPE SCHETKY is a remarkable double-peaked height, at the south extremity of the Landfall Islands, some rocks just awash lie off it, distant one mile. The *true* course along shore, after giving the Apostles a proper berth, is S. 29° E., as far as the latitude of Cape Tate, (No. 12,) the southern limit of Otway Bay.

Cape Tate. Off CAPE TATE, which is rather high, and rounded at the summit, are several clusters of rocks, called the COLLEGE ROCKS : they are only seen when near the land.

Fincham Islands. The FINCHAM ISLANDS next are noticed in passing along shore. There are many islets and rocks near, and very many scattered between the islands and Cape Tate. As a reference to the chart will shew, there is no good anchorage hereabout, the coast is very dangerous and unfit to be approached. The Beagle tried to anchor in DEEPWATER SOUND, but failing to find a proper depth of water, was obliged to drop her anchor upon the shelving end of a small island, being too far up the sound to get out again before dark.

• It seems probable that a communication may exist between this inlet and the Abra, in the Strait, opposite Playa Parda. See page71.—P. P. K.

88

Between the Fincham Islands and Cape Gloucester, is Breaker Bay. BREAKER BAY; a large wild place, full of rocks and breakers, and exposed to all the strength of the west winds. I had neither time nor inclination to examine it, for I never saw a place more unfit for the approach of a vessel. The surrounding coast is broken into islands, islets, and rocks, almost innumerable.

CAPE GLOUCESTER is a very remarkable promontory, and Cape cannot be mistaken. (See Nos. 13, 14, 15, 16, and 17.) At a Gloucester. distance it appears to be a high, detached island; but, on a nearer approach, a low neck of land is seen, which connects it with the largest of the Grafton Islands (No. 18). A rock (on which the sea breaks) lies nearly one mile to the north-west; there is no other danger. The cape may be passed quite close, being steep to.

Cape Gloucester is a guide to EUSTON BAY, (Nos. 19, 20, and Euston Bay, a 21,) one of the best anchorages on this coast, one which can good Anchorbe approached and left with any wind, without risk, and in which a fleet may lie in perfect security from all but the S. E. winds, the least prevalent of any on this coast.

The GRAFTON ISLANDS extend about twenty miles in a south- Grafton Islee. east direction from Cape Gloucester; between them are several anchorages, but the best and easiest of access is Euston Bay.

Passing Cape Gloucester, you see a high island to the southeast, distant seven miles; this is Ipswich Island (Nos. 19 and Ipswich Island. 20). Between it and Cape Gloucester is a bay, in which are many rocks and breakers.

Rounding Ipswich Island, you must give a good berth Directions, to the rocks under water, which lie one mile from its south-east extremity. The sea does not always break upon them, but it does generally. Their place in the chart may be depended upon. There is no other hidden danger. After clearing these rocks, pass close to Leading Island, (Nos. 19 and 20,) and steer for the opening of LAURA BASIN, which Laura Basin. you will see under a high peaked mountain (Nos. 19, 20, and 21). Choose your berth by the eye, if intending to anchor in the bay, or work as far up the passage to the basin as you think proper, then anchor and warp to the berth marked in the plan.

Description.

The Beagle worked up all the way against a fresh wind blowing directly out. There is water for a frigate in the basin, but it is better suited to a small vessel. Large ships should anchor Good Harbour. in the bay; and as the bottom is even and good, and the bay capacious, exposed only to south-east winds, which come on gradually and seldom blow hard, it may be considered a fit place for ships of any size, or for a squadron. Wood and water are plentiful, and easy to be obtained. The depth of water in the bay varies from 5 to 20 fathoms—the bottom generally fine speckled sand.

Bed of Kelp across the Harbour, A large patch of kelp lies across the entrance of the harbour, but there is no danger beneath it, except for a line-of-battle ship, as in one spot there are 4 fathoms only. This kelp was very closely examined, and its safety satisfactorily proved.

Other Anchorages.

There are other anchorages among these islands, but none fit or desirable for a ship while so near Euston Bay. HOP HARBOUR is one of those formerly used by sealing

Hope Harbour.

Isabella Island.

vessels.

Under ISABELLA ISLAND is an anchorage fit for a scaling vessel, but no other. Rocks lie in the way to it, as the chart shews; the Beagle passed a night there, but not by choice.

Appearance of the Grafton Islands. The GRAFTON ISLANDS are high, and the remarks on the general character of the coast are applicable to them. (See No. 21.) Behind them lies a passage, through which a sealing vessel has passed. To the north-east of it is a mass of land, broken into islets and rocks.

Having passed Cape Gloucester, your attention is drawn to
Noir Island.
Noir Island.
Noir Island, of moderate height, about six hundred feet above the sea, and having a remarkable neck of land to the south-west, ended by a rock like a steeple, or tower. (See Nos. 22, 23, and 24.) One mile south of this point is a sunken rock, over which the sea occasionally breaks: two other breakers are in the bight close to the point.

Noir Roads.

There is an excellent roadstead under the cast side of NOIR ISLAND. Several ships may lie there, secure from all winds between north and south by the west, over a clear, sandy bottom. Wood and water plentiful, and easily obtained. There is a cove at the south part of the island, where boats would be perfectly

# CAPE PILLAR TO MELVILLE SOUND.

safe in any weather, but the entrance is too narrow for vessels of any kind.

The large space between Noir Island and the AGNES ISLANDS Number of is extremely dangerous for shipping, being scattered with rocks, some just awash, many shewing themselves several feet above, others under water. Still there is abundant room to go round the island in perfect security, therefore no ship need fear being hampered by an east wind, in the event of anchoring in Noir Roads. A rock lies in the roads, and another, a very dangerous one, four miles to the eastward: they are exactly laid down in the chart. If here months and shares soil glob be detail again a

Seven miles south of Noir Island are the TOWER ROCKS (No. Tower Rocks. 23); they are high, quite steep to, and exactly laid down in the chart. A ship may pass close to either side of them.

Between Noir Island and CAPE SCHOMBERG, on London Dangers in the Island, lie many reefs, and a great number of detached outlying rocks, which render this part of the coast extremely dangerous and unfit for vessels. No chart could guide them; they must trust to daylight and clear weather, with a good look out, if necessary to enter or leave the Barbara Channel, which opens into this bay. Addition that worked input to interest signally our

The AGNES ISLANDS, and those in their neighbourhood, do Agnes Islands not require any description. They are so fortified by outlying rocks, as not to be fit places for the approach of any vessel.

Northward of them is STOKES BAY, and to the eastward a Stokes Bay. number of islands, between which is the Barbara Channel.

No vessel ought to entangle herself in these labyrinths-if she Bad place for does, she must sail by eye. Neither chart, directions, nor soundings, would be of much assistance, and, in thick weather, her situation would be most precarious.

Between Noir and Kempe Islands, (No. 25,) is the MILKY WAY, Milky Way. a space of sea, in every part of which rocks are seen just awash with, or a few feet above, the water. On them the sea continually breaks.

The Beagle passed in shore of them all, close to the Agnes, Beagle's Kempe, and Fury Islands; but I should not advise any vessel to follow her track, nor is there any probability of its ever being attempted.

Rocks.

91

entrance of Melville Sound.

Salut stanfinst

shipping.

Track.

This part of the coast only requires to be known to be the more avoided.

Fury Harbour.

At the south side of Fury Island is FURY HARBOUR, a bad place, unfit for any vessel. The Saxe Coburg sealing schooner was lost in it in the year 1827. There is little shelter, and very bad ground. (See page 42.)

Between Fury and London Islands is the entrance of the Barbara and Cockburn Channels. (No. 26 b.) Rocks shew them-East and West selves in every direction,-the two clusters called East and West Furies being the most remarkable. They have been much frequented by sealing vessels' boats, fur seal being numerous upon them at times. (See page 42.)

Remarkable Mountains in MelvilleSound.

Furies.

Four remarkable mountains point out the entrance to the Barbara Channel very distinctly. The KEMPE PEAKS (No. 25) are high, and shew three points. The FURY PEAKS (No. 26 a, and No. 27) are high and divided. MOUNT SKYRING (No. 26 a, 26 b, and 27) is high, and has a single peak. ST. PAUL'S is similar to, and in one view, from near Fury Island, appears very like the dome of the cathedral whose name it bears.

Rocks off the Barbara Channel.

North Cove.

The situation of the rocks off the channel's entrance, as laid down in the chart, is accurate; but no vessel should attempt to pass them without daylight and clear weather, so that she may sail more by a good eye at the mast-head, than by any chart.

At the north side of Fury Island is a snug and perfectly safe anchorage, called North Cove (see page 42). It is, however, only fit for small vessels. When there, they are in security; but it must be remembered that there is no anchorage in the channel, nor until you get into the cove, unless you close the weather shore, and find a creek, in which the anchor will hold you temporarily. At the north side of Mount Skyring is another anchorage, Tom's Harbour (see page 42), fit for small vessels. The Adelaide, tender to His Majesty's sloop Adventure, anchored in it when exploring these parts.

Soundings on the coast.

There are soundings over all the tract of sea between Noir and London Islands, seldom exceeding 60 fathoms, and near the rocks diminishing to 20, 15, and 10.

London Island.

LONDON ISLAND is one of a large group called the Camden Islands. At its cast end is a safe anchorage called TOWNSHEND HARBOUR (No. 27). The HORACE PEAKS (No. 27) point out its situation. Some rocks, on which the sea breaks violently, lie off the islands, and near the entrance of PRATT PASSAGE. They are exactly laid down in the chart. As there are no soundings in less than 50 fathoms after passing these rocks, and getting into the passage, you must depend upon the wind lasting to carry you into or out of the harbour. The holding ground in ground. it is excellent, and though you have tremendous squalls off the high land to the westward, there is no fear of an anchor starting. The Beagle lay here, moored, during the worst weather she had Beagle moored on the coast. A very high sea was raised outside by a violent southerly gale, but she remained in perfect security without moving an anchor.

The lee side of high land, as I have elsewhere remarked, is not the best for anchorage in this country. When good holding can be found to windward of a height, and low land lies to windward of you, sufficient to break the sea, the anchorage is much preferable, because the wind is steady, and does not blow home to the heights. Being to leeward of them is like being on the west side of Gibraltar Rock when it blows a strong Levanter.

Between, and to the northward of these islands, are passages with deep water, numbers of islets and rocks, and anchorages opposite to most of the valleys, or between the islands, in which small vessels could lie securely, if necessary.

BRECKNOCK PASSAGE is wide, and clear of all danger. should prefer entering or leaving the Barbara Channel by this way, rather than by passing the Fury Rocks.

CAPE DESOLATION, the south point of BASKET ISLAND, is a Cave Desolavery remarkable headland (No. 27); it is rugged, with many tion. peaks.

The next promontory which is approached in passing along the coast is CAPE CASTLEREAGH (No. 27); it is high and re- Cape Castlemarkable. Between this and Cape Desolation is a large space reagh. of water, called DESOLATE BAY, leading to COURTENAY SOUND, Desolate Bay THIEVES SOUND, and WHALE-BOAT SOUND.

Townshend Harbour and Horace Peaks.

Good holding

I Brecknock Passage.

#### TIERRA DEL FUEGO.

fit for shipping ; no doubt small vessels might, in clear weather,

traverse any of these passages, but it would always be with much risk, and should not be attempted without an adequate object.

Rocks and breakers abound, and make these sounds quite un-

These Sounds are practicable, but not advisable.

Stewart Harbour. Such an object does not now, nor is it likely to exist. Under Cape Castlereagh is an excellent anchorage called STEWART HARBOUR. It is not large, but for small vessels is an exceedingly good place, being easy of access with any wind, having three openings. A vessel may anchor in the entrance and warp in; there is nowhere more than 16 fathoms, generally from 6 to 12. Wood and water, as in every Fuegian harbour, are plentiful, and easily obtained.

Two rocks lie nearly in the middle, just awash at high water. The plan shews their place exactly.

A rock, on which the sea breaks, lies one mile west of the middle opening to the harbour. There is no other danger.

Farther to the south-east are the GILBERT ISLANDS, off which, eight miles S. 30° E, from Cape Castlercagh, are the NICHOL-SON ROCKS.

Between the Stewart and Gilbert Islands is ADVENTURE PASSAGE, an open space, with deep water, clear of danger.

At the north-eastern side of the eastern Gilbert Isle is DORIS COVE, a safe anchorage for a small vessel. The Beagle lay there, moored, one week. There are no hidden dangers hereabouts; the eye and the chart will guide a vessel safely.

I say nothing of the large sounds and numerous passages lying to the northward of these and the Stewart Islands, because they are not likely to be again visited.

The LONDONDERRY ISLANDS are the next, they extend nearly to Christmas Sound.

TREBLE ISLAND is a remarkable height, having three peaks; it is visible from a considerable distance; near it are some straggling rocks, shewn in the chart.

Nine miles S. 22° E. from Treble Island, are the PHILLIPS ROCKS. They are dangerous, though above water, because so far from the shore, and so low.

Nicholson Rocks.

Rocks.

Adventure Passage.

Doris Cove.

Sounds to the northward of Stewart Islands.

Londonderry Isles.

Treble Island.

Phillips Rocks.

COOK BAY is a large space between Cape Alikhoolip and Cook Bay Waterman Island. Broken land, islets, and breakers, surround and make it unfit for the approach of vessels. Its shores were explored by the Beagle's boats.

At the north-east is the entrance of the BEAGLE CHANNEL, and Beagle Chana passage to Whale Boat Sound, both unfit for sailing vessels. excepting with a fair wind.

WATERMAN ISLAND (No. 28) is soon known by the remark- Waterman able heights at its south part. The southernmost was named by Captain Cook "YORKMINSTER," from its fancied resemblance to Yorkminster. that building. He well describes it as a "wild looking rock" (No. 28).

Eight miles west of "York Minster," and five from Point May, are the CAPSTAN ROCKS, above water about twenty feet. There are no other dangers to seaward of a line from York Minster to the Phillips Rocks.

Hauling round York Minster, you may enter CHRISTMAS There is no hidden danger; the chart and plan are SOUND. exact. ADVENTURE COVE (in which Captain Cook anchored) is the easiest of access, but it will only hold one vessel.

MARCH HARBOUR is large, with good holding ground, but there are many rocky places; and one rock, under water (see the plan). having on it only one fathom; its place is marked by very thick kelp. The Beagle worked through the narrow passage, round SHAG ISLAND, from Adventure Cove, and worked into the innermost corner of the harbour without using a warp: larger vessels would of course find themselves more confined.

I do not think a vessel of more than five hundred tons should attempt to enter Christmas Sound.

The Beagle lay moored in this harbour all the month of March, in perfect safety ; but her chain cables became entangled . Chains caught with the rocks, and were not hove in without much difficulty and by the rocks. delay.

PORT CLERKE is a bad place for any vessel, though quite Port Clerke, secure when in it; access is difficult, and from its situation, it is exposed to very violent squalls.

Island.

Caustan Rocks.

Christmas Sound.

Adventure Cove.

March Harbour.

Pickersgill Cove.

Description of Christmas Sound. PICKERSGILL COVE (named by Cook), as well as Port Clerke, is unworthy of notice as an anchorage.

