**Anti-Jacobin**, the poetry of the, 247; great reputation of the Anti-Jacobin, 248; origin of satire, *ib.*; truth, the basis of effective satire, 249; geniality of great satirists, *ib.*; gravity of English satire, 250; superiority of the English as caricaturists, 251; Peter Pindar, *ib.*; William Gifford, 252; "Classic Canning," 253; origin of the Anti-Jacobin, 254; Sapphics, the "needy knife-grinder," *ib.*; Parody on Southey's "Inscription," 255; "The Loves of the Triangles," 256; the Anti-Jacobin overrated, 257.

## B.

**Belief**, the restoration of, 94; wide-spread indifference to religion in England, *ib.*; clerical seceders from the Church, *ib.*; their influence on the general opinion, *ib.*; belief cannot be restored, but must be renovated, 95; the first number of the series entitled, "The Restoration of Belief," 95, 96; the author's positions, 96; history met, and history evaded, 97; historical criticism necessarily concerns itself with details, 98; false history discoverable, while true is unattainable, *ib.*; devotion to a person, the characteristic of genuine theism as opposed to pantheism, 99; this condition was imported from the Hebrew to the Christian system, *ib.*; was wanting to the paganism of the empire, *ib.*; dualism mingled with all genuine theistic faith, 100; martyrdom monopolized by the orthodox, 101; are heretics to keep a conscience? 102; the ethics of opinion, 103; what does the martyr attest? 105; "infidel" fidelity, 105; the loss of a historic belief not identical with loss of all faith, 105, 106; theological candour, 106; misrepresentation of Mr. Newman and Mr. Grey by the author of "The Restoration of Belief," 106, 107; believers' scepticism, 107; alleged incompatibility between science and opinion, 107, 108; the authority of the Bible must share the fate of other probabilities, 108, 109; relation of religion to science, 110.

**Botanists.** See *Plants*.

## C.

**Colonial Empire**, our, 214; emigration not a panacea, 214, 215; probable effects of emigration, 215; colonization a necessary result of natural tendencies, 216, 217; extent of our colonial interests, 217; the main question on

which our American colonies separated from us, 219; change in the relative importance attached to unrestricted commerce and freedom from taxation, *ib.*; "taxation without representation" the hereditary formula of grievance with our American colonies, *ib.*; views of the colonists inconsistent and imperfect, 220, 221; disruptive forces, 221; necessity for reviewing the principles of colonial government, 222; grounds of separation, *ib.*; its evils, 223; natural relations of the colony and the mother country, *ib.*; incidence of law, *ib.*; colonies advantageous to the mother country, 224; the demand of allegiance involves the duty of protection, 225; the mother country advantageous to colonies, *ib.*; local legislation, 226; nature and consequences of our present colonial system, 227; government by crises, 227, 228; complaints of the colonies well-founded, 228; chiefly occasioned by the absence of any special arena for the public discussion of colonial questions, *ib.*; the power of a colonial representative body should be simply advisory, 229; such an addition to the constitution is in accordance with precedent, 230; and may be safely ventured on, *ib.*; confederation on the British platform, 231; reception of non-British communities, 233.

**Commission, the Oxford.** See *Oxford*.

## E.

**Edinburgh Review.** See *Jeffrey*.

**Education**, secular, 1; necessity for educating the people, 2; social contrasts, *ib.*; grounds of indifference to popular education, 3; the kind of education which should be given to the people, 3, 4; education in the Highlands, 4; practical inutility of the ordinary teaching, 5; bearing of religious instruction on temporal evil, 5, 6; opinion of Dr. Chalmers, 6; history of our scholastic institutions, 6; temporal wisdom essential to temporal success, 7; popular education advocated by Archbishop Whately, 7, 8; the system of instruction which will lead to the general well-being, 8; connexion of religion with science, *ib.*; effects of their dissociation, 9; desire and capacity of the people for secular instruction, *ib.*; the Birkbeck schools, 9, 10; by whom should the people be taught? 10; reasons for taking secular education out of the hands of the clergy, 10, 11; secular educationists no opponents of religious instruction, 11; schools dependent on voluntary effort, 12; plan of the National Public School Association, *ib.*; its advantages, 12, 13; results of secular instruction, 13; Mr. W. Ellis's work on "Education as a means of Preventing Destitution," 13, 14; instruction in the social duties, 14;

the morals of expenditure, 14, 15; instruction in economical science, 16; Mr. Church's pamphlet on National Education, 17; education the key to well-being, *ib.*

England, contemporary literature of, 133, 295; theology, 134; natural science, 135; history and biography, 137, 297; philosophy and legislation, 141; law and politics, 301; travels, 142, 306; education, 304; fiction, 145; miscellaneous, 312.

England, the tendencies of, 60; the causes of pauperism not economical, 61; pauperism not peculiar to modern times, *ib.*; the idea of progress as opposed to the ancient idea of a cycle in national development, *ib.*; general progress of the race compatible with the decline of particular nations, 62; recent triumphs of tyranny, *ib.*; despotism fatal to mental advancement, *ib.*; causes of the actual prevalence of tyranny not moral, 63; but industrial, 64; disparities of wealth, 64, 65; disparities of intellectual culture, 66; the fact that the cohesions of society are in horizontal layers only, the great disease of modern Europe, 67; mutual local duties the source of patriotism and of social cohesion, 63; need of local organization, 69, 70.

England's Forgotten Worthies. See *Worthies*.

### F.

France, contemporary literature of, 165, 330; philology, *ib.*; history, 166, 333; belles lettres, 338.

### G.

Geology, the future of, 37; amount of attention given to geology, *ib.*; the youngest of the sciences, 37, 38; the foundations of true geological science laid by Britons, 39; the geological fathers, 39; superiority of British geologists due to their eclecticism, 40; extreme opinions of foreign geologists, *ib.*; exceptions—Von Buck, Humboldt, and D'Archiac, 40, 41; fear of geological heterodoxy, 41; Dr. Henry More's "philosophic" interpretation of Gen. ii. 4, 41, 42; Scriptural geologies, 42; the first appearance of life on the globe, 43; conclusions on the subject premature, 44; indications of lost tribes, *ib.*; sources of the eagerness to fix the beginning of organic life, 44, 45; three theories as to the origin of species, 48; geological evidence at present most in favour of the independent origin of species, 46; progression of organization, 46, 47; Mr. Hopkins on inorganic progression, 47, 48; probable incompleteness of the received geological classification, 48; the *facies* of epochs, 48, 49; missing formations, 49; advantage of organized surveys, 50; prospects for discoverers, 51; geology a desirable branch of school teaching, *ib.*

Germany, the contemporary literature of, 155, 322; philology, *ib.*; philosophy, *ib.*: history, 157, 324; political science, 157; natural science, 158; religious philosophy, *ib.*; biography, 159, 325; travels, 162; poetry, 163; fiction, 163, 329; theology and church history, 324; miscellaneous, 327.

Goethe as a man of science, 258; antithesis between poetry and science, *ib.*; how the scientific character of Goethe is regarded by competent authorities, *ib.*; his irritability as to his theory of colours a hindrance to the due appreciation of his scientific labours, 259; the two philosophic types, 261; Cuvier and Geoffrey St. Hilaire, *ib.*; Goethe a positive thinker, not a metaphysician, 261; his views on method, *ib.*; history of his studies, 262; his discovery of the intermaxillary bone in the human skeleton, *ib.*; his theory of plant-metamorphosis, 263; discussions of the British Association indicating the present state

of scientific thought, 263, 264; Goethe on the law of transformation, 265; theory of evolution as opposed to creation, 267; Goethe's estimate of the relative importance of scientific and of political revolutions, 267, 268; organic laws, 268; coincidence between the notions of Goethe and those of Geoffrey St. Hilaire, 269; discovery of the vertebral structure of the cranium, *ib.*; Oken's account, *ib.*; his charge against Goethe false, *ib.*; proofs of Goethe's priority, 270; his claims as a legislator for science, 272.

### J.

Jeffrey, Lord, and the Edinburgh Review, 52; the Edinburgh school of literature, 53; Lord Cockburn and his "Life of Lord Jeffrey," 54; Jeffrey as a critic and an orator, 55, 56; as a man, 56; chief celebrity due to his editorship of the Edinburgh Review, 56, 57; the permanent reputation of the Review dependent on its instrumentality in diffusing political and social doctrines, 57; Jeffrey mainly responsible for its literary criticism, *ib.*; character of its political economy, 58; services to the cause of education, &c., *ib.*; the "Edinburgh" not distinguished in science, *ib.*; its merits as an instrument of political enlightenment, 58, 59; influence on public opinion, 59, 60.

### L.

Lady Novelists, the, 70; significance of woman's appearance in the field of literature, *ib.*; reality the basis of all effective literature, 71; in what sense literature is the expression of society, *ib.*; woman contributes a special element to that expression, 72; the literature of woman too much one of imitation, *ib.*; influence of sorrow on female literature, 72, 73; Miss Austen, 73; George Sand, 74; Lady Morgan, *ib.*; Miss Edgeworth, 74, 75; Observation and sentiment the peculiar qualities of female writers, 75; "Jane Eyre" and "Mary Barton," *ib.*; Daniel Stern, 76; distinction between writing from experience and writing to inform the public of private affairs, *ib.*; Miss Jewsbury, *ib.*; Miss Lynn, Miss Muloch, &c., 76, 77.

Literature, the profession of, 272; biography justified only by something unusual in its subject, *ib.*; "the Autobiography of William Jerdan" not so justified, 273; incidents of Mr. Jerdan's life, 273, 274; exaggerations of autobiography, 275; Mr. Jerdan's disparagement of the literary profession, *ib.*; profligacy and prudence, 276; biographical criticism, 277; the literary man in a false position, 278; the reward of literature, 279; sources of failure in literature, 280; course of the literary adventurer, 280, 281; comparison of professions, 281, 282; Mr. Jerdan's anecdotes, 283, 284; curiosities of style, 284, 285.

### N.

Niebuhr, the political life and sentiments of, 77; Niebuhr's youthful days, 78; his entrance upon public life, 79; residence in Edinburgh, *ib.*; his view of English politics in 1799—some inconsistencies, 80, 81; his marriage, 82; bombardment of Copenhagen, *ib.*; his ability as a financier, 82, 83; removal to Berlin, 83, 84; flight from the French army, 84; resignation of all office in Prussia, 85; his short-comings and regrets, 85, 86; return to Berlin, 86; he is made historiographer to the king, *ib.*; patriotism of the Prussians, 86, 87; Niebuhr's opinion of the present king of Prussia, 87, 88; he retires from office, 88; is made Prussian minister at Rome, *ib.*; death of his father and of his wife, *ib.*; his

second marriage 88, 89; his unhappiness, 89; the Tugendbund, 90; feast of the Wartburg, 90, 91; Niebuhr's increasing discontents, 91, 92; his death, 93; lessons to be derived from a consideration of his political life and sentiments, *ib.*  
 Oxford Commission, the, 171; Report of the Commissioners, *ib.*; tenure of corporate property, 172; unecclesiastical character of the early university, 173; foundation of the colleges, 173, 174; theory of the founders, 174; anti-protestant features in the constitution of the colleges, 175; the Caroline statutes, 176; perjury inevitable to members of the university, 177; comparison of the last and the present century, *ib.*; actual state of things in the university, 178; salaries and duties of Fellows, 178, 179; their moral and intellectual incapacity, 179; small number of students, 180; complaints of existing mischief, *ib.*; expense, and the causes of it, 181; habits of undergraduates, 182; private tutors and public, 184, 185; proposed changes, 185; Church Reform, 185, 186; confiscation of sinecures, 186.

## P.

Peel, Sir Robert, and his policy, 111; public confidence in Peel, 113; majority of commoners among eminent statesmen of the last century, *ib.*; changes during Peel's career, 114; advance in official integrity, 114, 115; contrast between Peel's character and position, the key to his political conduct, 115; how our statesmen used to be educated, 115, 116; indulgence due to hereditary errors, 116; Peel's early trammels, 117; the party of the past and the party of the future, *ib.*; Peel a liberal in the conservative camp, 118; his prudence and decorum, 119; his quick perception of public opinion, 119, 120; his capacity for business, 120; charge of "inconsistency," 121; wise and unwise constancy, 122; Peel's course progressive, not vacillating, 123; his candour, 124; the Catholic question, 125; Peel unbiassed by personal interest, 128; the Corn-Law question, 129; Peel had not the highest qualities of statesmanship, 131; his opposition to the Reform Bill, 132; estimate of him by Disraeli and Roebuck, *ib.*; Wellington's eulogy on him, 133.

Philosophy of Style. See Style.

Philosophy, Whewell's Moral, 187; extent of Dr. Whewell's labours as an author, 187, 188; character of philosophical speculation in the English universities, 188; Dr. Whewell's works on Moral Philosophy, 189; variations in the philosophy of orthodoxy, 189, 190; influence of German metaphysics, 190; Dr. Whewell's statement of the two schemes of morality, *ib.*; Paley and Bentham, 191; Bentham as a moral philosopher, 192; "principle of asceticism," 193; "principle of sympathy and antipathy," *ib.*; Dr. Whewell's objections to utility as the foundation of ethics, 193; tendencies of actions calculable, *ib.*; utility requires general rules, 196; utility confounded with the selfish system, 187; Dr. Whewell's finishing argument against Bentham, 198; animals have moral rights, 198, 199; Dr. Whewell's attempts to define Right, 199; intuitive ethics must reason in a circle, 200, 201; Dr. Whewell's criteria of moral rules, 201; his ultimate resort to utility as a standard, 202; appeal to utility unavoidable, 202, 203; moral feelings not their

own justification, 203, 204; Dr. Whewell's criticism of Bentham as a jurist, 204; views on marriage and divorce, 205; character of Dr. Whewell's moral doctrines, 206; his inculcation of intolerance, 207.

Plants and Botanists, 207; various paths in botanical science, 208; the number of plants, *ib.*; Dr. Hooker's "Flora Antarctica," 209; vegetable embryology, 210; the beginning of a pine-tree, 211; investigators of plants, 212; the royal botanist, 213; humble naturalists, 213, 214.

Poetry of the Anti-Jacobin. See Anti-Jacobin.

## S.

Style, the philosophy of, 234; no general theory of expression yet enunciated, 235; law underlying the current maxims—economy of the reader's attention, *ib.*; superiority of Saxon-English on this ground, *ib.*; from early association, 236; from the imitative character of Saxon words, *ib.*; superiority of specific over generic words, *ib.*; sequence of words, *ib.*; collocation of the substantive and adjective, 237; order of subject and predicate, 237, 238; arrangement of oppositions, 238, 239; the juxtaposition of words and clauses should be governed by their relation in thought, 239; the inverted style, 239, 240; figures of speech, 240; synecdoche, *ib.*; metonymy, *ib.*; the simile, 240, 241; the metaphor, 241; suggestiveness, 243; secondary causes of force in expression, *ib.*; a theory of poetry, 244; economy of the sensibilities, 245; artistic composition, 245, 246; genius anticipates theory, 246; fixity of style an evidence of imperfect development, 247.

## W.

Wellington, the Duke of, 285; alternations of activity and repose in the history of the world, 286; the last three-quarters of a century a period of activity, *ib.*; contemporary judgments often defective, 286, 287; exceptional cases, 287; comparison of Wellington and Napoleon, 287, 288; consistent individuality of Wellington, 288; his best fame based on his Peninsular campaigns, *ib.*; his vexations and difficulties, 288; ministerial neglect, 288, 289; falsehood and perversity of the Spaniards, 289, 290; difficulties in Portugal, 290, 291; Wellington's courage, constancy, and patriotism, 291; his comprehensiveness, 292; his want of amenity, *ib.*; his conscientiousness, 293; his character as a statesman, 293, 294; parallel between Wellington and Marlborough, 295.

Whewell, Dr. See Philosophy.

Worthies, England's forgotten, 18; the spring of great actions, *ib.*; Hakluyt's Voyages, a prose epic, 19; the Hakluyt Society, *ib.*; its failures, 19, 20; Hawkins's "Voyage to the South Sea," 20; a story of Indian heroism, 21; editorial incapacity, *ib.*; why Elizabeth was beloved, *ib.*; the maritime crusade against Catholicism, 22; against Spanish cruelty, 23; Raleigh's last enterprise, 24; cool atrocity of the Spaniards, *ib.*; heroic resolution of the Indians, 25; Catholic colonization, 26; conflict of the new and old religion in the western world, *ib.*; massacre of French emigrants in Florida, *ib.*; the English navigators the armed soldiers of the Reformation, 27; discipline of ship's companies, *ib.*; anecdote of Drake, 28; Humphrey Gilbert, 29; his last voyage, 30; the death of a hero, 31, 32; John Davis, 32; the Revenge, 35.

## INDEX TO VOL. LIX.

### A.

America, contemporary literature of, 149, 313; theology, *ib.*; ethics, 151; history, 151, 314; biography, 153, 317; criticism, 155; fiction, *ib.*

American Slavery. See Slavery.

Atomic theory, the, 87; progress of science dependent on fixed laws, *ib.*; doctrine of Comte, 88; order of development of the sciences dependent on their relation to the conditions of man, *ib.*; mechanics and astronomy, *ib.*; chemistry, 89; application of mathematics to chemistry, *ib.*; anticipation of modern science by the Greek physiologists, 90; ancient conceptions of the atomic theory, 91; Democritus, 92; materialism, *ib.*; mathematical argument against the atomic theory, *ib.*; what an atom is, 93; small basis of fact for the pre-Christian atomic theory, 94; its completeness, 95; true scientific observation initiated in the tenth century, *ib.*; not by Francis Bacon or at the Reformation, 96; the alchemists, Mahometan and Christian, 97; post-Christian phase of the atomic theory, 98; Dalton, *ib.*; hypothetical character of the atomic theory, 98, 99; three kinds of phenomena which it renders intelligible, 99; somatic, *ib.*; astronomical, 100; chemical, *ib.*; two distinctions between the Greek and Teutonic forms of the atomic doctrine, 101; the latter reared on a vast accumulation of facts, *ib.*; its practical availableness, *ib.*; characteristics of the Greek intellect, 102; moral clue to the development of science in Christendom, *ib.*

### C.

Charity, noxious and beneficent, 32; tendencies of the age, *ib.*; epicureanism of our philanthropy, 33; the new poor-law, *ib.*; the charities of England, 34; charities in Spitalfields, *ib.*; charities of London generally, 36; effect of indiscriminating charity on its recipients, 37; mendicancy, 38; effect of almsgiving on society at large, 39; justice before benevolence, 40; the poor-laws a taxing of the frugal and industrious for the support of the improvident and idle, *ib.*; effects of "charity" on the donors, 41; false application of biblical precepts, *ib.*; the letter and the spirit,

41, 42; how we may really serve our fellow creatures, 42; misinterpretation of Deut. xv. 11; personal exertion in doing good, 43, 44; the Westminster Ragged Dormitory, 44, 45; destitution and charity alike evanescent, 45, 46.

Christianity, early, its creeds and heresies, 276; recently discovered manuscript "On all heresies," 276, 277; not by Origen, 277; but by either Hippolytus or Caius, *ib.*; life of Hippolytus, 277, 278; facts concerning Caius, 279; claim of Hippolytus to the authorship of the manuscript "On all heresies," *ib.*; case against him, 280; the manuscript not, as M. Bunsen maintains, the treatise referred to by Photinus, *ib.*; by the same author as the treatise "On the Universe," 281; probably identified with the "Labyrinth," mentioned by Photinus, *ib.*; arguments against attributing the authorship to Caius, 282; their invalidity, 282, 283; what is the worth of this treatise on heresies? 283; information concerning life in the third century which the author might have communicated, 284; disappointing nature of his work in this respect, 285; of no value further than as a mere register of opinion, *ib.*; the Roman Catholic conception of "truth," 286; the Protestant rule of truth, 286, 287; elements of religion in history, 287; religious idea of the Hebrew, 288; of the Greek, *ib.*; Christianity ultimately a fusing of the two, *ib.*; joint perpetuity of error and inspiration, 289; M. Bunsen's idea of revelation, 289, 290; relation of the newly found work to Romanism and orthodox Protestantism, 290; M. Bunsen's view of the actual state of religion in England, 291; defects of the writer "On all heresies," 293; development of the Trinitarian doctrine, 293, 294; how long did it take for the Christian faith to assume the leading features of its orthodox form? 294; prevalent belief on this subject, 295; theory of Priestley, *ib.*; the Tübingen doctrine, 295, 296; date of the fourth gospel, 297; earliest citations from it, 297, 298; question of its date unaffected by the newly discovered work, 298; strongest argument against the Tübingen theory, 299; why was Theodotus excommunicated? *ib.*; authenticity distinct from religious authority, 300, 301; M. Bunsen's work, 301, 302.

## E.

Educational institutions of the United States, 254; two Englands 255; United States and Great Britain genealogically and psychologically one, *ib.*; value to the latter of the political and social experience of the former, 256; Dr. Siljeström's work on "Educational Institutions in the United States, *ib.*"; peculiarity of England's political development, *ib.*; increasing interest of the continental nations in English literature and institutions, 257; local or self-government as combined with centralization, *ib.*; developed in any great degree only by the Anglo-Saxon race, 258; the study of its development in the United States, especially in the department of public instruction, the object of Dr. Siljeström's visit to that country, *ib.*; education previous to the American Revolution, 258, 259; subsequent attempts to improve it, 259; school system in Massachusetts, 260; in New York, 261, 262; school missions to the west, 263; education in the great cities, 263, 264; the High School of Philadelphia, 264; secular system as affecting religion, 265, 266; evidence of the good working of the system, 266; necessity of exertions on our own part, 268; our statesmen and press inert, 269; public instruction in Tahiti, *ib.*; educational prospects in England, 270.

England, contemporary literature of, 137, 302; theology, *ib.*; education, 139; philosophy, 304; history and biography, 141, 307; historical topography, 147; political and social economy, 305; travels and topography, 309; poetry, 149; miscellaneous works, 311.

## F.

France, contemporary literature of, 165, 328; philosophy, 165, 328; history, 167, 331; biography, 330; belles lettres, 168; travels, 333.

French policy, French writers on, 233; M. le Masson's work on "Les limites de la France," *ib.*; a manifesto of the aggressive party, *ib.*; M. le Masson's idea of the object of monarchy in France, 234; his opinion of Louis Philippe's policy, 235; the "general and permanent policy" recommended by M. le Masson, *ib.*; his further theories and maxims, 236; his account of the revolution of December, 1851, 237; reasons for tolerating the actual government, 238, 239; question of war or peace, 239; incorporation of Belgium with France, 240; the ideas which really interest the European mind, *ib.*; advantages of constitutional monarchy, *ib.*; is a French invasion of England probable? 241; reasons for the negative, 241, 242; "Portraits politiques contemporains," by M. de la Guéronnière, 143; a defence of the new empire, *ib.*; the main idea of the work, the evil of parliamentary government, 244; process of putting down a parliament, *ib.*; programme of the empire, 245.

## G.

Germany, contemporary literature of, 157, 319; study of the classics, 157; history, 159, 319; philosophy, 161; political philosophy, 161; philology, 322; natural science, *ib.*; travels, 161, 323; poetry, 162; miscellanea, 163, 326.

German philosophy, iconoclasm in, 202; Arthur Schopenhauer, 203; his career as an author, *ib.*; the cause of his remaining in obscurity, *ib.*; strange and incomprehensible reasoning of German philosophers, 204; in contrast with Schopenhauer's lucidity, 205; tendency of German

philosophy, *ib.*; tendency of Schopenhauer's doctrine, 205, 206; his familiarity with English philosophers, 206; reconciliation of Berkeley and Kant, *ib.*; chief point of difference between the English and German metaphysicians, *ib.*; Schopenhauer's theory, 207; his definition of reason, *ib.*; his opinion on a "first cause," 208; on the will, 209; his use of the Platonic *idens*, 210; Schopenhauer's moral doctrine, 211; his ideal, 212.

## I.

Ireland, condition and prospects of, 18; novelty of the present phase of things in Ireland, 19; previous condition, *ib.*; deficiency of a middle class, 20; the Irish landlord, *ib.*; legal restrictions on the landowner, 21; his position generally, 22; Irish capital invested in the English funds, 23; character of the Irish as to industry and providence, *ib.*; the potato, *ib.*; season of famine, 24; apostles of the season, 26; Incumbered Estates Act, 27; restoration of land interest, 27, 28; the churches in Ireland, 28; Protestant missionaries, 29; Catholic priests, 30, 31; probable result of their contentions, 31; promise from the National Schools, 31, 32; other hopeful signs, 32; men who ought to be in parliament, *ib.*

## J.

WESTMINSTER REVIEW,

No. CXIII.

FOR JULY, 1852.

ART. I.—SECULAR EDUCATION.

1. *Education as a Means of Preventing Destitution; with Exemplifications from the teaching of the Conditions of Well-Being, and the Principles and Applications of Economical Science, at the Birkbeck Schools. Prefaced by a Letter to the Right Hon. Lord John Russell, M. P.* By William Ellis, Author of the "Outlines of Social Economy," &c. 8vo. pp. 153. London. Smith, Elder, and Co.
2. *The Rise and Progress of National Education in England; its Obstacles, Wants, and Prospects: a Letter to Richard Cobden, Esq., M. P.* By Richard Church, Hon. Sec. of the Yorkshire Society for Promoting National Education. 8vo. pp. 125. London. John Chapman.
3. *The First, Second, and Third Annual Reports of Williams's Secular School.* Edinburgh. Maclachlan and Stewart. London. Simpkin, Marshall, and Co.

In the *Home Journal* of New York, of the 25th of October, 1851, we read the following remarks:—

"There are two classes of philanthropists—the feelers and the thinkers, the impulsive and the systematic—those who devote themselves to the relief or the mitigation of existing misery, and those who, with a long patience, a deep insight, and a wider vision, endeavour to prevent its recurrence and perpetuation by an investigation and eradication of its causes. The former, in imitation, as they imagine, of their master, go from house to house, assuaging wretchedness; but, alas! not always doing good; relieving present evils, but too often leaving an increasing crop ever springing up under their footsteps; attended and rewarded by blessings, but doomed, probably, at length to feel that they have ill-deserved them.

Far different is the course of the latter class: their life is spent in a laborious research into remote and hidden causes—in a patient and painful analysis of the operation of principles from the misapplication or forgetfulness of which our social disorders have sprung—in sowing seeds and elucidating laws that are to destroy the evil at a distant date which they themselves may never see, while sometimes its pressure may be aggravated during the period which they do see.

"They are neither rewarded by the gratitude of those for whom they toil—since the blessings they confer are often in disguise and *in futurum*—nor gratified by beholding the fruit of their benevolent exertions, for the harvest may not be ripe till all of them have passed away, and till most of them have been forgotten. Nay, more, they are misrepresented, misconstrued, accused of hardness of heart by a misconceiving generation, and too often cursed and thwarted by the very men in whose service they have spent their strength. And while those who have chosen the simpler and easier path are reaping blessings, in return for the troubles they have ignorantly stimulated and perpetuated by relieving, these men—the martyrs of philanthropy—must find their consolation and support in unswerving adherence to true principles, and unshrinking faith in final victory; and must seek their recompense, if they need one, in the tardy recognition of their virtues by a distant and a wiser time—addressing themselves to the most unthankful task of attacking the source rather than the symptoms—of eradicating social evils rather than alleviating them."

There is great beauty and truth in this representation, and the advocates of the universal education of the people must take their lot with the second class of philanthropists here described. We have published so much on this subject, that it is difficult to find new topics either to enforce or illustrate it; but as new minds are constantly entering the field, and old opponents continue to repeat oft-refuted objections, the friends of the cause should never relax in the dissemi-

nation of their principles until victory has crowned their efforts.

On the present occasion we propose to consider, *First*, The necessity for educating the people; *Secondly*, What kind of education should be given to them; and, *Thirdly*, By what means that education should be supplied.

It may appear superfluous, in the present day, to discuss the necessity for educating the people; but there are many well-meaning, influential, and by no means unintelligent persons, in both the higher and middle ranks, who continue to express doubts of the expediency of such a measure. We lately heard an extensive landed proprietor, a man of taste and talent, and himself an author, gravely expounding the danger of rendering the working classes too refined for their inevitable condition and duties, and, in consequence, discontented and dangerous, if their tastes and intellect were awakened and enlarged by a really good education. "If," said he, "all are rendered intelligent, and trained to skilled labour, where shall we find hewers of wood and drawers of water?" This gentleman and all of his class may keep their minds at ease on this point. Different capacities are bestowed by nature on different individuals, and after we shall have done our best to instruct and train the people, there will always remain a sufficient number of them whom no education, however much it may improve their morality, will ever raise intellectually above the humbler duties of civilized life. By a thorough education of the employers of labour, also, and by the interposition of science, the duties of the humblest working man may be rendered far less irksome than they now are, and by this means his position may be improved to an extent quite equal to his advance in intelligence and refinement. The necessity for educating the working man is dictated by the very reasons which these objectors urge as arguments against it. In the savage and barbarian states of society, the humblest member of the tribe is not, in point of acquired information, intellectual power, and refinement of taste, nearly so far below his chief and the magnates of the land, as is the peasant or labourer who can neither read nor write, beneath our educated upper and middle ranks. The high instruction of the minority, and the unabated savage-like ignorance of the majority of our population, have silently effected the greatest social revolution that the world has ever witnessed. Education has given a scope of knowledge and an intellectual capacity to the former, which have placed in their hands the resources of nature, wealth, refinement,

and political power, to an extent unparalleled in the history of nations, while scarcely one step in advance in all these advantages has been made by that portion of the people which continues altogether uneducated. The consequence is, that in helplessness, ignorance, intellectual incapacity, improvidence, vices, and coarseness of feeling, the latter exhibit many of the characteristics of the red Indian, without his self-respect, power of endurance, and circumspection. The atmosphere of civilization has dimmed their manhood, while it has left many of the worst features of the savage or barbarian state unchanged. Need we wonder, then, that those mental qualities ripen into crime and pauperism, and overflow the land as with a wasting flood?

This degradation punishes, with scorpions' stings, the upper and middle classes, through whose blindness and apathy it has occurred. If they have human sympathies, they are galled, particularly in seasons of scarcity, by the spectacle of wan-faced, sickly, starving men; emaciated, half-naked, dirty, and debased women; ragged, shivering, and famished children, whose numbers are so overwhelming that they plunge the kind-hearted in despair. Again, they are visited by tax-collectors, claiming their substance for the support of criminal officers, gaols, houses of correction, ships for transportation, and pauper workhouses, to an extent that often seriously impairs their power of educating and providing for their own offspring and dependents, and this solely to restrain and maintain this abject portion of our people. They are exposed also to the overflowings of infectious diseases, which ever and anon break out in the dens of filth and misery where those unfortunate creatures reside, and which, occasionally reaching the higher ranks, sweep away, indiscriminately, youth and age among them as if by an avenging scourge. Finally, they live in a habitual sense of danger from the overwhelming physical power, unguided by knowledge, and unrestrained by moral and religious principle, which is known to reside in the masses. They fear that if pressed upon beyond endurance, it may, at any moment, burst forth like a volcano, and deluge the country with blood.

These are some of the reasons which dictate the necessity for educating the people; and they appear to us so cogent, that our surprise is great that they have not sooner produced energetic action. One grand cause of the prevailing indifference may be found in the want of political power on the part of the masses. We are no believers in the capacity of ignorance successfully to execute

social functions which require knowledge and experience for their beneficial exercise, and still less in the notion that any multiples of ignorance will constitute knowledge. But in *this* we have undoubted faith—that if the people possessed political power, the mere selfish instincts of the upper and middle classes would render them as anxious to educate them, as they have hitherto been apathetic. When we visit the lion in his cage, and are satisfied that the bars have strength sufficient to confine him, we look with indifference, or mere curiosity, on his teeth and his claws; but break down the iron gratings, and let him loose upon us, or shut us up beside him, and we should hasten to extract, if we could, those implements of destruction. Thus it is with the people. While we are able, by horse, foot, and artillery, criminal officers, judges, and gaols, to restrain them, with all their rude habits and fierce instincts rife within them, we quietly leave them in degradation until we settle our own ecclesiastical and theological disputes regarding the persons by whom, and the manner in which, their teeth and claws should be removed. Were they once invested with votes for parliamentary representatives, and let loose into the political arena, other counsels would speedily be seen to prevail. In the United States of North America we were witnesses to this result. When the masses, enjoying universal suffrage, began to take an interest in political questions, and to decide them by their votes, every form of Conservatism became alarmed. The rich discovered that their lives and property were in the hands of the people, and there arose among them one unanimous cry, Let us educate them, or we perish! The philanthropists who, from benevolent and patriotic motives, had long called aloud for education unheeded, and the religious public who, from the love of souls, but with the same want of success, had petitioned for the instruction of the people, suddenly found their ranks recruited and their spirits cheered by the owners of lands and dollars, who cared not for the people, but who now feared them as the fountains of legislative power; and also by the better class of trading politicians, who, looking only to place and profit, perceived that ignorant electors would be prone to bestow these on the most unprincipled candidates who promised most recklessly and flattered most egregiously. All interests, therefore, were now united, and the legislatures of the States entered upon the work of education in earnest. The issue was, that entrance to a school for secular instruction was provided free to every child in the commonwealth.

There is a general conviction in the States that on the success of the teaching and training in these schools, more than on any other single cause, will henceforth depend the prosperity and endurance of the Union.

Who that is endowed with a sense of justice will not condemn the spirit in which the education of the people is resisted in our own country? The abject ignorance of the masses is urged as a plea for denying them the political franchise; yet we refuse to remove that ignorance! We complain of their recklessness, drunkenness, vices, and crimes, and of the load of taxation which these entail upon us; yet we decline to use the most effectual means for diminishing these evils! And why? Because, forsooth, we profess to be so deeply interested about their souls, that we cannot consent to remove their temporal sufferings without at the same time securing their salvation! But we cannot agree among ourselves regarding the true way of salvation! And the practical result is, that although there is little difficulty in deciding on the means of improving their temporal well-being, this must not be attempted until we have settled also the faith which they must be taught, to insure the welfare of their souls! Such a mode of action is disowned by justice, reason, benevolence, and, let us add, by true religion; and we must look for its source in something different from all these. It springs from Churchism, and Sectarianism, consciously or unconsciously cloaking themselves under the pretence of care for the souls of the people. These *isms*, when closely examined, are embodiments of mere self-love, the love of dominion, bigotry, and all uncharitableness; and their fruit corresponds with the trees which produce it.

Assuming, then, that the people should be educated, we proceed to inquire, what kind of education should be given to them? Hitherto, it has generally been supposed that instruction in reading, writing, arithmetic, and the catechism, constitutes an ample education for the lower orders of the people. We wholly dissent from this opinion. To reach the merits of this question, we must look deeper than the surface of existing social institutions. We must examine into the nature of man, and into that of the divine government to which he is subjected.

The Scriptures describe to us a divine government conducted by supernatural means. In the time of the Commonwealth many of our ancestors believed in the permanent continuance of this form of administration, and conceived themselves to be living under it. They sought for tem-

poral well-being, in soundness of religious faith, and for victory, in prayer. They ascribed famine, defeat, pestilence, and other calamities, to Heaven's avenging wrath, excited by their sins and unbelief. But the progress of science, and an extended experience, have banished this notion from the minds of the great majority of Englishmen of our own generation. Is there, then, any other form of divine government cognizable by man? If there is not, then the world must be a theatre of anarchy, without the practical manifestation of a God! and Atheism must be true! If another form of divine rule exists, and is comprehensible by man, it follows that a really practical education can be no other than one which instructs the youthful mind in the method and leading details of this government, and trains it to subordinate all its desires, pursuits, and actions, to the divine requirements.

Now, do reading, writing, arithmetic, and the catechism fulfil this condition? Words are mere arbitrary sounds invented to express ideas and emotions, and have no natural connection with the things signified. This fact is palpably demonstrated by the difference of the words invented by different nations to express the same object or desire. Trite and obvious as this remark is, the educators of the people in past ages have generally been blind to the practical conclusion which follows from it. They have taught the children of the poor to read words, but they have used no adequate means to enable the reader to attach ideas to the sounds he utters. In consequence, the reading, except in the case of individuals of superior native talent, conveyed but little instruction, and excited no interest. In his school books, the pupil found most meagre information concerning the objects with which he was to deal in practical life—such, for example, as the qualities and modes of action of the things which are the fountains of wealth, and also of health or disease; the qualities of the animals which men are called on to rear, the faculties of the mind, which, operating in himself and his fellow-men, constantly affect his social condition; the laws of his country which he is called on to obey; and a thousand other items of information on which every man's well-being on earth depends. "Our education," says the shrewd and sensible Montaigne, "has not taught us to follow and embrace virtue and prudence, but it has imprinted in us their derivation and etymology. We know how to decline virtue, but we know not how to love it. If we do not know what prudence is really, and in effect, and by experience, we have it,

however, by heart!" So blind were even men called educated to the fact that words do not convey their own meaning, that in the Highlands of Scotland, the Celtic peasantry, who understood no language but Gaelic, were, for half a century, taught to spell, pronounce, and read English, without its having ever occurred to the schoolmasters who taught them, to the clergy who superintended the schools, or to the landlords who paid the schoolmasters, that it was necessary also to tell the children what the English words meant in Gaelic, before they could understand them! These children read English fluently, but they did not attach a single idea to the sounds. When they were spoken to in the words which they had read, they stared vacantly as if they had been addressed in Dutch or French! This fact would appear incredible, were it not authenticated beyond the possibility of dispute. An irrefragable record of it appears in a *Prize Essay on the State of Society and Knowledge in the Highlands of Scotland*, from 1745 to 1825, by Mr. John Anderson, Writer to the Signet, published at Edinburgh in 1827. After stating the facts now mentioned, Mr. Anderson gives an extract from a letter of "a Highland clergyman to an intimate friend" of the author, in which the clergyman says:—

"Pray, what is the use of forcing children to read and repeat what they do not understand? I could find thousands in the Highlands of Scotland who will read the *English Bible* tolerably well, but cannot understand more than *yes*, or *no*; and being thus obliged to continue reading a language completely unintelligible to them, it gives them no pleasure, but rather disgust; and the moment they leave school, if they remain at home, they lay their books aside and never look at them more."

This practice continued in the Highlands till the beginning of the present century, and in particular localities to a much later date.

The example is instructive to all educators. The labourers of Devonshire, Dorsetshire, Yorkshire, and other counties of England, speak dialects certainly more nearly related than the Gaelic to the English language, but still so remote from the language of English classical literature, presented in books, that to them, also, English is, to a very considerable extent, a foreign tongue, and, therefore, unintelligible until explained. Moreover, no word can, in any country or circumstances, be correctly understood until it has been connected in the mind with some definite comprehensible idea, emotion, or sensation. The common

reading of schools, therefore, is not in itself knowledge of anything beyond that of the sounds of certain combinations of letters. Acute minds, as they grow up, may learn the meaning of many words by insensible induction from hearing them used, or by reading and guessing at their signification. But to enjoy the former source of instruction, they must mingle familiarly with persons who speak the language of books, which few labourers do; and to profit by the latter they must be endowed with something approaching to a genius for literature in its highest forms.

Need we be surprised, then, at the slender improvement which our peasantry and labouring people generally derive from the art of reading, and at the rapidity with which many of them forget it? The grand difficulty in the way of improving our schools is, as we have said, the ardour of the religious public to provide for the salvation of the people as a concomitant to teaching them the things conducive to their temporal well-being. But this zeal has a parently blinded their understandings to the utter inadequacy of the "reading" which they have so long taught in common schools to accomplish this object. It does not enable the humbler classes to understand the language of the liturgy and the pulpit! If the religious opponents of secular education will only try an experiment on a class of labourers of forty years of age, they will make a discovery that will probably prove little less astounding to them than was that made by the Scotch clergy, when an enlightened Highland landlord opened their eyes to the profound ignorance of the Celts concerning the meaning of the English language after half a century of instruction in its words. Let them read some pages of the prayer-book, and of the last sermon that was preached, to twenty such persons, taken at random, in a country parish, and ask the assembled hearers what notions they attach to the words; their answers will reveal the extent to which they are capable of profiting by listening to such exercises, and we venture to predict that it will be limited indeed. The influence of the lay preachers sent forth by some sects, over the common people, may be traced, to a considerable extent, to the colloquial language which they employ. Their words and sentences convey ideas, and awaken emotions in the listeners, because they are already the representatives of ideas and emotions in uncultivated minds. The Church will never enjoy this advantage until the "reading" in schools is rendered significant; and this cannot be done without a system of in-

struction that shall convey the information and awaken the feelings in the humbler hearers which the language of the pulpit is intended, although not in their case calculated, to express.

The second element in the people's education is "writing." In general this is carried little farther than instructing them how to form the letters and words of the language. They are not taught composition; many of them scarcely the common rules of grammar. And there is too good a reason for this omission; they cannot learn composition, or the art of forming intelligible sentences (lacking which "writing" is a shadow), without knowing the meaning of the words they employ; and their common education does not teach them such meaning! If, then, we except individuals of great natural talent, who surmount difficulties by inherent acuteness and energy, we may safely affirm that the "writing" taught in the schools for the people is as inefficient for raising their condition as is their "reading."

"Arithmetic" is the third branch of instruction, and it is all good, however limited in extent; for children can scarcely fail to discover the meaning of "twice one is two;" and "three times four are twelve." But if we give them no more solid instruction than a knowledge of numbers, we shall bestow on them the power of counting without anything to reckon. Arithmetic may be compared to a common yard measure, or a sliding rule, placed in the hands of a labourer. If he have nothing corporeal, or incorporeal, to compute or measure, it will be of small utility to him in his daily life.

The last element in our common school education is "the catechism," and whatever portion of religious instruction usually accompanies it. We shall allow the advocates of this instruction to attach to it the highest importance which their most sanguine estimates of its advantages can reach; but we ask them—is its object the spiritual welfare of the pupil in the world to come, or his temporal well-being in the present life? Notoriously, and undeniably, it is chiefly the former, and it was not framed with any systematic or intentional view to the latter. That it contains not only metaphysical theology which can never be practically applied to the improvement of mankind in this world, but also moral precepts which are conducive to that end, as well as to salvation, is freely allowed; but the secular Educationists desire to introduce into schools not only these precepts, but such an exposition of the order of nature as shall give them force as practical

rules, and such a training of the understanding and affections as shall render them guides to conduct in this life. Moral precepts are taught in the schools of the United States of North America, and can be successfully taught in this country, apart from theological dogmas. The former are based on nature, as well as commanded in Scripture; they are invariable, and bind all sects alike; while the latter vary as sects differ. Each sect will teach its own dogmas to its own children, and, as all agree in the precepts of morality, each will enforce these as an appendage to its own theology, and thus give new efficacy to the moral lessons of the secular school.

But a good deal more than moral precepts and religious dogmas teaching the way to salvation, is necessary to remove the wretchedness of our present condition. The social evil with which England is afflicted is *temporal*. Large masses of her people are destitute of food, clothing, and shelter; they are ignorant of the natural causes which have placed them in this condition, and of the natural means of escaping from it; and in consequence they are unhappy, restless, reckless, vicious, criminal! The Churches of nearly all denominations say, "As a remedy for this temporal misery, let us teach them religious truth." There may be a benevolent piety in such a proposal, but there is little practical wisdom. It is to some extent the counterpart of the conduct of the slave-holders in America. They fine, imprison, or banish any benevolent person who presumes to teach their slaves to read, write, and think; while they not only allow, but many of them pay missionaries to instruct them in the way of salvation! Nor is this instruction without its advantages. It is not meant, nor does it tend, to *remove* the miseries of their temporal condition; but it soothes their minds under them with the hope of a futurity in which "no Christians shall thirst for gold," and in which the slave shall be free from his master; and this prospect renders them more tranquil and resigned under the load of their present ills. If the religious opponents of secular instruction would acknowledge that this is also *their* object, we could understand them; but as they profess to be as desirous to remove the temporal sufferings of the people as we are, we are forced to inquire into the relation of the catechism, and the religious instruction which accompanies it *to this end*.

The late Dr. Chalmers attempted to grapple with this question. In the third number of the *North British Review*, he published an

article on the Political Economy of the Bible, in which he arrived at the conclusion that it is not necessary to teach the laws of Political Economy to the people, but only the morality and religion of the Gospel, and that in virtue of the governing laws of Providence, public prosperity will result from the sum of private duties duly discharged, without the individuals knowing *how* this is brought about. Most of the existing schools for the people appear to have been founded on this principle. They omit instruction in physical, physiological, and economical causation, and give moral and religious instruction often of the most general kind, in addition to reading, writing, and arithmetic; and their conductors appear to consider these as sufficient guides to *temporal* prosperity. This instruction expounds no practical plan, order, or rules, according to which temporal well-being is bestowed or withheld by Providence. According to Dr. Chalmers, it is not necessary to teach this to the people. But is such a conclusion warranted by philosophy? We shall by and by inquire into this point: meantime, as comprehending the origin of a vicious system often disposes men to desire its removal, we shall briefly advert to the history of our existing scholastic institutions. This has been ably given by Dr. Adam Smith in his book v., chapter i., of *The Wealth of Nations*.

"In the ancient philosophy," says he, "whatever was taught concerning the nature either of the human mind or of the Deity, made a part of the 'System of Physica.' The object which the ancient moral philosophy proposed to investigate was, wherein consisted the happiness and perfection of a man, considered not only as an individual, but as the member of a family, of a state, and of the great society of mankind."

But the greater part of the universities of Europe were ecclesiastical corporations, institutions for the education of churchmen founded by authority of the Pope; and the subjects taught in them were suitable to the end of their institution, either theology, or something that was merely preparatory to theology.

"At last," says he, "the doctrine of spirits, of which so little can be known, came to take up as much room in the system of philosophy as the doctrine of bodies, of which so much can be known. The doctrines concerning these two subjects were considered as making two distinct sciences. What are called metaphysics or pneumatics were set in opposition to physics, and were cultivated not only as the more sublime, but, for the purpose of a particular profession, as the more useful science of the two. The proper

subject of experiment and observation, a subject in which a careful attention is capable of making so many useful discoveries, was almost entirely neglected. The subject, in which, after a few simple and almost obvious truths, the most careful attention can discover nothing but obscurity and uncertainty, and can consequently produce nothing but subtleties and sophisms, was greatly cultivated."

He concludes—

"The institutions for the instruction of the people of all ages are chiefly those for religious instruction. This is a species of instruction of which the object is not so much to render the people good citizens in this world, as to prepare them for another and a better world in the life to come."

The influence of this state of things is conspicuous in our schools. The clergy and aristocracy of England who govern them have been educated in universities which still correspond essentially to the description here given, and they have no adequate ideas of the importance of teaching the elements, agencies, and laws of the physical and physiological world as branches of general education. They have omitted from the common schools Greek, Latin, and Metaphysics, as unnecessary for the people, and left in them reading, writing, arithmetic, and occasionally a smattering of mathematics, which they consider useful for persons engaged in labour; and in doing so, they have acted according to the views of Dr. Chalmers. But is this philosophy sound? Is it true that Providence will evolve temporal prosperity out of moral and religious duty duly discharged, and the practice of a secular calling, without the individual understanding how his prosperity is accomplished? With all deference, the doctrine of Dr. Chalmers is founded on a false analogy. Even if it were true, that a great city like London is daily supplied with the necessaries of life by thousands of individuals, pursuing each his own vocation and contributing his part in this magnificent result, without knowing, or needing to know, what his neighbours are doing, it does not follow that these persons can with equal safety dispense with all knowledge of the natural conditions which regulate their own trades. Will not the market-gardener who knows and practises the best and most economical methods of rearing vegetables succeed best? Will not the miller best play his part in this great drama, who is best instructed in the qualities of grain, and the modes of converting it into flour and meal? And will not the farmer who supplies cattle for the market discharge his

duty most successfully, when, to the knowledge of agriculture, he adds skill in animal physiology and chemistry, sufficient to enable him to preserve his beasts in the highest health, and to combine the elements of their food so as to accomplish with it the highest attainable nutrition? Even the great general results which seem to be regulated by divine Providence by inscrutable laws, really are not withdrawn from individual ken. The farmer who studies the report of the relation between supply and demand furnished by the *Mark Lane Express* may bring his produce to a more profitable market, than another who, following Dr. Chalmers's advice, merely cultivates his fields, says his prayers, and sends his grain to market when it suits himself, without regarding what his neighbours are doing, but merely trusting to an over-ruling, though to him incomprehensible Providence, to prompt him to send the right quantity at the right time. The same remarks apply to all other branches of industry devoted to the supply of social wants. In every one of them knowledge of the natural conditions, physical and moral, on which success depends, will prove a safer guide to prosperity than ignorance and piety, however sound the faith, and exemplary the moral and religious conduct of the trader may be. The condition of Europe is greatly changed since the ancient universities, and the system of instruction pursued in them, were instituted. Modern civilisation has advanced chiefly by the application of scientific discoveries and mechanical inventions to the purposes of life, and mere piety and muscular strength no longer suffice to preserve the labourer in the same place which, before these innovations, he occupied relatively to the superior ranks.

In opposition to Dr. Chalmers's view, Archbishop Whately\* advocates the necessity of "a liberal education" for the labouring classes.

"This," says he, "is what some persons are found to grudge any share of to the mass of the people, as not only useless but dangerous; while others again regard it as at least a matter with which the clergy are nowise concerned. And some seem to think that, generally, each man has the greater advantage in respect of religious education the less he possesses of any other education. . . . Other things being equal," he continues, "you will find that those who have had the best general training, are the best prepared for a correct and profitable reception of religious instruction, and that those who have been taught little or nothing besides what are called 'the

\* The Right Use of National Afflictions, p. 29.

'general principles of religion and morality' not only do not embrace those principles so well as those of more cultivated understanding, but will be still more deficient in the right *application* of such principles."

The Archbishop illustrates this proposition as follows:—

"That it is a Christian duty to relieve the distressed, and to promote the general happiness of the community, is beyond dispute. Now different men, acting on that principle, may seek to promote this end, one, by striving to establish a *community of goods* (according to a plan which you must all have heard of); another, by *despoiling the rich*, and introducing *equality of property*; and, again, another by *securing to each man the fruits of his own and his ancestors' industry*, and encouraging the accumulation of capital. Whichever of these persons is *practically right*, the others must be most *mischievously wrong*. Yet they differ, not in the *general principle they set out from*, but in their *applications of it*. . . . *Ill-directed charity*, again, frequently produces (as you are doubtless aware) much more evil than good. And against this no man can be guarded by a mere inculcation of the Christian duty of *charity*."

Having thus shown the origin of our present scholastic establishments, and their unsoundness in philosophy and inefficiency in practice, we proceed to the question, What, then, should be taught in the schools for the people? The grand reform now needed is, to teach, *first*, things that exist; *secondly*, their modes of action; *thirdly*, the nature of man; *fourthly*, how the elements of nature are adapted to the human mind and body, and how their action gives rise to most of the pleasures and pains of life. And, *lastly*, in every step of this instruction, we should direct the emotional faculties of wonder, reverence, benevolence, conscientiousness, and the love of the beautiful, to God as the author of all, and train these faculties practically to the faith, that, in conforming to His laws, we are paying Him the highest homage that can be offered by a rational being to his Creator; and at the same time expanding, elevating, and improving our own minds. Under such a system of instruction and training, the laws of nature, by which health and disease, poverty and riches, honour and disgrace, and every other worldly enjoyment or suffering are produced, would become the finger posts and trumpet tongues of Providence warning the people that "in this direction lies happiness—in that misery;" and we may hope that, if comprehended to be divine enunciations, and taught and revered as such from infancy, they would produce practical effects on conduct, if man be really a ra-

tional being. Indeed, until he shall be so instructed and trained, and until he shall thus regulate his conduct, he will never exhibit the true characteristics of a rational creature; and when he has done so for a few generations, he will find himself in a state of civilisation and well-being, such as, in his present circumstances, he cannot believe ever to be attainable.

One effect of teaching religion dissociated from science, and founding it on the Bible alone, has been to produce a general unconsciousness that the Book of Nature is truly a divine revelation calculated to guide human conduct. It is viewed by practical men as a repository of materials for realizing wealth, and by the rich as a source of polite amusement; but by neither as embodying a code of rules for the direction of conduct, each duty having its reward and each its penalty attached to it. And yet it is really such, and only misdirection of our education prevents us from seeing this to be the case.

In reference to personal and social well-doing, religion, severed from the laws of nature, stands in the same predicament that mathematics do when unapplied to practical objects. The profoundest mathematician could not by his science steer a ship to China. To his abstract propositions and their solutions he must add a practical knowledge of ships, and of the mode of applying mathematics to direct their course at sea. In like manner, all personal and social processes which lead to human improvement, depend on physical and physiological conditions. Health and life depend on them; wealth and destitution depend on them; mental vigour, even the ability to pray, depends on them; for when the brain is incapable of action, the religious emotions vanish. Before, therefore, religion can accomplish its full practical effects in promoting the temporal improvement of man, its teachers must study and inculcate obedience to the laws of nature. In so far as it *has* benefited the world without having designedly allied itself with these laws, it has *undesignedly* acted in accordance with them; for, up to a certain point, they are forced upon the human understanding by their inherent relations to its faculties, and by their irresistible influence on our happiness. But we must advance beyond a blind obedience.

Those who have been accustomed to connect religious emotion exclusively with the Bible, find a difficulty in understanding *how* it can be associated with science. But this difficulty may easily be removed. God has endowed man with emotions of awe, reve-

rence, admiration, hope, fear, love, and aversion, which by early training may be directed to, and intimately associated with, a great variety of objects. Priests know this law of the human mind well, and largely turn it to account. In training the young of his flock, the Roman Catholic clergyman directs the emotions of hope, love, awe, and reverence, first to God and the saints, next to the Pope, the Romish church, and himself; and the feelings of fear and aversion to the Protestants and their worship. The Protestant clergy reverse the greater portion of this process. They direct the religious emotions of their hearers first to God, and then to their own church, its doctrinal standards, and themselves: the emotions of fear and aversion they associate with the Pope, and his priests and doctrines; and by these means Roman Catholic Christians and Protestant Christians, each with their peculiar reverences and aversions, are *manufactured* as obviously and systematically, as different patterns of Coventry ribbons, or Paisley shawls! But the clergy of neither of these sects, with a few honourable exceptions, train these affections to love, reverence, and obey God as manifested in the laws which He has instituted in nature, and by means of which He dispenses temporal well-being and misery.

By directing the religious emotions too exclusively to the objects treated of in the Bible, and dis severing them nearly altogether from nature, the clergy have produced, in the minds of the people, a desecration of nature and its Author, which is the twin brother of that infidelity which they so much deplore. They are blind to the fact that adaptation of conduct to the laws of action impressed on external nature, is as indispensable to *temporal* well-being, as a knowledge of Christianity can possibly be to *eternal* happiness. They do not perceive that the Bible is directed chiefly to teaching the latter, while the duty of using our reason, under the guidance of our religious emotions, to discover the laws of nature, is imposed upon us by our own constitution and its relations to external objects. With great seriousness they propose to remove "*spiritual destitution*," as an infallible means of putting an end to *temporal* ignorance and want, and all their debasing consequences. But this is sheer fanaticism. The real question is, Are the natural conditions of temporal well-being practically embodied in the emotions and conceptions awakened by the peculiar doctrines of the Gospel? Assuredly they are not; for no spectacle is more common, and at the same

time more lamentable, than to see undoubtedly religious persons grossly violating the natural laws of health, and bringing suffering, and perhaps premature death, on themselves and their offspring; violating the laws of political economy, and involving themselves and their friends in ruin; or mistaking the laws of social well-being, and advocating the most injurious political institutions. To act with success in temporal affairs, we must learn the laws by which temporal affairs are governed; and as youth is the appropriate season for acquiring all knowledge that is necessary for our welfare, instruction in these laws should undoubtedly be introduced into the schools for the people.

Fortunately for the cause of education, the desire and the capacity of the people for this kind of instruction, wherever it has been placed within their reach, is no longer doubtful. In point of fact, wherever able teachers have presented really useful knowledge of nature to children, the mental appetite of the learners for it has been found to be much more nearly on a par with their appetite for food than has hitherto been generally believed. This is proved by the rapid growth of schools for the children of the working classes, in which not only reading, writing, and arithmetic, but also the elements of natural history, chemistry, physiology, mechanical philosophy, and social economy, with their practical applications, are taught. The pupils pay a considerable fee: in London, 6s.; in Edinburgh, 4s.; in Manchester, 6s. per quarter. Mr. Ellis, the author of the work in our title, which we shall presently notice, has the merit of having brought out and demonstrated the truth of what we have stated. In the autumn of 1846 he commenced teaching social economy to a class of boys in the British and Foreign Society's school, in Camberwell, of which Mr. Holmes is the master; and his success was complete. He offered his services to the Borough-road school and to the Church Training College at Battersea, to give lessons in social economy, but they were politely declined. This led him, aided by other enlightened and benevolent men, to institute the Birkbeck Schools in London. It was only in July, 1848, that the first of these was opened at the Mechanics' Institute, Southampton Buildings, and now there are the following schools in active operation, in which are taught the branches of *secular instruction* before mentioned.

	Attended by	
	Boys.	Girls.
The British and Foreign School, Cambridge	280	
Birkbeck School, London Mechanics' Institute	350	50
Finsbury Birkbeck School	280	
Paddington and Mary-le-bone (Birkbeck)	130	
Bethnal Green (Birkbeck)	160	80
Vincent Square (Birkbeck)	110	
National Hall School, Holborn	150	70
Mr. Brooks's School, John Street	140	
Mr. Angell's School, Manchester	110	
Mr. Williams's School, Edinburgh	103	54
Glasgow Secular School (Boys and Girls)	143	
Glasgow Secular School (Boys and Girls)	40	
<b>Total</b>	<b>1996</b>	<b>254</b>

This list of successful schools establishes two points of importance in secular education: *first*, that it is *possible* to give the children of the working classes a far higher and more useful education than has hitherto generally been placed with their reach; and, *secondly*, that they appreciate its value, and eagerly avail themselves of its advantages.

It will probably be asked, Do we, then, altogether object to Christian Churches taking up the work of education? Certainly not. We divide education into two branches: *First*, instruction in religious truth, and training to act in conformity with it: *Secondly*, instruction in the objects and agencies of nature, and in their influence on temporal well-being. The leading aim of Bible religious instruction is to communicate such principles of faith and practice as may insure the salvation and happiness of the individual in a life to come. That of secular instruction is to impart such knowledge and habits of action as may conduce to well-being in the world in which we now live. We propose to disjoin these two branches, and to establish a separate school for each; and this leads us to

The *third* question which we named for discussion, viz., By whom and by what social arrangements should these two branches be taught? The clergy, of nearly all denominations, answer that both should be taught by *them*, or by teachers directed and controlled by them. We at once consign the teaching of the religious department to them; but let us inquire into their qualifications for superintending and controlling the *secular* branch of public instruction. If experience is to guide us in solving this question, we should at once say that they are most unfit for this latter duty. Hitherto, with few exceptions, they have alto-

gether failed to appreciate the necessity and advantage of this instruction to the well-being of the people; for the reading and writing which they patronised were avowedly given chiefly to enable the young to read the Bible. They boasted of this as their leading object; so that we are justified by facts when we affirm that, generally speaking, the clergy, in their education of the people, have ignored and withheld all profitable instruction in the order and agencies of nature by which temporal well-being is determined. They have done so, because their own education and professional pursuits were devoted to the administration, not of temporal, but of spiritual interests; and this is still, and will long continue to be, the case. They are, therefore, not qualified by experience, education, or position, to superintend the secular branch of public instruction; while, on the contrary, laymen, who live, move, and have their being in the thick and throng of temporal affairs, are better qualified for this duty. Moreover, from the overwhelming importance attached by the clergy to eternity in comparison with time, they would lie under a constant temptation, often unperceived by themselves, unduly to subordinate secular to spiritual instruction. While, therefore, they are naturally indicated as the proper directors of the religious branch of education, regard to the public welfare leads us to deprecate the consignment of the secular branch to their administration.

But the best of all reasons, in our opinion, why secular should be separated from religious instruction, is, that it is *impossible*, in the present state of opinion, to unite them in a manner that will satisfy the *whole* people; or, what is practically the same thing, an overwhelming majority of them. And *this* is an indispensable condition in any efficient system of national education.

In regard to the doctrines to be believed, and the conduct to be pursued, as the means of securing salvation in the world to come, and also in regard to the form of church government sanctioned by Scripture, there exist great, and, at present, irreconcilable differences of opinion among men equally enlightened, benevolent, and sincere. Hence the conscientious Episcopalian declines to allow his children to be instructed in the religious standards of the Church of Scotland; while the Presbyterian objects to the instruction of his children in Episcopal tenets. The Roman Catholic protests against the doctrines and church government of both, as unauthorized by Scripture, and dangerous to the souls of

men; while these Protestant sects denounce the Church of Rome as the promulgator of "soul-destroying" errors. The practical question is—How, while these and many other differences exist, is the religious instruction of the children of the whole people to be accomplished?

The multitudes of neglected and vicious children who infest the streets and lanes of our large towns are the offspring of Roman Catholic, Socialist, or other dissenting parents, who, although they may not frequent any place of public worship themselves, still cling to some form of faith, or of unbelief, which induces them to withhold their children from the religious teaching of the Church of England or of Scotland. We saw it lately stated, on the authority of Dr. Strang, the Chamberlain of Glasgow, that in that town there are 80,000 persons of the Roman Catholic persuasion. These, as a body, would as soon allow their children to be educated by the Jews as by the Church of Scotland. In point of fact, they have exactly the same repugnance to send their children to receive religious instruction from the schoolmasters of the Established Church, as any evangelical Protestant would have to send his own children for doctrinal faith to the school of a Roman Catholic priest. The proposal, therefore, which has been made to extend the religious teaching of the Church of Scotland as a means of giving religious instruction to these children, and rescuing them from personal and social degradation, is preposterous—it is an indication of that blindness of understanding which ardent partisanship in religion is so apt to induce.

The advocates of secular education are not opponents of the religious instruction of the people, but they are not blinded by sectarian zeal. If they were hostile to religious education they would shake hands with their religious opponents, and join in proposing to commit to *one* sect, no matter which, the duty of educating *all* in religious faith. By this means their irreligious end would be certain to be gained; because, in the present state of opinion, no sect could collect all the destitute children into its fold, not even if aided by her Majesty's Horse, Foot, and Artillery. Being sincere in their desire to furnish religious instruction to the people, these advocates, therefore, propose to do so in a manner which is not a mockery, but practical and real. They suggest that religious should be separated from secular instruction, and that each sect should give religious instruction to the children which it claims as its own. If there be children deserted by their pa-

rents and guardians, claimed by no sect, and left destitute of all religious guidance, there can be no objection to their being delivered over to the parish which maintains them, for religious training as well as for food and raiment; but these do not constitute the mass of our degraded juvenile population.

It is vain to urge as an objection that ignorant and debased parents cannot be expected to give religious instruction to their children. Those who urge this fight with a shadow; because secular educationists have never propounded such an idea as the objection assumes. Their fundamental proposition is, that, in order to induce the children of all sects to enter a school for secular instruction, it is necessary to separate that school from the school in which they propose to teach religious doctrines about which sects differ in opinion. They urge as earnestly as the sectarians the establishment of religious schools, but separate from the secular; and managed not by one sect, as the churchmen propose, nor by hostile sects, but by individuals belonging to each sect, who will charge themselves with superintending the religious instruction of the young belonging to their own persuasion.

This point being settled, the next question is, Why do we propose to give such instruction in secular schools as will be acceptable to all sects? Because the order of God's secular providence is the same for Jew and Gentile, Roman Catholic and Protestant, believer and unbeliever. The sun shines on them alike, ripens their corn by the same process, warms them by the same influence, and its retreat to the distant regions of the south leaves them all alike enveloped in winter's desolation. The atmosphere carries health or sickness, the storm destruction, and the fire warmth or torture to all alike, according as they expose themselves, wisely or unwisely, to the action of the elements. The laws of social well-being which determine the production and distribution of wealth, the destitution of some and the riches of others, are the same to all; and secular instruction means the communication of these and other natural things and agencies.

If, then, it be not only objectionable in principle, but impossible in practice, to accomplish the secular education of the whole people by means of churches and the clergy, the question occurs, To whom should the task be committed? Should we leave the people to depend on adventure schools, and schools instituted and maintained by voluntary associations? Or should we raise rates by Acts of Parliament for enabling

the community of every district to found and maintain schools for themselves? The objections to adventure schools are, first, that when they are instituted for the lowest class of the people, they will never remunerate the teachers, and therefore cannot continue to exist; and, secondly, that the teachers who will attempt to establish them, will be men of slender expectations, and equally slender accomplishments, and therefore incapable of giving the kind of instruction which the people need. When we speak of educating the *people*, we should think chiefly of the lowest class; for all above them are capable of doing something for themselves; and moreover, we should keep constantly in view that the education wanted is one which shall impart not only real, useful, practical *knowledge*, but ardour to the moral emotions, and vigour to the understanding. We must aim at strengthening the minds of this class, so as to enable them to cope with the difficulties of life, which beset them more severely than any other order of the community.

In regard to schools supported by voluntary associations, we appeal to every practical observer whether the leading motives of the members of such bodies have not been religious? We do not state this as an objection to the individuals composing such associations, or as implying disrespect to their principle of action, but simply to call attention to the fact that their *leading aim* was to impart *religious* and not *secular* instruction. They have generally stopped short at reading, writing, arithmetic, and the catechism or Bible, and left all the natural laws of social well-being untaught. The schools referred to have been the appendages of churches, or the recruiting stations of chapels; and in their addresses they have dwelt largely on the spiritual benefits they were conferring on the pupils whom they educated. Let them have their meed of praise, and by all means let them continue their benevolent exertions; but let them not deceive themselves and imagine, as hitherto they have too often done, that in communicating spiritual instruction they are conveying at the same time that secular knowledge which is indispensable to terrestrial well-being. We have no hope that the excellent persons who have spent their lives in conducting these schools on religious principles, will ever become thoroughly conscious of their great error in omitting from their curriculum the whole counsel of God as revealed in the constitution and laws of the material world. Before, therefore, we can hope for an adequate supply of schools for the lowest class of the people, founded

on truly practical principles, and supported by voluntary associations of the rich, we must effect an entire change in the views and convictions of the middle and upper classes themselves, and half a century may be needed for accomplishing this purpose. We do not, therefore, enter further into the merits of the scheme for educating the people by voluntary efforts; nor is it necessary to do so, since its inadequacy to realize the object in view has been abundantly demonstrated, and it has now only a few, although these are very earnest and respectable adherents.

In our opinion the true plan for educating the people is that which has been frequently explained and advocated in this journal, and which is universally known as that of the National Public School Association for England and Wales, whose head-quarters is Manchester. It proposes to separate religious from secular instruction; to leave the former to parents and pastors, and to impart the latter in schools supported by local rates, and managed by local committees of ratepayers: the schools to be open to, but not controlled by, government inspectors, and every form of sectarian theology to be rigidly excluded.

Some of the advantages which we should expect to follow from the scheme are the following. The separation of the religious from the secular element would insure a better treatment of both branches. Religious instruction given by men educated in theology, and whose profession it is to teach it, would become earnest, substantial, and practical. It would sink deep into the young hearts, and live there, associated with emotions of love and reverence for the teacher and his doctrines, instead of being, as at present, too often hated and expelled from the memory under the recollection of blows and drudgery associated with it in our common schools. In the next place, the understandings of teachers and the public would open to the real nature and unspeakable importance of the secular branch of public instruction, and it would acquire a character of substantive reality and practicability, which it has never yet attained, and which it never can reach while the minds of laymen remain confused by the prevailing error of believing that the religious element *includes* the secular. When once the separation is made, the distinction between the two branches will become so palpable, and the advantages of teaching them apart so conspicuous, that men will wonder at their past repugnance to sever them. They will see that while the *supernatural* constitutes the basis of the faith that is to lead to sal-

vation, the fixed, permanent, and undeviating elements of nature form the groundwork on which temporal well-being reposes, and out of which it must be educed by human intelligence and effort. Not only is there this palpable distinction, but the action of the mind in studying the different branches is widely dissimilar. In learning theology resting on a supernatural basis, the intellect, in many instances, must yield itself up to the emotions of awe, wonder, reverence, hope, and fear: "*Faith is the evidence of things not seen.*" In studying secular science, on the contrary, the intellectual process is reversed. Everything must be closely observed, profoundly analyzed, and rigidly investigated. The pupil who, under the present system of training, goes into actual business without any distinct perception of the line of demarcation between faith and reason, is prone, in many temporal affairs, to act with a neglect of due investigation, and a blindness to inevitable consequences, which are evidently referrible to the habits of easy trust and reliance which he has acquired in the department of faith. How often do we see sincerely religious persons relying on prayer as a means of securing health, while, through lack of physiological knowledge, they are living in habitual violation of the laws on which God has seen it proper to make this blessing depend! How many prayers are offered up for the success of mercantile and manufacturing enterprises by religious men, who in conducting them have disregarded every natural law of social well-being! And after ruin—the natural, and therefore inevitable, termination of their course of action—has overtaken them, how frequently and sincerely have they sought consolation in religion for their sorrows and mortifications; ascribing their miscarriages to sin, or to the chastening hand of God, out of love to their souls, instead of to their own ignorance, rashness, and folly. The confusion occasioned in men's minds by the jumbling of the supernatural and natural in their training can alone account for such senseless abuses of religion. By the separation of the two, the inflexible reality of Nature will be recognised, and the young will be trained to the investigation of the laws of her operations, and to yield obedience to their requirements. Secular instruction will then embrace the substances, agencies, and laws of the material and mental worlds, and their relations to human well-being—including the human organism itself, with all its corporeal and mental functions, on the latter of which the laws of natural morality and natural religion will be found to rest as on a

rock. Historical events and biographical characters (instruction in which will naturally form a branch of such a curriculum) will then be expounded in connection with the basis on which they rest, and thus become far more effectual guides to practical conduct than the empirical expositions of them which have hitherto been given even in the best schools.

After a few generations shall have enjoyed this improved instruction, modifications in religious faith may be expected to follow; but they will be gradually introduced, will rest on moral and intellectual convictions, and be supported by divine truth drawn from the infallible book of revelation in nature. Under the present system, religious belief is hastening to a state of anarchy. The Bible is undergoing a criticism of reason, such as it was never before exposed to, and the discoveries of science are daily shaking the established interpretations of it to the foundation. To ignore natural science in our common schools is not the way to strengthen the falling faith, but the reverse; it tends to encourage atheism. In point of fact, many of the professors of atheism among the working classes are strong-minded and dauntless thinkers, who, owing to the entire omission of logical and scientific instruction and training in their youth, have been left to flounder in a chaos of crude and disjointed facts and inferences until their understandings have become bewildered. The orthodox custom of expressing horror and alarm at the avowal of their opinions, and proposing mere bible teaching as the only remedy for it, proceeds from blindness to its cause. Let the professors of orthodoxy cease to obstruct the introduction of secular knowledge into our schools, and let them try the power of a clear and forcible exposition to the youthful mind of God's agencies in nature, accompanied by an appeal to the religious emotions, as a cure for this form of unbelief, and reserve their horror until this teaching, too, has failed, as *theirs* has done, to render these individuals religious. Horror and abuse of our erring brethren may be reserved till we have fulfilled our own duty towards them in a rational form, as well as in a benevolent and religious spirit.

But it is time that we should advert to the works whose titles stand at the head of this article. The first, on "Education as a Means of Preventing Destitution," &c., is from the pen of Mr. William Ellis, and is distinguished by his well-known qualities of clear perception, and lucid exposition, of the true and the useful in economical science.

The introductory letter to Lord John Russell contains a forcible appeal to him as the Prime Minister of the country to take up the education of the people as a national measure; and from Lord John's announcement when in office of a Government Bill for education for the next Session, we may infer that this and other similar appeals had not been without their effect on him. Mr. Ellis has done more than call aloud for the boon. As already mentioned, he has shown practically how it may be conferred, and how eagerly the small portion of it dispensed by him and a few other individuals has been received by the people. In the present work he embodies many of his principles.

"Education," says he, "deals with causes — punishment with effects." What volumes of practical wisdom are embodied in this simple remark! He continues:—

"Men in want steal. All agree that theft, if possible, must be prevented. The educator would prevent theft by providing such teaching and training as will enable all to keep themselves from want, and out of temptation. The punisher would prevent theft by exhibiting to hungry men how other hungry men have brought down legal penalties upon themselves by stealing, in order to allay the pangs of hunger. (P. 11.) . . . . To grant that education is indispensable for all is to grant that the withholding it from some is an act of revolting atrocity."

Mr. Ellis gives a forcible exposition of the things which should be taught, and the manner of teaching them; and if we do not here quote largely from his pages, it is only because we have already extracted their substance, and made use of it in the foregoing remarks. After mentioning most of the branches of knowledge before named, as proper to be included in a good education, he proceeds:—

"There is another portion of knowledge that must not be omitted. It can readily be shown that every man of us all greatly depends for his own well-being or happiness upon the conduct of his fellow-men, as they do, in their turn, upon his. The investigation of the consequences of this undeniable and important fact leads to the discrimination between what conduct is good, and what is bad—leads to a thorough appreciation of what are called the social duties. If, for example, it be seen that men are dependent for their well-being upon an abundant supply of food, clothing, shelter, and fuel, and that these can be obtained only by a general prevalence of industry, skill, knowledge, and economy, and that those who are deficient in these qualities must suffer from want, or procure relief from others who are pre-eminently gifted with these qualities, does it not follow, that to work, to apply, to learn, and to save, are social duties? And if it be seen that division of labour, interchange, partnerships, buy-

ing and selling, and credit and confidence, materially assist man in making his labour productive, does it not follow that honesty, fidelity, punctuality, and order, are social duties? It need scarcely be mentioned, that, as drunkenness is sure to incapacitate for the proper performance of these duties, so its opposite, sobriety, must be classed among social duties. That a population knowing these duties, and performing them, will surely be in possession of abundant supplies of the necessaries and comforts of life, seems to be one of those truths so obvious, that to enunciate it is enough. But, it may be asked, will they who know, always do what they ought? Our experience of man's history and nature forces us to admit that, as ignorance causes good conduct to be improbable, so knowledge by itself does not necessarily prevent ill conduct. The consideration of what must be brought to co-operate with knowledge to make sure of good conduct, brings us to the second educational function—the training or forming the disposition."—P. 19.

This extract will indicate how grievously those religious persons err, who imagine that if the Bible and catechism are excluded from secular schools, no moral precepts or moral training can find admission into them.

The second section of the work embraces "the conditions of well-being," as taught in the Birkbeck schools, and as they "ought to be taught everywhere else." A rapid and masterly survey is taken "of the whole field of knowledge, that we may the better appreciate how far knowledge and well-being depend one upon the other;" and in pursuing this theme the author brings into constant and prominent view the indispensable necessity of moral principles and habits being associated at every step with knowledge, to render it fruitful of good.

"The task of creating the virtues belongs chiefly to the educators of the people; that of repressing the vices to the governors of the people. . . . Can we fail to perceive, that, in proportion as we succeed in accomplishing the first, the difficulty of the latter diminishes, the sacrifices for the purpose becomes less onerous, and well-being more diffused?"

The conclusion arrived at in this section is, that the means at our disposal for promoting well-being "all resolve themselves into human conduct," and this can be most effectually influenced for good by instruction and training in youth.

The third section is on "The Morality of Expenditure, or of the Disposal of Wealth in General," and is the most original portion of the work.

"The answer to the question, 'May I not do as I like with my own?' will, says Mr. Ellis, vary according to the meaning that we attach to the little word *may*, with which the question begins. *Legally*, we may do what the law per-

mits; morally, we may do nothing that to our knowledge tends to diminish the general well-being. . . . A man may thus do legally what he may not do morally. A lawmaker does not say, 'Do everything that I do not prohibit;' but he says, 'Make a moral use of the licence that I am bound to trust you with in my efforts to promote the general well-being.'

By this aphorism may the truth be concisely expressed; "Property has its *moral* duties as well as its *legal* rights."

"A wide field of inquiry here opens upon us. How is a man to spend his income morally, or to make a moral use of his wealth? Ought he to sell all, and give to the poor? Ought he to spend hospitably? Ought he to live sparingly, so as to be able in the end to endow a charity or found a family? Or ought he to do a little bit of each of these things, or what proportion of each?" Mr. Ellis says, "You must not look to me for answers to these questions, for I do not pretend to be competent to give them."

Shall we turn, then, to our clerical educators, and ask them whether they have introduced these questions and the answers to them into the schools under their direction, or into their pulpit discourses?—because, for the guidance of conduct in *this world*, they could scarcely deal with more important topics. In point of fact, they never dream of grappling with such practical questions as these. Their education, based on religion, leaves unheeded this, and almost every other practical inquiry into the due management of temporal affairs. Mr. Ellis, however, does more than he promises. He supplies us with very instructive, if not exhaustively complete, answers. He classes the various modes of expenditure, or of dealing with wealth, under four different heads, represented by so many individual types.

"Lord Mere-acres has inherited an income of 20,000*l.* a year. He is amiable, hospitable, and in no respect ill-disposed. He has a town-house and country-mansion, in both of which he maintains respectable establishments. He hunts and shoots, visits watering places, attends quarter-sessions occasionally, and takes his seat from time to time in the Upper House. He spends the whole of his income, and, according to general report, liberally—but lives within it."

He takes no share in railways or other industrial undertakings, and is guided in his conduct by the opinions of his order.

"Lord Care-nought inherited a similar income, but by racing, betting, riotous hospitality, and indulgence in sensual pleasures, he found himself deeply involved in debt at the expiration of the first year of his coming into possession of the

paternal property. . . . After a wild career of five years, he found himself an outlaw and a beggar."

"John Save-all likewise possesses an income of 20,000*l.* a year. His career has been very different from that of either of the the two lords just mentioned."

He received a common school education, started without property, and by energy, industry, frugality, and integrity, acquired a large fortune. "The habits which elevated him to his position stick to him." He lives in his work, limits his expenditure to 500*l.* a year, and every year adds the whole remainder of his income to his capital, employing it in productive machinery and other remunerative forms. "Robert Steer-well," whose start in life was somewhat similar to that of Save-all, has not been so saving, although quite as industrious as he. While saving, he has looked on wealth as a means to an end; for self-support in the first place; for the due performance of the nearer and dearer duties of domestic life in the second; and, "lastly, to aid in the performance of some of the wider and nobler duties of social life. No attempts at gorgeous display meet the eye in his dwelling, but within and without and around may be seen traces of advancing civilisation, towards which his wealth, guided by his intelligence and benevolence, has contributed."

Then follows a searching analysis of the effects produced by these several methods of disposing of income:—"Lord Mere-acres is intent upon his own gratification, and, in pursuing it, does that modicum of good which is inseparable from the interchange which he is compelled to take part in." The butcher and baker, confectioner, wine-merchant, upholsterer, tailor, coachmaker, *et hoc genus omne*, besides a large class of diners-out, regard him as a pattern nobleman; but to any higher praise he has no claim. Lord Care-nought excites our active dislike and censure. Mr. Save-all does the same good through interchange as Lord Mere-acres; only he employs a different class of workmen. He encourages skilled artizans in making new machinery, and skilled labourers in working it; and, although he does not practise hospitality, "he promotes all those useful social qualities which necessarily rally round successful industrial enterprise." But "his accumulative efforts, so protracted, strike us as purposeless." His example

"Does not satisfy our yearnings after excellence. Industry and economy, admirable as they are, do

not comprise the whole duty of a man. A good use of the results of industry and economy is required before we can even consent to bestow our highest meed of praise upon those indispensable virtues. This recalls our attention to Mr. Steer-well, who may, perhaps, be considered to represent the style of man that we can admire throughout. He accumulates up to a certain point—beyond that he spends. In his estimation, wealth to one extent provided by the parent is a blessing to his children—to a greater extent, it has a tendency to degenerate into a curse; and wealth destined to more general purposes of benevolence is better applied under his own superintendence, than reserved to be administered by he knows not whom, and he knows not how. He thus closes his life, having worked well, saved well, and, what is more rare, spent well.

“A reflection suggests itself here, which it would be wrong to suppress. The man who spends productively—that is, with a view to have his expenditure returned to him with increase, if he conduct his operations with skill, will always afford encouragement to those social qualities, upon the prevalence of which the general well-being of society depends. The man who spends unproductively, especially in the exercise of benevolence, if he be not circumspect, may afford encouragement, however unintentionally, to idleness, vice, and improvidence.”

Mr. Ellis touches on the expenditure of fashionable life, and shows how little it contributes to social well-being:—

“Are you not deeming grace and elegance,” he continues, “in thus running down the kind of expenditure which distinguishes what is called fashionable life? I hope not. Display and luxury are not identical with grace and elegance, which are more often than otherwise found in company with modest simplicity. The fine arts, and everything that conduces to elevation and refinement of taste, must on no account be disparaged. Their influence upon well-being is so precious that I should deeply regret were words expressed, or words omitted, to expose me to the imputation of undervaluing any conduct that tends to favour them. But elegance, refinement, and taste, as far as I can judge, owe as little to the Mere-butterflies of society, as the more substantial parts of the social fabric do to the Mere-acres.”

This Essay, as we have said, contains an able analysis of a most important social and moral question, and it appears to us calculated greatly to enlighten and assist the rich and benevolent, who abound in England, who desire to do public good with their surplus wealth, but often do not know how successfully to realize their object.

The fourth section of the work is entitled “What is Competition?” and is—as we are informed—“little less than a connected summary of the answers given by the boys attending the Social Economy Class at the

Birkbeck School (London Mechanics’ Institution), during two interrogative lessons upon the effects of competition.” It is dedicated to Mr. Runtz—“the excellent master of that school”—as an expression of regard and esteem for his efforts “to aid in the extension of a sound and useful education to all classes of his countrymen.”

We notice this little incident because we consider the example highly worthy of imitation. We have repeatedly visited Mr. Runtz’s school, and heartily concur in the encomium here passed upon him. Indeed, we consider it a sacred duty of the press to do justice to the merits of the able, energetic, well-instructed, and laborious men who are now dedicating their lives to the introduction of a superior system of education for the people; and Mr. Runtz stands high in the list of these benefactors of their country.

The fifth section bears the title of “Not Over-Population, but Under-Education, the Cause of Destitution; not more Emigration, but more Education, and of better quality, the remedy for Destitution.” This is another lesson in Mr. Runtz’s Birkbeck School, and is admirably reasoned and illustrated; but we cannot enter into its details.

The sixth and last section consists of “Reasons for insisting that Instruction in Economical Science shall no longer be excluded from our Schools.” Mr. Ellis says:—

“Of late years I have been giving lessons in this science in many schools, and have been endeavouring to persuade others to obtain the introduction of similar teaching into schools over which they exercise control or influence. It is gratifying to me to be able to state that I have met with much success. I must also admit that disappointments and rebuffs have not been unknown to me. The result of my experience, thus far, is a growing conviction that if once the public can be made to see what Economical Science really is—how simple, how beautiful, how interesting, I might almost say, how grand, when unfolded step by step, without pedantry or pretence—what blessings would be secured, what suffering warded off, what heart-burnings and asperities softened down by a general familiarity with its leading principles—all other difficulties would vanish, and instruction in Economical Science would speedily be as common in all our schools and colleges as its exclusion is at present.”

We subscribe to every word of these remarks, and testify from the closest observation and experience that children from ten to fourteen years of age are not only capable of understanding, but actually take a lively interest in, the truths of economical

science, when expounded in the manner pursued in the Birkbeck schools. In May last we accompanied one of the most distinguished Members of the House of Commons to Mr. Runtz's school, and, for forty minutes, listened to a lesson on this subject given by a monitor of fourteen years of age, to a class of sixty boys, most of whom were younger than himself. Our friend remarked, on leaving the room, "One-half of the House of Commons might listen to these lessons with advantage." We recommend this section to the consideration of all interested in communicating *real* instruction, not mere words, to the children attending schools under their charge or influence.

We take leave of Mr. Ellis's little work, with the hope that it will be extensively read and practically applied. It opens a new vista in education, which cannot be too seriously contemplated, or too earnestly urged upon public attention.

The second publication in our title is, "The Rise and Progress of National Education in England; its Obstacles, Wants, and Prospects: a Letter to Richard Cobden, Esq., M.P.," and were we to follow the impulse with which it has inspired us, we should transfer it entire to our pages. But this cannot be: suffice it, then, to say that the object which Mr. Church proposes to himself is—

"To touch upon the rise, progress, obstacles, wants, and prospects of working-class education. To effect this I shall—

"*First*, Endeavour to give a brief sketch of the rise and progress of the Education question, especially noting the development of what is called Voluntaryism,—the motives that produced and the arguments that have been adduced to support it. From this sketch—imperfect though it must necessarily be—we shall learn how little the great question of National Education in this country has been treated on its own merits; how fatally subordinated to antagonist ambitions; how systematically diverted from its grand object of enabling the popular intellect to judge independently and soundly of all matters that concern it; and how used as a mere instrument for perpetuating or overthrowing existing ascendencies, and stereotyping received opinions.

"*In the second place*, I shall ask your attention to the utter inadequacy of the actual means of education, whether material or moral, and the utter improbability of their being supplied by any of the resources now in existence.

"From the evidence which I shall adduce on this point, we shall be able to come to a pretty clear notion whether it is our duty and interest to have recourse to some new and powerful machinery, or to be satisfied with that which we have.

"*In the third place*, I shall touch upon the

schemes of improvement which have been suggested, and endeavour to show which of them has the best chances of success."

The author pursues the discussion of these questions with a degree of vivacity, earnestness, perspicuity, and force of reasoning that renders his pamphlet not only most instructive, but highly interesting as a psychological history. It embraces all the *debateable* questions of national education (omitting only the subjects that should be taught), and it deals with them with a master's hand. It is well timed, and will do excellent service to the cause. It is a proof, among many others, that the question of national education is at last rousing the higher minds of England, and that a copious stream of moral zeal, practical knowledge, and intellectual power is flowing towards it. A more noble cause never solicited the aid of these high qualities, and now that they have entered the lists, victory is certain; victory, not only for education, but for social progress generally.

This letter is most appropriately addressed to Mr. Cobden. Having been one of the grand instruments for insuring a constant supply of food for the bodies of the people, the still more important work remains for him, to bring his great moral and intellectual power to bear on the supply of useful knowledge and moral training for their minds. Success in this will form the crowning merit of his life. Without education, all other boons provided for the people—food, the franchise, personal liberty, and freedom of thought and speech—are incomplete, for the recipients do not know *how* to employ them to produce their greatest happiness. Add sound knowledge and moral training, and the workman will rise above the adventitious disadvantages of his condition, and become an intelligent co-operator in the great plan of Providence on earth. His sufferings will diminish and his enjoyments increase, and life will wear to him the aspect of a boon, instead of being, as now, in the language of his clerical instructors, a weary wilderness in which there is no resting-place. This is literally true for the sons of toil; but these guides to heaven contrive to find both rest and enjoyment for their own souls and bodies while journeying through this wilderness of thorns; and we consider it possible to place the same advantages, by education, within the reach of the working man.

Those who desire to learn how the principles now advocated work when practically applied have only to visit any of the schools

before named, or to read the reports of Mr. Williams's seminary mentioned in the third head of our title, and they will be able to form a judgment on this important subject for themselves. Many competent judges have reported the results to be highly satisfactory.

ART. II.—ENGLAND'S FORGOTTEN WORTHIES.

1. *The Observations of Sir Richard Hawkins, Knt., in his Voyage in the South Sea in 1593.* Reprinted from the Edition of 1622, and Edited by R. H. Major, Esq., of the British Museum. Published by the Hakluyt Society.
2. *The Discoverie of the Empire of Guiana.* By Sir Walter Raleigh, Knt. Edited, with copious Explanatory Notes, and a Biographical Memoir, by Sir Robert H. Schomburgk, Phil. D., &c.
3. *Narratives of Early Voyages undertaken for the Discovery of a Passage to Cathaia and India by the North-west;* with Selections from the Records of the worshipful Fellowship of the Merchants of London, trading into the East Indies, and from MSS. in the Library of the British Museum, now first published, by Thomas Rundell, Esq.

THE Reformation, the Antipodes, the American Continent, the Planetary system, and the Infinite deep of the Heavens have now become common and familiar facts to us. Globes and orreries are the playthings of our school-days; we inhale the spirit of Protestantism with our earliest breath of consciousness; it is all but impossible to throw back our imagination into the time when, as new grand discoveries, they stirred every mind which they touched with awe and wonder at the revelation which God had sent down among mankind. Vast spiritual and material continents lay for the first time displayed, opening fields of thought and fields of enterprise of which none could conjecture the limit. Old routine was broken up. Men were thrown back on their own strength and their own power, unshackled to accomplish whatever they might dare. And although we do not speak of these discoveries as the cause of that enormous force of heart and intellect which accompanied them (for they were as much the effect as the cause, and one reacted on the other), yet at any rate they afforded scope and room for the play of powers, which without such scope, let them

have been as transcendent as they would, must have passed away unproductive and blighted.

An earnest faith in the supernatural, an intensely real conviction of the divine and devilish forces by which the universe was guided and misguided, was the inheritance of the Elizabethan age from Catholic Christianity. The fiercest and most lawless men did then really and truly believe in the actual personal presence of God or the devil in every accident, or scene, or action. They brought to the contemplation of the new heaven and the new earth an imagination saturated with the spiritual convictions of the old era, which were not lost, but only infinitely expanded. The planets whose vastness they now learnt to recognise were, therefore, only the more powerful for evil or for good; the tides were the breathing of Demogorgon; and the idolatrous American tribes were real worshippers of the real devil, and were assisted with the full power of his real army.

It is a form of thought which, however in a vague and general way we may continue to use its phraseology, has become, in its detailed application to life, utterly strange to us. We congratulate ourselves on the enlargement of our understanding when we read the decisions of grave law-courts in cases of supposed witchcraft; we smile complacently over Raleigh's story of the island of the Amazons, and rejoice that we are not such as he entangled in the cobwebs of effete and foolish superstition. The true conclusion is the opposite of the conclusion which we draw. That Raleigh and Bacon could believe what they believed, and could be what they were notwithstanding, is to us a proof that the injury which such mistakes can inflict is unspeakably insignificant: and arising, as they arose, from a never-failing sense of the real awfulness and mystery of the world, and of the life of human souls upon it, they witness to the presence in such minds of a spirit, the loss of which not the most perfect acquaintance with every law by which the whole creation moves can compensate. We wonder at the grandeur, the moral majesty, of some of Shakespeare's characters, so far beyond what the noblest among ourselves can imitate, and at first thought we attribute it to the genius of the poet who has outstripped nature in his creations; but we are misunderstanding the power and the meaning of poetry in attributing creativeness to it in any such sense; Shakespeare created, but only as the spirit of nature created around him, working in him as it worked abroad in those among whom he lived. The men

whom he draws were such men as he saw and knew; the words they utter were such as he heard in the ordinary conversations in which he joined. At the Mermaid, with Raleigh and with Sidney, and at a thousand un-named English firesides, he found the living originals for his Prince Hals, his Orlandos, his Antonios, his Portias, his Isabellas. The closer personal acquaintance which we can form with the English of the age of Elizabeth, the more we are satisfied that Shakespeare's great poetry is no more than the rhythmic echo of the life which it depicts.

It was, therefore, with no little interest that we heard of the formation of a society which was to employ itself, as we understood, in republishing in accessible form some, if not all, of the invaluable records compiled or composed by Richard Hakluyt. Books, like everything else, have their appointed death day; the souls of them, unless they be found worthy of a second birth in a new body, perish with the paper in which they lived, and the early folio Hakluyts, not from their own want of merit, but from our neglect of them, were expiring of old age. The five-volume quarto edition, published in 1811, so little people then cared for the exploits of their ancestors, was but of 270 copies; it was intended for no more than for curious antiquaries or for the great libraries, where it could be consulted as a book of reference; and among a people, the greater part of whom had never heard Hakluyt's name, the editors are scarcely to be blamed if it never so much as occurred to them that general readers would ever come to care to have it within their reach.

And yet those five volumes may be called the Prose Epic of the modern English nation. They contain the heroic tales of the exploits of the great men in whom the new era was inaugurated; not mythic, like the Iliads and the Eddas, but plain broad narratives of substantial facts, which rival them in interest and grandeur. What the old epics were to the royally or nobly born, this modern epic is to the common people. We have no longer kings or princes for chief actors, to whom the heroism, like the dominion, of the world had in times past been confined. But, as it was in the days of the apostles, when a few poor fishermen from an obscure lake in Palestine assumed, under the divine mission, the spiritual authority over mankind, so, in the days of our own Elizabeth, the seamen from the banks of the Thames and the Avon, the Plym and the Dart, self-taught and self-directed, with no impulse but what

was beating in their own royal hearts, went out across the unknown seas fighting, discovering, colonizing, and graved out the channels, and at last paved them with their bones, through which the commerce and enterprise of England has flowed out over all the world. We can conceive nothing, not the songs of Homer himself, which would be read, among us at least, with more enthusiastic interest than these plain massive tales; and a people's edition of them in these days when the writings of Ainsworth and Eugène Sue circulate in tens of thousands, would perhaps be the most blessed antidote which could be bestowed upon us. The heroes themselves were the men of the people—the Joneses, the Smiths, the Davises, the Drakes; and no courtly pen, with the one exception of Raleigh, lent its polish or its varnish to set them off. In most cases the captain himself, or his clerk or servant, or some unknown gentleman volunteer, sat down and chronicled the voyage which he had shared, and thus inorganically arose a collection of writings which, with all their simplicity, are for nothing more striking than for the high moral beauty, warmed with natural feeling, which displays itself through all their pages. With us the sailor is scarcely himself beyond his quarterdeck. If he is distinguished in his profession, he is professional merely; or if he is more than that, he owes it not to his work as a sailor, but to independent domestic culture. With them their profession was the school of their nature, a high moral education which most brought out what was most nobly human in them; and the wonders of earth and air and sea and sky were a real intelligible language in which they heard Almighty God speaking to them.

That such hopes of what might be accomplished by the Hakluyt Society should in some measure be disappointed is only what might naturally be anticipated of all very sanguine expectation. Cheap editions are expensive editions to the publisher, and historical societies, from a necessity which appears to encumber all corporate English action, rarely fail to do their work expensively and infelicitously; yet, after all allowances and deductions, we cannot reconcile ourselves to the mortification of having found but one volume in the series to be even tolerably edited, and that one to be edited by a gentleman to whom England is but an adopted country—Sir Robert Schomburgk. Raleigh's "Conquest of Guiana," with Sir Robert's sketch of Raleigh's history and character, forms in everything but its cost

a very model of an excellent volume. For every one of the rest we are obliged to say of them that they have left little undone to paralyse whatever interest was reviving in Hakluyt, and to consign their own volumes to the same obscurity to which time and accident were consigning the earlier editions. Very little which was really noteworthy escaped the industry of Hakluyt himself, and we looked to find reprints of the most remarkable of the stories which were to be found in his collection. They began unfortunately with proposing to continue the work where he had left it, and produce narratives hitherto unpublished of other voyages of inferior interest, or not of English origin. Better thoughts appear to have occurred to them in the course of the work; but their evil destiny overtook them before their thoughts could get themselves executed. We opened one volume with eagerness, bearing the title of "Voyages to the Northwest," in hope of finding our old friends Davis and Frobisher, and we found a vast unnecessary Editor's Preface; and instead of the voyages themselves, which with their picturesqueness and moral beauty shine among the fairest jewels in the diamond mine of Hakluyt, an analysis and digest of their results, which Milton was called in to justify in an inappropriate quotation. It is much as if they had undertaken to edit "Bacon's Essays," and had retailed what they conceived to be the substance of them in their own language; strangely failing to see that the real value of the actions or the thought of remarkable men does not lie in the material result which can be gathered from them, but in the heart and soul of those who do or utter them. Consider what Homer's "Odyssey" would be reduced into an analysis.

The editor of the "Letters of Columbus" apologizes for the rudeness of their phraseology. Columbus, he tells us, was not so great a master of the pen as of the art of navigation. We are to make excuses for him. We are put on our guard and warned not to be offended before we are introduced to the sublime record of sufferings under which his great soul was staggering towards the end of his earthly calamities, where the inarticulate fragments in which his thought breaks out from him, are strokes of natural art by the side of which the highest literary pathos is poor and meaningless.

And even in the subjects which they select they are pursued by the same curious fatality. Why is Drake to be best known, or to be only known, in his last voyage?

Why pass over the success, and endeavour to immortalize the failure? When Drake climbed the tree in Panama, and saw both oceans, and vowed that he would sail a ship in the Pacific; when he crawled out upon the cliffs of Terra del Fuego, and leaned his head over the southernmost angle of the world; when he scored a furrow round the globe with his keel, and received the homage of the barbarians of the antipodes in the name of the Virgin Queen;—he was another man from what he had become after twenty years of court life and intrigue, and Spanish fighting, and gold-hunting. There is a tragic solemnity in his end, if we take it as the last act of his career; but it is his life, not his death, which we desire—not what he failed to do, but what he did.

But every bad has a worse below it, and more offensive than all these is the editor of the Hawkins's "Voyage to the South Sea." The book is striking in itself; it is not one of the best, but it is very good; and as it is republished complete, if we read it through, carefully shutting off Captain Bethune's notes with one hand, we shall find in it the same beauty which breathes in the tone of all the writings of the period.

It is a record of misfortune, but of misfortune which did no dishonour to him who sunk under it; and there is a melancholy dignity in the style in which Hawkins tells his story, which seems to say, that though he had been defeated, and had never again an opportunity of winning back his lost laurels, he respects himself still for the heart with which he endured a shame which would have broken a smaller man. It would have required no large exertion of editorial self-denial to have abstained from marring the pages with puns of which *Punch* would be ashamed, and with the vulgar affectation of patronage with which the sea captain of the nineteenth century condescends to criticize and approve of his half barbarous precursor; but it must have been a defect in his heart, rather than in his understanding, which betrayed him into such an offence as this which follows. The war of freedom of the Araucan Indians is the most gallant episode in the history of the New World. The Spaniards themselves were not behindhand in acknowledging the chivalry before which they quailed, and, after many years of ineffectual attempts to crush them, they gave up a conflict which they never afterwards resumed; leaving the Araucans alone of all the American races with which they came in contact a liberty which they were unable to tear from

them. It is a subject for an epic poem, and whatever admiration is due to the heroism of a brave people whom no inequality of strength could appal and no defeats could crush, these poor Indians have a right to demand of us. The story of the war was well known in Europe; and Hawkins, in coasting the western shores of South America, fell in with them, and the finest passage in his book is the relation of one of the incidents of the war.

"An Indian captain was taken prisoner by the Spaniards, and for that he was of name, and known to have done his devoir against them, they cut off his hands, thereby intending to disable him to fight any more against them. But he, returning home, desirous to revenge this injury, to maintain his liberty, with the reputation of his nation, and to help to banish the Spaniard, with his tongue intreated and incited them to persevere in their accustomed valour and reputation, abasing the enemy and advancing his nation; condemning their contraries of cowardliness, and confirming it by the cruelty used with him and other his companions in their mishaps; showing them his arms without hands, and naming his brethren whose half feet they had cut off, because they might be able to sit on horseback; with force arguing that if they feared them not, they would not have used so great inhumanity—for fear produceth cruelty, the companion of cowardice. Thus encouraged he them to fight for their lives, limbs, and liberty, choosing rather to die an honourable death fighting, than to live in servitude as fruitless members of the commonwealth. Thus using the office of a sergeant-major, and having loaden his two stumps with bundles of arrows, he succoured them who, in the succeeding battle, had their store wasted; and changing himself from place to place, animated and encouraged his countrymen with such comfortable persuasions, as it is reported and credibly believed, that he did more good with his words and presence, without striking a stroke, than a great part of the army did with fighting to the utmost."

It is an action which may take its place by the side of the myth of Mucius Scaevola, or the real exploit of that brother of the poet Æschylus, who, when the Persians were flying from Marathon, clung to a ship till both his hands were hewn away, and then seized it with his teeth, leaving his name as a portent even in the splendid calendar of Athenian heroes. Captain Bethune, without call or need, making his notes merely, as he tells us, from the suggestions of his own mind as he revised the proof-sheets, informs us, at the bottom of the page, that "it reminds him of the familiar lines,—

"For Widdrington I needs must wail,  
As one in doleful dumps;  
For, when his legs were smitten off,  
He fought upon his stumps."

It must not avail him, that he has but quoted from the ballad of Chevy Chase. It is the most deformed stanza\* of the modern deformed version which was composed in the eclipse of heart and taste, on the restoration of the Stuarts; and if such verses could then pass for serious poetry, they have ceased to sound in any ear as other than a burlesque; the associations which they arouse are only absurd, and they could only have continued to ring in his memory through their ludicrous doggrel.

When to these offences of the Society we add that in the long-laboured appendices and introductions which fill up valuable space, which increase the expense of the edition, and into reading which many readers are, no doubt, betrayed, we have found nothing which assists the understanding of the stories which they are supposed to illustrate; when we have found what is most uncommon passed without notice, and what is most trite and familiar encumbered with comment; we have unpacked our hearts of the bitterness which these volumes have aroused in us, and can now take our leave of them and go on with our own more grateful subject.

Elizabeth, whose despotism was as peremptory as that of the Plantagenets, and whose ideas of the English constitution were limited in the highest degree, was, notwithstanding, more beloved by her subjects than any sovereign before or since. It was because, substantially, she was the people's sovereign; because it was given to her to conduct the outgrowth of the national life through its crisis of change, and the weight of her great mind and her great place were thrown on the people's side. She was able to paralyse the dying efforts with which, if a Stuart had been on the throne, the representatives of an effete system might have made the struggle a deadly one; and the history of England is not the history of France, because the inflexible will of one person held the Reformation firm till it had rooted itself in the heart of the nation, and could not be again overthrown. The Catholic faith was no longer able to furnish standing ground on which the English or any other nation could live a manly and a godly life. Feud-

\* Here is the old stanza. Let whoever is disposed to think us too hard on Captain Bethune compare them.

"For Wetharrington my harte was wo,  
That ever he slayne sholde be:  
For when both his leggis were hewen in to,  
He knyled and fought on his knee."  
Even Percy, who, on the whole, thinks well of the modern ballad, gives up this stanza as hopeless.

alism, as a social organization, was not any more a system under which their energies could have scope to move. Thenceforward not the Catholic Church, but any man to whom God had given a heart to feel and a voice to speak, was to be the teacher to whom men were to listen; and great actions were not to remain the privilege of the families of the Norman nobles, but were to be laid within the reach of the poorest plebeian who had the stuff in him to perform them. Alone of all the sovereigns in Europe, Elizabeth saw the change which had passed over the world. She saw it, and saw it in faith, and accepted it. The England of the Catholic Hierarchy and the Norman Baron, was to cast its shell and to become the England of free thought and commerce and manufacture, which was to plough the ocean with its navies, and sow its colonies over the globe; and the first thunder birth of these enormous forces and the flash of the earliest achievements of the new era roll and glitter through the forty years of the reign of Elizabeth with a grandeur which, when once its history is written, will be seen to be among the most sublime phenomena which the earth as yet has witnessed. The work was not of her creation; the heart of the whole English nation was stirred to its depths; and Elizabeth's place was to recognise, to love, to foster, and to guide. The government originated nothing; at such a time it was neither necessary nor desirable that it should do so; but wherever expensive enterprises were on foot which promised ultimate good, but no immediate profit, we never fail to find among the lists of contributors the Queen's Majesty, Burleigh, Leicester, Walsingham. Never chary of her presence, for Elizabeth could afford to condescend, when ships were fitting for distant voyages in the river, the Queen would go down in her barge and inspect. Frobisher, who was but a poor sailor adventurer, sees her wave her handkerchief to him from the Greenwich Palace windows, and he brings her home a narwhal's horn for a present. She honoured her people, and her people loved her; and the result was that with no cost to the government, she saw them scattering the fleets of the Spaniards, planting America with colonies, and exploring the most distant seas. Either for honour or for expectation of profit, or from that unconscious necessity by which a great people, like a great man, will do what is right, and must do it at the right time, whoever had the means to furnish a ship, and whoever had the talent to command one, laid their abilities together

and went out to pioneer, and to conquer, and take possession, in the name of the Queen of the Sea. There was no nation so remote but what some one or other was found ready to undertake an expedition there in the hope of opening a trade; and let them go where they would, they were sure of Elizabeth's countenance. We find letters written by her, for the benefit of nameless adventurers, to every potentate of whom she had ever heard, to the Emperors of China, Japan, and India, the Grand Duke of Russia, the Grand Turk, the Persian Sofee, and other unheard-of Asiatic and African princes; whatever was to be done in England, or by Englishmen, Elizabeth assisted when she could, and admired when she could not. The springs of great actions are always difficult to analyse—impossible to analyse perfectly—possible to analyse only very proximately, and the force by which a man throws a good action out of himself is invisible and mystical, like that which brings out the blossom and the fruit upon the tree. The motives which we find men urging for their enterprises seem often insufficient to have prompted them to so large a daring. They did what they did from the great unrest in them which made them do it, and what it was may be best measured by the results, by the present England and America. Nevertheless, there was enough in the state of the world, and in the position of England, to have furnished abundance of conscious motive, and to have stirred the drowsiest routinier statesman.

Among material occasions for exertion, the population began to outgrow the employment, and there was a necessity for plantations to serve as an outlet. Men who, under happier circumstances, might have led decent lives, and done good service, were now driven by want to desperate courses; "Witness," as Richard Hakluyt says, "twenty tall fellows hanged last Rochester assizes for small robberies;" and there is an admirable paper addressed to the Privy Council by Christopher Carlile, Walsingham's son-in-law, pointing out the possible openings to be made in or through such plantations for home produce and manufacture.

Far below all such prudential economies and mercantile ambitions, however, lay a noble enthusiasm which in these dull days we can hardly, without an effort, realize. The life-and-death wrestle between the Reformation and the old religion had settled in the last quarter of the sixteenth century into a permanent struggle between England and Spain. France was disabled. All the

help which Elizabeth could spare barely enabled the Netherlands to defend themselves. Protestantism, if it conquered, must conquer on another field; and by the circumstances of the time the championship of the Reformed faith fell to the English sailors. The sword of Spain was forged in the gold-mines of Peru; the legions of Alva were only to be disarmed by intercepting the gold ships on their passage; and, inspired by an enthusiasm like that which four centuries before had precipitated the chivalry of Europe upon the East, the same spirit which in its present degeneracy covers our bays and rivers with pleasure yachts then fitted out armed privateers, to sweep the Atlantic, and plunder and destroy Spanish ships wherever they could meet them.

Thus, from a combination of causes, the whole force and energy of the age was directed towards the sea. The wide excitement and the greatness of the interests at stake, raised even common men above themselves; and people who in ordinary times would have been no more than mere seamen, or mere money-making merchants, appear before us with a largeness and greatness of heart and mind in which their duties to God and their country are alike clearly and broadly seen and felt to be paramount to every other.

Ordinary English traders we find fighting Spanish war ships in behalf of the Protestant faith; the cruisers of the Spanish main were full of generous eagerness for the conversion of the savage nations to Christianity; and what is even more surprising, sites for colonization were examined and scrutinized by such men in a lofty statesmanlike spirit, and a ready insight was displayed by them into the indirect effects of a wisely-extended commerce on every highest human interest.

Again, in the conflict with the Spaniards, there was a further feeling, a feeling of genuine chivalry which was spurring on the English, and one which must be well understood and well remembered, if men like Drake, and Hawkins, and Raleigh, are to be tolerably understood. One of the English Reviews, a short time ago, was much amused with a story of Drake having excommunicated a petty officer as a punishment for some moral offence; the reviewer not being able to see in Drake, as a man, anything more than a highly brave and successful buccaneer, whose pretences to religion might rank with the devotion of an Italian bandit to the Madonna. And so Hawkins, and even Raleigh, are regarded by superficial persons, who see only such outward circumstances of their history as

correspond with their own impressions. The high nature of these men, and the high objects which they pursued, will only rise out and become visible to us as we can throw ourselves back into their times and teach our hearts to feel as they felt. We do not find in the language of the voyagers themselves, or of those who lent them their help at home, any of that weak watery talk of "protection of aborigines," which as soon as it is translated into fact becomes the most active policy for their destruction, soul and body. But the stories of the dealings of the Spaniards with the conquered Indians, which were widely known in England, seem to have affected all classes of people, not with pious passive horror, but with a genuine human indignation. A thousand anecdotes in detail we find scattered up and down the pages of Hakluyt, who, with a view to make them known, translated Peter Martyr's letters; and each commonest sailor-boy who had heard them from his childhood among the tales of his father's fireside, had longed to be a man, that he might go out and become the avenger of a gallant and suffering people. A high mission, undertaken with a generous heart, seldom fails to make those worthy of it to whom it is given, and it was a point of honour, if of nothing more, among the English sailors, to do no discredit by their conduct to the greatness of their cause. The high courtesy, the chivalry of the Spanish nobles, so conspicuous in their dealings with their European rivals, either failed to touch them in their dealings with uncultivated idolators, or the high temper of the aristocracy was unable to restrain or to influence the masses of the soldiers. It would be as ungenerous as it would be untrue, to charge upon their religion the grievous actions of men who called themselves the armed missionaries of Catholicism, when the Catholic priests and bishops were the loudest in the indignation with which they denounced them. But we are obliged to charge upon it that slow and subtle influence so inevitably exercised by any religion which is divorced from life, and converted into a thing of form, or creed, or ceremony, or system, which could permit the same men to be extravagant in a sincere devotion to the Queen of Heaven, whose entire lower nature, unsubdued and unaffected, was given up to thirst of gold, and plunder, and sensuality. If religion does not make men more humane than they would be without it, it makes them fatally less so; and it is to be feared that the spirit of the pilgrim fathers, which had oscillated to the other extreme, and had again crystallized into a

formal antinomian fanaticism, reproduced the same fatal results as those in which the Spaniards had set them their unworthy precedent. But the Elizabethan navigators, full without exception of large kindness, wisdom, gentleness, and beauty, bear names untainted, as far as we know, with a single crime against the savages; and the name of England was as famous in the Indian seas as that of Spain was infamous. On the banks of the Oronooko there was remembered for a hundred years the noble captain who had come there from the great Queen beyond the seas; and Raleigh speaks the language of the heart of his country, when he urges the English statesmen to colonize Guiana, and exults in the glorious hope of driving the white marauder into the Pacific, and restoring the Incas to the throne of Peru.

“Who will not be persuaded,” he says, “that now at length the great Judge of the world hath heard the sighs, groans, and lamentations, hath seen the tears and blood of so many millions of innocent men, women, and children, afflicted, robbed, reviled, branded with hot irons, roasted, dismembered, mangled, stabbed, whipped, racked, scalded with hot oil, put to the strappado, ripped alive, beheaded in sport, drowned, dashed against the rocks, famished, devoured by mastiffs, burned, and by infinite cruelties consumed, and purposeth to scourge and plague that cursed nation, and to take the yoke of servitude from that distressed people, as free by nature as any Christian.”

Poor Raleigh! if peace and comfort in this world were of much importance to him, it was in an ill day that he provoked the revenge of Spain. The strength of England was needed at the moment at its own door; the Armada came, and there was no means of executing such an enterprise. And afterwards the throne of Elizabeth was filled by a Stuart, and Guiana was to be no scene of glory for Raleigh; but, as later historians are pleased to think, it was the grave of his reputation.

But the hope burned clear in him through all the weary years of unjust imprisonment; and when he was a gray-headed old man, the base son of a bad mother used it to betray him. The success of his last enterprise was made the condition under which he was to be pardoned for a crime which he had not committed; and its success depended, as he knew, on its being kept secret from the Spaniards. James required of him on his allegiance a detail of what he proposed, giving him at the same time his word as a king that the secret should be safe with him, and the next day it was sweeping out of the port of London in the swiftest of the Spanish ships, with private orders to the

Governor of St. Thomas to provoke a collision when Raleigh should arrive there, which should afterwards cost him his heart's blood.

We modern readers may run rapidly over the series of epithets under which he has catalogued the Indian sufferings, hoping that they are exaggerated, seeing that they are horrible, and closing our eyes against them with swiftest haste; but it was not so when every epithet suggested a hundred familiar facts; and some of these (not resting on English prejudice, but on sad Spanish evidence, which is too full of shame and sorrow to be suspected) shall be given in this place, however old a story it may be thought; because, as we said above, it is impossible to understand the actions of these men, unless we are familiar with the feelings of which their hearts were full.

The massacres under Cortez and Pizarro, terrible as they were, were not the occasion which stirred the deepest indignation. They had the excuse of what might be called, for want of a better word, necessity, and of the desperate position of small bands of men in the midst of enemies who might be counted by millions. And in De Soto, when he burnt his guides in Florida (it was his practice when there was danger of treachery, that those who were left alive might take warning); or in Vasco Nunnez, praying to the Virgin on the mountains of Darien, and going down from off them into the valleys to hunt the Indian caciques, and fling them alive to his bloodhounds; there was, at least, with all this fierceness and cruelty, a desperate courage which we cannot refuse to admire, and which mingles with and corrects our horror. It is the refinement of the Spaniards' cruelty in the settled and conquered provinces, excused by no danger and provoked by no resistance, the details of which witness to the infernal coolness with which it was perpetrated; and the great bearing of the Indians themselves under an oppression which they despaired of resisting, which raises the whole history to the rank of a world-wide tragedy, in which the nobler but weaker nature was crushed under a malignant force which was stronger and yet meaner than itself. Gold hunting and lust were the two passions for which the Spaniards cared; and the fate of the Indian women was only more dreadful than that of the men, who were ganged and chained to a labour in the mines which was only to cease with their lives, in a land where but a little before they had lived a free contented people, more innocent of crime than perhaps any people upon earth. If we can conceive what our own feelings would be, if, in the “development of the mammalia” some

baser but more powerful race than man were to appear upon this planet, and we and our wives and children at our own happy firesides were degraded from our freedom, and became to them what the lower animals are to us, we can perhaps realize the feelings of the enslaved nations of Espanola.

As a harsh justification of slavery, it is sometimes urged, that men who do not deserve to be slaves will prefer death to the endurance of it; and that if they prize their liberty, it is always in their power to assert it in the old Roman fashion. Tried even by so hard a rule, the Indians vindicated their right, and before the close of the sixteenth century, the entire group of the Western Islands in the hands of the Spaniards, containing, when Columbus discovered them, many millions of inhabitants, were left literally desolate from suicide. Of the anecdotes of this terrible self-immolation, as they were then known in England, here are a few out of many.

The first is simple, and a specimen of the ordinary method. A Yucatan cacique, who was forced with his old subjects to labour in the mines, at last "calling those miners into an house, to the number of ninety-five, he thus debateth with them :"—

"My worthy companions and friends, why desire we to live any longer under so cruel a servitude? Let us now go unto the perpetual seat of our ancestors, for we shall there have rest from those intolerable cares and grievances which we endure under the subjection of the unthankful. Go ye before, I will presently follow you.' Having so spoken, he held out whole handfuls of those leaves which take away life, prepared for the purpose, and giving every one part thereof, being kindled to suck up the fume; who obeyed his command, the king and his chief kinsmen reserving the last place for themselves."

We speak of the crime of suicide, but few persons will see a crime in this sad and stately leave-taking of a life which it was no longer possible to bear with unbroken hearts. We do not envy the Indian, who, with Spaniards before him as an evidence of the fruits which their creed brought forth, deliberately exchanged for it the old religion of his country, which could sustain him in an action of such melancholy grandeur. But the Indians did not always reply to their oppressors with escaping passively beyond their hands. Here is a story with matter in it for as rich a tragedy as *Œdipus* or *Agamemnon*; and in its stern and tremendous features, more nearly resembling them than any which were conceived even by Shakespeare.

An officer named Orlando had taken the

daughter of a Cuban cacique to be his mistress. She was with child by him, but, suspecting her of being engaged in some other intrigue, he had her fastened to two wooden spits, not intending to kill her, but to terrify her; and setting her before the fire, he ordered that she should be turned by the servants of the kitchen.

"The maiden, stricken with fear through the cruelty thereof, and strange kind of torment, presently gave up the ghost. The cacique her father, understanding the matter, took thirty of his men and went to the house of the captain, who was then absent, and slew his wife, whom he had married after that wicked act committed, and the women who were companions of the wife, and her servants every one. Then shutting the door of the house, and putting fire under it, he burnt himself and all his companions that assisted him, together with the captain's dead family and goods."

This is no fiction or poet's romance. It is a tale of wrath and revenge, which in sober dreadful truth enacted itself upon this earth, and remains among the eternal records of the doings of mankind upon it. As some relief to its most terrible features, we follow it with a story which has a touch in it of diabolic humour.

The slave-owners finding their slaves escaping thus unprosperously out of their grasp, set themselves to find a remedy for so desperate a disease, and were swift to avail themselves of any weakness, mental or bodily, through which to retain them in life. One of these proprietors being informed that a number of his people intended to kill themselves on a certain day, at a particular spot, and knowing by experience that they were too likely to do it, presented himself there at the time which had been fixed upon, and telling the Indians when they arrived, that he knew their intention, and that it was vain for them to attempt to keep anything a secret for him, he ended with saying, that he had come there to kill himself with them; that as he had used them ill in this world, he might use them worse in the next; "with which he did dissuade them presently from their purpose." With what efficacy such believers in the immortality of the soul were likely to recommend either their faith or their God; rather, how terribly all the devotion and all the earnestness with which the poor priests who followed in the wake of the conquerors laboured to recommend it were shamed and paralysed, they themselves too bitterly lament. It was idle to send out governor after governor with orders to stay such practices. They had but to arrive on the scenes to become infected with the same fever, or

if any remnant of Castilian honour, or any faintest echoes of the faith which they professed, still flickered in a few of the best and noblest, they could but look on with folded hands in ineffectual mourning; they could do nothing without soldiers, and the soldiers were the worst offenders. Hispaniola became a mere desert; the gold was in the mines, and there were no poor slaves left remaining to extract it. One means which the Spaniards dared to employ to supply the vacancy, brought about an incident which in its piteous pathos exceeds any story we have ever heard. Crimes and criminals are swept away by time, nature finds an antidote for their poison, and they and their ill consequences alike are blotted out and perish. If we do not forgive them, at least we cease to hate them, as it grows more clear to us that they injured none so deeply as themselves. But the *θηριώδης μαχία*, the enormous wickedness by which Humanity itself has been outraged and disgraced, we cannot forgive, we cannot cease to hate that; the years roll away, but the tints of it remain on the pages of history, deep and horrible as the day on which they were entered there.

“When the Spaniards understood the simple opinion of the Yucaian islanders concerning the souls of their departed, which, after their sins purged in the cold northern mountains should pass into the south, to the intent that, leaving their own country of their own accord, they might suffer themselves to be brought to Hispaniola, they did persuade those poor wretches, that they came from those places where they should see their parents and children, and all their kindred and friends that were dead, and should enjoy all kinds of delights with the embraces and fruition of all beloved things. And they, being infected and possessed with these crafty and subtle imaginations, singing and rejoicing left their country, and followed vain and idle hope. But when they saw that they were deceived, and neither met their parents nor any that they desired, but were compelled to undergo grievous sovereignty and command, and to endure cruel and extreme labour, they either slew themselves, or, choosing to famish, gave up their fair spirits, being persuaded by no reason or violence to take food. So these miserable Yucaians came to their end.”

It was once more as it was in the days of the apostles. The New World was first offered to the holders of the old traditions. They were the husbandmen first chosen for the new vineyard, and blood and desolation were the only fruits which they reared upon it. In their hands it was becoming a kingdom not of God, but of the devil, and a sentence of blight went out against them and against their works. How fatally it

has worked, let modern Spain and Spanish America bear witness. We need not follow further the history of their dealings with the Indians. For their colonies, a fatality appears to have followed all attempts at Catholic colonization. Like shoots from an old decaying tree which no skill and no care can rear, they were planted, and for a while they might seem to grow; but their life was never more than a lingering death, a failure, which to a thinking person would outweigh in the arguments against Catholicism whole libraries of faultless *catenas*, and a *consensus patrum* unbroken through fifteen centuries for the supremacy of St. Peter.

There is no occasion to look for superstitious causes to explain it. The Catholic faith had ceased to be the faith of the large mass of earnest thinking capable persons; and to those who can best do the work, all work in this world sooner or later is committed. America was the natural home for Protestants; persecuted at home, they sought a place where they might worship God in their own way, without danger of stake or gibbet, and the French Huguenots, as afterwards the English Puritans, early found their way there. The fate of a party of Coligny's people, who had gone out as settlers, shall be the last of these stories, illustrating, as it does in the highest degree, the wrath and fury with which the passions on both sides were boiling. A certain John Ribault, with about 400 companions, had emigrated to Florida. They were quiet, inoffensive people, and lived in peace there several years, cultivating the soil, building villages, and on the best possible terms with the natives. Spain was at the time at peace with France; we are, therefore, to suppose that it was in pursuance of the great crusade, in which they might feel secure of the secret, if not the confessed, sympathy of the Guises, that a powerful Spanish fleet bore down upon this settlement. The French made no resistance, and they were seized and flayed alive, and their bodies hung out upon the trees, with an inscription suspended over them, “Not as Frenchmen, but as heretics.” At Paris all was sweetness and silence. The settlement was tranquilly surrendered to the same men who had made it the scene of their atrocity; and two years later, 500 of the very Spaniards who had been most active in the murder were living there in peaceable possession, in two forts which their relation with the natives had obliged them to build. It was well that there were other Frenchmen living, of whose consciences the Court had not the keeping, and who were able on emergencies to do

what was right without consulting it. A certain privateer named Doinique de Gourges, secretly armed and equipped a vessel at Rochelle, and, stealing across the Atlantic and in two days collecting a strong party of Indians, he came down suddenly upon the forts, and taking them by storm, slew or afterwards hanged every man he found there, leaving their bodies on the trees on which they had hanged the Huguenots, with their own inscription reversed against them, "Not as Spaniards, but as murderers." For which exploit, well deserving of all honest men's praise, Dominique de Gourges had to fly his country for his life; and, coming to England, was received with honourable welcome by Elizabeth.

It was at such a time, and to take their part amidst such scenes as these, that the English navigators appeared along the shores of South America, as the armed soldiers of the Reformation, and as the avengers of humanity; and as their enterprise was grand and lofty, so was the manner in which they bore themselves in all ways worthy of it. They were no nation of saints, in the modern sentimental sense of that word; they were prompt, stern men—more ready ever to strike an enemy than to parley with him; and private adventurers as they all were, it was natural enough that private foolishness and private badness should be found among them as among other mortals. Every Englishman who had the means was at liberty to fit out a ship or ships, and if he could produce tolerable vouchers for himself, received at once a commission from the Court. The battles of England were fought by her children, at their own risk and cost, and they were at liberty to repay themselves the expense of their expeditions by plundering at the cost of the national enemy. Thus, of course, in a mixed world, there were found mixed marauding crews of scoundrels, who played the game which a century later was played with such effect by the pirates of Tortuga. But we have to remark, first, that such stories are singularly rare; and then, that the victims are never the Indians, never any but the Spaniards or the French, when the English were at war with them; and, on the whole, the conduct and character of the English sailors, considering what they were and the work which they were set to do, present us all through that age with such a picture of gallantry, disinterestedness, and high heroic energy, as has never been over-matched; the more remarkable, as it was the fruit of no drill or discipline, no tradition, no system, no organized training, but was

the free native growth of a noble virgin soil.

Before starting on an expedition, it was usual for the crew and the officers to meet and arrange among themselves a series of articles of conduct, to which they bound themselves by a formal agreement, the entire body itself undertaking to see to their observance. It is quite possible that strong religious profession, and even sincere profession, might be accompanied, as it was in the Spaniards, with everything most detestable. It is not sufficient of itself to prove that their actions would correspond with it, but it is one among a number of evidences; and, coming, as they come before us, with hands clear of any blood but of fair and open enemies, these articles may pass at least as indications of what they were.

Here we have a few instances—

Hawkins's ship's company was, as he himself informs us, an unusually loose one. Nevertheless, we find them "gathered together every morning and evening to serve God;" and a fire on board, which only Hawkins's presence of mind prevented from destroying ship and crew together, was made use of by the men as an occasion to banish swearing out of the ship.

"With a general consent of all our company, it was ordained that there should be a palmer or ferula which should be in the keeping of him who was taken with an oath; and that he who had the palmer should give to every one that he took swearing, a palmada with it and the ferula; and whosoever at the time of evening or morning prayer was found to have the palmer, should have three blows given him by the captain or the master; and that he should still be bound to free himself by taking another, or else to run in danger of continuing the penalty, which, being executed a few days, reformed the vice, so that in three days together was not one oath heard to be sworn."

The regulations for Luke Fox's voyage commence thus:—

"For as much as the good success and prosperity of every action doth consist in the due service and glorifying of God, knowing that not only our being and preservation, but the prosperity of all our actions and enterprises do immediately depend on His Almighty goodness and mercy; it is provided—

"First, that all the company, as well officers as others, shall duly repair every day twice at the call of the bell to hear public prayers to be read, such as are authorized by the church, and that in a godly and devout manner, as good Christians ought.

"Secondly, that no man shall swear by the name of God, or use any profane oath, or blaspheme His holy name."

To symptoms such as these, we cannot but attach a very different value when they are the spontaneous growth of common minds, unstimulated by sense of propriety or rules of the service, or other official influence lay or ecclesiastic, from what we attach to the somewhat similar ceremonials in which, among persons whose position is conspicuous, important enterprises are now and then inaugurated.

We have said as much as we intend to say of the treatment by the Spaniards of the Indian women. Sir Walter Raleigh is commonly represented by historians as rather defective, if he was remarkable at all, on the moral side of his character. Yet Raleigh can declare proudly, that all the time he was on the *Oronoko*, "neither by force nor other means had any of his men intercourse with any woman there;" and the narrator of the incidents of Raleigh's last voyage acquaints his correspondent "with some particulars touching the government of the fleet, which, although other men in their voyages doubtless in some measure observed, yet in all the great volumes which have been written touching voyages, there is no precedent of so godly severe and martial government, which not only in itself is laudable and worthy of imitation, but is also fit to be written and engraven on every man's soul that coveteth to do honour to his country."

Once more, the modern theory of Drake is, as we said above, that he was a gentleman-like pirate on a large scale, who is indebted for the place which he fills in history to the indistinct ideas of right and wrong prevailing in the unlightened age in which he lived, and who therefore demands all the toleration of our own enlarged humanity to allow him to remain there. Let us see how the following incident can be made to coincide with this hypothesis:—

A few days after clearing the channel on his first great voyage, he fell in with a small Spanish ship, which he took for a prize. He committed the care of it to a certain Mr. Doughtie, a person much trusted by, and personally very dear to him, and this second vessel was to follow him as a tender.

In dangerous expeditions into unknown seas, a second smaller ship was often indispensable to success; but many finely intended enterprises were ruined by the cowardice of the officers to whom such ships were entrusted; who shrank as danger thickened, and again and again took advantage of darkness or heavy weather to make sail for England and forsake their commander. Hawkins twice suffered in

this way; so did Sir Humfrey Gilbert; and, although Drake's own kind feeling for his old friend has prevented him from leaving an exact account of his offence, we gather from the scattered hints which are let fall, that he, too, was meditating a similar piece of treason. However, it may or may not have been thus. But when at Port St. Julien, "our General," says one of the crew,—

"Began to inquire diligently of the actions of Mr. Thomas Doughtie, and found them not to be such as he looked for, but tending rather to contention or mutiny, or some other disorder, whereby, without redresse, the success of the voyage might greatly have been hazarded. Whereupon the company was called together and made acquainted with the particulars of the cause, which were found, partly by Mr. Doughtie's own confession, and partly by the evidence of the fact, to be true, which, when our General saw, although his private affection to Mr. Doughtie (as he then, in the presence of us all, sacredly protested) was great, yet the care which he had of the state of the voyage, of the expectation of Her Majesty, and of the honour of his country, did more touch him, as indeed it ought, than the private respect of one man; so that the cause being thoroughly heard, and all things done in good order as near as might be to the course of our law in England, it was concluded that Mr. Doughtie should receive punishment according to the quality of the offence. And he, seeing no remedy but patience for himself, desired before his death to receive the communion, which he did at the hands of Mr. Fletcher, our minister, and our General himself accompanied him in that holy action, which, being done, and the place of execution made ready, he, having embraced our General, and taken leave of all the company, with prayers for the Queen's Majesty and our realm, in quiet sort laid his head to the block, where he ended his life. This being done, our General made divers speeches to the whole company, persuading us to unity, obedience, love, and regard of our voyage, and for the better confirmation thereof, willed every man the next Sunday following to prepare himself to receive the communion, as Christian brethren and friends ought to do, which was done in very reverent sort, and so with good contentment every man went about his business."

The simple majesty of this anecdote can gain nothing from any comment which we might offer upon it. The crew of a common English ship, organizing of their own free motion on that wild shore a judgment hall more grand and awful than any most elaborate law court, with its ermine and black cap, and robes of ceremony for mind as well as body, is not to be reconciled with the pirate theory, which we may as well henceforth put away from us.

Of such stuff were the early English navigators; we are reaping the magnificent

harvest of their great heroism ; and we may see once more in their history and in what has arisen out of it, that on these deep moral foundations, and on none others, enduring prosperities of what kind soever, politic or religious, material or spiritual, are alone in this divinely governed world permitted to base themselves and grow. Wherever we find them they are still the same. In the courts of Japan or of China, fighting Spaniards in the Pacific, or prisoners among the Algerines, founding colonies which by and by were to grow into enormous transatlantic republics, or exploring in crazy pinnaces the fierce latitudes of the Polar seas, they are the same indomitable God-fearing men whose life was one great liturgy. "The ice was strong, but God was stronger," says one of Frobisher's men, after grinding a night and a day among the icebergs, not waiting for God to come down and split them, but toiling through the long hours, himself and the rest fending off the vessel with poles and planks, with death glaring at them out of the ice rocks, and so saving themselves and it. Icebergs were strong, Spaniards were strong, and storms, and corsairs, and rocks, and reefs, which no chart had then noted—they were all strong, but God was stronger, and that was all which they cared to know.

Out of the vast number it is difficult to make wise selections, but the attention floats loosely over generalities, and only individual men can seize it and hold it fast. We shall attempt to bring our readers face to face with some of these men ; not, of course, to write their biographies, but to sketch the details of a few scenes, in the hope that they may tempt those under whose eyes they may fall to look for themselves to complete the perfect figure.

Some two miles above the port of Dartmouth, once among the most important harbours in England, on a projecting angle of land which runs out into the river at the head of one of its most beautiful reaches, there has stood for some centuries the Manor House of Greenaway. The water runs deep all the way to it from the sea, and the largest vessels may ride in safety within a stone's throw of the windows. In the latter half of the sixteenth century there must have met, in the hall of this mansion, a party as remarkable as could have been found anywhere in England. Humfrey and Adrian Gilbert, with their half brother, Walter Raleigh, here, when little boys, played at sailors in the reaches of Long Stream ; in the summer evenings doubtless rowing down with the tide to the port, and wondering at the quaint figure-heads and

carved prows of the ships which thronged it ; or climbing on board, and listening with hearts beating to the mariners' tales of the new earth beyond the sunset ; and here in later life, matured men, whose boyish dreams had become heroic action, they used again to meet in the intervals of quiet, and the rock is shown underneath the house where Raleigh smoked the first tobacco. Another remarkable man, of whom we shall presently speak more closely, could not fail to have made a fourth at these meetings. A sailor boy of Sandwich, the adjoining parish, John Davis, showed early a genius which could not have escaped the eye of such neighbours, and in the atmosphere of Greenaway he learned to be as noble as the Gilberts, and as tender and delicate as Raleigh. Of this party, for the present we confine ourselves to the host and owner, Humfrey Gilbert, knighted afterwards by Elizabeth. Led by the scenes of his childhood to the sea and to sea adventures, and afterwards, as his mind unfolded, to study his profession scientifically, we find him as soon as he was old enough to think for himself, or make others listen to him, "amending the great errors of naval sea cards, whose common fault is to make the degree of longitude in every latitude of one common bigness ;" inventing instruments for taking observations, studying the form of the earth, and convincing himself that there was a northwest passage, and studying the necessities of his country, and discovering the remedies for them in colonization and extended markets for home manufactures, and insisting with so much loudness on these important matters that they reached the all-attentive ears of Walsingham, and through Walsingham were conveyed to the Queen. Gilbert was examined before the Queen's Majesty and the Privy Council, the record of which examination he has himself left to us in a paper which he afterwards drew up, and strange enough reading it is. The most admirable conclusions stand side by side with the wildest conjectures ; and invaluable practical discoveries, among imaginations at which all our love for him cannot hinder us from smiling : the whole of it from first to last saturated through and through with his inborn nobility of nature.

Homer and Aristotle are pressed into service to prove that the ocean runs round the three old continents, and America, therefore, is necessarily an island. The gulf stream, which he had carefully observed, eked out by a theory of the *primum mobile*, is made to demonstrate a channel to the north, corresponding to Magellan's

Straits in the south, he believing, in common with almost every one of his day, that these straits were the only opening into the Pacific, the land to the south being unbroken to the Pole. He prophesies a market in the East for our manufactured linen and calicoes:—

"The Easterns greatly prizing the same, as appeareth in Hester, where the pomp is expressed of the great King of India, Ahasuerus, who matched the coloured clothes wherewith his houses and tents were apparelled, with gold and silver, as part of his greatest treasure."

These and other such arguments were the best analysis which Sir Humfrey had to offer of the spirit which he felt to be working in him. We may think what we please of them. But we can have but one thought of the great grand words with which the memorial concludes, and they alone would explain the love which Elizabeth bore him:—

"Never, therefore, mislike with me for taking in hand any laudable and honest enterprise, for if through pleasure or idleness we purchase shame, the pleasure vanisheth, but the shame abideth for ever.

"Give me leave, therefore, without offence, always to live and die in this mind: that he is not worthy to live at all that, for fear or danger of death, shunneth his country's service and his own honour, seeing that death is inevitable and the fame of virtue immortal, wherefore in this behalf *mutare vel timere sperno.*"

Two voyages which he undertook at his own cost, which shattered his fortune, and failed, as they naturally might, since inefficient help or mutiny of subordinates, or other disorders, are inevitable conditions under which more or less great men must be content to see their great thoughts mutilated by the feebleness of their instruments, did not dishearten him, and in June, 1583, a last fleet of five ships sailed from the port of Dartmouth, with commission from the Queen to discover and take possession from latitude 45° to 50° north—a voyage not a little noteworthy, there being planted in the course of it the first English colony west of the Atlantic. Elizabeth had a foreboding that she would never see him again. She sent him a jewel as a last token of her favour, and she desired Raleigh to have his picture taken before he went.

The history of the voyage was written by a Mr. Edward Hayes, of Dartmouth, one of the principal actors in it, and as a composition it is more remarkable for fine writing than any very commendable thought in the author of it. But Sir Humfrey's

nature shines through the infirmity of his chronicler; and in the end, indeed, Mr. Hayes himself is subdued into a better mind. He had lost money by the voyage, and we will hope his higher nature was only under a temporary eclipse. The fleet consisted (it is well to observe the ships and the size of them) of the *Delight*, 120 tons; the barque *Raleigh*, 200 tons (this ship deserted off the Land's End); the *Golden Hinde* and the *Swallow*, 40 tons each; and the *Squirrel*, which was called the frigate, 10 tons. For the uninitiated in such matters, we may add, that if in a vessel the size of the last, a member of the Yacht Club would consider that he had earned a club-room immortality if he had ventured a run in the depth of summer from Cowes to the Channel Islands.

"We were in all," says Mr. Hayes, "260 men, among whom we had of every faculty good choice. Besides, for solace of our own people, and allurements of the savages, we were provided of music in good variety, not omitting the least toys, as morris dancers, hobby horses, and May-like conceits to delight the savage people."

The expedition reached Newfoundland without accident. St. Johns was taken possession of and a colony left there, and Sir Humfrey then set out exploring along the American coast to the south; he himself doing all the work in his little 10-ton cutter, the service being too dangerous for the larger vessels to venture on. One of these had remained at St. Johns. He was now accompanied only by the *Delight* and the *Golden Hinde*, and these two keeping as near the shore as they dared, he spent what remained of the summer, examining every creek and bay, marking the soundings, taking the bearings of the possible harbours, and risking his life, as every hour he was obliged to risk it in such a service, in thus leading, as it were, the forlorn hope in the conquest of the New World. How dangerous it was we shall presently see. It was towards the end of August.

"The evening was fair and pleasant, yet not without token of storm to ensue, and most part of this Wednesday night, like the swan that singeth before her death, they in the *Delight* continued in sounding of drums and trumpets and fifes, also winding the cornets and haughtboys, and in the end of their jollity left with the battell and ringing of doleful knells."

Two days after came the storm; the *Delight* struck upon a bank and went down in sight of the other vessels, which were unable to render her any help. Sir Hum-

frey's papers, among other things, were all lost in her; at the time considered by him an irreparable loss. But it was little matter; he was never to need them. The *Golden Hinde* and the *Squirrel* were now left alone of the five ships. The provisions were running short, and the summer season was closing. Both crews were on short allowance; and with much difficulty Sir Humfrey was prevailed upon to be satisfied for the present with what he had done, and to lay off for England.

"So upon Saturday, in the afternoon, the 31st of August, we changed our course, and returned back for England, at which very instant, even in winding about, there passed along between us and the land, which we now forsook, a very lion to our seeming in shape, hair, and colour; not swimming after the manner of a beast by moving of his feet, but rather sliding upon the water with his whole body, except his legs, in sight, neither yet diving under and again rising as the manner is of whales, porpoises, and other fish, but confidently showing himself without hiding, notwithstanding that we presented ourselves in open view and gesture to amaze him. Thus he passed along, turning his head to and fro, yawning and gaping wide, with ugly demonstration of long teeth and glaring eyes; and to bidde us farewell, coming right against the *Hinde*, he sent forth a horrible voice, roaring and bellowing as doth a lion, which spectacle we all beheld so far as we were able to discern the same, as men prone to wonder at every strange thing. What opinion others had thereof, and chiefly the General himself, I forbear to deliver. But he took it for *Bonum Omen*, rejoicing that he was to war against such an enemy if it were the devil."

We have no doubt that he did think it was the devil; men in those days believing really that evil was more than a principle or a necessary accident, and that in all their labour for God and for right, they must make their account to have to fight with the devil in his proper person. But if we are to call it superstition, and if this were no devil in the form of a roaring lion, but a mere great seal or sea lion, it is a more innocent superstition to impersonate so real a power, and it requires a bolder heart to rise up against it and defy it in its living terror, than to sublimate it away into a philosophical principle, and to forget to battle with it in speculating on its origin and nature. But to follow the brave Sir Humfrey, whose work of fighting with the devil was now over, and who was passing to his reward. The 2nd of September the General came on board the *Golden Hinde* "to make merry with us." He greatly deplored the loss of his book and papers; and Mr. Hayes considered that the loss of manuscripts could not be so very distressing, and that there

must have been something behind, certain gold ore, for instance, which had perished also—considerations not perhaps of particular value. He was full of confidence from what he had seen, and talked with all eagerness and warmth of the new expedition for the following spring. Apocryphal gold-mines still occupying the minds of Mr. Hayes and others, who were persuaded that Sir Humfrey was keeping to himself some such discovery which he had secretly made, they tried hard to extract it from him. They could make nothing, however, of his odd ironical answers, and their sorrow at the catastrophe which followed is sadly blended with disappointment that such a secret should have perished. Sir Humfrey doubtless saw America with other eyes than theirs, and gold-mines richer than California in its huge rivers and savannahs.

"Leaving the issue of this good hope (about the gold)," continues Mr. Hayes, "to God who only knoweth the truth thereof, I will hasten to the end of this tragedy, which must be knit up in the person of our General, and as it was God's ordinance upon him, even so the vehement persuasion of his friends could nothing avail to divert him from his wilful resolution of going in his frigate; and when he was entreated by the captain, master, and others, his well-wishers in the *Hinde*, not to venture, this was his answer—'I will not forsake my little company going homeward, with whom I have passed so many storms and perils.'"

Albeit, thinks the writer, who is unable to comprehend such high gallantry, there must have been something on his mind of what the world would say of him, "and it was rather rashness than advised resolution to prefer the wind of a vain report to the weight of his own life," for the writing of which sentence we will trust the author, either in this world or the other, has before this done due penance and repented of it.

Two-thirds of the way home they met foul weather and terrible seas, "breaking short and pyramid-wise." Men who had all their lives "occupied the sea" had never seen it more outrageous. "We had also upon our mainyard an apparition of a little fire by night, which seamen do call *Castor and Pollux*."

"Monday, the ninth of September, in the afternoon, the frigate was near cast away oppressed by waves, but at that time recovered, and giving forth signs of joy, the General, sitting abaft with a book in his hand, cried out unto us in the *Hinde* so often as we did approach within hearing, 'We are as near to heaven by sea as by land,' reiterating the same speech, well becoming a soldier resolute in Jesus Christ, as I can testify that he was. The same Monday night,

about twelve of the clock, or not long after, the frigate being a-head of us in the *Golden Hinde*, suddenly her lights were out, whereof as it were in a moment we lost the sight; and withal our watch cried, 'The General was cast away,' which was too true."

*So stirbt ein Held.* It was a fine end for a mortal man. We will not call it sad or tragic, but heroic and sublime; and if our eyes water as we write it down, it is not with sorrow, but with joy and pride.

"Thus faithfully," concludes Mr. Hayes (in some degree rising above himself), "I have related this story, wherein some spark of the knight's virtues, though he be extinguished, may happily appear; he remaining resolute to a purpose honest and godly as was this, to discover, possess, and reduce unto the service of God and Christian piety, those remote and heathen countries of America. Such is the infinite bounty of God, who from every evil deriveth good, that fruit may grow in time of our travelling in these North-Western lands (as has it not grown?), and the crosses, turmoils, and afflictions, both in the preparation and execution of the voyage, did correct the intemperate humours which before we noted to be in this gentleman, and made unsavoury and less delightful his other manifold virtues.

"Thus as he was refined and made nearer unto the image of God, so it pleased the Divine will to resume him unto himself, whither both his and every other high and noble mind have always aspired."

Such was Sir Humfrey Gilbert; we know but little more of him, and we can only conjecture that he was still in the prime of his years when the Atlantic swallowed him. Like the gleam of a landscape lit suddenly for a moment by the lightning, these few scenes flash down to us across the centuries; but what a life must that have been of which this was the conclusion. He was one of a race which have ceased to be. We look round for them, and we can hardly believe that the same blood is flowing in our veins. Brave we may still be, and strong perhaps as they, but the high moral grace which made bravery and strength so beautiful is departed from us for ever.

Our space is sadly limited for historical portrait painting; but we must find room for another of that Greenaway party whose nature was as fine as that of Gilbert, and who intellectually was more largely gifted. The latter was drowned in 1583. In 1585 John Davis left Dartmouth on his first voyage into the Polar seas; and twice subsequently he went again, venturing in small ill-equipped vessels of thirty or forty tons into the most dangerous seas. These voyages were as remarkable for their success

as for the daring with which they were accomplished, and Davis's epitaph is written on the map of the world, where his name still remains to commemorate his discoveries. Brave as he was, he is distinguished by a peculiar and exquisite sweetness of nature, which, from many little facts of his life, seems to have affected every one with whom he came in contact in a remarkable degree. We find men, for the love of Master Davis, leaving their firesides to sail with him, without other hope or motion; and silver bullets were cast to shoot him in a mutiny; the hard rude natures of the mutineers being awed by something in his carriage which was not like that of a common man. He has written the account of one of his northern voyages himself; one of those, by the by, which the Hakluyt Society have mutilated; and there is an imaginative beauty in it, and a rich delicacy of expression, which is a true natural poetry, called out in him by the first sight of strange lands and things and people.

To show what he was, we should have preferred, if possible, to have taken the story of his expedition into the South Seas, in which, under circumstances of singular difficulty, he was deserted by Candish, under whom he had sailed; and after inconceivable trials, from famine, mutiny, and storm, ultimately saved himself and his ship, and such of the crew as had chosen to submit to his orders. But it is a long history, and will not admit of being mutilated. As an instance of the stuff of which it was composed, he ran back in the black night in a gale of wind through the Straits of Magellan, by a chart which he had made with the eye in passing up. His anchors were lost or broken; the cables were parted. He could not bring up the ship; there was nothing for it but to run, and he carried her safe through along a channel often not three miles broad, sixty miles from end to end, and twisting like the reaches of a river. For the present, however, we are forced to content ourselves with a few sketches out of the north-west voyages. Here is one, for instance, which shows how an Englishman could deal with the Indians. Davis had landed at Gilbert's Sound, and gone up the country exploring. On his return, he found his crew loud in complaints of the thievish propensities of the natives, and urgent to have an example made of some of them. On the next occasion he fired a gun at them with blank cartridge; but their nature was still too strong for them.

"Seeing iron," he says, "they could in no case forbear stealing; which, when I perceived, it did

but minister to me occasion of laughter to see their simplicity, and I willed that they should not be hardly used, but that our company should be more diligent to keep their things, supposing it to be very hard in so short a time to make them know their evils."

In his own way, however, he took an opportunity of administering a lesson to them of a more wholesome kind than could be given with gunpowder and bullets. Like the rest of his countrymen, he believed the savage Indians in their idolatries to be worshippers of the devil. "They are witches," he says; "they have images in great store, and use many kinds of enchantments." And these enchantments they tried on one occasion to put in force against himself and his crew.