Cook's description of Chrismas Sound is as accurate as his accounts of other places. His "Great Black Rock" and "Little Black Rock" shew themselves as you enter. Near York Minster are several rocks and islets, *close* to the eastward; one rock, on which the sea breaks violently, lies two miles E. 20° S. from the south extreme of the Minster. You may pass it quite close. Off the "Great Black Rock," there are two or three breakers, caused by rocks under water.

But little current sets among these Islands. To seaward of them, and near the headland, it sets as I before described.

The Tides between Cape Pillar and Cape Horn are regular, as regards their rise and fall, and time of high-water, but not so with respect to their velocity and direction. It appeared to me that while the water was rising upon the shore, the tide (or rather current) set along shore from the north-west towards the south-east at the rate of one mile an hour, or more, according to the wind.

During the six hours of falling water, or ebb tide, there was little or no current setting along shore.

At Cape Pillar it is high-water at one o'clock on the days of full and change. At York Minster it is high-water at three in the afternoon.

At the intermediate places the time gradually changes from one to three as you go to the south-east.

Further castward, high water is still later. At Cape Horn it is at half-past three.

The rise of tide varies from four to eight feet. It is noted in each plan.

Eastward of Christmas Sound lie the WOOD ISLANDS. There is no good anchorage among them. Passages and broken land lie behind them to the northward.

Point Nativity. Off POINT NATIVITY are two islands and an outlying rock. HOPE ISLAND is six miles to the south-east of this point.

The ILDEFONSOS, a large group of rocks and islets, next claim attention. They are thirty-five miles distant from York Minster,

Tides

Rise of Tide.

Lidefonsos.

96

# CHRISTMAS SOUND TO CAPE HORN.

and bear from that spot S. 41° E. They extend five miles Ildefonsos. in a north-west and south-east direction, are very narrow, and about one hundred feet above the sea (see No. 29). They appear to be the remains of the ridge of a mountain, broken through in many places by the sea. You may pass close by them in a vessel, for there is no danger. Sealers have much frequented them for fur seals. Neither TREFUSIS BAY nor ROUS SOUND afford anchorage.

LEADING HILL (of Mr. Weddell) is a very remarkable double Mr. Weddell's peaked height; beyond it are DUFF'S BAY, MORTON and HEN-DERSON ISLANDS, and the entrance of INDIAN SOUND (of Mr. Weddell).

There may be good anchorage between these islands. There was not time to examine some coves on the east side of Morton Island, whose appearance promised shelter and holding ground.

CLEARBOTTOM BAY is at the north end of Morton Island, and a good anchorage. It is described in Mr. Weddell's useful and interesting Journal.

INDIAN COVE, in which also he anchored, and remained some Indian Cove. time, is not a place to be recommended to vessels. They must go far among the islands to reach it, and when there, have a bad rocky bottom, with deep water, excepting one corner, where the Jane lay at anchor with the Beaufoy. Many better anchorages may be attained on this coast with less trouble.

INDIAN SOUND is a large tract of water, extending to the north-west. It is full of islands.

Between CAPE WEDDELL, at the east side of Indian Sound, and FALSE CAPE HORN (No. 33), is a tract of broken land, which has not been properly examined. It is, however, a lee shore during south-west and southerly winds, and therefore unfit for anchorage.

On HENDERSON ISLAND is a high sharp-pointed hill, which is visible at a great distance. From its summit the DIEGO RAMIREZ ISLANDS (Nos. 30, 31, and 32) were seen, though fifty miles The highest point of these islands is about one hundred distant. and fifty feet above the sea. There is no hidden danger near them. They lie nearly north and south, and extend over a space of five miles. the least form Far

A ship may pass between the northern cluster and that to the southward. Detached rocks lie off the southern island: all the The southern or BOAT ISLAND has outer ones are above water. a cove at its north-east corner, in which boats may land; there is Landing-place. water on the point close to the eastward of this landing-place.

Their place on the chart may be depended upon, because they were seen from, and connected by triangulation to, Henderson and Hermite Islands (Kater's Peak). There are soundings on each side, but too deep for anchorage, excepting to the southeast, where Mr. Weddell lays down some soundings (in his chart), which were not found.

Between the Diego Ramirez and the Hermite Islands there is no danger of any kind.

FALSE CAPE HORN is a very remarkable headland (No. 33). From the east or west it looks like a large horn. It is a leading mark to the best anchorage on this coast-"ORANGE BAY."

To anchor in this bay you must pass to the eastward of the False Cape, as close as you please. Steering N. E. (true) for four miles will bring you abreast of Point Lort; a bay two miles wide is then opened, in which you may anchor, if necessary, in 8 or 10 fathoms, over a fine sandy bottom. Some rocks, above water, lie at the north side. Beyond the point which forms the north side of this bay, is a small cove, with 18 fathoms water in the middle; beyond it is another cove, rather larger, after which you open SCHAPENHAM BAY (so called by the Nassau fleet). A north course (true) from Point Lort will take you abreast of Orange Bay.

SCHAPENHAM BAY is one mile and a half wide; there is a small black rock, above water, rather to the northward of its middle. A great deal of kelp, lying over a rocky bottom, is seen at the head of the bay, and a large waterfall marks the place distinctly. There is anchorage in from 10 to 15 fathoms, near the south point: but I should not recommend a vessel to use it, when by going further she may get into an unexceptionable harbour, or anchor off its entrance in perfect security.

The land behind these coves that have been mentioned is high and rugged : two singular peaks shew themselves, which resemble sentry-boxes. Near the shore the land is low, compared with other Near Schapenparts of the coast, and has not the iron-bound forbidding appearance of the more westerly shores.

From the heights sudden and very strong squalls blow during Squal's. westerly winds. Being generally a weather shore, and regular soundings extending along it, there is no difficulty in choosing or approaching an anchorage.

Off ORANGE BAY anchor soundings extend to two miles from Orange Bay. the land. The opening of the bay is three miles wide, and in that part are eighteen or twenty fathoms, over fine speckled sand. Two islands, the larger having a smooth down-like appearance, lie in the middle; behind them is the harbour, a square mile of Anchorage. excellent anchorage, without a single rock or shoal. In the two creeks at the south side is good anchorage for small vessels: the depth of the water varies gradually from 5 to 20 fathoms. The Depth. bottom every where is a fine speckled sand. The land hereabouts is low. comparatively speaking, and you are not annoyed by the No squalls. violent squalls which come from the heights in other places.

You may go close to the shore in every part, therfeore no shore steep. directions are necessary to point out the way to the best berth which is marked in the plan. Wood and water are plentiful; Wood and the best watering place is in a small cove at the north side, called water. WATER COVE. This harbour is fit for a fleet of line-of-battle ships, and could supply them with any quantity of wood and water.

Off the north point are several small islets, which must not be approached too closely; they are, however, out of the way.

Six miles N. N. W. of the outer anchorage is a curious island, Packsaddle Island. like a castle. or a PACKSADDLE.

Orange Bay is somewhat open to east winds, but they seldom blow strong, and would be fair for ships bound westward. No sea can be thrown in, because of the Hermite Islands.

There is no current here worthy of notice. The tide rises six Current. feet : high-water at half-past three.

Opposite to the land lying between New Year's and Tekeinika Sounds, called Hardy Peninsula, on the east side of which is Orange Bay, are the HERMITE ISLANDS (No. 34, 35, and 36.)

ham Bay.

Tide.

Ł

#### . TIERRA DEL FUEGO.

Hermita Islands.

Beagle Channel.

Nassau Bay.

Is- Their northern shores have not yet been examined. The southern are accurately laid down in the chart.

NASSAU BAY extends to the north and north-west into the BEAGLE CHANNEL. There is nothing to lead a vessel into these openings, therefore a description of them is not necessary. They may prove useful for boats, and a glance at the chart will be of more service, for their purpose, than any directions.

NASSAU BAY is very accessible, and free from dangers. Anchorage may be found on each coast, and the only dangers are some rocks (or islets), above water, shewn in the chart, and visible at a distance by daylight. The northern shore is low, particularly towards GUANACO POINT, where the coast first begins to shew signs of approaching EASTERN PATAGONIA, changing its rocky heights for level land, and low, earthy cliffs.

Cape Horn.

West Cape.

Mountains.

Current near False Cape. On the southernmost of the Hermite Islands is CAPE HORN. There is nothing very striking in the appearance of this promontory, as seen from a distance; but, in passing near, it is more remarkable, shewing high black cliffs towards the south: it is about five hundred feet above the sea. (*The Sketches, Nos.* 34, 35, and 36, are faithfully drawn.)

No dangers exist to the southward, in approaching these islands-they may be closed without hesitation.

WEST CAPE is low. The land about ST. MARTIN'S COVE is high and rugged. WOLLASTON and HERSCHEL ISLANDS have also ridges of mountains. KATER'S PEAK, the highest land (excepting MOUNT HYDE) on the islands, is seventeen hundred feet above the sea.\*

In the channel between False Cape Horn and the Hermite Islands, a current is found setting into Nassau Bay, and rather towards the Hermite Islands, at the rate of two knots an hour with the flood tide, and about half a knot with the ebb. As this current sets rather towards West Cape, a good berth must be given to it in passing.

FRANKLIN SOUND is clear of obstruction, and has no other dangers than those which are shewn in the chart.

\* By barometrical measurement, 1742 feet above high-water mark. - P. P. K.

100

Franklin Sound.

In Nassau Bay the compasses are much affected; they become Compasses very sluggish, and might cause a serious error if not carefully attended to.\*

A strong current sets, at times, along the outer coast of the Bay of St. Hermite Islands, and through the Bay of St. Francis. It varies from half a knot to two knots an hour, according to the wind and the time of tide; and, in the bay, changes its direction with the change of tide.

With the sketch or chart, no one would require a direction to point out ST. MARTIN'S COVE. Temporary anchorage may be had in the small bay leading to ST. JOACHIM'S COVE, or under St. Joschim's Cove. the south head of St. Martin's Cove, where you find from 20 to 25 fathoms, over a clear, sandy bottom. As you approach the western end of St. Martin's Cove the water shoals to 15 and 10 fathoms. It is perfectly secure, but visited by very violent squalls during a westerly wind.

PORT MAXWELL is a perfectly secure anchorage, and un- Port Maxwell. troubled by mountain squalls (or willywaws), but it is rather out of the way. Though it has four openings, only two are fit for vessels,---those to the north and east. The best berth in it has sixteen fathoms water, over a clear, sandy bottom. This harbour is decidedly good, though it requires a little more time and trouble in the approach.

The passages between these islands have deep water, and are Deepwater free from dangers: what few rocks there are, shew themselves

• The magnetic needle was very remarkably affected in many parts of the islands of the group, although I did not observe any great difference, when at a distance from the rock of which they are formed, or on board the ship. On one occasion, on ascending the summit of Maxwell Island, in Port Maxwell, the compass was placed for convenience upon the rock, when the needle was found to be so much influenced by the ferraginous nature of the rock, composed of Quartz with large and numerous crystals of Hornblende, that its poles became exactly reversed. An experiment was afterwards made by taking a set of bearings of a distant object, (to prevent an error of parallax,) at several stations around, at fifty yards from the above magnetic rock; when the extreme difference amounted to 127°. The block upon which the compass was placed in the first instance is now in the museum of the Geological Society.

No sensible difference, however, was found in the valley, at the bottom of St. Martin's Cove, where the variation of the compass was observed by several different instruments, and compared with astronomical bearings, when the deviation did not amount to more than the usual amount of the variation in that neighbourhood, -P, P, K.

Passages.

above water, or are thickly covered with kelp. Some rocks lie off the south end of Chanticleer Island, too close to be of much consideration.

Rock off Cape Horn.

One mile to the westward of CAPE HORN there are three rocks, generally above water; the sea always breaks on them.

Cape Deceit.

Off the east point of HORN ISLAND, are some small rocks and breakers. Off CAPE DECEIT are several rocks, all above water; and two miles to the south-east, is a cluster, rising thirty or forty feet above the sea.

Current near Cape Horn.

Barnevelt Isles.

Evouts Isles.

Off CAPE HORN the current is as strong as on any part of the coast. Between it and Cape Pillar, it is by no means regular; sometimes with a strong wind and flowing tide it runs two knots an hour, at others it is hardly worth notice.\* I never found it set to the westward at any time of tide, or with any wind.

The BARNEVELT ISLANDS (No. 38) lie eleven miles N. E. by E. from Cape Deceit. The chart and sketch are a sufficient description. For the Evours Isles (No. 38), I should refer also to the chart and the accompanying view; and for the appearance of this part of the coast, from Cape Horn to Cape Good Success, to the sketch (No. 37).

The space between Cape Deceit and New Island, is free from hidden dangers, as far as I am aware, but it has not yet been sufficiently examined.

Goeree Road.

In GOERBE ROAD, there is very good anchorage in six or seven fathoms water, over a sandy bottom.

Lennox Island.

nd. LENNOX ISLAND, as well as NEW ISLAND, and indeed any part of the coast hereabouts, may be approached with confidence, using the lead and looking out for kelp.

No shoals, but regular soundngs.

There are no shoals, but the water is not so deep as to the west of Cape Horn, neither is the land near so high.

At the east side of Lennox Island is excellent anchorage; small vessels may go into a cove, in which the Beagle lay moored, but large ships must anchor in the road, which is quite secure and sheltered from all but south-east winds, with which of course

102

<sup>•</sup> In beating up to the anchorage in St. Martin's Cove, at from 20 to 60 miles to the eastward of Cape Horn, I found the current setting constantly at from half to one mile per hour, the wind throughout being south-westerly.—P. P. K.

a vessel would not wish to remain at anchor. To the north of Lennox Island is the eastern opening of the BEAGLE CHANNEL. Beagle Chan-It is easy of access, but useless to a ship. Boats may profit by its straight course and smooth water. It runs one hundred and twenty miles, in nearly a direct line between ranges of high mountains, covered always with snow. The highest are Ranges of between three and four thousand feet above the sea. This channel averages one mile and a half in width, and in general has deep water; but there are in it many islets, and rocks near them.

A range of high mountains runs uninterruptedly from the High Moun-Barbara Channel to Strait Le Maire. Mount Sarmiento, more tairs. Mountains.

TIERRA DEL FUEGO.

BellMountain.

104

ļ

Cape Good Success.

tain. The BELL MOUNTAIN is remarkable: it is seen far at sea, from the north as well as from the south; it is high, and in shape resembles a large bell.

CAPE GOOD SUCCESS is high and bluff (No. 40); some rocks lie close to it, above water.

The land from the Bell Mountain to Good Success Bay is higher than that near Lennox and New Islands; it more resembles the south-west coast.

Between Cape Horn and Staten Island, regular soundings are found, between thirty and seventy fathoms, over a sandy bottom.

The soundings in STRAIT LE MAIRE are similar near their southern entrance. Towards the north the soundings diminish; and two miles from Cape San Diego, there are not more than 30 fathoms water over a rocky bottom. The strait is clear of all obstacles, the tide excepted. The land, from Cape Good Success to Maurice Cove, is high and bold, with water for a ship as near to it as she ought to go.

Rather more than two miles north-east of Cape Good Success is a projecting headland, which, at first, appears to be the cape; two rocky islets shew themselves close to it, and from a distance appear like a ship under sail.