"Being on shore on the 4th day of July, one of them made a long oration, and then kindled a fire, into which with many strange words and gestures he put divers things, which we supposed to be a sacrifice. Myself and certain of my company standing by, they desired us to go into the smoke. I desired them to go into the smoke, which they would by no means do. I then took one of them and thrust him into the smoke, and willed one of my company to tread out the fire, and spurn it into the sea, which was done to show them that we did condemn their sorceries."

It is a very English story—exactly what a modern Englishman would do; only, perhaps, not believing that there was any real devil in the case, which makes a difference. However, real or not real, after seeing him patiently put up with such an injury, we will hope the poor Greenlander had less respect for him than formerly.

Leaving Gilbert's Sound, Davis went on to the north-west, and in lat. 63° fell in with a barrier of ice, which he coasted for thirteen days without finding an opening. The very sight of an iceberg was new to all his crew; and the ropes and shrouds, though it was midsummer, becoming compassed with ice,—

"The people began to fall sick and faint-hearted—whereupon, very orderly, with good discretion, they entreated me to regard the safety of mine own life, as well as the preservation of theirs; and that I should not, through overboldness, leave their widows and fatherless children to give me bitter curses.

"Whereupon, seeking counsel of God, it pleased His Divine Majesty to move my heart to prosecute that which I hope shall be to His glory, and to the contentation of every Christian mind."

He had two vessels, one of some burthen, the other a pinnacle of thirty tons. The result of the counsel which he had sought was, that he made over his own large vessel

to such as wished to return, and himself, "thinking it better to die with honour than to return with infamy," went on, with such volunteers as would follow him, in a poor leaky cutter, up the sea now called Davis's Straits, in commemoration of that adventure, 4° north of the furthest known point, among storms and icebergs, by which the long days and twilight nights alone saved him from being destroyed, and, coasting back along the American shore, discovered Hudson's Straits, supposed then to be the long-desired entrance into the Pacific. This exploit drew the attention of Walsingham, and by him Davis was presented to Burleigh, "who was also pleased to show him great encouragement." If either these statesmen or Elizabeth had been twenty years younger, his name would have filled a larger space in history than a small corner of the map of the world; but if he was employed at all in the last years of the century, no *vates sacer* has been found to celebrate his work, and no clue is left to guide us. He disappears; a cloud falls over him. He is known to have commanded trading vessels in the Eastern seas, and to have returned five times from India. But the details are all lost, and accident has only parted the clouds for a moment to show us the mournful setting with which he, too, went down upon the sea.

In taking out Sir Edward Michellthorne to India in 1604, he fell in with a crew of Japanese, whose ship had been burnt, drifting at sea, without provisions, in a leaky junk. He supposed them to be pirates, but he did not choose to leave them to so wretched a death, and took them on board, and in a few hours, watching their opportunity, they murdered him.

As the fool dieth, so dieth the wise, and there is no difference; it was the chance of the sea, and the ill reward of a humane action—a melancholy end for such a man—like the end of a warrior, not dying Epaminondas-like on the field of victory, but cut off in some poor brawl or ambuscade. But so it was with all these men. They were cut off in the flower of their days, and few indeed of them laid their bones in the sepulchres of their fathers. They knew the service which they had chosen, and they did not ask the wages for which they had not laboured. Life with them was no summer holyday, but a holy sacrifice offered up to duty, and what their Master sent was welcome. Beautiful is old age—beautiful as the slow-dropping mellow autumn of a rich glorious summer. In the old man, nature has fulfilled her work; she loads him with her blessings; she fills him with the

fruits of a well-spent life; and, surrounded by his children and his children's children, she rocks him softly away to a grave, to which he is followed with blessings. God forbid we should not call it beautiful. It is beautiful, but not the most beautiful. There is another life, hard, rough, and thorny, trodden with bleeding feet and aching brow; the life of which the cross is the symbol; a battle which no peace follows this side the grave; which the grave gapes to finish, before the victory is won; and, strange that it should be so, this is the highest life of man. Look back along the great names of history; there is none whose life has been other than this. They to whom it has been given to do the really highest work on earth—whoever they are, Jew or Gentile, Pagan or Christian, warriors, legislators, philosophers, priests, poets, kings, slaves—one and all, their fate has been the same—the same bitter cup has been given to them to drink; and so it was with the servants of England in the sixteenth century. Their life was a long battle, either with the elements or with men, and it was enough for them to fulfil their work, and to pass away in the hour when God had nothing more to bid them do. They did not complain, and why should we complain for them? Peaceful life was not what they desired, and an honourable death had no terrors for them. Theirs was the old Grecian spirit, and the great heart of the Theban poet lived again in them:—

“Θανέειν δ' οἷσιν ἀνάγκη  
 τί κέ τις ἀνώγειον γῆρας ἐν σκότῳ  
 καθήμενος ἐφοι μάτων, ἀπάντων  
 καλῶν ἄμμορος.”

“Seeing,” in Gilbert's own brave words, “that death is inevitable, and the fame of virtue is immortal; wherefore in this behalf *mutare vel timere sperno*.”

In the conclusion of these light sketches we pass into an element different from that in which we have been lately dwelling. The scenes in which Gilbert and Davis played out their high natures were of the kind which we call peaceful, and the enemies with which they contended were principally the ice and the wind, and the stormy seas and the dangers of unknown and savage lands; we shall close amidst the roar of cannon and the wrath and rage of battle. Hume, who alludes to the engagement we are going to describe, speaks of it in a tone which shows that he looked upon it as something portentous and prodigious; as a thing to wonder at—but scarcely as deserving the admiration which we pay to actions

properly within the scope of humanity—and as if the strength which was displayed in it was like the unnatural strength of madness. He does not say this, but he appears to feel it; and he scarcely would have felt it, if he had cared more deeply to saturate himself with the temper of the age of which he was writing. At the time all England and all the world rang with it. It struck a deeper terror, though it was but the action of a single ship, into the hearts of the Spanish people, it dealt a more deadly blow upon their fame and moral strength, than the destruction of the Armada itself; and in the direct results which arose from it, it was scarcely less disastrous to them. Hardly, as it seems to us, if the most glorious actions which are set like jewels in the history of mankind are weighed one against the other in the balance, hardly will those 300 Spartans who in the summer morning sate “combing their long hair—for death” in the passes of Thermopylæ, have earned a more lofty estimate for themselves than this one crew of modern Englishmen.

In August, 1591, Lord Thomas Howard, with six English line-of-battle ships, six victuallers, and two or three pinnaces, were lying at anchor under the island of Florez. Light in ballast and short of water, with half their men disabled by sickness, they were unable to pursue the aggressive purpose on which they had been sent out. Several of the ships' crews were on shore; the ships themselves “all pestered and rommaging,” with everything out of order. In this condition they were surprised by a Spanish fleet consisting of 53 men-of-war. Eleven out of the twelve English ships obeyed the signal of the Admiral, to cut or weigh their anchors and escape as they might. The twelfth, the *Revenge*, was unable for the moment to follow; of her crew of 190, 90 being sick on shore, and, from the position of the ship, there being some delay and difficulty in getting them on board. The *Revenge* was commanded by Sir Richard Grenville, of Bideford, a man well known in the Spanish seas, and the terror of the Spanish sailors; so fierce he was said to be, that mythic stories passed from lip to lip about him, and, like Earl Talbot or Cœur de Lion, the nurses at the Azores frightened children with the sound of his name. “He was of great revenues,” they said, “of his own inheritance, but of unquiet mind, and greatly affected to wars,” and from his uncontrollable propensities for blood eating, he had volunteered his services to the Queen; “of so hard a complexion was he, that I (John Huighen von Linschoten, who is our authority here,

and who was with the Spanish fleet after the action) have been told by divers credible persons who stood and beheld him, that he would carouse three or four glasses of wine, and take the glasses between his teeth and crush them in pieces and swallow them down." Such he was to the Spaniard. To the English he was a goodly and gallant gentleman, who had never turned his back upon an enemy, and remarkable in that remarkable time for his constancy and daring. In this surprise at Florez he was in no haste to fly. He first saw all his sick on board and stowed away on the ballast, and then, with no more than 100 men left him to fight and work the ship, he deliberately weighed, uncertain, as it seemed at first, what he intended to do. The Spanish fleet were by this time on his weather bow, and he was persuaded (we here take his cousin Raleigh's beautiful narrative and follow it in his words) "to cut his mainsail and cast about, and trust to the sailing of the ship."

"But Sir Richard utterly refused to turn from the enemy, alledging that he would rather choose to die than to dishonour himself, his country, and her Majesty's ship, persuading his company that he would pass through their two squadrons in despite of them, and enforce those of Seville to give him way, which he performed upon diverse of the foremost, who, as the mariners term it, sprang their luff, and fell under the lee of the *Revenge*. But the other course had been the better; and might right well have been answered in so great an impossibility of prevailing: notwithstanding, out of the greatness of his mind, he could not be persuaded."

The wind was light; the *San Philip*, "a huge high-cargued ship," of 1500 tons, came up to windward of him, and taking the wind out of his sails, ran aboard him.

"After the *Revenge* was entangled with the *San Philip*, four others boarded her, two on her larboard and two on her starboard. The fight thus beginning at three o'clock in the afternoon continued very terrible all that evening. But the great *San Philip*, having received the lower tier of the *Revenge*, shifted herself with all diligence from her sides, utterly misliking her first entertainment. The Spanish ships were filled with soldiers, in some 200, besides the mariners, in some 500, in others 800. In ours there were none at all, besides the mariners, but the servants of the commander and some few voluntary gentlemen only. After many enterchanged volleys of great ordnance and small shot, the Spaniards deliberated to enter the *Revenge*, and made divers attempts, hoping to force her by the multitude of their armed soldiers and musketeers; but were still repulsed again and again, and at all times beaten back into their own ship or into the sea. In the beginning of the fight the *George Noble*, of London, having received some shot through

her by the *Armadas*, fell under the lee of the *Revenge*, and asked Sir Richard what he would command him; but being one of the victuallers, and of small force, Sir Richard bade him save himself and leave him to his fortune."

A little touch of gallantry, which we should be glad to remember with the due honour to the brave English heart who commanded the *George Noble*; but his name has passed away, and his action is an *in memoriam*, on which time has effaced the writing. All that August night the fight continued, the stars rolling over in their sad majesty, but unseen through the sulphur clouds which hung over the scene. Ship after ship of the Spaniards came on upon the *Revenge*, "so that never less than two mighty galleons were at her side and aboard her," washing up like waves upon a rock, and falling foiled and shattered back amidst the roar of the artillery. Before morning fifteen several armadas had assailed her, and all in vain; some had been sunk at her side; and the rest, "so ill approving of their entertainment, that at break of day they were far more willing to hearken to a composition, than hastily to make more assaults or entries." "But as the day increased so our men decreased, and as the light grew more and more, by so much the more grew our discomfort, for none appeared in sight but enemies, save one small ship called the *Pilgrim*, commanded by Jacob Whiddon, who hovered all night to see the success, but in the morning bearing with the *Revenge* was hunted like a hare among many ravenous hounds—but escaped."

All the powder in the *Revenge* was now spent, all her pikes were broken, 40 out of her 100 men killed, and a great number of the rest wounded. Sir Richard, though badly hurt early in the battle, never forsook the deck till an hour before midnight; and was then shot through the body while his wounds were being dressed, and again in the head; and his surgeon was killed while attending on him. The masts were lying over the side, the rigging cut or broken, the upper works all shot in pieces, and the ship herself, unable to move, was settling slowly in the sea; the vast fleet of Spaniards lying round her in a ring like dogs round a dying lion, and wary of approaching him in his last agony. Sir Richard seeing that it was past hope, having fought for fifteen hours, and "having by estimation eight hundred shot of great artillery through him," commanded the master gunner, whom he knew to be a most resolute man, to split and sink the ship, that thereby nothing might remain of glory or victory to the Spaniards;

seeing in so many hours they were not able to take her, having had above fifteen hours' time, above ten thousand men, and fifty-three men of war to perform it withal; and persuaded the company, or as many as he could induce, to yield themselves unto God and the mercy of none else; but as they had, like valiant resolute men, repulsed so many enemies, they should not now shorten the honour of their nation by prolonging their own lives for a few hours or a few days."

The gunner and a few others consented. But such *δαμονίη ἀρετή* was more than could be expected of ordinary seamen. They had dared do all which did become men, and they were not more than men, at least than men were then. Two Spanish ships had gone down, above 1500 men were killed, and the Spanish Admiral could not induce any one of the rest of his fleet to board the *Revenge* again, "doubting lest Sir Richard would have blown up himself and them, knowing his dangerous disposition." Sir Richard lying disabled below, the captain finding the Spaniards as ready to entertain a composition as they could be to offer it, gained over the majority of the surviving crew; and the remainder then drawing back from the master gunner, they all, without further consulting their dying commander, surrendered on honourable terms. If unequal to the English in action, the Spaniards were at least as courteous in victory. It is due to them to say, that the conditions were faithfully observed. And "the ship being marvellous unsavourie," Alonzo de Bacon, the Spanish Admiral, sent his boat to bring Sir Richard on board his own vessel.

Sir Richard, whose life was fast ebbing away, replied, that "he might do with his body what he list, for that he esteemed it not;" and as he was carried out of the ship he swooned, and reviving again, desired the company to pray for him. The Admiral used him with all humanity, "commending his valour and worthiness, being unto them a rare spectacle and a resolution seldom approved." The officers of the rest of the fleet, too, John Higgins tells us, crowded round to look at him, and a new fight had almost broken out between the Biscayans and the "Portugals," each claiming the honour of having boarded the *Revenge*.

"In a few hours Sir Richard, feeling his end approaching, showed not any sign of faintness, but spake these words in Spanish, and said, 'Here die I, Richard Grenville, with a joyful and quiet mind, for that I have ended my life as a true soldier ought to do that hath fought for his country, queen, religion, and honour. Whereby my

soul most joyfully departeth out of this body, and shall always leave behind it an everlasting fame of a valiant and true soldier that hath done his duty as he was bound to do.' When he had finished these or other such like words, he gave up the ghost with great and stout courage, and no man could perceive any sign of heaviness in him.

Such was the fight at Florez, in that August of 1591, without its equal in such of the annals of mankind as the thing which we call history has preserved to us; scarcely equalled by the most glorious fate which the imagination of Barrère could invent for the *Vengeur*; nor did it end without a sequel awful as itself. Sea battles have been often followed by storms, and without a miracle; but with a miracle, as the Spaniards and the English alike believed, or without one, as we moderns would prefer believing, "there ensued on this action a tempest so terrible as was never seen or heard the like before." A fleet of merchantmen joined the armada immediately after the battle, forming in all 140 sail; and of these 140, only 32 ever saw Spanish harbour. The rest all foundered, or were lost on the Azores. The men-of-war had been so shattered by shot as to be unable to carry sail, and the *Revenge* herself, disdaining to survive her commander, or as if to complete his own last baffled purpose, like Samson, buried herself and her 200 prize crew under the rocks of St. Michael's.

"And it may well be thought and presumed," says John Huyghen, "that it was no other than a just plague purposely sent upon the Spaniards; and that it might be truly said, the taking of the *Revenge* was justly revenged on them; and not by the might of force of man, but by the power of God. As some of them openly said in the Isle of Terceira, that they believed verily God would consume them, and that he took part with the Lutherans and heretics . . . saying further, that so soon as they had thrown the dead body of the Vice-Admiral Sir Richard Grenville overboard, they verily thought that as he had a devilish faith and religion, and therefore the devil loved him, so he presently sunk into the bottom of the sea and down into hell where he raised up all the devils to the revenge of his death, and that they brought so great a storm and torments upon the Spaniards, because they only maintained the Catholic and Romish religion. Such and the like blasphemies against God they ceased not openly to utter."

## ART. III.—THE FUTURE OF GEOLOGY.

1. *Histoire des Progrès de la Géologie de 1834 à 1850, par le Vicomte D'Archiac. Publiée par la Société Géologique de France, sous les auspices de M. le Ministre de l'Instruction Publique.* 1847—1851.
2. *The Geological Observer.* By Sir Henry T. de la Beche, C.B., F.R.S. Longmans. 1851.

6. *Principles of Geology.* By Sir Charles Lyell, F.R.S. Eighth edition. Murray. 1850.
7. *Address delivered at the Anniversary Meeting of the Geological Society of London, on the 20th of February, 1852.* By William Hopkins, Esq., President of the Society. R. Taylor. 1852.
8. *Passages in the History of Geology.* By Andrew C. Ramsay, F.R.S. Taylor and Walton. 1849.

GEOLOGY is in the ascendant. It counts in its ranks some of the most energetic and able men of science of the day; it claims for its service the only scientific Society that can bring together a considerable congregation of attentive and intelligent listeners; it occupies and fills, at the annual gatherings of the British Association, the largest meeting hall of all the sections, and wins admiration in the provinces by a yearly sitting of six almost consecutive days, distinguished for the liveliness of the debate and the interest of the subjects discussed; it enforces its importance on the attention of Governments, and into the ears of politicians, usually dull of hearing when addressed concerning matters purely intellectual, or calculated to advance rather than impede human progress. Extensive surveys are instituted for the prosecution of geological research; noble museums are erected for the display of geological treasures; lectureships are endowed for the inculcation of geological truths. A conviction has taken root among the people, that the history of the formation of the earth, and the investigation of its structure and contents, are worthy subjects of national inquiry, and—what with practical men

weighs more heavily—likely to prove conducive to the development of national wealth. A few years ago, geology was perhaps more fashionable and more amusing; as the work became harder, and the talk less diverting, her fashionable friends fell away. But better and truer allies are arising among the masses of the people. Let geology put trust in them, work for them, teach what she has learnt to them, and there shall be greater honours in store for her than can be conferred by the applause of magnates, and the smiles of fine ladies. The hard and horny hand of the miner and mechanic will be frankly proffered for the pledge of fraternity—no languid pressure there, but a warm grasp and hearty shake. The farmer, ever slow and suspicious, will hold back awhile; but the good sense that lies smouldering in this dullest of the avatars of John Bull will, sooner or later, burn up, and, like the light streaming from the eye of a dark lantern, shew science at hand to help, where an enemy and plunderer was suspected.

Neither man nor science can work the way to permanent position without a struggle. Whatever is worth gaining must be fought for. The rest of peace, which is faith either in virtue, or in truth, or in order, must be won according to its kind by war moral, or intellectual, or physical. The man whose course through life provokes no enemy, and excites no opposition, must be a nonentity; so, too, with doctrine, discovery, and science. A late eminent and eccentric Scotch naturalist and antiquarian professed to disbelieve the results of his researches, and set about seeking for errors in them, whenever they were at once accepted without opposition or cavil. There was reason in this odd fancy—more than critics gave him credit for. Geology would not have been now what it is, had the path of its progress been less thorny, and its opponents less active. The energy and enthusiasm of geologists has made the growth of their science seem almost magical in rapidity; yet it was no unsubstantial Boletus, springing in a night, or it had been trampled down by its adversaries as fast as it grew. It had, however, its adventitious helps, that served to gain for it the attention of the unscientific and of men of the world. The younger of all the Minervas that have budded from the brain of Jupiter, Geology would have languished, and possibly pined away beneath the cold glances of her stern and mature sisters, and the more damaging enmity of her father's priests, had not paternal love endowed her with an Ægis in the shape of a winning pre-

sence, and the gift of the gab. Her missionaries during the time—scarcely yet gone by—when she won her way most rapidly into public favour, were orators and men of mark. There was no orack modesty about her; perhaps not overmuch of the reality of that virtue. Like a woman of genius—and a handsome one too—she was opinionative and dogmatical; bold in assertions, and apt to let imagination get the mastery over judgment. But these were the failings of healthy youth—the consequences of fulness and richness of blood, and much more likely to end—as they have done—in a sound condition of ripened limb and body, than if they had been substituted by excess of caution, fear of giving offence, shrinking timidity, and dread of authority.

Of the three subjects which seem to suggest themselves most naturally to the inquisitive faculty of the human mind—the constitution of man himself, the constitution of the world upon which he lives, and the constitution of the universe, of which that world forms a part—it is remarkable that the second, and apparently easiest, should have been neglected for ages after earnest study of the other two had commenced and advanced, or was so treated as to be prolific only in vague fancies, and generate no true science. Geology, as contradistinguished from cosmogony, seems to have lain dormant during the brightest epochs of antiquity, and to have excited scarcely a spark of thought, even in the combustible brain of Aristotle himself. A shrewd and accurate observer, old Strabo, it is true, had notions about volcanoes and the isolation of morsels of land, that made a fair approach to geological theorizing; but with this almost solitary exception, it was reserved for modern—in reality, for very modern—philosophers to inaugurate a science which, during its brief infancy and shorter youth, attained the dimensions of a giant, and claimed and won an equal seat with its proudest compeers. Solitary prophets arose from time to time, and seemed in imperfectly understood predictions to foretel the advent of a new philosophy. Great men were among them; men who, in the midst of sterner and fairer pursuits, saw dim indications of mysterious and wonderful workings in the soil beneath their feet, and the mountains that cast long shadows. They asked of themselves, why should there be hills to cast these shadows; and how grew up the mountain tops? They demanded whether there was not an anatomy to be dissected out of the corpse of mother earth, as in the bodies of her living and moving children? They ventured to

think that rugosities of the world's surface were the wrinkles of age, the stamps of ancient cares, the ravages of unrecorded convulsions. They gathered petrifications out of the rocks, and, comparing them with ejectamenta of the ocean, saw, and what is more, admitted to themselves that they saw, the unquestionable proofs of a similar organization and an identical origin. In Italy especially was a light seen dimly heralding the dawn; and foremost among those who marked the glimmer was that astonishing old painter, Leonardo da Vinci, on whose active mind all the sciences of his time, and scraps of sciences then unborn, seem to have been spread in dabs, like the colours on his professional palette. It is a great glory to Italy to have played the part she did in the nursing and nourishing of infant geology. Alas! too many of the children reared by that most beautiful of mothers have been abandoned by her in their childhood, or disowned after attaining their youth or manhood. Not so with this sturdy science; Italy has still her geologists, and good ones too; yet even these might have been denied to her had the training of the infant rested in her care. Under the colder and cloudier skies, amid the rougher and sterner minds of Britain, did geology attain that vigour which has resulted in the strength of an immortal.

"L'histoire de la géologie," remarks Count d'Archiac, "ressemble assez à celle des peuples anciens. Comme eux, elle a eu son époque fabuleuse, et elle se trouve mêlée à toutes les théogonies de l'Orient; puis son époque héroïque, encore enveloppée d'une certaine obscurité jusque vers la fin du XVIII<sup>e</sup> siècle; enfin, son époque critique ou de l'histoire proprement dite, qui ne remonte pas à plus de soixante ans." The historical and critical epoch of geology owes its development in a great measure to the energy of Britons. In the philosophical speculations of Hutton, and the practical generalisations of William Smith, were laid the firm foundations of the science. To the indefatigable exertions and disinterested enthusiasm of the early members of the Geological Society of London, is due its rapid advance when young and rising. On the establishment of that society, indeed, the development of practical geological research has mainly depended. More than forty years ago, it commenced its labours under the presidency of its most active founder, who still sits at its council-board, the Nestor of geologists, enthusiastic as the youngest, learned even to the latest memoir, impartial yet sternly critical, always encouraging his juniors by advice and the wisdom gained

through a long experience of field-research. In the history of geology the name of GREENOUGH will ever hold a conspicuous and honoured place. Most of those who along with him so successfully worked the Society during its early years, after labouring sedulously in the geological field, directed their attention eventually to other objects of science or public benefit. Such were WOLLASTON, HORNER, WARBURTON, STOKES, and others; some of whom are no more, some fortunately still visitors of the institution, in which they retain all their interest and much just pride. A body so founded could not but prosper, and under its genial protection soon arose a rapid succession of illustrious men, whose names are now geological watchwords, and most of whom are still active and doing. By well-directed labour in the field, each filled up some great gap in geology, and by public spirit and personal qualities, aided in diffusing its influence. Earliest came FIRTON, the explorer and classifier of the upper secondary strata, warm-hearted, fervid, eloquent, and witty, ever ready to conduct the defence of all who seemed unjustly assailed, and dreaded only by the luckless unfortunates who ventured to trespass on his own chosen and well-protected preserve of green sand. BUCKLAND, whose accumulations of original observations and collected information, not only on geology, but on all collateral subjects, astonished his esoteric listeners, and whose redundant humour and picturesque descriptions inveigled into the precincts of science many a delighted congregation of unscientific hearers, is, alas, though near us, no longer amongst us. CONYBEARE, a rare visitor of these meetings now, but one of the fathers of geology, enriching its early stages by solid labour, and enlightening it by ripe learning and ardent genius; SEDGWICK, impetuous, eloquent, charming by sparkling wit and thoughts of exquisite beauty, mingling pathos with humour, varying his exposition of the results of laborious research among the intricacies of the most ancient and disturbed regions of our islands with unexpected similes and episodes of personal adventure; MURCHISON, his friend and colleague in work, the founder of a Silurian empire which will hold together longer than any realm of King or Czar, the most active and energetic of observers, clear and fluent in statement and description, possessing a rare and almost instinctive power of perceiving the essentials of the subject of his research, foremost among the contributors to comparative geology; DR LA BECHE, ever justly insisting on the necessity of cau-

tion and the remembrance of physical conditions, whose lasting monument will be the great geological map of the British islands, the beautiful museum and its associated college, that have been founded through his unceasing exertions and wise foresight for the application of British science to the development and advance of our national arts and pursuits; LYELL, pre-eminently a philosopher, the demonstrator and classifier of Tertiary formations, the great interest and increasing importance of which he clearly perceived and insisted upon when these more recent strata were disregarded, whose admirable writings have done more to diffuse a sound spirit of geological inquiry and reasoning than any ever published; MANTELL, who, working alone, and in the midst of unceasing professional duties, did inestimable service to British palæontology, the discoverer of the Wealden, the enthusiastic chronicler and firm friend of Iguanodons and other draconic prodigies; PHILLIPS, the cleverest of expounders and best of advisers, most fluent and persuasive in his eloquence, a contributor to almost every department of the geology of our country, and a worthy inheritor of the mantle of his illustrious uncle, William Smith—these are the men whose presence in friendly debate filled the benches of the Geological Society of London with an audience remarkable for the variety of its pursuits and extent of its acquirements. Under their auspices, and through their exertions, a second stage of the historical epoch of geology became gradually inaugurated; one to which more especially the invaluable and precise labours of OWEN in palæontology and of HOPKINS in dynamical geology belong. It can claim many able and earnest labourers, worthy associates and followers of those who so nobly led the way.

Whilst we bear testimony to the sterling merits of the geological chiefs whose good-humoured and elegant word-combats have delighted many an intellectual assembly, and won fresh converts to their charming science, we must not forget to remind our readers that there are soldiers of equal merit, highly honoured and appreciated by those very leaders, but who, from natural reserve, dislike of display, or too retiring modesty, never figure in the tournay, though taking an active and laborious part in the serious battle where there are no idle spectators. The transactions and records of geological societies are stored with the fruits of men who may appropriately be termed *unseen* geologists. Their works are as often embodied in the memoirs of their

more dashing colleagues, as put forward in the names of their authors. Thoroughly loving their science for truth's sake only, equally uncovetous of temporary *éclat* and lasting fame (though sure of the laurel, whether they seek for it or not), delighting in feeding great fires, in helping more daring spirits to do the work which after all can be done only by daring spirits, happier still when cheering on the promising beginner, guiding his first steps and the first strokes of his hammer, these are the men who like good angels guard over academies, suppress errors, cherish truths, and see that justice is done unto all. Geology owes much to such earnest and faithful adherents. One name, little known out of the limited sphere of working geologists, must be mentioned, in justice, as a type of the class: the name of LONSDALE.

If we seek for the cause of the prominent position held by British geology, we shall find it in the eclectic treatment of the science by British geologists. The debates of the Geological Society of London, and the writings of its members, are alike characterized by an equal and just appreciation of the physical and natural history evidences with which they have to deal. Occasionally a stern mineralogist will utter a crystallized growl at the overpraise of a rotten bone or shell; or a supercilious collector turn aside in disgust from an unfossiliferous lump of sandstone, dignified with a conspicuous position on the Society's table; but, far oftener, almost always, palæontological, physical and mineral evidences combined, are treated as constituting necessary elements of the question under discussion, the tendency on the part of the debater being rather to lay an overstress upon that department with which he is least practically acquainted, than to despise the light which its resources may throw upon the problem. On the continent, these constitutional notions are supplanted, in too many instances, by extremes of opinion. Out of twelve geologists abroad, we shall find two, it may be, eclectic in their views, and opposed by the ten, five of whom will be ultra-palæontologists, and five ultra-mineralogists or physicists. A puts his faith entirely in his acid-bottle and microscope, using the latter only for the determination of the number and shape of mineral grains; the sight of a stratum without a fossil gives zest to his search, whilst organic remains are to him nuisances, confusers, and impediments. B sides with A in his rejection of natural history data, but holds, besides, that mineral character is a very poor guide, and that unconformities and indications of physical con-

vulsions must supplant all other evidence in illustrating the age and value of formations. C, on the contrary, slights both A and B; declares his utter contempt of all inorganized matter, except so far as it is a matrix for the preservation of organic remains; holds a fault to be a bore; and scorns even superposition as valueless in comparison with palæontological facts. A has his pupils, B his disciples, and C his followers, all of whom, as usual, exaggerate the opinions of their masters. In the train of each are irregulars and camp-followers, as loud in dispute without any knowledge of what they are squabbling about, attracted, either by interest or personal admiration, to one or other of the philosophic generals. The mineral-dealers stand by A; the fossil-sellers by C; whilst B, less encumbered by such embarrassing adherents, has the interested division of his tail limited, probably, to a few half-informed land-surveyors. The disinterested section of *claqueurs* attached to each will be swelled or diminished according to the genius, affability, eloquence, personal influence, public position, and private fortune of their heroes. Urged on by vanity, indiscreet praise, or the persuadings of too zealous partizanship, A, B, and C become more and more convinced that the exclusive views with which they started are all in all, and thus are apt to travel farther from the truth year after year. In the meantime, the small minority of eclectics pursue their way with sorry escorts (for the multitude will always, in the long run, prefer extreme opinions, however absurd) and, through their disgust, are apt to contract an affection for, and advocacy of, negotiations, as opposed to progress as the headlong advances in a wrong direction of their exclusive opponents.

There are, however, many distinguished exceptions to this general censure. The patriarch of German geologists, the illustrious VOX BUCHI, has set a very different example during his long and laborious, but glorious career. A geologist in every sense of the word, no living man has so thoroughly appreciated the co-ordination of the physical, chemical (mineralogical), and biological elements of his favourite science. All his writings are filled with evidences of a rare combination of minute research with great powers of generalization. In those parts of palæontology which advance geology most, as distinguished from those divisions of the science which rather conduce to the advancement of zoology and botany, (a distinction not always, indeed rarely, borne in mind by the writers of general geological treatises,) no man has worked with more

success than this veteran philosopher, whose presence, with that of HUMBOLDT—*par nobile fratrum*—confers a lasting light and honour on the court of Berlin. Whatever may be the monarch of Prussia's political shortcomings, it is but fair to render him the meed of praise for his enlightened appreciation of such men as those we have just named, and of many more, high in the ranks of science; not in the shape of grudging and demeaning patronage, but manifested by unmistakable proofs of sincere and reverential admiration, and by unassuming attentions that show how all artificial distinctions, drawn on the wrong side by human vanity, between king and philosopher, cannot prevent the growth of a true friendship in the bosoms of each.

In France, too, the justest views on the nature and extent of geological evidence characterized all the writings of D'ARCHIAC, who in an important work, the title of which is enumerated at the head of this article, has undertaken, at the request of the Geological Society of France, and with the sanction and aid of several successive governments, to perform the difficult duty of being at once the historian and judge of the progress of geology during the epoch of its most precise condition and surest advance. No one who is unacquainted with the extent and variety of geological literature, the host of memoirs, great and small, scattered through all sorts of transactions and journals, in all manner of languages, can form an idea of the difficulty of the undertaking. Five closely printed volumes of his "Histoire des Progrès de la Géologie, de 1834 à 1850," have already appeared, of which tertiary and cretaceous geology constitute the chief themes. They are most remarkable documents, full of learning, personal knowledge, original views, and sound criticism. M. D'Archiac has endeavoured to execute his delicate task in the strictest spirit of justice, and however we may differ with him on occasional points of detail, and here and there of theory, we freely admit that he has succeeded. His work is distinguished for perspicuity of style and clearness of arrangement, and we look forward, with many anticipations of instruction and pleasure, to the future volumes concerning the oolitic and palæozoic stratas, which doubtless will appear in due time, unless the Autocrat of France, whose love for either literature or science is not becoming proverbial, should take it into his sapient head that all pre-Napoleonic ideas (such as those ancient formations were) should be extinguished.

Astronomy was the black sheep among

the sciences during the middle ages; geology has played that unpleasant part in later and more enlightened times; nay, is even shunned as disreputable by numbers of generally well-informed and well-intentioned people at the present day. Although, to the honour of the priesthood, not a few of its ablest advocates, and some of its earliest and boldest supporters have come from their ranks, parsons as a body still fight shy of geology and geologists, and were martyrdom by roasting in fashion, we might see Greenough, Lyell, Murchison, De la Beche, Filton, and Mantell all protesting against plutonic agencies at Smithfield, whilst Conybeare, Sedgwick, Henslow, and possibly even the Bishop of Oxford (who knows more of geology than common people give him credit for,) would be doing penance for their unsanctified acquirements in chilly dungeons on a neptunian diet of cold water. The two cardinal sins of geologists in the eyes of good people, are their belief in the world's preadamitic antiquity, and their disbelief in the universality of the deluge. The vague general distrust of them that pervades respectable country society, and concentrates into positive abhorrence in the congregations of Exeter Hall will, when minutely analyzed, be found to resolve itself into more or less clearly understood objections against the two articles just mentioned. Of course, truth must conquer, and before twenty years are over, the world's antiquity and the partiality of the deluge will be taught to children in schools with no more hesitation than is now entertained about teaching the motion of the earth round the sun. Strange to say, the first of these obnoxious doctrines was treated as an open question by many divines before geological discovery brought facts to bear upon it. Almost exactly two hundred years ago, one of the brightest and purest spirits among the clergy of the Church of England, Dr. Henry More, published his "Conjectural Essay of Interpreting the Mind of Moses."\* In this singular treatise he boldly maintained that the narrative of the Creation contained in the commencing chapters of Genesis, professes on principle to describe the appearance (as distinguished from the reality) of things to sense and obvious fancies, "accommodating the outward cortex of Scripture to the most narrow and slow apprehension of the vulgar," and offering "reasons of sundry notable phenomena of nature, bearing al-

\* "Conjectura Cabalistica; or, a Conjectural Essay of interpreting the mind of Moses, according to a three-fold Cabbala—Literal, Philosophical, Mystical, or Divinely Moral. London: 1653."

together a most palpable compliance with the most rude and ignorant conceits of the vulgar." In accordance with his somewhat eccentric plan, he makes Moses interpret his history, verse by verse, for the benefit of the more enlightened. His "philosophic" interpretation of the fourth verse of the second chapter of Genesis is very remarkable:—"I (*i. e.*, Moses) do not take upon me to define the time wherein God made the heavens and the earth; for he might do it at once by his absolute omnipotency, or he might, when he had created all substance, as well material or immaterial, let them act one upon the other, and in such periods of time, as the nature of the production of the things themselves required." This curious passage (and the volume containing it) seems to have escaped the researches of Pye Smith and others who battled in controversies about scriptural geology; discussions, the only value of which is their tendency to remove the prejudices or scruples of honest but timid men who fear to confront their faith with scientific truth. Such interpretation as this may prove to them how dangerous it is to lay an overstress on the apparent meaning of passages susceptible of various readings. On the view taken by More of the meaning of the scriptural text cited, the most heretical of cosmogonists, Lamarckian transmutationists, spontaneous generationists, and believers in the doctrines of the "Vestiges of Creation," might all stoutly, and with equal reason, maintain that their peculiar tenets are scriptural and orthodox. Let this be a warning to those who would dogmatically put down scientific speculations on religious grounds alone. Let it also be a warning to geologists who are over-anxious to reconcile the literal reading of the Sacred Writings with the logical interpretation of the facts revealed to them in the course of scientific research. We might extend the caution to the best informed of writers upon scriptural geology, and in that category we would place among the foremost Professor Hitchcock, whose recent work, entitled "The Religion of Geology," is the safest and best of an unsafe class. Far superior to Pye Smith in practical acquaintance with his subject, he treats it in a more masterly and convincing style, but the resulting conviction is more in favour of the earnestness of the author than of the soundness of his arguments.

Some of the older and steadier sciences, who, having long ago come to years of discretion, ought to have known and behaved better, have been inclined now and then to disparage and trip up their younger and

more impetuous sister, whose enthusiasm, haste, and occasional levity, excited their ill-will. The enemies of geology delighted in seeing the slight put upon her by these grave and ancient maidens, who used her very much as the proud sisters treated Cinderella. One cause of dislike arose from the circumstance that the active advocates of geology were not always trained workmen, but volunteers, who had assumed the hammer without previous preparation, or very much consideration respecting its purpose or their own. To see good work done by such undisciplined troops troubled the disciplinarians much in the manner that old soldiers become troubled when they find militia-men fighting a good battle, or amateur tacticians developing excellent plans of warfare. In truth, however, if a man had wished to educate himself regularly into a geologist during the earlier days of the science, there was no school—certainly none in England—where he could be instructed in even the elements of the subject. Things have been altered for the better since, and there are now many opportunities of acquiring the fundamental knowledge desirable for those who would enter upon geological research. In a few years a number of young men will be engaged in occupations of which geology forms, or should form, an element, better trained for their work than any of the builders-up of the science were. The examination papers submitted during this spring to the students of the newly established Government School of Mines would demand for answering a long sitting of even the leading members of the Geological Society, and, (just possibly, of course,) might not be answered after all.

It was the tremendous pace at which some of the early geologists went, that threatened to kill their own, and called forth the censures of the slower sciences. They thought nothing of submitting our planet to sudden extremes of heat and cold; shivering it into small fragments as suddenly as a Prince Rupert's drop; doubling it into intricate contortions with the facility (a not unusual illustration) that a pocket-handkerchief or a sheet of paper may be crumpled; melting it down, stirring it up, and keeping a sufficient supply of internal heat to produce a hypertropical climate during immeasurable ages; killing off whole floras and faunas at a moment's notice, and creating a new batch of beasts and vegetables with equal ease and rapidity; swamping the earth with no end of universal deluges; investing it in all but unbounded fluvial formations; or, wrap-

ping it in a chilling crystalline coat of solid ice. With them our unlucky planet was fast becoming—

“ A world of wonders, where creation seems  
No more the work of Nature, but her dreams ; ”

and there is no surer proof of the good stuff of which geology is made, than the awful trials to which she was submitted by her over-zealous disciples.

Among the mysterious problems upon which geology promised, from its starting, to throw some light, is that concerning the first appearance of life upon our globe. The mind of man is prone to search out beginnings, and too apt to assume that the search has been successful. In the majority of the writings of geologists, allusions are made to the first dawnings of existence, to the very earliest forms of life, the first efforts of creation—as if we had really arrived at unquestionable traces of the protozoic proto-plasts. Nevertheless it is certain that the deeper geological research has penetrated among the secrets of pre-Adamite time the farther have receded the evidences of life and being. Like unsubstantial and vanishing phantasmagoria the shapes of the first creatures are ever evading our grasp. We speak familiarly of *palæozoic* and *protozoic* fossils—are we really convinced that we have as yet found them? Are they not merely provisional terms, convenient for the nonce, and only inconvenient when showy and unsubstantial theories are built upon the assumption? If types truly deserving of such epithets have not as yet been clearly revealed, is there a hope of discovering them during the progress of future research? Let us look for a moment dispassionately at the real condition of the evidence on this important question.

The most ancient traces of living beings as yet made known occur in rocks belonging to the older or lower division of the Silurian system. As far as we know at present, the rocks in question are the oldest fossiliferous formations. The only symptom of an exception to this statement shall presently be cited. According to the usual interpretation these precious relics are the remains of creatures that formed a portion of what may emphatically be termed the *PRIMEVAL* fauna. They were the Adams and Eves of their respective species, or, if not precisely first, were at least the Cains and Abels. The Cains had a considerable run in time, and we find their descendants in many successive strata; but the Abels were killed off at the beginning, and we see

no more of them after having noted their first appearance. These reputed first-born of the earth are not very wonderful to look upon—a few trilobites, low creatures that were distant relatives of crabs; a few shell-fish, which, if hauled up to-morrow, would require the zeal and acuteness of Hugh Cuming to see at a glance that they were not already contained in his own or in any other collection; then a radiate animal or two, essentially but not wonderfully or strikingly different from some that did not appear until long afterwards; and a few corals, who chiefly distinguished themselves by stretching out their fingers in all-fours instead of all-sixes, but otherwise had shapes and sizes very comparable with more modern zoophytes—these, none of them a giant for size or angel for beauty, were the reputed first colonizers of the world Man now calls his. Many a great family, it is true, has had even a more insignificant origin, and assuredly cannot show such authentic portraits of its founders as are displayed in the illustrated works of palæontologists of the little beasts we have just mentioned.

Why are these modest buddings of nature regarded as her first fruits? Because, triumphantly replies the geologist, older than these there is no sure trace of a living thing. That was said before of creatures who flourished, judging by the thickness of the sea-beds deposited in the interval, myriads of years after these which we now would honour as prototypes. It will be said, again, when these so-called earliest of beings shall be proved to have succeeded others of far earlier origin. But is not this an assumption? Not quite; in older rocks even than those recognised as lower Silurian, in rocks which, if Professor Sedgwick would wish to see a cherished term of his own invention stereotyped in geology, we should like to call Cambrian, as something probably distinct from, certainly lower in place and more ancient in time than the lowest Silurian, a few unmistakable traces of organic remains have been detected, especially a zoophyte, or zoophytoidal mollusk, to which the name of *Oldhamia* has been assigned. These are sorry indications, but not the less sure, of a pre-existing creation. When Robinson Crusoe saw one single foot print on the sand, the inference he drew was that savages—in the plural—had been there. Judging from the style of argument used not unfrequently by geologists, when they infer the insignificance and paucity of the primeval faunas, from the scantiness of relics of them as yet brought to light, we can fancy, had one of these gen-

tlemen been placed in the position of the immortal Crusoe, he would have concluded that a single savage only had visited the island, and that the said barbarian had only one leg. Below the whole vast mass of Silurian strata are mighty rocks that exhibit in their structure no evidence in favour of a beginning of things—sandstones, mudstones, and conglomerates, that testify unmistakably of calms and storms, seas and shores, torrents, and mountains whence those torrents flowed. Many of these rocks are so changed in texture by metamorphic action—the true cause of the change is still a matter of dispute—that had the seas in which the sediment composing them was deposited, been teeming with living beings, animal and vegetable, we could hardly expect to find a trace of their organisms preserved in their petrified envelope. In the conglomerates forming part of them are pebbles of rocks still older, fragments of ground-up ante-worlds. Can we conceive, arguing from all the analogies at our command, that those early seas and lands were silent and unpeopled; that the continents and islands of our planet were bare and cheerless expanses of rock, and the rivers and oceans desert, unenlivened flows and sheets of water? Deserts we can understand—deserts in sea as well as on land; but we can no more realize the notion of a desert world, a world on which there was no sign of living thing, animal or vegetable, whilst, at the same time, atmospheric influences were in action, making soil on the shore, and sediment in the sea,—the conditions that accompany, cherish, and serve life, active and manifest,—than we can comprehend our planet with its present terrestrial population, without water to break the expanse of the land, or without land to circumscribe the boundaries of its mighty oceans.

Let those who look for physical evidences of a beginning of things cease to rack geology for affirmative answers to their momentous questions, and leave the science to march onwards, truthwards, through the as yet interminable vistas of palæozoic ages. Surely it has been tortured enough for such replies, and many a lie forced from the agonized sufferer. Geology knows of no beginning—the first is beyond her ken and search. So far as we know, and so far as we can anticipate the future, the oldest sedimentary rocks contain fragments of others that preceded them, and of which no traces have as yet been found in either. As far as the unassisted eye and mind of man can observe and discover, there is sign neither of beginning nor of end to be dis-

cerned in purely geological phenomena. But in the midst of these there is one mighty beginning indicated—the advent of Man, the beginning of reason. And with indicating—not demonstrating, that would be too strong an expression—strong as are the data upon which the naturalist founds his belief in the recent origin of the human race as compared with the great mass, if not the whole of animal and vegetable species extinct and existing—with indicating that most wonderful of all beginnings the geologist must be content, and resign the demonstration to the theologian, the philologist, the ethnologist, and the historian—to each separately and all combined—according to their faith in their capability to make it clear.

Throughout, too, the long series of geological phenomena, we have the appearance and disappearance of specific types, marking, as it were, by animated milestones, the sections of geological time. What we wish to impress alike on our geological and un-geological readers is, that there has been obtained as yet no sufficient proof that creatures whose existence can be traced farthest back in time, were members of the first battalions of that mighty army with which we have only a fragmentary acquaintance, and of which we can, alas, never have a complete knowledge, however much more the progress of research shall make known to us. Families, tribes, and even entire orders, may have perished so as to leave no traces, since to leave any implies the presence of preservable portions in their framework, and the cooperation of favourable conditions for their petrification. How many beings now living are there whose organization is anomalous, and in a manner isolated! Are not such only representatives of lost tribes, legions of animals and plants that have been, and ceased to be, but of whose aspect and extent man can never form an idea? That strange fish, the *Branchiostoma* or *Amphioxus*, for example—how solitary it seems amidst its piscine brethren! If buried suddenly in the sea-mud at the present day, with every circumstance that could favour its preservation, what notion could the geologist of a billion or two centuries hence form of its shape and features? None. And yet, in all probability, this fish is but one out of many—an ichthyic ‘Last of the Mohicans.’

The desire to lay stress upon the earliest types of life of which remains are found in the fossil state, and to consider them as the first created, as well as oldest yet discovered, has sprung from the preconceived impressions of two very different classes of theo-

rists. One set is intent upon fixing the positive epoch of the first creation, because they dread the notion of an unlimited past, and, through some strange confusion of ideas, regard the acceptance of such a view as antagonistic to Christianity and sound religion. That this most illogical fancy is abroad and mischievous is too certain to be passed without notice, although too incongruous to merit more than a moment's regard. A very different order of minds is anxious to discover a starting point or first genesis of life, from which to develop a system of succession of types proceeding from simplicity towards perfection, and evolving its successive phases through the action of an inherent law. In this latter division are thinkers of the most opposite tendencies; some, earnest and philosophical, seeking only for the truth, but over-influenced by a favourite hypothesis, and often too slightly acquainted with the facts to which they look for support for their arguments; others, biassed unconsciously by peculiar theologies, or by prejudices opposed to all theology. Both classes have contributed to impede the progress of sound geology; but such is the love of mankind for premature certainties and definite creeds, that the great majority of readers of geological treatises, in spite of all the repeated cautions and sound arguments urged in the clearest of language by Lyell and the few who have written in a like spirit, will be found distributed through one or other of the categories we have just indicated.

All, whatsoever may be their favourite hypothesis, so as they do not hermetically seal their minds against scientific evidence—and alas, in these days not a few men of high capacity and ample acquirements feel a pleasure in this self-mutilation of their intellects—all ask of geology to inform them respecting the manner of beginning of the separate species which careful research has shown to mark the epochs of time. Has geology yet answered this question, and if not, can it be answered through her aid?

There are three modes, in one or other of which the variety of specific forms can be supposed to have originated; but which are incompatible with each other. The first is that known as the Lamarckian hypothesis; it supposes all forms now regarded as specific to have been gradually evolved under the influences of time and change, by transmutation from one original germ. In strict biological language, it regards all types of life, existing or extinct, as modifications of one species. The second assumes an immediate evolution of protoplasts of new species from pre-existing species, all being so derived

from an original one. The third and most generally accepted holds the independent creation or calling into being of a protoplast for each species. What might appear at first sight as a fourth mode, viz., the evolution of all the various types either by transmutation or immediate production from several independent original protoplasts or germs, properly falls under the third category, with the idea of evolution, either gradual or sudden, to account for the multiplicity of types, superadded.

To stigmatize any of these propositions as absurd *à priori*, is to talk nonsense. Any one of them may be fairly maintained as a likely hypothesis, until facts can be shown to militate against it. Yet not a little abuse has been lavished on each by the advocates of the others, even when the discussers of the question have professed to argue on purely scientific grounds. Geology has been appealed to in favour of all three: can it give more than provisional support to any one?

The facts of palæontology are most certainly every day going more and more distinctly against the first of these hypotheses—that of evolution by transmutation of the descendants of a single original type. Within the limits of known geological time, we can find no support for this notion. That modifying influences may and do produce varieties in species capable of surviving their action, is known for certain. But we cannot assert in the face of the long array of geological and palæontological facts, that the changes of conditions exhibited in the succession of strata which have been as yet sufficiently explored, effected the gradual transmutation of a primæval type into the numerous and wonderfully dissimilar specific forms of which the remains are preserved in Palæozoic, Mesozoic, and Tertiary strata. Unless the import of geological facts changes materially as research progresses, and new and unsuspected data be brought to light, the science must pronounce against the probability of the first hypothesis; recollecting, however, as we must strongly urge, that there is no inherent absurdity in the notion.

The advocacy of the first and third modes has absorbed most of the controversialists about origin of species. For the second there are but few maintainers, although it is really much more capable of a palæontological defence than the first. The geological difficulties are of a kind that might be seriously opposed by those who hold the scale of formations, as at present received, to be very incomplete; a notion which we shall presently have occasion to show, is more

than probably true. In the present state of our knowledge, it is not in geology that we can hope to find sound support for this mode of genesis; nor, indeed, can we see how it can ever be maintained except as an hypothesis. It is just possible that in the course of zoological or botanical discovery—and we are rapidly advancing in our acquaintance with the facts and laws of physiology—new and unexpected light may dawn upon us respecting the origin of animal and vegetable species. Indeed, only a few months ago, one of the greatest of living physiologists, J. Müller of Berlin, believed—for a moment at least—that he had solved the problem, and proclaimed, from observation, that “animals with separate sexes did not arise in the air, nor in the mud of the sea, but in an organ *ad hoc* within a pre-existing animal.” He believed that he had demonstrated the development of mollusks within radiate animals of the order *Holothuriadae*.\* The facts upon which he founded his conclusion were indisputable, but there was a fallacy in the interpretation which has left us in the position in which we were before.

The simplest interpretation of geological facts, such as we have them, favours the belief in the independent origin of species, and in the permanency of specific types; though this last quality or accident of species need not be affected if we regard them as productions derived by immediate evolution from pre-existing types. Many persons entertain a repugnance to the idea of independent creation of protoplasts. If we analyse their objections, we shall find these, in most instances, to spring from the difficulty they have in comprehending the first appearance of a highly-organized being without a progenitor for it. But if we suppose each new form of being to be derived from another preceding it, whether by gradual transmutation, or by immediate evolution, we must, in the course of what an illustrious Irish philosopher styled “retrograde progression,” come eventually to a protoplast, whose origin, however simple its organization, is as difficult to conceive as the beginning of any number of primary types and genitors, simple or complex. When a sceptical but reasonable old lady was urged by her father-confessor to believe in the miracle of St. Denis walking away with his head under his arm after martyrdom, she, quoting the proverb, replied, that “the first step was the only difficulty.” So it is surely in this discussion about one or more protoplasts. It is as difficult, or rather as impos-

sible, to conceive the manner of creation of the first monad as of the first man, or of one as of many. The balance of facts at present supports the hypothesis of many.

Among the unsettled questions which have sprung out of geological research, that respecting the much disputed progression of organization of animals and plants in time, is one upon which future labours are sure to throw much light. Even within the limits of the portions of the world minutely explored, the doctrine of progression has assumed a different phase, as the work of each year reveals new forms of ancient life. At first maintained to be true with respect to class, order, and tribe, it has gradually been narrowed to the maintenance of the precedence, in time, of invertebrata before vertebrata, and, very nearly, to the precession of appearance of the great groups of vertebrata only. Among them there is assuredly, at present, the semblance of a progression. But the question still comes up, how far does this semblance depend on the chances of preservation of aquatic creatures as compared with terrestrial? It is an ominous fact, that in those tribes of animals which, above all others, are most likely to be preserved abundantly in the fossil state, there is no, or to put the expression in the mildest form, only very obscure indication of progression. This is well stated by Sir Charles Lyell in his excellent introductory remarks to the latest edition of his “Manual of Elementary Geology,” from which we quote the following passage:—

“In our efforts to arrive at sound theoretical views on such a question, it would seem most natural to turn to the marine invertebrate animals as to a class affording the most complete series of monuments that have come down to us, and where we can find corresponding terms of comparison, in strata of every age. If in this more complete series of her archives, nature had really exhibited a more simple grade of organization in fossils of the remotest antiquity, we might have suspected that there was some foundation of facts in the theory of successive development. But what do we find? In the lower silurian there is a full representation of the radiata, mollusca, and articulata, proper to the sea. The marine fauna, indeed, in these three classes, is so rich as almost to imply a more perfect development than that which now peoples the ocean. Thus in the great division of the radiata, we find asteroid and heli-anthoid zoophytes, besides crinoid and cystidean echinoderms. In the mollusca of the same most ancient epoch, M. Barrande enumerates, in Bohemia alone, the astonishing number of 253 species of cephalopoda. In the articulata we have the crustaceans, represented by more than 200 species of trilobites, not to mention other genera. It is only then, in reference to the vertebrata, that the argument of degeneracy, in proportion as we trace fossils back to older formations, can be main-

\* See “Annals of Natural History,” for January, 1852.

tained; and the dogma rests mainly for its support on negative evidence, whether deduced from the entire absence of the fossil representatives of certain classes in particular rocks, or the low grades of the first few species of a class which chance has thrown in our way."

The supposed progression of forms in the vegetable world is not likely to hold its ground any more than that of animal types. Gymnospermous trees seem to have replaced angiosperms during the earlier periods, but this was a replacement of compensation, one great section of exogens developed at the expense of another; a phenomenon commonly seen in palæontology, and often mistaken for evidence of progression. But even the angiosperms once supposed to date the epoch of their ample development and variety from the commencement of the tertiary period, threaten to give way before the remarkable discoveries of Dr. Debey of Aix, who, in strata referred by him to the base of the cretaceous system, and by M. Dumont placed still lower, has found an accumulation of foliage in exquisite preservation reminding us more nearly of the fossil plants of our own London clays than of any other extinct flora as yet observed. To the correctness of Dr. Debey's statements we can ourselves bear personal witness, and are sure that the publication of the full details and illustrations of his researches will make a deep impression upon geologists and botanists. Strange to say, amid all the abundant relics of numerous species of dicotyledonous trees and shrubs discovered at Aix, there has not as yet been found a single fragment of corresponding wood! The fragile portions of these ancient vegetables have been preserved in exquisite perfection; the most solid have hitherto evaded the search of indefatigable collectors. What a warning is this to believers in the importance of vegetable facts! We suggest the consideration of its significance to those who are not sufficiently convinced by the many instances adduced by Sir Charles Lyell.

In refusing our assent to the inference that a clear progression of organization is indicated by the fossil fauna and flora of successive epochs, as yet discovered, we would not be misunderstood, and supposed to dissent altogether from the idea of progression. In the face of the great fact of the advent of Man, morally and physically greatest and apparently last, at the head of the animal kingdom, as well as standing alone in his intellect, a kingdom so to speak, in himself, we cannot but suspect, if we do not already believe in, a progression of organized types in time. The analogies between the moral and physical spheres are too striking not to be laid stress upon, and in the advance of human principle

and human intellect—we have unshaken faith in their progress, even although we read the news from France daily in the *Times*—we see evidences of a law of progression that we cannot but believe is universal and all-pervading in its operation. But because we believe in such a law, it does not necessarily follow, that we must, in spite of facts, insist upon demonstrating it amid the fragments of extinct faunas and floras that have survived the wreck of worlds. For us, the arks that bore the primæval types, and those that succeeded again, had foundered in the seas of protozoic time long before the earliest creatures, of which we now find remains in the crust of our globe, flourished. If there were transformations and transmutations, and progressions among genera, it was during the dark and impenetrable ages of pre-geologic time.

Mr. Hopkins, of all living geologists the one whose opinions upon purely physical questions are entitled to most weight, has, in his anniversary address, as President of the Geological Society for this year, put forward in his character as a natural philosopher, an ingenious and weighty argument in favour of a progression in the arrangement of the inorganic matter composing our planet, well deserving of earnest consideration.

"There is one most important agent which has doubtless been most active, not only in producing the phenomena of elevation, but also in modifying the characters of the inorganic matter composing the crust of the globe, and it is extremely difficult to conceive how the activity of that agent can have consisted with non-progression.

"The agent I speak of is *heat*. I assume the truth of the simple proposition, that if a mass of matter, such, for instance, as the earth with its waters and its atmosphere, be placed in space, of which the temperature is lower than its own, it will necessarily lose a portion of its heat by radiation, until its temperature ultimately approximates to that of the circumambient space, unless this reduction of temperature be prevented by the continued generation of heat. If there be any propositions in experimental science which may be deemed incontrovertible, this, I conceive, is one of them. Now we know that the interior temperature of the earth is higher than that of its surface; and, in order that this state of terrestrial temperature may be consistent with non-progression, it must either be a permanent state, or must belong to a series of changes recurring periodically, but producing no permanent temperature. If the present temperature be permanent, it must be maintained by some cause constantly acting within the earth, and generating a quantity of heat exactly equal to that which is lost by radiation into surrounding space. No external cause, such as solar or stellar radiation, could produce an absolutely constant, stationary temperature which should increase in descending beneath the earth's surface. Chemical action might produce this effect, possibly, for a finite time; but philosophers, I

imagine, would no more believe that or any other internal cause capable of producing such an effect for an *infinite* time, than they would believe in perpetual motion, in the ordinary sense of the expression. I cannot conceive, therefore, the present state of terrestrial temperature to be a *permanent* state. Can it belong to a perpetually-recurring series of changes? I would reply, that no internal cause could account for any such *infinite* recurrence, more than for unlimited permanence of temperature. Such infinite recurrence could only be attributed to the external causes of solar and stellar radiation. If to the former, the quantity of heat radiating from the sun must be subject to enormous periodical changes, but still without permanent diminution; if to the latter, it might be attributed either to similar periodical changes in the radiation of the stars, or more probably to a change in the position of the solar system with reference to them, as I have explained in my paper on Terrestrial Temperature. But we shall probably all agree in regarding such hypotheses as extremely unsatisfactory, and utterly unfit to be made the foundation on which a great speculative theory may rest. But however unsatisfactory they may be, I repeat that we have no other alternative but that of adopting one of them, consistent with the most fundamental properties of heat, if we maintain the theory of non-progression, in the strict sense in which I have used the term. And, having placed the theory in this point of view, I might leave it there, without venturing into those speculations which assume the properties of the matter, constituting the stellar universe, to be the same as those which characterize the matter of our planet. Views founded on such assumptions ought to be advanced with diffidence, and held with cautious reserve; but if, with such reservation we assume the sun and the stars to have the same properties as our own planet, with respect to the generation and emission of heat, we must conclude that those bodies must be subject to permanent changes of temperature as well as the earth itself, from the effect of radiation. In such cases even solar and stellar radiation must necessarily fail to preserve the earth from that permanent change of temperature which would constitute essentially a state of progression. In fact, adopting the assumption just stated respecting the nature of the sun and stars, and reasoning from all we know of the properties of matter and of heat, I am unable in any manner to recognize the seal and impress of eternity stamped on the physical universe; regarded as subjected to those laws alone by which we conceive it at present to be governed."

In admitting the possibility of geological evidence hereafter going in favour of rather than against the idea of evolution of species by immediate derivation of their protoplasts from pre-existing types, we are bearing in mind the probable incompleteness of the received geological scale of formations. We are apt to forget that the tabular classification of epochs—period, and formation, and bed marshalled in linear series, the little epochs printed in small letters, the great ones

in small capitals, those still mightier in large capitals, and so on, as custom sanctions—is only a provisional and conventional arrangement, well adapted, if used discreetly, to further the advance of the science, but as likely, if it be received as an article of geological faith, to arrest progress and delay the recognition of truths. It is what the sexual system was in botany, and what Linnæus, its immortal inventor, intended that memorable device should be, a great assistance in gathering and arranging facts, a good index and a means towards a mighty end. Let us beware of the mistake made by so many botanists, who contrived to fetter their science by the very scheme invented to set it free. Equally let us not, because disgusted with a misuse of a good thing, fall into the stupidity of confounding the abuse with the instrument. Geology is just at the stage of its career when this danger is likely to waylay it. Such terms as *silurian*, *devonian*, *oolitic*, *cretaceous*, *eocene*, *miocene*, are employed in speech and writing frequently as if they were fixed, unchangeable, and cosmopolitan. Moreover, they are enumerated with their principal subdivisions as if they expressed the full and complete sequence of sections of geological time, and by too many persons, as if there was a definite and sharp line of separation between each chronological division. What do they really signify? Do they represent truly the terms of the chrono-geological scale? Is future discovery likely seriously to modify them?

They profess to mean systems. A system in geology is like a genus in zoology and botany, an arbitrary division for one person, an attempt to express a natural group for another and more philosophical head. It is consequently a term of very different value in the writings of one geologist to that which it enjoys in the works of another. What one calls a *formation*, his neighbour calls a *system*. Yet each, if he be aiming, as we presume is the purpose in most instances, at the establishment of a natural group in time, is really treating of the same order of thing, with a difference only in degree. It would be desirable, doubtless, that we should have one uniform terminology—but the age is not ripe for such an invention yet. We are working towards it, but must not hurry. An idea is gradually being evolved out of the efforts at the discovery and defining of geological subdivisions. It is the idea of *facies*. The faunas and floras that have succeeded each other, interlacing in their succession, during the course of geological ages, exhibited from time to time peculiar combinations of forms, affinities and analogies, which taken in their totality, im-

printed a recognisable *facies* on each assemblage of organisms—on the population of the earth and sea during successive epochs or groups of ages. When a palæontologist is shown a number of unknown fossils from a distant and unexplored country, he recognises almost instinctively an aspect in the collection which induces him to declare them, with little hesitation, to be palæozoic, or oolitic, or whatever the term may be. The pure geologist seizes with avidity on this determination, and assigns to the rocks from whence the specimens have been obtained a definite position in his scale of formations. If the naturalist recognise a previously determined species, his colleague is the more certain of his decision, and from the shell or plant or coral that is known decides upon the age, to a nicety, of the rock and region that are unknown. Nevertheless, it is more than questionable whether identity of species in two or more very distant localities should imply synchronism of age of the strata wherein they occur; indeed, it is less than improbable that the inference drawn from the fact should be exactly the reverse. If so, what becomes of the hard horizontal lines drawn on our tables and diagrams between systems and formations? They have been assumed, it is true, from the consideration of facts—but facts of a local character, and important only in connexion with limited regions. In reality, we are often endeavouring to apply a scale which, in its subdivisions, is true only in Britain and part of Europe, to the whole world. The procrustean operation has been too often performed by geologists.

Regarding, then, the geological scale of formations as an artificial scheme founded on local considerations, although an instrument and standard of comparison of great value when used judiciously, the questions have still to be answered which demand whether the terms of its graduation be required, and whether, such as we have them, they are complete. There are reasons for believing that they are far from being so, and that future research will intercalate many unrecognised stages.

See those jetty, sturdy stripes of demarcation painted on every diagram between the terms palæozoic and secondary, secondary and tertiary! Those lines are popularly understood to mark the boundaries between a complete cessation of one great system of types of species, and the commencement of an entirely new series of creatures, animal and vegetable. They really mark prodigious gaps in our knowledge of the sequence of formations and the procession of life. We endeavour to conceal our ignorance by the narrowness of the strip of black paint and

the proximity of the words on each side of it, where the minutest subdivisions of palæozoic, mesozoic, and cainozoic are blazoned forth in all the hues of lecture-room heraldry over a space that buries in insignificance the intervening band of black, itself a bar sinister, which for the legitimate geologist has no attractions. One of these supposed impassable barriers, that between "tertiary" and "cretaceous," threatens rapidly to give way and to vanish in due time as speedily as artificial social distinctions in society. In France, in Germany, in Belgium, in England, there are symptoms of an intergrowth between the long separated chalk and eocene. Strata are coming to light which rudely insist on finding elbow-room among our neatly-packed systems and formations. Janus-like fossils are turning up with two sets of features. Our preconceived notions of what ought to be are sadly disconcerted. An already extensive terminology is threatened with an inundation of new terms, too necessary to be evaded.

If we are not greatly mistaken there are little clouds rising on the geological horizon that indicate revolutions elsewhere in the series. That black line drawn between the words "Trias" and "Permian," has more meaning in it than its thin dimensions indicate. The line between "eocene" and "cretaceous," has swollen out, broken up, and is enlarging fast into intermediate sections. But all its changes and increase will be as nothing compared with those which must take place by and by in its representative lower down. If we interpret aright the signs indicated by extinct organisms preserved to us in palæozoic rocks, and the comparison of them with others contained in the lowest mesozoic, or secondary strata, there is a gap in our knowledge of the succession of formations, the extent of which it is almost disheartening to think upon. Although the palæozoic fauna and flora are assuredly portions of the same unique system of organised nature with the assemblages of creatures of after-date in time, they exhibit differences in detail so great that on superficial consideration we might almost be inclined to regard them as belonging to some other world than our own. These differences are such as at present set all our calculations respecting the climatal conditions of the primæval (palæozoic) epochs at defiance. But that these oldest of creations were linked with those that came after and those amidst which we live, is evident in the number of generic types common to all, and expressed yet more strongly in the presence of straggling representatives of types of life, characteristically palæozoic, among the very latest strata of the secondary period. All ana-

logy, however, teaches us that there is a graduation of one geological epoch into another; and every day's advance in research goes to confirm this belief. The facts to which we have alluded indicate evidences of such a graduation of palæozoic into mesozoic. But the stages of that graduation, the intermediate formations, have not yet been discovered. Calculating from the amount of the blank in the series of organized types, there must have been a vast interval of time intervening between the Permian and Triassic epochs, during which, doubtless, sediments were being deposited in seas, sea-beds upheaved, animals and plants flourishing, generations and generations, nay more, creations and creations (we use the popular and hypothetical term, for want of a better) appearing, succeeding, and disappearing; and yet of all these mineral accumulations and organized assemblages there has not been as yet a fragment found.

"They are but ill discoverers," wrote Lord Bacon, "that think there is no land when they can see nothing but sea." Columbus had fewer signs to warrant his belief in a new continent than we have to indicate an unexplored, and, as yet, unseen geological world. Such signs cannot be dissipated by any appeal to the series of strata already investigated. The answer to that appeal would be favourable to our hypothesis; moreover, in the present state of our knowledge of comparative geology, it would be folly to claim infallibility for geological scales founded upon the examination, partly minute, partly superficial, of regions chiefly confined to the land of the northern hemisphere. If we jot out on the map of the world those portions which have been sufficiently examined at once palæontologically and geologically, the space covered by our ink makes but a poor show; yet only about such districts can we lay claim to sufficient knowledge—if, indeed, knowledge be ever sufficient. Our hope lies in the rapidly advancing progress of comparative geology, especially through the aid and sure operation of organized surveys. All over Europe such surveys are in progress, or about to commence, sanctioned, as they ought to be, by governments of every shade of opinion. At their head are able and eminent directors, all of them imbued with that unconquerable love of laborious research which seems essential towards the construction of a good geologist. In America the States of the Union have long shown their enlightened appreciation of the importance of the work; and the fame, zeal, and ability of American geologists fairly places them side by side, and on an equa-

lity with their fellow-labourers in the Old World. Their reports, chiefly published by order, and at the expense of the several States, form a library in themselves brimful of original and important information. No European geologist, studying among palæozoic strata, can claim to be master of his chosen subject unless he be thoroughly versed in the geological literature of America. The colonies and dependancies of Great Britain are not left without their explorers. In Canada, there is a state survey far advanced, under the direction of Mr. Logan, the scientific results of which already take rank with any produced from European institutions of the same kind. The East India Company has established a geological survey in India, with Mr. Oldham, the predecessor of Mr. Jukes in the direction of the Irish geological survey, as chief; an appointment sure to prove satisfactory, and already, it is rumoured, becoming fertile in remarkable discoveries. Our Australian colonies are not behind in the appreciation of the importance of geological research; surveys are in progress, or about to be instituted, and we may fairly look for valuable scientific as well as economic results from the experience and practical knowledge of Mr. Stutchbury, and the sound training and youthful ardour of Mr. Selwyn.

Some three or four years ago it was publicly declared that the geology of England was done: a plausible announcement, since almost every corner of the country had been subjected to the tramp of ruthless invaders and the blows of their un pitying hammers. Yet, if we are not greatly mistaken, even the geology of England, the best-worked district in the world, has still to be done. It is sketched out; admirably sketched out. Portions of it have been developed with wonderful skill and ability. But by far the greater part will yield a luxuriant harvest of discovery to those able and willing to enter upon the task. Compare any sheet of the Ordnance map of England after it has been reissued with the geology laid down upon it by the Government surveyors, with any pre-existing geological map of the district, and see there what an amount of fresh detail has been educed by the patient labour and un-hurried explorations of the mostly youthful geologists to whom, under the superintendence of Sir Henry de la Beche, the work is due. The economical value of geological researches depends mainly on such work; the minuter the better for practical purposes, and if not minute, it is more likely to mislead than to guide. The nearer we

come to geologizing by inches instead of by square miles or leagues, the more valuable, and at the same time the more interesting, will be the results of our labours. Ages must elapse before we can hope to obtain similar results from all countries of the earth. And yet until we do, not even the geology of England, small though it be, can fairly be said to be completed: for not until we have obtained a full and minute knowledge of comparative geology, can we understand clearly one half the facts and phenomena exhibited in the structure of any country, however limited, in the world. The geology of the superficial deposits, of the so-called "Drifts," has been little more than commenced. "It is a branch of our science," remarks Mr. Hopkins, in his excellent and suggestive "Anniversary Address," "which has been making of late great progress, but in which much yet remains to be done before we arrive at a complete knowledge of the phenomena, and those sound theoretical views which may command something like unity of assent." It might almost be said that we know less of the history of the later than the older geological epochs. Until of late years they have been slighted by field-observers, and even at present the superficial drifts are frequently unnoticed in local geological memoirs, and rarely indicated on geological maps. What a field for future discovery is here!

As geological science advances—and every year it is becoming more and more certain—the question will arise whether it can be applied to the purposes of ordinary education—whether it can take its place alongside of astronomy and geography as at once a source of sound mental exercise and useful knowledge. Since the end aimed at in education is the developing and strengthening of the intellectual faculties when in that plastic condition which experience has shown to be their state during youth, none save the pedant or bigot would assert that the faculty of observation—of all others that which men are practically called upon to exercise in their every-day operations—should be left untrained. Nevertheless, such is the force of habit, the great mass—almost all—of our educators ignore, in practice, the training of the observing powers; not, in all cases, because they are opposed to the attempt, but because they do not know how to set about it. The plain and evident way is through the aid of natural history in one form or other. But since natural history is not taught to the teachers, it is not likely to be taught by them, or if attempted is likely to be so treated as to do

more harm than good. Yet assuredly the day is approaching when in some shape it will constitute an element of general education; and, since that must be, it behoves us to consider the best way of availing ourselves of its good qualities in good time. There are three forms in which natural history presents itself for such a purpose; physiology, systematic botany or zoology, and geology. Whilst some of the leading facts of the first may be taught as so much knowledge to the schoolboy, it is very questionable whether exercises in superficial physiology would be likely to serve the purposes of educational training, and doubtless, if we go deeper, there is a great deal essential and fundamental for the understanding of physiological inquiries, which must be reserved for the adult mind and for matured capacities. Systematic and descriptive natural history, on the other hand, is admirably adapted for educational purposes, and with efficient instructors, who, however, to be such must be physiologists beforehand, might be turned to great account. A considerable amount of natural history knowledge might be imparted with facility in schools, but this is not all that is required. More than this, however, can scarcely be hoped for without professional instructors, and such are not easily to be found. Now geology is, of all the sciences that regard animated and inanimate nature, the one which has the rare qualities of being at the same time interesting, suggestive, and untechnical. Its leading truths can be thoroughly comprehended without any preliminary foundation of peculiar knowledge not to be acquired in the ordinary course of education. Of that course it can itself be made an efficient element, for the examination of the simpler geological phenomena, such as those presented by sections of strata, examples of which are at hand everywhere, is as good an exercise of the observing powers as master or pupil could desire. Moreover, it is one sure to attract, and, from its out-door character, peculiarly likely to be popular with youth and intelligent boyhood. It has those qualities of bulk and relation to great questions which impress the young observer with the importance of what he is doing, and such an impression is a great aid towards the success of the teacher. Physiological study, independent of other objections, is repulsive to most youths on account of its sedentary character. Descriptive botany and zoology, though attractive to many, appear trifling to more, if not rightly comprehended or if opposed to their natural bias. But the study of the structure of the world on which we

live, of the anatomy of the mountain and the cliff, of the building-stones of our planet, can charm all save the dullest. Associated as it is with a vague notion of its practical importance, it enforces a respect even in the minds of the frivolous that cannot fail to assist the exertions of the instructor. Under its influence, capacities, otherwise difficult to move, may be developed and even genius elicited, which, with ordinary methods of training, would have lain dormant and unproductive.

ART. IV.—LORD JEFFREY AND THE EDINBURGH REVIEW.

*Life of Lord Jeffrey, with a selection from his Correspondence.* By Lord Cockburn, one of the Judges of the Court of Session in Scotland. In 2 Vols. Edinburgh.

THE young glories of the "Edinburgh Review" have become matter of history. The time is past when it enjoyed such a monopoly of popularity among periodicals that a satirist (himself a Londoner) introduced Gifford complaining that

"So stupid the people are grown,  
They really prefer Scotch Reviews to their own."

It is not merely that years and reflection have brought men to form a more correct estimate of the talent or genius displayed in the "Review:" in fact the old original "Edinburgh Review" has nearly been forgotten. Its tone, materially "modified" (as Lord Derby might express himself) before Jeffrey resigned the editorial office, has since entirely changed. Be the alteration for better or for worse, the "Edinburgh Review" of our days has scarcely anything in common with the "Edinburgh Review" which was (literally) kicked into the street by the Earl of Buchan, and which first taught Byron to write poetry by putting him in a passion. Of that "Edinburgh Review" the far greater part of the existing generation of the reading public knows nothing. They have enough to do to keep themselves *au courant* of the perennial stream of periodical literature; they have neither leisure nor inclination to study its antiquities.

The *Life of Jeffrey* by Lord Cockburn will affect very differently two different classes of readers. Those who are old enough to have been contemporaries of the "Edinburgh Review's" days of novelty, freshness, and petulance, will feel them-

selves carried back to an era of literary productiveness and power, in comparison with which the present appears to them tame and commonplace; to the times when poems by Byron, Moore, Wordsworth and Crabbe, and novels by Edgeworth, and Maturin, and Godwin, and Scott, were issuing in rapid succession from the press; when Sharon Turner, Hallam and Mackintosh in the department of history, Malthus, Ricardo, Mill and Bentham in that of mental and economical science, Jeffrey, Southey, and Hazlitt in criticism, were in the fulness of their productive vigour. The works of these writers were caught up with an avidity of which a generation gorged since childhood with cheap and useful publications can have no conception. As yet railroads were not, but the rivalry for "mail-coach copies" was intensely eager. Poems and works of prose, fiction or imagination, and the two reviews, went off in editions of ten, twenty, thirty thousands in a few days. The eagerness with which their publication was looked for, the impetuosity with which the public scrambled for them, rivalled the enthusiasm of the crowds which in the time of the Peninsular war blocked up the streets of every provincial town, when day after day mail-coaches, with flags proudly flying, brought news of battles fought and won. The intense vitality aroused throughout the whole British community by the country's great internecine duel with Bonaparte seemed to communicate itself to the national intellect and imagination as well. In politics, science, poetry, art, it was a period of feverish animation in which men achieved what in moods of sober health would have been beyond their power.

For the younger generation who are separated from the latest of these days by a gulf of some twenty or thirty years—who have been too intent upon reform-bill and anti-corn-law agitations, upon the labours of a society for the diffusion of useful knowledge and other promotions of cheap, useful literature, to have time or interest to spare for what occupied the minds of their predecessors, the life of Jeffrey will present much that is obscure. The epoch of his literary activity is already too remote to admit of its story being told by mere allusions to persons, incidents and controversies, of which by far the greater part of the living public know nothing; and yet so many of the actors in these scenes survive, that delicacy checks the communicativeness of the biographer. The minute and garrulous diligence of a Pepys or a Boswell is needed to impart fulness and characteristic resemblance to the personal history of authors

and their associates ; and nothing short of a Boswell's placid, self-complacent, obtuse, utter incapacity to feel or suspect that his gossiping revelations violated the sanctity of domestic seclusion, could enable any man to publish a work like his so soon after the death of his hero.

The literary history of Jeffrey and his contemporaries labours under another disadvantage, in addition to this of its being too remote for living interest, too near for the unrestricted communication warranted by the disappearance of all from this mortal scene, whose feelings might be hurt by too faithful a record of their sayings and doings. It is a local, a provincial history—the history of a literature which, though possessing a distinct character of its own, was in a great measure a parasitical plant rooted in the great literature of England, and deriving sap and nourishment from it. It wants breadth and completeness in itself, to interest the reader not prepossessed in its favour by local relations.

And yet there is a peculiar and piquant flavour—racy of the soil from which it sprung—about the Scotch, or more properly the Edinburgh school of literature, that would render a history of it—confined within modern limits—curious and attractive. The nationality of Scotland long survived the Union. It had laws and a great legal corporation, a church and a system of universities and parish schools, an electoral system, in short a complete civil organization within itself, entirely different from that of England, and of which the main-springs all centred in Edinburgh. Edinburgh therefore continued to be a capital in so far as the domestic affairs of Scotland were concerned, though denied all participation in the great imperial movements of the state into which it was incorporated. It had its own *noblesse de la robe*, was the residence of the most active and influential leaders in the church courts, had a university in which the young aspirants to admission among the said *noblesse de la robe* and into the church were trained, and upon which a flourishing school of medicine had been engrafted. There was enough of active business in Edinburgh to develop high practical talents, and enable men to acquire considerable fortunes. The gentlemen of the learned professions afforded a substitute for the Scotch aristocracy who had followed the court to London ; they were indeed many of them cadets of that aristocracy, and some of its least affluent members still lingered among them. The rising manufacturers of Scotland had seated themselves in the west and the north-east ; they came

not near Edinburgh. The intellectual and social tone developed in such circumstances suggested some racy sketches to Smollett in his "Humphrey Clinker," and has been turned to rich account by Scott in his novels. Additional illustrative matter is scattered through the "Lockhart Papers," the letter-press attached to the collected works of Kay, the Edinburgh caricaturist, and the biographies of various literary celebrities of "Auld Reekie." It is essentially Scotch with a strong tinge derived from the English literature of the age of Queen Anne on one side, and from the French literature of the Voltairian era on the other. Hume, Smith and Black, are men who have given a new impulse and direction to the science both of their own and other countries ; but apart from them the *littérateurs* of Edinburgh have been mainly characterized by a certain acuteness and shrewdness, a carefulness of finish rather priggish than elegant, and by the narrowness of range and inclination to dogmatize inseparable from a provincial literature. The preponderating influence of the church and the law tended to aggravate these characteristic defects. The social tone of Edinburgh was not much unlike its literature. The puritanism of its ministers and their kirk sessions, and the pedantry of its lawyers, rendered it formal ; pride of pedigree, the absence of mercantile enterprise, and addiction to literary pursuits, imparted to it an aristocratic dignity and chivalry ; the prevalent narrowness of the citizens' incomes perpetuated a considerable amount of slatternliness in their domestic arrangements and tavern indulgences ; and the recalcitration of independent minds and tempers against the rigid domination of the kirk was apt to degenerate into defiance of all decorum.

Such was Edinburgh, literary and social, from the time of Duncan Forbes to the close of the eighteenth century ; the age of Scott, Jeffrey, and Chalmers, was a transition era. Influences were then at work which have gone far to eliminate the peculiar features of Scotch society, and assimilate it more closely to that of England. The mercantile and manufacturing classes have risen in wealth and influence ; doctrines of mercantile law, and forms of legal procedure adopted from England, have modified or superseded great part of the old law of Scotland ; the internal struggles of the kirk have shaken it from its supremacy ; the Reform Bill of 1831-2 has revolutionised the political relations of Scotland. The records of the period during which these changes were elaborating is a curious

chapter in the intellectual and social history of Scotland. The materials for this chapter still lie in a great measure scattered and dispersed. Already, however, some valuable contributions to it have been made patent to the public. The most recent are the "Life of Lord Jeffrey," by Lord Cockburn, and the "Memoirs of Chalmers," by his son-in-law, Dr. Hanna. These, together with Lockhart's "Memoirs of Scott," which have now been some ten or twelve years common property, afford various curious peeps into the literary activity of Scotland during the first half of the nineteenth century; the social relations from which it took its direction and peculiar character; and the changes it has wrought in public opinion and sentiment. Scott, Jeffrey, and Chalmers, have achieved a reputation, their writings have exercised an influence beyond the limits of their own country; but to understand the men and their works thoroughly they require to be viewed in connexion with the society of which they formed a part.

The biographer of Jeffrey possesses some high and rare qualities for the performance of the task that has devolved upon him. For half a century he was intimately associated with the hero of his narrative—his friendly rival in the contest for professional distinction—the loved associate of his hours of relaxation—the faithful partner of the political proscription of his earlier, and the political triumph of his later years. Henry Cockburn has been endowed by nature with talents and qualities to which a certain constitutional indolence has perhaps prevented him from doing full justice. Of a cordial and affectionate disposition; seeing through the characters of men with an intuitive sagacity; capable of reasoning clearly and tersely on all practical questions; gifted with an earnest, impressive, pathetic eloquence in his graver moods, with an unsurpassed play of quaint, grave humour in his merrier; no man could be better qualified to know and portray Jeffrey, as a distinguished man can only be known and portrayed by the discriminating love of a kindred mind; by one who shrinks not from telling the whole truth, but always in a reverential and affectionate spirit. An exaggerated tone of provincial patriotism—partly sincere, partly affected—in which Lord Cockburn is pleased to indulge when expatiating on the merits of Edinburgh and Jeffrey, is rather a recommendation than otherwise. It adds to the interest of his book, while there is no difficulty in making the due allowance for prepossessions so frankly and ostentatiously avowed. But a reluctance to reawaken old grudges and angry feelings has led Lord Cockburn to dismiss with a mere allusion,

some passages in the political career of Jeffrey which were necessary to a full understanding of the man and his time. And possibly anxiety to preserve the due stateliness and dignity of a Lord of Session has prevented Lord Cockburn from recording some characteristic traits of the society of which Jeffrey formed the centre, which no one could have done more felicitously, had he seen fit. Lord Cockburn's ability to sympathise with, and participate in the *abandon* of the social hour, when men's characters display themselves most truly, cannot be doubted by any one who will turn to his exquisite sketch of that most grotesque of lawyers, John Clark. But all his other characters—Sir Henry and Sir James Moncrieff, Sir James Gibson Craig, &c., if they partake—as has not unjustly been said of them—of the weighty sagacity of Clarendon, partake also of his skilled diplomatic reserve. The personages, in short, who figure in the pages of Lord Cockburn are always arrayed in their drawing-room attire, and speaking and acting with drawing-room punctilio. Yet they could and did unbend—in a manner, it might be, as Samuel Johnson did at the Mitre; and Lord Cockburn could have told something of their "high-jinks" without derogating from their characters. Sydney Smith understood this when, on his last visit to Edinburgh, he insisted upon carrying a party of ladies to one of the few remaining parlours with sanded floors, below the level of the High-street, in which oysters were still consumed, in order to show them how Jeffrey and he enjoyed themselves when as yet the "*Edinburgh Review*" was not. A hint, for example, at the close of one of Jeffrey's letters to Mrs. Rutherford—"M'Bean has just renewed his wig, and looks as young as a viper who has just cast his enamelled skin"—might have recalled to Lord Cockburn's recollection a characteristic scene of "weel-timed daffin," in the gorgeously ornamented drawing-room of an ambitious and rising W. S.

The truth is that, grave or gay, Lord Cockburn deals too much in abstractions and generals to convey a perfect or satisfactory notion of what Jeffrey was. Jeffrey's writings are almost as much below his real powers, as we learn from Boswell that Johnson's were. Even the speeches delivered by Jeffrey on important occasions—or what he and his friends deemed such—are insufficient to explain his really deserved reputation for subtle, and brilliant, and vivacious ingenuity. Whether writing or speaking, conscious effort shackled his genius, or led him to smother it beneath a superfluous load of redundant verbiage. His very letters to those of his correspondents with whom he felt most at ease,

are not altogether free from this latter defect, though they contain many delicious indications of the real Jeffrey. He did most justice to himself in familiar conversation, or while pleading some case in the courts of law, to which he attached little importance. On such occasions he gave the reins to the spontaneous flow of his thought and fancy; and the result was inimitable. The secret of this peculiarity—through which it came that he was great on unimportant occasions, and too often the reverse on great occasions—is sufficiently apparent from Lord Cockburn's narrative.

The life of Jeffrey falls naturally into three divisions:—the preparatory stage, during which he was educating himself, from his birth in 1773, till the appearance of the first number of the "Edinburgh Review" in 1802; the stage of successful effort and growing reputation from 1802 till his resignation of the editorship of the review in 1829; the stage of comparative failure in official life, embracing the close of his career. In the first of these stages we find him animated by a precocious ambition of literary distinction, incessantly reading and writing; reading books so numerous and so various as to indicate the absence of a preponderating taste or talent for any one special field of intellectual effort; writing so unintermittingly that the development of the faculty of expression advanced far before the development of the powers of thought. The consequences of his inversion of the natural order in the unfolding of his mind, may be traced throughout the whole of his after career. He never thoroughly mastered any one branch of knowledge. He originated no new opinions, or trains of thought. His mind had no power of setting itself in motion, or choosing its own course; it required to be impelled by the suggestions of some book, some cause given him to plead, some topic started in conversation. To such suggestions both intellect and fancy responded with amazing promptitude and exuberant fertility. His perceptions, though not deep, and embracing no wide scope, were quick and clear. He readily apprehended isolated propositions, devised lucid and striking expressions of them, and illustrated them by copious analogies. As a critic he was unsatisfactory, from his inability to attain to first principles, or combine them into a system. His mind, preoccupied by theoretical formulæ, devised while his powers of expression were yet in advance of his powers of thought, was almost impervious to the thoughts and images presented in the writings of others. His reviews of poets in particular are little more than ingenious expositions of certain preconceived canons of taste and condemnations of all that is inconsistent, or that he believes

to be inconsistent with them. There is much that is plausible, or even true, in his reviews of Scott, Wordsworth, and others; but it is in general quite irrelevant to the poems ostensibly under consideration. It might have been said with equal propriety *à propos* of any other poem, and has no bearing on the merits or demerits of the one he professes to be criticising. He controverted the theories of poetical criticism, announced in the prefaces of Wordsworth, Southey, or Coleridge, as he would have controverted the opinions expressed by any preceding speaker in the Speculative Society, simply as an exercise of dialectic ingenuity. Their poetry—or the poetry of any of his contemporaries but Crabbe—he does not appear to have felt or understood, or made any effort to feel or understand. Where he has to deal with the works of systematic thinkers, like Bentham or Stewart, or with an abstract principle, like Parliamentary Law Reform, he is equally at sea. He throws out a number of brilliant and ingenious thoughts, but never arrives at any definite or satisfactory conclusion. His best reviews are those in which he has to deal with novels, the scene of which is laid in domestic life, with books of travel, memoirs, and collections of letters. He is then able to expatiate, untrammelled by the necessity of establishing a principle; and he goes on, pleased himself and pleasing others, throwing out innumerable just and striking remarks on social usages and maxims, and innumerable playful and beautiful images. He was, in fact, better qualified for becoming a graceful and instructive essayist, in the manner of Steele or Addison, than for playing the part of a critic. Two things only prevented him from attaining to the felicity of these writers—the cumbrous and inappropriate form of the review, assumed by his essays, and the habit of indulging in verbiage, contracted by his precocious habits of incessant composition.

The same qualities which characterized his writings pervaded his forensic and colloquial efforts, were there more perfectly appropriate, and even contributed to the success and efficacy of the former. The business of the advocate is to present the case of his client in as plausible a shape as his client would do for himself were he able. He has no abstract principle to discover or establish; he has to take for granted some maxim of positive law, and so to arrange and state his facts, that his dialectic skill may be able to convince the judge that it is applicable to them. Distinct conceptions leading to clear expression, habits of neat and perspicuous arrangement, a tenacious memory to retain the maxims of the positive law, and the

statutes or judicial decisions in which it is contained, an extensive and varied range of not very profound general knowledge to supply apt and pleasing illustrations, self-possession and ready command of language—these are the requisites of the forensic orator. And all these Jeffrey possessed in an eminent degree. His knowledge of law could not be said to be either profound or systematic, but the tenacity of his memory was inconceivable. He never forgot a case, judgment or statute, that he had once examined. When an agent addressed him suddenly in the Parliament House about any cause to which his attention had not recently been turned, he might hesitate for a moment, but the mention of one precedent recalled all the rest, and he was immediately as much *au fait* of the question as if he had just risen from studying it. A sound practical judgment, and a habitual dexterity in making the most of what he knew, enabled him to turn his desultory and incomplete acquaintance with the law of his country to better account in pleading than many sounder and more learned lawyers. In aid of these qualities came his talent for lucid narrative, the range of illustration which his extensive miscellaneous reading had supplied, a light natural grace of thought not the less piquant that it sometimes bordered on flippancy or petulance, above all, an intense vitality that seemed to pervade his whole being, making his ideas as they arose more like realities than their types. His redundant vocabulary was here rather an advantage than otherwise. The first word that offered itself was caught at, then another that seemed more appropriate was allowed to let fall, a third or even a fourth might be suggested. Every additional word presented its corresponding idea in a new and clearer light; the auditors felt their apprehensions grow more distinct along with those of the speaker; they were enlisted as associates in the process by which he was clearing up his own ideas. They insensibly and unconsciously adopted his ratiocinations, and while following his lead appeared to be working out his conclusions as their own. Their judgments were fascinated, enthralled, led captive. The same witchery pervaded his social conversation, the only difference was that, as a pleader, while pleasing he was still more convincing, as a companion he pleased more than he convinced.

This very peculiar conformation of intellect and fancy was combined with a disposition almost feminine both in its beauties and its faults. The exquisite moral purity that animates all the writings of Jeffrey per-

vaded his conversation also. He shrunk from grossness like a fine-minded woman. Allied to this was a lively sympathy and delicate regard for the feelings of others. His sense of what is just and honourable was rigorous, his benevolence large. All these are qualities in which women are generally found to excel; and he combined with them that love of pleasing, sometimes seducing into flattery, that is characteristic of the sex. But he had also much of their irresolution and disposition to be guided by more robust, though not more elevated or worthy natures. This weakness is apparent in his early correspondence about the Review, where he frequently apologises for something that has appeared in it as the result of his compliance with the wishes of some impetuous contributor against his own better judgment. It kept him through life rather an ornament than a leader of the political party to which he attached himself; a kind of constitutional chief placed in the van by his colleagues when they wished to make a good appearance, and treated in the eyes of the public with the utmost deference, though in fact he had received his cue from these same deferential gentlemen behind the scenes. This infirmity of purpose, confirmed by advancing years, became painfully apparent after he entered upon his official life, and rendered that point of his career distasteful to himself, disappointing and even humiliating to his admirers.

As might be inferred from this analysis, Jeffrey enjoyed a twofold reputation. One was the result of personal knowledge and observation of his intrinsic qualities, his graceful vivacity, acute perceptions, playful fancy, purity, generosity, honour. It was just, and cherished sincerely and affectionately by all who knew him. The other was the result of his position; the not unnatural tendency of those who saw him only from a distance to attribute to him—the visible and permanent representative of the “Edinburgh Review,”—almost all its merits, as they held him responsible for all its faults. This Jeffrey of the wider public was a very different man from the real Jeffrey: a much more powerful and accomplished, but a much less amiable man. The intense love borne to him by his intimate associates, however, and the veneration with which his countrymen are accustomed to regard a successful barrister, came even here to stand him in good stead, and keep even the grim Eidolon of the “Edinburgh Review” as popular as the real Francis Jeffrey.

Yet properly speaking it was only as editor of the “Edinburgh Review” that Jeffrey was a public character—that his perso-

nality must to a certain extent interest those who neither moved in his immediate circle nor lived in his day. It was therefore a sufficiently ludicrous, though not singular perversity, on the part of himself and Lord Cockburn, that they appear all along to have been rather ashamed of this connection. When Jeffrey and his friends first projected the "Edinburgh Review," they were proudly resolute not to accept any pecuniary recompense for their labours. When the good sense of Sydney Smith convinced them that except as a fair commercial enterprise—proceeding on the principle that the labourer is worthy of his hire—the work had no chance, and that with good pay to contributors it must succeed, it was only after some misgivings and hesitation that Jeffrey condescended to become its salaried editor. Even so late as 1827 he appears to have been dubious whether his editorial character did not compromise his gentility. In that year he wrote to Lord Cockburn: "From the very first I have been anxious to keep clear of any tradesman-like concern in the 'Review,' and to confine myself pretty strictly to intercourse with *gentlemen* only, even as contributors. It would vex me, I must own, to find that, in spite of this, I have lowered my own character, and perhaps even that of my profession, by my connexion with a publication which I certainly engaged with on very high grounds, and have managed I think without dirtying my hands in any paltry matters." Like the bear-leader in "She Stoops to Conquer," Jeffrey would only allow his animal to dance to the genteelst of tunes. Strange that men who see no degradation in accepting a fee to plead the cause of a murderer or swindler whom they know to be guilty, should have such punctilio about accepting an honorarium for an unequivocally honourable exercise of their intellects! Jeffrey gladly demitted the editorial office to be made Dean of the Faculty of Advocates, and subsequently Lord Advocate; yet as editor of the "Edinburgh Review" he had a European celebrity and position; these legal dignities made him at most but a great man in his own country—not necessarily even there when some of the worthies are recalled to memory who held them before him.

As a mere conversationist Jeffrey's reputation must of necessity be local and ephemeral; even the fame of a successful advocate is of a subordinate and transitory nature. If his name is to survive, it can only be as editor of the "Edinburgh Review." The value of the aggregate numbers of that periodical issued under his direction must stamp his character. He cannot indeed

claim credit for all the learning, all the ingenuity, all the original thought that may have appeared in its pages. But in addition to what respect is due to his own contributions, he is entitled to credit for the judgment evinced in the selection of contributions, for the temper and tact evinced in keeping contributors together and at work, and for the general tone and tendency of the publication.

It is mainly upon its efficiency as an instrument for the diffusion of more liberal political opinions, and more enlightened and tolerant views in social ethics, that the permanent reputation of the "Edinburgh Review" must depend. And it is a curious fact—which can however be substantiated by reference to the list of Jeffrey's contributions at the end of Lord Cockburn's first volume\*—that politics were exactly what its editor least cared for. His comparatively few political articles are such productions on general principles as are delivered from Scotch chairs of moral philosophy. His analyses of books of travels, memoirs of French *philosophes* and their female friends, poems and other works of imagination, are of varied merit. His comments on men, and society and its phenomena, are always sparkling, always genial, often just and instructive. For the literary criticism of the "Review," Jeffrey is mainly responsible. That criticism has retained so little hold on the public mind that it is now scarcely worth while to canvass its merits deliberately. His own contributions in this department occupy a middle position between such blunders as Brougham's review of Byron's "Hours of Idleness," and Hazlitt's reviews of Leigh Hunt and Coleridge. Lord Cockburn asks, "What poet whom Jeffrey condemns continues a favourite with the public, except in the works, or in the passages, or in the qualities, which he applauds?" The only answer to this question is the fact, that not one literary man in a hundred can now tell you what Jeffrey's judgment of any of his poetical contemporaries was, and that his adverse criticism has scarcely retarded the establishment of the poetical reputations of the Lake poets, Joanna Baillie, and others whom he assailed. In literature, the "Edinburgh Review," even under Jeffrey, slowly and imperceptibly conformed to the taste of the age; it assuredly did not lead it.

\* This list is very inaccurate: it omits articles which we have reason to believe were Jeffrey's; and contains some which we know were not his—as, for example, the reviews of "Rimini," and Coleridge's "Biographia Literaria"—both written by Hazlitt.

In the department of political economy, the services of the "Edinburgh" are less unequivocal. Horner grappled with the monetary question in the first number, and continued to mature and develop his views respecting it in those which followed, till he brought it before parliament. The work to which Peel applied a finishing hand in 1819 was begun, and far advanced, in the pages of the "Edinburgh Review." In such publications one good article calls forth many, one sound and judicious contributor attracts kindred minds. The contributions of Malthus, Mill, and (though at a considerable distance from the other three) of M'Culloch, have rendered the "Review" more instrumental in diffusing sound views of political economy than any contemporary publication.

Its services have been equally marked in what may be called the Exeter Hall class of topics, with one exception. The manly sense and deep-thoughted humour of Sydney Smith, and the impetuous, versatile, dazzling genius of Brougham, were devoted from the beginning to the promotion of general education and the abolition of slavery and slave-trade. The cause of Joseph Lancaster, of unsectarian education, of the education of the poor, was maintained by the former against the Mistress Trimmers of the day, with calm, crushing, laughing power. The atrocities of slavery were indignantly exposed. Nor was all the humanity of the writers in the "Review" reserved, as has too often been alleged with truth of the friends of the negro, for those only who had the good luck to be born with black skins. Sydney Smith's advocacy of the cause of the young chimney-sweeps, and his denunciations of spring-guns and man-traps, were among the first attempts to apply a rational reflecting humanitarianism to the minor morals of life. The one exception to the sympathies of the "Review" with Exeter Hall, above alluded to, was in its merciless, unjust, and indiscriminating attacks upon Methodists and missionaries. This topic would be in place in a review of the memoirs of Chalmers. Here it may suffice to allude to the anomaly that puritan Scotland should have given birth to a periodical which perhaps more than any of its contemporaries was inaccessible to the devotional sentiment; and of which all the earlier ecclesiastical articles were imbued with the hard worldly views of those members of the Anglican church who stand equally remote from the fanciful semi-Romanism of the modern High Church and the spiritual zeal of the Low.

In matters of science, physical and meta-

physical, the "Review" was respectable, without being distinguished. Neat and correct mathematical articles, by Playfair, were interspersed with, or followed by, the somewhat presumptuous sciolism of Brougham, and the turgidity of Leslie. The earlier numbers contained rather more than enough of able, but too technical articles on medical and chemical subjects. Their authors, however, were dissatisfied with the liberties which the editor took with their contributions, in order to render them more generally palatable, and drifted off one by one to special scientific periodicals. In geology and natural history generally, the "Review" did little more than chronicle the commencement of the increased interest taken in these subjects in England. Its metaphysics were those of acute and independent minds, who had little or no acquaintance with what had been written respecting them except by authors of the Scotch school. In historical inquiry, the contributions of Hallam, Allen, Macintosh, and Macaulay, imparted to the "Review" the charms of their graceful and genial, though superficial and inexact school. The "Edinburgh" rather lagged behind the age in recording the progress of geographical discovery; the provincial position of the editor rendered it difficult for him to compete against the "Quarterly," which had access to the department of government under which English discoveries were prosecuted. Classical literature was emphatically the weak side of the "Review;" as, indeed, of Scotland. In Jeffrey's private letters, he is constantly desiring his correspondents to obtain for him a good contributor on such subjects; but he never succeeded in getting anything better than some hard plodding investigator of particles, and scanner of measures, whose dry raw material he was obliged to serve up with the sauce of some elegant irrelevancies of his own.

The merits of the "Edinburgh Review" as an instrument of political enlightenment remain to be considered. At the time when it was started there was literally no liberal party in Scotland. A man might have counted the avowed Whigs on his finger. The forty-five Scotch members of the House of Commons were elected by less than five thousand titular landowners and self-elected town councillors. The whole executive power and political patronage of Scotland was vested in a clique of lawyers in Edinburgh, allied to the aristocracy, and thoroughly drilled tools of Lord Melville. The republican principles of the French Revolution had made converts in Scotland; but they belonged for the most part to the lower orders, and their few allies among the

wealthier classes were destitute of political power. The extent to which the people were identified with the kirk, by the Presbyterian parity and poverty of its ministers, and its lay eldership, retarded the progress of opinions associated with lax and sceptical religious principles. The contagion of European example, however, precipitated by discontents arising out of an oppressive militia system, gave occasion to associations and movements of the disaffected, which the compact discipline of the predominant political party crushed easily, and trampled down with the relentless inveteracy of fear. The defeated malcontents assumed the usual characteristic of a proscribed sect,—unreasoning ferocity. The young projectors of the “*Edinburgh Review*” were disgusted by the panic-inspired ferocity of the conquering, and the revengeful ferocity of the defeated. Their politics were of an abstract, eclectic, criticising character. Their isolation from numerous and organized sympathisers, and their provincial situation, remote from the great centre of political activity, perpetuated this character. But Sydney Smith soon returned to his native country, and was speedily followed by two of the most energetic of the reviewers, Horner and Brougham. The sympathies of the literary and fastidious *Edinburgh* reviewers were more in unison with those of the aristocratic English Whigs than of any other section of politicians. The success of the new periodical had attracted the notice of the Whig leaders. Its contributors, who had migrated to England, were gained mainly by the skillful caresses of Holland House, and the political intelligence supplied from headquarters to the provincial editor came thus to be mainly distilled through the medium of the Holland House coterie. The principal channels of communication were Horner and Brougham, two men of diametrically opposite characters, between whose inspirations Jeffrey seems to have stood not unlike Macheath between the clamorous urgencies of Polly and Lucy. Now the massive, well-balanced mind of Horner—amenable to discipline, and sympathising with the Romillies and Macintoshes—carried the day; now the impulsive impetuosity of Brougham, who, to the horror and dismay of Holland House, coquetted at times with Major Cartwright, Bertham, and the Westminster Rump, carried Jeffrey along with him. But in the main, the “*Review*” became essentially a Whig organ, the retailer of the *dilettante*, epicurean liberalism of Holland House. In this character it was confirmed by the opposition of the “*Quarterly Review*,” established to counteract its

Whiggery, and at a later period by the secession of the more stern and systematic political thinkers christened “*educated Radicals*,” by Blackwood, who established the “*Westminster Review*.” The great defect of the politics of the “*Edinburgh Review*” consisted of their being made up of vague, amiable sentiments, rather than of definite opinions or measures. This very defect, however, rendered the “*Review*” a more useful agent of liberal propagandism during the first twenty or thirty years of the century than any work advocating more definite principles could have been; especially in Scotland. There, at that time, no man dared to avow popular opinions: to do so closed against him all prospect of advancement at the bar or in the church, and even excluded him from pecuniary assistance by the banks if he were a merchant or manufacturer. But a number of influences were silently at work undermining the servile spirit generated by these circumstances. The growing wealth of the trading community inspired a sturdier temper, which essayed its young powers in assaults upon the close system of local municipal government. The abuse of patronage in the *Kirk* gave birth to a strenuous opposition in the church courts, organized and led by energetic practical men like Sir Henry Moncrieff and Andrew Thompson. A few of the better spirits at the bar preserved a proud independence, and endeavoured to resuscitate the defunct Whig party. The very vagueness of the politics of the “*Edinburgh Review*” encouraged these sectional and local Liberals to avow their assent to them. The “*Review*” thus became a magnet to attract and hold in combination all the straggling and partial liberalisms of Scotland. The habit of reading it, and taking pride in it as a publication which did honour to their country, insensibly reconciled to its politics many adherents of the dominant party. The whole country became thus by degrees leavened with a leaven of liberalism, vague indeed and indefinite, yet sufficiently strong and pervading, when circumstances had disunited and weakened the old Tories, and when a matured practical measure of Parliamentary Reform was held out, to rally around it, in an enthusiastic spirit, nine-tenths of the population of Scotland.

To speak of the “*Edinburgh Review*,” as was at one time customary with its partisans, as the great enlightener of the age, is simply absurd. The function of the reviewer is to be the medium of communication between the thinkers of his age and the busy public. It was fortunate for the “*Edinburgh Review*” that it sprung into existence at an epoch of intense national

intellectual activity. The part taken by England in the great European struggle between innovating philosophy and old establishments, had kindled a preternatural excitement in the public mind. In this mood men were called upon to discuss practical questions of vital moment in politics and economics. The Catholic Question, the Bank Question, and many others, necessitated a recurrence to first principles in political and economical science. The rapid progress in physical inquiry which had preceded the French Revolution, continued with unabated energy and success. The intellectual, warlike, and political struggles of the age, awakened its imagination as well as its intellect, and called into activity a band of poets of rare and diversified excellence. The "Review" became the interpreter between the contemporary master-minds of England and the masses. It brought their reasonings and utterances of impassioned imagination to the knowledge of many who might otherwise never have heard of them; it accelerated their communication even to the literary portion of society. It acted as a fly-wheel to quicken and increase the power of the action of the intellectual machine. And though much was due to these circumstances, much also was owing, no doubt, to the men by whom the "Review" was conducted. Lord Cockburn disparages unduly the Reviews of an earlier date. But publications which had numbered among their managers and contributors Smollett, Goldsmith, Gifford, Taylor of Norwich, and many more of their stamp, were by no means the contemptible things he is pleased to represent them. The "Edinburgh Review" surpassed them less on account of the superiority of those who laboured upon it than of the better materials placed within its reach, and the more favourable circumstances in which it appeared. Its utility was much diminished by the unacquaintance of its contributors with any modern literatures except those of France and England. It is, in consequence, an imperfect record of the European literary and scientific activity of its age. But it accomplished much for English literature, and breathed a liberal, enlightened, tolerant spirit into the dead political corporations of Scotland. For this, much credit is due, no doubt, to the raciness of Sidney Smith, the reckless eccentricity of Brougham, the solidity of Horner, the precision of Mill, the learned bonhomme of Hallam and Macintosh. But without the cementing influence of Jeffrey these heterogeneous natures could

never have been kept working harmoniously together.

---

ART. V.—THE TENDENCIES OF ENGLAND.

1. *A Sermon of the Perishing Classes in Boston: August 30, 1846.*  
*A Sermon of the Dangerous Classes in Society: January 31, 1847.* By Theodore Parker. Boston.
2. *Labour and other Capital: the rights of each secured, and the wrongs of both eradicated.* By Edward Kellogg. New York, 1849.
3. *London Labour and the London Poor.* By Henry Mayhew. 1851.
4. *The Rich and the Poor.* By Henry Mayhew. (Letters in the "Sunday Times," May, 1851.)
5. *The Leader.*
6. *The Christian Socialist.*

THE Reforms at which England has aimed in the last thirty-six years, have been honestly denoted by this name. They have endeavoured to alter not the essence, but only the form of institutions,—to regenerate, not to re-create. They have visibly effected great results for the middle classes, and have undoubtedly warded off terrible sufferings from the lowest. But inasmuch as there is in England a vast body of persons that live on daily and uncertain wages, and in our greatest towns a large class who may almost be called outlaws; who appear to be beyond any such reforms as have been yet whispered in Parliament, and to remain poor in the midst of wealth; the spirit of philanthropy is in many strongly disposed to become revolutionary, and to proclaim that we need, not reform of institutions, but totally new principles as to buying, selling, and possessing.

We altogether reject this opinion; yet we cannot make light of the fact that a cry fundamentally similar rises in several countries at once. In France, it may take the form, "Property is Theft;" in England, it may satisfy itself with vaguer phrases, denouncing competition, and profits, and capital; in America, by the pen of Mr. Kellogg, it ascribes all poverty to the high interest of money: but in all it means the same thing,—that *Property*, in any strict sense, ought not to exist. Those who talk of the "brute power" of capital, evidently regard private wealth as something dangerous to the community. Those who call it

"oppression of the poor," to receive an interest gladly paid for loans of money by men who are *not* poor, do not understand their own words if they shrink from the principle of periodically redistributing among the poorer all the "superfluous" wealth of the richer.

It is not our intention here to combat these views. We shall not take the pains to show that Mr. Kellogg is under mistake in saying that the State, by *permitting* interest to be received on loans, *gives* to money its value, and that all interest higher than one per cent. ought to be forbidden. It shall suffice us to indicate, that this gentleman opens with the singular assertion, that it is [bodily] *labour* which produces all wealth; and totally overlooks the part which *mind* plays in directing the sinews of the less intelligent. It is, however, more instructive to remark, that even in the United States, where land is so abundant, and both wages and profits are so high, and where no one who has health need be in want, all the same evils of pauperism are arising as in old Europe. No one reading Mr. Theodore Parker's Sermons would guess, by the phenomena which they describe, that they were written on the other side of the Atlantic. And this one fact may suffice to indicate, that the misery does not depend on *economical*, but on strictly *moral* causes. The fault does not lie in low wages, nor in high profits, nor in dear land, nor in usury; but in personal immorality and ignorance, which would not be altered by any redivision of wealth.

In this point of view, the domestic side of Robert Owen's theory is more to the purpose, if by living together in communities as he wishes, men could imbibe that universal moral culture in which, he believes, all the evils of society would quickly find their remedy. But it is a delusion to imagine that well fed communities necessarily grow up in moral self-control, or that any putting together of men into communities will inspire them with high desires: nor, if it would, is it possible to induce the unwilling to enter such conventual establishments. This form of remedy is vain; but the disease is rightly regarded as moral, and wise organization (if it cannot do everything) may do much to abate the evils.

It ought to be farther remembered, that the malady which we discern and lament has always been brought about in other ages of the world,—when great empires have been formed, when centralizing systems have swallowed up smaller ones, when population runs together by hundred-

thousands into towns, and when the poor become a nation that lives by itself, without moral unions to the richer. Such as we now call "the perishing classes," or "the dangerous classes," were in ancient histories, "the city rabble," or "the drags of Romulus," or "the impure crowd;" and every such mass of people was looked on with fear or despair by prudent statesmen or philosophers. Their increase generally portended the incipient dissolution of a free community, since they were always apt to be the ready tools of a profligate usurper.

The prevailing opinion among the old Greek speculators was, that all constitutions recur in a fixed cycle; insomuch that Polybius, while beholding with admiration Rome in her prime of strength and freedom, manifestly anticipates (vi. 9) for her an ultimate fate similar to that of Greece, the freedom of which was crushed by military despots. Out of a chaos of *anarchy* (said they) rose *heroic monarchy*, which was first supported, then supplanted, by an *aristocracy of birth*. This, in time, changed into an *aristocracy of wealth*, and farther into *democracy*. The last degenerated into *mob-rule*, from which came a *tyranny*, and this rooted out the aristocracy and destroyed all national institutions; so that the original chaos seemed to recur when the tyranny had ruined itself. Such a view, with minor variations, presents the circle of national growth and decay comprehended by the ancients.

The opposite doctrine of *progress* more easily finds acceptance with an English mind; whether because we have been long progressive ourselves, or because we held as a sort of religious creed that man is destined to improve. To those who believe in a God, and do not expect the speedy removal of the human race to another world, it seems inevitable to believe that a future better than our past awaits us, and that it is a high duty of each to contribute towards this great result. Moreover, we discern that the destruction of the free governments of ancient times was facilitated by two causes: *first*, that the freedom did not take up all the members of society; *secondly*, that so vast a barbarism lay outside the civilized nations. We must add, that the mutual enmity between the civilized units, whether of old Greece or middle-age Italy, played a large part in the dissolution. But now, the destruction of slavery—the immense spread of civilized art, and the narrowed realm of barbarism—the prodigious extent of reading—the connexion of many nations into a literary republic,—besides the mechanical inventions which

guarantee international communication,—give so novel an action to all political forces, that it would be pedantic and erroneous to assume that the old cycle is all that the world has to expect.

Nevertheless, there is abundance of stern warning given us in the facts of history, not to let any confidence in the doctrine of progress lull us into apathy and neglect. Whatever may be said or hoped concerning the general destined advance of the human race, nothing can be more manifest than that parts of it which once took the lead may fall miserably into the rear. Look at China, stagnant for two or three thousand years, and not likely to improve, except by some painfully convulsive process. Look at India, at Bactria, at Mesopotamia, at Syria, at Egypt, at Anatolia,—all of them once at the head of human cultivation; but, since those times, conquered and plundered by strangers, their native institutions destroyed, their industry disorganized, most of them decayed in population, wealth, and skill, some of them turned into deserts. It is very insufficient comfort to England under threatened calamity, to tell her that human nature is certain to march onward in a splendid career, if that still leaves the possibility, that England for two thousand years to come may suffer the fate of Egypt or of Babylonia.

What then is the actual stage of things in Europe, or at least in England? Can we get any defined perception of the contrasts between our older and our newer state? and of the relation between our present industrial, political, and moral life? So to do seems highly important, if we would judge wisely concerning the "re-organization" of institutions.

Indeed, as to Europe at large, a very alarming phenomenon shows itself. The national institutions have in most countries gone to ruin, and have not as yet been replaced by anything better or higher. Both Church and State have decayed, and in all the greatest communities freedom has been overthrown. For full 400 years this process has gone on in the State. Even France has had something to lose—at least in her comparatively independent church. Italy has for three centuries been a mangled corpse; Spain has deeply fallen; Sicily, long injured by viceroys, but in the past century recovering herself, has in the last thirty-six years been cruelly trampled down. Germany and Hungary, in certain ways morally elevated, are politically in disintegration, and have to regain freedom and nationality. Bohemia, a state formerly in advance of England, has lost her law and rights, her nationality, her religion, her literature, and almost her speech. Holland is

scarcely what she was. Poland is crushed under dread of the knout, the dungeon, the Caucasus, and Siberia, or by the *jacqueries* of the court of Vienna. Scandinavia alone seems to hold her head aloft, witnessing that the old institutions are not unfitted to the age, if only they can be held fast against intrigue and violence.

Such results, over the breadth of Europe, cannot be treated lightly. There is a large class of studious men, who will rapidly settle our difficulty, by assuring us that it rises from confounding political freedom with progress—that the true progress consists in mental growth—that in the State, the *summum bonum* is wise administration, and that this is perhaps best attained in absolutism—that the cruelties of despots are caused mainly by opposition—and that if all the nation would but be submissive to power, all would go right. Before we go farther, a few words on this opinion are needed.

We fully admit that the growth of the human mind and spirit is the highest national, as well as individual end: but all history witnesses, that despotism is ordinarily and in the long run opposed to, and fatal to, any such growth. This fact ought to be familiar to literary men, who, therefore, more than all others, are bound to be irreconcilable to despotic pretensions. Genius arose in Greece with its freedom; and decayed when it fell. In Constantinople, erudition laboured hard for a thousand years together, but with no fruit. Genius proved incapable of thriving under despotism there, or in the Mohammedan dominions. So too, in modern Italy, genius came forth with political freedom; and has been all but extinguished with it. But is it indeed necessary to prove that despots do not love the free diffusion of truth, or free communication of ideas? When the life is gone out of a nation, there is sometimes seen a literary sultan or emperor, who would fain re-animate it; but when a nation really comes to life, and begins to think and compare, and judge, and impart thought, the despotic ruler invariably takes fright, puts a censorship on the press, and endeavours to tune the public mind in his own way. Even without appealing to history, the present facts of the continent witness beyond denial, that despotism, as a system, is the inveterate enemy of general enlightenment. The support of it by those who profess to admire freedom and mental cultivation, is surely suicidal or hypocritical.

Nor can we admit that "good administration" is the *chief* desideratum, even politically. To be able to feel loyal attachment to our government, is a more important thing, than that that government should be wholly

wise. In short, as to a woman it is more important to feel that the man who governs her is her own rightful husband, than that he is wise in his government; so is it with a nation: and the more so, the higher is its mental susceptibility. But we do not mean for a moment to admit, that a despotic administration is *ordinarily* so wise or so just as that of a free state. On the contrary, the "judicious despot," so desired by some, is the rarest of beings, and his power of hindering the malversation of his subordinates is extremely limited. As a general rule, publicity and public censure are essential to good administration; but they are exactly what absolute power everywhere forbids. To connive at injustice is unmanly, and eats out the heart of virtue. A people which will not be guilty of such connivance, *cannot* permanently avoid to stir up the jealousies of despotism, and thereby to make it cruel.

We have named as a phenomenon of first-rate magnitude, so as almost to characterize modern Europe, the decay and destruction of the older institutions, especially by centralizing tyrannies. But it is remarkable how little this *political* is joined to any *moral* phenomenon? At this same time, the consciousness of liberty in the individuals of the oppressed nations is stronger than ever. Neither Frenchmen, nor Italians, nor Poles, nor Germans, nor Hungarians, have an inward crouching towards their oppressors. The nations know their rights and their duties; they are not yet swamped into Roman ruin, nor is their history closed: rather, it is only about to begin.

There is an unmeaning talk (we were going to say *cant*) too often heard, about certain European peoples being "*not yet fit for freedom.*" This is with some a corollary from the dogma of progress. Seeing a nation to be now enslaved, the speculator infers that it is so by the judgment of God for its immorality; but that at some future time, when its morality has ripened, it will become free. Alas! to deliver a man's flesh over to Satan that his spirit may be saved, seems a more hopeful recipe, than to deliver a nation over to despotism that it may become fit for freedom. Such reasoners are not always ignorant, but they seem to forget, that all the freedom of Europe rose out of deep barbarism; rose out of times in which there was little self-control in the powerful, and no wide-spread sympathies in the many; when no class had any power of generalization or any confidence in general principles. The prevailing notion of law was "*their custom*;" their ground for upholding their customs was mainly selfish, or at least concerned their town or their county more than their nation. The

votary of progress may perhaps be shocked, if we speak of a people as "*no longer fit for freedom,*" *because* they are become gentler, more humane, more thoughtful and refined, more cosmopolite, wealthier, more averse to field sports and to the use of arms: but such often are those who are called "*not yet fit*" to be free. The more correct phrase, in the case of many enslaved nations, would be,—"*eminently fit to use freedom, but unfit as women to save it from perfidious violence.*" To save freedom is certainly one eminent duty of a freeman. Unfortunately, the longer a people remains under tyranny, the more feeble, womanish, helpless, and degenerate is it likely to become.

France had been enslaved, but the ambition of her kings made and kept her eminently a military nation; hence, when the monarchy broke down by misrule, the nation did not sink, but was roused into intense energy by threatened invasion. If France had been drilled into dutiful obedience by kings who had foreign armies, she would have been at such a crisis as helpless as the ancient Britons before the Saxons. The Romans had found the Britons chivalrous freemen; they subdued them by superior skill in war, drilled them into "*civilization*," incapacitated them for that self-defence, without which civilization can never be permanent, and left them to miserable destruction. Surely the bold barbarians were better fitted for freedom, and far more likely to become a noble people, than the cultured and gentle provincial cosmopolites.

Spain has lost all her old admirable institutions, through the perjurious violence of her kings, and all her culture has been ruined by the Inquisition and the power of the clergy, which those kings established. She has retrograded into the twelfth century in her manners and arts; yet, for this very reason, she is capable of regaining her freedom twenty times, if she lose it twenty times. Her poverty and her martial habits make it hard to keep her enslaved. Nevertheless, institutions can only grow firm in long time, and her losses are difficult to repair.

No more words might seem needed to point out the grave mistake of supposing a nation to be "*morally undeserving*" of freedom because it is enslaved; yet this notion is singularly inveterate. It is often a part of our national pharisaism, which ascribes our freedom *to our virtue*, and despises others who are less happy. Some even go so far as to propound an apophthegm:—"No nation is ever enslaved, except when it is undeserving to be free;" as though small nations could never be trampled down by greater ones; or as though the division of a great nation into

many independent communities (which generally promotes early liberty and general progress) were a moral fault, because it often exposes them to foreign attack.

That England now "deserves to be free" better than at any former time, we cannot doubt, if her desert is to be measured by her love of legal and constitutional action, her hatred of violence, and her respect for individual rights of every kind. But if, for ever so short a time, she were by any strange accident to fall under despotism, she is far less able to regain her freedom than five hundred years ago; perhaps, indeed, less able than any other nation of Europe. Why? The reply brings us to an *industrial* phenomenon—because she is very rich, very industrious, very peaceful, very humane, very centralized, very untrained to arms, and abounding with sedentary and in-doors population. It is a remark well known to the old Greeks, that the increase of wealth in a nation tends to the rise of tyranny; nor is the explanation of the phenomenon obscure. Where wealth abounds, there either the ruler, or, in a small state, some eminent person, hires a band of soldiers, and seizes despotic authority. Rich men dread the convulsion necessary to expel him, and the secondary shock which will follow. Fearing to lose their property in the process, they not only acquiesce in his usurpation, but give moral support to it, if they have no personal fears. The political behaviour of our wealthier classes leaves no room for doubt, that if England were to find herself temporarily under a despot, who governed judiciously, they would rather support him, than run any risks of collision for the sake of a principle. They would allow every barrier of freedom to be broken down, one by one, and would regard a popular insurrection in defence of our old laws and liberties a dangerous and horrible disorder.

This selfishness of wealth is not wholly without excuse. The *landed* proprietor,—whether called Baron or Squire,—whose wealth arises from the payments of numerous dependants, who look to him as their natural leader, is by no means timid. Such men are strong in their followers; and where they form an order, are the best of all defences against tyranny. But wealth, held in *moveables* or in paper bonds, or in treasure, brings with it no bands of faithful supporters, but only marks out its holder as the natural and easy prey of a tyrant; moreover, the wealth itself is peculiarly apt to be impaired or lost by any civil commotion. No doubt, in a national war, every man knows that he may be slain or ruined, but he hopes for the best, and takes his risk. Commercial wealth, on the other hand, re-

gards itself as the certain and necessary victim, since fear and suspense hurt it, and not merely actual violence. We do not justify this extreme timidity, but in proportion as a man has more to lose, and a higher certainty of loss, deeper patriotism is needed, or keener foresight, to brace his courage to endure it.

In the trades which minister to luxury, the timorousness of wealth perhaps reaches its acme. Who will buy jewels, or chandeliers, or pictures, when the money may, ere long, be needed for sterner calls? The very dread of civil commotion paralyzes many of these trades. In prospect of the 10th April, 1848, so many of English nobility and gentry carried their jewels into the market, that the value of such articles was greatly depreciated. We were informed by a jeweller, that at that time his sale wholly ceased, and he became a large buyer, tempted by the prices. In consequence, when the 10th of April was past, he found his gains to be great, as the market at once recovered itself; but he might have gained much more,—to the full extent of his disposable money,—had he not himself at last been seized with alarm, when he found that everybody was for selling and no one for buying.

The great capitalists who lend money to princes, are of far more permanent harm to liberty, by lending to bankrupt tyrants and spreading an interest in the maintenance of tyranny. Austria borrows money to subjugate Venice and Milan. It is not to be imagined that these oppressed communities, if once free, will ever acknowledge such loans as made in their service, or for their interest; hence the whole of the Stock Exchange is enlisted on the side of the permanence of Austrian domination. This evil will probably correct itself violently, and it is now perhaps too late to bring legal remedies: but it seems to us, that to lend money to a foreign prince for state purposes is by no means a natural right of English citizens, nor one that ought to be ordinarily exempted from state control.

These loans suggest another industrial phenomenon—the Disparities of Wealth, which so characterize modern England, and strike every foreigner. Englishmen themselves, on casting back the eye to our earlier history, when there was no national debt, and when taxes fell on the landed proprietors, are strongly disposed to believe that in our existing system of landed property and finance there is something essentially unjust, which makes the poor poorer and the rich richer. It cannot be denied, that in the past century and a half

he many were\* unjustly taxed, and that various unjust advantages are still held by landlords. But these facts ought not to blind us to a deeper and truer cause of the disparities of wealth. We do not deny that rent has risen enormously; yet in the national scale, the landlords, as a class, have not risen. It is the commercial or professional people, who were emphatically the overtaxed class, that have made the monster fortunes. Against bankers, manufacturers, shopkeepers, and merchants, above all, is directed the blind anger of Socialists, who imperfectly analyze the causes of the offensive phenomenon, which, in fact, extends to that species of capital which inheres in the person. There is not more disparity of wealth between merchant and merchant, or between cotton-spinner and cotton-spinner, than between two barristers, or two painters, or two novel writers, or two opera dancers, or two singers: nor again, is there more disparity between the gains of a merchant and a merchant's clerk, or of a manufacturer and his foreman, than between those of Sir William Follett and his clerk, or between those of Chantrey and his working masons, or those of an eminent dentist and his subordinate assistants. To forbid or to "regulate" profits and interest will fail of exterminating vast disparities of remuneration. The Socialist must go a step farther, and forbid good work to be better paid than bad work, or at least must subscribe a minimum payment for the worst work, and a maximum for the best. Manifestly all high increase of national culture leads to an unlimited depreciation of everything inferior, in comparison to all that is superior. A pure taste despises bad sculpture or bad poetry, as emphatically as it admires the good; while a rude nation is "amusable," like a child, with the rudest performances. The principle which is so manifest in fine art, is as truly active in every department of English life, in proportion to the freedom of trade. To the most celebrated physician or barrister men flock, until his fees forbid access of emptier purses. The possessor of unequalled skill is able to amass riches in a few years, while his humbler rivals are happy if they can live through the year upon their earnings. In the case of the arts

\* No problem of economy seems to us more insoluble, than the incidence of *old taxes*. The difference of opinion between statistical writers on the question whether *the poor* are *now* much or little taxed, is very discouraging. But there can be no doubt that they are immensely less taxed than they were, and that a *skilful* English workman in the towns lives far more easily than at any earlier period, or perhaps than anywhere in the world, except where land is abundant.

and professions, no one who stops short of annihilating all personal right in property can carp at this result: for it is the natural premium to exertion and improvement,—the continued operation of that wisdom of Jupiter which Virgil celebrates:

"Pater ipse colendi  
Haud facilem esse viam voluit; . . .  
. . . curis acuens mortalia corda.  
Ille malum virus serpentibus addidit atris, . . .  
Ut varias usus meditando extunderet artes  
Paullatim."

We well understand, that man was not created for torpor, but for energetic improvement; and we at once discern that the unhappiness of the briefless barrister or of the unemployed physician, when contrasted with the painful overwork of the successful practitioners in each branch, is not a suitable ground for moralizing on "something evidently rotten" in the state of society, but on the contrary, as far as it goes, indicates something decidedly healthful, in spite of the partial pain. There are few indeed who would desire to correct the evil by enacting that all professional work should be rewarded in the same proportion to the time, and that no one should abound in employment while another was deficient. But if the case of professional wealth stands on so clear a moral basis, much more does that of manufacturers and commercial men. The successful cotton printer is not more highly remunerated for a piece of goods of equal texture, than his less successful competitor; but, because his patterns find acceptance, he sells a greater quantity; and hence his wealth. In a majority of cases, the large fortunes are made by selling wares equally good at a *lower* price than others. The mere mention of the fact, one might think, ought to stop all objection in any mind which allows of private property at all.

We have not even yet stated the full extent of this simultaneous change in English industry. In the first quarter of the last century, the skilled artizan of the towns,—we mean the carpenter, the mason, the glazier, the plasterer, &c.,—received no higher wages than good husbandry labourers, and very little more than the least skilled peasant. But, with the great improvement of tools, and the higher skill now ordinarily expected in artizans, their wages are exceedingly in advance of unskilled labour. In fact, compared with the mass of the nation, skilled artizans are becoming an aristocracy: nor is it possible to shut our eyes to the fact, that some of their most important strikes are directed to shut out the unskilled from attaining their skill, and thus competing with them. This by the bye.—We do not ima-

gine that the new position of things can be all gain: it has its danger, and its peculiar suffering. But we must treat it as a monstrosity in *skilled* workmen to make outcry that *they* are an oppressed body: the great pressure of the times is on the *un-skilled* population. Mere sinews without wisdom, judgment, skill, or tried faithfulness, become cheaper and cheaper with every advance in industrial power; and the easier it is to obtain any skill the cheaper it is rated.

To have neglected his professional education, inflicts a lifelong wound on a man who is to earn his support as a barrister, solicitor, physician, or surgeon; and constantly reduces those to the direst straits who have no wealthy friends. In poorer life, to have had no industrial education at all (through neglect or death or misfortune of parents) subjects a man to worse suffering than in ancient times. We do not mean that the real earnings of unskilled labour are lower than of old: probably otherwise: but such labour is more despised, because of the abundance of skill. Even if the proportion of those who cannot get employment is not increased, yet, in so much greater a population, the actual number is increased and is more clustered into masses. It becomes more self-conscious, more capable of union for violence, and politically more formidable. Besides, the unskilled labour which is employed and paid, even if paid as well as in ancient times, measures its fare by the standard of the highly skilled and better paid, and is thereby liable to severe discontent.

But our immediate object is to point at the *fact*, that increased freedom of industry and exchanges has led to a higher appreciation of good work, a depreciation of bad work, great disparities of wages, of fees, and of employment, and consequent disparities of wealth, such as previously existed nowhere except by a process of plunder. A phenomenon extremely similar exists likewise in our intellectual state; though this is by no means so novel: we refer to the enormous disparity of intellectual development in the very same community. In a savage people, the chief and the followers are about on a par in knowledge, mental power, and refinement. Among the Turks the distinction in different ranks is so slight, that the sultan has been known in our own day to elevate a slipper-holder in a very few years to be a pasha, who in that high station showed no mark of his low origin either in manners, dialect or ignorance. The obvious explanation is, that intellectual ignorance is there nearly universal, and so are good manners. Religion, morals, and courtesy, penetrate there

through nearly all society as effectually as in the richer classes. With us, difference of wealth and rank causes difference of habits; out of this rises separation; and out of separation, a degraded state of manners and speech in the ruder part of society. In old days, the baron lived on his estates, among his people, and talked the same tongue as they. Now, the children of the wealthy are educated in public schools and colleges, and talk a single English language; while the peasantry and the working-classes retain in each district a local dialect. In fact, the great length of school and college education among our superior ranks, the after-education of travel, communication with the most intelligent from all parts, and the vast realms of thought opened in literature by leisure and money and by the knowledge of languages, now produce an amount of cultivation wholly unprecedented in past history. In ancient Rome, there was as great a contrast between a Virgil or a Tacitus, and the herd of slaves, as anything that can now exist; but there was no large mass of cultivated men, nearly all of whom were either Greek teachers, or high functionaries of the State.

While the educated part of the community enjoys all the advantages which an immense literature gives, simultaneously with a greater facility of personal communication and locomotion than ever previously existed, much of the practical education of political life, which *freemen* everywhere inherited in the older world, is gone into decay. The more we are governed by functionaries, the less we have of juries and of wardmotes and folkmotes, the less needful it is for common men to know the laws of their country, (which, nevertheless, they are bound to observe,) the more we lose the old education of Englishmen; and those who cannot substitute something higher, fall back into a condition of ignorance, similar to that of ancient *slaves*. The state of mind described by Mr. Mayhew in the "costermongers" of London is wholly slavish; indeed, their state is compared by him, fancifully perhaps, to that of roaming tribes. What is learned from books, if there be no experience of life itself, is apt to be deceptive and pedantic even when there is extensive erudition; much more, to the half-learned, is it an inadequate substitute for the education of practical life. To be able to read, and enjoy half-an-hour's leisure every evening for reading,—even if the books were well chosen,—would be a training of the mind very inferior to that of hearing practical questions (parochial, or civic, or judicial) discussed once a month,

and being called to judge concerning them. In the not unjust anxiety abroad for national education, we fear that too scholastic a notion of education is apt to be prominent; and the severe loss incurred by the repression of free local institutions and by the growth of functionarism, is overlooked.

While moral and intellectual cultivation has become more and more dependent on books, and those who cannot become literary are degraded below the old standard of their class; at the same time each class of society more and more exclusively associates with itself, cares for itself, and sympathizes with itself. This phenomenon will be seen to be more wide-spread, the more attentively it is examined; and the importance of it also grows upon the mind with the study of it. We are disposed to call it the great disease of modern Europe, that the *cohesions of society are in horizontal layers alone*. The extreme opposite to this is, when a country is broken up into a number of petty states, each animated by an intense and exclusive patriotism of its own. To such states perpetual border war is a dreadful curse; nevertheless, population and wealth and intelligence will increase, as long as a tolerable balance of power is sustained. In this condition, the highest, middle, and lowest ranks of every locality are forcibly compressed into an intimate union. Each class feels the need of the other against the foreigner, for all neighbour towns are enemies; and in spite of frequent great sufferings from the ravages of war, yet (if foreign force be not overpowering) this state of things has many great advantages to the lowest orders, who are comrades in war and valued attendants of the highest. But in our opposite state, the poor are held off so far from the sympathies of the higher circles, as to feel themselves in a separate world, if indeed they have not the sense of being treated as tools or as cattle. Out of this follows a *disintegrating of patriotism*. Such is the national stage which we have here reached.

We believe that the *kings* began this European tendency. When the hereditary principle of succession continually gained force, so that for it the welfare of whole realms was sacrificed, and kingdoms degraded into vicerojalities; crowned persons began to disdain intermarriage with any but kingly families, and the royalties of Europe, though in constant rivalry, sympathized with one another as an Order. Hence, also, each king thought his "prerogative" unjustly limited, if it was less than that of his neighbour king; and the despotism violently and fraudulently gained by one, became a pattern and a justifi-

cation to another. The cruelty of their fierce wars has never fallen upon royal persons; and as soon as kings have been in danger from their subjects, they have very generally assisted one another. Naturally, from the day that any king threw off his legitimate and constitutional position, he looked on his people as enemies to be repressed and conquered, and like the tyrants of old Greece, sympathized with the principle of tyranny everywhere. Our own Elizabeth strikingly illustrates the struggle of inclinations in a royal bosom, when she supports Dutch or French or Scotch rebels at one moment, and at the next shows herself half-hearted in their favour. Our Stuarts not only made common cause with foreign monarchy, but at last became its paid vassals: and even in our House of Brunswick, the working of the Royal Marriage Act suffices to declare how great a chasm of feeling has opened between royalty and the very highest nobility.

Although the frequent ennobling of commoners, and the life-tenure of an episcopate, might seem to forbid a like isolation of the aristocracy, it is yet remarkable to how great an extent this is carried. The landed gentry and nobility live far less on their estates and in the provinces than in old times. They pass a larger part of the year in London; watering places or travelling occupies another part: and while on their estates, every increase in refinement cuts them off still more from the society of the other orders. When they hunted more and drank more, we do not say that they were wiser and better men; but they were in closer association of feeling with their inferiors in rank.

How the bishops have separated themselves from the clergy, and joined into an order, is instructively shown in the operations of the (misnamed) Church Reform. In redistributing ecclesiastical revenues, the Commission (under the inspiration of the late Archbishop of Canterbury and the present Bishop of London), instead of treating each diocese as a unit, and employing the superfluous funds of a bishop to relieve the poverty of his clergy, treated the episcopal order as a unit, and made it their first great business to raise the income of the poorest bishoprics to 5000*l.* a year, and build up palaces besides for all of them. Retribution for the deed will yet come on this corrupt and obsolete organization.

The high cultivation enjoyed by one part of our nation, the narrow range of thought in those whose time is eaten up by business, and the deep ignorance of the lowest, make social intercourse between different orders an impossibility, under our existing institutions. At the same time, all the old mercantile

guilds have fallen to nothing—which, mischievous as they were economically, did blend the different ranks of producers; and in their place we have unions of workmen against masters, and of masters against workmen. To the workmen a spurious patriotism has arisen out of this: his club demands and receives from him a loyal self-devotion. To its opinion he is more sensitive than to that of the general community. His honour and his sentiment are wrapt up in it, as that of peers in their *order*; and both the one and the other are worse citizens to their country on that account.

Political economy has also stepped in, to add intensity to the causes which are disintegrating national unions. We trust we shall not be suspected of undervaluing the material truths of this science, or the services it has rendered in exhibiting that the riches or poverty of each nation are shared with its neighbours. It has hereby cut away the roots of bitterness which fed many a deadly war. But while we rejoice in these good results of it, we cannot deny that it has so fixed the minds of many on the material interests of nations, as to aid towards the mischievous heresy, which teaches that these alone deserve the concern of the State. Its truths are very valuable, as are all the calculations of the shop; but they are seldom elevating; and like other science, it is cosmopolite, not patriotic.

No wisdom of economy, nor of Fourierism, can possibly cement a dissolving society, by appealing merely to a sense of *interest*, which is essentially selfish and isolating. Nor can religion, as such, bring us any adequate remedy: for its influences are either sectarian, or cosmopolite. When sectarian, they may produce here and there a community of Rappists, Mormons, Quakers; but, at best, the benefits are partial and temporary; no nation ever was or ever will be taken up by such an impulse, and its inherent unreasonableness insures its decay in the second generation. But when religion is *not* sectarian, it can be nothing but cosmopolite. Its very purity and truth force it to embrace the whole human race; and its grasp becomes too wide for immediate national, provincial, and local coherence.

Nor, thirdly, shall we find any remedy in an improved administration under State *functionaries*. On the contrary, the abler such administration is, the worse does it benumb the political instinct of the upper classes; who, when the work of governing is done well for them, no longer trouble themselves about it, and, finding no necessity to care for the public, care only for their own pleasures or their own tastes, and associate more and more exclusively with

their own order. Patriotism can never be generated by a passive enjoyment of good. We need only look to a city like London, to see the evil tendency of this. The rich who live together in streets of fine houses many miles long—who find that an active police under the control of the State defends them day and night,—who have every comfort provided for them without their interference,—who need nothing from the poorer but what they buy for money, and conclude that the same State which cares for them will care equally for the poor,—such rich men have every inducement to become isolated from all but the few with whom it is pleasant to live. On the contrary, negligent or even tyrannical administration, which made itself felt painfully by the rich, might confer the moral benefit of forcing them into closer union with other ranks and classes.

When a nation once homogeneous is beginning to suffer dissolution into separate orders, uncemented and ultimately hostile,—(a very threatening state of things, assuredly,)—all must see that a reorganization is needed; and we have stated why this cannot rise out of interest, nor out of religion, nor out of functionaries who are proxies of citizenship. Patriotism only grows out of one root; viz., the consciousness of especial reciprocal duties: these must have a definite sphere, and must comprehend every individual in that sphere; hence they must be based on territorial division. The chasm between us will soon be filled up, when there are assigned to all ranks, indiscriminately, *mutual local duties*. Where a population shifts rapidly, it is difficult to sustain patriotism, for the very reason that it is difficult to define and enforce such duties. This will always have to be struggled and dealt with in detail. But in proportion as families are really settled, it is a feasible problem to call them all into the performance of duty, as indeed they have very obvious mutual rights. The experience of Holland shows how great patriotism may be then developed, without the advantage of separative features on the landscape. Where Nature herself has mapped out the country by hill and dale, and wood and brook, and where actual beauty in the scenery kindles the heart's love to a well-known place, it seems easier to fix in the minds of the many an earnest interest in the well-being of all who dwell there together. We believe that such peculiarities in the scenery of a country *are* a real advantage. Still, the multiplied experience of history proves that these influences are on the one hand insufficient, and on the other unessential, for energetic patriotism. The political action of locali-

ties, whether for military training, or for legislative and judicial action, brings together poor and rich of all pursuits, and of all religions, and teaches them that they have a country in common. It instructs in moral right and wrong by action, and not merely by book. It is not like a mercantile union, which appeals to men's selfishness: but to tell men of their duties calls out their conscience, and hereby unites society. On the other hand, mere local *elections*, to which so many of the erring friends of freedom wish popular action to be limited, are precisely its most uncertain part; which, however necessary, is most apt to demoralize and raise parties deaf to reason,—which most divides a community and least cultivates it,—which most of all depends on other influences for its good working,—and which, without a great variety of other freedom and good institutions, is simply a covert tool of oligarchical and monarchical tyranny. Mere elections do not deserve to be called *organization*: they are “a delusion and a snare.”

It is not by accident that in ancient times the Stoics were *patriots*, and the Epicureans *cosmopolites*. The cosmopolite verifies the vulgar saying, that what is everybody's duty is nobody's duty: he is necessarily self-indulgent, (or at best, absorbed in his private tastes,) from the want of definite relations beyond his family circle. In vain shall we expect statesmen to have a higher patriotism than the average of the nation. Whatever good moral qualities we desire in the few who bear office in the central power, must be cultivated in the many, through every locality. We do not at all say, that no man can love England, who has no special love for any one parish; but we do say, that unless special interest in localities is generally prevalent, patriotism must be exceedingly rare in a nation, and is not at all to be expected in a statesman. The lukewarm and shadowy character of patriotism in those who are too cosmopolite, is indeed proverbial. Their principle is practically to acquiesce in any or every sort of government, (under the plea perhaps that the moral and religious influences in individuals are alone deserving of regard;) and when once bad men discover that a large part of a nation cares only for “vigorous and able administration,” the times are ripe for a usurper, who will subvert all the national institutions.

It is wonderful how any can expect warm attachment to the constitution of the country from poor men who know of no institution except a central parliament, to which, of course, they can have no access. The

sense of desolation produced in those who find themselves members of no political union, gives the great impetus to clubs of workmen (which are a mere *horizontal cohesion*), and sends others into longings after Socialist communities. No English statesman will, in the abstract, undervalue local unions; yet, in detail, an absolute parliament always grudges to leave power over local matters in local hands. As the Colonial Office fears that the colonies will act unwisely, if left to their own energies, such also are the parental anxieties of the parliament. We fully admit that a central legislature has its own appropriate functions; but we add, that though omnipotent for evil, its power of good is very narrowly limited. By intermeddling too much, it can ruin a nation; but when it is wisest, every locality has still to work out all the laws in detail; to bestow moral and industrial training, to prevent or to relieve poverty.

We think it impossible to cast even a cursory glance on England,—to see how the metropolis and the parliament have encroached,—and doubt that stronger local authority, for the purposes of legislative, judicial, executive, military and scholastic functions, is a principal want. Pauperism and neglect of children are evils beyond the control of central power. General principles may be laid down by a supreme legislature, but the mode of applying them will differ widely in a vast city and in a petty market town,—in a suburban country and in a pastoral district,—in a manufacturing town and in a watering-place. The differences are so great as to need all the detailed attention of local knowledge, and all the stimulus of deep local interest, to attain adequate organization and superintendence. To complain of the *inefficiency* of local action, is the shallowest trick of despotic centralizers: evidently the inefficiency is contrived by the existing malarrangements. The mass of affairs to be dealt with by an English provincial town, equals those of an old Greek or Italian republic. Give but its full dignity to local service, and competent men will be found to conduct it.

The first obvious step, in order to relieve the overtasked central legislation, and to force the local organs into healthy action, is to refuse *private bills* in parliament, until they have been discussed and approved by proper\* local legislatures; after which, they would at most need a formal and easy confirmation by

\* We are forced by our limits to content ourselves with enunciating the principle; without proceeding to the important inquiry, *what* local legislatures have an actual existence in English law, though at present in mere suspended animation.

Parliament. With the habit of public discussion, the localities would learn their duties, their powers, and their rights; and local organization would assure a new life. Theodore Parker has no need in Boston to dwell on such topics; but he is far too earnest and clear-sighted not to be aware of the mischief of resigning the duties of the state to voluntary philanthropism. Voluntary partnerships in trade are of the best kind; voluntary associations for matters of special taste and opinion must be permitted; but voluntary unions for that which is the universal duty and interest of the nation,—to promote those moral and industrial attainments without which no man can be a worthy citizen,—are a fungus-growth, which tells sad tales of the decay of the tree that bears them. No voluntary schools, or churches, or other societies, ever can take up the whole strength or the whole weakness of society; nor can they ever escape a sectarian or partizan taint. Until public arrangements are made on the assumption that *all* men are active citizens—until public opinion expects all to sustain local duty, the public functions will be performed, not by the wisest, but by the most bustling men, and those who are fondest of power. But when the local organization takes in the whole of the educated and uneducated classes, and each town and each country awakes to a sense of its powers and responsibilities, they will deal with the state of the poor in a fundamental way, quite impossible to a parliament, which at each step encounters local opposition. It may always be necessary for the central power to prompt the local, and remain open to appeal against neglect; but we shall no longer feel bound hand and foot as now. That there will then be no speculative Socialism we do not say, but we hope that such speculation will no longer be goaded on by the public abandonment of entire castes of the population. Disparities of wealth will exist, but are no evil, if there be no degrading poverty; they do but proclaim that mind is infinite, and that neither its achievements nor its rewards can be measured by those of muscle. But as long as vice exists in masses, and children are reared in it, and political authority winks at the fact—so long the subversion of the foundations of society will be calmly talked of by kindly intentioned men; and it will be impossible to foresee what may not be attempted by an alliance of the selfish and the desperate.

## ART. VI.—THE LADY NOVELISTS.

1. *Œuvres Complètes de George Sand*. Paris.
2. *The Novels of Miss Austen, Mrs. Gore, Mrs. Marsh, Mrs. Trollope, Miss Jewsbury, and Miss Lynn*.
3. *Jane Eyre: an Autobiography*. By Currer Bell. London: Smith and Elder.
4. *Mary Barton: a Tale of Manchester Life*. London: Chapman and Hall.