Six miles from these rocks, N. E. by N., is the BAY OF GOOD SUCCESS (No. 40). It is a good anchorage, perfectly safe, provided that a vessel does not anchor too far in towards the sandy beach at its head; for, during south-east gales, a heavy swell with dangerous rollers sets right into the bay. The best berth is shewn in the plan. Heights, of about twelve hundred feet above the sea, surround the bay; therefore with strong winds, it is subject to squalls, which, during westerly gales, are very violent.

Good Success Bay is an excellent anchorage for vessels of any size to stop in to get wood or water, but it would not answer if a vessel required to lie steady for repairs, as a swell frequently sets in. It is quite safe; but in the winter season, when easterly winds are common, no vessel should anchor so near the head of the bay as she might in summer.

Cook's Broad Road. The "Broad Road," mentioned by Cook, is a good mark for the bay, if the inbend of the land does not sufficiently point out its situation. It is a barren strip of land on the

Strait Le Maire.

Good Success Bay.

Squalls.

height at the south side of the harbour. MAURICE COVE has no Maurice Core. good anchorage, it is merely a rocky bight.

Hence to Cape San Diego, the land is much lower, and the water near it less deep.

CAPE SAN DIEGO is low; a ship may go close to it. There Cape San Diego. are shoaler soundings towards the east, for about two miles, than in other parts near here; for a rocky ledge under water seems to project from the cape. On this ledge there are over- Ledge off Cape San Diego. falls, strong eddies, and a violent race of tide when the wind is opposed to it.

Beyond Cape San Diego the land suddenly trends away west\_ ward.

CAPE ST. VINCENT is a rocky point, with low bluffs above it. Cape St. Vin-Between this point and Cape San Diego, is "THETIS BAY," Cont. Thetis Bay.

a tolerable anchorage during west or southerly winds, though the bottom is rocky in many places. Between the heads the tides run with great strength, therefore a ship should anchor off a green bluff at the west side, and within the line of the heads she will have from six to twelve fathoms of water, over a coarse sandy bottom, mixed with patches of rock.

Beyond Cape St. Vincent the land trends to the west and Land beyond Cape St. Vinnorth-west; it is rather low near the sea, but in shore are many cent. hills partially covered with wood.

Regular soundings extend to seaward for many leagues; and soundings. good anchorage may be found near the land, on any part of Coast easy of this coast, during westerly winds.

The tides, in STRAIT LE MAIRE, are as regular as in any part Tides in Strait of the world. They will assist a vessel materially in her passage, if taken at the right time.

As the strait is very wide, perfectly free from obstacles of any kind, the soundings regular, with Good Success Bay close at hand, in case the wind or tide should change, vessels may pass through without difficulty or risk.

When the tide opposes the wind and swell, there is a heavy, Tide rip off. and, for small vessels, dangerous, race of tide off Cape San Diego; where, as I said before, there is a shoal ledge, and the tide runs very strongly. We found it so in the Beagle at even a neap flood tide; but let it be remarked that, on another day, at

P

800855.

Le Maire.

the top of the springs, being the day after full moon, we passed the same spot at half flood, with perfectly smooth water.

Though the tide was running three or four knots an hour round the cape, and eddies were seen in every direction, the vessel's steerage was but little affected by them.

It is high-water on the shore in GOOD SUCCESS BAY, and slack water in the strait, at four in the afternoon on the full and change days, and low water with slack tide in the offing at ten in the morning. The tide rises perpendicularly from six to eight feet, according to the wind.

At Cape Pillar, (as I before said,) the turn of tide is about one o'clock (p. 96). Along the south-west and south-east coasts, the time gradually increases to four in the afternoon at this place.

From Cape San Diego to the northward, the tide sets north and west along the shore, from one knot to three. The ebb sets in a contrary direction, but not so strongly.

In Strait Le Maire the flood tide runs from two to four knots near the cape, and from one to three in mid-channel, more or less according to the strength and direction of the wind. The ebb sets to the southward, about one knot an hour.\*

At times, when a strong flood tide is opposed by a northerly wind, there is an overfall off Cape San Diego, like the "Bores" on our own coast and elsewhere.

Staten Island.

STATEN ISLAND is high, and its mountains are generally covered with snow. Its shores lying towards the strait are very bold and rugged. No danger is near them, excepting strong eddies and races, caused by the tide near the headlands.

CAPE ST. ANTONY, MIDDLE CAPE, and CAPE SAN BARTHO-LOMEW, are high, bluff promontories. The soundings to the northward are very regular, and give notice of your approach to Staten Island, or the Strait Le Maire.

• The flood tide sets through Strait Le Maire from the southward, and along the north and south sides of Staten Island from east to west. It is high-water, at full and change, at the anchorage within the New Year's Isles, as well as on the east side of Strait Le Maire, at 5 o'clock. The current is very strong, running from 4 to 6 knots. Off Cape St. John there is a tide race, which extends for some distance off the point.—P. P. K.

General Observations upon the appearance and character of the Sea Coast of Tierra del Fuego; Description of the Anchorages; and Remarks upon the Seasons. Wind, and Weather.

From Cape Pillar to Cape Horn the coast of Tierra del Fuego Cape Pillar to is very irregular and much broken; being, in fact, composed of Cape Horn. an immense number of islands. It is generally high, bold, and Nature of the free from shoals or banks; but there are many rocks nearly level coast. with the surface of the water, distant two and even three miles from the nearest shore, which make it very unsafe for a vessel to approach nearer than five miles, excepting in daylight and clear weather. The coast varies in height from eight to fifteen hundred Height above feet above the sea. Further inshore are ranges of mountains the Sea. always covered with snow, whose height is from two to four thousand feet, and in one instance (Sarmiento) five thousand.

With daylight and clear weather a vessel may close the shore without risk, because the water is invariably deep, and no rock Rocks buoyed is found which is not so marked by sea-weed (or kelp, as is by kelp. generally called), that by a good look out at the mast-head, its situation is as clearly seen as if it were buoyed. By avoiding kelp you are sure of having sufficient water for the largest ships on any part of this coast. At the same time it must be remembered that kelp grows in some places from a depth of 30 fathoms, and that on many parts of this coast you may pass Kelp or seathrough thick beds of sea-weed without having less than 6 danger. fathoms water; still it is always a sign of danger, and until the spot where it grows has been carefully sounded, it is not safe to pass over it with a ship. As an instance :- after sounding a large bed of this weed in one of the Beagle's boats, and thinking it might be passed safely, a rock was found, not more than four feet in diameter, having only one fathom water over it.

Viewing the coast at a distance, it appears high, rugged, Appearance of covered with snow, and continued,-as if there were no islands.

the Coast.

When near you see many inlets which intersect the land in every direction, and open into large gulfs or sounds behind the seaward islands.

Appearance of the Land.

You now lose sight of the higher land, which is covered with snow throughout the year, and find the heights close to the sea thickly wooded towards the east, though barren on their western sides, owing to the prevailing winds. These heights are seldom covered with snow, because the sea winds and the rain melt it soon after it falls.

Opposite to the eastern valleys, where the land is covered with wood, and water is seen falling down the ravines, good anchorage is generally found. But these valleys are exposed to tremendous squalls which come from the heights. The best of all anchorages on this coast, is where you find good ground on the *western* side of high land, and are protected from the sea by low islands. It never blows near so hard *against* high land as from it, but the sea on the weather side is of course too formidable, unless stopped, as I mentioned, by islets.

Where the land is chiefly composed of sandstone or slate, anchorages abound; where of granite, it is difficult to strike soundings.

The difference between the granite and slate or sandstone hills, can be distinguished by the former being very barren and rugged, and of a grey or white appearance; whereas the latter are generally covered with vegetation, are dark coloured, and have smoother outlines. These slate or sandstone hills shew few peaks, and the only rugged places are those exposed to wind or sca.

Soundings extend to thirty miles from the coast. Between ten and twenty miles from the land the depth of water varies from 60 to 200 fathoms, the bottom almost everywhere a fine white or speckled sand. From ten to five miles distant the average depth is 50 fathoms; it varies from 30 to 100, and in some places no ground with 200 fathoms of line. Less than five miles from the shore the soundings are very irregular indeed, generally less than 40 fathoms, but in some places deepening suddenly to 100 or more: in others a rock rises nearly to, or above, the surface of the water.

After carrying 50, 40, 30, or 20 fathoms, towards an inlet,

Squalls. Best anchor-

Anchorages where found.

Difference between granite and sandstone, or slate bills.

Soundings.

which you are desirous of entering, you will probably find the soundings. water deepen to 60 or 100 fathoms as soon as you enter the opening: and in the large sounds, behind the seaward islands, the water is considerably deeper than on the outside.

There is a bank of soundings along the whole coast, extending from twenty to thirty miles from it, which appears to have been formed by the continued action of the sea upon the shore, wearing it away and forming a bank with its sand.

Between the islands where there is no swell or surf worth notice, the water is deep, and the bottom very irregular.

A small ship may run among the islands in many places, and find good anchorage; but she runs into a labyrinth, from which her escape may be difficult, and, in thick weather, extremely dangerous.

Fogs are extremely rare on this coast, but thick rainy weather Fogs. and strong winds prevail. The sun shews himself but little; the sky even in fine weather being generally overcast and cloudy. A clear day is a very rare occurrence.

Gales of wind succeed each other at short intervals, and last weather. several days. At times the weather is fine and settled for a fortnight, but those times are few.

Westerly winds prevail during the greater part of the year. Winds. The east wind blows chiefly in the winter months, and at times very hard, but it seldom blows in summer.

Winds from the eastern quarter invariably rise light, with fine Easterly weather ;- they increase gradually,- the weather changes,- and winds. at times end in a determined heavy gale. More frequently they rise to the strength of a treble-reefed topsail breeze, then die away gradually, or shift to another quarter.

From the north the wind always begins to blow moderately, North and but with thicker weather and more clouds than from the east- north-west ward, and it is generally accompanied by small rain. Increasing in strength, it draws to the westward gradually, and blows hardest between north and north-west, with heavy clouds, thick weather, and much rain.

When the fury of the north-wester is expended, which varies from twelve to fifty hours, or even while it is blowing hard, the wind sometimes shifts suddenly into the south-west

### TIERRA DEL FUEGO.

South-west wind.

Changes from north to south.

Nature of the Summer.

quarter, blowing harder than before. This wind soon drives away the clouds, and in a few hours you have clear weather, but with heavy squalls passing occasionally.

In the south-west quarter the wind hangs several days (generally speaking), blowing strong, but moderating towards its end, and granting two or three days of fine weather.

Northerly winds then begin again, generally, during the summer months; but all manner of shifts and changes are experienced from north to south by the west during that season, which would hardly deserve the name of summer, were not the days so much longer, and the weather a little warmer. Rain and wind prevail much more during the long, than the short days.

It should be remembered that bad weather never comes on suddenly from the eastward, neither does a south-west or southerly gale shift suddenly to the northward. South-west and southerly winds rise suddenly and violently, and must be well considered in choosing anchorages, and preparing for shifts of wind at sea.

The most usual weather in these latitudes, is a fresh wind between north-west and south-west, with a cloudy overcast sky.

Much difference of opinion has prevailed as to the utility of a barometer in these latitudes. I can only say, that during twelve Symplesometer months' constant trial of a barometer and symplesometer (Adie's), I found their indications of the utmost value. Their variations do not of course correspond to those of middle latitudes, but they correspond to those of high northern latitudes in a remarkable manner, changing south for north (east and west remaining the same).

Current.

Common weather.

Barometer and

There is a continual current setting along the south-west coast of Tierra del Fuego, from the north-west towards the southeast, as far as the Diego Ramirez Islands. From their vicinity the current takes a more easterly direction, setting round Cape Horn towards Staten Island, and off to seaward to the E. S. E.

Much has been said of the strength of this current, some persons supposing that it is a serious obstacle in passing to the westward of Cape Horn, while others almost deny its existence.

I found it run at the average rate of a mile an hour. Its strength is greater during west ;-less, or insensible, during east-

110

erly winds. It is strongest near the land, particularly near the projecting capes or detached islands.

This current sets rather from the land, which diminishes the danger of approaching this part of the coast.

There is, in fact, much less risk in approaching this coast Const not than is generally supposed. Being high and bold, without sandbanks or shoals, its position accurately determined, and a bank of soundings extending twenty or thirty miles from the shore, it cannot be much feared. Rocks, it is true, abound near the land, but they are very near to the shore, and out of a ship's way.

A line from headland to headland (beginning from the outermost Apostle), along the coast will clear all danger excepting the Tower Rocks, which are high above water, and steep to.

Gales of wind from the southward, and squalls from the Southerly south-west, are preceded and foretold by heavy banks of large white clouds rising in those quarters, having hard edges, and appearing very rounded and solid. (Cumuloni.)

Winds from the northward and north-westward are preceded North and and accompanied by low flying clouds, with a thickly overcast north-west winds. sky, in which the clouds appear to be at a great height. The sun shews dimly through them, and has a reddish appearance. For some hours, or a day, before a gale from the north or west, it is not possible to take an altitude of the sun although he is visible; the haziness of the atmosphere in the upper regions causing his limbs to be quite indistinct. Sometimes, Northerly but very rarely, with the wind light between N. N. W. and wind and fair weather; N. N. E., you have a few days of beautiful weather. They succeeded by are succeeded by gales from the southward, with much rain.

It may be as well to say a few words respecting the seasons in the neighbourhood of Cape Horn, as much question has Seasons. arisen respecting the propriety of making the passage round the cape in winter or in summer.

The equinoctial months are the worst in the year, generally speaking, as in most parts of the world. Heavy gales prevail Equinoxes. at those times, though not, perhaps, exactly at the equinoxes. In August, September, October, and November, you have the Spring the worst months in the year. Westerly winds, rain, snow, hail, and cold weather, then prevail.

gales.

southerly gales.

worst season.

December, January, and February, are the warmest months: Summer gales. the days are long, and you have some fine weather: but westerly winds, very strong gales at times, with much rain, prevail throughout this season, which carries with it less of summer than in almost any part of the globe.

> March. as I said, is stormy, and perhaps the worst month in the year with respect to violent winds, though not so rainy as the summer months.

In April, May, and June, the finest weather is experienced; and though the days shorten, it is more like summer than any other time of the year. Bad weather is found during these months, but not so much as at other times. Easterly winds are frequent, with fine clear settled weather. During this period there is some chance of obtaining a few successive and corresponding observations. To try to rate chronometers by equal altitudes would be a fruitless waste of time at other seasons. June and July are much alike, but easterly gales blow June and July. more during July.

> The days being so short, and the weather cold, make these months very unpleasant, though they are, perhaps, the best for a ship making a passage to the westward, as the wind is much in the eastern quarter.

I should say that the summer months, December and January, Best time for are the best for making a passage from the Pacific to the Atlanpassage round tic Ocean, though that passage is so short and easy, that it hardly requires a choice of time. For going to the westward, I should prefer April, May, and June.

Lightning and thunder.

making the

Cape Horn.

Squalls.

Lightning and thunder are seldom known; violent squalls come from the south and south-west, giving warning of their approach by masses of clouds. They are rendered more formidable by snow and hail of a large size.

## SECTION VIII.

# SOUTH-WEST COAST, or WESTERN PATAGONIA, from the Strait of MAGALHAENS to Cape TRES MONTES.

Very small portions of the sea-coast of this interval were seen by us. The following descriptions are principally abstracted from the manuscript Journals of the late Captain Stokes, Lieutenant (now Captain) Skyring, and Mr. Kirke, Mate, of His Majesty's Surveying Sloop, Beagle.