THE appearance of Woman in the field of literature is a significant fact. It is the correlate of her position in society. To some men the fact is doubtless as distasteful as the social freedom of women in Europe must be to an eastern mind: it must seem so unfeminine, so contrary to the real destination of woman; and it must seem so in both cases from the same cause. But although it is easy to be supercilious and sarcastic on Blue Stockings and Literary Ladies,—and although one may admit that such sarcasms have frequently their extenuation in the offensive pretensions of what are called “strong-minded women,”—it is certain that the philosophic eye sees in this fact of literature cultivated by women, a significance not lightly to be passed over. It touches both society and literature. The man who would deny to woman the cultivation of her intellect, ought, for consistency, to shut her up in a harem. If he recognise in the sex any quality which transcends the qualities demanded in a plaything or a handmaid—if he recognise in her the existence of an intellectual life not essentially dissimilar to his own, he must, by the plainest logic, admit that life to express itself in all its spontaneous forms of activity. It is very true that ink on the thumb is no ornament: but we have yet to learn that stains upon the blouse or the dissecting sleeves are ornamental; few incidents of work are. What then? Moreover we confess it is very awkward and uncomfortable to hear a woman venture on Greek, when you don't know Greek, or to quote from a philosophical treatise which would give you a headache; and something of this feeling doubtless lies at the core of much of the opposition to “learned women;” the men are “put out” by it. The enormity seems equivalent to the domestic partner of your joys assuming the privilege of a latch-key! “Where is our supremacy to find a throne if we admit women to share our imperious dominion—Intelligence?” So reasons the intellectual Jones. But one might quietly ask him whether he professed any immense delight in the society of the man who threw Greek and philosophy at his head? Pedantry is the ostentation of learning, the scholar's coxcomb; no one likes it,

any more than he likes other forms of obtrusive self-assertion. Therefore we may say with Mademoiselle de Scudéry: "Je veux donc bien qu'on puisse dire d'une personne de mon sexe qu'elle sait cent choses dont elle ne se vante pas, qu'elle a l'esprit fort éclairé, qu'elle connaît finement les beaux ouvrages, qu'elle parle bien, qu'elle écrit juste et qu'elle sait le monde; mais je ne veux pas qu'on puisse dire d'elle: *c'est une femme savante*: car ces deux caractères sont si différents qu'ils ne se ressemblent même point."\*

One may admit that much folly is spoken and written on the subject of "woman's mission" and "emancipation:" folly *pro*, and folly *con*; one may admit that literary women are not *always* the most charming of their sex (are literary men of theirs?)—but let us leave all such side questions and definitely ask ourselves, What does the literature of women really mean? To aid us in arriving at something like distinctness, it will be well to settle a definition of literature itself.

Literature must be separated from philosophy and science; at least for our present purpose. Science is the expression of the forms and order of Nature; literature is the expression of the forms and order of human life.

All poetry, all fiction, all comedy, all *belles lettres*, even to the playful caprices of fancy, are but the expression of experiences and emotions; and these expressions are the avenues through which we reach the sacred adytum of Humanity, and learn better to understand our fellows and ourselves. In proportion as these expressions are the forms of universal truths, of facts common to all nations or appreciable by all intellects, the literature which sets them forth is permanently good and true. Hence the universality and immortality of Homer, Shakspeare, Cervantes, Molière. But in proportion as these expressions are the forms of individual, peculiar truths, such as fleeting fashions or idiosyncrasies, the literature is ephemeral. Hence tragedy never grows old, for it arises from elemental experience; but comedy soon ages, for it arises from peculiarities. Nevertheless even idiosyncrasies are valuable as side glances; they are aberrations that bring the natural orbit into more prominent distinctness.

It follows from what has been said that literature, being essentially the expression of experience and emotion—of what we have seen, felt, and thought—that only *that* literature is effective, and to be prized accordingly, which has *reality for its basis* (needless to say that emotion is as real as the Three

per Cents.), and effective in proportion to the depth and breadth of that basis.

It was M. de Bonald we believe who gave currency to the famous definition, so constantly accepted as accurate, "Literature is the expression of society." To make it acceptable, however, we must depart very widely from its direct meaning. The most cursory glance at literature on the one hand and at society on the other, will detect the glaring discrepancy. So far from literature being a mirror or expression of society, it is under most aspects palpably at variance with society. Idylls flourish on the eve of violent social outbreaks (as we see in Florian, Gesner, and George Sand); chivalry finds a voice as chivalry is passing from the world; wild adventurous novels agitated with hair-breadth 'scapes solace a money-making society "so eminently respectable;" love in a cottage makes the heart flutter that is about to sell itself for a splendid match. The remark is as old as Horace—

"Luctantem Icaris fluctibus Africum  
Mercator metuens otium et oppidi  
Laudat rura sui: mox reficit rates  
Quassas, indocilis pauperiem pati."

Not only so, but our novels and plays, even when pretending to represent real life, represent it as no human being ever saw it.

If, however, instead of regarding literature as the expression of society, we regard it as the expression of the emotions, the whims, the caprices, the enthusiasms, the fluctuating idealisms which move each epoch, we shall not be far wrong; and inasmuch as women necessarily take part in these things, they ought to give them *their* expression. And this leads us to the heart of the question, What does the literature of women mean? It means this: while it is impossible for men to express life otherwise than as they know it—and they can only know it profoundly according to their own experience—the advent of female literature promises woman's view of life, woman's experience; in other words, a new element. Make what distinctions you please in the social world, it still remains true that men and women have different organizations, consequently different experiences. To know life you must have both sides depicted.

"Der Mann muss hinaus  
Ins feindliche Leben,  
Muss wirken und streben!"

Let him paint what he knows. And if you limit woman's sphere to the domestic circle, you must still recognise the concurrent necessity of domestic life finding its homeliest and truest expression in the woman who lives it.

\* "Le Grand Cyrus."

Keeping to the abstract heights we have chosen, too abstract and general to be affected by exceptions, we may further say that the Masculine mind is characterized by the predominance of the intellect, and the Feminine by the predominance of the emotions. According to this rough division the regions of philosophy would be assigned to men, those of literature to women. We need scarcely warn the reader against too rigorous an interpretation of this statement, which is purposely exaggerated the better to serve as a sign-post. It is quite true that no such absolute distinction exists in mankind, and therefore no such correlative distinction will be found in authorship. There is no man whose mind is shrivelled up into pure intellect; there is no woman whose intellect is completely absorbed by her emotions. But in most men the intellect does not move in such inseparable alliance with the emotions as in most women, and hence although often not so great as in women, yet the intellect is more commonly dominant. In poets, artists, and men of letters, *par excellence*, we observe this feminine trait, that their intellect habitually moves in alliance with their emotions; and one of the best descriptions of poetry was that given by Professor Wilson, as the "intellect coloured by the feelings."

Woman, by her greater affectionateness, her greater range and depth of emotional experience, is well fitted to give expression to the emotional facts of life, and demands a place in literature corresponding with that she occupies in society; and that literature must be greatly benefited thereby, follows from the definition we have given of literature.

But hitherto, in spite of splendid illustrations, the literature of women has fallen short of its function, owing to a very natural and very explicable weakness—it has been too much a literature of imitation. To write as men write, is the aim and besetting sin of women; to write as women, is the real office they have to perform. Our definition of literature includes this necessity. If writers are bound to express what they have really known, felt, and suffered, that very obligation imperiously declares they shall not quit their own point of view for the point of view of others. To imitate is to abdicate. We are in no need of more male writers: we are in need of genuine female experience. The prejudices, notions, passions, and conventionalisms of men are amply illustrated; let us have the same fulness with respect to women. Unhappily the literature of women may be compared with that of Rome; no amount of graceful talent can disguise the internal defect. Virgil, Ovid, and Catullus were assuredly

gifted with delicate and poetic sensibility; but their light is, after all, the light of moons reflected from the Grecian suns, and such as brings little life with its rays. To speak in Greek, to think in Greek, was the ambition of all cultivated Romans, who could not see that it would be a grander thing to utter their pure Roman natures in sincere originality. So of women. The throne of intellect has so long been occupied by men, that women naturally deem themselves bound to attend the Court. Greece domineered over Rome; its intellectual supremacy was recognised, and the only way of rivalling it seemed to be imitation. Yet not so did Rome vanquish Pyrrhus and his elephants; not by employing elephants to match his, but by Roman valour.

Of all departments of literature, Fiction is the one to which, by nature and by circumstance, women are best adapted. Exceptional women will of course be found competent to the highest success in other departments; but speaking generally, novels are their forte. The domestic experiences which form the bulk of woman's knowledge find an appropriate form in novels; while the very nature of fiction calls for that predominance of sentiment which we have already attributed to the feminine mind. Love is the staple of fiction, for it "forms the story of a woman's life." The joys and sorrows of affection, the incidents of domestic life, the aspirations and fluctuations of emotional life, assume typical forms in the novel. Hence we may be prepared to find women succeeding better in *finesse* of detail, in pathos and sentiment, while men generally succeed better in the construction of plots and the delineation of character. Such a novel as "Tom Jones" or "Vanity Fair," we shall not get from a woman; nor such an effort of imaginative history as "Ivanhoe" or "Old Mortality;" but Fielding, Thackeray, and Scott are equally excluded from such perfection in its kind as "Pride and Prejudice," "Indiana," or "Jane Eyre;" as an artist, Miss Austen surpasses all the male novelists that ever lived; and for eloquence and depth of feeling, no man approaches George Sand.

We are here led to another curious point in our subject, viz., the influence of Sorrow upon female literature. It may be said without exaggeration that almost all literature has some remote connexion with suffering. "Speculation," said Novalis, "is disease." It certainly springs from a vague disquiet. Poetry is analogous to the pearl which the oyster secretes in its malady.

"Most wretched men  
Are cradled into poetry by wrong,  
They learn in suffering what they teach in song."

What Shelley says of poets, applies with greater force to women. If they turn their thoughts to literature, it is—when not purely an imitative act—always to solace by some intellectual activity the sorrow that in silence wastes their lives, and by a withdrawal of the intellect from the contemplation of their pain, or by a transmutation of their secret anxieties into types, they escape from the pressure of that burden. If the accidents of her position make her solitary and inactive, or if her thwarted affections shut her somewhat from that sweet domestic and maternal sphere to which her whole being spontaneously moves, she turns to literature as to another sphere. We do not here simply refer to those notorious cases where literature has been taken up with the avowed and conscious purpose of withdrawing thoughts from painful subjects; but to the unconscious unavowed influence of domestic disquiet and unfulfilled expectations, in determining the sufferer to intellectual activity. The happy wife and busy mother are only forced into literature by some hereditary organic tendency, stronger even than the domestic; and hence it is that the cleverest women are not always those who have written books.

Having said thus much on the general subject of female novel writing, let us glance rapidly, and without pretence of exhaustive criticism, at some of the novelists; doing in careless prose what Leigh Hunt has done in genial verse in his "Blue Stocking Revels." We have been great readers and great admirers of female novels; and although it is difficult to give authors a *satisfactory* reason for not including their names among the most celebrated, we beg our fair novelists to put the most generous construction upon all our "omissions," and to believe that when we are un gallant and omisive, there is "a design under it" as profound as that under Swift's dulness. To include *all* would obviously be impossible in these limits; and we shall purposely exclude some names of undoubted worth and renown, in order not even to seem invidious.

First and foremost let Jane Austen be named, the greatest artist that has ever written, using the term to signify the most perfect mastery over the means to her end. There are heights and depths in human nature Miss Austen has never scaled nor fathomed, there are worlds of passionate existence into which she has never set foot; but although this is obvious to every reader, it is equally obvious that she has risked no failures by attempting to delineate that which she had not seen. Her circle may be restricted, but it is complete. Her world is a perfect orb, and vital. Life, as it presents itself to an English gentlewo-

man peacefully yet actively engaged in her quiet village, is mirrored in her works with a purity and fidelity that must endow them with interest for all time. To read one of her books is like an actual experience of life; you know the people as if you had lived with them, and you feel something of personal affection towards them. The marvelous reality and subtle distinctive traits noticeable in her portraits has led Macaulay to call her a prose Shakspeare. If the whole force of the distinction which lies in that epithet *prose* be fairly appreciated, no one, we think, will dispute the compliment; for out of Shakspeare it would be difficult to find characters so typical yet so nicely demarcated within the limits of their kind. We do not find such profound psychological insight as may be found in George Sand (not to mention male writers), but taking the type to which the characters belong, we see the most intimate and accurate knowledge in all Miss Austen's creations.

Only cultivated minds fairly appreciate the exquisite art of Miss Austen. Those who demand the stimulus of "effects;" those who can only see by strong lights and shadows, will find her tame and uninteresting. We may illustrate this by one detail. Lucy Steele's bad English, so delicately and truthfully indicated, would in the hands of another have been more obvious, more "effective" in its exaggeration, but the loss of this comic effect is more than replaced to the cultivated reader by his relish of the nice discrimination visible in its truthfulness. And so of the rest. *Strong* lights are unnecessary, *true* lights being at command. The incidents, the characters, the dialogue—all are of every day life, and so truthfully presented, that to appreciate the art we must try to imitate it, or carefully compare it with that of others.

We are but echoing an universal note of praise in speaking thus highly of her works, and it is from no desire of simply swelling that chorus of praise that we name her here, but to call attention to the peculiar excellence at once womanly and literary which has earned this reputation. Of all imaginative writers she is the most *real*. Never does she transcend her own actual experience, never does her pen trace a line that does not touch the experience of others. Herein we recognise the first quality of literature. We recognise the second and more special quality of womanliness in the tone and point of view; they are novels written by a woman, an Englishwoman, a gentlewoman; no signature could disguise that fact; and because she has so faithfully (although unconsciously) kept to her own womanly point of view, her works are durable. There is nothing of the *doctri-*

*naire* in Jane Austen ; not a trace of woman's "mission ;" but as the most truthful, charming, humorous, pure-minded, quick-witted, and unexaggerated of writers, female literature has reason to be proud of her.

Of greater genius, and incomparably deeper experience, George Sand represents woman's literature more illustriously and more obviously. In her, quite apart from the magnificent gifts of Nature, we see the influence of Sorrow, as a determining impulse to write, and the abiding consciousness of the womanly point of view as the subject matter of her writings. In vain has she chosen the mask of a man, the features of a woman are everywhere visible. Since Goethe no one has been able to say with so much truth, "My writings are my confessions." Her biography lies there, presented, indeed, in a fragmentary shape, and under wayward disguises, but nevertheless giving to the motley groups the strange and unmistakeable charm of reality. Her grandmother, by whom she was brought up, disgusted at her not being a boy, resolved to remedy the misfortune as far as possible by educating her like a boy. We may say of this, as of all the other irregularities of her strange and exceptional life, that whatever unhappiness and error may be traceable thereto, its influence on her writings has been beneficial, by giving a greater range to her experience. It may be selfish to rejoice over the malady which secretes a pearl, but the possessor of the pearl may at least congratulate himself that at any rate the pearl has been produced ; and so of the unhappiness of genius. Certainly few women have had such profound and varied experience as George Sand ; none have turned it to more account. Her writings contain many passages that her warmest admirers would wish unwritten, but although severe criticism may detect the weak places, the severest criticism must conclude with the admission of her standing among the highest minds of literature. In the matter of eloquence, she surpasses everything France has yet produced. There has been no style at once so large, so harmonious, so expressive, and so unaffected : like a light shining through an alabaster vase, the ideas shine through her diction ; while as regards rhythmic melody of phrase, it is a style such as Beethoven might have written had he uttered in words the melodious passion that was in him.

But deeper than all eloquence, grander than all grandeur of phrase, is that forlorn splendour of a life of passionate experience painted in her works. There is no man so wise but he may learn from them, for they are the utterances of a soul in pain, a soul that has been tried. No man could have written her

books, for no man could have had her experience, even with a genius equal to her own. The philosopher may smile sometimes at her philosophy, for *that* is only a reflex of some man whose ideas she has adopted ; the critic may smile sometimes at her failure in delineating men ; but both philosopher and critic must perceive that those writings of hers are *original*, are genuine, are transcripts of experience, and as such fulfil the primary condition of all literature. It is not our present purpose to enter upon details, but we may add in passing that although *all* her works will be found to partake of the character of confessions, there is one wherein the biographical element takes a more definite and literal shape, viz., in "Lucrezia Floriani." Wide as the incidents of this story are from the truth, the characters of Lucrezia, Karol, and Vandoni, are more like portraits than is usual with her.

By a whimsical transition our thoughts wander to Lady Morgan, the "Wild Irish Girl," who delighted our fathers, and gave the "Quarterly" an opportunity of displaying its accustomed amenity and nice feeling for the sex. Lady Morgan has been a staunch upholder of the rights of woman, and in her own person vindicated the claims of the sex to be heard as authors. But Leigh Hunt shall touch her portrait for us :—

"And dear Lady Morgan! look, look how she comes,  
With her pulses all beating for freedom, like drums—  
So Irish, so modish, so *mixtish*, so wild ;  
So committing herself, as she talks, like a child,  
So trim yet so easy, polite yet high-hearted,  
That truth and she, try all she can, won't be parted.  
She'll put on your fashions, your latest new air,  
And then talk so frankly, she'll make you all stare."

From the same hand you shall have a sketch of Miss Edgeworth—a strange contrast to her countrywoman just named :—

"At the sight of Miss Edgeworth, he\* said,  
'Here comes one  
As sincere and as kind as lives under the sun,  
Not poetical, eh?—nor much given to insist  
On utilities not in utility's list.  
(Things, nevertheless, without which the large heart  
Of my world would but play a poor husk of a part.)  
But most truly within her own sphere sympathetic—  
And that's no mean help towards the practice poetic.'  
Then smiling, he said a most singular thing—  
He thanked her for making him 'saving of string'!!

\* Apollo.

But, for fear she should fancy he didn't approve her in  
 Matters more weighty, praised much her 'Ma-  
 nouëvring';  
 A book, which, if aught could pierce craniums so  
 dense,  
 Might supply cunning folks with a little good  
 sense.  
 And her Irish (he added) poor souls! so impress-  
 ed him,  
 He knew not if most they amus'd, or distress'd  
 him!"

Miss Edgeworth possesses in a remark-  
 able degree the peculiarly feminine quality  
 of *Observation*, though but little of that  
 other quality *Sentiment*, which distinguishes  
 female writers, and which, combined with  
 observation, constitute the staple of novels.  
 Indeed one might class novelists thus—1st,  
 Those remarkable for Observation. 2nd,  
 Those remarkable for Sentiment. 3rd,  
 Those remarkable for the combination of  
 the two. Observation without Sentiment  
 usually leads to humour or satire; Senti-  
 ment without Observation to rhetoric and  
 long-drawn lachrymosity. The extreme  
 fault of the one is flippant superficiality;  
 that of the other is what is called "sickly  
 sentimentality."

Miss Burney, for example, had a quick  
 Observation, notably of ridiculous details,  
 and with a certain broad vulgar gauge of  
 human nature, contrived to write one or  
 two novels that admirably reflected the  
 passing manners of her age; but when—as  
 in the "Wanderer"—she attempted to in-  
 terest by Sentiment, her failure was hope-  
 less. L. E. L., on the other hand, was  
 essentially deficient in that which made the  
 reputation of Fanny Burney, but her quick  
 emotive nature, trembling with sensibility,  
 enabled her to write passages of exquisite  
 beauty, which were not, however, more  
 durable than mere emotion is. Mrs. Gore,  
 again, who might perhaps, with more care  
 bestowed upon her works, have been the  
 Fanny Burney of our age, exhibits in every  
 chapter the marvellous finesse and quick-  
 ness of Observation, winged with a certain  
 airy gaiety of style which, if it be not wit,  
 has half the charm of wit; and this faculty  
 of Observation has allowed her to write  
 heaps of fashionable novels, as fugitive as  
 the fashions they reflect, yet as gay and  
 pleasant. But who does not miss in them  
 that element of serious Sentiment which  
 gives to other novels their pathos, their  
 poetry, their psychology?

We might run through the list of female  
 writers thus contrasting them, noting the  
 strong sarcastic observation of Mrs.  
 Trollope and the wearisome sentimentality

of Mrs. Marsh, (who has, nevertheless,  
 written one most powerful tale "The  
 Admiral's Daughter," and whose most  
 popular work, "Emilia Wyndham," we are  
 willing to take upon trust, not having read  
 it,) but the excursion would carry us beyond  
 our limits. Enough, if we have indicated  
 the point of view.

Two celebrated women whose works  
 have produced an extraordinary "sensa-  
 tion"—the authoress of "Jane Eyre," and  
 the authoress of "Mary Barton," owe their  
 success, we believe, to the union of rare yet  
 indispensable qualities. They have both  
 given imaginative expression to actual ex-  
 perience—they have not invented, but  
 reproduced; they have preferred the truth,  
 such as their own experience testified, to  
 the vague, false, conventional notions cur-  
 rent in circulating libraries. Whatever of  
 weakness may be pointed out in their  
 works, will, we are positive, be mostly in  
 those parts where experience is deserted,  
 and the supposed requirements of fiction  
 have been listened to; whatever has really  
 affected the public mind is, we are equally  
 certain, the transcript of some actual in-  
 cident, character, or emotion. Note, more-  
 over, that beyond this basis of actuality  
 these writers have the further advantage of  
 deep feeling united to keen observation.  
 The presence of observation is more appa-  
 rent in "Mary Barton" than in "Jane  
 Eyre," as it is possibly more predominant  
 in the mind of the authoress; and this is why  
 there never was even a momentary doubt  
 as to the writer's sex—a woman's delicate  
 hand being visible in the strongest pages;  
 whereas "Jane Eyre" was not only  
 attributed to a man, but one of the most  
 keen witted and observing of female writers  
 dogmatically pronounced upon internal  
 evidence that none but a man could have  
 written it. The force and even fierceness  
 of the style certainly suggested doubts, but  
 what man could have drawn Jane herself;  
 above all, what man could so have drawn  
 Rochester! The lyrical tendency—the  
 psychological and emotional tendency which  
 prevails in "Jane Eyre" may have blinded  
 some to the rare powers of observation  
 also exhibited in the book; a critical exami-  
 nation, however, will at once set this right,  
 the more so when we know that the  
 authoress has led a solitary life in a seclud-  
 ed part of Yorkshire, and has had but little  
 opportunities of seeing the world. She has  
 made the most of her material.

The deep impression produced on Europe  
 by George Sand, has naturally caused many  
 imitations—notably in Germany and  
 France. As to the Germans—*palmam qui*

*meruit ferat!* let the most gifted bear away the palm—and the palm of bad novel writing certainly belongs to them. However, as the names of these Indianas and Lelias have scarcely crossed the German Ocean, we will leave them in untroubled emancipation.

“non ragioniam di lor  
Ma guarda e passa.”

The name of Daniel Stern (pseudonyme for the Comtesse d'Agoult) has had more attention. Her first appearance was in “Nélida,” a novel in which she idealized herself, and branded her truant lover, Franz Liszt. It had a certain “succès de scandale.” The assumption of a man's name, and the abiding imitation of Madame Sand, lessened perhaps the admiration the novel would otherwise have excited, because it claimed a standard to which, in no sense, could it be compared. Since that, Daniel Stern has earned a more serious reputation as a political and historical writer. Her “History of the Revolution of 1848” is the best that has been written on that subject.

Apropos of “Nélida,” and of Lady Bulwer Lytton's novels, it may be pertinent to distinguish between writing out your actual experience in fiction, and using fiction as a medium for obtruding your private history on the sympathies of the public. We hold that the author is bound to use actual experience as his material, or else to keep silent; but he is equally bound by all moral and social considerations not to use that experience in such forms that the public will recognise it, and become, as it were, initiated into the private affairs of his characters. If he avow himself as the Juvenal or Aristophanes of his age, and satirize his friends and foes, he has, at any rate, the excuse, that everyone is on guard against avowed satire. But if he have been mixed up in some deplorable history which has become notorious, and if he take advantage of that notoriety to tell *his* version of it under the transparent disguise of fiction, then we say he violates all principle of truth and of literature; because in fiction he has an immunity from falsehood. He does not profess to tell you the story, yet he gives you to understand what he wishes. He paints himself as an injured innocent; and if you object to his portrait of you, as that of an incarnate demon, his answer is ready—“That is a character in my novel; who said it was a portrait of you?”

It was notorious, for example, that Madame Sand had lived for some years with

Chopin, and that Madame d'Agoult had children by Liszt, and that both women had finally separated from their lovers. Now, although we hold that if Madame Sand or Madame d'Agoult wished to write, they were bound to go back for material to their own personal experience, it is quite clear that, in so doing, they were bound by the very notoriety of their histories to work up that material into shapes so unlike the outward form of these histories, that no one should detect the origin. Instead of doing so, they both take the public into confidence, and manage to paint themselves as victims, and their lovers as insupportable. We are touching upon a delicate distinction, but the moral sense of every impartial reader easily distinguishes between the legitimate and illegitimate employment of experience.

As examples of the legitimate employment, let us name the works of Geraldine Jewsbury and Eliza Lynn, two writers in whom the influence of George Sand is traceable, and in whom, although we know that actual experience is taken as the material used, no one ever pretends to recognise private life. Recurring to our rough classification, we should cite Miss Jewsbury as one in whom Observation and Sentiment were about equal; but although she possesses, in an eminent degree, both qualities, she does not work them harmoniously together. Her keen womanly observation of life gives to her novels the piquancy of sarcasm, and her deep womanly feeling of life gives to them the warmth and interest of sentiment; but—there *is* a but!—the works seem rather the offspring of *two* minds than of one mind; there is a want of unity in them, arising perhaps from want of art. Curious it is to trace the development of her mind in the three novels she has published at wide intervals: “Zoe,” in which the impetuous passionate style clearly betrays the influence of George Sand; “The Half Sisters,” in which the style is toned down to a more truthful pitch; and “Marian Withers,” in which there is scarcely any trace of the turbulence and fervour of “Zoe.” If we look closely we shall find that age and experience have had their customary influence, and while subduing the exuberance of Sentiment, have brought into greater prominence the strong characteristics of Observation. Miss Jewsbury excels in subtle and sometimes deep observation of morals as of manners; and we look to her for still finer works than any she has yet written.

Miss Lynn occupies a strange and defiant position. In her first work, “Azeth,” she astonished by the recondite reading exhibited in her Egyptian colouring, and by the

daring voluptuousness of her eloquence. In her second romance, "Amymone," she quitted Egypt for Greece, showed an equal amount of laborious study and of exuberant rhetoric, but assumed a still more hostile position against received notions by a paradoxical defence of Aspasia. In "Realities," a novel of our day, the antagonism was avowed, incessant, impetuous; it was a passionate and exaggerated protest against conventions, which failed of its intended effect because it was too exaggerated, too manifestly unjust. Splendour of diction, and a sort of rhythmic passion, rising oftentimes into accents of startling power, have never been denied her; but one abiding defect of her novels we must allude to, and that is, the want of that Observation which we have insisted on as a requisite in fiction. In "Realities," this want was singularly apparent, and gave it the air of unreality so detrimental to such a work. The realm of imagination is better suited to her powers than that of fact; she feels deeply, paints vividly what she feels, but she sees dimly.

Miss Muloch has also a great gift of eloquence, and considerable power in the dramatic presentation of character. "The Ogilvies," "Olive," and the "Head of the Family," may be compared with Miss Jewsbury's three novels, as indicating the rapid progress in observation, and a more subdued employment of sentiment; although sentiment, after all, remains her forte. Not so the authoress of "Rose Douglas," and the "Two Families," in whom we recognise a wonderful truthfulness of touch in the portraiture of quiet village life, and quiet village character. The authoress of "Margaret Maitland" excels in delineation of character of greater range and depth; and her pictures of Scottish life are among the most memorable and agreeable we know. They place her beside the charming Madame Charles Reybaud, whose novels, we may parenthetically add, are among the few French fictions admissible into the libraries of young ladies.

But we must cease this rapid flight over the large field of female literature. We have done enough if in this bird's-eye view we have indicated the most characteristic details; and we have proved our case if we have proved the right of Woman to citizenship in the Republic of Letters.

ART. VII.—THE POLITICAL LIFE AND SENTIMENTS OF NIEBUHR. *The Life and Letters of Barthold George Niebuhr; with Essays on his Character and Influence, by the Chevalier Bunsen, and Professors Brandis and Scobell.* Chapman and Hall.

If those who desire to understand the mighty history of the last three-quarters of a century could have their wish, that wish would probably be to be presented with the life and writings of a qualified person, born at the date of the American Declaration of Independence, and living over the period of the French Revolution of 1830; unless, indeed, he might live over that of 1848. The wish would be, in regard to this person's qualifications, that he should be a man of earnestness and integrity; that he should have a warm and sympathising heart; that he should be a great historian of ancient times and races; that he should be practically engaged in the political life of his own time, and of a race and nation eminent for thoughtfulness, learning, and speculative ability; that he should be, by birth, of humble rank, and by employment the companion of rulers; that he should be of such intellectual rank as to be sought after as a counsellor and agent by statesmen and princes, while he was looked up to as informant and guide by the rising youth of his nation; and that, in addition to the powers of conception, memory, and reflection implied in his character as an eminent historian, he should have those higher faculties of imagination, comparison, and judgment which would constitute him a speculative philosopher. Such a man, writing and acting in such a time, must be considered not only an adequate interpreter of his age, but a mighty teacher while living, and a prophet when dead. Such a man, so furnished, with one great exception, for his life's work, was Barthold George Niebuhr. He had all the requisites we have specified, except the last, the qualities which would have made him a speculative philosopher. What was the loss to the world from this deficiency, no one may be able to estimate; but we may form some idea of it from a review of the volumes which treat of his life and influence.

These volumes do not present him in his character of historian; and we shall, therefore, not treat of his life under that aspect. He can never fail to receive due tribute of honour from this generation, and many to come, for the splendid services he rendered to all time when he seized and used the true method of investigating and presenting historical facts. All his best powers of heart

and mind went into that work ; and it was noble, and will for ever be fruitful accordingly. And in this direction more wealth may be looked for. The preface to the work before us declares that "letters on learned subjects" exist, which will be offered in a third volume, if due encouragement is given by the reception of the first two.

The preface also tells us, that "the account of his public career is very incomplete, and by no means one that enables the reader to perceive the relation in which Niebuhr stood to his times," in the work from which the contents of these volumes are translated: that some letters throwing light on his public life, have been here added, and also such notes and notices as go far to supply the deficiency ; but that many memorials, dispatches, and letters remain inaccessible which are necessary to a complete view of his political life. And again, we are warned "with regard to his political sentiments, that it was necessary, in Germany, to observe great caution in the publication of facts or opinions on such subjects, and, therefore, these letters give no complete view of what he thought and felt, even on the passing events of the day. Nevertheless, it may be hoped that he will not be misunderstood in England, and that those who occupy themselves with political questions will lay his words to heart."

We earnestly desire not to misunderstand him ; but it appears to us that, whatever may be kept back, there is enough here presented to us of what he did say, and did not do, to enable us to form an opinion of the political portion of Niebuhr's life. As for words to lay to heart, we wish there had been more of them ; and not less earnestly do we wish that there had been more of something higher than sayings—deeds, single, and expanded into a course of action through whole periods.

The family from which Niebuhr was descended had for generations possessed a small freehold property within the Electorate of Hanover. His father, the great traveller, was sent out on his expedition by the Danish government ; and on his return, married into the family of the king of Denmark's physician. It was at Copenhagen that Barthold G. Niebuhr was born. His birth took place in August, 1776—seven weeks after the Declaration of Independence was issued in America, and just when the news of it must be reaching Europe. When the boy was nearly two years old he was removed, with the rest of the family, to a quiet corner of the duchy of Holstein, where his father was henceforth to fulfil the duties of a local office. There, among the marshes, in

the little town of Meldorf,—the sleepiest of places,—the boy passed his childhood, and some years of youth. He brought thence a very ample experience of ague, by which his health was weakened for life from his fifth year ; the anxious and somewhat melancholy conscientiousness of his father ; the nervous impressibility of his mother ; a mass of book-knowledge terrible to think of for one so young ; and, what was better than any book-knowledge, a strong sympathy with the peasant proprietary class among whom his father's official duties lay. At home the boy learned, as by magic, whatever was put before him in the way of study. His recreations were making fortifications in the garden, under his father's direction, in true military style ; collecting coins and seals, in a genuine historical spirit ; and hearing his father tell stories and read manuscripts about Egypt, Arabia, India and Persia. Such amusements were interesting enough, no doubt, to such a child. They seem to have been rather too much so for a delicate young creature, who had more power of imagination than his stout-built and elderly father could conceive of ; and we are glad therefore to read of dancing in the evenings, when the conscientious parent, fulfilling his duty of amusing the children, fiddled for them and their young neighbours, and gave his explicit sanction to a romp. Moral beauty, and the charm of historical parallels, seem to have been all the gratification that the boy had of any sense of beauty that might exist in him. The aspect of the country was hideous. He drew maps instead of pictures. He devoured geography as other children do their first epic and tragedy ; and, as he leaned against his father's knee, long courses of historical biography were to him instead of fairy tales. When he went forth into the world, therefore, he was (as he afterwards declared) well nigh blind to natural beauty. He was also insensible to the value of natural science. The fortunes of society were his great object of interest and subject of incessant study. His collateral learning was prodigious. He never forgot anything, and held in his head, at one time when thirty years of age, twenty languages. His faculty of conception was remarkably vigorous ; so that every line of what he read conveyed distinct and full imagery to his mind's eye : and thus he saw the life of the ancients from the merest frame-work of suggestion, as vividly and easily as, in the East, his father had seen from the parapet, at eventide, the greetings of men in the bazaars, and their journeyings over the plain and their repose on the river-banks. As a

boy, Barthold had an imaginary kingdom of his own, called Low England, the wars, legislation, and universal interests of which he conducted with much energy and wisdom. It was a very real affair to him; and the old Greeks and Romans were, apparently, neither more nor less real. All were the great pleasure and interest of his existence; an innocent pleasure, and a virtuous interest, because these were the studies which were to furnish him forth for his work in life. That such a faculty of conception, so incessantly nourished, should never have overborne, in the slightest degree, his sense of truth is the highest possible evidence of his inborn and sacredly-guarded integrity. That his clear vision of the past should never have interfered with his transaction of present business, is a proof of the strength of his practical faculties. That his power of conception and his moral instincts and training together could not raise him to any height of speculation on social subjects,—should never have yielded him a glimpse of an ideal, was an unspeakable misery to himself, and an inestimable misfortune to the world. It is absurd to long for what cannot be had, and to lament that any sort of good man was not some other sort of good man; yet it is hard to avoid regretting that Niebuhr's faculty of conception did not rise into a high power of imagination. For want of it, his remarkable gift of seeing things as they once were gave him no aid towards seeing things as they might be,—or even as they were at the present hour.

He studied for a short time at a school at Hamburg, and for two years at the University at Kiel. These years were, without doubt, the most important of his life, as they gave him the friendship of the person "who, by what she was, and what she did, affected his development and his destiny more perhaps than any other human being," and through whom he obtained both his wives. This was Madame Hensler, a young widow when he first knew her. He married first her sister, and then her adopted daughter. To her we owe the chief and best part of what we know of him; for his letters to her are worth all the rest we have, written to the rest of the world; and she it was who issued in Germany the memoirs which form the basis of the work before us. At her father's house he won his Amelia,—a wife worthy of him; and through Madame Hensler's father-in-law he received the invitation which introduced him to his political life,—an invitation to be private secretary to Count Schimmelman, who was for thirty years minister of Finance and Commerce in

Denmark. Niebuhr was only twenty years old when he entered upon this office. It must be very striking to young men of twenty who read these volumes to see how many offers were made to Niebuhr within a few months of secretaryships, attaché-ships, consul-generalships, professorships, journeys to Rome and to Paris, and posts of confidence at home. He felt the need of leisure to complete his studies, and left the Count (without any lessening of their friendship) for the post of secretary at the Royal Library at Copenhagen. His intercourse with varied and good society at the capital had opened his eyes to the fact that he had lived too much among books, and that he had missed a world of knowledge lying outside that region. He knew that it was within his reach; but he found that he had no grasp of it, that he could not even see it. He therefore determined to travel; and he chose for his destination, partly because it was the most "material" place he could hear of, and partly for other reasons, Edinburgh, by way of London.

He spent a year in Edinburgh, indulging himself in historical and philological pursuits only by way of recreation. His serious studies were natural philosophy, chemistry, agriculture, and mineralogy. In so short a time he could make no great acquisitions in physical science; and it seems to have been, after all, chiefly interesting to him as an additional means of interpreting the life of the ancients. As an avenue to any sort of philosophy he appears never for a moment to have regarded it. The best service, perhaps, rendered to him by this new order of pursuits was the strengthening of his conviction that a life of reading and book-thought can be only half a life. He writes, in 1799, from Edinburgh:

"I reckon it among the most important results of my travels that the indifference with which I was in the habit of regarding the objects of nature around me has given way. It was a defect naturally connected with my short-sightedness; but it constantly grew upon me, through the dreamy forgetfulness of reality, in which from my childhood I was allowed to indulge. As you know, I sometimes pondered over it; but without a change in my circumstances, I could hardly have succeeded in overcoming it. This indifference has now vanished. For some time past I have taken a lively interest in mineralogy; and in fact it is this branch of natural history which has brought the others also into favour with me."—*Vol. i. p. 145.*

Out of the circle of his studies, he appears not to have been happy. Besides, that he had not the art, at any time of his life, of reposing on the position of the moment, he

was in our island at a disadvantageous time. Our narrowness, self-satisfaction, and apparent coldness, always striking to foreigners, must have been at their worst at the date of his visit, when communication with the Continent was almost impossible, when George III. was king, and Pitt was minister, when we began to fancy we admired German philosophy and literature, and ravings about Kant's philosophy, and Schiller's Robbers, came into immediate collision in Scotland with overstrained Puritanism. Niebuhr complains that the nonsense he heard about Kant "almost made him ill" one evening. He complains of the absence of tender and genial attachment in families. He complains of the frivolity of conversation in all social meetings, and of the fearful licentiousness among the young men, as a general rule. As to the politics of England at that time, here is a passage from a letter, which breathes a mysterious horror not very intelligible now. This letter was written the year after the suspension of cash payments; and the mutiny at the Nore; and a month after the victory of the Nile. Nelson was riding in the Mediterranean, and Napoleon was pent up in Egypt. There were militia riots all over England, and a burning of muster-rolls at market crosses. In Ireland, the parliament met in military uniform, and the French were looked for, in fear or in hope, all round the coast. There were scarcely any counties, cities, or towns in England which had not sent up petitions for the removal of ministers. The farmers were in high prosperity, and all other industrial classes sinking into dread or despair. In a population of 9,000,000 (for England and Wales) the poor-rates amounted to nearly 4,000,000*l.* Of all this Niebuhr's letters to Amelia say nothing. Perhaps those to his father did; but they have been lost by fire. What he did say to Amelia about our politics is this :

"I have read a good many political writings lately; indeed, devoted a great part of the day to them. Now I have got so far, that I shall soon be able to give up this employment. I have groped into every hole and corner for information, in order to obtain a correct notion of the very complicated politics of this empire, and of the present crisis; which, to the superficial reader, must appear a tedious confusion, barren of celebrated men—to the careful examiner a wonderful, unprecedented, but horrible drama. My heart has been wounded more deeply with every step towards its development, and all ideal notions of the people's capability of great things in a state of liberty, which were hitherto such welcome intruders, are now fled forever. I cannot bear to spoil a letter to you with the account of actions

and men which do not concern us. But because it has occupied me, and because I should tell you all about it if we were together, I will say this much to you, that, in the printed documents of the conspirators, I have learned to know men, who, while possessing almost unequalled eloquence, began a career which led them into crimes, and made them the cause of deep misery to numbers of their fellow-citizens; very different men from those who are the objects of admiration to our fools; extraordinary men, but men whose existence is the curse of their country. The politics of such a party is something higher than those which we both disapproved on principle, and which I promised you to handle cautiously, in spite of the current inclination."—Vol. i. p. 116.

Thus early, at the age of twenty-four, did Niebuhr renounce the "ideal notion" of the people's capability of great things in a state of liberty. Considering the condition of England at that time, we see in his conclusion the hasty generalization of a very young man but, unhappily, the "welcome intruder," this ideal notion, never troubled him again. Are these the words which "those who occupy themselves with political questions" are exhorted to lay to heart?"

As to his general impressions of England, we must remember, on all accounts, that he came from a virtuous and studious and affectionate home into a university life, which was lower, both intellectually and morally, than it has been since. We must bear in mind, too, his constitutional difficulty of being pleased. We are told that, after he had seen more of the world, he retained a great predilection for the English people, honoured "their consistency, general strict integrity, and their great truthfulness," and ranked them, morally, next to the Germans; and he never forgot that among us he had first learned to see and read nature.

It is not easy to imagine when it could have been that he was intruded upon by ideal notions of the blessings of popular liberty; for so early as the age of eighteen, we find him abjuring Fichte and his works, because he heard that Fichte had defended the right of insurrection. On this occasion, he writes (vol. i. p. 36,) much as Metternich might now do, of the effects of such "dreadful sophisms," and asks what refuge is left for good men, "if philosophy itself be turned against the cause of right and civil order." The panic, experienced so early, visited him at intervals up to the day when he died, in a state of horror at the popular rising against the ordinances of Charles X. Yet was Algernon Sidney, in the midst of his grief at Fichte's doctrines, his best beloved hero; insomuch,

that he kept sacred the anniversary of his death. This is curious, considering that Sidney was remembered at Copenhagen chiefly from the hubbub occasioned there by the lines he wrote about tyrants and liberty, in the album of the University; that he died in planning a revolution, and on the scaffold declared his adherence to republican opinions, and his love of "the old cause." Probably the charm of his virtues, so captivating to a heart like Niebuhr's, overpowered all repugnance to his political doctrines. But this appears to be the only instance in which Niebuhr could recognise a hero in a republican and a revolutionist of modern times. This, however, is not the only instance of conflict in his judgments about the right lodgment or distribution of political power, at an age when young men of energy like his are usually very confident in holding their particular view, and little able to do justice to any other. We find him (vol. i. p. 87,) admiring the way in which, among the ancients, the great body of the people participated in the education which is yielded by the discharge of "public functions." Declaring that "there were very few whose minds had not been developed by the active discharge of these functions," he proceeds to say, that "we see nothing among ourselves that can be compared to the indefatigable power and activity of the ancients; they were at all times men and free citizens." Yet, in our own day, nothing startled him more than any popular claim to be educated by the active discharge of public functions, at the risk of any collision with the will of sovereigns. In the same way, we find him in the same letter deploring the evils of a special class of learned men, and the consequent popular ignorance, and yet, to all appearance, approving the methods of his beloved "ancients," who concentrated science among sages, and did not permit its elements to be "diffused among the vulgar, producing a shallow knowledge." "Why were they," he asks, "so free from the monstrous absurdities by which we are surrounded?" But he would have literature popular. Of the Thirty Years' War he wrote—

"That most disastrous of wars, which made our princes absolute sovereigns, the Protestants of Upper Germany Catholics, and those of Lower Germany orthodox—which permitted the Jesuits to flourish, desolated the whole land, robbed the Empire of its independence, and our towns of their power—that lamentable war has ruined our language for ever. And this want of a language adapted at once to literature and popular use, is a curse that rears perpetually and exclusively on our nation."—Vol. i. p. 55.

Presently after he writes—

"The bloom of our literature is over, and, besides the usual course of nature, which has proved itself the same in all nations, it is the French Revolution, our infamous policy, and shameful undervaluing of our own people, the want of cultivation among them, resulting from this general indifference, and the desecration and shocking abuse of philosophy, that have brought us to this wretched pass."—Vol. i. p. 76.

If we consider that the philosophy of Niebuhr's time was the same thing with the science which "the ancients" declined to communicate to their "own people," we long to ask Niebuhr how it was that their "vulgar" fared so well, while his neighbours, from "the want of cultivation among them," were at so wretched a pass. If the answer is, that times and circumstances have changed, so be it; but then comes the regret that, when in office, he did not practically remember this. No man lamented more mournfully the failure of the Prussian system of education, in making good citizens of the people, yet no man did less in furtherance of their political education. It is curious to read, in this connexion, his expressions of delight about the state of the popular mind at the time of the Reformation—a theme which seems always to drive out of his mind, for the hour, his horror about "the right of insurrection." He allowed that "when hearts were lifted up, as in Luther's time," a reformation is a glorious benefit; and "Luther's way was correct," which appears to us as clear an admission of the right of insurrection as Fichte could have uttered. "I have bought," he says, "at an auction, a bundle of pamphlets, written in the sixteenth and beginning of the seventeenth century. If, in a collection formed so fortuitously, we find many things that are excellent, and none that are positively bad, we cannot but conceive a respect for the age that produced them. This collection contains a string of apothegms, under the title of "New and True Gazette for the year 1620." Our literature has not, since its revival, recovered the truthful and earnest spirit which they breathe, although it has taken a higher flight. What does this profit us? It is now the delight of a few; formerly it was an expression of the national character; and we may justly call the period from Luther to the Thirty Years' War the golden age of Protestant Germany." (Vol. i. p. 312.) In reading royalist historians, it is noticeable that his sympathies are occasionally, at least, with the people: "I willingly recognise," he writes to Madame Hensler, "Hume's great qualities, and his decided superiority to Gibbon; but,

in the earlier times, he overlooks many more things of the kind you have noticed, and in later periods he does not enter into the mental wants of the men whom he accounts fools and rebels. But this is equally the case with Gibbon." (Vol. i. p. 416.) Alas! the time was to come when Niebuhr himself should call men "fools" and "rebels," whose "mental wants" were precisely what, in the abstract, he was always pining to see expressed; but he never could recognise them when they were before his eyes. His mental and moral habit of discontent may account for much of his lack of consistency and of faith; but the misfortune to his time was not the less for its being easily accounted for.

He himself believed that the critical demon which spoiled his peace was exorcised by his marriage; and he certainly was as near happiness, for a short time, as his nature would allow. "Happiness is a poor word: find a better!" he writes to his sister-in-law, a few weeks after his marriage. "Her presence and conversation keep my heart at rest, and my mind healthy. Thus I am gradually recovering from the impression made upon me in past times, by the delusions and contradictions of the world." This might seem to be written by a man in middle life; but Niebuhr was, as yet, only twenty-four. Amelia was seven-and-twenty: and this was a case—one of the very few—in which the superior years of the wife were no disadvantage, but rather the contrary. Niebuhr himself said so, and the reader perceives that he was right. No years could make him more an object of reverence to his wife, whose high intellectual cultivation fitted her for the full appreciation of his. If princes and statesmen honoured his mind, without thinking of his age, well might she; while, at the same time, her mature thoughtfulness, and her greater experience of daily practical life, gave her an influence over his anxious temper, which, as he said, kept his heart at rest and his mind healthy. He held two offices under government, connected with India affairs at Barbary; and the small income yielded by his employments was enough for the modest wishes of the two who were all in all to each other. There was no drawback to their happiness but Amelia's bad health, which already interfered with his plans, by preventing his writing the Political History of Greece, which he had intended to do in the winter evenings of 1800-1801.

That was, however, a winter never to be forgotten by any office-holder under any northern sovereign. In December, Paul of Russia sent forth that absurd challenge to the sovereigns of Europe, to meet him in

single combat, each with his prime minister for his squire, which was the first open evidence to the world of his insanity. In the course of the winter, while the madman was sequestrating English property, and imprisoning British subjects, Count Bernsdorf, Niebuhr's patron, persuaded the Crown Prince of Denmark (nephew of George III.) to join the other northern powers in their leaning towards France, and their confederacy against England. We have no account of Niebuhr's feelings under this state of things, which must have been offensive alike to his affection for the English and his detestation of Napoleon. There is a gap in the correspondence of half a year, and we light upon the pair when they are listening for a cannonade in the direction of Cronburg, reading the "Odyssey," to pass the time and preserve calmness, and speculating on the strength of the defences, if Nelson should be really close upon them. Nobody knew then that Paul was dead. In the next letters we have an account of the bombardment and the consequences. After writing tranquilly of "single hollow shots," Niebuhr finds that these shots are bombs. "I never was so dismayed," he avows; and he tells "Milly only a part of it," calm as she is. Then comes the news of the "cartel-ship" that was the ship that brought the letter which Nelson would not fasten with a wafer, lest it should look like haste. When that letter, with its great round seal, arrived, the guns were quiet; and then followed the negotiations, in the course of which Nelson, in the presence of the Crown Prince, pointed to Count Bernsdorf, and accused him of being the author of the northern confederacy, and the cause of all the mischief that had been done. There is no knowing whether Niebuhr alluded especially to Bernsdorf, when writing that the citizens looked with indignation on the authors of their mistakes. He dwells at great length on the glorious heroism of the people, which, without comforting him about the state, made him rejoice to suffer with the nation. "It is," he says, "a battle that can only be compared to Thermopylæ; but Thermopylæ too laid Greece open to devastation." But it soon came out that Paul was dead. The Russian princes invited Nelson to court, and peace followed a long armistice—the Russians and English mutually promising "unalterable friendship and understanding:" all which left Count Bernsdorf no power to do anything, and Niebuhr no need to say anything.

In 1804 he became first director of the Bank of Copenhagen, while his other offices were made of higher importance and value. He proved himself so admirable a financier, that he was long regretted after he left Denmark.

—for his official ability no less than for his scrupulous integrity, and the earnestness with which he put his heart into whatever came under his hand. Exhausted as he was every day with business, he rushed to his books every evening, and studied late into the night. Ancient history was still his delight; but he also acquired the Arabic language at this time. In 1804, he had hopes of being able to bring the finances of the country “into a state of the highest prosperity.” In 1805, he suffered with all the intensity of which his nature was capable, at the calamities of Ulm and Austerlitz. “I have ever hated the French as a state,” he writes (vol. i. p. 190,) to Count Adam Moltke, “and regarded the humiliation of Germany with the same feelings that breathe through your Odes. . . . Happy are we who have no children! For perhaps it might be well for whole nations to die out with this generation. With two gifts has England’s genius blessed Lord Nelson, and rewarded him for his deeds; that he died victorious, and therefore still full of hope, before he could know the defeat of Ulm; and secondly, that he left no children to grovel under the oppression of those whom he had so often made to pass under his yoke. We shall soon see how the French will govern the world. What we shall not see in its consummation, but can already perceive in its commencement, is the degeneration of intellect, the extinction of genius, of all free, all liberal sentiments—the domination of vice, of sensuality, not even disguised by hypocrisy; the decay of taste and literature. In this respect, we are already long past the dawn.” Under a despair like this, he resorted to his Demosthenes, and was so roused by the study, that he translated and printed the first Philippic, hoping that all Europe would draw the parallel between Philip and Napoleon, and be roused to resistance with the readiness of old Greeks. This was done so entirely upon impulse, that he forgot all about it, and was extremely surprised and amused when, many years afterwards, a friendly publisher wrote to him about a new edition. This happened when Napoleon had been for ten years cold in his grave; and the demand was probably due to Niebuhr’s fame; but this explanation did not occur to him so readily as to some other people.

Next followed an event which, we should suppose, can never be regarded by observers of Niebuhr’s life but with regret. He left the service of his own country for that of another. The removal would be an utter mystery but for the hint given by his biographers, that he listened to the invitations of a Prussian official, in a moment of jealous irritation with his own government. He thought himself

neglected, and felt aggrieved that a young nobleman was talked of for an office which he had understood was intended for himself, if the Crown Prince should agree to his appointment. He thought that he was appreciated only abroad; and it does not seem to have occurred to him that it might be well to remain at his useful and honourable work at home, whether he was appreciated or not. The matter was in abeyance for some months, during which matters came right with his comrades in office, and his anger passed away. But the idea of leaving his country for higher honour abroad had found entrance into his mind; his feelings were afloat between the two countries, and in May, 1806, he accepted the overtures of the Prussian government. He hoped for release from much tedious work upon details, but he feared, very soon, something much worse than this. A probability arose of an alliance between France and Prussia, in which case, Prussia and Denmark would be enemies. He would not have gone over to an enemy. Nobody ever supposed for a moment that he would. But the step of leaving Denmark at all was not a favourable one for his fame or his peace of mind. He was very unhappy while preparing to leave Copenhagen. If he had foreseen what was awaiting him at Berlin, he would have indulged his heart, and have remained. That he, whose faculty of prevision was noted wherever he was known,—prevision especially about the political and military movements of individuals, and of Napoleon above all,—should have been utterly blind as to the punishment now about to be inflicted on Prussia for her recent faithlessness and vacillation, shows that his faculty of prevision was not of a high order. Niebuhr could not but have known that Prussia was proposing peace at one and the same time to us and to Napoleon: that her envoy hung on the skirts of the armies before the battle of Austerlitz, to see how the fortunes of the war would go; and that the victor insultingly bade the humble suitor retire to Vienna, and wait for him there till his good fortune was quite secure; and also that Prussia had concerted with Napoleon the confederacy of the Rhine for her own purposes. While Niebuhr was preparing his acceptance of office at Berlin, Prussia was annexing Hanover, and publishing false excuses for the act. Between his acceptance and his setting out on his journey, it became known to the Prussian government that Napoleon was treating with Mr. Fox for the restoration of Hanover, and hinting to Alexander that any part of Polish Prussia was at the service of Russia.

While Niebuhr was travelling to his new home, the truth was revealed that the Con-

federacy of the Rhine was now an instrument in Napoleon's hand for the humiliation of Prussia! He and Amelia reached Berlin on the 5th of October, and on the 14th arrived the news of the defeat of the Prussians at Jena, followed by several others within a few days. How it was that Niebuhr, with his upright mind, and his clear and practised eye, did not discern, even as well as others, what was impending, can be accounted for only by the supposition that his judgment was impaired by the moral dubiousness of the step he was taking. His biographers say of him and Amelia at this time, "they went forward with the courage of resignation that was prepared to sacrifice all, where all was at stake;" and great indeed was the courage necessary when the possible sacrifices had no savour of patriotism in them, but rather an ill scent of selfishness. Niebuhr wrote (vol. i., p. 193) to his parents before leaving Copenhagen, "We shall be nearer to you in Berlin than we are here, and the permission to travel will most likely be obtained with less difficulty. But still there will be a new kind of separation between us." One is glad that he felt this before events pressed it upon his heart. Many years afterwards, we find him expressing to De Serre an ingenuous hope that the Germans, though liberal as to what they include within the political boundaries of Germany, will not always be remarkable for the facility with which they enter into the political service of other courts than their own; and here we recognise "words" which may be profitably "taken to heart" "by those who occupy themselves with political questions"—for once, we should say, rather the words than the deed. It was in the department of finance that Niebuhr's business was to lie. His first offices,—Directorship of the Bank and of a Royal Commercial Company,—were to be merely steps to a higher position. But all was confusion when he arrived, and in a few days the French commissioner had received from seven of the ministers, who did not even consult their sovereign, the oath of fidelity to France. Niebuhr had not even the comfort of having sacrificed himself to assist a virtuous government, struggling against a gratuitous invasion. The Prussian government had trimmed to the last moment; and when the due retribution came, and the ministers themselves joined in the betrayal of their disgraced sovereign, a stranger entering the government could only share in its just humiliation, without any chance of doing good. The affair is passed over as lightly as possible in the book before us; as is very natural, considering that it comes out under the sanction of eminent Prussians. But we are

bound to observe closely this crisis in Niebuhr's life, because it shows, among other things, how his marvellous sagacity was at fault,—precisely on the most important occasions, for a want of a living political faith.

Von Stein was among the faithful of the Prussian ministers. He just saved the money of the state offices under his direction (by a few hours only), and sent Niebuhr on with it to Stettin. Amelia went with her husband, for she could not remain alone in the strange city of Berlin. The advance of the enemy drove them from place to place, till they were actually obliged to take refuge at Memel. As their prospects in Prussia seemed at once destroyed, Niebuhr felt at liberty to settle where he pleased. Proposals followed him, from home, from England, and from Russia: but he was heart-sick, and desired to seclude himself from office till it should be seen whether Napoleon was really to rule the whole world. The hungering soldiery and peasantry before his eyes, however, won his services. There was not corn enough for seed; and, being asked to aid in organizing the commissariat, he could not refuse. The winter and spring were dreadful. Amelia was ill in Memel when he was himself prostrated by typhus fever, at a distance from her; and early in February was fought the battle of Eylau, where Napoleon was stumbled upon by some Russian soldiers, as he stood by the churchyard, and *not* captured,—from their not being sure who he was. What a moment for Europe and the world! What a moment for the Niebuhrs—if they had known of it—he on his sick-bed at Bartenstein, and she pining under low fever at Memel! As it was, the French came on, and still on; and the Niebuhrs fled, with the Prussian ministers, to Riga. He had made up his mind to take up the first ship which would carry him to Copenhagen, or any where out of the line of the French; but the Prussian minister, Hardenberg, besought him, even with tears, not to desert the sovereign and the government; and it was impossible, at such a moment, to consult his own wishes. In April, Alexander had mingled tears with the king of Prussia and his spirited queen; with mutual embracings, they had vowed eternal enmity to Napoleon and fidelity to each other: in May, Alexander (of whose "magnanimity" Niebuhr had been wont to speak) wrote to George III. "that there was no salvation to himself or to Europe but by eternal resistance to Bonaparte:" yet, before the end of June, he was on a raft in the middle of the Niemen, entering the pavilion, of which Napoleon opened

the door to him, and sitting down with his new friend to volunteer the information how cordially he hated England, and to consult how they might best betray and pillage Prussia. Of these proceedings we find scarcely a hint in the volumes before us, deeply as they concern Niebuhr's political life, on his entrance into the service of Prussia. The treaty of Tilsit is spoken of as lamentable, simply because it proved that further resistance to Bonaparte was not to be thought of. Niebuhr appears to have had some idea of failure on the part of Russia. On or about the same day that Alexander wrote as above to George III., Niebuhr wrote (vol. i., p. 217) to his wife: "You may reckon with undiminished confidence on the *courage* of the Russians, but I cannot be blind to other things. However, I must not speak of this in letters. The departure for Tilsit, it is now said, will not take place before the end of the week." He stood out against being made a member of a provisional commission, for governing and restoring the ravaged and curtailed country of his adoption, and sent in his resignation to the king at Tilsit, where the monarch's heart was breaking under the treatment of his "magnanimous" "brother" Alexander. The two emperors were always consulting together, excluding the king, or forgetting his presence; riding away from him in the morning, and walking off together in the evenings. At this time it was that Niebuhr's resignation of all office in Prussia reached his new sovereign. The humbled king besought him to stay, at least for a time: and Niebuhr acquiesced. We have no right to censure Niebuhr for any part of this course of action. His health was very bad at this period, and his anxious temper was not one to bear the stress of such times. It was not his own country that he desired to leave. He did not come for patriotic purposes, and he was the more free to go when all hope seemed over. We narrate the circumstances because they are (perhaps necessarily) very cursorily indicated in the book before us; and it is indispensable, in reviewing Niebuhr's political life and character, to observe what he witnessed of the conduct of sovereigns, the condition of countries, and the moods of conquered peoples, when he had reached the age of thirty-one. What he saw and felt inspired him with deep regret that he had entered upon political life. Several affecting passages of his letters record, at intervals, this grief. Making every allowance for his constitutional tendency to discontent with the place and circumstances he was in, these regrets might be quoted

with profit when men are arguing, as we often hear them now, in favour of paying honour to literature and science by endowments of political office. Niebuhr is an instructive spectacle in this light. He had some insight into old Etruscan politics, and was perfectly familiar with those of Rome, in all centuries. He could speak of the rights and wrongs of peoples high up on the ancient Nile, and could say how the affairs of Asiatic empires, thousands of years ago, could best be administered. But what was he able to do, when posted high amidst the most marked and most momentous struggle (as he believed it) that the world ever saw? Does the heart of freedom now beat the stronger for him? Are princes and ministers wiser, are their subjects braver and more enlightened, any one of them, than if Niebuhr had spent his life among his books? We fear, rather the contrary. He could see, as he said, in the dark ages; and he was unaware that he could not see in the light of the present time. He could and did see what would be the next march, or the next political move of this or that individual; but of the antagonist forces of despotism and liberty in the general heart of the time he perceived nothing: and the great geographer, who could teach all about every ancient battle-field, never discovered the vast one lying at his feet, where the East and the West must soon come up against each other, and fight till the one or the other has the possession of Europe, and the command of the destinies of a whole hemisphere. When he looked behind him, all was marvellously clear, though the sun had long set. Where others saw only by faint rays of scattered stars, those stars were to him like little suns, revealing the kingdoms of the dead and the glory of them. Forgetting that the dawn must be on the other side, and not aware, as others were, that it was breaking, all the future was to him an impenetrable mist. He heard something of the gushings of the torrent of revolution which must first be crossed, and he shrank back from it. The many who listened for the voice of one so wise heard him calling the despots "magnanimous," and the patriots, however teachable and disinterested, "fools," "fanatics," "aping lackeys," "children of the devil," and so forth. But his half-consciousness of his own false position fills the reader with tender regret, which leaves no room for harsher feeling. He writes to his wife:—

"The various spheres of action resemble the different regions of the atmosphere, which suit dif-

serently organized classes of men. Some are most comfortable in low countries; others in the ordinary middle atmosphere; others can only exist in the pure mountain air. I belong to the last class; to those who must have freedom for the soul and intellect; and for this very reason I ought not to have entered into the restraints of official life. I am often seized with regret when I think of my beautiful researches into history—my happy meditations on dark periods—my power of bringing them vividly before my mind's eye—my life in antiquity. Where is all this gone? Shall I ever renew it? Shall I ever be able to restore it to fresh life?"—Vol. i. p. 216.

Again :

"This consciousness, with which I was vividly impressed with regard to official life in general, before I had entered on it, did not warn me, when, after my entrance, a path opened to me towards finance. For a long time past I have been almost unable to refresh myself by study; and yet the mind becomes sadly poverty-stricken when filled by no other thoughts than those arising from one monotonous occupation. This estrangement from my true life has now already lasted nearly three years and a half, and time tends ever onwards away from the forsaken shore, till return becomes impossible."—Vol. i. p. 290.

Again, when about to go to Rome as ambassador :

"There are many things which become indispensable to us when we are accustomed to them; and if you are conscious of being able to fill more than one vocation, you cannot resist the impulse to fill more than one. Indeed, you feel that you wrong the cause, as well as yourself, if you renounce either of them. This is my feeling now with regard to the highest spheres of statesmanship. Unhappily, we always learn wisdom too late, and I shudder when I look at the years that lie behind me, and the age I have already reached."—Vol. ii. p. 13.

On his return to Berlin, he was occupied, as a member of the provisional commission, in retrieving the finances of the country. The pressing difficulty was to raise the tribute promised to France. Till this was done, the French were to occupy the country; and no improvement could take place till they were gone. A Dutch loan was to be attempted; and early in 1808, Niebuhr went (accompanied by his wife) to negotiate it, being invested with the dignity of Prussian minister at the court of Holland. It is really painful to dwell on the political history of Prussia for the next few years. Niebuhr, devoted and industrious, and in some affairs too wise for the men with whom he had to act, passed the weary years in hope, now and then, but much oftener in disappointment, fear, irritation, and, at last, in deep despondency. He was not made for

co-operation. He had too much honesty, too much sagacity, and too much personal sensitiveness for it. In 1810 he quitted office, plunged among his books, and wrote a Treatise on the Amphictyons. He had now entered on the happiest three years of his life. He was historiographer to the king; and the University of Berlin was about to open, placing him in the society of scholars and men of science. He forgot the politics of the day, and lived among the old Romans.

This portion of his life, only too short, is charming to read of. At last he was happy—as happy as his temperament ever allowed him to be. His kindling over his work—his modest consciousness of its greatness—his innocent exultation at its success—his tender pleasure for his wife's sake,—are a relief and joy the reader. But two gigantic shadows were stalking on to chill his life. Napoleon was coming to possess himself of Prussia, on the way to Russia; and some way behind, death was coming to snatch away Amelia. In the midst of this first calamity there arose a joy which he had not anticipated. His countrymen proved themselves nobler than he had believed them. It was ever his misfortune, in his relations with the existing generation, to believe nothing good but what was before his eyes at the moment. In great crises he was taken by surprise, by the people turning out so much better than he had expected: in the interval of those crises, he fell back into despondency. Honesty and disinterestedness usually inspire and maintain faith. With Niebuhr it was not so; and he suffered needlessly and bitterly from this infirmity of his nature. While Prussia was in the grasp of Napoleon, in 1808, he had written:—

"I have tried another medicine, in the shape of some most select reading. I wanted a book that would rouse my imagination and my feelings, so I took up Mirabeau's 'Essai sur la Despotisme.' . . . What inimitable sayings! 'L'animal que déchire le féroce léopard, admire-t-il la garrire de sa peau, ou la variété de ses ruses?' Set in the place of the first word, the subject, the equivalent term l'Allemand, and the deep truth of the saying is gone. The animal knows nothing beyond the impulse of natural feeling, and seeks no false consolation; but our countrymen have no true feeling left, not even that of pain or enjoyment. And on this account I cannot conceive what is to become of us. Are we to be apes of apes? I implore the mercy of heaven to grant us a new revelation; for salvation must come to man from without; our own longings only prepare the way for it."—Vol. i. pp. 256-258.

When the revelation was made to him that there was "true feeling" left, his let-

ters, like his mind, glowed with delight—a delight vivid but transient. He tells how symptoms of the “true feeling” had appeared, while it was unsafe for him to write about them—before Napoleon left Paris for Russia; he tells how one citizen gave to the cause of freedom his entire income from his lands; another his farm-horses; another his stores of corn; how a brass-founder shut up shop, and volunteered, with a troop of journeymen and apprentices, all furnished forth at his expense; he tells of the 11,000 volunteers in Berlin alone, when volunteering involved the sacrifice of everything. He had even admiration for the noble spirit of students now—now, when their veneration for him as their teacher had opened his heart to them, and shown him their really teachable nature, when trusted and well guided. Would that it could have been so in after years, when his faith in the young was of even more consequence than now! He did his own share of the work of the day, first, by drilling in a volunteer company, and then by re-entering public life, at the command of the king. After Napoleon's return from Moscow, Niebuhr repaired to Dresden, where the allied sovereigns had their place of meeting. His admiration of the people held out over this journey. After his return he writes:—

“I think that, while we were still in Dresden, I mentioned to you that the change in my residence and society was anything but cheering. At Berlin, the consciousness of the excellent spirit which animated the nation was ever present to us; and yet we were sufficiently removed from the sight of all that is saddening in the actual details of the war. We lived with all the energies of our souls and hearts in action, and each one derived his belief in the immeasurable energy of the nation, from his own inward consciousness. It was this which made us so full of confidence. In Dresden, we were separated from the nation, and its most excellent part, the army, and transported into a circle of fashionable people who were strangers to us; at least, there were only a few of our public men among them. Here we saw as exclusively what was commonplace, as at home what was beautiful and good.”—Vol. i. p. 387.

When he speaks thus of the army, we must remember that it was mainly a citizen army.

“Never have good will and good ideas ripened so universally into good deeds as with our people. He who had before declared what ought to be done when the time of trial should come, did it now himself (with very few exceptions) and to the fullest extent. The behaviour of the women, too, is admirable. There are hundreds who not only renounce every pleasure, but even a close attention to their households, in order to superin-

tend the hospitals, to cook, to tend the sick, to mend their linen, to procure money and other necessaries, to look after the hired nurses, and keep them up to their duty. Many have already fallen victims to typhus fever. The men can scarcely interfere with the regular course of these occupations, which have assumed quite an organized character. All that is the spontaneous expression of the national mind is elevating. The recruits leave their homes with shouts of rejoicing; practise the exercise together out of the hours of training, that they may be able to join the army so much the sooner. And this is not done that they may lead a merry life of excess; the soldier hangers, when his host can give him nothing, rather than use violence; he gives his cloak to his captive when he is shivering himself. One cannot speak of these things without emotion,—without saying to one's self that these people are better than we should be in their place.”—Vol. i. p. 398.

“... Only let us now preach to every one—we have no need to recal it to ourselves—that an inactive joy were as despicable as it were innoxious. Our deliverance cannot remain an incomplete work; it cannot go back, if we in any measure do that to which we are summoned by every motive.”—Vol. i. p. 373.

Again and again he says this. While the affairs of Europe were in course of settlement, after the downfall of Napoleon, he wrote and he said, with characteristic earnestness, that the princes of Germany must give representative institutions to their peoples. The constitutions were promised, and, with the single exception of Saxe Weimar, never given. And what did Niebuhr do then? He was the Prussian Minister at Rome, and in perpetual consultation, of course, with the government at home. He said he lamented the “mistakes” of the princes, in letting the right time go by. He hinted at some sad “faults” in the ruling powers; he got into raptures with the Crown Prince of Prussia; and when the young men of Germany demanded from their princes the promised constitution, he wrote of their crimes, and called them fools, rebels, fanatics, and aping lackeys. Among his many charming pictures of his beloved Crown Prince, (for some time his pupil, and now King of Prussia,) it is difficult to pick out the one most radiant with hope. There are several at intervals of years such as this:—

“I am delighted with the Crown Prince (then eighteen, in 1813). His noble poetical nature is gradually beginning to be recognised by some. He has extraordinary depth of feeling; and he preserves his individuality of character, sometimes without effort, sometimes consciously, among people who do not understand him, and are always blaming him. There is something very uncommon about him; the King calls his strongest feelings into play. He gives promise of great

days for Prussia, and Germany—of the fulfilment of all that is yet wanting.”—Vol. i. p. 399.

In 1824—

“The Crown Prince has improved beyond description; his heart remains what it ever was, and his mind is enriched by an extensive knowledge of facts. Prince William appears equally warm-hearted and good. In truth, the man who is not satisfied with these Princes must make unwarrantable demands upon the world.”—Vol. ii. p. 293.

What is written of him now does not agree very well with this. Letters from Prussia say now, “Every one seems to have given up doing or saying anything, in a kind of apathetic despair.” . . . “The Second Chamber has (May 1852) thrown out the proposal about the new peers; so I believe it is to be done without their consent. The Empress of Russia is expected to-day. The Emperor will not come as long as the Chambers are in existence. For all the existence they have, he need not allow them to come in his way. Everyone grows more and more discontented, but no one does anything, and very few have the courage even to speak.” The nation would willingly exchange some of the “poetry” of this King’s nature for a little veracity; some of his “heart,” as shown in speechifying and tears, for a little conscience; some of his “individuality” for a little ordinary fidelity; some of his “extensive knowledge of facts” for the smallest real intercourse with his “beloved Berliners.” Enough of him! For Niebuhr’s sake, no more shall be said of him here.

It was not till 1824 that Niebuhr retired from office. Besides being sent hither and thither on financial negotiations, he was consulted on all occasions by his government about the settlement of Germanic affairs in general, and Prussian in particular, till he entered upon his last political function—that of Prussian Minister at Rome. Before he went there, some great griefs saddened his heart—one for ever, for he certainly never fully recovered from it. Before his wife died, he had lost his father. The old man died at the age of eighty-two, in May, 1815; and the life of him, by his son, by which we best know the great traveller, was written as a kind of solace, when Niebuhr was mourning his wife. In that life there is a curious anecdote, which makes us wish to know some more particulars still of the senior Niebuhr’s mind and temperament. “It is extraordinary,” says his son, “that this man, so remarkably devoid of imagination, so exempt from illusion, waked us on the night

in which his brother died, though he was at such a distance that he knew not even of his illness, and told us that his brother was dead. What had appeared to him, waking or dreaming, he never told us.”

By this time—in the midst of the Hundred Days—all Europe was watching every movement of Napoleon; but Niebuhr had little attention to spare even for the preparations for Waterloo. Amelia was dying. It was three days after the battle of Waterloo that this incomparable woman expired. The physician had forbidden any notice to her of her danger. It is the physician’s office to give advice on this head; and it is for surrounding friends to regard it or not, as physical or moral considerations prevail. Niebuhr did not speak to Amelia of her approaching death. “Once only, a few days before her death, as he was holding her in his arms, he asked her if there was no pleasure that he could give her—nothing that he could do for her sake. She replied, with a look of unutterable love, ‘You shall finish your History whether I live or die.’ This request was ever present to his mind, and he regarded its fulfilment as a sacred duty; though years elapsed before he was able to resume his work.” (Vol. ii. p. 1.)

This injunction was a very heavy care to him. His was not a spirit that could bear lightly and cheerfully any permanent engagement, or protracted task. He was too nervously conscientious, and had too little power of will to bear any constraint of the kind. The energy which would have carried him through any work, if he had not been bound to do it (by either promise or conscience) was turned to self-corrosion by his “over-exquisite” solicitude. His history had nearly ceased to be a pleasure to him before his re-entrance into political life;—it was poisoned by the coolness of the reception of the second volume, in comparison with the first, and it was henceforward a constant burden upon his mind, connected as it was with his promise to Amelia. The story of the rest of his life, as given in the second volume of this book, is very painful; and it grows more and more so to the end. We shall pass rapidly over it, as it adds little to the revelation of his mind in political life already contemplated.

Madame Hensler nursed her sister to the last; and from this time it is easy to see that Madame Hensler was his chief interest in life. There is evident obscurity about this part of the story. She was to have gone to Rome with him; but she did not go; and another went, strangely enough, in her place. When Madame Hensler visited the mourning wi-

dower, she took with her a young girl, her adopted daughter, to whom Niebuhr was married in a very few weeks. Poor Gretchen was a good little girl, and had been well educated; but her health was wretched, and she was no companion for her husband. She was devoted to him, and he treated her with all tenderness: but it is mournful to see how his life was frittered away after this time. Amelia's ill health was a sorrow, but scarcely an impediment. She seems to have been a furtherance to him in every way. With Gretchen it was otherwise; and apparently only because she was less wise and lofty than Amelia. She was a patient, suffering, loving creature, adoring him whom she could not comprehend;—to such a point that she could not survive him. She died nine days after him.

His constitutional tendency to discontent grew upon him so manifestly after Amelia's death, that it is clear how benign was her influence in cherishing such peace as he was capable of. While she lived, the tendency showed itself in an almost amusing way about minor matters; for instance, when, in relating how much he had been occupied in reviewing, he hoped his reviews would be forgotten, because the books reviewed, like almost all modern books, were so very bad. It seems not to have occurred to him that, in that case, he had only to let them alone. Now, his discontent extended itself to his position, his vocation, his coadjutors, his government, his nation, the Catholics, the Protestants, his life at Rome,—his life everywhere. It is necessary to point this out, that his vehement expressions of contempt and hopelessness about the Italians—all Italians—may not go for more than they are worth. Putting them together with his growing horror of the doctrine of the right of revolution, the inference would naturally be that he would now, if living, be on the side of Austria and the Pope in Italy, and would give his aid to the cause of despotism throughout Europe. This would be an injustice to him. He would, no doubt, if living, anathematize Mazzini, and in the abstract, counsel endurance, as he did to the Germans in 1808; but his heart would glow at the spectacle of what the Italians could do and bear, during these latter years, and he would have written of them as he did of the Prussian people in 1813. When we read of his irritations with the Burschenschaft, and his downright vindictiveness with the Italians, we must remember that events fared no better with him than nations and sects. He could not bear to be congratulated on going to Rome, which his friends knew to have been the goal of his wishes for many years: he found fault with his life there,

though his health presently became better than it had ever been in his life. He liked scarcely anybody there but the Pope and the German artists; and he begins, by and by, to disparage these last. He mourned over his inability to write his history there, and was always hearing the gentle chidings of his Amelia about his promise to her; and yet, when, at his own request, he is recalled, he not only visits with bitter pain, for the last time, his haunts of seven years, but at length remembers how good his health had been, and how fine his opportunities; and, when returned to Prussia, tells his friends that at Rome only could he finish his history to his own liking, and that there only did people know how to value him. One passage out of many will suffice to show how morbid were his feelings. On his return to Prussia, after a seven years' residence at Rome, he writes (December 11th, 1823):—

“It must certainly be owing to some carelessness in expressing myself, that you could suppose I meant to say anything to the disadvantage of the Germans, as compared with the Italians. God forbid! What I mean is that I ought to have an adequate compensation for what I give up in point of health and comfort, and the variety of interesting objects of contemplation, if I am not to feel that I have lost by the exchange. The case is different with anyone who has retained his youthful connexions in Germany. I come back to a world in which the opposing parties are impelled and guided by vague sentiments and heated passions, and all alike have adopted their opinions on the authority of newspapers, periodicals, and the Conversations-lexicon; and in these authorities they put such faith, that they anathematize everyone who has more insight than themselves. I would just as soon talk about religion with a bigoted Catholic peasant, as converse with such people about the weightiest concerns of the world. Such wisdom I may dare to despise, when three men of three such different nations, and each of them the first among, or among the first men of their nation, as M. Von Stein, M. de Serre, and Lord Colchester, give me credit for a profound knowledge of the material and intellectual condition of the leading states of Europe, ask me for my opinion, and take my verdict on matters as an authority, whilst in these trivial circles every one is wiser than I.”—Vol. ii, p. 280.

The plain state of the case, in the eyes of the people about him, was this:—that the princes of Germany had promised, in an hour of difficulty and danger, to give constitutions to their people; that they had not done so; and that Niebuhr gave no countenance to the demand for the fulfilment of the promise, but, on the contrary, treated with vehement contempt the remonstrants, who perilled their all in urging the demand. He did so from Rome; he did so on his return

to Prussia, and yet because he, in his heart, blamed the faithless princes, he was angry at all distrust of his patriotism. Let us look at one single chapter of facts.

After the wretched year of 1807, when the peace of Tilsit dismembered Prussia, the Tugendbund was formed, and so countenanced by the government that Napoleon interfered, and demanded its dissolution. The patriots who formed this virtuous league hoped to regenerate the national spirit, through the elevation of the national morals. Education, was, naturally, one of the first departments looked into. Pestalozzi's example and method had forcibly struck some of the chief movers in the Tugendbund, and they kindled over the fresh idea of the importance to human character of a regulated physical development and training. Out of this arose the Gymnastic System. Jahn published his work on "German Nationality," and in 1808 began, at Berlin, the training of a few boys in bodily exercise. The results were so approved that he opened his gymnasium in 1811. No French was spoken there; the place was a national institution in its language and manners, that it might become so in all its ideas and feelings. The Royal Family were often present, and Jahn was honoured and salaried by the government. Presently there were gymnasia throughout the country; and (let it be well noted), it was out of these institutions that issued that soldiery which Niebuhr praised and loved with his whole heart during the crisis of 1813. The Treaty of Tilsit forbade Prussia to maintain an army exceeding 40,000 men. From among the youth already prepared by the gymnastic system (which had spread far beyond the walls of the schools themselves,) levies were made, rapidly trained, and dismissed to make room for more; and thus it was that the nation showed itself so ready as it was to use the occasion of Napoleon's reverses. The students, whom Niebuhr had so heartily admired on their march, went back, when all was quiet, to their universities, and resumed their studies. If, because they did so, Niebuhr expected that they should forget what they had seen and done, what the princes of the empire had promised, and what their peoples aspired to, he expected what was impossible. If so good a man failed to honour the spirit and practice of the great body of German students, under the inspiration of the time, it must have been because he did not understand them. The constituent bodies of the universities had long been degenerating; the students set about reforming them; and it is affecting to see how conscientiously they began with reforming themselves. The fervour with which they

set about the work of self-discipline,—genuine, personal self-control,—was not likely to last as a characteristic of the universities; for it was not likely that a succession of youths should be open to the same inspiration; but it was, for a time, so noble and so beautiful, that it ought to have commanded the esteem and love of such a man as Niebuhr; it must have done so if it had fixed his mind's eye as the virtues of ancient races could at all times do. It was the deliberate, solemn, cheerful purpose of not one, but many, to become Christ-like in all but miraculous power. This did not, in their idea, include the duty of non-resistance. They endeavoured to supersede the absurd practice of duelling with swords, so long prevalent; but they took up the sword when no other means would avail, to withstand the petty tyrants of their communities. The purer their lives, and the stricter their enforcement of moral reforms, if even among themselves alone, the more were they hated, opposed, and traduced by the despotic, the licentious, and the merely old-fashioned who remained within the walls. The young confessors and apostles were accused of revolutionary tendencies; and rumors of conspiracies against the State got abroad. Jahn's motto, which had been so loudly cheered when first given out, "Frisch, frei, fröhlich und fromm," now seemed very dangerous. The governments had not given the representative institutions for which the people were waiting; and, in this consciousness, every saying which roused enthusiasm and commanded a wide assent, was feared as revolutionary. Jahn was imprisoned, and, by order of government, his schools were closed. The man was the same as when Napoleon was marching upon Berlin; the schools were the same; the spirit of the youth of the nation was the same; but Napoleon was now a long way off, and these good things were all highly inconvenient. An inquiry into the political action of the students at Giessen University was instituted by order of government, and every one came out clear from all imputation of revolutionary tendencies. But they were denounced from university to university, that reception might be denied them. Their preparation for life was embittered by calumny, and calumny was to go before them, to embitter their after-life. In 1817, on the anniversary of the battle of Leipsic, and the tricentenary of the Reformation, the day was celebrated by the University of Jena and the whole country. Within a walk is the Wartburg, where Luther lay imprisoned in the castle; and it is, or was then, customary to light a bonfire on the mountain, called the October fire. Into this fire a Berlin student threw, after giving his reasons in a single

sentence, a handful of anti-liberal works, together with an Austrian corporal's stick, a Hessian pig-tail, and a Prussian military sash. Nothing that was said that day could be laid hold of by the most suspicious reactionaries; so they eagerly grasped at this deed, and the more vindictively because the works thrown into the fire were written by men high in the Prussian service. Charles Follen's Great Song, which had by that time spread over Germany, was sung at the close of the proceedings. When the government was making the arrests consequent upon this celebration, it would doubtless have laid hands first upon him, if accusation had been possible. But he was not at the feast of the Wartburg. His heart was with his friends there, but he and some others preferred remaining at home, at another kind of feast—they commemorated the day by partaking together of the Lord's Supper. Now how does Niebuhr speak of these young men—the true comrades (when not the same men) of those whom he had so honoured four years before?—

"The coarse proceedings on the Wartburg, mingled as they are with religious comedy, have deeply distressed me. They exhibit our youth as empty, conceited, and vulgar. Freedom is quite impossible when the youth of a country are devoid of reverence and modesty."  
 "Under the gymnastic regime there must inevitably be an end of science and literature, and, indeed, of all that is noble, quiet, and beautiful."

#### And to Savigny —

"I give you special thanks, on my own account, for your masterly essay on the advocates of legislative novelties, which is as just in thought as it is powerfully written. My Cassandra spirit says indeed, alas! it will be of no avail. We are absolutely powerless to turn the broad shallow current of the spirit of the age into a deeper channel. But it is in itself a noble thing to sacrifice yourself by unwearyed exertions; and more meritorious to scoop out in the mud a bed for the stream than to sustain a sublime conflict with wild torrents. I cannot help thoughts of this kind. It is not because my own little barrel runs thick, but because everywhere things are on the lees, that I despair of the age and of posterity."—Vol. ii., pp. 110, 117, 88.

As he could nowhere see comfort, it follows that he did not approve the conduct of government about this Wartburg affair. He had not the consolation of thinking anybody in the right. And, indeed, the governments of Berlin and Vienna were so completely stultified by the issue of their investigations, that a Niebuhr could not be conceived of as sharing in the disgrace

of them. The same account of things applies to the unhappy case of Kotzebue's murder,—in which, however, there was something more like a reason for supposing revolutionary purposes to be involved. Though it was presently made clear that the murderer was a fanatic, who acted without concert or confidant, it was excusable to suppose at first, that some wild plot lay underneath. But that such a supposition should lay open the whole Burschenschaft to a charge of disaffection, and to treatment corresponding with such a view, is in no way excusable, and so Niebuhr thought,—amidst all his terror, grief, and wrath, at the event which gave occasion to the Carlsbad decrees. It is but justice to him to quote what he says of the proceedings of Hardenberg and Metternich in this matter. Their censorship of the press, their new watch set over the universities, and their permission to supersede existing authorities by the Diet, in case of alarm, were too much, even for his perturbed spirit of fear. He writes from Rome:—

"The Carlsbad decrees have made a most mischievous impression on the Germans here, who are mostly young men, and many of them possessed by wild dogmas: from this we may easily gather the effect they will produce in Germany. A favourable impression they cannot make on any unbiassed mind. It is equally severe and unjust to have recourse to severe and coercive measures against a sect, which your very violence converts into a party, without in the least reforming your own proceedings, without redressing a single real grievance. How utterly without love, without patriotism, without joy,—how full of discontent and grudge must life be, where this is the relation between the subjects and the governments! Our rulers do not perceive that Prussia can only subsist upon a moral and spiritual basis. I know very well whose spiritual children the democrats are: I know that you cannot allay their wild clamour, however well you govern, unless you do them the favour of adopting their senseless plans; but they would be detached from the people at large, if the latter found that they were governed wisely and well."  
 —Vol. ii. p. 160.

If any one asks what Niebuhr would have done if he could have had the control of events, the answer must be—there is no saying. He is in despair about everything; but there is no sign of his having anything to propose. The one evident fact is, that he never saw that the turbulence of our time is a feature of a transition state which a philosopher must know to be inevitable. But Niebuhr was not a philosopher, intellectually or morally; and in nothing is this more painfully shown than in his inability alike to resign himself to a course of

affairs which he did not like, and to comfort himself with the perception that it was a part of a great scheme of events.

We have given the case of the students of Germany. We shall not cite any of Niebuhr's opinions about the Italian liberals. The case of the Germans proves that his opinions on such matters were not worth much; and that is why we have gone so far into the subject. We would not run any risk of injuring the Italian cause by needlessly spreading harsh opinions of its adherents: and we trust that such of our readers as may see the book will remember that the same good man who thus writes of foreign patriots is extremely eager to disclaim having ever been connected, more or less, with the Tugendbund at home.

The further the reader goes in these two volumes, the heavier grows his heart. It is not only that he sees in the virtuous man himself an incapacity for serenity, and for the enjoyment which should attend upon such innocence and enlightenment as his. His hereditary melancholy becomes early in his history an established fact, to which those who honour and love him must reconcile themselves as they best may. It is less easy to withstand the influence of his constantly recurring portraiture of the woes and crimes of all the states of society that come under his notice. In the presence of his hopelessness, it is difficult to maintain any hope at all for more than a few individuals of the human race. While in Italy, he tells us of the wretchedness of the peasantry, the levity and profligacy of the proprietors, the infidelity of the priests, and, indeed, of all Catholics, the criminal jacobinism of the liberals—of nothing but sin and misery everywhere; except that he admires the Pope, and has "met with one noble-minded and agreeable young man, who unites depth of feeling and profound melancholy about the state of the world, with a very poetical mind, and a considerable amount of scholarship;" to which he adds, "He is not, however, a native of Italy, but a Greek, from Corfu." When he is returning to a Protestant country, where states are in course of demarcation, for purposes of local government, and the organizing of representative institutions, and where the Prussian system of education is coming into operation, the reader looks at last for a little cheerfulness; but he finds the melancholy deeper in proportion as the commentator cares more for his own country than for a foreign one. Representative institutions will do no good, because the evils lie in the heart and mind of the people. If there is federation in the representative as-

semblages, nothing will be done for want of community of interests; if the states are small, and self-governing, the "cursed divisibility" of land will go on till the whole agricultural population are beggars. Education itself fails and disappoints him. If we are granted a glimpse of "the prosperity of the Rhenish provinces," remarkable increase of population, activity among the vineyards, through protective duties, new houses rising in and about Cologne, Düsseldorf, and Coblenz, and so on, we are immediately told that "the Catholic religion in these parts is a benighted heathenism;" that nothing else is so clear as, "above all things, how powerless Protestantism is nowadays;" that, on the Rhine, the larger estates are entirely disappearing, and the smaller ones in constant course of subdivision, reducing the peasants to beggary; that the "great difficulty is the frightful increase of population," which people are beginning to be alarmed at, after having childishly rejoiced at it; and that "one learns with horror that out of 55,000 inhabitants (of Cologne) there are 20,000 in the receipt of alms." He goes on to ask, "What will be the position of Europe within a century?"

What will it be? This is not the place for a speculation on that subject. The use of the question here is to remind us that Niebuhr's misfortune lay in his utter forgetfulness of the fact, that Europe is, as she has been for three centuries, in a state of transition from an old to a new organic condition of society, and that the consolation for present evils is in a recognition of the deep-lying principles on which the change is proceeding. Some men may gain a clearer insight into these principles than others; and wise and good men may differ as to what these principles are; but unless they have faith that such exist—unless they perceive that humanity is progressive, they can only mourn hopelessly over the evils which are before their eyes, for which they see no remedy, if, indeed, the past cannot be restored. Such was Niebuhr's inability and misfortune; and we contemplate his suffering under it with respectful sorrow.

While he was at Rome, a son and several daughters were born to him; and they seem to have been so many rays of sunshine in his clouded life. His zeal about his boy's education is rather alarming to the reader. When the baby is a month old, the father is telling how it shall "undoubtedly take the gods and heroes for historical beings," and how very early it shall speak the ancient languages by practice; and it is painful to observe, during the few remaining years,

how the fine little fellow is subjected to the same liabilities of prematurity which irreparably impaired the health and happiness of his father. Soon after this child's birth, Niebuhr wrote,—“In my earliest youth, the longing desire arose within me to spend my life exclusively within the precincts of a narrow circle, teaching and labouring: would to God it had been my fate!” Yet the forcing method which he was even then contemplating with regard to his son was exactly what, in his own case, precluded the gratification of this early desire.

The Niebuhrs arrived at Bonn in August, 1823; and there the family lived till the death of both the parents in January, 1831. At Bonn he lectured, and revised and continued his history. His mode of life suited him better than any official position, and he recovered some of the cheerfulness which adorned his professional life at Berlin. There is little appearance of this cheerfulness in his correspondence; but we are told that it existed, and we are glad to believe it. Life could never again be to him what it was while Amelia was by his side; but it was brighter than it had been since her death, till the year 1830, which closed the scene very cloudily. In February of that year his new house was burned down. He bore the disappointment, inconvenience, and loss thus occasioned very manfully. He suffered much more from the French Revolution of the following July. It was to him as if chaos had come again. The ensuing months were a season of fevered anguish to him. He took his death in gratifying his eagerness about the trial of the ministers of Charles X. On Christmas night he became over-heated in the news-room, and then chilled in going home; and he died in consequence on the 2nd of January. When his wife fell ill, two days before, and could not come to him, he turned his face to the wall, exclaiming, “Hapless house! to lose father and mother at once!” On the 11th, Gretchen followed him.

If it be asked why we have contemplated so exclusively the political life and sentiments of a man who was more eminent in another view? why we have dwelt on the least cheerful and the least favourable aspect of a good and able man's character? we answer that it is not without a purpose. We wish to present what may be called a practical reply to two suggestions which we think need to be met. Much is said among us at present of the superiority of the treatment of learned men abroad over that which is seen among us; and the continental practice of inviting men of science and letters to political office is pointed out as honourable

and desirable. It is possible that the spectacle of Niebuhr's false position (so regarded by himself) may make some of us consider whether two great careers may not be spoiled, or deeply injured, by making the scholar into a politician; we do not say a statesman, till we have an example worthy of the term. For ourselves, we utterly disbelieve in the possibility of the union of creative scholarship with statesmanship, worthy the name. Niebuhr's case may help us in the consideration of the question.

A more weighty reason for what we have done is this:—that a protest is required against despair of the commonwealth, and discouragement about human progression, on the ground of Niebuhr's discouragement and despair. The influence of such a man—so good, so learned, so really wise, in regard to the affairs of the old world—may be most mischievous, if allowed to work, without any counteracting protest, on the minds of the timid, the superficial, and the faithless. It seems to be necessary to indicate that Niebuhr, while able and virtuous, was not great. Great as an author, he was not so as a man. Fully adequate to the concrete Past, he sank utterly before the abstract Future. With all his marvellous power of interpreting the past, he had no recognition of the present; no kind of prevision of the future, in any direction whatever. Thus he was not intellectually great. And his want of hope, and of aspiration, and of serenity, prevent our admitting him to be morally great—however noble were some of his attributes, and however dear his character as a whole. We may delight to see everybody loving and honouring him; but we must hold out a warning against his being relied on as an authority in political matters, or chosen as a guide. Ours is no time for negation in such affairs; and Niebuhr's political views, character and life, were all one great negation. Having said this, we cannot refrain from presenting one out of the multitude of fine passages in his letters, which showed what was the temper of the man when he allowed his best instincts fair play—when politics, position, and prejudice were out of sight. Writing of Göthe's account of his life in Italy, he says:

“Is it not enough to make one weep? To treat a whole nation and a whole country simply as a means of recreation for oneself; to see nothing in the wide world and nature but the innumerable trappings and decorations of one's own miserable life; to survey all moral and intellectual greatness, all that speaks to the heart, where it still exists, with an air of patronizing superiority; or, where it has been crushed and overpowered by folly and corruption, to find amusement in the comic side of the latter, is to

me absolutely revolting,—perhaps more so to me personally than I can reasonably expect it to be to others; but I think it ought to excite sentiments similar in kind, if not in degree, in every breast. I am well aware that I go into the opposite extreme; that my politico-historical turn of mind can find full satisfaction in things for which Göthe had no taste, and that I could live contentedly without feeling the want of art, not only amidst the glorious scenery of the Tyrol, but on moor or heath, where I was surrounded by a free peasantry, who had a history.”—Vol. ii. p. 91.

Göthe may well afford the quotation of this passage. He speaks for himself elsewhere: and he so honoured Niebuhr, that he would have enjoyed, like anybody else, Niebuhr's most true account of the difference between them. Niebuhr had a heart which could appreciate “a free peasantry who had a history;” and those who would conceive of him in his glory, should think of him in the Tyrol, climbing among the haunts of Hofer. Thus in the latter days is there some echo from the earliest; and we once more see in the Minister to Rome the little Barthold, who, in that marshy corner of Holstein, could listen all day long to tales which came warm from the true peasant-heart of his father. Sadly, now, do his words recur, “In my earliest youth, the longing desire arose within me to spend my life exclusively within the precincts of a narrow circle, teaching and labouring—would to God it had been my fate!”

#### ART. VIII.—THE RESTORATION OF BELIEF.

*The Restoration of Belief. No. I. Christianity in Relation to its Ancient and Modern Antagonists.* Cambridge: Macmillan & Co. 1852.

WE have heard it quoted as the remark of a distinguished foreigner, conversant with the choicest society in several of the capitals of Europe, that nowhere is the alienation of the higher and professional classes from all religious faith so wide-spread and complete as in England. That the masses at the other end of the social scale are indifferent or disaffected to the institutions which visibly embody the Christianity of our age, can be no secret to any observant inhabitant of a large English town. It is on the middle class alone that the various forms of Protestant worship have any real hold. Removed alike from the passionate temptations of the homeless artisan, and

from the mental activity of the statesman or man of letters, the rural gentry and the urban tradespeople are detained under traditional influences, partly by the wholesome conservatism of moral habit, partly by helpless accommodation to conventional standards. Men of this class, if once really touched and possessed by earnest conviction, are the best defenders of a religion from political assault. But a faith exposed to an intellectual struggle finds among them but a precarious shelter; especially if their attachment to it is less a living persuasion than a fear of the blank which its removal would create. Persecuted by the magistrate, they know how to defend their worship from the oppression of law. Assailed by the critic, they can offer but the resistance of a dumb impenetrability: they cannot bring their sterling personal qualities to bear upon the contest: they are obliged, for all active conduct in the strife, to trust to a body of literary Swiss, engaged to protect the Vatican of their faith, and accustomed never to report defeat. In proportion as the methods of sceptical aggression become more formidable, and its temper more earnest, it is found necessary to improve the training of the band of Church defenders: a measure at once indispensable and fatal;—for it lifts them into an intellectual position, which spoils the blind singleness of their allegiance, discloses the hopelessness of the task expected from them, and often destroys their antipathy to the noble revolutionary foe. It is the vainest of hopes, that a body of clergy, brought up to the culture of the nineteenth century, can abide by the Christianity of the sixteenth or of the second; if they may not preserve its essence by translation into other forms of thought, they will abandon it, in proportion as they are clear-sighted and veracious, as a dialect grown obsolete. The number accordingly is constantly increasing, in every college capable of training a rich intellect, of candidates for the ministry forced by their doubts into lay professions, and carrying thither the powerful influence, in the same direction, of learning and accomplishment. The higher offices of education are, to no slight extent, in the hands of these deserters of the church: and through the tutor in the family, or the master in the school, or the professor in the lecturer-room, contact and sympathy are established between the best portions of the new generation and a kind of thought and culture with which the authorized theology cannot co-exist. College friendships, foreign travel, current literature, familiarise all educated young men with the phenomenon of scepticism, and in a way most likely to dis-

enchant it of its terrors. Thus by innumerable channels it enters the middle class at the intellectual end of their life; assuming in general the form of historic and critical doubt; while from below, from the classes born and bred amid the whirl of machinery, and shaped in their very imagination by the tyranny of the power-loom, it pushes up in the ruder form of material fatalism. The intermediate enclosure, safe in the dull innocence of an unsuspected creed, is growing narrower every day; and though reserved to the last for its hour of temptation, will be the least prepared to win its victory.

No one who appreciates the real sources of a healthy national life, and knows what to expect from the dissolution of ancient faiths, can look without anxiety at a prospect like this; especially in a country whose religious institutions, rigid with usage, overloaded with interests, charged with the bequests of the past, are manifestly unequal to the crisis, and in their attempt to train the affections of the Future, wield every power but the right one, and are indeed already regarded, like the Court of Chancery with its wards, as a dry nursery for grown babies. A people that reverences nothing—nothing at least that stretches a common heaven over all—has lost its natural unity. Incipient decay is spreading through the secret cement of its civilisation, which, far from bearing the weight of further growth, precariously holds its existing mass together. So far we are entirely at one with those who see something to deplore in the “Eclipse of Faith,” and something to desire in the “Restoration of Belief.” They do not overrate the evils of a state of society in which, if you think with the wise, you must cease to believe with the vulgar. We would join with them, heart and hand, in the effort to terminate this fatal discrepancy, and find some language of devotion and aspiration, veracious alike from the lips of the richest knowledge and the most primitive simplicity. But when, like the author whose publication is before us, they would abolish the discrepancy by simply reinstating the taught in the creed of the untaught; when they insist on the surrender without terms of modern philosophy and criticism to the “unabated” authority of the Bible; when they pretend to wipe out from calculation all the theological researches of the last half century, as if they were mere cyphers made in sport on the tablet of history, and had no effect on our computed place at all,—we separate sorrowfully from them, largely sympathising with their wish, but wholly despairing of their method. The received theory of the origin of Christianity from agencies exclusively

divine, and of the infallible character of the canonical books, can no more be “restored,” than Roman history can be put back to its state before Niebuhr’s time, or Greek mythology be treated as if Heyne and Otfried Müller had never lived. The present age is not more distinguished by its advance in the material arts, than by its astonishing progress in the interpretation and true painting of the past: a Boeck or a Grote carries in his mind a picture of Athenian life in the days of Pericles more perfect, it is probable, than could be formed by Plutarch or Longinus: and it would be strange if the Christian era—certainly the object of the most elaborated study—were the only one to escape the work of reconstruction, or to undergo it without considerable change. The limits of that change are at present definable by no consentient estimate; but that they are such as to remove the old lines of Christian defence, and require the choice of more open ground, can no longer be denied, except by the astute consistency of a Romanist hierarchy, and the innocent unconsciousness of English sects. When the time shall come for a dispassionate history of the first two centuries,—a history which, resolving the canon back into the general mass of early Christian literature, shall find an original clue for tradition, instead of accepting one from its posthumous hand,—which shall detect opinions before they were heretic or orthodox, and trace the several streams of tributary thought to their confluence in a determinate Christianity,—the narrowness of our present polemic will be apparent of itself; its fears and triumphs be regarded with a smile; and many, both of its positive and negative results, will vanish from the interests of religion, and be absorbed in a higher view of the relation between the Divine and Human in this world.

We had hoped at first that the author of the “Restoration of Relief” was about to take up the problem of Christianity with a real appreciation of its altered conditions, and with unaffected justice towards those who cannot solve it like himself. His present essay is but the commencement of a series, designed to arrest the progress of educated scepticism, to expose the sophistries of modern criticism, and re-establish the plenary authority, as oracles of faith, of the Hebrew and the Christian Scriptures. It would perhaps be unreasonable to complain that his argument does not march very far in this first movement; and engages us rather by the stateliness of its step, than by the clearness of its direction. Nevertheless, we do think that the discursive licence of introductory exposition is carried by him to an extreme

which promises ill for the exactitude of his method. At the outset he declares that the difficulties which embarrass modern faith go down to the very depths of philosophy, and can be resolved only by reaching the ultimate roots of thought. Yet he remains on the upper surface of history, and, without once hinting how this is to lead him to the pith of the controversy, dwells only on facts which are undisputed, and his conception of which might be as readily gathered from Gibbon as from Neander. Like many writers whose eye is caught by grandeur of effect, and whose imagination is sensitive to wonder, he is fascinated by the moment in human affairs, when the Roman Empire was exactly poised between the forces of external unity and of internal decay; and the political organism of the Past, so august in its mass and its proportions, held no soul but the young spirit of the Future. Of this crisis, assigned to the reign of Alexander Severus, our author presents an impressive and, we believe, a faithful sketch. Amid the splendour, the misery, the decay of belief and hope, the universal incertitude of that period, there emerges into notice the beautiful and beneficent phenomenon of a real Faith—a Faith that can live, a Faith that can die. The inevitable conflict between this new power and the pagan prerogatives of the Cæsars is well brought out by the essayist; and the victory of Christianity is justly ascribed to the peculiar character of the religion, as a feeling directed to a PERSON rather than the simple assent to an IDEA. It was the force of this personal feeling which first awakened in men the sentiment of obligation in regard to religious truth, and substituted faithful veracity for indifference and laxity of profession. The author thus sums up the positions which he regards the present essay as establishing:—

“That the Christian communities did, during the period that we have had in view, make and maintain a protest against the idol-worship of the times, which protest, severe as it was in its conditions, at length won a place in the world for a purer theology, and set the civilized races free from the degrading superstitions of the Greek Mythology.

“That in the course of this arduous struggle, and as an unobserved yet inevitable consequence of it, a New Principle came to be recognised, and a New Feeling came to govern the minds of men, which principle and feeling conferred upon the individual man, however low his rank, socially or intellectually, a dignity unknown to classical antiquity; and which yet must be the basis of every moral advancement we can desire, or think of as possible.

“That the struggle whence resulted these two momentous consequences, affecting the welfare of men forever, was entered upon and main-

tained on the ground of a definite persuasion, or Belief, of which a PERSON was the object.

“That this belief toward a person embraced attributes, not only of superhuman excellence and wisdom, but also of superhuman POWER and AUTHORITY. If we take the materials before us as our guide, it will not be possible to disengage the history from these ideas of superhuman dignity.”—P. 106.

These positions we certainly conceive to be unassailable. But they lie so completely out of the field of modern doubt and controversy, that we are at a loss to imagine what possible use the author can make of them. The general features of the Christian faith, and the character of the church, had assumed in the third century a determinate form, about which there is no important question between believer and unbeliever. Who would deny that the disciples for whom Clement of Alexandria and Origen wrote, whom Tertullian and Minucius Felix defended, and to whose institutes Cyprian was a convert, believed in Jesus Christ as a person at once historical and divine; and were strengthened by that belief to the endurance of martyrdom? The real and only difficulties lie higher up, in the attempt to trace the sources and earlier varieties of this belief; and if our author can show that, in winding its way through two centuries, and traversing several distinct regions of thought, it dropped or rounded off no primitive facts, and became mingled with no foreign ideas; if he can establish the essential constancy and uniformity, from the first, of the tradition and doctrine which obtained ascendancy at last,—he will indeed reduce legitimate scepticism within very narrow limits, and deserve a niche in the Valhalla of critical renown. But if he contemplates clearing these centuries by an argumentative leap; if, from the martyr-faith of an age later than the Antonines, he means to conclude the certainty of the Incarnation two hundred years before; then, we must say, he attempts a logical feat which puts to shame the cautious steps of such reasoners as Paley, Marsh, and Whateley. The catena of well-linked testimonies, with its bridge of safe footing, which they have endeavoured to sling across the chasm of the post-apostolic age, is but a paltry cowardice of ecclesiastic engineering to one who can pass the gulf upon the wing of inference. An advocate is intelligible, and proceeds upon admitted rules of evidence, who says with these earlier divines, “Here are the writings of Paul, of John, of Matthew, and of other men who were present at the events they relate or assume; whose lives were turned into a new channel by their influence; and

who went to prison and to death rather than deny them. They positively declare that they witnessed the most stupendous miracles, and, after their Master had been visibly taken up through the clouds, themselves habitually exercised the same supernatural power. You must admit that the guarantees of testimony can go no further: surrender yourself therefore to the gospel." This is an argument which accomplishes all that is possible with historical evidence in such a case; and were its allegations of fact sustainable, it would still be the best form into which the reasoning could be thrown. Unfortunately, we can no longer feel assured that any first-hand testimony exists, as a distinguishable element, in the narrative books of the New Testament: so that we can regard them only as monuments of the state of Christian tradition during a secondary period. Still, this flaw is not repaired by striking into the course of belief three or four generations lower down, and substituting the "Martyr-literature" of the third century for the Evangelist memorials of the second or the first. And when our author transfers to Clement and Origen the praise of unaffected simplicity usually awarded to the apostolic writers, and actually presents it as sufficient proof of divine attributes in Christ, we can only suppose that, in his opinion, some truths are too good to have any bad way to them. What else can be said of the following mode of inference?

"Much do we meet with in these writers that indicates infirmity of judgment or a false taste; yet does there pervade them a marked simplicity, a grave sincerity, a quietness of tone, when He is spoken of whom they acknowledge as LORD. If there be one characteristic of these ancient writings that is *uniform*, it is the calm, affectionate, and reverential tone in which the martyr church speaks of THE SAVIOUR CHRIST!

"I am perfectly sure that, if you could absolutely banish from your mind all thought of the inferences and the consequences resulting from your admissions, you would not, after perusing this body of Martyr-literature, fall into the enormity of attributing the notions entertained of CHRIST, as invested with Divine attributes, to any such source as 'exaggeration,' or 'extravagance,' or to 'orientalism,' or 'enlarged Platonism.' Exaggeration and inflation have their own style; it is not difficult to recognise it. No characteristic of thought or language is more obvious. You will fail in your endeavour to show that this characteristic *does* attach to the writings in question; and why should you make such an attempt? There can be no inducement to do so, unless it appears to be the only means of escaping from some consequence which we dislike."—P. 107.

Our author professedly opposes "Ancient Christianity" to modern scepticism, because

"History," as he observes, "is solid ground," and no region of atmospheric phantasms, births from the refracted rays of metaphysic light. History, however, is solid ground only so far as it is really explored: and the trending of the land and curving of the shore in one latitude of time no more enables us to lay down the map of another, than an anchorage at the Ganges' mouth would enable us to paint the gorges of the Himalayas, and distinguish the real from the fabulous sources of the sacred stream. To take us into the basilicas and show us how Christians worshipped in the days of Alexander Severus, to introduce us to the Proconsul's court and bid us witness their refusal of divine homage to Cæsar's image, and then ask us whether a faith like this *could have had* any origin but ONE; this is not *history*, but the mere *evasion* of history. We want to know, not what *must have been* the source, but what *was* the source, of the great moral power that rose upon the world as Rome declined. Whoever wishes to shut out human ideas and natural agencies from participation in the matter, must go patiently through the entire remains of the early Christian literature; must trace the conflict between the Hebrew and the Pauline gospel; find a place for the peculiar version of the religion given by the evangelist John; fix the limits of Ebionitism, of Chiliasm, Docetism; and show that these modes and varieties of doctrine stop short of the substance of the early faith, and do not enter the canonical scriptures with any disturbance of their historic certainty. Nothing of this kind do we expect from our author. For he entertains a conception, respecting the logic of Christian evidence, which, however prevalent among English divines, betrays in our judgment a mind not at all at home with the present conditions of the problem. He seems to think that we can *first* prove the historic truth of the Scriptures *in general*; and then get rid of the *difficulties in particular*: and requires us, in obedience to this pedantic law of logical etiquette, to carry into our investigation of every successive perplexity, the rigid assumption that the writings with which we deal are "inspired," and their contents of "Divine authority."

"When a collection of historic materials, bearing upon a particular series of events, is brought forward, it will follow upon the supposition that those events have, on the whole, been truly reported, that any hypothesis the object of which is to make it seem probable that no such events did take place, must involve absurdities which will be more or less glaring. But then, *after* the truth of the history has been established, and

when the trustworthiness of the materials has been admitted, as we proceed to apply a rigid criticism to ambiguous passages, we shall undoubtedly encounter a crowd of perplexing disagreements; and we shall find employment enough for all our acumen, and trial enough of our patience, in clearing our path. And yet no amount of discouragements, such as these, will warrant our falling back upon a supposition which we have already discarded as incoherent and absurd."—P. 110.

We cannot call this a vicious canon of historical criticism; for it simply excludes historical criticism altogether. The critic's work is not a process which can go on generically, without addressing itself to any particular matters at all; and vindicate comprehensive conclusions in blindness towards the cases they comprise. The judgment that, on the whole, a certain book contains a true report of events, can only be a provisional assumption, founded on natural and child-like trust, and can claim no scientific character, till it comes out as a collective inference from an investigation in detail of the narrative's contents. No doubt, the bare fact of the existence of Christianity as a great social phenomenon in the age of the Antonines, may afford evidence enough that Jesus of Nazareth was no imaginary being: the genius of the religion, and the traditional picture of its author, may indicate the cast of his mind and the intensity of his influence: the institutions of the Church may betray its origin in Palestine, and the approximate date of its birth. But these conclusions, founded entirely on reasonings from human causation, can never carry us into the superhuman: or enable us to say more respecting the memorials of the life of Jesus, than that they *may be true*, and do not forfeit, *ab initio*, their title to examination by fundamental anachronism, misplacement, and moral incongruity. How far the existence of this *primâ facie* case falls short of "establishing the truth of the history," and "the trustworthiness of the materials," we need not point out to any one accustomed to deal with questions of evidence. And as for the great proposition, that "the Gospel of Christ is a supernaturally authenticated gift," we cannot imagine how it is to be proved *in general*, without research into a single miracle. Is it indifferent to the fact of the Incarnation, that the only two accounts of the birth and infancy of Jesus are hopelessly at variance with each other? Is the evidence of the Resurrection unaffected by the discrepancies on which harmonists have spent a fruitless ingenuity? Are we as sure that, in reading the apostles' works, we have to do with

"inspired writers," as if they had *not* made any false announcements about the end of the world? What does our author mean by admitting these things as "difficulties," yet denying them any just influence in abatement of our confidence? He may form one estimate of their weight, and his opponent another: but in neither case can they be postponed for treatment in a mere appendix to the discussion of Christian evidence: they are of the very pith of the whole question; and so long as they lie in reserve as quantities of unknown magnitude and direction of influence, render historical belief and unbelief alike irrational.

Nor can we for a moment allow that the failure of ever so many "German theories" to give a satisfactory account of the origin of Christianity, is any good reason for contented acquiescence in the received doctrine. Our author insists, that we must make our definitive choice between some modern hypothesis and the evangelical tradition; and either take the facts as they are handed down to us, or else replace them by some better representation. By what right does he impose on us such an alternative necessity? Is the critic disqualified for detecting false history, because he cannot, at his distance, write the true? Is it a thing unknown, as a product of scholarship, that fabulous elements disclose themselves amid the memorials of fact? and is it not an acknowledged gain to part with an error, though only in favour of an ignorance? If a modern hypothesis as to the mode in which the religion arose may "break down" by mere internal incoherence and improbability, why may not the ancient account, if it should be chargeable with similar imperfections, be liable to the same fate? It is surely conceivable that *all* the finished representations we possess,—Hebrew and Alexandrine, as well as German,—furnish, more or less, an ideal and conjectural history of the infancy of Christendom; and that the reproduction of that time may not only be *now* impossible, but have already become so, ere a hundred years were gone. The baffling of one solution implies therefore no triumph of another: and if the tradition on which we stand be insecure, our position is not improved by clipping the wings of every adventurous hypothesis on which we had thought to escape the common ground.

Our author cannot then change the *venue* of the great Christian cause from the first century to the third, and, on the evidence present there, give even preliminary judgment. The conflict between the new religion and the old which characterized that period, he paints with striking and truthful effect: and, contrasting the severe and holy veracity

of martyred disciples with the careless indifference of paganism to religious truth, he rightly refers the superiority of the Christians to their faith in a *Person*, instead of mere assent to an *Opinion*. Is it, however, correct to regard this as original and exclusive to the gospel, and to set it on the forehead of the Church as the very mark of her distinctive divinity? We think not. The same feature is manifest in Judaism, to which again it belongs, not as a peculiarity, but in common with every faith whose Only God is the apotheosis of humanity. It is the one grand moral characteristic of genuine Theism, as opposed to Pantheism; rendering it more than the enthusiasm of poetry, the earnestness of philosophy, the inspiration of genius, and constituting it, in the deepest sense, Religion. Nor is the ground of the distinction far to seek. Religion, in its ultimate essence, is a sentiment of Reverence for a Higher than ourselves. Higher than ourselves, however, can none be, that have not what is most august among our endowments; none, therefore, by reason of size, of strength, of duration; none simply by beauty or by skill; none even by largeness of discerning thought, but only by free and realizing preference of the most Just and Good. A Being of living Will can alone be nobler than myself, lift me above the level of my actual mind by looking at my latent nature, and emancipate me into the captivity of worship. In other words, reverence can attach itself exclusively to a *Person*: it cannot direct itself on what is *impersonal*,—on physical facts, on unconscious laws, on necessary forces, on inanimate objects and their relations, on space, though it be infinite; on duration, though it be eternal. These all, even when they rule us, are *lower* than ourselves: they may evade our knowledge, defy our power, overwhelm our imagination, but never rise to be our equals, or conspire to furnish even the symbol of our God. The mere deification of Nature, the recognition of oneness pervading her variety, the sense of an absolute ground abiding behind her transient phenomena, may supply a faith adequate to the awakening of wonder and the apprehension of ideal beauty, but not to the practical consecration of life; glorifying the universe as a temple of Art, but railing off within it no oratory of Conscience. In order to extract anything like a religion of *conduct* from this type of belief, its hierophants are obliged to approach as near as they can to the language of proper Theism, and not even despise typographical aid for pushing personification to the verge of personality: uttering various warnings not to neglect the “*intentions* of Nature,” or insult the “*Relentless Veracities*,” and inviting sundry offenders to

*blush* before “the Eternal Powers.” The whole force of such expressions is evidently due to the false semblance of living thought and will, with which they clothe the conceptions of mere abstract relations or physical tendencies. These rich tints are no self-colour, but a borrowed light reflected from a grander Presence studiously withdrawn from view: and when their gloss is gone, no positive residuum is found, but a doctrine of hope and fear, without any element of Duty. It were a mockery, an inanity, to bid a man spend his affections on hypostatized laws that neither know nor answer him. In his crimes, it is not the heavy irons of his prison, but the deep eye of his judge, from which he shrinks: and in his repentance he weeps, not upon the lap of Nature, but at the feet of God. In his allegiance, his vow is made, not to the certainty of facts, but to the majesty of Right, and the authority of an Infinitely Just: and his acts of trust are directed by no means to the steadiness of creation’s ways, but to the faithfulness of a perfect Mind. In short, all the sentiments characteristic of religion presuppose a Personal Object, and assert their power only where Manhood is the type of Godhead. This condition was imported, or rather continued, from the Hebrew to the Christian system; and brought with it the devout loyalty of heart, the singleness of service, the incorruptible heroism of endurance, which had encountered Antiochus Epiphanes at Jerusalem, as it now met Pliny in Bithynia, and Quadratus at Smyrna. The paganism of the empire, on the other hand, failed entirely of this condition. It was a mere nature-worship, expressive of the political dynamics by which, through the award of a mysterious necessity, Rome had become the centre of the world. If, among the deities whose congress was now assembled on the Tiber, there were any which once, in their indigenous seats, had commanded the full moral faith, and touched the true theistic devotion, of a people, that time had passed: and the conquered tribes suffered a more fatal loss when the victorious city adopted their religion, than when she crushed their liberty. Removed to Rome, the rites of a provincial worship expressed nothing except that its gods were gods no more, but had descended from divine monarchic rights to a place among a pensioned hierarchy. Vanquished divinities inevitably become delegated powers of nature, and resign their sceptre to the sovereign they are compelled to own. As the administration of the empire embraced a congeries of checked nationalities, so did its pantheon include a collection of extinguished religions. While as Emperor the head of the state was the embodiment of its unity by

natural force, as Divus he represented its unity by preternatural sanction: and the divine honours paid to him were the acknowledgment of a necessity more than human in the culminating majesty of Rome. These honours would be freely rendered to him by those who looked on all realized existence, on everything charged with force enough to come up and be, as equally decreed by "the Eternal Powers,"—equally divine. Such homage would appear to them the mere expression of a fact, and a graceful owning of mysterious fates in its production; and no scruple could withhold them from an act which contradicted nothing in their mind, and did but fling a breath of pious incense around the thing that veritably was. It were absurd to expect the protest of a martyr from a man whose religion you cannot contradict; who will see a god wherever you ask him; and whose worship asserts nothing but that, a phenomenon being there, an occult power is behind it. A faith of this sort is deficient, as an Hegelian would say, "in the moment of negation:" it is all unobstructed affirmation; and can strike no light, because it thus finds nothing to dash itself against. But let the divine element in the universe cease to be impersonal and impartially coalescent with the whole, let it live an Individual Mind, and the requisite antagonism immediately appears. To the Jew, the worship of Cæsar would be no other than high treason to Jehovah, whose tool, whose whip of lightning, and whose cup of consolation, the pagan emperor might become; but whose emblem and incarnation he could so little be, that he rather stood defiantly at the head of the opposing realm, and even when forced to be the organ, did not cease to be the competitor of God. For *opposing realm* there must be, wherever proper Theism exists. Man feels that his personal attributes, his will, his character, his conscience, demand conflict for their condition, and without the possibility of ill could never be: and when he carries them out into the infinite region, to serve as his image of the Highest, they bear with them the inseparable shadow of evil, and give it place in the universe, as the darkness in whose absence light would want its distinction, the privative without which the beauty of holiness were nothing positive. Hence, expressed or unexpressed, a dualism mingles with all genuine theistic faith. All is not divine for it. It has a devil's province somewhere. Face to face as Ebal to Gerizim, the frown of blighted rock to the smile of verdant heights,—hostile as the priest of falsehood to the true prophet,—there stand contrasted in this creed two domains of the world,—one surrendered to insurgent powers, the other reserved as the

nursing ground from which right and truth shall be spread. To the Hebrew, the pagan world was given over to a false allegiance, and inspired with diabolical delusions. For him to sacrifice to the genius of Cæsar would have been, therefore, a desertion to the enemies of God, forbidden by every claim of faithfulness and veracity. Thus we conceive that the moral conditions of the martyrs' protest against idol-worships were complete within the limits of Judaism before the mission of Christ: and that the essence of it lies, not in the exclusive characteristics of the gospel, but in the difference between Theistic reverence for a Personal Being, and the Pantheistic acknowledgment of an impersonal divineness. The peculiar function of Christianity in this respect was to become missionary to the world of this heroic fidelity transmitted from the parent faith, and hitherto bounded by its limits; and to find a place in the universal conscience of civilized nations for the duty of bearing testimony, though with tortures and death, to the pricelessness of truth and the sanctity of conviction. True it is that the gospel was qualified for this office by directing human faith upon a *Person*; and would have exercised no such power, had it been a mere philosophy presenting propositions for assent, instead of a Living Mind for trust and reverence. But this condition would have been attained by the simple extension of the Jewish Theism. The Personality, which is needed as a centre of intense fealty and affection, is found in the God of Hebrew tradition, and, for its effects in kindling a martyr-courage and constancy, did not require to be sought in the historical Jesus of Nazareth. He, no doubt, as the mediate expression of the Supreme Will, as the Being with whom the Church stood in direct contact, as the presence of the Divine in the Human, was the object of the disciples' actual allegiance. We do not in the least question this as a *fact*, but only as a *necessity*, ere we can account for the moral features of a martyr-age.

In singling out, as one of the grandest practical results of Christianity, the recognition it has obtained for the *Obligations of religious truth*, our author has rightly seized a characteristic distinction of modern from ancient society. The principle is a real agency of the first order in history: we do not accuse him of overrating its importance, but of mistaking its genealogy. And now we must add, that if we differ from him as to the source whence it comes, we differ still more as to the issues whither it conducts. So inconsiderately does he allow himself to be borne away by his evangelical zeal, that

he claims for the gospel, not only the glory of first revealing, but the exclusive right of ever practising, the duties of religious veracity. None but historical believers have the least title to attach any sacredness to their convictions, or to feel any hesitation about denying them. What business have the authors of the "Phases of Faith," and the "Creed of Christendom," to any better morality of belief than Gallio or Lucian? If they have not fallen back into the pagan indifferentism, they *ought* to have done so, and our author will continue very indignant till they do. He is offended with Mr. Newman for asking judgment on his "argument and himself, as before the bar of God;" and with Mr. Greg for saying that, in the process of changing cherished beliefs, "the pursuit of truth is a daily martyrdom," and for giving "honour to those who encounter it, saddened, weeping, trembling, but unflinching still!" And he is not ashamed to declare that the guileless veracity which in himself would be a martyr's constancy, would be in another an overweening conceit. So astonishing, logically and ethically, are his statements on this subject, and so curiously do they determine his intellectual position, that we must present them in his own words:—

"We Christian men of this age, along with our venerated martyr brethren of the ancient Church, in making this profession—that we may not lie to God, nor deny before men our inward conviction in matters of religion; we (as they did) affirm that which is consistent within itself, and which, in the whole extent of its meaning, is certain and is reasonable, grant us only our initial postulate, that Christianity is from heaven.

"But how is it, when this same solemn avowment comes from the lips of those who deny that postulate, and who scorn to recognise the voice of God in the Book? It is just thus; and those whom it concerns so to do, owe it to the world and to themselves, to make the ingenuous avowal.

"In the first place, the style and the very terms employed by these writers in denouncing the fact of the martyrdom they are undergoing, are all a flagrant plagiarism, and nothing better! A claim, in behalf of the Gospel, must be made of what is its own, and which these writers, without leave asked, have appropriated. As to every word and phrase upon which the significance of this their profession turns, it must be given up, leaving them in possession of so much only of the meaning of such phrases as would have been intelligible to PLUTARCH, to PORPHYRY, and to M. AURELIUS. A surrender must be made of the words CONSCIENCE, and TRUTH, and RIGHTEOUSNESS, and SIN; and, alas! modern unbelievers must be challenged to give me back that ONE awe-fraught NAME which they (must I not plainly say so?) have stolen out of the Book: when they have frankly made this large surrender, we may return to them the *re* *quis* of classical antiquity.

"Yet this plagiarism, as to terms, is the smaller part of that invasion of rights with which the same persons are chargeable. It is reasonable, and it is what a good man *must* do, to suffer anything rather than deny a persuasion, which is such that he could not, if he would, cast it off. So it was with the early Christian martyrs: their persuasion of the truth of the gospel had become part of themselves; it was faith absolute, in the fullest sense of the word. The same degree of irresistible persuasion attaches to the conclusions of mathematical or physical science; but it can never belong to an opinion, or to an undefined abstract belief. A man may indeed choose to die rather than contradict his personal persuasion of the truth of an opinion; but in doing so he has no right to take to himself the martyr's style. So to speak is to exhibit not constancy, but opinionativeness, or an overweening confidence in his own reasoning faculty.

"Polycarp could not have refused to die when the only alternative was to blaspheme CHRIST, his Lord: but Plutarch could not have been required to suffer in attestation of his opinion—good as it was—that the Poets have done ill in attributing the passions and the perturbations of human nature to the immortal gods; nor Seneca, in behalf of those astronomical and meteorological theories with which he entertains himself and his friend Lucilius.

"When those who, after rejecting Christianity, talk of suffering for the 'truth of God,' and speak as if they were conscience-bound 'toward God,' they must know that they not only borrow a language which they are not entitled to avail themselves of, but that they invade a ground of religious belief whereon they can establish for themselves no right of standing. They may indeed profess what *opinion* they please as to the Divine Attributes; but they cannot need to be told that which the misgivings of their own hearts so often whisper to them, that all such opinions are, at the very best, open to debate, and must always be indeterminate, and that at this time their own possession of the opinion which just now they happen to cling to, is, in the last degree, precarious. How then can martyrdom be transacted among those whose treading is upon the fleecy clouds of undemonstrable religious feeling?"—Pp. 92-94.

If, being orthodox, you die at the stake, you are a martyr: if, being heretic,—why,—then you are a man burnt:—a doctrine which Robert Hall compressed within the narrowest compass, when he said, "It is the saint which makes the martyr, not the martyr the saint." This is the very gospel of intolerance: and whoever preaches it may feel assured that he can lend no help in any worthy "Restoration of Belief;" for he is himself infected with the most profound and penetrating of scepticisms,—scepticisms of moral realities. The rule, "that we may not lie to God, nor deny before men our inward conviction in matters of religion," is, in our author's view, the gift and glory of Christianity. Be it so. This rule either holds for all men at all times, or

it does *not*,—if there be persons who, notwithstanding it, *may* lie to God, and deny their inward conviction,—then the Scriptures, in communicating it, have revealed no universal principle of duty, no obligation having its seat in the nature of things and the constitution of the human soul; but a mere sectional bye-law, an arbitrary precept for the security and good-ordering of one exclusive community. Then must we talk of it no more so exceeding proudly, as if it were a hidden truth revealed, a latent beauty opened: it is no part of the holy legislation of the universe, but a statutory enactment under which we fall, or from which we escape, as we pass in or out at the door of a certain historical belief. Need we say that this side of the alternative strips Christianity of every pretension to be a moral revelation at all? If, to take the other side, the rule in question *does* hold for all men, then it is no less binding on Mr. Newman and Mr. Greg than on our author; and in bowing to its authority and owning its sanctity, they render a homage as devoutly true as his, only different in this, that, while they feel no disturbance from his kneeling in the sanctuary at their side, he cannot be at peace till he has sprung to his feet and hurled them from the place. They are guilty of “plagiarism” forsooth! and in what? in knowing their duty, without knowing where they learned it! Oh shame upon this greediness, that would turn moral truth itself, and struggling aspiration, into a property! as if Christ were one to stand upon the copyright of revelation, and, unless his name were in the title-page, would suffer neither thought nor prayer to dedicate itself to God! Our author, as public prosecutor in the Supreme Court, demands that the defendants shall empty themselves out of every earnest sentiment, and surrender back the words CONSCIENCE, and TRUTH, and RIGHTEOUSNESS, and SIN, and GOD, “as *stolen* from the book!” What then was “the Book” given for, but that it might freely furnish these?—and how better can it fulfil its end, than by opening for them a sacred welcome wherever the *things* are which they disclose? Let their spirit breathe where it listeth; it will not be less a Holy Spirit that we know not “whence it cometh:” nor let it be forgot how old a feature of evangelic blessing it is, that “he that was healed *wist not who it was.*” As “the Book” does not, by its presence, *create* the facts which it reveals, so neither does its absence or rejection *destroy* them. Conscience, as an element of human nature, does not come or go,—

God, as reality in the universe, does not live or perish,—according as the Bible is kept in the pocket or laid upon the shelf: even if their first *witness* were in Scripture, *they themselves* are in the world; as active, as near, as certain, in the transactions of today, as in the affairs of distant history. Scientific truth, once well ascertained, can take care of itself, without being everywhere attended by the report of its first discovery: it is in the safe keeping of the objects on which it writes a new meaning, and the phenomena amid which it introduces a fresh symmetry. And moral truth, when once embodied and revealed, is not less independent of its earliest expression: it finds its response in human consciousness, its reflexion from human life; and weaves itself up into the very fabric of many souls, whose pattern bears no motto of its origin. Thus “revelation,”—just in proportion as it *is* revelation, and tells us what is cognate to ourselves, and bound up with the realities around us,—passes of necessity into “natural religion:” and precisely according to the measure in which it does so, will it acquire strength and permanence, and dispense with evidence by merging into self-evidence. Did it awaken in us *no* confirming experience, did it *nowhere* link itself with the visible system of things,—then, solving nothing, glorifying nothing, missed by all the moving indices of nature and Providence, it would sit apart, and become incredible. That could hardly be a truth at all, which, after roaming the world and searching the soul for eighteen centuries, has found no *natural* ground on which to rest, and must wander as an *ipse dixit* still. And if natural ground it has acquired, *that* is surely a proper basis for its present support: it may innocently cease to be held on mere authority: the very “plagiarism” so vehemently denounced is rather the fulfilment than the destruction of the faith; for it is only that men no longer resort to an oracle for things which the oracle has enabled them to see for themselves.

Our Christian advocate, however, is not content with reserving to his side the sole power of *discerning* the duty of religious veracity; he further claims the sole right to *practise* it. He teaches that it is *not binding* on all men at all times; and that its obligation is in any case conditional on the “initial postulate, that Christianity is from heaven.” He thinks, apparently, that the duty is not so much *revealed* as *constituted* by the gospel, so as to have no existence beyond the pale. We can collect from his words two considerations, under whose influence he seems to pronounce this strange

judgment. He evidently assumes that the duty of veracious profession is contingent partly on the *object-matter* of belief; partly on the *degree of evidence*. If my faith is directed towards a *Person*, then, he implies, there is treachery, even blasphemy, in denying it: but if not, my disclaimer gives no one any title to complain, and I cannot be expected to die on behalf of a proposition. Polycarp must not renounce Christ, his Lord; but Plutarch might very properly recant, without at all altering, his judgment against the poets, for ascribing passions to the gods. Is it so, indeed? Then there is no harm in a lie, unless some one is betrayed or insulted by it besides the hearers whom we deceive? and we may report as falsely as we please our persuasion about *things* provided we are true to our sentiments about *persons*? With full recollection of the questionable verdicts, on problems of veracity, which are given by Xenophon and Plato, Aristotle and Cicero, we doubt whether any pagan moralist can be quoted in favour of a doctrine so unworthy as this. The author seems to imagine that the obligation to speak the truth is a mere duty of personal affection; and that in the absence of this element, its claims altogether disappear. Identifying falsehood with detraction and ingratitude, he concludes that, since an abstract theory is insensible to what people say about it, and can have no services owing to it, it may be blamelessly repudiated by those who really believe it. This is tantamount to an expunging of veracity from the list of human duties altogether; for it gives importance to what is purely accidental, and slights what is alone essential to it. The conditions of a lie, in all its full-blown wickedness, are quite complete, when there is a person to speak it, a person to hear it, and a social state to be the theatre of the deception: should there be also a person *spoken of*, that is a circumstance in no way requisite to constitute the guilt, but a supplementary condition, flinging in a new element of pravity, and turning falsehood into faithlessness. The introduction of this additional person into the case, may doubtless render the offence much more flagrant, especially if he be one who has acknowledged claims on gratitude and reverence. Calumny and perfidy are justly held in deeper abhorrence than equivocation untainted with malignity. But to be unaffected by the criminality till it kindles with this diabolical glare, and not even to believe in it unless it smells sulphurous and burns red, betrays a perception too much accustomed to melodramatic contrasts of representation to appreciate the more

delicate tints and finer moral lights of the real and open day. And so far from the glory of martyrdom being heightened by the presence of deep personal affection as its inspiration, this very circumstance renders the act a less arduous sacrifice; just as to fall in the hot blood of battle may need less heroism of will, than to die under the knife upon the surgeon's table. In proportion as the denial of Christ in the hour of trial would be the more intolerable blasphemy, must the temptation to it be less overwhelming, and the merit of a good confession less amazing. And those who, in matters touching no such deep affection, can yet be true,—those who, in simple clearness of conscience, can dispense, if need be, with the help of enthusiasm, and so shut their lips against a lie, that not the searing iron can open them—those who do not want a grand occasion, but just as certainly use the smallest, to fling back the thing that is not,—have assuredly a soul of higher prowess and more severely proved fidelity to God. And it is a heartless thing to turn round upon these men, and taunt them with having no one at whose feet to lay their offering, and no popular sympathy to redeem their uprightness from the imputation of conceit.

There is, however, another consideration which weighs with our author in granting to "modern unbelievers" a dispensation from the duty of religious veracity. They have only a "personal persuasion" resting on precarious grounds, and not the certitude attaching to "the conclusions of mathematical and physical science:" and it would be folly to suffer on behalf of "*undemonstrable* religious feeling!" Are we then to lay it down as a canon in ethics, that intensity of assurance is the measure of our obligation to speak the truth,—so that we are to state our certainties correctly, but may tell lies about our doubts? If so, scrupulous fidelity is incumbent on us only within the limits of deductive science and of immediate personal observation: and in the great sphere of *human* affairs, in matters of historical, moral, and political judgment, nay, in the incipient stage of all knowledge, we may say and unsay, may play fast and loose with our convictions, according as the favour or the fear of men hangs over us. Newton was bound to stand by his "*Principia*;" but Locke might have renounced his treatise on Government and taken his oath to the divine rights of kings! Were he indeed to refuse so easy a compliance, it would be a great reflection upon his modesty; for if a man, on being threatened with death, will not belie his own persuasion of probable

truth, he is chargeable with "overweening confidence in his own reasoning faculty!" It is happy for the world that it does not always accept the morals of the church, but brings an unperverted feeling to correct the twisted logic of belief. "Opinion," a wise man has said, "is but knowledge in the making;" and how little knowledge would get made, if opinion were emptied of its conscience, and looked on itself as an egotism rather than a trust! If there is one fruit of intellectual culture which more than another dignifies and ennobles it, it is the scrupulous reverence it trains for the smallest reality, its watchfulness for the earliest promise of truth, its tender care of every stamen in the blossoming of thought, from whose flower-dust the seed of a richer futurity may grow. To cut against this fine veracious sense with the weapons of unappreciating sarcasm, and crush its objects into the ground as weeds with the heel of orthodox scorn, is a feat which can advance the step of Christian evidence, only by betraying the Christian ethics. Our author has entangled himself in the metaphor indicated by the word "*martyrdom*:" he thinks of the confessor as *bearing witness* to something,—which is indeed quite true; and supposes that the things to which he bears witness must be the *facts or doctrines* held by him; and *this* is not true at all. For that which we attest in the hour of persecution is simply *our own state of mind; our belief*, and not the object believed. We are required to utter words, or to perform acts, that shall give report of our persuasion: this persuasion is a fact in our personal psychology about which there is no ambiguity; which, as a presence in our consciousness, is wholly unaffected by the question, how it got there, and by what logical tenure it holds its seat. Whether we have demonstrated it into the mind or fetched it thither in a dream, whether we had it yesterday, or shall continue to have it to-morrow,—are matters in no way altering the fact that it is there; and if we say 'No' to it, while conscious of a 'Yes,' the aim is neither greater when the belief concerns the properties of a geometric solid, nor less when it touches some indeterminate problem of metaphysics. The logical ground of our judgments is various without end,—perception, testimony, reasoning, in every possible combination. But the persuasion, once attained, is a simple phenomenon, whose affirmation, or denial, being always positively true, cannot change its moral complexion with every shade in the evidence now left behind. It is plain that, in our author's favourite case of martyrdom, no testimony could be borne by the Christian

to anything but his own conviction. Poly-carp and Cyprian could only answer in the face of death, that they were Christians; it was not "on behalf of" any outward fact, but simply because they would not belie their inward belief, that they laid down their lives. And had Plutarch been dragged before some anthropomorphist inquisition, and been called on publicly to declare his belief that the immortal gods were well and truly painted by the poets as having passions like mankind, the lie to which he was tempted would have been precisely of the same kind; and had it passed his lips, would have made him despicable as an apostate. He had no power, nor had the church confessor, over the truth or evidence of his opinion; neither of them had any *witness*, in the strict sense, to bear; but both might veraciously scorn to deny a fact unambiguously present to their self-knowledge. If the heathen's firmness is an example of "overweening confidence in his own reasoning faculty," by what favouring difference does the Christian's escape the same imputation? That his faith is "absolute," his persuasion "irresistible," so far from furnishing a vindication, only avows the fact that his "confidence" is intense; whether it be "overweening" too, must depend on the proportion between the certitude he feels and the grounds of just assurance he possesses. But at all events it is a confidence,—in this case as in the other,—undeniably reposed "*in his own reasoning faculty*." How else could any belief,—except a groundless belief,—reach the convert's mind at all? It is vain to pretend that the receivers of an historic doctrine plant their reliance piously on God, while its rejecters proudly trust themselves. There is no less subjective action of the mind on the positive side than on the negative; and on the soundness of that action does the worth of the result in either instance depend. The evidence on both sides comes into the same court of criticism; and pleading and counter-pleading must ask a hearing from the same judicial intelligence. If our author refers the gospels to the first century, and his opponents to the second: if he finds a miracle in the gift of tongues, they a delusion; if he thinks that the reasoning out of the Old Testament in the New is exegetically and logically sound, they that it is in both respects unsound; is he not concerned with the same topics, conducting the same processes, liable to the same mistaken estimates, as they? How then can he flatter himself that the same thing is believed on one tenure, and disbelieved on quite another? How affect, even while playing the advocate, to be raised above the contingencies of the "reasoning

faculty," and entitled to rebuke its pride? How renounce it for himself, appeal to it for your assent, abuse it for your dissent, in the wayward course of two or three pages?

Our author stands, therefore, in spite of every effort to escape it, on the same logical ground as his opponents; and they, notwithstanding his objection to their companionship, are on the same footing of religious obligation with himself. He is offended to find such a one as Mr. Newman on the same sacred pavement, and to overhear from unbelieving lips the genuine tones of prayer; and thanking God, apprises men, that he "is not as this publican." He prosecutes for trespass all who, after rejecting his Christianity, can dare to profess allegiance to the "truth of God," and "speak as if they were conscience-bound towards God." Are they then *not* so bound? Has no one a conscience except the approved historical believer? Is it not in others also a Divine voice—a Holy Spirit—which to resist and stifle were the true and only "Infidelity?" Surely the faith in God, and the earnest acceptance of the laws of duty as the expression of his authority, are not forbidden to men who cannot assume the disciple's style. These sentiments, so far from waiting on revelation for their possibility, are the prerequisite conditions of all revelation, the state of mind to which it speaks, the secret power by which it finds us out: and if men cannot be "conscience-bound towards God" *before and without* Christianity, never can they become so, *after it and with it*. It does not take us up as Atheists and brutes, and supply us with the faulties as well as the substance of faith; else were there no medium of suasion across the boundary of unbelief;—but it appeals to us as knowing much and aspiring to more,—as already before the face, only shrinking from the clear look of God,—as feeling the divine restraint upon us of justice, purity, and truth, but unable, without some emancipating power, to turn it into freedom and joy. This spirit of profound sympathy, not of arrogant insult, towards the highest faiths and affections of our nature, we recognise in the portraiture and teachings of Jesus Christ: and when we find one who, like our author, instead of rejoicing that the sacred embers of nature are yet warm, instead of kneeling over them to fan them with a breath of reverence into a flame, flings them with scattering scorn on the damp ground of his own moral scepticism to show how little they will burn,—we see reversed in the "Restorer of Belief" the divine temper of the "Author of Faith." Such a teacher will vainly endeavour to recover by severity

of warning the influence he forfeits by want of sympathy. He cannot frighten men like Parker, Newman, Greg, by appealing to fancied "misgivings of their own hearts" respecting the precariousness of their convictions, and uttering dismal prophecies about yawning gulfs; which, however alarming as a shudder of rhetoric, can disturb no quiet trust in reality. Let us hear the words, however:—

"Educated men should not wait to be reminded that those who, after abandoning a peremptory historic belief, endeavour to retain Faith and Piety for their comfort, stand upon a slope that has no ledges: Atheism in its simplest form yawns to receive those who there stand; and they know themselves to be gravitating towards it.

"It would be far more reasonable for a man to die as a martyr for Atheism—a stage beyond which no further progress is possible, than to do so at any point short of that terminus, knowing as he does that every day is bringing him nearer to the gulf. The stronger the mind is, and the more it has of intellectual massiveness, the more rapid will be its descent upon this declivity. Minds of little density, and of much airy sentiment, may stay long where they are, just as grats and flies walk to and fro upon the honied sides of a china vase; they do not go down, but never again will they fly."—P. 94.

This is one of the conventional minatory arguments which betray the absence of security and repose from the heart of the received theology; whose teachers could never propound it, except from a position of conscious danger. They must imagine in their own case that, if they were to find the gospels no longer oracular, they would plunge at once into endless depths of negation: and that unless they can refute an interpretation of De Wette's, or correct a date of Baur's, there will be eternal night in heaven. They feel the universe, and life, and love, and sorrow, and the history of times and races unbaptised, to be all atheistic through and through,—profane to the core,—untraced by a vestige, untransfigured by a colour, of divine significance. What they can think of a Being who creates all reality and lives in it on these blindfold terms, we will not attempt to decide: but it is no wonder that, having once brought themselves to believe in Him, they feel how a single move would upset them into disbelief. This thing, however, is true of their own state of mind alone; whose spaces, dark throughout with scepticism but for one distant lamp, might easily be left without a ray. It is consistent neither with reason nor with experience to threaten with this rule men who have opened their souls to something else than documentary authority. It is notoriously false that the career of his-

toric doubt usually terminates in the loss of all faith in God: nor do we suppose that our author would have awarded to the Atheist, for actually reaching this point, the praise of "intellectual massiveness," had he not wanted a heavy weight to slide down his metaphorical inclined plane,\* and outstrip the slippery believers who try to stop half-way. The accusation against Theism, of being possible to the light-minded and superficial,—a mere sweet-bait to entrap the silly insects of the intellectual world,—is confuted by the whole history of philosophy and human culture: all whose grandest names have connected themselves with the recognition of a religion indigenous or accessible to the faculties of the soul. Let our author collect on one side of his library all the giants and heroes of utter disbelief, and on the other the literature of natural faith; nay, let him ransack for fresh names and forgotten: suffrages Lalande's "Dictionnaire des Athées;" and if, having weighed the various merits of Leucippus and Lucretius, of Baron d'Holbach and La Mettrie, of Robert Owen and Atkinson, he thinks them of more sterling mass than the pure gold of thought and life accumulated by Socrates, Plato, Antoninus,—by Anselm and Abelard,—Descartes and Arnaud,—by the authors of the "Theodicée," the "Essay on the Human Understanding," and the "Principles of Human Knowledge,"—by Kant and Cousin, by Butler and Paley and Arnold;—we can only profess a dissent from his intellectual taste, not less than from his moral judgment.

The few pages on which we have been commenting were the first,—though they are near the end of the treatise,—that fully opened our eyes to the author's theological *animus*. For awhile, his large professions, and, no doubt, sincere purpose of fairness,—his apparent breadth of view, and his free hand in putting down his subject on the canvass, secured our admiring confidence, and made us feel that here at length justice, earnestness, and accomplishment will go together. One feature, indeed, we noticed as giving a suspicious appearance to his equity of temper: it displays itself more in

\* The question has been raised, whether the author of the "Restoration of Belief," who presents himself to us through the Cambridge publisher, is really a University man? To those who are curious about such critical problems, we would suggest this consideration, as having some bearing on the case: "Could a person who had studied the laws of accelerated motion at the authoritative school of English science, have so forgotten his formulas as to make his *heaviest* man on that account his *quickest*?" The authorship, however, is not less evident than if the boo: had been published by Messrs. Longmans, or by Holdsworth & Ball.

ensoriousness towards his friends than in large-heartedness towards his antagonists. He readily allows faults in the advocates of his own side, but is never carried away into even a momentary appreciation of the other. This particular form of impartiality, which consists in detracting from the merits of allies, instead of delighting in those of opponents, is the ecclesiastic counterfeit of candour,—the half-shekel, which is alone payable in the temple-service, but which nowhere, save at the sacred money-table, is deemed equivalent to the good Roman coin of common life. Much as we dislike the chink of this consecrated metal, we hoped that it would only ring for a passing instant on the ear. But alas! it is an indication seldom deceptive; and we feel constrained to report that there are, in this tract, quotations from both Mr. Newman and Mr. Greg, which, if we were in the court of veracity, and not of theology, we would say, are unconscionably made. The quotations are made anonymously as well as unfaithfully, so that the reader, unless haunted by the checking impressions of memory, cannot correct the injustice of the writer. "The Phases of Faith" describes, it will be remembered, the gradual course of Mr. Newman's defections from his original orthodoxy. His first movements of doubt were naturally timid and inconsiderable, bringing him only to the conclusion, that the genealogy in the first chapter of Matthew was copied wrong, and counted wrong, from the Old Testament. On this step followed a second, and a third, each more important than the preceding, and necessitating a next more momentous than itself. The latter stages of his progress included an inquiry into the evidence of the Resurrection, the miraculous gifts ascribed to the early church, the claims to credit of the Apostle Paul, and other topics, undeniably affecting the very essence of Christian evidence. Having traced the successive advances of his doubts, Mr. Newman, in a recapitulatory "Conclusion," makes a solemn appeal to his readers, to say at what point he could have stopped, and to lay a finger distinctly on the place at which the guilt of his scepticism began. One by one he counts out the steps by which he had proceeded, and asks, "Was this the sinful one?" The whole effect of the appeal is certainly an impression that the series, if not an inevitable sequence, is very difficult to break; and that, small as the beginnings were, they linked themselves, by close connexion, with very momentous results. From this chapter our author cites a sentence or two, but in such a way as immediately to conjoin the small initial steps of doubt with the great ultimate conclusion, and to make it appear

that Mr. Newman renounced Christianity, because he could not make out the pedigree of Jesus to his satisfaction. The genealogical difficulty is the only one which he quotes, and as to which Mr. Newman is permitted to speak for himself. Presenting this as a specimen, and suppressing all the rest, he says that he could have shown "this writer" a course far better "than, on account of difficulties such as these, to renounce Christianity!" His citation from Mr. Greg is introduced as follows:—

"Let another witness be heard; and in hearing him one might think that his words are an echo that has come softly travelling down, through sixteen centuries, from some field of blood, or some forum, or some amphitheatre, where Christian men were witnessing a good confession in the midst of their mortal agonies! This witness is one who assures us that 'he can believe no longer, he can worship no longer: he has discovered that the creed of his early days is baseless, or fallacious.' Yet he, too, takes up the MARTYR TRUTH, that we must not lie to God."—p. 91.