Between CAPE VICTORY and LORD NELSON STRAIT, the coast is very much broken, and intersected by channels leading between the islands of QUEEN ADELAIDE ARCHIPELAGO; on Queen Adethe sea-coast of which, to the N. N. E. of Cape Victory, is a pelago. remarkable pyramidal hill called Diana Peak, which, in clear Diana Peak. weather, is visible to ships entering the strait. (See page 85.) CAPE ISABEL is a steep, rocky promontory of great height, with a peaked summit, and a sharply serrated ridge, having two detached columnar masses of rock. BEAGLE ISLAND, lying Beagle Island, off it, is wall-sided; but, although tolerably high, is much lower than the land of the cape.

CAPE SANTA LUCIA, the westernmost point of Cambridge Cape Santa Island, is high and precipitous. CAPE GEORGE, at the south end, is lower, and forms a bluff point.

The SAN BLAS CHANNEL, DUCK and DUNCAN Harbours, the DUNCAN Rock, and other rocks off them, are inserted from the oral information of the master of an American schooner, and, probably, are very incorrectly laid down. AUGUSTA Island Augusta Isand the WHITE HORSE were seen by Lieutenant Skyring.

CAPE SANTIAGO, the south end of MADRE DE DIOS Archi- Cope Santiago.

Lucia.

113

pelago, is correctly placed, as are also the general direction of the coast to the northward, and the summits of the land that are particularized viz.-the opening of WEST CHANNEL, APRIL PEAK, TOWER ROCK, and the bay to the north of it, and CAPE THREE POINTS, which is the south entrance of the GULF OF TRINIDAD.\* Opposite to the latter cape is CAPE PRIMERO.+ the south point of the mountainous island of Mount Corso;t the land of which may be seen, in clear weather, from the southward, at the distance of ten leagues. It forms the visible northern termination of the coast line. Viewed when bearing north, or any point to the westward of north, its summit makes like a round mount rising conspicuously above the contiguous land, from which a small portion of low coast extends for two degrees beyond it to the westward. The land of the northern shore of the gulf makes in mountainous ridges and peaks, the average height of which Captain Stokes estimated to be about three thousand feet.

Cape Three Points. CAPE THREE POINTS || rises to a lofty rocky mountain, nearly two thousand feet high, the summit being of peaks and sharp serrated ridges, with a detached mass of rock of pyramidal form at the base, which shuts in with the land on the bearing of N. 51° E.

Variation.

Port Henry.

The variation here is 20° 58'.

PORT HENRY is three miles to the N. E. of Cape Three Points. The shore between them is lined for nearly a league off with rocks and islets, of which several scores might be counted in the space of a square mile; but they seem to be of bold approach, and no dangers probably exist that are not above water, or are not shewn by kelp.

Directions.

Bound to PORT HENRY, a vessel should keep on the south side of the gulf; for the northern part is strewed with many rocks, and seemed to be exceedingly dangerous. The soundings, also, are very irregular, and the bottom is foul and rocky.

The entrance of PORT HENRY will be easily distinguished by

Gulf of Trini-

dad.

its sandy beach, since it is the first that is observed on the south Directions for shore on entering the gulf. It is a small, light-coloured beach, with a lowish sandy cliff at the back, and a round, rocky, and wooded mount at its western end. The SEAL BOCKS, also in the offing, are a good mark; they bear N. 12° E., five miles, from the west point of the entrance, which is about a mile wide. The channel is bounded on each side by low rocks, lying off highish. round, rocky islets, that may be approached within one and a half cable's length. The soundings are from 20 to 26 fathoms. on a sandy bottom; afterwards they decrease pretty gradually to the anchorage, which is in 9 and 10 fathoms.

When the sandy beach bears S. 19° E. mag., the fair way of the entrance will be quite open; and a vessel may stand in, keeping the round mount at the western end of the sandy beach on the larboard bow, until nearly abreast of it; she may then proceed up the harbour as high as convenient, and select her berth : for the ground is quite clear of danger to the line of rock weed, which skirts the shores and islets. The depth of water is between 12 and 8 fathoms, and the bottom generally of sand and mud.

In turning in there are some patches of kelp on each side, growing upon rocks that watch at high-water, which must be avoided: their positions are given in the plan.

As the squalls off the high land are sometimes very strong, it Caution will be advisable for a ship to anchor as soon as possible, and against strong squalls. warp up to her berth; which, from the smoothness of the water, may be easily effected. Any security may be obtained in this harbour; the plan will shew that the basin at the bottom of the harbour is a complete wet dock. Wood and water at the sandy beach are in abundance.

It is high-water at full and change within a few minutes of Tides. noon, and rises five feet. The stream of the tide, however, is very inconsiderable, and never exceeded half a mile an hour. The observations for latitude and longitude, &c. were made on Situation. a rock at the western side of the port, marked A in the plan, The lat. is 50° 00' 18", lon, 75° 15' 11". Variation of the compass, 20° 50'.

The Gulf of Trinidad separates Wellington Island from

Port Henry

MADRE DE DIOS. It is nearly ten leagues long, and from four to eight miles wide. Its south shore, or north coast of Madre de Dios, is very much broken, and, probably, contains many ports. None of them were visited excepting for night anchorages. Under the east side of Division Island is PORT DE LA MORRO, which, with POINT CANDELARIA and PORT ROSARIO, are inserted from Sarmiento's account.\*

On the northern shore are two opening-like channels: the westernmost probably communicates with the FALLOS Channel; the other, Sarmiento's BRAZO DE NORTE, or NORTH ARM, appeared to trend under the base of the range of mountains, among which CATHEDRAL MOUNT is a conspicuous object. From the entrance of the strait this mountain resembles the spire and roof of a church, and is visible for more than twenty leagues. Between the two openings is NEESHAM BAY, in which the Adelaide found a secure anchorage in 11 fathoms. There is also good anchorage for a small vessel in WINDWARD BAY.

The gulf meets the WIDE CHANNEL at its junction with CON-CEPCION STRAIT, where the channel is contracted by an island to the width of one mile and a half. There are several isles and rocks in the gulf, of which the most remarkable are the SEAL ROCKS, before mentioned; the VAN ISLES, opposite the Western Channel; and a group of numerous islands extending for a league to the southward of the land to the westward of NEESHAM BAY. On the south shore are also several isles, but they are near the coast, and are particularized in the chart. The most remarkable is MIDDLE ISLAND, which, with the reef off its S. W. end, is well described by Sarmiento.<sup>+</sup>

Mount Corso.

Dangers near Cope Primero. The Island of MOUNT CORSO is separated from Cape Brenton by SPARTAN PASSAGE. For more than a league off CAPE PRIMERO are some extensive reefs: indeed the whole line of the west coast of MADRE DE DIOS is fronted by rocks, some of which are two leagues from the shore. There are regular soundings in the entrance of the gulf, but the water deepens immediately after passing to the eastward of PORT HENRY.

PICTON OPENING and DYNELY BAY very probably insulate

# Sarmiento, p. 82 and 83.

Trinidad.

the land that separates them, of which CAPE MONTAGUE is the Picton Open-There are some rocks eight or ten miles off Bay. south-west extreme. the coast to the southward; but between Cape Montague and Cape Dyer they are more numerous: several are from eight to ten miles off the shore; many are dry, some are awash, and others shew only by the breaking of the sea. The coast to the north of DYNELY BAY is very broken.

CAPE DYER is in lat. 48° 05' 55", lon. 75° 34' 35". At five Cape Dyer. miles S. 86° W. from it is a rocky islet, called by Bulkely and Cummings "THE ROCK OF DUNDEE," from its similarity "to Dundee Rock that island in the West Indies, but not so large; it lieth about 4 leagues\* from the southernmost point of land out at sea."+

This rock is a good mark for PORT SANTA BARBARA, from the entrance of which it bears S. 64° W. (S. W. mag.), distant nine miles.

At one mile to the north of the rock the depth is 23 fathoms, and gradually decreases on approaching PORT SANTA BARBARA; Port Santa Barbara. in steering for which, as soon as CAPE DYER bears South, by compass, you will be close to some rocks, which you should keep Directions on your larboard hand. Abreast of this rock, one-eighth of a mile off, the depth will be 11 fathoms. The channel here is one mile wide, but gradually narrows on approaching the south-west end of BREAKSEA ISLAND; and at WRECK POINT, the west head of the port, the width is about one-eighth of a mile. There are several rocks in this passage, but as the depth is from 6 to 8 fathoms, the anchor may be dropped, and the ship warped clear of them, in case of being becalmed : calms, however, are of rare occurrence here.

BREAKSEA ISLAND, more than two miles long, fronts the port, Breaksea the heads of which are three quarters of a mile apart. In the entrance of the port the depth is  $3\frac{1}{2}$  and 4 fathoms, and gradually decreases to  $2\frac{1}{2}$  fathoms, but at the bottom there is a basin with This is a very good harbour, and from the 6 and 8 fathoms in it. rare opportunity of anchoring your ship in a moderate depth, is of easy access. It is also readily made out by its vicinity to the DUNDEE ROCK, which serves to point out its position.

Island.

There must be a mistake here, it should probably have been four miles;

<sup>+</sup> Bulkely and Cummings' Voyage to the South Seas, p. 113,

Port Sant**a** Barbara. The west head of the port is in lat.  $48^{\circ}$  02' 15', and lon. 75' 29' 45'; variation 19' 10'. High-water takes place at full and change, at 0<sup>h</sup> 28', and rises three to four feet (*neaps*).

To the N. E. of Break sea Island are many straggling rocks. The Beagle having entered the port by the western entrance, left it by threading the rocks to the eastward, in doing which she had not less than 9 fathoms.

Between the island and the mouth of the port, the depth is from 6 to 7 fathoms, good ground, which renders the entrance and exit very easy.

FLINN SOUND is a deep opening to the castward of the port; that was not examined.

POINT BYNOE, with the group of islands—Bynoe Islands, extending for two miles off it, is the west head of the FALLOS CHANNEL, which was explored for thirty miles without offering any interesting feature. Mr. Kirke, who examined it, describes it to be perfectly clear of rocks, and abounding in anchorages for small vessels, although the water is deep. The bottom is sandy. Its general width is one and a half to two miles. The western side of the mouth [is a ridge of mountains; the eastern side is much lower, and very broken, and formed by many small islands. At five miles within it, on the west side, is Our Lady's Bay, of the old charts. FALLOS CHANNEL probably communicates with the sea by DYNELY BAY and PICTON OPENING; and, beyond the latter, was supposed to communicate with the Gulf of Trinidad by the channel to the west of Neesham Bay.

Guaianeco Islands, The GUAIANECO ISLANDS, twenty miles in extent, are composed of two principal islands, and many smaller islets—the westernmost is called BYRON ISLAND, and the easternmost WAGER ISLAND. They are separated by RUNDLE PASS called in Bulkely's Narrative, THE LAGOON;\* on the west side, and at the north end of it is SPEEDWELL BAY.<sup>†</sup>

Rundle Pass.

RUNDLE PASS is only a quarter of a mile wide, but perfectly clear in the whole extent of its channel, excepting the northern entrance; where it is guarded by many detached rocks, which

• Bulkely and Cummings' Narrative, p. 106.

Flinn Sound.

Point Bynoe.

<sup>†</sup> Ibid, p. 105.

render the entrance to Speedwell Bay rather difficult.\* Ac- Rundle Pass. cording to Byron's and Bulkely's Narratives, the situation of the wreck of the Wager is near the west end of the north side of Wager Island. HARVEY BAY and GOOD HARBOUR are mentioned by Bulkely. Off the western end of Byron Island are some rocky islets; and its north coast is also very much strewed with them, even to a considerable distance from the shore.

The GUAIANECO ISLANDS are separated from the land of Guaianeco Wellington Island by a clear, but, in some parts, narrow passage. At its S. W. end it is contracted by rocks to a mile and a half, and at the south end of Byron Island is scarcely a mile broad : afterwards, however, it widens to two and a half and three miles.

The north point of Wellington Island is CAPE SAN ROMAN. It is the west head of the MESIER CHANNEL.

TARN BAY is about five leagues wide. The AVAUTAU Is- Tern Bay, LANDS are four miles from the coast, but the interval is occu- Ayantar. pied by several rocky reefs, between which, Lieutenant Skyring thought, there seemed to be a "sufficiently clear passage." The pilot, Machado, however thought differently. + The latter describes a small boat-haven on the larger island, but it is among rocks. Opposite to AVAUTAU is a port, called by the missionary voyagers, SAN POLICARPO ;? which, from its exposure to the San Policarpo westward, I should not think very inviting. The Ports of TIANI- Tianitan and TAU and ASAURITUAN are also mentioned by the missionary Asaurituan. priests, in their journals. The former is described to have many islands in its entrance, || and to be to the northward of SAN POLICARPO: and the latter to be to the south of TIANITAU, and opposite to AYAUTAU,

\* Machado, the pilot who explored this coast in the year 1769, by order of the Governor of Chiloe, Don Carlos de Beranger, describes these islands at some length, but with a little confusion of bearings. The north end of Rundle Pass, he calls the west end, and the south outlet, the eastern. Byron's Island, he describes as being the southern island. I think his Port Ballemas must be on the south side of Wager Island, for he describes it to be opposite to Cape Roman (p. 213); therefore, Port Eustaquio should be on the north coast, probably, in the strait within San Pedro Island. - Agueros, p. 211 to 218.

Islands.

### WESTERN PATAGONIA.

Channels Mouth. The CHANNELS MOUTH of the old chart is laid down, as well as all this part of the coast, from Machado's account,\* who describes the opening, and gives its lat. 47° 25', which is only three miles in error. We found it to extend in a S. E. direction for eleven miles, and then to divide into two arms, one trending fifteen miles to the eastward, and the other eleven miles to the south, where they terminate. They are merely deep and narrow arms of the sea, running between steep-sided ranges of mountains. The shores are rocky, and afford neither coves nor bights, nor even shelter for a boat, and are perfectly unproductive; for no scals or birds were seen, and the shores were destitute even of shell-fish.

CapeMachado.

Anchorages under the Hazard Isles. CAPE MACHADO, in lat. 47° 27' 35", lon. 74° 26' 10", is the north head of this opening. Two miles off it are two rocks, which the pilot carefully and correctly describes, as he also does the rocks and breakers which extend off the south head for very nearly a league. The Beagle twice occupied an anchorage under the HAZARD ISLES, in the entrance, and on both occasions was detained many days from bad weather, with three anchors down.

Excepting this very bad and exposed anchorage, there exists none in the channel. Captain Stokes describes it to be an extremely perilous anchorage. "The anchors," he says, "were in 23 fathoms, on a bad bottom, sand and coral. The squalls were terrifically violent. Astern, at the distance of half a cable's length, were rocks, and low rocky islets, upon which a furious surf raged, and on which the ship must have been inevitably driven, if the anchors, of which three were down, had started."

Between CHANNELS MOUTH and JESUIT SOUND, the coast is more unbroken and low than usual. In lat. 47° 17' are some reefs which project two miles to sea; behind them there was an appearance of a bight, which may afford anchorage.

Jesuit Sound.

JESUIT SOUND, like Channels Mouth, is quite unfit to be entered by any ship. It terminates in two inlets, BENITO and JULIAN. The former is bounded on either side by high mountains, and terminates in low land, with a rivulet that originates Jesuit Sound. in a large glacier. The latter ends in high mountainous land, with streams of water between the hills: one part of it is cliffy; and it has, on the S. W. side, a long sandy beach. In its entrance is a large island, making the passages on each side very narrow, and they are rendered still more so by rocks and islets.

Separated by CHEAP CHANNEL from the main, is XAVIER Xavier Island. ISLAND,\* the MONTROSE ISLAND of Byron's Narrative.+ It is eleven miles and a half long, and four wide, and is very high and thickly wooded with lofty trees. The only two anchorages which the island affords are noticed and named by Machado, the northern one, PORT XAVIER, the southern IGNACIO BAY. Port Xavier. The former is by much the better place, being secure from prevailing winds, with 17 fathoms at eight hundred yards from the shore. The south end of the bay is a sandy beach, backed by tall beech trees. The shore to the south of Xavier Bay, for the first four or five miles, consists of a high, steep, clay cliff, with a narrow stony beach at its base, backed by mountains of twelve or fourteen hundred feet high, and covered by large and straight-stemmed trees. The remainder of the coast, to IGNACIO Bay, is low, and slightly wooded with stunted trees; and its whole extent is lashed with a furious surf, that totally prevents boats from landing.

IGNACIO BAY affords anchorage in 9 fathoms. The western Ignacio Bay. coast of the island is lined by reefs extending two miles off, upon which the sea breaks high.

KELLY HARBOUR is situated at the bottom of the north-east KellyHarbour. corner of the Gulf of Peñas, in the bay formed between the land of ST. ESTEVAN GULF and XAVIER ISLAND. It trends inwards in an easterly direction for eight miles. The land about the harbour is high, rugged, and rocky, but by no means destitute of verdure. In the interior are lofty-peaked and craggy ranges of snow-covered mountains. The points of the entrances are two miles asunder, and are thickly wooded and low, compared with the adjacent land; their magnetic bearing is N. 48° E. and S. 48° W. Between them is a channel of from 35 to 40

Agueros L. c.

121

### WESTERN PATAGONIA.

122

bour

fathoms deep, over a mud bottom, without danger, to a cable's length of the rocky islets that fringe the shore for a quarter of a mile off. On approaching the harbour the remarkable muddied appearance of the water is rather startling: but the discolouration proceeds only from the freshes of the river, and the streams produced from a very extensive glacier that occupies many miles of the country to the north. The plan will shew the depth of water. The course in is E. S. E. by compass, until in a line between the inner north point, and an inlet on the south shore that is fronted by five or six wooded islets. Then haul up along the larboard side of the harbour, as close to the shore and as far as you please, to an anchorage. The best berth is when the two points of entrance are locked in with each other, and within a cable and a half of the sandy spit that extends off the western end of a high and thickly wooded island. The ground is excellent, and so tenacious, that it was with difficulty that the Beagle lifted her anchors. Shelter, wood, and water, however, are the only advantages offered by the Environed by lofty mountains, some fourteen and harbour. eighteen hundred feet high, and ice-filled vallies and ravines-it is chill, damp, and dreary. A few birds, and a small number of hair seals, were the only living animals seen by us. Not a trace of human beings was observed.

For knowing Kelly Harbour the glacier is a capital leadingmark. It is a large field of ice, lying on the low part of the coast, about two miles to the northward of the harbour. The water at the anchorage, at half tide, was perfectly fresh, but was too muddied to be fit for immediate use. When in the fair way of the harbour, the Sugar Loaf in Holloway Sound will be seen just on with the end of the land, to the north of Purcell Island, bearing W. 1° N. by compass. The latitude of the north point of the harbour is 46° 59', and the lon. 74° 05' 30'; the variation about 20°. The mountain on the south shore, three miles and a half east-southerly from the north point, is 1,540 feet high.

St. Estevan Gulf.

Situation.

ST. ESTEVAN GULF. The entrance of this gulf, which is situated nine miles north of the N.E. end of Xavier Island, is four miles wide. The land, on the western side, Forelius PENINsula, is a narrow tongue of land nearly five leagues long.

Kelly Har.

The eastern side of the gulf is a long sandy beach, curving round to the N. W. towards the entrance of the River SAN TADEO, between which and CIRUJANO ISLAND, forming the south (or rather the west) point of entrance, the width is less than five miles; and at a league farther to the westward, it is not more than three miles and a half across. Here, in the centre there is a small islet called DEADTREE Island.

Beyond this is St. Quentin Sound, ten miles deep ;\* and, at St. Quentin its N. W. corner, ALDUNATE Inlet extends in for about eight miles. St. Quentin's Sound terminates in continuous low land, with patches of sandy beach, over which, among other lofty mountains, the DOME of ST. PAUL's is seen. The shores are thickly wooded with shapely and well-grown trees; the land near the beach, for the most part, is low, rising into mountainous peaks; a little distance in the interior of which, some are 1,500 feet high, but they are not craggy.

ST. ESTEVAN GULF is one of the best harbours of the coast. being easy of access, and with moderate depth of water all over; with good holding ground, and a clean bottom. The best anchor- Anchorage. age is at about two miles above DEADTREE Island, in from 4 to 6 fathoms, sandy bottom. This will be at two miles from either shore, but the berth is perfectly land-locked; and, if necessary, anchorage may be taken up much nearer to it.

CIRUJANO Island, above mentioned, is that on which the Ciruiano Is. Surgeon of the Wager was buried.+ The missionary priests land. describe a port on the island, called SAN TOMAS.<sup>+</sup> The island is separated from the extremity of Forelius Peninsula by a strait, one mile to three quarters of a mile wide.

The mouth of the RIVER SAN TADEO, is easily distinguished River San on entering the gulf, by the sand hills on each side of its entrance, Tadeo. and the bearing of the east trend of Cirujano Island, S. W. 1 S.,

\* Agueros, p. 209.

+ Of this circumstance I was informed by Pedro Osorio, an old soldier, whom I saw at Chiloe, who formed one of the party of the missionary voyages. I asked him why it was called El Cirujano, to which he replied : " Porque alli murió el cirujano del Wager."-(Because the Surgeon of the Wager died there.) Pedro Osorio knew Byron's party well, although it was eighty-eight years since they visited the island,-See also Byron's Narrative, p. 147.

‡ Agueros, p. 231.

Sound.

Digitized by Google

River San Tadeo.

(by compass S. by  $W. \neq W$ .) A sandy beach extends to the east and west of it for many miles; the land is low and marshy, and covered with stumps of dead trees. It has a bar entrance, much of which must be nearly dry at spring tides. A heavy swell breaks upon it for its whole length, so that no opening or swatch way is left, and, excepting in very fine weather, it is very hazardous to cross. At the mouth, the breadth is not more than a quarter of a mile; but, within the entrance, it opens to a basin of some extent; and at three miles up it is 300 yards wide, after which it gradually narrows. Nine miles from the entrance, the stream is divided into two arms; the Northern, or BLACK River, takes a northerly, and the other an easterly direction. The former is a strong and rapid stream, quite uninfluenced by tide, which, however, extends for a short distance up the eastern arm ; after which, the current down becomes gradually as strong as in the Black River. The banks of the latter are comparatively barren those of the Black River, where the wood is very thick. The courses of both arms are very tortuous, and the bed of the river so choked with trunks and branches of trees as to prevent its complete exploration, as well as the detection of the DESECHO the place where the Indians carry their canoes across the Isthmus of Ofqui.\*

Purcell Island.

PUBCELL ISLAND is separated from the land of FORELIUS PENINSULA by a good channel, two miles wide; it is moderately high and thickly wooded, and about six miles in circuit. About mid-channel, and nearly abreast of the east end of the island, is a rock only a few feet above the water. The channel to the south of the rock is from 18 to 22 fathoms deep, and the bottom sandy.

Upon the peninsula, opposite the west end of PURCELL ISLAND, is an ISTHMUS of low, sandy land, scarcely a mile wide; the one over which I think it may be inferred, from the Narrative,<sup>+</sup> that the cances in which Byron and his companions were embarked, were carried. One day's journey by land to the west of this isthmus, Byron describes a river, up which the Indian guides attempted to take the Wager's barge.<sup>+</sup> This river, if it exists, probably falls into BAD BAY.

1 Ibid, p. 108 and 111.

<sup>•</sup> See Byron's Narrative, p. 149 to 156; and Agueros, p. 209, 229, and 244.

<sup>+</sup> Byron's Narrative, p. 119 and 120.

The Beagle anchored in BAD BAY after dark, in 8 fathoms, sandy Bad Bay. bottom, and left it at 9 o'clock the following morning. Of this place, Captain Stokes remarks: "At daylight, we found that we had anchored in a small bay about half a mile off a shingle beach, on which, as well as on every part of the shore, a furious surf raged that effectually prevented our landing to get chronometer sights. The mouth of this bay is N. 50° E. (mag.) nine leagues from Cape Tres Montes, which in clear weather may be seen from its mouth. Like all this shore of the gulf, it is completely open to the S. W., and a heavy rolling sea. About nine A. M., we left it, and proceeded to trace the coast to the S. E."\*

To the westward, between BAD BAY and the land of CAPE TRES MONTES, is an extensive bight, sixteen miles wide, and about twelve deep. The centre is occupied by a group of Islands, called MARINE Islands, + upon which the SUGAR LOAF, a mountain 1,840 feet high, is very conspicuous. It was seen from the Wager the day before her wreck. ± Upon the Main, five miles and three quarters N. 15° E. from the Sugar Loaf, is another equally remarkable mountain, called the DOME OF ST. PAUL's, 2,284 feet high.

NEUMAN INLET, at the N. E. corner of this gulf, extends for Newman Inseventeen miles into the land, where it terminates; but it is of no let. use, as the water is too deep for anchorage. It is the resort of large numbers of hair seal. At the north-west corner is HOPPNER SOUND, about five miles in extent. At its south-west Hoppner end is a deep inlet, extending seven miles to the S.W., and reaching to within two miles of the sea coast, from which it is separated by an isthmus of low and thickly-wooded land. Captain Stokes walked across it to the sea-beach, from whence he saw Cape RAPER. The Beagle anchored at the bottom of HOPPNER Sound, off the mouth of the inlet. The mouth of the sound is very much blocked up by the MARINE Islands; but the southern channel, although narrow, has plenty of water. On the south-west side of the Marine Islands is HOLLOWAY Sound, in Holloway

Sound.

WESTERN PATAGONIA.

Port Otway.

which is PORT OTWAY, an inlet extending for five miles into the land, in a S.W. direction.

The entrance of PORT OTWAY is on the west-side of Holloway Sound, about fourteen or fifteen miles distant from Cape Tres Montes, and may be readily known by its being the first opening after passing the cape. Off the mouth are the Entrance Isles, among which is the LOGAN Rock, having a strong resemblance to the celebrated rock whose name it bears. It is broad and flat at the top, and decreases to its base, which is very small, and connected to the rock upon which it seems to rest. Immediately within the entrance on the west shore is a sandy beach, over which a rivulet discharges itself into the bay. Here anchorage may be had in 9 or 10 fathoms. It is by far the most convenient one the port affords. The plan will shew the particulars of the inlet, which contains anchorage all over it, but the depth is generally inconveniently great, from 20 to 30 fathoms.

Cape Tres Montes. CAPE TRES MONTES is a bold and remarkable headland, rising from the sea to the height of 2,000 feet. It lies in lat. 46° 55'  $\pm$ 7', and lon. 75° 27' 30', and is the south extremity of the Peninsula of Tres Montes.

To the northward of it is CAPE RAPER, in lat. 46° 48' 25'. Rocks and breakers extend off it for half a league to seaward.

POINT MITFORD REES, the northernmost land seen by the Beagle, is in lat. 46° 43'.

### Of the WIND and WEATHER.

The climate of the coast of Western Patagonia, described in this section, is cold, damp, and tempestuous. The reigning wind is north-west; but if it blows hard from that quarter, the wind is very liable to shift suddenly round to the westward and blow a heavy gale, which raises a mountainous cross sea. These westerly gales do not generally last long, but veer round to the southward, when the weather, if the barometer rises, will probably clear up. Should they, however, back round to the N. W. again, and the barometer keep low, or oscillate, the weather will, doubtless, be worse. Easterly winds are of rare occurrence; they are accompanied with fine clear weather; but westerly

Digitized by Google

winds bring with them a constant fall of rain, and a quick suc- Wind and cession of hard squalls of wind and hail.

Should a vessel be near the coast during one of these northerly gales, it would be advisable for her to make an offing as quickly as possible, to guard against the sudden shift to the westward that is almost certain to ensue. The discovery, however, of the anchorages of Port Henry, Port Santa Barbara, Port Otway, and St. Quentin's Sound, has very much reduced the dangers of the lee shore; and a refuge in either of them will always be preferable to passing a night on this coast in a gale of wind.

The barometer falls with northerly and westerly winds, but rises with southerly. It is at its minimum height with N. W. winds, and at its maximum when the wind is S. E. The temperature is rarely so low as forty degrees, excepting in the winter months. At Port Otway, in the Gulf of Peñas, the maximum and minimum for nineteen days, in the month of June, were 51° and 271°.

### Of the TIDES.

HIGH-WATER, at most parts of this coast, takes place within Tides. half an hour on either side of noon. The stream is inconsiderable, and the rise and fall rarely more than six feet.

The VARIATION of the compass, at the western entrance of the Variation. strait, is 232°; at Port Henry, 21°; at Port Santa Barbara, 19°; at Xavier Island, 20°; and at Port Otway, 201°.

197

# SECTION IX.

## Of the INTERIOR SOUNDS and CHANNELS between the Strait of MAGALHAENS and the Gulf of PENAS.

The western coast, between the Strait of Magalhaens and the Gulf of Peñas, is formed by a succession of islands of considerable extent, the largest of which, WELLINGTON ISLAND, occupies a length of coast of one hundred and thirty-eight miles. It is separated from the main by the MESIER and WIDE CHANNELS;\* and from MADRE DE DIOS by the GULF of TRINI-DAD. MADRE DE DIOS, which is probably composed of several islands, has for its inner or eastern boundary the CONCEPCION STRAIT.

HANOVER ISLAND has the SARMIENTO and ESTEVAN CHAN-NELS ON its eastern side, and on the south is separated from QUEEN ADELAIDE ARCHIPELAGO by LORD NELSON STRAIT, which communicates by SMYTH CHANNEL with the STRAIT OF MAGALHAENS

Smyth Channel.

Deep Harbouri

¢

SMYTH CHANNNEL commences in the strait at BEAUFORT BAY, on the eastern side of CAPE PHILLIP; N. 78° E., five miles and a half from which are the FAIRWAY ISLES; and, at a little more than six miles from the cape, on the west shore, is the anchorage of DEEP HARBOUR, the entrance of which is a quarter of a mile wide. The anchorage is about half a mile within the head, off the entrance of a lagoon, in from 30 to 35 fathoms. North and south of the port are inlets, each one mile deep. In entering, there is a patch of kelp on the starboard hand, and the shore is fronted for a short distance off by rocks.

\* Brazo Ancho of Sarmiento, p. 994

GOOD'S BAY, the next anchorage, is better than the last, Good's Bay. the depth being from 20 to 25 fathoms. It is convenient for vessels going to the northward, but when bound in the opposite direction NORTH ANCHORAGE will be better, from the North Anchordepth being less; but it is small, and the entrance is more fronted by rocks than Good's Bay. If it is not intended to anchor in either of the above places, the widest and best channel is to the eastward of Middle Island. There is a plan of these anchorages.