Here, then, Mr. Greg (with concealment of his name) is represented as one who, by his own confession, *can neither believe nor worship any more*. Turning to the preface of the "Creed of Christendom," we find the following original to this quotation:—

"The pursuit of truth is easy to a man who has no human sympathies, whose vision is impaired by no fond partialities, whose heart is torn by no divided allegiance. To him the renunciation of error presents few difficulties; for the moment it is recognised as error, its charm ceases. But the case is very different with the Searcher whose affections are strong, whose associations are quick, whose hold upon the Past is clinging and tenacious. He may love Truth with an earnest and paramount devotion; but he loves much else also. He loves errors, which were once the cherished convictions of his soul. He loves dogmas which were once full of strength and beauty to his thoughts, though now perceived to be baseless or fallacious. He loves the church where he worshipped in his happy childhood; where his friends and his family worship still; where his grey-haired parents await the resurrection of the Just; but WHERE he can worship and await no more. He loves the simple old creed, which was the creed of his earlier and brighter days; which is the creed of his wife and children still; but which inquiry has compelled him to abandon. The past and the familiar have chains and talismans which hold him back in his career, till every fresh step forward becomes an effort and an agony; every fresh error discovered is a fresh bond snapped asunder; every new glimpse of light is like a fresh flood of pain poured in upon the soul. To such a man the pursuit of Truth is a daily martyrdom—how hard and bitter let the martyr tell. Shame to those who make it doubly so; honour to those who encounter it saddened, weeping, trembling, but unflinching still."—P. xvi.

Our author would snatch from Mr. Greg the right to say, we must not lie to God. Which has the better right to say, "Thou shalt not lie to Men?"

The more ingenuously the modern orthodoxy lays bare its essence, the more evident is it that a profound scepticism not only mingles with it, but constitutes its very inspiration. The dread of losing God, the impression that there is but one patent way, not of duty, but of thought, of meeting him, haunts the minds of men, driving some to Anglicanism to compensate defect of faith by excess of sacrament; some to Rome in quest of the Lord's body; and prompting others to conservative efforts of Bibliolatry, conducted with ever-decreasing reason and declining hope. We have seen, however, no such exemplification of this radical distrust as in the treatise before us. Already has the writer declared that the moral side of the universe sends in, with regard to religion, an empty report. And now he hastens to tell us that, on the physical side, the watchmen from every observatory of nature cry out, "No God." He represents the natural sciences as a huge, Titanic, resistless mass of knowledge, perfectly demonstrable, and completely irreligious; descending, like a glacier, from the upper valleys of frozen thought; sure to scrape away the wild pine woods and the green fields of natural religion, yet considerate enough, for some reason unexplained, to spare the foundations of the village church. Designating every faith except his own by such phrases as "theosophic fancies," and "pietistic notions," he assures us that they will all be put "right out of existence" by "our modern physical sciences;" and he borrows from the "Positive Philosophy," (apparently by unconscious sympathy) the following maxim to justify his prediction:—

"In any case when that which on any ground of proof takes full hold of the understanding, (such, for example, are the most certain of the conclusions of Geology,) stands contiguous to that which, in a logical sense, is of inferior quality, and is indeterminate, and fluctuating, and liable to retrogression,—in any such case there is always going on a silent encroachment of the more solid mass upon the ground of that which is less solid. What is SURE will be pressing upon what is uncertain, whether or not the two are designedly brought into collision or comparison. What is well defined weighs upon, and against, what is ill defined. Nothing stops the continuous involuntary operation of SCIENCE in dislodging OPINION from the minds of those who are conversant with both.

"A very small matter that is indeed determinate, will be able to keep a place for itself against this incessantly encroaching movement; but nothing else can do so. As to any of those

theosophic fancies which we may wish to cling to, after we have thrown away the Bible, we might as well suppose that they will resist the impact of the mathematical and physical sciences, as imagine that the lichens of an Alpine gorge will stay the slow descent of a glacier."—P. 97.

Here it is alleged that Science and Opinion cannot co-exist,—that the demonstrable will banish the probable. And be it observed, this is to take place, not simply where contradiction arises between the two orders of belief, but in *all cases*, from the mere *distaste* which quantitative studies produce towards everything which evades their rules. In this allegation there is, we believe, with much exaggeration, a certain small amount of truth,—a truth, however, which, so far from supporting our author's plea against natural religion, offers it a conclusive refutation. It may be admitted that the exact and mixed sciences *do* disincite their votary to put trust in the processes by which judgments of probability are formed, and alienate him from thinkers who read off the meaning of the universe by another key than his. Accustomed to deal with Number and Space, with Motion and Force alone; to reason upon them by a Calculus which is helpless beyond their range; to exercise Faculties involving nothing beyond the interpretation of mensurative signs and the conception of relative magnitudes; he owes it to something else than his peculiar discipline, if he has either the instruments or the aptitudes for moral and philosophical reflection. He carries into the world, as his sole means of representing and solving its phenomena, the notion of physical necessity and linear sequence, secretly defining the universe to himself as Leibnitz defined an organized being,—“a machine, whose smallest parts are also machines,”—and naturally grows impatient when he finds himself in fields of thought over which this narrow imagination opens no track. With respect, therefore, to a certain class of minds, rendered perhaps increasingly numerous by the long neglect of the moral sciences in England, it may be quite true, that a spirit of utter disbelief towards everything beyond the range of necessary matter may more and more prevail. Let us further grant to our author, for the moment, three things assumed by him, all of them, however, false. 1, That this tendency of the “demonstrable sciences,” is their *only* one having a bearing on “Theosophic systems.” 2, That it is so *new*, at least in degree, as to give “opinion” a worse chance for the future than it has had in the past. 3, That it is a *good* tendency, favourable to human knowledge and charac-

ter. Still we must ask, how is the *oracular authority of the Bible* to escape the fate predicted for all probabilities? Our author assures us that it *will* escape: but he gives no faintest hint of a reason for so singular an exception to his own canon. It cannot be contended that the evidences of Christianity and Judaism belong to any of the “demonstrable” or “physical” sciences. It cannot be denied that they lie wholly within the limits of contingent knowledge, and terminate only in “probabilities;” that the authorship, for instance, of the fourth Gospel, the credibility of the introductory chapters of Matthew, the correctness of the prophecies about the second advent, are matters which, “standing contiguous” to the laws of refracted and reflected light, occupy the position of the *less sure* in relation to the *more sure*; that the *relative* chronology of the Scripture books is more indeterminate than that of the geologic strata, and their *actual* dates more uncertain than those of the eclipses fatal to Nicias and to Perseus. What then is to exempt these judgments of verisimilitude from being pushed “right out of existence” by the “silent encroachment of the more solid mass” of knowledge beside it? Nothing can be plainer than that all testimonial knowledge whatsoever, all history, criticism, and art,—the whole system of moral and political sciences, must fall under our author's fatal sentence: and how the propositions which sustain the infallible authority of the canonical books are to hold their ground against the huge glacier on which Herschel, Airy and De Morgan, Comte and Leverrier, triumphantly ride, it is not easy to conceive. Amid the universal crash of probabilities, may not the Mosaic tables of stone, broken once, be pulverized at last? With the abrasion of all the alluvial soil in which the growths of wonder strike their roots,—will the garden of Eden, will the blighted fig-tree, remain to mark a verdant and a barren spot in history? Will these riding philosophers from their cold observatory find Paul's “third heaven”? May not their icy mountain slip into “the abyss” whence all the demons came, and fill it up? These questions indeed are answered for us in experience. It is notorious that whenever an unbounded devotion to science has produced a prevalent tendency to disbelief, Revelation, so far from being spared, has been usually the first object of attack: and, both at the origin of modern science in the sixteenth century, and during its accelerated advance towards the close of the eighteenth, the widening conception of determinate Law was found to threaten nothing so decisively

as the faith in supernatural dispensations. The greater scepticism includes the less: and the habit of mind which lets slip all beliefs not legitimated by the canons of natural science, cannot possibly retain Christianity.

But our author has only *half* described the mental effect of studies purely scientific. They do not, in the nature of things they *cannot*, simply push out of the mind all contingent judgments. Human life and action are one continuous texture of such judgments, with some interweaving, no doubt, of mathematic forms, which could not be picked out without spoiling the symmetry of its pattern: but were you to withdraw the threads of probable opinion, still more to cut the warp of primitive assumptions that stretches through it, the web would simply fall to pieces. No youth can decide on a profession, no man appoint an agent in his business, no physician prescribe for a patient, no judge pronounce a sentence, no statesman answer a despatch, without a constant resort to "surmises," a reliance on slender indications, often even a deliberate adoption of very doubtful hypotheses. All men are driven from hour to hour into positions demanding combinations of thought which can be borrowed from no natural science; where not the laws of matter and motion, not the equilibrium of forces, not the properties of things, are chiefly concerned,—but the feelings and faculties of persons, the action and reaction of human affairs. Mathematicians and natural philosophers being in no way exempt from these conditions, are obliged to have just as many "opinions" and "guesses," as other men: they cannot, if they are to keep their footing on this world at all, have a smaller stock than their neighbours of this "logically inferior" order of persuasions. They are unable to abdicate the necessity of having these persuasions: and their only peculiarity is, that they sometimes import into contingent affairs the methods with which habit has rendered them familiar in another sphere, and so find the conditions of belief unsatisfied; and at others, from consciousness that their own clue will not serve, yet inaptitude for seizing a better, surrender themselves to the fortuitous guidance of ill-balanced faculties and external solicitations. Hence their judgments are frequently fantastic, frequently sceptical; not less liable to be too easy from one cause than to be too reluctant from another: and were a history to be written of the most remarkable extravagances, positive as well as negative, by which religion and philosophy have sprung aside from the centre of common

sense and feeling, it would contain more names of great repute in the exact sciences than from any other intellectual class whatever. From Pythagoras to Swedenborg, the eccentricities of mathematical and physical imagination have been the chief disturbers of a natural and healthy faith. Harmonic theories of the universe, Ideal Numbers, Geometric Ethics, Rosicrucian fraternities, Vortices and Monads, Apocalyptic studies, new Jerusalems, and Electrobiological metaphysics, have all borne testimony to the aberrant fancy of eminent proficients in the sciences. It is, therefore, far from being universally true, that disputable theosophies and conjectural systems of the universe, are distasteful to minds schooled in the "demonstrable sciences." If to men of this order we owe the successive dislodgment of one such hypothesis after another, to them also do we owe their continual reproduction. Whether the unsoundness of judgment which is contracted in the absence of historical, moral, and metaphysical studies shall show itself in an excessive slowness or an excessive facility of belief, will depend on accidents of personal character and social position. But of this we may be sure:—if the *sceptical* temper be the direction taken, the Bible will not be spared;—if the *credulous*, "theosophic fancies" will be copiously saved.

Can there, after all, be a more paradoxical spectacle, than that of a religious writer allying himself with the sceptical propensities of science, in order to get rid of gainsayers of the Bible? It is the counterpart in logic of the Italian game in politics,—the Pope appealing to Parisian swords to drive out the Republic, and save the head of Christendom? Is it possible that our author can *approve* the agency which he thus invokes? that he can really wish to see it in the intellectual ascendant, and garrisoning every sacred fortress of the world? Does he remember what are the fundamental canons of its logic,—that we know nothing but Phenomena,—that Causation is nothing but phenomenal priority,—or else, that Force is the prior datum of which Thought is a particular and posterior development? And what, on the other hand, are the "theosophic fancies," against which he would plant this barbaric artillery of Fate? They are such as these,—That our faculties give us trustworthy reports, not of phenomena only, but of their abiding Ground,—Soul within, God without; that the moral Law of Obligation in the one, is the expression of Holy Will in the other;—that faithfulness in the Human mind to its highest aspirations, brings it into communion with the

Divine ;—that as the Soul is the free Image, so is Nature the determinate Handiwork of God. If these doctrines, spurned by our author with so rude a flippancy, were to surrender to the hostility on which he relies, is he unaware of the character the conflict would assume, and of the dynasty of thought which would reign undisputed at the close? Fighting by the side of such allies against “theosophic fancies,” he may skirmish with the “fancies,” but they will bear right down upon the “Theism” in the centre: and when the day is over, the standard they will plant upon the conquered towers will be, not the sacred dove he took into the field, and lost to the defeated foe, but their own blind black eagle of necessity. How strange is the perversion of instinctive sympathies, when a theologian disparages the sciences of reflection and self-knowledge, and takes his stand on the evidence of sense and measurement alone!—when he proposes to sweep out beliefs that trouble him with their neighbourhood, by a general crusade against all probabilities;—and when, with this design, he violates the just balance of power among the kingdoms of human knowledge, and flatters, as if it were a virtue, the pretensions of a mental habit which, out of its own province, is one of the most incapacitating, yet destructive, of intellectual vices! There is, however, a certain secret affinity of feeling between a Religion which exaggerates the functions and overstrains the validity of an external authority, and a Science which deals only with objective facts, perceived or imagined. The point of sympathy is found in a common distrust of everything internal, even of the very faculties (as soon as they are contemplated as such) by which the external is apprehended and received. And between this sort of faith and the mathematics, there is another analogy, which may explain so curious a mutual understanding. Both rest upon *hypotheses*, which it is beyond their province to look into, but after the assumption of which, all room for opinion is shut out by a rigid necessity. Once get your infallible book, and (supposing the meaning unambiguous) it settles every matter on which it pronounces: and once allow the first principles and definitions in geometry to express truths and realities, and you can deny nothing afterwards. It is the business of philosophy to go *below* the mathematics, and determine whether they are *more than hypothetical* science,—whether their assumptions are a mere play of subjective necessity, or are objectively trustworthy. It is the business of both reflective philosophy and historical criticism

to go below “the book,” and determine whether it has *more than hypothetical* infallibility,—whether the conditions, inner and outer, of such a claim are or are not satisfied. If even the Mathematics, which have little to fear from the investigation of their basis, have not been on the best terms with Metaphysics, it is hardly surprising that a Religion of mere external authority should feel antipathy for the studies which pry into its foundations, with the inevitable effect of showing that what is *certainly* above ground is *opinion* below. Nor is it wonderful that both sets of beliefs are fond of forgetting their hypothetical origin, contemplating only their acquired semblance of security, and speaking as if they disowned contingency altogether, and despised the detractors who could suspect such a taint in their blood. Hence the fellow-feeling which occasionally unites a rigid theology, and an exclusive physical and mathematical science. It is founded on their joint antipathy to the sources of *moral* knowledge,—their common blindness to one half of human culture. Like all alliances resting on antipathy alone, it is neither honourable nor durable. It is the function of Religion to occupy a tranquil seat above the contests of partial pursuits and narrow interests; as, in the world of action, to hold the balance of Right, so in the world of intellect, to preserve the equities and the equilibrium of Truth: and her trust is betrayed by any one who flings himself, as her representative, into the civil wars of the sciences, and in her name signs away whole provinces of thought, and abandons them to outrage and confiscation as conquered lands. Human faith has nothing to fear from the unity and perfection of all the sciences; but much from the blind ambition of each one. It is from this persuasion alone, and not from any defective appreciation of physical studies, that we have spoken freely of their tendency, when the mind is entirely inclosed within them. The undoubted source of inestimable blessings to mankind, and an indispensable element of culture to the individual, they are mischievous only when they grow dizzy with success, and propound schemes of universal empire. The moment they undertake either to create or destroy a religion, the sign is unmistakable that this intoxicated ambition has begun to work.

The relation of Religion to History our author appears to us to conceive much more correctly than its relation to Science. On this great topic, however, our limits forbid us to enter. One remark only we will make. The author misconceives the objec-

tion of Theodore Parker and others to the ordinary doctrine of historical revelation. They do not, as he affirms, "disjoin religion from history," or in the least decline the "travelling back to ages past" on its account. It is not the *presence* of God in antiquity, but his presence *only* there,—not his inspiration in Palestine, but his withdrawal from every spot besides,—not even his supreme and unique expression in Jesus of Nazareth, but his absence from every other human medium,—against which these writers protest. They feel that the usual Christian advocate has adopted a narrow and even irreligious ground; that he has not found a satisfactory place in the Divine scheme of human affairs for the great Pagan world; that he has presumptuously branded all history but one as "profane;" that he has not only read it without sympathy and reverence, but has used it chiefly as a foil to show off the beauty of evangelic truth and holiness, and so has dwelt only on the inadequacy of its philosophy, the deformities of its morals, the degenerate features of its social life; that he has forgotten the divine infinitude when he assumes that Christ's plenitude of the Spirit implies the emptiness of Socrates. In their view, he has rashly undertaken to prove, not one *positive* fact,—a revelation of divine truth in Galilee;—but an *infinite negative*,—no inspiration anywhere else. To this *negation*, and to this alone, is their remonstrance addressed. They do not deny a *theophany* in the gift of Christianity; but they deny two very different things, viz., 1, That this is the *only* theophany; and, 2, That this is theophany *alone*; that is, they look for *some* divine elements elsewhere; and they look for *some* human here. It is not therefore a smaller, but a larger, religious obligation to history, which they are anxious to establish; and they remain in company with the Christian advocates, so long as his devout and gentle mood continues; and only quit him when he enters on his sceptical antipathies. This, in spite of every resistance from the rigour of the older theology, is an inevitable consequence of the modern historical criticism. Its large and genial apprehension opens for us new admirations, new sympathies, clearer insight into human realities, throughout the nations and ages of the past. It melts away from our ancient moral geography the ideal contrasts of colouring which made the world the scene of an unnatural dualism, and reinstates the great families of man in unity. It is doing for our conception of the moral world what science has already done for our conception of the natural: it is expanding

our notion of Divine agency within it. As, in reference to physical nature, we have learned to think that God did not enact creation but once and cease; so are we beginning to perceive, in relation to the human mind and life, that he did not enter history only once and quite exceptionally. Whoever opens his heart to this great thought will find in it not the uneasiness of doubt, but the repose of faith. He will no longer fancy that, in order to keep Christianity as the divinest of all, he must fear to feel aught else divine. He will worship still at the same altar, and sing his hymn to the same strain; only with a richer chorus of consentient voices, and in a wider communion of faithful souls.

---

#### ART. IX.—SIR ROBERT PEEL AND HIS POLICY.

1. *Life and Times of Sir Robert Peel.* By W. C. Taylor. London. 1848.
2. *Speeches of Sir Robert Peel.* (In course of publication.) London. 1851.
3. *Political Life of Lord George Bentinck.* By B. Disraeli. London. 1852.
4. *History of the Whig Administration.* By J. A. Roebuck. London. 1852.

WITHIN one generation three statesmen have been suddenly called away in the zenith of their fame, and in the full maturity of their powers. All of them were followed to their graves by the sincerest sorrow of the nation; but the nature of the grief thus universally felt was modified in each case by the character of the individual, the position which he held, and the nature of the services which the country anticipated from him. When Sir Samuel Romilly fell beneath the overwhelming burden of a private calamity, the nation was appalled at the suddenness of the catastrophe, and mourned over the extinction of so bright a name. He had never held any very prominent public office, though the general estimation in which he was held designated him ultimately for the very highest. He had achieved little, because he was a reformer in a new path, and had to fight his way against the yet unshaken prejudices of generations, and the yet unbroken ranks of the veteran opponents of all change; but thoughtful men did honour to the wisdom and purity of his views, and there was steadily growing up among all classes of the community a profound conviction of his earnestness, sincerity

ty, and superiority to all selfish and party aims, and a deep and hearty reverence for the stern, grave, Roman-like virtue which distinguished him from nearly all his contemporaries. It was universally felt that if he had lived he would have risen high and have done much; and that whether he lived or died, the mere existence of so lofty and spotless a character reflected lustre on the country where he shone, and raised the standard by which public men were judged. It was felt that although England might not suffer greatly by the loss of his services, it would at least be the less bright and glorious for his departure; and hence he was mourned for with an unusually unselfish and single-minded grief.—The regret of the nation at Canning's untimely death was at once more bitter and more mixed. A brilliant "spirit was eclipsed;" the voice that had so long charmed us was henceforth to be silent; the intellect that had served the country so long and so gallantly could serve her no more. All this was sad enough, but there was something beyond this. There was the feeling that the curtain had fallen before the drama was played out, when its direction had just been indicated, but while the issue could as yet be only dimly guessed. There was a general impression that, with his acceptance of the Foreign Office in 1822, a new era and a noble line of policy had commenced for England, and that, with his accession to the premiership in 1827, the ultimate triumph of that policy was secured; that the flippancy and insolence which had made him so many enemies in early life were about to be atoned for by conscientious principle and eminent services; that years and experience had matured his wisdom while sobering his temper and strengthening his powers; that the wit and genius which, while he was the ill-yoked colleague of Pitt, Sidmouth, and Castlereagh, had too often been employed to adorn narrowness, to hide incapacity, and to justify oppression, would now be consecrated to the cause of freedom and of progress;—and that the many errors of his inconsiderate youth would be nobly redeemed by the dignified labours of his ripened age. With one memorable and painful exception, his former antagonists were yearning to forgive the past, and to form the most sanguine visions for the future; and the dismay which his elevation spread among the tyrants abroad was the measure of the joy with which it was hailed by the Liberals at home. When, therefore, he died after only four months' tenure of his lofty station, the universal cry was, that the good cause had lost its best soldier and its brightest hope. Men

could scarcely forbear from murmuring that so brief a sceptre had been granted to one who meant so well and could have done so much; and to all the friends of human progress the announcement of his death was like thick darkness settling down upon their cherished anticipations. But another feeling mixed with those of sorrow and despondency—a feeling of bitter indignation. Right or wrong, it was believed that Canning had fallen a victim, not to natural maladies, nor yet to the fatigues of his position, but to the rancorous animosity of former associates and eternal foes. It was believed that he had been *hunted to death*, with a deliberate malignity, which, to one so acutely sensitive as himself, could scarcely have been otherwise than fatal. There was much truth in this. The old aristocrats hated him as a plebeian, though Nature's self had unmistakably stamped him as a noble: the exclusives loathed him as an "adventurer;" the Tories abhorred him as an innovator; powerful and well-born rivals could not forgive him for the genius which had enabled him to climb over their heads; some could not forget his past sins; others could not endure his present virtues;—and all combined to mete out to him, in overwhelming measure, the injustice, the sarcasm, the biting taunt, the merciless invective, with which, in days long gone by, he had been wont to encounter his antagonists. There was something of righteous retribution in the treatment which must have made it doubly difficult to bear:—what wonder that he sank under the assault? But the British nation, which instinctively revolts from any flagrant want of generosity, and will not endure that a man should be punished for attempting, however tardily, to recover and do right,—have done full justice to his memory, and have never heartily pardoned his assailants.

The sudden and untimely death of Sir Robert Peel gave a severe shock to the feelings of the country, occasioned deeper and wider regret, a more painful sense of irreparable loss, and of uneasiness and apprehension for the future, than any similar event since the death of Canning. The loss of Mr. Huskisson was a great one; but the country felt that there were others on whom his mantle had fallen who were competent to follow in his steps, and to replace him at the council board. Lord Grey, when he died, had long retired from office; he was as full of years as of honours, and the nation had nothing to anticipate from his future exertions; thus the general sentiment at his departure was one of simple sympathy and calm regret. Lord Spencer, too, popular and

respected as he had once been, belonged rather to the past than to the present; and though regretted, he was no longer wanted. But long as the public career of Sir R. Peel had been, no one regarded it as closed; great as were the services which he had rendered to his country, there were yet many more which it looked to receiving at his hands. The book was still open: though no longer in the early prime, or the unbroken vigour of life, he was in that full maturity of wisdom with which age and experience seldom fail to crown an existence as energetically spent as his had been; he filled a larger space in the eyes of England and the world than any other statesman of his day and generation; and to his tried skill, his proved patriotism, his sedate and sober views, and his unmatched administrative capacity, the nation looked with confidence and hope as the sheet-anchor of its safety. We believe there never was a statesman in this country on whose trained and experienced powers, on whose adequacy to any emergency and any trial, both friend and foe, coadjutor and antagonist, rested with such a sense of security and reliance. As long as the Duke of Wellington remained in the full possession of his powers, the country felt that it need not fear the result of any war; as long as Sir R. Peel was spared to us, the country felt that it need not lose heart at any domestic convulsion or civil crisis. Hence the universal feeling of dismay which attended the announcement of his unexpected death in 1849. It was not that we could not yet boast of many men of great administrative ability, some statesmen of profound and comprehensive views, and several rising politicians who may, in the future, vindicate their claim to high renown; but Sir R. Peel left behind him no one whom the nation esteemed his equal—no one who, naturally and by universal acclamation, stepped into his vacant place, as the acknowledged inheritor of his influence and his fame—no one whom, in case of danger or emergency, England could unanimously and instinctively place at the head of affairs.

The time has perhaps scarcely yet come for a full and impartial estimate of the character and career of this eminent man. The shock of his death is still too recent, the memory of his signal services in the great struggle of the day too fresh in the mind of the nation, and the possibility of crises, in which we shall incline to turn to him with unavailing longing, too imminent, to make it likely that we can avoid erring on the side of lenity to his failings, and undue admiration of his capacities and his achievements. His own papers and correspondence, which we trust will shortly be given to the world, are still

also a sealed book; and we may err in our estimate of some transactions for want of the light which the publication of these documents could throw over them. But on the other hand, many impressions are now fresh in our minds which fade away year by year. We have always been conscientious opponents of the great party with which he acted during four-fifths of his career; and we feel wholly free from the bias which connexion with any political school can scarcely fail to create. We are conscious of no feelings or prepossessions which should prevent us from trying Sir Robert Peel by the fairest standard which morality and philosophy can set up; and if we should be thought, wherever doubt is possible, to incline to the more charitable explanation, it is because we from our hearts believe that, in estimating public men in England, the more charitable our judgment is, the more likely is it to be just.

It is interesting to observe what a vast majority of our most eminent statesmen, during the last century, have been commoners, and how many even of these have sprung out of the middle class, strictly so called. William Pitt, "the great Commoner," was the second son of a country gentleman, who had acquired parliamentary importance by the purchase of close boroughs. Edmund Burke was the son of an Irish attorney. The father of Charles James Fox was the second son of a country baronet of no very enviable reputation, in Walpole's time. Canning's father was a briefless barrister, whose family 'cut him off with an annuity of 150*l.*, and whose widow was afterwards obliged to support herself by going upon the stage. His friend Huskisson was the son of a country gentleman in Staffordshire, of very restricted means. The origin of Sir Robert Peel was humbler than that of any, his father having begun life as a manufacturer in a small way, in Lancashire, and having rapidly risen to enormous wealth. These recollections are encouraging enough; they seem to indicate that, whatever may be the fate or condition of our aristocratic families, the under strata of society are fully adequate to furnish a constant supply of suitable candidates for the public service, and that there is nothing in our national system which need prevent such men from rising to their proper station. It is worthy of note, that none of those we have named owed their elevation to the legal profession, which, in all times, has been a ready ladder by which plebeian ambition could attain the highest posts.

Sir Robert Peel's father early destined him for public life, and was resolved that he should enjoy every advantage for the race he

was to run. No pains were spared in his education. At Harrow he was noted for steady diligence, but not for brilliant parts. At Oxford he took a double-first. He entered parliament in 1809; was made Under Secretary for the Colonies in 1811; Chief Secretary for Ireland in 1812; Home Secretary in 1822; Prime Minister in 1834; and again in 1841. His parliamentary life lasted just forty years; and during the whole of it, whether in or out of office, he was prominently before the public eye.

His public life exactly coincides with the eventful period during which an entire change has been wrought in the tone and spirit of our national policy, foreign and domestic—a change which he, partly intentionally, partly unconsciously, contributed much to bring about. When he appeared upon the stage, old ideas and old principles were predominant, triumphant, and almost unshaken. When, at the age of sixty-one, the curtain closed upon his career, everything had become new. When he entered public life, we were in the midst of the most desperate war England ever had to wage, undertaken on behalf of an exiled royal family, and ended by replacing them upon a throne from which they had already been once driven by popular insurrection, and from which they were soon to be ignominiously expelled a second time. Before three summers have passed over his grave, we find statesmen of every party—Lord Derby, Lord John Russell, and Lord Palmerston—vying with each other in proclaiming as the guiding principle of the foreign policy of Britain, the acknowledgment of the indisputable right of every nation to choose its own rulers and its own form of government. When Sir Robert Peel became Chief Secretary for Ireland at the age of twenty-four, the penal laws against the Catholics were in full force, and seemingly stereotyped into our statute book. One of his last measures during his last term of office was to endow in perpetuity the Catholic College of Maynooth. When he began life, the Test and Corporation Acts were unrepealed, and the Dissenters were fettered and irritated by numberless injustices; by the passing of the Dissenters Chapels Bill before his death he helped to sweep the last of them away. In 1809, the old glories of rotten boroughs and purchasable constituencies were untouched and unbreathed upon; the middle classes and the great towns to which England owed so much of her wealth and energy, were almost without a voice in the legislature; and the party which had held power, by a sort of prescriptive right, for a quarter of a century, was pledged to resist any change in the representation. In 1849, Parliamentary Reform had

been a matter of history for seventeen years, and rumours of a new and further innovation were beginning to be heard without either alarm or incredulity. In 1809 the most restrictive and protective commercial policy was not only established, but its wisdom and justice were not even questioned. In 1849, Sir Robert Peel went to his grave amid the blessings of millions for having swept it away for ever. Finally, when he entered political life, the old Tory party seemed as rooted in Downing street as the oak of the forest, and the Whigs to have their permanent and natural place in opposition. When he finally quitted office, the old Tory party was broken up and obsolete, and even their modified and advanced successors maintained an unequal contest with the Liberals. Everything that the men with whom he was first connected most dreaded and deprecated had been done; everything that they had pronounced impossible had come to pass. Parliament had been reformed; Catholics had been emancipated; Dissenters had been raised to a footing of equality; Unitarians and Quakers sat in St. Stephens; Republics had been unhesitatingly acknowledged; the corn laws and the sugar duties had been ruthlessly abolished. An entirely new spirit has been infused into our policy—the spirit of freedom and progress. If Sir Robert Peel's first chief, Mr. Perceval, could return to life, he would find himself in a world in which he could recognise nothing, and in which he would be shocked at everything; and it is hard to say whether England or her quondam premier would be most scandalized at each other's mutually strange and ghastly apparition. And all this mighty change has taken place during the career, and partly by the instrumentality, of a single statesman.

Sir Robert Peel's accession to the cabinet in 1822 in place of Lord Sidmouth, synchronizing as it did with Canning's return to the management of our foreign affairs, coincides with the commencement of a purer morality and a higher tone of character among public men. Since that time there has been little jobbing, and scarcely a single transaction that could be called disgraceful among English ministers. Speculation and actual corruption, or rather corruptibility, have, it is true, never been the characteristics of our political personages since the time of Walpole and Pelham, but up to the beginning of this century, jobbing of every kind among public men was common, flagrant, and shameless. Even in the days of Pitt, places, pensions, and sinecures, were lavished with the most unblushing profusion to gratify official avarice, to reward private friendship, or to pur-

chase parliamentary support. Ministers provided for their family and relations out of the public purse with as little scruple as bishops do now; and indeed considered it as a part of the emoluments of office to be able to do so. The Prime Minister (Perceval, for example,) pocketed two or three comfortable sinecures himself, as a matter of course. Public opinion and the public press exercised only a very lax and inadequate watchfulness over the public purse. The trial of Lord Melville, first Lord of the Admiralty, for malversation, is familiar to every one. The same laxity of official morality prevailed in Perceval's time, and, indeed, with little improvement, till Lord Sidmouth's retirement. A glance over the pension and sinecure list of those days is painfully instructive. In 1810 the number of sinecures was 242, and the emoluments attached to them 279,486*l.* a year: in 1834, these were reduced to 97,800*l.* and they do not now exceed 17,000*l.* In the reign of George III. the pension list considerably exceeded 200,000*l.* a year, and even as late as 1810, it reached 145,000*l.*: it is now reduced to 75,000*l.*; and of this sum not more than 1200*l.* can be granted in any one year. The committee on official salaries, which sat during 1850, brought out in strong relief the contrast between the present and the past in all points connected with the purity of our administrative departments; and it is impossible to read the evidence in detail without being strongly impressed with the high morality and spotless integrity which now distinguish our public men. All the acuteness of our financial reformers on that occasion could not drag to light a single job, and scarcely a single abuse, while it placed in the very brightness of noon-day the official probity and honour of the existing race of statesmen.

But this is far from being the only improvement that has taken place among them. Their notions of patriotism have become loftier and more just; their allegiance to party more modified and discriminating; their devotion to their country more paramount and religious. They are more conscientiously obedient to their own convictions, and less submissive to the trammels of regimental discipline. Statesmen are beginning to feel not merely that they are playing a noble game, pregnant with the most thrilling interest, and involving the mightiest stakes,—but that they are called upon to guide a glorious vessel, freighted with richer fortunes than ever Cæsar carried with him, through fluctuating shoals, and sunken rocks, and eddy whirlpools, and terrific tempests; that on their skill,

their watchfulness, their courage, their purity, their abnegation of all selfish aims, depend the destinies of the greatest nation that ever stood in the vanguard of civilization and freedom; that they must not only steer their course with a steadfast purpose and a single eye, and keep their hands clean, their light burning, and their conscience clear,—but that even personal reputation and the pride of consistency must be cast aside, if need be, when the country can be best served by their immolation. They must act

“As ever in their Great Taskmaster's eye,”

and must find in these lofty views of a statesman's honour and requirements the only counteraction that can be found to the mean struggles, the wearisome details, the unworthy motives, the low and little interests with which they are brought daily into contact.

The key to all the enigmas, all the imputed guilt, all the peculiar usefulness to his country of Peel's career, is to be sought in the original contrast between his character and his position. Of a cautious and observing temper, and conscientiously desirous to do the best for his country whenever that best became clear to him, he was the son of a Tory of the narrowest and stiffest sort, whose mind had been enlarged by no culture and whom no experience perhaps could have taught; and he was at once enlisted into the ranks and served under the orders of men who rarely doubted, who never inquired, into whose minds no suspicion ever entered that what was best for their party might possibly not be best for the nation also, to whom every article in their own creed appeared unquestionably right, and every article in their opponent's creed as unquestionably wrong. In those days—in all times perhaps to a greater or less extent—the young men whose birth or connexions or paternal position destined them for a political career, entered public life, as our young clergymen enter the church now, with the thirty-nine articles of their faith put, ready cut and dried, into their hands—unexamined, unquestioned, often unread; their opinions, like their lands, were a portion of their patrimony; and they no more suspected the soundness of the one than the value of the other. As at Oxford and Cambridge men are educated for the clerical profession not by a searching critical and philosophical investigation into the basis of the creed they are to teach—not by an acquisition of all those branches of knowledge which alone could entitle them to form an independent opinion on its merits—not by a judicial hearing of all that can be said

against it as well as for it—but simply and solely by a memorial mastery of the items which compose it, and a competent acquaintance with the stock arguments which the learning and ingenuity of all times have discovered in its favour;—so were the young politicians of Peel's day prepared for the arena into which they were cast and the strife they were to wage—not by a careful study of political science in the works of the masters who have thrown light upon it *from all sides*—not by a profound acquaintance with the wisdom which is learnt from history—not by mastering the difficult problems of political and social economy—not by a conscientious appreciation of the truth that lay in the views of their antagonists and a sedulous elimination of the error that had crept into their own,—but merely by habitually seeing and hearing only one side of every question—by imbibing every prejudice, reflecting every passion, learning to echo with thoughtless confidence every watch-cry of the party for whose service they were designed. And as our young clergymen begin their theological studies—as far as those studies consist in the first great duty of ascertaining and following the truth—only after they have assumed the livery and sworn the oath of fealty and of faith, only when the fatal document has been signed and the investiture of slavery received, only when their doom is irrevocably fixed, and when earnest and single-minded inquiry incurs the awful hazard of landing them in doctrines which they have vowed, and were enlisted, to combat and destroy, and—if they be honest men—of casting them forth upon the world with the blighted prospects and the damaged character of renegades and apostates, or at best with the stigma of instability and inconsequence for ever clinging to their name;—so did the young statesmen of Peel's days begin their political education when they had already taken their seats in parliament, returned by a particular interest, and on the faith of definite or understood professions: they began to examine and reflect on political questions when such deliberation was especially difficult, because in the midst of an exasperating contest, and especially dangerous because, if sincere, it was as likely as not to lead them to desertion and damnation. Hence, with the members of both professions, it has been the too common practice—natural and, from human weakness, scarcely avoidable and only gently to be condemned—to shut their eyes and fight blindly on, endeavouring to believe themselves conscientious so long as they were consistent and satisfied, so long as they used the old weapons, marched under the old banner, and stood by the old friends.

Great as is the public evil and severe the individual misery arising from the source just indicated, few who reflect how large a portion of the opinions of all of us is *hereditary*, will be disposed to deal severely either with the sinners or the sufferers. We naturally adopt the views of those whom we have loved and honoured from our infancy, and it is right we should. We naturally imagine that those who have been wise and faithful in all that regards ourselves, are equally wise and faithful in matters that lie beyond the scope of our present knowledge. We naturally believe that doctrines against which we have never heard anything said, are doctrines against which nothing can be said; and we find it hard to conceive that what we have always heard treated as axioms of science are among the most disputable matters of opinion. Not only our positive creed but our tone and turn of mind are framed instinctively after the model of those among whom we live; and thus it becomes a matter of the greatest difficulty both to enter into and do justice to the views of others when presented to us, or to divest ourselves even of what may hereafter be proved erroneous in our own. No man can start in life, whether in a political, religious, or literary career, with his mind a *carte blanche*: few can wait to take up a definite position till they have thoroughly mastered and impartially weighed all sides of the great questions with which they have to deal. In public affairs, especially, action is an essential requisite to a complete understanding of them; it is only by being involved in them that you can see deeply into them; it is only in parliament that the education of a member of parliament can be completed. It is not till you hear views diametrically opposed to those you have inherited, stated by an opponent whose powers you cannot but recognise as superior to your own, and whose sincerity of conviction you cannot doubt, that you perceive, with amazement and dismay, how doubtful appears much that you had always considered as self-evident, and how plausible seems much that you had been taught to regard as monstrous and indefensible. An abyss seems to open beneath your feet: the solid ground is no longer stable: and all the landmarks of your mind are shaken or removed. Much change, many inconsistencies, some vacillation even, should be forgiven to all who serve the country as senators or statesmen, especially to those who enter on her service young.

Few men have drawn more largely than Sir Robert Peel on this wise indulgence, and few have had a stronger claim to have it extended to them in overflowing measure. It was his irreparable calamity to have been

thrown by nature into a false position. His birth was his misfortune—a sort of original sin which clung to him through life. Born in the very centre of the Tory camp, in a period when Toryism was an aggressive principle, an intolerant dogma, a fanatic sentiment,—in a period, too, when party passions were virulent and unmeasured to a degree of which we, in our times, have had only one brief specimen, and when Toryism was rampant, dominant, and narrow, in a manner which amazes and shocks us as we read the contemporary annals of those days,—Sir Robert Peel was yet endowed with native qualities which could not fail to place him at once in antagonism with his position, for he had a solid intellect, an honest conscience, an innate sense of justice and humanity, an acute observation, and a keen spirit of inquiry, which were incompatible with Toryism as it then existed,—mental and moral endowments which, from the moment he entered public life, placed him among the most liberal and enlightened of his own party, which speedily created a sort of secret uneasiness among them, and which clearly showed that he was destined either to drag them on with him, or to march on before them and without them. To this originally false position may be traced nearly all those obliquities and inconsistencies which have laid Sir Robert Peel's career so open to hostile criticism. Created of the stuff out of which moderate Liberals are made, but born into the ranks in which only rigid Tories could be found, his whole course was a sort of perpetual protest against the accident of his birth—an inevitable and perplexing struggle between his character and his circumstances, his conscience and his colleagues, his allegiance to principle and his allegiance to party. As his mind ripened and his experience increased, he was compelled, time after time, to recognise the error of the views which he had formerly maintained, and which his colleagues still adhered to; and like all progressive statesmen, he was frequently obliged to act on his old opinions, while those opinions were in process of transition, and to defend courses the policy of which he had begun to suspect, but had not yet definitively decided to abandon. Hence, if we look at his strange and incongruous career in a severe and hostile spirit, we see a minister who through life was incessantly abandoning doctrines he had long pertinaciously upheld, and carrying out systems of policy he had long denounced as dangerous and unsound—deserting and betraying his own party, and usurping the victory of his opponents. Looking at the same career from a more generous, a more philosophic, and, as we deem it, a juster point of view, we see a statesman born in intolerant

times, and cast among a despotic and narrow-minded party, whose path through history may be traced by the *cauvie* he has left lying by the wayside, by the garments he has outgrown and flung away, by the shackles from which he has emancipated himself, by the errors which he has abandoned and redeemed.

The political progress of a country with free institutions and a parliamentary government like that of England, is brought about by the perpetual struggle between two great parties, each of whom is the representative—often imperfect and unworthy enough—of distinct principles and modes of thought. The predominant idea and feeling of one party is reverence for ancestral wisdom and attachment to a glorious Past, beautiful in itself, but unduly gilded by a credulous and loving fancy:—the predominant sentiment of the other is aspiration after a better Future. The efforts of the first are directed to preserve and consolidate what is left to us: those of the second to achieve whatever is not yet attained. From their contests and compromises—contests confined within fixed limits, and conducted according to certain understood rules of war—compromises by which one party foregoes something to obtain an earlier victory, and the other sacrifices something to avert an utter defeat—results the national advance towards a more humane, just, and comprehensive policy. The progress bears the stamp of the mode in which it is wrought out; it is slow, fragmentary, and fitful, but it is secure against retrogression, and it never overleaps itself. It exhibits none of those mournful, disappointing, and alarming spectacles with which the political struggles of the Continent abound. The party of the Past, however mighty in possession, and however doggedly entrenched, is never able *wholly* to resist. The party of the Future, however elastic with the energy and buoyant with the hopes of youth, is never powerful enough to carry *all* before it. Those who pull forward and those who hold back, never fairly break asunder. All move together—against the wish of the latter—but far more slowly than the former would desire. Neither party entirely separates from the other as in Germany. Neither party entirely overpowers the other, as in France.

Now this peculiar character of our progress, to which must be attributed both its durability and its safety, is due to a class of men to whom England owes more than to almost any of her sons, and to whom she is in general most scandalously ungrateful—viz., the Liberals in the Conservative camp, and the Conservatives in the Liberal camp. Unappreciated by the country—misrepresented by

the press—misconstrued and mistrusted by their friends—suspected of meditated desertion—reproached with virtual treason—suffering the hard but invariable fate of those who are wise among the narrow, comprehensive amid the *bornés*, moderate among the violent, sober among the drunken—condemned to combat against their brethren, and to fraternize with their antagonists—they lead a life of pain and mortification, and not unfrequently sink under the load of unmerited obloquy which their unusual, and therefore unintelligible, conduct brings upon them. The Liberals call them timid and lukewarm Laodiceans; the Tories call them crotchety, impracticable, and fastidious. They do the hardest duty of the conscientious patriot, and are rewarded by the bitterest abuse that could be lavished on the common enemy. Lord Falkland was one of these men; Burke was another; Lord Grey, in a measure, was a man of the same stamp. These were all Conservatives among the friends of progress. Sir Robert Peel was a liberal, cast among the friends of stationariness and reaction. In the march of the nation towards securer prosperity, sounder principles, and a wiser policy, he occupied for more than a quarter of a century that post of pain, calumny, and mortification—but of inestimable importance also—the *Leader of the Laggards*,—the man who chained together the onward movement and the backward drag—the Reformers and the Tories; who saved the latter from being left utterly behind—stranded, useless, and obsolete; and checked the too rapid advance of the former, by acting as the bond which compelled them to draw the reluctant conservatism of society along with them.

Peel's naturally just and liberal sentiments showed themselves in various small indications early in life, and excited some uneasy misgivings in the minds of his own bigoted colleagues. As early as 1812, when he was Irish Secretary, and when such notions were rare among his party, he expressed in Parliament his anxiety for the extension of education among the Irish peasantry; and in 1824, when he was Home Secretary, he gave great offence to the Ultra-Protestants of his party by expressing himself thus:—"In the education of the poor in Ireland, two great rules ought now to be observed: first, to unite, as far as possible, without violence to individual feelings, the children of Protestants and Catholics under one common system of education: and secondly, in so doing, studiously and honestly to discard all idea of making proselytes. The Society, whose exertions had been referred to, [the Kildare Street Society] seemed to him to have

erred in the latter respect." When he came into office, after the Reform Bill, as is well known, he steadily supported and firmly administered the system of mixed education introduced by the Whigs. As soon as he entered the Cabinet in 1822, he directed his immediate attention to the amelioration of our prison discipline and the mitigation of the scandalous severity of the criminal code, and in June of that year announced that Government were preparing measures on these important topics. In March, 1826, he introduced two valuable Bills for "the Improvement and Consolidation of the Criminal Laws," in a speech of singular modesty, discretion, and good feeling; but most unhappily he omitted to do justice to the harder labours of his predecessors in the same field; and those who remembered the persevering but unavailing efforts of Sir Samuel Romilly, and Sir James Mackintosh, for similar objects, at a time when humanity was rarer and less reputable, could not forgive his apparently ungenerous silence. They ever afterwards accused him of "gathering where he had not strewed, and reaping where he had not sown." Three years later, when the colleague of the Duke of Wellington, he introduced one of the greatest administrative improvements of our time—the new police force in place of the old incapable nocturnal watchmen, and the inefficient and scanty parish constables. And throughout the whole of this term of office he showed the most earnest spirit of economy and retrenchment, such as extorted the applause even of the opposition. "They (says Mr. Roebuck, vol. I. p. 164) who were most conversant with the finances of the country considered that economy was carried further than had been yet known, and that a spirit of fairness and complete freedom from jobbing or nepotism pervaded every branch of the administration. Mr. Hume, who was undoubtedly the most earnest advocate for retrenchment in the House, frankly acknowledged that 'the Chancellor of the Exchequer had gone as far as he imagined he could go with safety on the present occasion.' Mr. Baring and Mr. Huskisson, both great authorities on such subjects, confessed that 'the Chancellor of the Exchequer had gone to the utmost verge of reduction possible in the present state of the country, without the substitution of other taxes.' And generally, the selection of the taxes to be taken off was deemed judicious—and made solely with a view to public and not partial interests.—We have enumerated briefly these points in Sir Robert Peel's career, to prove that the liberalism which he showed so increasingly in later life was no external element superinduced upon his character by the change

in his political position and party connexions, but one which had been always present though long kept under restraint by unsympathising colleagues and the native caution of his temperament.

Many of Sir Robert Peel's qualities and defects as a minister lay upon the surface, and might be comprehended at a glance. He was not a man of genius; he was not a man of consistent action; he had nothing of the deep-seated science of the philosophic statesman; and till the last four or five years of his life, he displayed nothing of the high historic grandeur of the patriot-hero. But he had other qualifications and endowments, which, if less grand and rare, were probably more suited to the age in which his lot was cast, and the part which he was called upon to play. In the first place, he was, pre-eminently, and above all things, *prudent*. Cautious by temperament, moderate by taste, his instinctive preference was always for a middle course: he disliked rashness, and he shrank from risk; the responsibilities of office were always for him a sobering and retarding weight: and those who watched his course and studied his character, early perceived that he was not a leader who would ever push matters to an extreme, or put to hazard the tranquillity or the welfare of the country by too pertinacious and protracted an adherence to personal sentiments or old opinions, or by too desperate a fidelity to prejudice or party. He might be too tardy sometimes in yielding; but no one doubted that he would yield, if it became obviously wise and necessary to do so. He carried prudence almost to the height of genius, and early earned for himself the most serviceable of all reputations in this country—that of being a “safe man.”

Connected with this leading characteristic was another of the same order. He was uniformly *decorous*, and had a high sense of dignity and propriety. He was a worshipper of the *το εἶσενον*, both in manners and in conduct. He scarcely ever offended against either the conventional or the essential *bienséances* of society. He never made enemies, as Canning did, by ill-timed levity or heartless jokes. His speeches and those of his brilliant colleague, on the occasion of the Manchester massacre, place in strong contrast the distinctive peculiarities of the two men. Both took the same side, and nearly the same line of defence; but the tone of the one was insolent and unfeeling, that of the other dignified and judicial. The language of Canning on that occasion was never forgotten or forgiven: after a few years no one remembered that Peel had ever had the misfortune to defend so bad a cause. Peel too had, even at the beginning of his career,

too great a respect for his own character, to allow himself to be dragged through the dirt by his superior colleagues. Even when his position obliged him to excuse what was indefensible, he contrived to allow his inward disapproval to pierce through his apology. He was fortunate enough, or skilful enough, to be out of office during the memorable prosecution of the Queen; and the only time that he was compelled to speak upon that disgraceful business, he expressed a grave regret that a suitable palace had not been provided for her Majesty, and that her name had been excluded from the liturgy.

One requisite for an English statesman—perhaps at the present day the most indispensable of all—in which the Whigs generally have been singularly deficient—Peel possessed in unusual measure, at least in the latter portion of his life—viz., a quick and instinctive perception of public opinion. He had a keen and sensitive ear to the voice of the nation, and an almost unerring tact in distinguishing the language of its real leaders and movers from that of mere noisy and unimportant declaimers. He seems first to have acquired this faculty in 1829, or at least to have awakened to a sense of its vast importance; and the memorable two years during which the Reform Bill was under discussion—a time in which his political education advanced with marvellous rapidity—brought it almost to perfection. This peculiar tact Lord John Russell never has been able to learn. And in truth it is not easy to acquire it, or to say how it is to be acquired. It is an instinct rather than an attainment; and an aristocracy which does not belong to the people, or live much with them, or sympathize promptly in their feelings, seldom possesses it. Public opinion expresses itself in many ways: its various organs hold fluctuating language, and give forth conflicting oracles; the powerful classes are often silent: the uninfluential classes are generally clamorous. If novel and important measures are proposed, those who concur are commonly satisfied with a quiet and stately nod of approbation: those who object are loud and vehement in their opposition. How, amid these contradictory perplexities, is a statesman to ascertain the sentiments of the intelligent and effective portion of the nation? If he goes to the members of the House of Commons, he cannot overlook the fact that they represent only the feelings of their constituents, or, it may be, of their nominators; and that the unrepresented, or the unequally represented, portion of the community forms a most essential element in the popular opinion. At best, members cannot be relied on to speak more than the sentiments of the

country at the time of their election; and they, like the minister, are students of the same problem, and puzzled with the same conflicting clamours. If he looks to petitions, he is inquiring in a most deceptive quarter; for we all know how even "monster" petitions can be "got up." If he looks to public meetings, he cannot fail to be aware that their importance and significance depend entirely on the character and position of the people who take a part in them; that there are meetings of many thousands in the open air, which it would be folly to listen to, and mere weakness to respect; and meetings of a few scores "in an upper chamber," indicative of an influence and of sentiments which it would be absolute insanity to disregard. Lastly, if he looks to the press, how is he to know among what class of readers each newspaper circulates? How can he tell whether it is really expressing their sentiments, or merely seeking to lead them to its own? How can he ascertain whether on any particular topic, such as Lord Palmerston or the Poor Law, the *Times* is actually the organ of public opinion, or only that of private malignity, or idiosyncratic crotchets? How is he to distinguish how many of its readers read it with disgust and disagreement, like himself, and how many with acquiescence and credulity? Where the press is not unanimous, or nearly so—where it is widely divided in its judgments, as is almost constantly the case—how is the statesman to apportion to each organ its actual influence, or the number and weight of its clients, so as to gather from the whole something like an accurate estimate of the national expression? It is abundantly obvious that he must be left very much to the guidance of his own sagacity; and with this sagacity Sir Robert Peel was endowed in a most unusual measure. After 1832, he scarcely ever made the mistake—which his antagonists were making every day—of not knowing whose quiet voice to listen to, and whose clamorous demands to disregard.

Sir Robert Peel was not certainly a statesman of the highest order which we can picture to ourselves for the government of a great state; but it is by no means so clear that he was not the most finished specimen of that peculiar class of statesmen who alone can find a place in a representative constitution such as ours, in which the democratic element so largely preponderates. He had no far-seeing plans for the preservation and regeneration of the empire, which he kept in view through all vicissitudes, and to which, amid all his various terms of office, he perseveringly made everything conduce. His policy was based upon no profound or well-

digested system, upon no philosophic principle to which he could adhere through good report and ill report, and keep ever before him as the guide and pole-star of his career. To praise like this he has no claim. He often erred as to what ought to be done, and he often discovered it deplorably too late. But whatever he had to do he did well. He had the rare merit, among our public characters, of being a thorough *man of business*. He was a statesman of consummate administrative ability. His measures were always concocted with the most deliberate and patient skill. His budgets were models of clearness and compactness. As soon as discussion began, it was made apparent that he had weighed every difficulty and foreseen every objection. He was always master of his subject. The result was that his proposals scarcely ever underwent any alteration in their passage through parliament; they might be accepted or rejected; they were never mutilated or transmogrified. Those of his opponents, on the other hand, even when in the plenitude of their power, and commanding such a majority as had backed scarce any minister since the days of Pitt, were so clipped, curtailed, modified, and added to, that when they came forth from the ordeal, the parents could scarcely recognise their own offspring. Peel's measures were finished laws before they were brought forward: the Whig proposals were seldom more than the raw materials of legislation thrown down on the floor of the House of Commons, to be wrought by that manufactory into the completed fabric. Hence grew a general conviction, that though the Whigs were often right, yet that they could not be trusted to embody their own ideas in simple and judicious enactments;—that Peel might be often mistaken, yet that he was always *up to his work*. He was often on the wrong tack, but he always sailed well.

Peel's whole heart was in the public service. He seemed actually to love toil. He was indefatigable and most conscientious in the performance of his official duties. The veriest drudge of office was not more constant at his desk. The most plodding committee-man could not rival him in the persevering regularity of his attendance in the House of Commons. During his short but most memorable ministry in 1835, he went through an amount of labour that was almost incredible. He was Chancellor of the Exchequer as well as First Lord of the Treasury. He had scarcely a single colleague competent to afford him any efficient aid. He had to struggle against a hostile House of Com-

mons and a mistrusting country. The fight was not of his choosing, and he knew from the first that it was a hopeless one. But he contended gallantly to the last—toiling incessantly from seven o'clock in the morning till long past midnight—and when at last he resigned, he had risen fifty per cent. in public estimation.

We now come to the great peculiarity of Sir Robert Peel's career—that which has brought upon him the accusation of being a traitor, a turn-coat, a man of infirm purpose, and of variable and inconstant views—*want of consistency*. On three several occasions he recanted all his previous professions—adopted the opinions he had hitherto strenuously opposed—and carried out the policy which he had been accustomed to denounce as mistaken and dangerous. He did so on the question of a metallic basis for the currency; he did so on the question of Catholic Emancipation; and he did so on the question of the Corn Laws. All were topics of first-rate magnitude—all involved great and long-contested principles—on all his views underwent an entire and radical change. For this change he was bitterly reproached with treachery and tergiversation by those who did not see the truth as soon as he did, and by those who have not seen it yet; he was ungenerously taunted by those who were wise enough or happy enough to see it earlier; and made the subject of depreciation and grave rebuke by those who appear to hold that if a statesman cannot discern the right path at the beginning of his career, he ought at least to persevere in the wrong one to the end.

Now this charge of "inconsistency" and tergiversation has so long been popularly regarded as the heaviest and most damaging that can be brought against the character of politicians, that it is well worth while to spend a few moments in inquiring *how* it comes to be so estimated, and how much of justice may be awarded to this estimate, when weighed in the balance of unprejudiced reason. When a statesman draws himself proudly up, and declares, amid the prolonged cheering of his audience, "*I never abandoned my party; I never changed my opinions; I never voted in favour of measures I had spent the best years of my life in opposing,*" he imagines that he is putting forth the most irrefragable claim to public confidence and admiration. When he seeks the most fatal and irritating weapon with which to wound or discredit an antagonist, he rakes up from buried volumes of Hansard the expression of sentiments and doctrines widely at variance with those now professed, and taunts him

with sitting side by side with colleagues who were his foes in years gone by; and the arrow generally strikes home; and though none are invulnerable by it, none seem able to refrain from using it, and none can receive it without suffering and shrinking. Why is this? Why should the charge be felt so painfully?

The explanation is an historical one. Our morality and our sensibility on this subject have descended to us from those days when parliament was not an assembly in which the interests of the nation were discussed by the representatives of the nation with the object of ascertaining its wishes and promoting its welfare, but an arena in which trained gladiators contended for the mastery—a field of battle in which two marshalled hosts contended for the victory; days when senators were not men selected by the people to investigate, deliberate, and legislate for the exigencies and the progress of the country according to the best light which science and study could bring to shine upon them—but soldiers enlisted for an avowed cause, marching under a known banner, owing allegiance and obedience to an acknowledged chief. Hence the morality of parliament *then* was the morality of *military* life; and in the military code desertion is the most heinous of all crimes. Again, in those times from which our present party morality has been inherited—the times of Walpole, and Pelham, and the first Pitt—tergiversation and change of party were nearly always traceable, or supposed to be traceable, to some mean or sinister motive. It was generally accompanied and explained by the acceptance of a peerage, a pension, or a place.

From these two circumstances, it naturally resulted that political inconstancy was regarded less as indicative of a mental process of conviction, than as involving personal honour: the accusation was a flagrant insult; the fact was fatal to a statesman's popularity and the stainless purity of his reputation. But why the same conventional rule of judgment should be maintained *now*, when no senator is ever influenced in his changes by the promise of a bribe or the hope of a place, and scarcely ever by low ambition or personal pique, and when members of parliament are not party combatants, but deliberating legislators, it is not easy to perceive. Still less reasonable does it seem, when we reflect that no statesman of the present generation, and scarcely any of the last, can point to a career of unswerving consistency. Lord Eldon, indeed, was a model of unchanging constancy; but it is impossible to regard this as a virtue in him, for we know that it was the result of a bigoted temper, and a narrow

mind, and was about the most mischievous of his many noxious qualities. Had all his colleagues been like him, we should, ere now, have seen a revolution as complete and unsparing as that of France. "What a consistent career has Lord Eldon's been," wrote a contemporary of his in 1829, "the ever active principle of evil in our political world! In the history of the universe, no man has the praise of having effected as much good for his fellow-creatures as Lord Eldon has thwarted." The consistent career of the late Lord Grey does, indeed, present many points for admiration; but we must remember that Lord Grey started in life with opinions far in advance of his day and generation, many of which were wholly inapplicable, and out of place then; and there was more than one occasion both in early and in later life, when his fidelity to party led him into language and conduct deplorably inconsiderate, unworthy, and unjust. Among living statesmen, who can point to a consistent career, in the ordinary sense of the term? Is it Lord Derby, who was at one time the fiercest assailant, and at another, the subordinate minister of Peel; at one time the vigorous reformer, at another time the resolute stickler for the intact existence of the Irish church? Is it Sir James Graham, the radical of early days, who, in 1831, stood in the very van of the Whig party, as the colleague of Lord Durham and Lord Grey; who, in 1835, was a devoted adherent of the seceding Lord Stanley; and in 1845, a colleague of Sir Robert Peel, and an opponent of Lord Stanley? Is it Lord Palmerston, who has held office successively under the Duke of Portland, Mr. Perceval, Lord Liverpool, Sir Robert Peel, Mr. Canning, Lord Grey, and Lord John Russell? Is it Mr. Gladstone, either in what he has done, or in what he has contemplated? Is it Mr. Disraeli, the quondam Radical, the present leader of the reactionary rump? Finally, is it even Lord John Russell, who made the "appropriation clause" a *sine qua non* in 1835, and passed a bill without it in 1838; who opposed the motion for an inquiry into the operation of the Corn Laws in 1839; who proposed a fixed duty of eight shillings in 1841, and declared for total repeal in 1845? We do not mean to intimate that all these statesmen were not conscientious, and may not even have been right in their various changes of party and modifications of opinion; but assuredly none of them can lay claim to the attribute of immutability.

There is a wise, and there is an unwise, species of political constancy. There is a narrow and mechanical, and there is a large and comprehensive, view of the same great principle of rectitude. There is a steadiness

of opinion and of purpose which imbues itself with noble sentiments, and places great objects ever before it; which, having studied deliberately the best interests of the country and decided the direction in which it ought to steer, keeps those interests and that goal in view through all bewildering storms, and through every intervening cloud; which in each emergency selects that policy best suited, during that emergency, for nearing the appointed haven; which in every danger chooses and follows the pilot who best understands that peculiar portion of the chart of destiny over which the vessel of the state is at that moment steering; and which knows how to preserve an essential, if not a superficial, consistency by varying its means and its course to secure the unity of its end. And there is a stubbornness of will, and unbending *rectilinearity* of march, like that of the Norwegian Leming, which cannot comprehend that perils which press from one quarter are not to be met by the same weapons and the same attitude which is appropriate against those which menace from an opposite direction; which would apply the same panacea to every social malady, and to every condition of the patient—to the state of excitement and the state of collapse; which cannot conceive that altered national circumstances may demand altered national policy; which, in the difficult navigation of public life, ascertains its position and calculates its course, not by fixed landmarks, but by floating fragments—not by objects eternal in the Heavens, but by objects moving upon earth; and which deludes itself into a belief that it is nobly pursuing one consistent purpose, so long as it is surrounded by the same familiar faces, and uttering the old ancestral shibboleth of party—though the circumstances which made its companions patriots, and its war-cry a just and noble reality, have long since been reversed. There is a perseverance which is "instant in season;" there is a pertinacity which is instant "out of season;" and there is a national purblindness which confounds the two qualities—so diametrically distinct—in one common admiration. Finally, there is a consistency—the boast of the shallow and the vain, but often of the conscientious too—which forms its opinions, collects its maxims, and adopts its party according to the best light it has, and then shuts the door of the mind against all disturbing knowledge and all bewildering and novel illumination,—which petrifies into impenetrability or congeals into a frozen fog. And there is an open and earnest convincibility, which, aware that the utmost wisdom it can attain at the outset of its career is at best fragmentary and imperfect, is constantly storing up new facts, mastering new discoveries,

deliberating on new arguments, profiting by old errors, digesting the lessons of past experience; which feels that the first duty of a high position is to abjure prejudice, and to give to the country the full benefit of every added information, of every successful experiment, of every elaborated science. Men of this stamp of mind are marked out for misrepresentation and for taunt; they are made the butt of every Tory blockhead to whom so unegotistical a conscience, so lofty and unconventional a standard of public duty, are things utterly incomprehensible; but they are the men who most truly serve, and most often save, their country, and the country generally appreciates them better than either Parliament or party.

The truth is that in a country of free institutions, like England, of which progress is the law and life, that sort of inconsistency which is implied in political *conversion* must be not only an admitted fact, but a recognised prerogative; and in an age of transition like that in which we live, these conversions must be necessarily frequent and rapid. Were it otherwise—were conversion a forbidden thing—the strife of parties would become a war of extermination; the nation could advance in her course of enlarging and enlightening policy only by the death or political extinction of the conservative statesmen. Not only would our progress be more tardy, but it would be more fitful, spasmodic, and dangerous. There would be no change till by process of election or of death the obstructions were reduced to an absolute and permanent minority, and then the change would be sudden and immense. We should lose all the advantage and all the safety which now arises from the gradual modifications which take place in the views of the most reflective statesmen of all parties, and by the ceaseless and often almost imperceptible passing over of influential politicians from one camp to the other: those who, yielding to the moulding spirit of the age, and the influx of new impressions, desert the ranks of the Tories for those of the Reformers, carrying with them many of their early associations with a venerated past, and much of the native conservatism of their temperament: those, on the other hand, who having achieved the great reforms on which they had set their hearts, or swayed by the insensible influence of increasing years, begin to fear the too rapid encroachments of the democratic element, and therefore join the ranks of the retarders, carrying with them to the quarters of their former antagonists many of their popular sympathies, and some faint embers of their old enthusiasm for reform. A progress which draws the whole nation along with it is not

only securer, but far more *complete* than one which results from the defeat of one party and the predominance of another; and for this it is essential that the *liberty of conversion* should be upheld as one of the indisputable privileges of our public men. But, like all other liberties, it must be surrounded with such guarantees, limits, and conditions as shall prevent it from degenerating into licence.

These conditions are three:—the public have a right to require from a statesman who abandons his former opinions, or party, that his changes shall not be vacillations, but advances; that they shall be fairly and candidly avowed as soon as decided; and that they should not, if possible, be in the direction of his personal interest; not so much so at least as to give the slightest fair opening for ascribing them to sinister motives. Let us try Sir Robert Peel's conversions by this standard.

In the first place, though a perpetually changing, he was never a vacillating statesman. His course was essentially *progressive*. Every step he took was a step forward. He never "tried back." From the Peel of 1812 to the Peel of 1829, the advance is rapid and remarkable: from the Peel of 1829 to the Peel of 1849, the improvement is so wonderful that individual identity is almost lost. He began life as the underling of Lord Sidmouth—the shallowest, narrowest, most *borné*, and most benighted of the old Tory crew. He ended life leading the vanguard of the most liberal of the matured statesmen of the age. He began life the advocate of the civil disqualifications of Catholics and Dissenters. He ended it the advocate of complete religious freedom. He was born a monopolist; he passed through many phases of gradual emancipation, and at last died a free-trader. Unlike Lord Stanley, who started from the front rank of the Reformers, and has now, in his course of retrogression, reached almost the rear-rank of the Obstructives,—Sir Robert Peel started in the race with every disadvantage, clogged with every weight and fetter which could impede his progress; but he cast them one by one aside, and advanced, with slow and timid, but not oscillating footsteps, to complete emancipation from early prejudices and from old connexions.

Further, in all his changes, as soon as he saw his way clearly, he stood to his colours manfully. "When he was ambiguous, unsatisfactory, reserved, and tortuous (says Mr. Disraeli,) it was that he was perplexed, and did not see his way." When once he had fixed upon his line, he never attempted to shirk the consequences or corollaries of his new policy. He not

only accepted, cheerfully and candidly, the deliberate decisions of the Legislature, even when opposed to his own opinions, as settled and accomplished facts (as in the case of the Reform Bill;) but when his ripening convictions, or the wisdom which time and experience brought with them, compelled him to retreat from a position, to retract a policy, or avow a change, he never attempted to deny the fact, or extenuate the magnitude of that change—he was never guilty of the common subterfuge of little minds—of endeavouring, by petty and underhand manœuvres, to counteract the effect of the course he was publicly obliged to take. He did not do things by halves, or in a niggard and reluctant spirit. When, in 1819, a careful inquiry in a Committee of the House of Commons produced an entire change of opinion on the subject of our metallic currency, the bill which he then introduced for the resumption of cash payments was a complete and thorough measure, and formed the basis for all his subsequent action on the same topic in 1834 and 1844. When in 1829 he felt obliged, in direct contravention of all his previous policy, to concede emancipation to the Catholics, the measure he brought forward was a complete and generous one. There were no needless reservations of the high places of the State; there was no attempt to save appearances by the enactment of fancied securities; there were no evasive clauses, to undo by a side-wind the manifest and declared intention of the measure. It was as graceful a surrender at discretion as could well be made; and not only did he subsequently show no wish to undo his work, or to escape from its consequences, but in his steady support of the Irish national education system, in his augmentation and establishment of the Maynooth College, and in his erection of the “Godless Colleges,” he uniformly proved himself prepared and resolved to act in the spirit of his own great measure. The Reform Bill was carried against his most strenuous opposition; but having been carried, after deliberate discussion, by the pronounced will of the nation, Sir Robert Peel struck no back-handed blow at its efficiency. And when, in 1846, he at length perceived the wisdom and necessity of a resignation of the Corn Laws, he proposed, not the half-way house of a fixed duty, but total abolition—while admitting that in so doing he laid himself open to the deepest obloquy and the most unsparing criticism. And ever afterwards he supported ministers manfully, whenever this measure, or any of its consequences, was in

question. When, therefore, a statesman’s changes have thus invariably been slowly and cautiously made, honestly avowed, resolutely and unflinchingly carried out, and when, above all, they have always been in *one direction*—not backwards and forwards, but invariably onward—what more can be said in defence of inconsistency, if inconsistency in a statesman be allowable at all?

Secondly, Sir Robert Peel always fulfilled the other conditions we have specified as required to sanction change of opinion and to redeem it from moral reprobation. In many of the most important measures of his life, he adopted the views and carried out the plans of his opponents; but (save on one occasion, which has been already noticed) he was always careful to render honour where honour was due—to give the credit of the triumph of the principles he had tardily embraced to those who had early maintained them. Thus in 1811, just after his entrance into public life, and probably before he had time to give any consideration to the subject, he adopted the views of his ignorant and bigoted old father on the Bank Restriction Act, and voted against the celebrated bullion resolutions of Francis Horner. But when, in 1819, in compliance with the order of a select committee of the House of Commons, he introduced his measure for the resumption of cash payments, we find him saying, “I am ready to avow without shame or remorse that my views on this subject were materially different when I voted against the resolutions brought forward in 1811 by Mr. Horner, as chairman of the bullion committee; but having gone into this inquiry determined to dismiss all former impressions, to apply to the subject my unprejudiced attention, and to adopt every inference that authentic information or mature reflection could offer to my mind—I now conceive the principles laid down by Mr. Horner to represent the true nature and laws of our monetary system; and it is without shame or repentance that I thus bear testimony to the superior sagacity of that distinguished statesman.” In 1829, in bringing forward his memorable bill for Catholic emancipation, Sir Robert Peel spoke as follows:—“The credit of this measure belongs to others, not to me. It belongs to Fox, to Grattan, to Plunket, to the gentlemen opposite (the Whigs), and to an illustrious friend of mine (Mr. Canning), who is now no more. By their efforts, in spite of my opposition, it has proved victorious.” Again, in 1846, on the night when he took leave of power after the final carrying of the repeal of the corn-laws, the

crown and consummation of a long series of measures in the direction of free trade, he spoke thus:—"The name which ought to be associated with the success of these measures, is not the name of the noble lord opposite, nor is it mine. The name which ought to be and will be, associated with those measures, is that of one, who acting, as I believe, from pure and disinterested motives, has, with untiring energy, made appeals to our reason, and has enforced those appeals with an eloquence the more to be admired because it was unaffected and unadorned—the name which ought chiefly to be associated with the success of these measures is the name of Richard Cobden."

Sir Robert Peel never attempted to disguise or diminish the fact of his change of opinion. When decided and complete, it was always manfully avowed as soon as circumstances would permit. The tergiversation which has brought upon him the severest animadversion was that which took place on the Catholic question. In the passionate language of the time, it was designated by no gentler name than that of treachery. It is worth while, both for the sake of the individual and for the elucidation of political morality, to go a little closer into the facts of this remarkable question. In the first place, it is alleged that to change at all on such a topic reflects no honour on his sagacity: for this was no new question, with respect to which want of knowledge or of previous consideration could be pleaded. The subject was one specially connected with his earliest official situation: it had always been a prominent one: he had been in the habit of discussing it for seventeen years. Every argument in favour of the *principle* of Catholic emancipation had been repeatedly urged upon him, and been repeatedly repudiated by him. Every danger likely to arise from its refusal had been pointed out in the clearest manner, and with wearisome reiteration, and had been by him denied, undervalued, or despised. How came the truth to dawn upon him so slowly, and to be admitted so reluctantly? And how can the long persistence and the tardy recantation be reconciled with any character for statesmanship?