Off the N. E. point of Shoal Island is a rocky patch, upon Shoal. which the Adelaide struck. The channel, for the next four miles, is rather intricate; but all the dangers are pointed out.

Opposite to CAPE COLWORTH is CLAPPERTON INLET, beyond CapeColworth. which is a considerable tract of low country,---a rare sight in Hose Harbour. these regions. Two miles further, on the eastern side, is Hose HARBOUR, suitable for a small vessel; and, on the opposite Retreat Bay. shore, is RETREAT BAY, fronted by low rocky islets. The depth within is 24 fathoms.

Onwards, the channel is clear as far as OAKE BAY, where the Oake Bay and depth is 9 fathoms: but the anchorage is better among the OTTER ISLANDS, the depth being 6 and 7 fathoms, and the ground clean.

The channel, for the next eight miles, becomes more strewed with islands and rocks, and has much shoal water off every low point. The coast, also, is very low on the eastern shore, as far as the base of Mount Burney, which is five thousand eight hundred feet high, and covered with perpetual snow.

The best CHANNEL is on the east side of the Otter Islands. and between the Summer Isles and Long Island, for which the chart and a good look out for kelp will be sufficient guides.

FORTUNE BAY is at the south-east extremity of, apparently, Fortune Bay. an island in the entrance of a deep channel, which is, probably, one that Mr. Cutler, the master of an American sealing vessel, passed through.\* Upon the supposition of its leading through

Otter Islands.

<sup>·</sup> We met this intelligent person two or three different times whilst employed upon the survey, and received much valuable, and what afterwards proved to be correct, information from him, which I am here much gratified to have an opportunity of acknowledging.-P. P. K.

Fortune Bay. the land, and insulating the western shore of Smyth Channel, to the north of Point Palmer; the latter is distinguished by the name of RENNEL ISLAND. FORTUNE BAY is a very convenient and good anchorage, the depth being moderate, and bottom good; the best berth is within Low Island, in from 8 to 12 fathoms. At the bottom of the bay is a thickly wooded valley, with a fresh water stream.

Isthmus Bay.

A league to the north of POINT PALMER, on the opposite shore, is ISTHMUS BAY, affording excellent anchorage, but open to S. W., which here is, not of much moment, for the channel is only two miles wide. The bottom of ISTHMUS BAY is formed by a very narrow strip of land, separating it from what I have no doubt is Sarmiento'S ORACION BAY.\* Five miles north of Point Palmer is WELCOME BAY, also affording an excellent place to anchor in, with moderate depth and good bottom. A plan was made of it.

In SANDY BAY, on the east side of the channel, and off INLET

Bay, on the opposite shore, there are good anchorages: both

have a moderate depth, and are sheltered from the prevailing

In latitude 52° 01' is VICTORY PASSAGE, + separating ZACH PENINSULA from HUNTER ISLAND, and communicating with UNION SOUND, which leads to the Ancon Sin Salida of Sarmiento. + On the west side of Hunter Island is ISLAND BAY, with good anchorage both to the north and south of the islets.

winds, which generally are north-westerly.

The Adelaide anchored in the latter in 17 fathoms.

Anchorages near Zach Peninsula.

Anchorages near Piazzi Island. At the south extremity of PIAZZI ISLAND is HAMPER BAY, with anchorage in from 7 to 15 fathoms. Here the channel widens to three miles and a half; but, at two leagues farther on, near CERES ISLAND, under the S. E. end of which the Adelaide anchored in 10 fathoms, it narrows to two miles. ROCKY COVE is not to be recommended, and NARROW CREEK scems confined.

Hence to the mouth of the channel, which again widens here to five miles, and in which, during strong N. W. winds the sea runs heavy, we know of no anchorage; but a small vessel in

#### SMYTH CHANNEL.

want will, doubtless, find many, by sending her boat in search. North en-The Adelaide anchored among the DIANA ISLANDS, and in Smyth Chan-MONTAGUE BAY, having passed through HEYWOOD PASSAGE. nel, The northern point of Piazzi Island is Sarmiento's West Point, (Punta del Oeste\*), and a league to the south is his Punta de Mas-al-Oeste, or Point more West. Lieutenant Skyring concludes the Journal of his survey of Smyth Channel with the following remarks:

"So generally, indeed, do the northerly winds prevail, that it would be troublesome even for working vessels to make a passage to the northward; but it is a safe channel for small craft at any time. The tides are regular; the rise and fall at the southern entrance is eight and nine feet, but at the northern only five and six. The flood tide always sets to the northward, and the strength of the stream is from half to one mile and a half an hour: so that a vessel is not so likely to be detained here for any length of time, as she would be in the Strait of Magalhaens, where there is little or no assistance felt from westerly tides. The channel, besides, is comparatively free from sea, and the winds are not so tempestuous."-Skyring's MS.

As the Sounds within SMYTH CHANNEL will never be used Interior for any purpose of navigation, little need be said in a work destined solely for the use of shipping frequenting the coast. The chart will be sufficient to refer to for every purpose of curiosity or information. They possess many anchorages for small vessels, affording both shelter and security.

Sarmiento,+ on his third boat-voyage to discover a passage through the land into the Strait of Magalhaens, gives a detailed and very interesting account of his proceedings. All his descriptions are so good, that we had no hesitation in assigning positions to those places he mentions, to all of which his names have been appended. CAPE Año-NUEVO\* cannot be mistaken, and the description of his ANCON SIN SALIDA is perfect. He says: " The Morro of Año-nuevo trends round to the

#### INTERIOR SOUNDS.

Sarmiento's account of Ancon Sin Salida. S. E. and S. S. E. for a league to the first water ravine that descends from the summit. In an east direction from this, appears a large mouth of a channel, about two leagues off. We went to it, and found it to be a bay without a thoroughfare, forming a cove to the north, about a league deep; so that, finding ourselves embayed, we returned to the entrance, which we had previously reached with great labour and fatigue. This bight has four islets. The bay, from the islets to the westward, has a sandy beach, backed by a low country for more than a league and a half to the Morro of Año-nuevo."\*

Anchorages in the Interior Sound. The anchorages that were used by the Adelaide upon the examination of the interior sounds, were as follows :---

LEEWARD BAY, exposed, and being upon the leeward shore, is not to be recommended.

WHALE BOAT BAY, about one mile to the east of Grey Cape. A small cove on the north shore of Kirke Narrows, about a mile to the east of Cape Retford.

FOG BAY, two miles and a half to the north of the east end of Kirke Narrows.

Canal of the Mountains.

EASTER BAY, a convenient anchorage within White Narrows. The CANAL OF THE MOUNTAINS, nearly forty miles long, is bounded on each side by the high snow-capped Cordillera, the western side being by very much the higher land, and having a glacier of twenty miles in extent, running parallel with the canal. Eighteen miles from Cape Earnest, where the canal

• "Este Morro de Año-nuevo por la cabeza de la banda del Leste va en redondo al Sueste y Susueste como una legua hasta la primera quebrada de agua que desciende de la cumbro por un rio, y Leste-oeste con este rio parece una gran boca de canal como dos leguas. Fuimos allá, y hallamos ser Ensenada sin salida, y hace cula á la vuelta del Norte como una legua; y como nos vimos ensenados, volvimos a salir por donde habiamos entrado con harta pena. Tiene este codo quatro isletas que hacen canales; y esta Ensenada desde las isletas para el oeste va haciendo plaja de arena y tierra, playa baxa, mas de legua y media husta el Morro alto de Año-nuevo."—Sarmiento, p. 142.

A comparison of this account of Sarmiento's with our chart, cannot fail to claim for that excellent and persevering navigator the admiration of all geographers. Nor should the late Admiral Burnoy be forgotten; for the plan formed principally by him, from Sarmiento's Journal and other documents, is an extraordinarily correct delineation of what our chart now shows to be the true geographical features of the place.

Digitized by Google

commences, the channel is contracted to the width of about half a mile, otherwise its width is from one to two miles.

WORSLEY BAY and SOUND extend fifteen miles into the land, Worsley Bay,

LAST HOPE INLET is forty miles in length. Its mouth is three Last Hope miles and a half wide, but at eight miles the breadth is contracted by islands\* to less than a mile, the channel being 5 to 14 fathoms deep. Beyond this narrow the sound trends to the W. N. W.

DISAPPOINTMENT BAY. The land at the bottom is very low, Disappointand thickly covered with stunted wood. Mr. Kirke traced its shores, and found them to be formed by a flat stony beach, and the water so shallow, that the boat could seldom approach it within a quarter of a mile. A considerable body of water was noticed by him over the low land; probably a large lagoon, for it communicates with the bay by a rapid stream fifty yards wide. No high land was seen in an easterly direction; so that the country between Disappointment Bay and the castern coast may probably be a continued pampa, or plain, like the coast of Eastern Patagonia.

OBSTRUCTION SOUND extends for thirty miles in a south by east Obstruction direction, and then for fifteen more to the W.S.W., where it terminates. It is separated from the bottom of Skyring Water by a ridge of hills, perhaps twelve miles across. Some water was seen from a height, about six miles off, in the intervening space, but the shores were so carefully traced that Lieutenant Skyring, who examined it, feels satisfied that no communication exists. This question, however, will probably be set at rest by Captain Fitzroy, during his intended voyage.

A large plan was made of these sounds, to which a reference will give every desired information.

SARMIENTO CHANNEL, communicating between the east side of Sarmiento PIAZZI ISLAND and STAINES PENINSULA, continues to the northward of the mouth of PEEL INLET, where it joins the SAN ESTE-VAN CHANNEL, from which it is separated by the Islands of VANCOUVER and ESPERANZA: between these is a passage nearly a league wide, but strewed with islands.

RELIEF HARBOUR, at the south end of Vancouver Island, is a Relief Har-

peranza Island is the deep opening of ELLEN BAY, which may probably be a channel passing through and dividing Hanover Island. To the north the anchorages of REJOICE HARBOUR and ANCHOR BAY are commodious and useful. PEEL INLET extends in for seven leagues, communicating with PITT CHANNEL, and insulating CHATHAM ISLAND, which

is separated from the north end of Hanover Island by a continuation of the Sarmiento and San Estevan Channels, of which ws. the principal feature is the GUIA NARROWS.<sup>+</sup> These narrows are six miles long, and, excepting the north end, where it is only one-fifth of a mile wide, is from half to one mile broad. The tides here are not very rapid. High-water at full and change takes place at 2<sup>h</sup> 8', the flood running to the southward. At the south entrance of San Estevan Channel, the reverse is the case, of which, for vessels passing through, some advantage may be taken.

Guard Bay.

The north-west coast of CHATHAM ISLAND has many bights and coves fronted by islands, among which is GUARD BAY, where the Adelaide anchored; but the coast is too exposed to the sea and prevailing winds, to offer much convenient or even secure shelter.

The north-west points of Hanover and Chatham Islands are more than ten miles apart, and midway between them is situated Sarmiento's INNOCENTS ISLAND (Isla de los Ignocentes).<sup>±</sup>

CONCEPCION STRAIT separates Madre de Dios and its island

Mesier Channel.

- yards. The passage lies on the west side of the channel, to the westward of all the islands.

From the north end of the Narrows to the outlet of the MESIER, at TARN BAY, in the GULF OF PEÑAS, a distance of seventy-five miles, the channel is quite open and free from all impediment.

The ANCHORAGES in the WIDE and MESIER CHANNELS are more numerous than we have any account of. Those occupied by the Adelaide in her course through, are as follows, viz :--

FATAL BAY, in latitude 47° 55', on the western shore, at the north entrance of the channel, insulating MILLAR ISLAND. This bay is open and exposed.

ISLAND HARBOUR, on the east shore, in latitude 48° 06' 03", is a small but excellent land-locked anchorage, with good holding ground; wood and water close at hand, and abundance of fish.

WATERFALL BAY, in lat.  $48^{\circ}$  17'; at the entrance of an inlet on the east side of the channel.

At this part of the Mesier Channel the tides are regular, and run six hours each way, the flood setting N. by W.

WHITE KELP COVE, on the north side of Lion Bay, about one mile within the head, is confined, and only fit for a small vessel.

HALT BAY, on the east shore, at the north end of the English Narrows, in latitude 48° 54'. Here the flood sets to the S. S. E., and the tide being confined by the narrow width of the channel, runs with considerable strength.

LEVEL BAY, on the eastern side of the channel, at the south end of the narrows; is in latitude 49° 07' 30'.

ROCKY BIGHT, opposite the N. E. point of Saumarez Island, in from 17 to 12 fathoms.

FURY COVE, near RED CAPE, the extremity of EXMOUTH PROMONTORY. It is very confined, there not being room for more than two small vessels; but the ground is good, and although open to the S. W., it is a secure haven.

SANDY BAY, on the west shore of Wide Channel, in lat.  $49^{\circ} 45' 30''$ .

SMALL CRAFT BIGHT, also on the west shore, near the south

Anchorages in Wide and Mester Channels.

Tides.

end of the Wide Channel, is of small size, but answers every Anchorages in the Wide and the Wide and Mesier Chan-

OPEN BAY, on the east shore, opposite the Gulf of Trinidad. The anchorage is sheltered by two islands; but it is too exposed to trust a vessel in, and therefore not to be recommended.

Besides the above anchorages, there are many equally convenient, and, perhaps, much better, that may be occupied by vessels navigating these channels. Every bight offers an anchorage, and almost any may be entered with safety. On all occasions the weather shore should be preferred, and a shelving coast is generally fronted by shoaler soundings, and more likely to afford moderate depth of water than the steep-sided coasts; for in the great depth of water alone consists the difficulty of navigating these channels.

Throughout the whole space between the Strait of Magalhaens and the Gulf of Peñas, there is abundance of wood and water, fish, shell-fish, celery, and birds.

nels.

## SECTION X.

## **REMARKS** upon the PASSAGE round CAPE HORN, and to and from the ATLANTIC and PACIFIC Oceans, through the STEALT OF MAGALHAENS.

Advantageous to keep close to the land.

Winds during the winter months.

Easterly gales of rare occurrence.

Winds during the summer.

Winds variable near this coast.

To make the land near Cape Blanco.

SHIPS bound from the Atlantic to any of the ports in the Pacific, will find it advantageous to keep within 100 miles of the coast of Eastern Patagonia, as well to avoid the heavy sea that is raised by the westerly gales, which prevail to the eastward, and increase in strength according to the distance from the land, as to profit by the variableness of the wind when fixed in the western board. Near the coast, from April to September, when the sun has north declination, the winds prevail more from the W. N. W. to N. N. W. than from any other quarter. Easterly gales are of very rare occurrence, but even when they do blow, the direction being obliquely upon the coast, I do not consider it at all hazardous to keep the land on board. In the opposite season, when the sun has south declination, the winds will incline from the southward of west, and frequently blow hard; but, as the coast is a weather shore, the sea goes down immediately after the gale. In this season, although the winds are generally against a ship's making quick progress, yet as they seldom remain fixed in one point, and frequently shift backward and forward 6 or 8 points in as many hours, advantage may be taken of the change so as to keep close in with the coast.

Having once made the land, which should be done to the southward of Cape Blanco, it will be beneficial to keep it topping on the horizon, until the entrance of the Strait of Magalhaens be passed.

With respect to this part of the voyage, whether to pass Passage through Strait Le Maire, or round Staten Island, much difference through Strait of opinion exists. Prudence, I think, suggests the latter; yet I should very reluctantly give up the opportunity that might offer of clearing the Strait, and therefore of being so much more to windward. With a southerly wind it would not be advisable to Not advisable attempt the strait; for, with a weather tide, the sea runs very cross with southerly winds. and deep, and might severely injure and endanger the safety of a small vessel, and to a large one do much damage. In calm weather it would be still more imprudent (unless the western side of the Strait can be reached, where a ship might anchor), on account of the tides setting over to the Staten Island side; where, if it becomes necessary to anchor, it would necessarily be in very deep water, and close to the land. With a northerly wind the But with route seems not only practicable, but very advantageous, and it northerly winds would require some resolution to give up the opportunity so in- practicable. vitingly offered. I doubt whether northerly winds, unless they Northerly are very strong, blow through the Strait-if not, a ship is drifted winds do not over to the eastern shores, where, from the force of the tides, she must be quite unmanageable.

Captain Fitz Roy, whose authority, from his experience, must be very good, seems to think there is neither difficulty nor risk in passing the strait (see p. 105). The only danger that does exist, and that may be an imaginary one, is the failure of the wind. Ships passing through it from the south, are not so liable to the Passage failure of the south-westerly wind, unless it be light, and then it through the will probably be from the N. W., at the northern end of the southward. strait. The anchorage in Good Success Bay, however, is admirably situated, should the wind or tide fail. (See p. 104.)

In passing to leeward of Staten Island, the tide race, which ex- Tide race off tends for some distance off Cape St. John, at the N. E. end of the island, must be avoided, otherwise there exist no dangers. (See note at p. 106, relating to the tide.)

The anchorage under New Year's Islands, although it is a Anchorage unwild one and the bottom bad, and the tide very strong, yet Islands. offers good shelter from south-west winds, and might be occupied with advantage during the existence of a gale from that quarter ; since it is unfavourable for ships bound round the Horn.

To stand to the southward as far as 60° S. lat.

Winter passage preferable to the summer.

Advice after passing round Tierra del Fuego.

North-west winds

Barometer.

After passing Staten Island, if the wind be westerly, the ship should be kept upon the starboard tack, unless it veers to the southward of S.S. W., until she reaches the latitude of 60° south, and then upon that tack upon which most westing may In this parallel, however, the wind is thought to prebe made. vail more from the eastward than from any other quarter. Never having passed round Cape Horn in the summer season, I may not perhaps be justified in opposing my opinion to that of others; who, having tried both seasons, give the preference to the summer months. The advantage of long days is certainly very great, but from my experience of the winds and weather during these opposite seasons at Port Famine, I preferred the winter passage, and in our subsequent experience of it, found no reason to alter my opinion. Easterly and northerly winds prevail in the winter off the cape, whilst southerly and westerly winds are constant during the summer months; and not only are the winds more favourable in the winter, but they are moderate in comparison to the fury of the summer gales. (See p. 112.)

Having passed the meridian of Cape Pillar, it will yet be advisable to take every opportunity of making westing in preference to northing until reaching the meridian of  $82^{\circ}$  or  $84^{\circ}$ , which will enable a ship to steer through the North-westerly winds that prevail between the parallels of  $50^{\circ}$  and  $54^{\circ}$ . (See Hall's South America, Appendix.)

With respect to the utility of the barometer as an indicator of the weather that is experienced off Cape Horn, I do not think it can be considered so unfailing a guide as it is in the lower or middle latitudes. Captain Fitz Roy, however, has a better opinion of the indications shewn by this valuable instrument: my opinion is, that although the rise or fall precedes the change, yet it more frequently accompanies it. The following sketch of the movement of the barometer, and of the weather that we experienced, may not be without its use.

Being to the north of Staten Island for three days preceding full moon, which occurred on the 3rd April, (1829,) we had very foggy weather, with light winds from the eastward and northward, causing a fall of the mercury from 29.90 to 29.56. On the day of full moon the column rose, and we had a beautiful morning, during which the high mountains of Staten Island were Weather off quite unclouded, as were also those of Tierra del Fuego. At noon, however, a fresh gale from the S. W. set in, and enveloped the land with a dense mist. No sooner had the wind changed. than the mercury rose to 29.95, but fell again the next morning : and with the descent the wind veered round to, and blew strong from N. W., with thick cloudy weather and rain, which continued until the following noon, when the wind veered to S. W., the barometer at 29.54, having slightly risen; but after the change it fell and continued to descend gradually until midnight, when we had a fresh gale from W. S. W. When this wind set in. the mercury rose, and continued to rise, as the wind veered without decreasing in strength to S. S. W., until it reached 29.95, when it fell again and the weather moderated, but without any change of wind. During the descent of the mercury, the sky with us was dull and overcast with squalls of wind and rain, but on shore it seemed to be very fine sunshinv weather.

The column now fell to 29.23, and during its descent the weather remained the same, dull and showery ; but as soon as the mercury became stationary, a fresh breeze set in from the southward, with fine weather.

After this to new moon the weather was very unsettled, the wind veering between South and W. S. W.; the barometer rising as it veered to the former, and falling as it became more westerly: but on no occasion did it precede the change.

The mean height of the barometer is about 29.5.

The mercury stands lowest with N. W. winds, and highest with S. E.

With the wind at N. W. or northerly the mercury is low. if it falls to 29 inches or 28.80, a S. W. gale may be expected, but does not commence until the column has ceased to descend. It frequently however falls without being followed by this change. In the month of June, at Port Famine, the barometer fell to 28.17. and afterwards gradually rose to 30.5, which was followed by cold weather, in which the thermometer stood at 12°.

Cape Horn.

Meteorological Abstract.

#### Of the PASSAGE to and from the ATLANTIC and PACIFIC Oceans, by the STRAIT of MAGALHAENS.

Passage through the Strait.

The difficulties that present themselves to Navigators in passing round Cape Horn, as well from adverse winds as the severe gales and heavy sea that they are exposed to, are so great, that the Strait of Magalhaens has naturally been looked to as a route by which they may be avoided. Hitherto no chart has existed in which much confidence could be placed; but by the present survey, then avigation through it, independent of wind and weather, has been rendered much easier; since a correct delineation of its shores, and plans of the anchorages, have been made; and in the preceding pages sufficient descriptions of them have been given to assure the navigator of his place, and furnish him with advice as to his proceedings. The local difficulties therefore have been removed, but there remain much more serious ones, which I should not recommend a large, or even any but a very active and fast-sailing, square-rigged vessel to encounter, unless detention be not an object of importance

For a square-rigged vessel bound through the Strait, the following directions will be useful :---

In the eastern entrance, the winds will frequently favour a ship's Directions for artival off the First Narrow; where, if she selects a good anchorage strait. on the bank which bounds the northern side of the channel (see p. 20 to 22), she may await an opportunity of passing through the FIRST NARROW and of reaching GREGORY Bay; where also a delay may safely be made for the purpose of passing the SECOND NARROW and arriving at the neighbourhood of Cape NEGRO: at which place the difficulties and dangers of the eastern entrance cease.

The dangers being carefully placed on the chart, and sufficiently described in the preceding part of this memoir, nothing need be repeated here; and indeed much must be left to the judgment and discretion of the navigator.

The passage of the FIRST NARROW, the anchorage to the eastward of, and in, Gregory Bay, the passage of the Second Narrow, the anchorage to the north of Elizabeth Island, and the passage round its south side, are described between pages 20 and 27.

The tides answer best for vessels entering the Strait at the period Best time to of full and change of the moon, since there are two westerly tides Narrow. in the day. In the winter season, if the morning tide be not sufficient to carry a vessel through the FIRST NARROW, she may return to Possession Bay, select an anchorage, and be secured again before night; or, in the summer, if she has passed the NARROW, and enabled to anchor for the tide, there will be sufficient daylight for her to proceed with the following tide to Gregory Bay, or at least to a safe anchorage off the peaked hillocks, on the north shore. (See page 23.)

I have twice attempted to pass the First Narrow, and been obliged to return to the anchorage in Possession Bay (see p. 21); and twice I have passed through it against a strong breeze blowing directly through, by aid of the tide; which runs, in the narrower parts, at the rate of ten or twelve miles an hour. When the tide Tide in the and wind are opposed to each other, the sea is very deep and First Narrow. heavy, and breaks high over the decks; it is therefore advisable to close reef, or lower the topsails on the cap, and drift through; for the tide, if at the springs, will generally be sufficient to carry

a ship to an anchorage although, not always to one that it would be safe to pass the night at. On this account, it would be prudent to return; for, although the holding ground is exceedingly good, yet, to part in the night, or drift towards, or through the NARROW, could scarcely happen without accident.

In leaving the anchorage in Gregory Bay, attention must be paid to the tide, which continues to run to the eastward in the SECOND NARROW, three hours after it has commenced to set to the S. W. at the anchorage, (see p. 24).

With a leading wind through the Second Narrow, a ship will easily reach an anchorage off LAREDO BAY (p. 28;) but, if the tide fails upon emerging from it, she should seek for a berth in the Bay to the north of Elizabeth Island, (p. 26 and 27) as near to the island as possible, but to the westward of its N. E. end, to be out of the influence of the tide. The depth of water, however, will be the best guide.

Directions to pass round the south side of Elizabeth Island are given at p. 27; and as this part offers some dangers, the chart and the description should be carefully referred to.

The only advice that seems wanting to improve the directions of the coast from this to PORT FAMINE is, with a south-westerly wind, to keep close to the weather shore, in order to benefit by the flaws down the vallies; but this must be done with caution, in consequence of the squalls off the high land, the violence of which, to a person unaccustomed to them, cannot be well imagined, (p. 29).

The fourth Section, from p. 47 to 52, gives an account of the anchorages between Port Famine and Cape Froward; of which the only convenient one for a ship is St. Nicholas Bay (p. 50), and to which, if defeated in passing round the Cape, a ship had better return; for it is easy to reach as well as to leave, and extremely convenient to stop at, to await an opportunity of proceeding.

From CAPE FROWARD to the westward, unless favoured by a fair wind, it is necessary to persevere and take advantage of every opportunity of advanci.#g step by step. There are several anchorages that a ship may take up, such as Snug Bay, off Woods Bay, near Cape Coventry, in Fortescue Bay, Elizabeth Bay, and York Roads. These are described between pages 55 and 58. To the

Tide in the Second Narrow.

Anchorage off the north end of Elizabeth Island.

Advisable to keep near the shore.

Heavy squalls.

Anchorages to the west of Cape Froward. westward, in CROOKED REACH, the anchorages are not so good, Also in and excepting Borja Bay (p. 64), none seem to offer much con- Crooked Reach. venience. BORJA BAY, however, is well calculated to supply the Boria Bay. deficiency, although for a square-rigged vessel there must be some difficulty in reaching it.

LONG REACH is both long and narrow, and ill supplied with Long Reach. anchorages for a ship; such as they are, Swallow Harbour, Playa Parda, Marian's Cove, and Half Port Bay, seem to be the best (p. 67, 70, and 72). In thick weather, although the channel is very narrow, yet one side is scarcely visible from the other, and the only advantage it has over other parts of the strait is the smoothness of the water. In SEA REACH there is a heavy rolling Heavy swell swell, with a short and deep sea, which renders it very difficult to beat to windward (p. 75).

Tamar Harbour (p. 78), Valentine Harbour (p. 81), Tuesday Anchorages Cove (p. 82), and the Harbour of Mercy (p. 83), are the best in it. anchorages; and the latter is particularly convenient to occupy, to await an opportunity of sailing out of the strait.

In the entrance, the sea runs very heavy and irregularly during Entrance. and after a gale; so that a ship should not leave her anchorage in the Harbour of Mercy, without a fair or a leading wind to get her quickly through it.

For small vessels, particularly if they be fore-and-aft rigged, No difficulty many, if not all of the local difficulties vanish; and inlets which a for small vessels. ship dare not or can not approach, may be entered with safety, and anchorage easily obtained by them. A large ship will perhaps be better off in entering and leaving the strait where there is open space and frequently a heavy sea; but for the navigation of the strait, a small vessel has considerably the advantage. She has also the opportunity of passing through the Cockburn Can pass Channel should the wind be north-westerly, which will very much through the reduce the length of the passage into the Pacific.

One very great advantage to be derived from the passage through Advantage of the Strait is, the opportunity of obtaining as much wood and wooding and watering, water as can be required, without the least difficulty; another and refreshgreat advantage is, that by hauling the seine during the summer months, from January to May, at the mouth of the river or along the beaches in Port Famine, at the first quarter flood, a plentiful

in Sea Reach.

Cockburn Channel.

ments.

Fish.

supply of fish may be obtained. Excellent fish are also caught at the anchorage with the hook and line, at all seasons, early in the morning or late in the evening. Fish may also be obtained with the seine at any other place where there are rivers. Freshwater Bay and Port Gallant are equally productive. On the outer coast of Tierra del Fuego an excellent fish may be caught in the kelp.

#### DIRECTIONS for passing through the STRAIT of MAGALHAENS, from the PACIFIC to the ATLANTIC.

The advantage which a ship will derive from passing through the strait, from the PACIFIC to the ATLANTIC, for there must be some great one to induce the seaman to entangle his ship with the land when fair winds and an open sea are before him, is very great. After passing through the strait, the prevailing winds being westerly, and more frequently from the northward than from the southward of west, they are fair for his running up the coast; or if not, the ship is not liable to receive much injury from the sea, which is comparatively smooth; whereas, to a ship passing round the Horn, if the wind be north-west she must go to the eastward of the Falkland Islands, and be exposed to strong gales and a heavy beam sea, and hug the wind to make her northing. To a small vessel the advantage is incalculable; for, besides filling her hold with wood and water, she is enabled to escape the severe weather that so constantly reigns in the higher latitudes of the South Atlantic Ocean.

Coming from the northward it will be advisable to keep an offing until the western entrance of the strait is well under the lee, to avoid being thrown upon the coast to the northward of CAPE VICTORY, which is rugged and inhospitable, and, forming as it were a breakwater to the deep rolling swell of the ocean, is for some miles off fringed by a cross hollow sea almost amounting to a rippling.

The land of Cape Victory is high and rugged, and much broken; and if the weather be not very thick, will be seen long before the Evangelists, which are not visible above the horizon from a ship's deck, for more than four or five leagues.\*

• From the Adventure's deck, the eye being thirteen feet above the water, they were seen on the horizon at the distance of fourteen miles.

Digitized by Google

Advantage to ships passing through the strait from West to East.

Ships going round the Horn must go to leeward of the Falkland Islands.

Directions.

Description of Cape Victory and the Evangelists. Pass to the southward of them, and steer for Cape Pillar which Cape Pillar. makes like a high island. In calm weather do not pass too near to the cape, for the current sometimes sets out, and round the Cape to the southward; but with a strong wind get under the lee of it as soon as you please, and steer along the shore. In the night it will be advisable to keep close to the land of the south shore; and if a patent log be used, which no ship should be without, your distance will be correctly known. The course course onalong shore, by compass, is E. 2 S.; and if the weather be thick, wards from Cape Pillar, by keeping sight of the south shore, there will be no difficulty in proceeding with safety.

The Adventure entered the strait on the 1st of April, 1830, at Sketch of the sunset; and after passing within half a mile of the islets off the Adventure's Harbour of Mercy, steered E. 3 S. magnetic, under close reefed through. topsails, braced by, the weather being so squally and thick that the land was frequently concealed from us: but, it being occasionally seen, the water being quite smooth, and the course steadily steered, with the patent log to mark the distance run. we proceeded without the least anxiety; although the night was dark and the squalls of wind and rain frequent and violent. When abreast of Cape Tamar, that projection was clearly distinguished, as was also the land of Cape Providence, which served to check the distance shewn by the the patent log, but both giving the same results proved that we had not been subjected to any current; whereas the account by the ship's log was very much in error, in consequence of the violence of the squalls and the long intervals of light winds, which rendered it impossible to keep a correct account of the distance. At daybreak we were between Cape Monday and the Gulf of Xaultegua; and at 8 o'clock we were abreast of Playa Parda, in which, after a calm day, the ship was anchored.

In the summer season there is no occasion to anchor any where, Not necessary unless the weather be very tempestuous, for the nights are short to anchor in the summer. and hardly dark enough to require it, unless as a precautionary measure, or for the purpose of procuring wood and water; the best place for which is Port Famine, where the beaches are strewed with abundance of logs of well seasoned wood,

which is very superior to the green wood that must otherwise be used.

Currents in the strait.

Direction for

side of Elizabeth Island.

the navigation of the south Notwithstanding the Adventure experienced no current in the western part of the strait, there is generally a set to the eastward, which is more or less felt according to circumstances. The direction and strength of the currents are caused by the duration of the gales.

The chart will be a sufficient guide for vessels bound through from the westward as far as Laredo Bay; after which a few directions will be necessary. The land here should be kept close on board, to avoid the REEF off the south-west end of SANTA MAGDALENA. Being abreast of it, bear away, keeping the N. E. extremity of Elizabeth Island on the starboard bow, until you see SANTA MARTHA in one with, or a little to the southward of, the south trend of the Second Narrow (CAPE ST. VINCENT,) which is leading mark for the fair channel until you pass the spit of shoal soundings, which extends across to Santa Magdalena. There are also shoal soundings towards the south-west end of Elizabeth Island; at half a mile off we had 5 fathoms,-Cape St. Vincent being then the breadth of Santa Martha open to the northward of that island. Keeping the Cape just in sight to the northward of Santa Martha, steer on and pass round the low N. E. extremity of Elizabeth Island, off which are several tide eddies. The tide here sets across the channel. (See remarks upon the tide at p. 27.)

Second Narrow, Now steer for the SECOND NARROW, keeping Cape Gregory, which will be just discernible as the low projecting extreme of the north side of the Second Narrow, on the starboard bow, until you are three miles past Santa Martha; the course may then be directed for the Cape, opening it gradually on the larboard bow as you approach it, to avoid the shoal that extends off it.

Anchorage in Gregory Bay. If you anchor in GREGORY BAY, which is advisable, in order to have the whole of the tide for running through the First Narrow, haul up and keep at a mile and a half from the shore. When the north extremity of the sandy land of the Cape is in a line with the west extreme of the high table land, you will be near the anchorage; then shorten sail, and when the green slope begins to

Digitized by Google

open, you will have 14 fathoms: you may then anchor or keep away to the N. E., and choose a convenient depth, taking care not to approach the shore, so as to bring Cape Gregory to the southward of S. by W. 1 W. (by compass). The best berth is with the Cape bearing S. S. W. (See p. 23).

Hence, to the FIRST NARROW the course by compass is due N.E. Course to First by E.\* The land at the entrance, being low, will not at first be perceived, but on steering on you will first see some hummocky land, making like islands. These are hills on the eastern or Fue- Description of gian side of the Narrow. Soon afterwards a flat, low sand-hill the S. W. end will be seen to the northward, and this is at the S. W. extremity Narrow. of POINT BARRANCA. (see p. 23). On approaching the narrow at four miles off, keep a cliffy head, four or five miles within the east side of the narrow, open of the trend of Point Barranca, by which you will avoid the shoal that extends off the latter point (p. 22). You should not go into less depth than 6 fathoms. At most times of the tide there are long lines and patches of strong ripplings through which you must pass. The shoal is easily distinguished by the kelp.

When the channel through the narrow bears by compass Course to steer N. by E. <sup>2</sup>/<sub>4</sub> E., steer through it; and that, or a N. N. E., course in passing the Narrow. will carry you through. On each side, the bank extends off for some distance; but by keeping in mid-channel, there is no danger until the cliffy coast be passed, when reefs extend off either shore for some distance, particularly off Cape Orange. The N. N. E. course must be kept until the peak of Cape Orange bears South, and the northern Direction Hill (p. 20 and 22) W. S. W., or W. by S. & S. by compass. Then steer E. N. E. for Cape Possession, taking care not to approach too near to the bank off Cape Orange, or the one on the north side of Possession Bay, for which the chart must be consulted.

For a small vessel, the passage through the strait from west to The route not east is not only easy, but to be strongly recommended as the best but proper for and safest route. Indeed, I think the passage would be quite as

Digitized by Google

Narrow.

of the First

only advisable, a small vessel.

<sup>\*</sup> If from the Second Narrow, N. E. ‡ E. will be the compass course ; but I should recommend a ship hauling up to the northward until abreast of Cape Gregory, and then to steer as above.

expeditious, and, perhaps, much safer to enter the Gulf of Trinidad, and pass down the Concepcion Strait, the Sarmiento or St. Estevan Channels, and Smyth's Channel, and enter the strait at Cape Tamar. In these channels northerly winds prevail, and there is no want of convenient and well-sheltered anchorages for the night, many of which have already been mentioned, and multitudes of others, and perhaps much better ones, might be found.

# ADDENDA.

[WHILE the preceding sheets were going through the press, the author had an opportunity of obtaining some additional matter from a MS. Journal, kept by the late Lieutenant Simpson,\* who was a Midshipman with Commodore Byron in the Dolphin: and of extracting from his own manuscript some notes that will be found useful.]

Mr. Simpson's Journal says, Shoals off Cape Blanco. SHOALS OFF CAPE BLANCO. "Found various soundings, the shoalest water 7 fathoms on a bank. Then Cape Blanco bore S. W. by W 1 W. 2 leagues. and the southmost land in sight South. This shoal shows itself by a great rippling; we had 12 fathoms without it, close to the rippling, and were soon over it and steered directly in for the The water soon after deepened very fast; at one league land. from the shore we had 42 fathoms."

The shoals, therefore, that the Adventure passed, (p. 3.) are the same as the above. Hawkesworth (i. 13.) has doubtless made an erroneous extract from the Commodore's Journal, in describing them to be four, instead of two, leagues off the shore.

CAPE BLANCO. At page 4. is noticed a supposed error of the Position of chart. The Spanish chart, from which I have laid down the cape, places it in latitude 47° 15'. Mr. Simpson's Journal describes it to be in latitude 47° 10', which is only 2 miles short of what our observations made it.

PORT DESIRE. I have recommended the river to be entered at young flood, (p. 5.), but Mr. Simpson thinks the last quarter

Cape Blanco.

<sup>•</sup> Mr. Simpson died a few years back at the Royal Hospital of Plymouth, of which establishment he was one of the Lieutenants for many years. The Manuscript above referred to is now the property of Captain J. F. Newell, R. N. who obligingly communicated it to me during the printing off of my last sheet.

flood to be the best time. If the latter be adopted, I would advise that the ship should be anchored off the entrance during the low water, in order to see the banks and rocks uncovered; since they will not be visible after half tide.

Fresh Water at Port Desire.

Eddystone

Bellaco.

Rock, or the

The Journal also mentions that the Commodore found a small run of good FRESH WATER at about 2 miles S. W. of the Tower Rock. They filled five or six tons of it. A pole was erected near it, to point the spot out to future visitors.

EDDYSTONE. Byron saw this rock, but from his position of it, there seems to be little doubt that it is the Bellaco rock of Nodales. Mr. Simpson's journal says, "it is 5 leagues from the shore, and is covered at high water. It bears from Penguin Island S. S. W., a little westerly, distance 14 or 15 leagues; and it is in latitude 48' 36'. (The latitude of the Bellaco is 48° 30' 50", see p. 9.)

SANTA CRUZ. At p. 17, eleven o'clock is given for the time of high water at full and change; but from a further consideration of Captain Stokes' journal, and of the tide tables kept on board the Beagle, it should rather be  $10^{h}$  15', it rises 33 feet.

PORT ST. JULIAN. High water at Port St. Julian takes place at full and change, at 10<sup>h</sup> 34', and the tide rises 38 feet.

Simpson's Journal notes the time of high water at Port Desire, at full and change, to be one o'clock, the tide to rise 21 feet, and the stream to run at 7 or 8 miles an hour.

The shoal soundings of 5 fathoms off Cape Virgins (p. 19), bear from the Cape, S. 35° E.

There is anchorage under Dungeness, with westerly winds. Wallis anchored in 10 fathoms gravel; Cape Virgins bearing N. by W.  $\frac{1}{4}$  W., and Dungeness S. by W., (Hawkesworth, i. 372); but these bearings, when laid down in the chart, do not appear to be correct. The Dolphin anchored at 4 miles off the Cape, bearing N.  $\frac{1}{4}$  E., and at 2 or 3 miles from the extremity of the Ness, bearing S. S. W.  $\frac{1}{4}$  W.

**REEF OFF CAPE ORANGE.** This reef extends off to the E. N. E. for a considerable distance. Byron struck upon it (Hawkesworth i, 42), as did also the Santa Casilda (Ult<sup>°</sup> Viage, Appendice). The Adeona, a sealing vessel, in 1828, also struck upon it and was left dry; and the Beagle, in going to her

Tide at Santa Cruz.

SHOALS IN POSSESSION BAY and FIRST NARROW. The follow- Shoals in Pos-"Passed and First ing extract from Mr. Simpson's Journal may be useful. over 64 fathoms: the Asses Ears N. W. by W. 4 W. 3 leagues. and the north point of the First Narrow, W. by S. 5 or 6 miles."

" January 6. The ship grounded on a bank in 15 feet, and lay about 10 minutes, and then drove off into 9 and 10 fathoms. This shoal is in the mid channel to the First Narrow, and is off a great length and is steep to. When on it the Asses Ears bore N. W. 1 W. 6 or 7 miles. Entrance of the Narrow S. W. 2 leagues, and Point Possession N. E. 3 leagues. At 6 we anchored in 15 fathoms, the Asses Ears N. W. by W. 7 or 8 miles, the entrance of the Narrow S. W. by W. 2 or 3 leagues. The shoal, N. N. W. 1 mile. Anchored again in 61 fathoms about 31 leagues from the south side of the shoal: the Asses Ears, N. W. by W. 4 leagues, and the south point of the entrance of the First Narrow W. S. W. Sent the boats out sounding between the shoal and the south shore, and found a channel. but at low water the shoal shews itself in some places by a great rippling."

"Jan. 7. At 8 in the morning, weighed; little wind at W. S. W., steered S. E. by E., having Mr. John Simpson a-head of the ship, sounding. Steering this course half a mile we deepened the water to 13 fathoms, and then steered between East and E. N. E. along the south side of the shoal, and at 6 or 7 miles from the shore; the soundings being very regular, between 9 and 15 fathoms: but in hauling nearer we soon shoaled the water to 7 fathoms. The shoal is more than 2 leagues in length from east to west, and nearly 2 leagues in breadth between the shoal and the south shore. The boats had soundings on a bank in 61 fathoms at low water, and deep water within it. At noon we hauled over for the north shore, being to the eastward of the bank, and soon deepened the water to 20 fathoms. Then Point Possession bore N. N. W. 4 or 5 leagues, and the Asses

session Bay Narrow.

#### ADDENDA.

Ears, W. N. W., 6 or 7 leagues. Cape Virgin Mary, N. E. 1 E. 7 leagues."

PointAnegada.

POINT ANEGADA. Sarmiento's Point Anegada is certainly the Shoals off Cape Orange, for he says, "From Point Baxa, the coast of the south shore extends E. 1 N. E. (Leste quarta al Nord-este)\* 51 leagues towards a very low point, which I called Point Anegada (drowned land), Sarmiento, p. 273. In printing page 22, I have considered the above point to be the Shoals off Point Delgada, which is manifestly erroneous.

POINT BARRANCA bears from Cape Gregory, N. 48° 1 E. and

Simpson's Journal says

Point Barranca.

Shoal to the S.W. of Santa Magdalena. is 194 miles distant.

ELIZABETH BAY.

SHOAL OFF SANTA MAGDALENA.

Cape Froward.

by us was 5 fathoms. See p. 27. CAPE FROWARD. Byron found the depth of water at less than a cable's length from the point 40 fathoms. Midway between St. Nicholas Bay and Port San Antonio, we had no bottom with 256 fathoms.

there are 3 fathoms on it in many places; the least water found

Snug Bay.

SNUG BAY. At Byron's anchorage in Snug Bay, "Cape Froward bore E. 1 S., 5 miles; the islet in the Bay, W. by S. 1 mile; the river's mouth, N, W. by W. 1 mile. Shoaled suddenly from 17 to 9 fathoms, but had no ground until near the Island." (Simpson's Journal.)

anchorage here in 10 fathoms. Rupert's Island bore S. by E., 2 or 3 miles; Passage Point S. E. by S.  $\frac{3}{4}$  mile; the west part of the bay W. by N., 2 miles, and a reef of rocks about a cable's length from the shore N. W. by W.,  $\frac{1}{4}$  mile. The reef is quite covered at high water. Here the flood set to the eastward, and

Mr. Simpson describes the Dolphin's

## LATITUDE AND LONGITUDE, VARIATION OF THE COMPASS, AND TIDE.

#### I.

#### COASTS OF BRAZIL, RIVER PLATA, AND EASTERN PATAGONIA.

The Latitudes to which the character ⊙ is prefixed, have resulted from Astronomical Observation. The Longitudes which have been determined by Chronometers, are designated by C.; and those by Lunar Distances by ⊙ D. Those without distinguishing marks are the result of Triangulation.

The Longitudes in the following Tables depend upon that of Villegagnon Island at Rio de Janeiro, which was found by 14 Chronometers from Plymouth to be 43° 05' 03" West of Greenwich.

TABLE III. (continued.)

## TABLE IV.

#### OUTER, OR SÉA COAST, OF TIERRA DEL FUEGO.

In order to adapt the longitudes of the places mentioned in this Table to the meridians of Port Famine and St. Martin's Cove, at Cape Horn, the following corrections have been made to Captain Fitz Roy's chronometrical results, viz :--

Townshend Harbour Stewart Harbour Doris Cove March Harbour Good Success Per	have been placed		- <b>66</b> )	to the Eastward of Captain Fitz Roy's chro- nometrical deductions.
Good Success Bay	)	L 2	0 )	•

By Captain Fitz Roy's observations St. Martin's Cove would be in long. 67° 31' 18", which is 2' 15" to the Westward of the mean of upwards of thirty chronometrical results from Monte Video. The difference has therefore been equally divided between North Cove and St. Martin's Cove; the longitude of the latter being taken at 67° 29' 03", and of Port Famine at 70° 54'.