Little can be said to weaken the force of these representations, except that the whole history of the question shows the peculiar character of the man's mind. It was his nature to yield to conviction slowly and reluctantly. He was *born* on the wrong side, and it cost him seventeen years of warfare to get right. That, with his hereditary notions as to the sanctity and authority of the English Church, he should shrink from

throwing open the doors of the constitution to the hereditary and irreconcilable enemies of that Church, does not surprise us. That, knowing the Irish Catholics as he did, he should dread and deprecate the introduction of such men into the British legislature, surprises us still less. The conduct of the "Irish Brigade" in recent years has shown us that he was not wholly wrong. But that a man naturally so just and equitable should not have shrunk from denying to so large and respectable body of his fellow-subjects the full rights of citizenship, does, we confess, appear incongruous. And that so keen an observer and so cool a reasoner should have so long continued blind to the danger, increasing every year, arising from the internecine strife, is quite inexplicable, and clearly shows that at this period of his life he read "the signs of the times" far less truly and promptly than he afterwards learned to do. But it must be observed that he himself placed the cause of his yielding in 1829 what he had till then opposed, upon its right footing. It was a change of *policy*, not a change of *opinion*. He held as strongly as ever his conviction of the desirableness of Catholic exclusion. But it was no longer possible. *Circumstances had changed.* Through the organizing and agitating powers of Mr. O'Connell, the danger of refusing had at length become greater than the danger of conceding,—and therefore only did he yield. He chose then, as he had chosen hitherto, that which he believed to be the least of two evils for his country. Catholic emancipation and civil war were both mischiefs to be dreaded and averted; but the latter was the worst mischief of the two. When the alternative was put thus clearly before him, he logically and inevitably gave way. "According to my heart and conscience," said he, "I believe that the time has come when less danger is to be apprehended to the general interests of the empire, and to the spiritual and temporal welfare of the Protestant Establishment, in attempting to adjust the Catholic question, than in allowing it to remain any longer in its present state. . . . Looking back upon the past, surveying the present, and forejudging the prospect of the future, again I declare that the time has at length arrived when this question must be adjusted. . . .

. . . I have for years attempted to maintain the exclusion of Roman Catholics from Parliament and the high offices of the State. I do not think it was an unnatural or unreasonable struggle. I resign it in consequence of the conviction that it can no longer be advantageously maintained. . . . I yield,

therefore, to a moral necessity which I cannot control, being unwilling to push resistance to a point which might endanger the establishments that I wish to defend." In plain words, he saw that he was defeated, and therefore capitulated, to save useless bloodshed and a worse catastrophe. This was not the language of a great or a foreseeing statesman; but it was the language of a prudent and conscientious minister, and of an honest man.

"But," it is said, "if such were his views, he should not have proposed Catholic Emancipation at all. He should have resigned, and have left the settlement of that great question, with its satisfaction and its glory, to those whose opinions regarding it were thus proved to have been right." Undoubtedly he would have consulted both his own feelings and his own fame by acting thus; and under ordinary circumstances this would have been the proper course to have pursued. But higher than mere personal considerations were here involved. Let us look into the details of the case: in them we believe we shall find his complete justification.

The state of affairs, as already stated, produced, towards the close of the year 1828, in the minds both of the Duke of Wellington and Sir Robert Peel, a strong conviction that the government of Ireland, on the old system, had become impossible, and that Catholic emancipation must be conceded, if they were not prepared to hazard the alternative of civil war. Having arrived at this conviction, the first point was of course to secure that a measure for this purpose *should be carried*; the second, *longo intervallo*, was that it should be carried by the proper parties. Fortunately, the publication of Lord Eldon's correspondence has thrown great light upon the Ministerial difficulties at this crisis. Lord Eldon, who hated the Catholics like poison, was in constant communication with the King, and has described his state of mind in vivid colours. George IV., whose conscience had never in the course of sixty years withheld him from the indulgence of any bad passion or the commission of any agreeable crime, felt an insuperable objection, partly of mortified pride, partly of alarmed scruple, to conceding Catholic emancipation. He could not, however, turn a deaf ear to the representations of his ministers. He at length assented to their proposals. Then he withdrew his assent. He played fast and loose with them; entreated them to forego their intentions; entreated them not to desert him; empowered Lord Eldon to see if he could not rescue him from them; kept them in doubt up to

the last moment whether he would not break his pledged word, and by pronouncing the royal veto give the signal for civil war. These difficulties with the King, ministers could not explain—could scarcely even hint at; and hence their explanations always seemed incomplete and unsatisfactory. The history of the case was this, as we know it now from authentic sources.\*

In August, 1828, after the close of the session, Sir Robert Peel wrote confidentially to the Duke of Wellington, explaining to him in the clearest manner the absolute necessity of at once settling this great question, which had now reached a position which made all government impossible, and concluding in this manly language:—

"I must at the same time express a very strong opinion, that it would not conduce to the satisfactory adjustment of the question, that the charge of it in the House of Commons should be committed to my hands.

"I put all personal feelings out of the question. They are, or ought to be, very subordinate considerations in matters of such moment; and I give the best proof that I disregard them, by avowing that I am quite ready to commit myself to the support of the principle of a measure of ample concession and relief, and to use every effort to promote the final arrangement of it.

"But my support will be more useful, if I give it with the cordiality with which it shall be given, *out of office*. Any authority which I may possess, as tending to reconcile the Protestants to the measure, would be increased by my retirement. I have been too deeply committed on the question—have expressed too strong an opinion with respect to it—too much jealousy and distrust of the Roman Catholics—too much apprehension as to the immediate and remote consequences of yielding to their claims—to make it advantageous to the King's service that I should be the individual to originate the measure."

From that period to the end of the year the ministers were occupied in endeavouring to obtain the consent and to fix the mind of the false and vacillating monarch. When this consent was finally obtained, and it became necessary to prepare for meeting Parliament on the new footing, Sir Robert Peel, on the 12th of January, 1829, again wrote to the Duke, praying for permission to retire, stating, "that retirement from office was the only step he could take which would be at all satisfactory to his own feelings, and deprecating in the most earnest manner his being the person to bring forward the measure in

\* "Lord Eldon's Life and Correspondence." Speech of Sir R. Peel in the House of Commons, Dec. 17, 1831.

the House of Commons." But in the mean time the difficulties of the Duke had been greatly increased by the announced hostility of the bench of bishops, and he intimated to Sir Robert Peel that he could not maintain his ground if he (Sir Robert Peel) persisted in resigning. "The earnest appeal, also, made to him by the King, not to shrink from proposing a measure which, as a minister, he advised the King to adopt, left him no alternative, consistent with honour and public duty, but to make the bitter sacrifice of every personal feeling, and himself to originate the measure of Roman-Catholic Relief. Could he, when the King thus appealed to him—when the King referred to his own scruples, and uniform opposition to the measure in question—when he said, 'You advise this measure—you see no escape from it—you ask me to make the sacrifice of opinion and consistency—will not you make the same sacrifice?' What answer could he make to his sovereign but the one he did return? viz., that he would make that sacrifice, and would bear his full share of the responsibility and unpopularity of the measure he advised."

The plain and brief truth of the case was this:—the safety of the country required that Catholic Emancipation should be at once conceded—of this there was no doubt. The Whigs, no doubt, ought to have carried it,—but the King, it was well known, would not endure a Whig ministry, and the King was impracticable, testy, and prevaricating, and manageable by no one but the Duke. If the Duke had resigned, he would have thrown himself into the hands of the old Tories, Emancipation would have been refused, and civil war and national retrogression and disgrace would have been the consequence. But the Duke's resignation would have been necessitated by Peel's retirement. As an honest and disinterested patriot, therefore, Sir Robert Peel, in our judgment, had no option but to act as he did act.

Considerable blame was thrown upon Sir Robert Peel at the time, on the ground of the apparent suddenness of his conversion. In 1828, it is said, he declared that his opinion as to the impolicy of concession remained unchanged, while at the beginning of 1829, he himself proposed concession. And, more than this, he allowed his brother and brother-in-law to deliver speeches at public meetings in various parts of the country, most violent and decided in their denunciations of Catholic Emancipation, at the very time when it appeared he had advised his sovereign to grant emancipation, and shortly before he himself proposed it to Parliament. With regard to the latter charge, which brought upon him much odium and the bitter indignation

of his relatives, it will suffice to observe that not only could he not, consistently with his oath and duty as a cabinet minister, have given them any intimation of the change under consideration,—but that from the vacillation and unreliableness of the King, ministers themselves felt no security *till the speech from the throne was actually delivered*, that they would be allowed to bring forward their proposals, and that infinite mischief and embarrassment would have resulted from permitting their intention to leak out before the monarch was publicly committed on the subject. With regard to the suddenness of Sir Robert Peel's conversion, we know now that it was rather apparent than real; and of sudden ministerial changes in general a more honourable explanation can be given than is commonly supposed. That explanation has been thus stated:—"Men in public life, and more especially ministers in actual office, when new facts, deeper reflection, stronger arguments, or altered positions, come to shake their previous opinions and produce an incipient change, are placed in a situation of singular difficulty. They can seldom retire or lie by till the inchoate operation is complete; their position often calls upon them for constant action and perpetual speech; in the meantime, they are obliged to conceal from the public the mental process which has just commenced, so long as it is imperfect and uncertain; they must speak and act in accordance with their past, not with their future selves; if they speak, they must speak in conformity with the old opinions over which doubt is gradually creeping; if they act, they must act on the principles which they are beginning to abandon, not on those which they are beginning, but only beginning, to adopt. This is a hard and painful position; yet it is one which duty to their colleagues and their country not unfrequently compels public men to endure. Like other men, if they are honest, inquiring, and open-minded, they must inevitably find modification after modification coming over their opinions in the course of their career, as knowledge ripens, as facts develop, as wisdom matures. Yet for a leading senator to be silent, or for a chief minister to retire, every time he felt the first warning symptoms of such an alteration, would be simply impracticable in actual life, though no doubt the most comfortable course for his own feelings, and the safest for his reputation. Thus he is in a manner obliged, by the requirements of his position, to continue making the best defence he can for his old course and his old principles till his *suspicion* of their unsoundness has risen into a clear and settled *conviction*; and when, having arrived at this point,

he suddenly and conscientiously avows his change, there is unquestionably, *primâ facie*, a very dark case against him. We believe we have here indicated the secret of that course of conduct which brought down so much obloquy upon Sir Robert Peel on two memorable occasions in 1829 and 1846. We do not affirm that it presents a full justification: but we do hold that it affords a fair and not discreditable explanation of many apparently sudden or too rapid changes in the opinions and measures of public men."

In the third place, a statesman's changes, we have said, ought never to be so manifestly in the direction of his personal advantage as to leave any decent ground for attributing them, either wholly or in part, to sinister or interested motives. On this head, Sir Robert Peel's tergiversations stand free from the slightest suspicion. Whatever might have been said in the angry surprise of the moment by a deserted and disappointed party, every one now feels not only that all his changes were conscientious, but that all of them were made at the most bitter sacrifice of personal feeling. His first inconsistency—on the currency question, in 1811—brought him into immediate and very unpleasant collision with his father, who even spoke before him in the debate; and it is understood that the old gentleman scarcely ever heartily forgave his son for his change of opinion, either on this occasion or in 1829. Few men, indeed, ever made greater sacrifices than Sir Robert Peel to his views of public duty; for he deliberately sacrificed to them—what to minds as ambitious and as sensitive as his, is far dearer than place, or power, or popular applause and admiration—the attachment of his party, the good opinion of his personal friends. In 1829, he incurred—knowingly and manfully, though with acknowledged pain and reluctance—the reproaches and indignation of a great party, the fury of those bigots who had long regarded him as their safest and most presentable champion, the rupture of many private ties, the blame of many dear connexions, and the representation of the University of Oxford, to which he had long clung with honourable pride, and which Canning had so ardently desired; and what, perhaps, to a proud man was worst of all, the humiliation of avowing an ignominious defeat, and the mistake and short-sightedness of years. "The tone of his observations," observes Mr. Roebuck, "proved how acutely he felt the suffering of the fiery ordeal to which the indignation of his former friends had subjected him, how his mind still lingered about the objects of his former solicitude, and with what pain he divested

himself of the character of the great Protestant leader."

"Allusion has been made," he said, indignantly, "to the sacrifice of the emoluments of office, which, it is insinuated, ought to have been preferred to the course I have adopted. Good God! I cannot argue with the man who can place the sacrifice of office or emolument in competition with the severe, the painful sacrifice I have made—a sacrifice which it seems to be supposed I have consented to in order to retain my office. . . . Perhaps (he concluded) I am not so sanguine as others in my expectations of the future; but I have not the slightest hesitation in saying that I fully believe the adjustment of the question in the manner proposed, will give better and stronger securities to the Protestant interest and the Protestant establishment than any other that the present state of things admits of, and will avert evils and dangers impending and immediate. What motive, I ask, can I have for the expression of these opinions, but the honest conviction of their truth? . . . I well know I might have taken a more popular and selfish course. I might have held language much more acceptable to the friends with whom I have long acted and to the constituents whom I have lately lost. 'His ego gratiora dicta alia esse scio; sed me vera pro gratis loqui, et si meum ingenium non moneret, necessitas cogit. Vellem equidem vobis placere; sed multo malo vos salvos esse.'"

What it must have cost Sir Robert Peel, and what it did cost him, in pride, in affection, in repute, to break loose from his party in 1846, and propose the repeal of the corn laws, we can now fully estimate.\* The desertion

\* Mr. Disraeli, in his "Life of Lord George Bentinck," gives a graphic sketch of the memorable night when the Protectionists revenged themselves on their leader by voting with the Whigs on the Irish Coercion Bill, and so ejecting him from office. It was the evening when the repeal of the Corn Laws had finally passed the House of Lords:—

"At length, about half-past one o'clock, the galleries were cleared, the division called, and the question put. . . . More than one hundred Protectionist members adhered to the Minister; more than eighty avoided the division; nearly the same number followed Lord George Bentinck. But it was not merely their numbers that attracted the anxious observation of the Treasury bench, as the Protectionists passed in defile before the Minister to the hostile lobby. It was impossible he could have marked them without emotion—the flower of that great party which had been so proud to follow one who had been so proud to lead them. They were men, to gain whose hearts, and the hearts of their fathers, had been the aim and the exultation of his life. They had extended to him an unlimited confidence, and an admiration without stint; they had stood by him in the darkest hour, and had borne him from the depths of political despair to the proudest of living positions. Right or wrong, they were men of honour, breeding, and refinement, of high and generous character, and of great weight and station in the country, which they had ever placed at his disposal. They had been not only

of many with whom he had long acted—the rage of the country gentlemen whom he had disappointed—the bitter indignation of those whom he dragged over the grave of their pledges and their prejudices to support his new policy—the merciless sarcasms, the unsparing imputations of premeditated treachery, nightly cast at him by the impotent fury of the deceived, and the deep malignity of the baffled—altogether formed a combination of painful and formidable obstacles, which would have deterred from such a course any man who loved his country less, or valued his reputation and his comfort more. But he faced all with a grave and sorrowful fortitude, which has not been without its reward. The nation saw and appreciated the earnest and unselfish sincerity of the man; did full justice to the honesty of his purpose, and the difficult firmness of his resolution, and in the end placed him on a pinnacle of popularity achieved by no statesman since Lord Grey. Never has it been the fate of a statesman to do his duty to his country in the face of so many difficulties—difficulties, it is true, the main portion of which were created by his own antecedents—and at the cost of so complete a surrender of all that statesmen hold most dear. In the course of thirty years, he changed every opinion, violated every pledge, broke up every party, disappointed every prophecy, deserted every colleague whom he could not draw along with him; yet, in spite of all, at the time of his death he stood in public estimation and respect the unquestioned chief, *longo intervallo*, of all the statesmen of the day. And why was this?—but because it was clear to all that sincere conviction and conscientious, unselfish devotion to his country's service were throughout the actuating principles of his conduct—were at the bottom of every changed opinion, of every broken pledge, of every scattered combination, of every severed friendship, of every disappointed hope. It

his followers, but his friends; had joined in the same pastimes, drunk from the same cup, and in the pleasantness of private life had often forgotten together the cares and strife of politics.

"He must have felt something of all this, while the Manners, the Somersets, the Bentincks, the Lowthers, and the Lennoxes passed before him. And those country gentlemen—those 'gentlemen of England'—of whom but five years ago this very same building was ringing with his pride of being the leader—if his heart were hardened to Sir Charles Burrell, Sir William Jolliffe, Sir Charles Knightly, Sir John Trollope, Sir Edward Kerrison, Sir John Tyrrell—he surely must have felt a pang when his eye rested on Sir John Yarde Buller, his choice and pattern country gentleman, whom he had himself selected and invited but six years back to move a vote of want of confidence in the Whig Government, in order, against the feeling of the Court, to instal Sir R. Peel in their stead."—(P. 300.)

occurs to many public men to sacrifice place, power, and friends to their principles and their faith: it was reserved to Sir Robert Peel to sacrifice to them his reputation—and this, not once, but time after time—and yet to find it, like the widow's cruse, undiminished by the daily waste.

Of Sir Robert Peel's conversions, his conversion to free trade and the repeal of the Corn Laws is the one which brought upon him the greatest obloquy and the heaviest charges, but we think with little justice. If, indeed, when he took office at the head of the Conservative party, in 1841, after ousting the Whigs—who, in their hour of danger and despair, had begun to tamper with the protection hitherto afforded to the agricultural and the colonial interest—he had already discerned the necessity and made up his mind to the wisdom of a surrender, and yet led his party on to the attack, and assumed name and power in the name and for the defence of the old party,—then no language can be found severe enough to condemn such black and premeditated treachery. But there is not the slightest ground for believing this to have been the case. When, after the general election of 1841, he was summoned to take office by the large majority of a Parliament elected under the combined influence of a general conviction of Whig incapacity and mismanagement—aided by the alarm created among the agriculturists by their proposal of a fixed duty, and among the West Indians by their attempt to reduce the differential duties on slave sugar—he found the country in a condition calling both for immediate action to rescue it from misery and depression, and for a sincere and searching study of the causes which had plunged it into such adversity. The finances were deplorably dilapidated. The deficit was annual, and annually increasing; and the Whigs had tried in vain to cure it. The trade of the country was languishing, manufacturers were failing, many mills were closed, bread and meat were scanty and dear, want of employment and want of food were driving many to despair, and goading others into violence. Altogether it was a gloomy period, the suffering and despondency of which are even now fresh and painful in our memory. It was one of those epochs that make all men earnest, and cause many to think and question who never thought or questioned before. Sir Robert Peel met Parliament in the autumn, passed the necessary routine measures for the service of the country, and then steadily refused to give any intimation of the plans by which he proposed to meet the alarming

state of matters, till he had the five months of the recess for careful deliberation. Those months were spent by himself and his colleague, Sir James Graham, in anxious investigation and reflection. Few men are aware how effectually, in all worthy and honourable minds, the awful responsibilities of office during a time of national distress, crush and drive away all selfish and personal considerations; how they tear away the veil from the flimsy arguments which sufficed to answer an objection or silence an opponent: how they shrivel into nothing the claims of consistency, the prejudices of connexion, the pride of reputation; and how they *compel* the most sincere and laborious efforts to arrive at truth. The impression made upon the two leading ministers by that dreadful time never faded from their minds. Those who knew them then saw an unwonted gravity upon their faces. Those who knew them afterwards heard them say that no party or political considerations would induce them to risk the recurrence of such a period of suffering and gloom. It was the remembrance of 1842 that shaped their course in 1846; they saw a similar period approaching, and they dared not, and could, not meet it with *any* restriction on a starving nation's supply of food.

Sir R. Peel met Parliament in 1842 with bold and statesmanlike proposals:—He saw that it was necessary to restore the finances, to relieve and unfetter industry, and to increase the supply of food for the people. So he imposed a property tax to enable him to modify a prohibitive and oppressive tariff; he greatly reduced the duties on the raw materials of manufactures, and he admitted foreign cattle and meat at moderate rates of duty. Further than this he would not go: *because further than this he did not see his way*. His new Corn-law was scarcely an improvement on the old one; and he was aware of this himself. On that subject his opinions, though shaken, were still undecided. *He did not see his way*; and his language showed this. Those who reproached him with ignorance and cowardice for not repealing the Corn-laws then, and those who reproached him with treachery and tergiversation for repealing them four years later, alike showed that they had not studied his career and did not understand the peculiar character of his mind. He was, as a statesman, exactly what the English are as a nation. They are, in spirit, essentially Conservative. They instinctively venerate what is old, dread what is novel, mistrust what is untried. They are ever unwilling to make a change till unmistakable expediency or ne-

cessity forces it upon them. They hold by precedent and custom till the position in which these retain them has become no longer tenable or safe. They hate rash experiments, but they love substantial justice. Hence, during the greater part of his life, Sir Robert Peel was a man after their own heart. He was pre-eminently a *tentative*, not a scientific statesman. He had nothing of the political philosopher about him: he never formed a theory, and then followed it out systematically to its consequences; he always *felt his way*. He felt his way in criminal law reform; he felt his way in the concession of equal institutions to Ireland; he felt his way on the currency question; he felt his way in his financial measures; he felt his way in his liberal commercial policy. His first steps towards free-trade, in 1842, were made in doubt and trembling: it was obvious that he had no thorough confidence in the *principles* of the free traders, and that he still thought there was much weight in the reasonings and the fears of their antagonists, but he perceived that the effect might be serviceable, and it was desirable that the experiment should be tried; and it was not till he saw how buoyantly the commerce of the country sprang forward under the timid and tentative relief which he had given, showing that at least he had done no harm and made no mistake, —that he began to see his way more clearly, and to announce his opinions more courageously, and with fewer reservations and misgivings. Had bad harvests, instead of good ones, followed his first tamperings with the old protective tariff, and the distress of the country been exacerbated instead of being relieved, we believe he would have concluded that he had been wrong, and that the further alterations of 1843, and the systematic revision of 1845, would have been indefinitely postponed.

In the same way he proceeded with the Corn Laws. No one could see his countenance and hear his speech, when, after six months of anxious reflection, he proposed his new scale of duties in 1842, without being convinced that he had begun to feel thoroughly doubtful of his ground:—the fearful distresses of his countrymen had compelled him to look into the subject more closely than he had ever done before, and to listen with more candour and attention to the reasonings of his opponents. The consequence was that his mind became utterly unsettled: he had to propose a law at a time when his own views had been greatly shaken, but when the antagonistic views of the free-traders had not yet wrought full conviction: hence he defended

his measure by arguments wholly unworthy of an intellect like his, and for three years insisted on giving it a fair trial. But during all this period, as was evident from his altered and hesitating language, his mind was gradually ripening for the final change: it was impossible for him, charged as he was with the destinies of England, to sit night after night in the House of Commons, listening to the lucid expositions, the crushing logic, of the small but indefatigable band of the champions of commercial freedom, without finding first doubt, then admiration and surprise, then conviction, successively creeping over him. We well remember, as he sat silent after one of the calm, clear, irrefutable speeches of Mr. Cobden (regarding the effect of the Corn Laws on grazing and dairy farmers), which made an unwonted impression on the house,—the dismayed country gentlemen began to whisper anxiously from the back benches: "This will never do! Why don't Peel get up and answer him?" Sir Robert Peel turned half round and muttered in a low voice: "Those may answer him who can."

When his conversion was thus almost completed, came the memorable and terrible summer of 1845—incessant rain, a damaged and defective harvest, and the universal potato-rot—and the work was done. Peel felt that he dared not encounter another period of distress and scarcity with the Corn Laws still unrepealed; he saw starvation in prospect for Ireland, and possibly for England also; and he recognised the impossibility of maintaining any impediments to the most unlimited supply of foreign food. The more he thought, the more he listened, the more he observed,—the clearer became his vision, and the more resolute his purpose. At the beginning of November he proposed to throw open the ports, but his colleagues were by no means unanimous, and he felt it was not a step to be taken with divided councils. Later in the month Lord Morpeth joined the league: on the 22nd, Lord John Russell wrote his celebrated letter to the electors of London; he too, like his great rival, was a convert to the pressure of the times and the arguments of the leaguers. A week after, Sir R. Peel resigned, after recommending the Queen to send for Lord John Russell, and placing in her Majesty's hands a written promise to assist his rival, by every means in his power, in effecting the now necessary settlement of this great question. The issue is well known: Lord John Russell could not form a ministry, and Sir R. Peel again took office with all his colleagues, except Lord Wharncliffe, who died, and Lord Stanley, whose prejudices were too stubborn

to yield to facts, and whose heart was not yet touched by the prospective sufferings of his fellow-countrymen. He carried the repeal of the Corn Laws in the session of 1846, after a hard contest, and the most savage and bitter personal attacks, and then, according to a tacit understanding, gracefully laid down his power, and retired for ever from official life.

That a tentative and gradually progressive policy like his does not indicate the possession of the highest qualities of statesmanship, we readily concede. The merit of the prophetic mind that sees far into the future belongs not to Sir R. Peel. Few politicians ever read the present better, or the future less. He was clear-sighted, rather than far-sighted. "His life was one perpetual education," says Mr. Disraeli. "He was not a rapid learner," observes Mr. Roebuck, "but he was continually improving. He was ever ready to listen to the exposition of new ideas."—The truth is, as Mr. Disraeli perceived, Sir R. Peel was not an *original* mind: he drew his inspiration from others. He was not of that order of great men who early embrace vast objects and prolific principles, inculcate the country with them, and educate the country up to them through long years of effort, obloquy, and misconstruction. He was not even of those who say, with Artervelde,—

"I will not wait upon necessity,

And leave myself no choice of vantage ground;  
But rather meet the times while still I may,  
And mould and fashion them as best I can."

He scarcely ever anticipated the verdict of the country; he was never too early; often too late. But when we reflect how great a change has of late years come over the political action of the country; how completely the general rules, and many even of the smaller details of our policy, are now decided by public opinion out of doors;\* how entirely both ministers and parliament have become mere instruments to realize, embody, and execute those decisions to which the exertions of independent thinkers and associ-

\* Mr. Disraeli, indeed, conceives that much of this change lies at the door of Sir Robert Peel. "No minister," he says, "ever diminished the power of Government in this country so much as this eminent man. No one ever strained the constitution so much. He was the unconscious parent of political agitation. He literally forced the people out of doors to become statesmen, and the whole tendency of his policy was to render our institutions mere forms." There is much truth in this: but surely the Whigs must share the guilt—if guilt there be—for what party of late years have so constantly compelled the country to modify their measures and make amends for their deficiencies?

ated bodies have gradually led the national mind,—it may be questioned whether a man who sympathizes and adopts, is not more needed at the helm, in our times, than a man who initiates—still more than one who anticipates or misreads. The day is past when British rulers could govern according to the dictates of their own wisdom; nothing can now be done that the country is not ripe for; and a minister who is too forward for his age, finds himself simply powerless.

“Had the intellect of Sir Robert Peel,” says Mr. Roebuck, “been of a bolder and more original cast, he would probably have been a less successful minister, as in that case he might often have proposed reforms before the nation was prepared to receive them, and thus have diminished his power as a minister while earning the renown of a philosopher. . . . The philosopher who discovers great truths, and collects the evidence by which they are eventually established, must be content to have his reward in the reverence and gratitude of posterity, and must be satisfied with the consciousness of the real value and importance of his discoveries. But the statesman, to be useful, must be powerful; and in a government like ours, and among a practical people like the English, the safest course for a reforming minister is never to be before his age. Let him not be obstinately wedded to any views or opinions—let him be ever ready to hear, and carefully and respectfully listen to, all sides of every question—but let him religiously abstain from appropriating or assenting to any novel conception, until the public thoroughly understands and earnestly adopts it.”—*Preface*, xix.

On one memorable instance, however, Sir Robert Peel hung back behind his age. He did not recognise the demand of the nation for reform, and when he did, he refused to bow to its wishes. He opposed the Reform Bill to the last; though when passed, he proclaimed it to be “a final and irrevocable settlement of a great constitutional question, which no friend to his country would attempt, directly or insidiously, to disturb;” and set himself diligently and with consummate sagacity to the task of reconstructing the disorganized Conservative party on a basis suited to the altered circumstances of the times. Yet it is to be observed that no man contributed more largely to the success of the Reform Bill than Sir Robert Peel himself,—since if it had not been for the breaking up of the Tory camp caused by his proceedings in 1829, that great measure could not have been carried, and indeed would never have been proposed. The

effect, too, of the discussions on that measure, the conduct of the people regarding it, and their subsequent course at elections, in completing his political education, and making him thoroughly comprehend the middle classes, can scarcely be too highly estimated.

Mr. Disraeli thus sums up his able and discriminating, but somewhat hostile, estimate of his great opponent:—

“One cannot say of Sir Robert Peel, notwithstanding his unrivalled powers of dispatching affairs, that he was the greatest minister this country ever produced; because, twice placed at the helm, and on the second occasion with the court and the parliament equally devoted to him, he never could maintain himself in power. Nor, notwithstanding his consummate parliamentary tactics, can he be described as the greatest party leader that ever flourished among us, for he contrived to destroy the most compact, powerful, and devoted party that ever followed a British statesman. Certainly, notwithstanding his great sway in debate, we cannot recognise him as our greatest orator, for in many of the supreme requisites of oratory, he was singularly deficient. But what he really was, and what posterity will acknowledge him to have been, is the greatest MEMBER OF PARLIAMENT that ever lived.”

Mr. Roebuck's estimate is juster and more comprehensive:

“His strongest sympathies were with the nation, and not with a dominant section or party; and in this he was pre-eminently distinguished from the Whig statesmen, to whom he was through life opposed. . . . His conduct during his last administration, though it gave offence, never to be forgiven, to some of his immediate partisans, made him the most popular minister, and the most powerful statesman, known in England since the days of the first William Pitt. The nation had confidence in his prudence; they believed him sincerely anxious to promote the welfare of his country, and to have real sympathies with the industrious millions of our people. There was a feeling every day growing stronger, that he was destined to be *the people's minister*;—that he would be able, by means of popular support, to which at length he could alone look for aid, to depart from the rule by which the whole government of the country had hitherto been placed exclusively in the hands of the aristocracy, and to unite upon the Treasury bench a really national administration. . . . Entertaining the hope that such was to be the ultimate mission of Sir Robert Peel, the nation looked with eager expectation to his future career. He rose in their affections in proportion as he lost the favour of his party, and was never so powerful as when by that party he was at last scouted, and deemed to be for ever dismissed.”

This is quite true. During the four years that elapsed between his resignation of office and his death, he grew daily in intellectual and moral stature, and in favour with the

great body of the people. For the first time in his long life he was free—unshackled by any party ties, and liberated from all embarrassing antecedents. He stood there as the great “Moderator”—a sort of consulting physician to the nation, to be called in when ordinary doctors were at fault. There was one service especially which it was hoped he might live to render. Rich in official experience, but unhampered by official connexion—exempt from the snares and prejudices of ambition, because no ambition could aspire to a higher eminence than he had already reached—apart and aloof from all the embarrassments of party, since he had for ever and voluntarily ceased to be a leader—it was felt that he, and he only, was the statesman competent to examine and report upon the whole machine of our government—to point out the defects in its *system*, and to suggest the quarter in which a remedy was to be sought; in a word, to reform Downing-street, and recal both the Legislature and the Executive to their original and proper functions. To enter further upon this topic—prolific as it is—would lead us into a digression now for which we have no space left.

We must conclude. When the Duke of Wellington, on receiving the melancholy tidings of Sir Robert Peel's death, emphatically pronounced him to be “the most honest man” he had ever known, the world was somewhat surprised at the peculiar terms of the eulogy. We were not. We can quite understand what the Duke meant. He intended to declare that in all his course his colleague had always appeared to him perfectly single-minded and conscientious. The praise was discriminating and deserved. We fully believe that Sir Robert Peel at all times did what he thought best for the country, according to his light and the scope of his vision; that whether he walked straightly or tortuously—whether he changed or persevered—whether he led his party or deserted them, he acted in each and every case as his conscience, in its then state of enlightenment, dictated.\* He did this at the cost of much personal pain, for he was a man acutely sensitive to the opinions and feelings of those around him,—

\* It is an interesting fact, and one that has come to us on high authority, that, for many of the latter years of his life, Sir Robert was in the invariable habit, at whatever hour he returned from Downing-street or the House of Commons, of reading for half an hour in some serious or religious book, before retiring to rest. It was only by this habit, he said, that he could keep his mind calm and clear after the distractions and irritations of the day.

at once proud and sensitive. Therefore we place him morally, though perhaps not intellectually, in the very first rank of public men. Would that all had his singleness of mind, his genuine patriotism, his honesty in seeking truth, his candour and courage in avowing error!

Sir Robert Peel was a scholar, and a liberal and discerning patron of the arts. He was a man of fine and sensitive organization, and of judicious and ready benevolence. Though not social, he had many literary interests, and much elegant and cultivated taste. Possessed of immense wealth, with every source and avenue of pleasure at his command, it was no slight merit in him that he preferred to such refined enjoyment the laborious and harassing service of his country. He had his recompence. By his unblemished private character, by his unrivalled administrative ability, by his vast public services, by his unvarying moderation, he had inspired, not only England, but the world at large, with a respect and confidence such as few attain. After many fluctuations of repute, he had at length reached an eminence on which he stood—*independent of office and of party*—one of the recognised Potentates of Europe; face to face, in the evening of life, with his work and his reward; his work, to aid the progress of those principles on which, after much toil, many sacrifices, and long groping towards the light, he had at last laid a firm grasp; his guerdon, to watch their triumph and their influences. Nobler occupation man could not aspire to; sublimer power no ambition need desire; greater earthly reward, God, out of all the riches of his boundless treasury, has not to bestow.

#### ART. X.—CONTEMPORARY LITERATURE OF ENGLAND.

[Under the conviction that brief and incidental literary notices, such as have been hitherto appended to the more important portion of the “Westminster Review,” are of little value in a quarterly periodical, it has been determined to substitute for them a connected survey of the chief additions made to our literature during the preceding quarter. The foreign department of the Review, which, since the incorporation of the “Foreign Quarterly” with the “Westminster,” has been confined to notices of a few foreign publications, will also, in future, be conducted on a new plan. American, French, and German literature will be treated in separate articles of a like comprehensive character with the one on English literature. It may happen that, for various reasons, the works noticed in each article, especially in the department of foreign litera-

ture, will not fall strictly within the limits of the previous quarter; but it is intended that the entire series shall give as complete a retrospect of the course of literary production during the year as the prescribed space will allow.]

THEO. THE first of a series of papers on the *logy*. "Restoration of Belief," which we announced as forthcoming in the last number of this "Review," has made its appearance, and is, perhaps, the most important theological production of the quarter, but we need not dwell on it here, as it forms the subject of a separate article in our present number.

We are always glad to welcome controversial works, which, if not in themselves direct contributions to truth, are helpful to that freedom of investigation, "by which truth was never yet injured." On this ground, but on no other, we welcome "The Eclipse of Faith." It is a clumsy attempt to work such stiff material as Butler's "Analogy" into the form and fashion of a theological fiction. Essays and epistles, dialogues and dreams, are jumbled together in the most chaotic confusion that fact or fiction ever fell into. The various *isms* in the theological world have their representative men in the discussion, the chief of whom are an orthodox old gentleman of the evangelical school; Fellowes, a shallow, sentimental spiritualist; and Harrington, a "genuine sceptic," who neither receives Christianity nor rejects it, who neither receives nor rejects anything, who, in fact, doubts everything, and who nevertheless doubts nothing without doubting whether he does doubt! The evangelical sticks to Butler and the Bible; the spiritualist finds his hagiography in Newman, Parker, Froude, and others of that class, whom he quotes ever and anon with the most absolute deference to their opinions. Harrington takes up the cudgels against him, and, by way of intellectual recreation, offers him the alternatives of atheism or orthodoxy. He *might* have offered him the alternatives of atheism or popery; but, of course, the argument is not suffered to expand into such inconvenient dimensions. The evangelical then steps in, and contends that since every system has its difficulties, and nothing remains to the inquirer but a choice of difficulties, it is most "prudent" to make choice of orthodoxy! And its difficulties with it, of course! In other words, you are to *believe at will!* The difficulties are to be swallowed with the truths, like pills coated with sugar; but to the truthful mind this is far from satisfactory, and its attitude toward

all difficulties *as such* is scepticism, as being the least affirmative. This is well illustrated in the present work. Harrington uses Butler's argument with effect against the dogmatist, but it is pointless when directed against himself. He is committed only to truth as such, and not to a system. Consequently he cannot be pushed into a corner, for he takes care not to get within walls, and every one feels that he has the advantage over all his opponents, and is, in fact, the only one of the company, at all times, and under all circumstances, accessible to truth. For this as well as for other reasons, to be attributed to the dramatic mismanagement of the author (for it is not what he intended), Harrington engrosses the sympathy of the reader. He is the hero of the fiction, if we may so speak; he is endowed with genius, learning, wit, and earnestness; he is surrounded with books and friends, and with such an ample allowance of wealth, health, and happiness as renders his position very enviable, and his scepticism very amiable,—*the only amiable thing in the book!* The author is one of those narrow-brained men who have sufficient logical dexterity to draw sound conclusions, provided they had sufficient intuitive power to know when they have started from right data. Vain jangling, religious sterility, the want of moral purpose and of controversial courtesy are the chief characteristics of his work.

"Sermons on National Subjects," by the author of "Alton Locke," are printed as preached in the village church of Eversley. Mr. Kingsley seems to prefer, with one of his predecessors, "to speak five words with the understanding than five thousand in an unknown tongue." Above all things he must get his hearers to "mark, learn, and inwardly digest" what he says to them; and, adapting himself accordingly to their capacity and circumstances, he makes brief, homely speeches instead of "sermons;" discusses as much as he may (but not as much as he might) the dialect of divines; and speaks to men and Englishmen, and not to saints and sinners. "We English," says Parson Lot, when beginning an exhortation; but the "English" that Parson Lot alludes to in the pulpit are an elect people like the Jews, all redeemed by the blood of Christ, all christened by the waters of holy baptism; all sanctified, or going to be, by the Holy Ghost; and they constitute, Christianly, a national brotherhood—a spiritual democracy, out of which a political and social democracy will eventually be developed. Christian socialism is the germ of Christian theocracy, which means liberty,

equality, and fraternity to the people, and tithes, offerings, and supreme power to the priesthood. It has in contemplation some sweeping measures for the extinction of paupers, capitalists, and political economists, but in the meantime recognises the inviolability of the crown, the hereditary peerage, and the established church,—those three fixtures which Lord John Russell has guaranteed to survive all political change and social progress! We regard Mr. Kingsley and his brethren of the new crusade as sincere and able men; but in regard to the former, we have not been helped to this conclusion by these sermons. On the dogmatic portion of them we pass no opinion, save that he fails, with all his straining after simplicity, to make his peculiar notions intelligible either to cultivated or uncultivated minds. On those portions of them, however, which come within our own province, we must take leave to say that such transcendental extravagances are not calculated to carry conviction to any class of the community.

“The Emphatic New Testament”<sup>4</sup> is based not on an intelligent perception of the sense of the text, but on mechanical application of a theory of the Greek article advocated by the author in a former work, in which he maintains that it should be regarded chiefly as a sign of emphasis. As the common version fails to indicate this and other peculiarities in the original text, deemed to be of importance to the English reader, a uniform system of typographical notation is here employed, which promises an advantage nearly equivalent to “hearing the words in the tone in which they were spoken by our Lord and his apostles.” This is not the place for a discussion on the Greek article; but it is a sufficient objection to Mr. Taylor’s scheme when the reader finds that many of the words here emphasized according to the *rule* are not those which he would emphasize according to the *sense*; and the conclusion is, either that the theory is wrong, or that the rule was not generally observed by Greek writers. The only advantage, therefore, of the black letter and small capitals with which these pages bristle is to equip illiterate polemics, who are able to advance beyond the paper-walls of the “authorized translation” with a few wooden canons from the arsenal of Greek criticism!

A catalogue of books, which, like the “Analytical Catalogue of Mr. Chapman’s

Publications,”<sup>5</sup> is itself a book in the highest sense of the term, merits notice in this summary, as a novelty in literature, and, in this section, as a volume of substantive value to the theological inquirer. It is a *multum in parvo* cyclopædia of modern criticism and speculation in the departments of religion and philosophy; and as such, a perusal of its pages will not only give a clear and condensed idea of the range and character of the progressive literature of England, Germany, and America, but, as an outline of the works of that class in *actual circulation* in this country, it is the best possible index to the real state of opinion amongst the liberal minds in the community. Not that the works here analysed are exclusively of a theological or speculative cast; on the contrary, a considerable proportion is comprised under the heads of “History, Biography, Fiction, and Miscellanea;” but its theological contents constitute, undoubtedly, its principal recommendation. Some of the papers are carefully elaborated expositions: those on Hennell’s “Inquiry,” Strauss’ “Life of Jesus,” Atkinson and Martineau’s “Letters,” and Chapman’s “Cotton and Commerce of India,” are especially entitled to this credit.

The publication of two important botanical works,<sup>6,7</sup> illustrative of the researches conducted during recent voyages of discovery, has just been commenced under the authority of the Admiralty. One of them is devoted to an account of the flora of New Zealand. The author is Dr. Hooker, one of our younger botanists, but already eminently distinguished, and likely to take the foremost place among the systematic botanists of Europe.—He is the worthy son of an illustrious father, Sir William Jackson Hooker, through whose activity, knowledge, and public spirit, the present flourishing and truly scientific condition of the noble gardens at Kew is mainly due. Dr. Hooker accompanied Sir James Ross in his famous voyage towards the south pole, and laboured most sedulously in exploring the flora of Antarctic countries. Since then he has pursued his scientific researches as laboriously and as successfully in the far different regions of the mountains of India. This “Flora of New Zea-

land" is a portion of his Antarctic task, and, strange to say, is the only flora (using the word in the full sense) of a British colony yet issued. Without detailed descriptions and investigations of this kind executed with like science, and from as ample materials, we can never hope to become sufficiently acquainted with the vegetable productions of our dependencies. Yet through such knowledge we may assuredly hope to gain much important information, and develop resources as yet unavailable. There is a feature in Dr. Hooker's Flora highly commendable and novel in works of this kind. It is the endeavour to make his work available not only for naturalists, but also for colonists, and, without sacrificing anything of the science, to keep in view its probable utility as a local manual. The illustrations are extremely beautiful, and are executed with equal spirit and care.

The voyage of the *Herald*, the botanical results of which form the subject of the other work, was to different regions. Captain Kellett explored a great part of the west coast of America from south to north. His main purpose was to conduct a hydrographical survey. It is highly creditable to the Admiralty that they secured scientific results from this important expedition by appointing a naturalist to the ship engaged. Large and valuable collections, and observations of much interest, were made in consequence. This first part of the botany contains an account of the flora of Western Eskimaux-Land. It is drawn up, and very well done, by Mr. Seeman, the naturalist appointed to the *Herald* after the accidental death of Mr. Edmonstone, a very promising and talented youth, who had already given signs of much genius. How well the region was explored is manifested in the critical list of 242 species of flowering plants here given. Strange to say, no species entirely new was met with in this inhospitable but interesting province, which fact is a satisfactory one, as showing that our knowledge of the North Polar flora is as nearly as possible complete.

Whilst we admire the liberality of the Admiralty in promoting, by grants of money, the publication of these researches made in the public service, and are confident that in these, and, indeed, in all instances of late years they have acted wisely in doing so, we should like to see some system adopted which might enable the public to benefit more, and both authors and publishers be enabled to venture on their work with less hesitation than is often the case at present. The sale for books of this kind cannot be remunerative; consequently the price put upon them is necessarily a high one. To be done well

they require to be expensively done, for elaborate illustrations and careful drawings require both skill and time, and must be paid for. With the authors it is always a labour of love, but we think that their merits should not always go unrewarded. Although grants are given, now by the Treasury, now by the Admiralty, there is no concerted distribution, and scarcely sufficient consideration of the purposes of the grant. It is the business of no one minister to look after such matters, and is left too much to chance, boring, or favour. When the books come out, there is often no superintendence of their distribution. Copies should be sent, at the public expense, to all the principal libraries in the kingdom, so as to render the work generally consultable. Perhaps the best way to do this effectively would be for Government to subscribe for some extensive number of copies, instead of granting money in the lump, undertaking to distribute those subscribed for to public institutions only, or, if to private individuals, to those only concerned in the special scientific subjects treated of in the volumes.

One of the ablest of living teachers of botany is the energetic professor of that science in the University of Edinburgh. He has just sent forth a new manual, in the shape of a profusely illustrated "Treatise on Structural and Morphological Botany." It is very full of matter, and, at the same time, sufficiently condensed. There are many peculiarities of arrangement in this text-book, most of them advances on previous methods, and doubtless suggested by the author's extensive experience. We question, however, the propriety of separating the treatment of the organography of plants from the account of their functions and the physiology of their organs. As a purely organographical treatise, we know none equal to this by Dr. Balfour.

Among our writers on zoology, there is none who describes in clearer and more elegant language the structure and habits of animals, than Professor Rymer Jones. After a long interval and somewhat unsatisfactory delay, a second volume of his at once popular and scientific "Natural History of Animals" has appeared. It is devoted to the ever-delightful subject of the organization and proceedings of insects. It is beautifully illustrated, and excellently adapted to its purpose.

Through the well-directed arrangements of

\* "Class-Book of Botany, being an Introduction to the Study of the Vegetable Kingdom." By J. H. Balfour, M. D., F. R. S. E. Edinburgh: Adam & Charles Black.

\* "The Natural History of Animals." By Thos. Rymer Jones, F. R. S. Vol. II. London: Van Voorst.

the Society of Arts, the teaching influence of the Great Exhibition has been extended beyond the duration of that magnificent and suggestive show. At the suggestion of Prince Albert, a series of lectures on the results of the Exhibition<sup>10</sup> has been delivered before the useful association just mentioned, by men eminent in their respective departments, and familiar, through serving on the Exhibition juries, with the objects and products displayed. These lectures, of unequal merit, but all highly interesting, have been collected and published in a volume, full of instruction and information. The subjects discussed are more especially the raw products derived from the animal, vegetable, and mineral kingdoms, machinery and philosophical instruments, naval architecture, the productions of India, and the educational bearings of practical science. Each lecturer has evidently taken up his task as a labour of love, and endeavoured to do full justice to his chosen theme. There is occasionally considerable freedom of criticism, more likely to prove beneficial than profuse praise. The defects, as well as the excellences of the collections at the Crystal Palace are freely indicated, and not a few hints of value to the merchant and manufacturer are thrown out.

Among the many "commissioners" sent forth from the office of the "Times" to investigate the grievances or the progress of the British community, was one whose task was an inquiry into the comparative condition of agriculture in the principal English counties. Although the more enlightened and enterprising of our farmers are advancing in science every day, there is a large body who make but little progress, trusting to the "rule of thumb" transmitted to them by their forefathers, and, finding their profession unprosperous, raise the stale and perfectly useless cry for "protection." These men are, in most instances, almost wholly unacquainted with what is doing beyond their own immediate neighbourhood. To improve them effectually, they must be informed of what others are about, and instructed in the appreciation of improved methods. In effecting this desirable reform, the reports prepared by Mr. Caird, and now collected in an interesting and valuable volume,<sup>11</sup> will prove of some service. They present distinct and critical pictures of the ways and practices, good and bad, of farmers in most of our agricultural districts, and though occasionally liable to

the imputation of hasty, and, perhaps, slightly prejudiced judgments, based upon too limited data, are, in the main, able and practical commentaries, written in an attractive and lucid style.

"The Story of Nell Gwyn"<sup>12</sup> History and Biography. which appeared, in the course of last year, in successive numbers of the "Gentleman's Magazine," duly presents itself in an independent form, corrected and enlarged. "It must be read (says the author) as a serious truth, not as a fiction—as a biography, not as a romance. It has no other foundation than truth, and will be heard of hereafter only as it adheres to history." That it *will* be heard of hereafter there seems little reason to doubt. A dish of this nature cooked in this fashion is too rare not to be well relished. Like forbidden fruit, indelicate pictures in gilded frames generally secure a glance both from men and women. The life of a royal courtesan from the graphic pen of an accomplished antiquarian, combining the seductions of low comedy with the attractive graces of light literature, need not despair of a market. "The Story of Nell Gwyn" will find a place in royal libraries with royal biographies of a more legitimate order, with as little question as Nell herself, when glittering in her jewels, was received at Whitehall or Windsor among the proudest princesses of the realm. It would seem, indeed, that "distance lends enchantment to the view;" for though, in reality, Nell was an impudent strumpet, and only gave Burnet too much ground for calling her "the wildest creature that ever was in a court," on paper—on these pages—she is nothing short of a goddess, fascinating you with her wit and beauty as she did her paramours; coaxing you with her liberality as she did "the London Apprentices;" and even gulling you with her orthodox cant as she did the grim Puritans who patronised her as the "Protestant Mistress!" But, for all that, you cannot find it in your heart to deal harshly with the "pretty witty Nell." You laugh at her jokes, and condole with her in her sorrows; for she was not a stranger to grief, nor finally, it is said, to "repentance." But be that as it may, you cannot but admit that she had many good qualities; and you remember that, in addition to other praiseworthy public actions, she was the virtual founder of Chelsea Hospital—a deed of charity sufficient to cover all her sins, if such you have the courage to call them, for, ere you get through the story, you are well nigh convinced, with

<sup>10</sup> "Lectures on the Results of the Great Exhibition, delivered before the Society of Arts." London: Bogue.

<sup>11</sup> "English Agriculture in 1850-51." By James Caird, Esq., the "Times Commissioner." London: Longmans.

<sup>12</sup> "The Story of Nell Gwyn, and the Sayings of Charles II." Related and collected by Peter Cunningham, F.S.A. Bradbury & Evans. 1852.

the etymologists, that morals are simply *mores*, and you feel that Nell grows in interest, if not in grace, the more faithfully she represents the vices of the times. At worst, she is better than could have been expected under the circumstances, which, from first to last, victimized her. And as for the "Merry Monarch," he is a wise and witty, free and easy soul—not a bad man after all! Such is the moral atmosphere which encircles the "Story;" and, if ever its moral influence cost the author much consideration, his misgivings were hushed by the plausible excuse that "what so good a man as Archbishop Tenison did not think an unfit subject for a funeral sermon, need not be thought an unfit subject for a book."

Biography presents an inviting field to such artistic-antiquarian *littérateurs* as Mr. Cunningham or Mr. Carlyle; and it were desirable that they or other masters of the pencil would deliberately devote themselves to this work in the spirit of the old chroniclers, whose pictorial pages charm the reader into the conviction that literature, in this department, has lost ground which it must now seek to recover. Tempted by this obvious necessity, writers of an inferior order are hurrying with successive heroes into the book-market, whence they get puffed off into the circulating libraries. It would appear to be some speculation of this sort which stimulates the prolific pen of Mr. Hepworth Dixon, who promises to be the father of a biographical progeny too numerous to be all decently accounted for. His "John Howard," and "William Penn," are still among "new publications," when "Robert Blake,"<sup>13</sup> is announced as "now ready." The merits of his last production are trumpeted by the author himself in a tone which seems to say, "Here you have it at last. I am the first to write the life of one of England's greatest men." Mr. Dixon does not appear to see that the reason why no adequate biography of Blake exists is owing to that very greatness which secured for the hero so conspicuous a place in history, that nothing seemed left for the biographer to add. Like the poet who writes his life in his poetry, Blake wrote his in his public actions. Other men have done the same, and yet have had an inner life quietly growing out of their individuality, to which individual portraiture alone could do justice. But Blake had little individuality; he was simply an Englishman; his whole personal history mingles itself organically with the history of his country; and Mr.

Dixon with "family and state papers" in his possession, and after "rausacking every nook and corner for anecdotes," can furnish nothing more than a *history* of those battles and public events in which Blake had a share. Yet he writes as if he had discovered that his hero has been a neglected man, whom it has been his good fortune to rescue from impending oblivion! The founder of England's naval greatness, who occupies, perhaps, the proudest place in her annals, and who lives in song as the compeer of the "mighty Nelson," seems, by our author's talk, to have hitherto loomed in the mist of popular ignorance, and like a mythic demigod, to have been "thus far chiefly known by a *few heroic outlines*," waiting along with other "spirits in prison," till Mr. Hepworth Dixon's magic pen should "recover a more distinct image of the Puritan Seaking," and awaken his ungrateful countrymen to a "better appreciation of the more moderate men of our revolutionary era!" Should some useless documents fall in his way about Cromwell, we shall be favoured next with an attempt to get up a "better appreciation" of old Noll. At present, however, the documents seem to decide in favour of "the more moderate men," who will now be jumping from the press as thick as the Greeks from the Trojan horse!

The "Life of Dr. John Reid,"<sup>14</sup> by the author of the "Life of Cavendish," can interest none beyond the circle of Dr. Reid's family and friends, unless a digressional lecture on physiology, or a dissertation on cruelty to animals, or a "full and particular account" of what is commonly termed a case of "death-bed repentance," recommend it respectively to students, to hacks hunting up matter for prize essays, or to those who regard "a good conversion" and "a good murder" as alike sweet and savoury reading. Whether it arise from the character of the materials placed in the author's hands, or from his own sense of what would form an appropriate selection, or both, is not explained, but to us it does seem incongruous that the centre of interest in a scientific biography should be found in the exposition of theological dogmas, and in the anatomy of religious experiences, which, though they happened to be among the circumstances of Dr. Reid's closing career, had no place in the developments of his life, and little or none in the constitution of his nature. Attacked by a fatal disease, he was led, as a man under sentence of death, to make his peace with God in the shortest

<sup>13</sup> "Robert Blake: Admiral and General at Sea." By Hepworth Dixon. Chapman & Hall. 1852.

<sup>14</sup> "Life of Dr. John Reid." By George Wilson, M.D. Sutherland & Knox. 1852.

and easiest way within his reach; but, without questioning the reality of his feelings, we may be permitted to question the propriety, under such circumstances, of obtruding them so prominently as is done here. In reference to the disease which prematurely ended his days, it was no doubt a striking coincidence that he should suffer the greatest pain in those nerves upon whose functions his experiments had thrown the most light, and it was pardonable for Dr. Reid himself to refer to this as a "judgment" for the suffering he had inflicted by his experiments on the lower animals; but (whether viewed in reference to the character of the Deity, or the unavoidable conditions of scientific investigation,) it is discreditable to Dr. Wilson, either as a Christian or as a philosopher, to echo the morbid, and, we trust, momentary feeling of the sufferer, admitting, as he does, at the same time, that not only was wanton cruelty abhorrent to his friend's disposition, but that pain was always as much minimized as was consistent with the object in view. Had this book been one of the issues (as in its present form it ought to have been) of the Religious Tract Society, it would not have been amenable to secular criticism; but a work which professes to be "a tribute to the memory of a great anatomist and physiologist, from the pen of a chemist," and which, under that guise, turns out to be a theological prescription from the pen of a spiritual apothecary, cannot be allowed to pass through our hands without censure.

Those who are in the habit of measuring the merits of a book by the quantity of type employed in heralding its advent have been anticipating that the promised six-volume "Autobiography of William Jerdan"<sup>10</sup> was about to create a sensation in the literary world; and, along with others, we had been flattered into the hope that, from his past position, he would have had at least something interesting to communicate, if nothing important to reveal; but in regard to this first volume, it is enough to say that its matter is too dull to repay perusal, and its style too loose to merit criticism. Mr. Jerdan seems to have pledged himself to turn out the six volumes before he had well considered where the materials were to be found or whether they were to be found at all; and only makes the discovery, after putting pen to paper, that they "were dissipated no one knew whither!" With this disappointment, and the interruptions which his inexperience had not taken into calculation, he fears

that he has patched up but a poor story, and penitently commends himself and his labours to the "candour of the critic, and the indulgence of the public!"

The career of royalty seems to be abandoning history for biography, and bids fair to absorb as large a space of the one as it used to do of the other. Miss Pardoe contributes another royal biography in the "Life of Marie de Medicis,"<sup>11</sup> and Mr. Urquhart a semi-royal one in the "Life and Times of Francesco Sforza."<sup>12</sup> The former is a work of considerable research, written in a style of vivacious, but somewhat inflated eloquence. The latter is merely an adapted translation from the *Rerum Italicarum Scriptores*, a source of information already exhausted by Sismondi. Sforza was a brave *condottiere*, or military adventurer, who, from being the son of a peasant of Romagna, rose to sovereign power in one of the most important states of Italy; but he by no means occupied the place in Italian history which is here assigned to him. With America before his eyes, too, why should Mr. Urquhart draw from the successes and crimes of such Napoleonic men as Sforza the indiscriminating conclusion that local self-government is inimical to civil liberty?

Kennedy's "Modern Poets and Poetry of Spain,"<sup>13</sup> as relating to men who all, with only one exception, lived within the present century, is supplementary to Sismondi and Ticknor, as well as to the excellent compendium published by the Messrs. Chambers. The volume is devoted to twelve leading poets,—being more than usually copious in its biographical sketches and poetical illustrations. The author has had the best opportunities of familiarizing himself with Spanish literature, and manifests an accurate acquaintance with his subject; but we cannot compliment him upon his skill in English versification.

The commercial value of a book influences so unconsciously the popular estimate of its intrinsic merits, that Michaud's "History of the Crusades"<sup>14</sup> is, for a time, in some danger of depreciation in consequence of being introduced to the English public through the medium of a cheap (but excellent) translation. Though it has always enjoyed the reputation,

<sup>10</sup> "The Life of Marie de Medicis." By Miss Pardoe. 3 vols. Colburn & Co. 1852.

<sup>11</sup> "The Life and Times of Francesco Sforza, Duke of Milan." By W. P. Urquhart. 2 vols. Blackwood. 1852.

<sup>12</sup> "Modern Poets and Poetry of Spain." By James Kennedy. Longmans. 1852.

<sup>13</sup> "Michaud's History of the Crusades." Translated by W. Robson. 3 vols. Routledge & Co. 1852.

<sup>14</sup> "The Autobiography of William Jerdan." Vol. I. Hall, Virtue & Co. 1852.

among scholars, of being a standard work in historical science, and of being the best ever written on the Crusades, it is comparatively unknown in this country, owing, we have no doubt, to the mistaken impression which prevails that it is unnecessary to translate works which are already accessible in a language so generally cultivated as French. The comparatively limited number of French or foreign books imported should dispel every delusion of this kind from the minds both of publishers and the public. Michaud was a predecessor in the field of history, journalism, and public life, of such as Guizot, Louis Blanc, and Thiers. To his history of the Crusades he devoted the best twenty years of his life,—thus joining to the vivacity of the Frenchman the laborious industry of the German, and furnishing an enduring contribution to the literature of Europe.

Another translation from the French fills up a blank (though not a felt one) in our historical literature with Bungener's "History of the Council of Trent,"<sup>10</sup> a reliable and (considering the subject) a readable work, originally called into being as an antidote to the proposed celebration in 1845 of the three hundredth anniversary of the Council, and now sent forth in an English dress more from polemical than literary motives. We think it highly desirable that the public should be furnished with such accessible means of information respecting ecclesiastical intolerance, provided the design were impartially executed. A history like this is, no doubt, a powerful argument against popery; but we fear that Protestantism is equally liable to be damaged when assailed, in similar style, by the accusations of history.

Sir John Davis' new work on China<sup>11</sup> forms an interesting supplementary chapter to the history of the Chinese war. The first volume, indeed, professes to be a "Chinese History," composed from secret state papers captured during the war, and translated by Dr. Gutzlaff; but the integrity with which it has been edited, and the accuracy with which it represents Chinese opinion, may be inferred from the character which it gives of the war: "At no time (says this 'Chinese History') was the traffic deserving of the full load of infamy with which many were disposed to heap it, for at the most it only supplied the poison which the Chinese were not obliged to take." After this manner these "native documents" are done into English! Instead of allowing these papers to give the *Chinese*

side of the story, which he professes to do, the only use which the editor makes of them is to make the case stronger against their authors. In the second volume, Sir John gives *his own* history of the peace; and here, again, the candour and impartiality of the historian may be estimated from the charge made against the Chinese government, that, after it had been forced to tolerate the traffic, "it was not sufficiently honest (!) to make a public avowal of this change in its system." Appended to this diplomatic version of the diplomatist's own diplomatic transactions are some interesting particulars of the origin and causes of the present rebellion in the south. It will not surprise him if the revolt prove successful. The concluding chapters are occupied with suggestive observations on the trade of Japan and the Indo-Chinese nations. The recent American expedition to Japan is evidently regarded by Sir John as a lucky hit on the part of that government. "Nothing important is likely to be gained by mere negotiation;" and if the American armament be insufficient to carry out strong measures, "it may lead to something farther from either the same or some other quarter." "First come first served" is the law of conquest; and now that England is helping itself to Burmah, and America to Japan, why should Russia hesitate to march its hordes over the "great wall" and annex the Celestial Empire to its Asiatic frontier?

When narratives from Criminal Trials are well selected and well told, so as to combine (as they must almost necessarily do) the liveliness of fiction with the impressiveness of fact, they form a valuable contribution to the stock of "readable books." In this respect Mr. Burton's recent volumes<sup>12</sup> have not quite answered our expectations. Though evincing, at the outset, a clear perception of the source of interest in such disclosures, he has failed to make a practical use of that perception in the construction of his work. It certainly develops some "remarkable social conditions," and throws light on some of "the secret impulses" of historical events; and so far, perhaps, it answers the purpose for which it was published. But had that purpose been more simple, the effect would have been more striking. Such a work should have been essentially dramatic; and though this kind of composition is not the author's forte, the defect would have been obviated, had he simply selected from the rich resources at his command what was *good* rather than what was *new*—had he, in short, been less of the mere antiquarian, and more of the chronicler. But instead of doing this, or of confining him-

<sup>10</sup> "History of the Council of Trent." From the French of L. F. Bungener. Edinburgh: Constable & Co. 1852.

<sup>11</sup> "China during the War, and since the Peace." By J. F. Davis. 2 vols. Longman. 1852.

<sup>12</sup> "Narratives from Criminal Trials in Scotland." By J. H. Burton. 2 vols. Chapman & Hall. 1852.

self either to what would have historical value, or to what would have popular effect, he bends the narrative now toward the one purpose, and now toward the other, thereby divesting it of that unity, continuity, and proportion which a straightforward tale naturally falls into, when left to take its own course. It gives us pleasure, nevertheless, to recognise the industry and ingenuity everywhere conspicuous in these volumes, and to express our high estimate of the historical elucidations which constitute their chief object and their real value.

The profound and elaborate metaphysical essays which have appeared from time to time in the "Edinburgh Review," from the pen of Sir William Hamilton, are now, with other matter, republished in a compact volume,<sup>22</sup> which will prove to many a student a rich store of philosophical observation, as well as a valuable intellectual discipline. A book so brimful as this of deep and varied learning, accurate scholarship, keen insight, and logical acumen, looks now-a-days like a miracle in literature. And we venture to hope that though, on their first appearance, some of these articles were hardly understood, and even pronounced incomprehensible, they will now be as highly prized in England as they have all along been in France, Germany, and America—if indeed they do not come to be regarded as singularly clear expositions of the most intricate questions which can exercise the human mind. Sir William has a peculiar fancy for stowing away his freshly-accumulated stores of information in notes, appendixes, and addenda, which form oceans and continents of independent dissertation. In these additional criticisms, while superfluously vindicating his own, he makes havoc of several respectable reputations, which will render them more cautious in running a tilt half-equipped against such a formidable antagonist.

Side by side with the philosophical papers of the Edinburgh professor, Dr. Whewell's prelections on the "History of Moral Philosophy in England"<sup>23</sup> appear to great disadvantage, not only in point of learning and logic, but still more as regards the grasp with which he lays hold of his subject, and the enthusiasm which he throws into the discussion. These lectures exhibit every indication, as they certainly possess nothing more than the merit, of being mere compilations of a very dull description. In a dry, sluggish, frigid style,

and in a form somewhat like a compromise between a commentary and a *catalogue raisonnée*, he reviews the principal ethical writers, from William Perkins, the puritanical casuist, to Jeremy Bentham, the utilitarian philosopher, to the latter of whom he devotes the six concluding lectures of the course. Though generally candid and courteous in his treatment of those from whom he differs in opinion, his antipathy towards Bentham betrays itself by dragging into the discussion of his sentiments some biographical facts touching the philosopher's intellectual infirmities, which would have the effect of exciting prejudice against his system. To counteract the influence of utilitarianism in England, and especially to effect its expurgation from his own university, seems to be the special mission of the Master of Trinity—with small advantage to ethical progress, either in theory or practice, if his own muddled system be all that he has to offer in its place.

But it is of little consequence. Paley, Bentham, and Whewell, are now each and all superseded. A second Newton—a greater than Newton has appeared!<sup>24</sup> The great primal law of the moral world has been discovered! Mr. Doubleday calmly divulges the mighty secret; he professes to reveal the name and nature of that law which holds the same place in "Mundane Moral Government" that gravitation holds in "Mundane Material Government." What can Mr. Doubleday mean? Has he considered what such a discovery involves! The law of progress and social harmony—is he ready with a doctrine which will explain it, and with a formula which will apply it? Has an eternal basis been found, at length, for social science, and does Mr. Doubleday expound its Principia? Shall we now be able to bring its rules to bear upon the tumultuous passions of human life, and direct them along the path of progress, as we now direct the locomotive along the line, or electricity along the wire? For if mind be subject to laws at all, their clear discovery and right application will yield up the moral world to our control as truly as the discovery and right application of the physical laws are daily extending our empire over matter. Chaos reigns over social life only by the aid of ignorance; and if this book be true to its profession, it gives to science the power of achieving its birthright, and hands over human destiny to human providence! What, then, is the astounding discovery which is here put forth as the counterpart of gravitation? We cannot help the bathos of the

<sup>22</sup> "Discussions on Philosophy and Literature, Education and University Reform." By Sir W. Hamilton. Longman. 1852.

<sup>23</sup> "Lectures on the History of Moral Philosophy in England." By W. Whewell, D.D. J. W. Parker. 1852.

<sup>24</sup> "On Mundane Moral Government, demonstrating its Analogy with the System of Material Government." By Thomas Doubleday. Blackwood. 1852.

reply:—"EXCITEMENT," says Mr. Doubleday, is the law of progress! Fancy Sir Isaac Newton dazzling the world with the discovery that MOVEMENT is the law of motion! "Excitement" is the steam-power of the social world—a discovery in social science equivalent to what was made in physical science, when (not when Newton discovered gravitation, nor when Watt applied his knowledge of the laws of steam to the construction of a steam-engine, but when—) it was perceived that steam was a powerful agency! Mr. Doubleday is an ingenious writer, but he is neither a Newton nor a Watt. He is the author of some valuable books, but, in the present instance, his theory is based on a ridiculous mistake, which, along with some others equally absurd, it would be easy to point out at greater length, were it either worth while, or would our space admit of it.

Mr. Pashley's work on "Pauperism and the Poor Laws"<sup>26</sup> begins with an inquiry, statistically, into the state of pauperism, as it now exists; then traces, historically, the progress of pauper legislation from the time that England became a portion of Christendom to the present day; after which it examines, controversially, the various remedies put forth by poor-law reformers; concluding with the author's own proposal, "that the law of settlement be wholly repealed; that the various provisions for raising and administering relief be consolidated into one statute; that the yearly sum needed for such relief continue to be raised by parochial rates on real property; that two-thirds of this sum be raised by a pound-rate equal throughout the whole country; and the remainder by a further pound-rate, raising in every parish a sum equal to one-third of the actual expenditure of such parish."

Though law does not, in our minds, or in the programme of this summary, associate itself with literature, yet as a work intended for the public as well as for the profession, and as a sample, moreover, of that Johnsonian industry which Mr. Carlyle longs to behold in these "latter days," we beg to notify to our commercial readers the completion of Leone Levi's work on "Commercial law,"<sup>27</sup> in which all the laws relating to commerce which have been sanctioned by the usages or statutes of all the commercial nations of the earth, are collected, analyzed, arranged, and compared; presenting in separate columns, and in a condensed form, their agreement or disagreement with each other, forming a sort

of commercial polyglott, or cyclopedia of mercantile jurisprudence, as serviceable for reference as a dictionary or an almanac. Obviously of great use to lawyers and legislators, mariners, and merchants.

Mr. Laing's "Denmark and the Duchies,"<sup>28</sup> exhibits the author's usual shrewdness and tact; though his "observations" do not always impress us either with their depth or impartiality. Few men, upon the whole, are better qualified to give a well-informed opinion upon the condition-of-Europe question, or to urge it with more force, directness, and independence; but we should wish to see more of the discrimination of the judge, and less of the warmth of the advocate—more of the comprehensiveness of the historian, and less of the iteration of the pamphleteer, ere we can place that reliance on his conclusions which would otherwise be due to so intelligent a traveller. Previous to setting out on his late tour, Mr. Laing seems to have been so far prepossessed with some plausible, but exaggerated theories on continental questions, that his mission assumed the aspect less of a calm and cautious inquiry than an eager canvass for proof cases in support of foregone conclusions. That of late years literature has been fraternizing with democracy, and that the "dangerous classes" of the continent are the alumni of the public schools, and the ornaments of the universities, is pretty well known; but it was reserved for Mr. Laing to bring against the literati of Europe the sweeping charge of having, for nearly half a century, cherished the conviction that political power was destined to fall into their hands, and of having aimed to give this corporate conviction such a shape that it would possess the unity and force of an organized conspiracy! Their ambition, it seems, was to establish a literary hierarchy, which should be as omnipotent in the nineteenth century as the Romish hierarchy was in the middle ages. The professors and schoolmasters were the principal promoters of the scheme; the machinery of public instruction was traitorously employed in educating the young into the grand idea; and with such subtlety was it managed, that even princes and potentates were led into the snare. At length the vision began to be partly realized, and to be acted out on the stage of history. First came the Frankfort farce, and then followed the comic-tragedy of the Schleswig-Holstein war. The battle of Idstedt broke the back of literature as an aspirant after political power; and on that account Mr. Laing

<sup>26</sup> "Pauperism and the Poor Laws." By Robert Pashley, Q. C. Longman. 1852.

<sup>27</sup> "Commercial Law, its Principles and Administration, &c. &c." By Leone Levi. Vol. II. Bennet & Co. 1852.

<sup>28</sup> "Observations on the Social and Political State of Denmark, and the Duchies of Sleswick and Holstein in 1851." By Samuel Laing. Longman. 1851.

considers that "in the future history of Europe the results of this battle will be considered by the philosophic historian more important than those of Waterloo for the social state of the continent." Possibly it may, and Idstedt may absolutely be the Armageddon of the Apocalypse; but whether either Idstedt or Waterloo will ultimately rank highest among the "decisive battles of the world" must be left for the future developments of destiny to determine. We commend the volume to our readers as one of great suggestiveness—a characteristic which is to be attributed to the happy faculty which the author possesses of viewing foreign objects from an English stand-point—not so as to see them in an English dress, which would create confusion, but with English eyes, which brings out those clear contrasts that help to impress the picture more vividly upon the mind. Denmark he visited as an ancestral home—a prepossession which opened up to him quite a fresh field of observation, the striking effect of which may be seen in the comparison between Edinburgh and Copenhagen, as well as between Scotland and Denmark generally. Inquiries so ingeniously conducted would soon furnish important contributions to comparative sociology.

The "public subjects" relative to the United States which are discussed in Mr. Tremmenheere's "Notes,"<sup>29</sup> are education, railways, water-supply, the ballot, and the press. On the first subject he considers that his inquiries into the public-school system warrant him to affirm "that the theory on which it is based—namely, that the religious instruction which is not given in the day-schools is given in the Sunday-schools—is not supported by facts, in reference to a large proportion of the labouring population;" and "that the injurious consequences of separating religious from secular instruction are becoming evident to some of the most observant persons and the most zealous supporters of popular education." Who are those "observant persons," and what sort of schools do they wish? They are high-church clergy, and they wish high-church schools. "I have heard the most earnest desires expressed by many clergy of the New England States, &c., for the establishment of such [denominational] schools." The "Bishop of Massachusetts" stated that "he should undoubtedly prefer, in the interests of religion, parochial schools." "Some of the principal clergy of the church of England in New York (!) are exerting themselves with that

object." "The Bishop of Pennsylvania is anxious, for the same reasons, for the establishment of similar schools." Mr. Tremmenheere visited Lowell, celebrated through the civilized world for its educational machinery, and there took the deposition of the Rev. Dr. Edson, Rector of St. Anne's, from which it appears that the intelligent young Lowellites show "great ignorance of the Bible, which they profess to take as their guide." Their ignorance is not attributed to the influence of scepticism: they are clearly sheep without a shepherd. "I find many not only unable to repeat any of the ten commandments, but entirely unaware of there being any ten commandments at all." As Dr. Edson speaks of his "frequent intercourse" with these young people "as a pastor," we are led to suppose that they belong to the worthy rector's own flock! He rebukes himself when he adds, in reference to the Irish population (who are now generally held accountable for all the statistical paganism and poverty with which we are afflicted), that they "are well looked after by their priests, and that nearly the whole of them attend some Sunday or other catechetical instruction." Mr. Tremmenheere concludes that the public-school system is something very frightful, and that we should pause before we commit ourselves to it in this country. Our readers can estimate for themselves the worth of this counsel, and of the author's reliability as a reporter of public opinion in America.\*

While the current of public excitement continues to flow so strongly toward the new El Dorado, a work on "Our Antipodes,"<sup>30</sup> by Colonel Mundy, very opportunely makes its appearance; and, at the present moment, the popularity which, under any circumstances, these volumes would have won, will be augmented by the "glimpse" afforded of the gold-fields, to which the author paid a hurried visit on the eve of embarkation for England, in August last. But, though thus seasonably apprised

\* Speaking of our English institutions as conservators of Christian courtesy, he remarks: "The ultra-democratic theory of social and political life, which so unduly exalts the individual, is at variance with every precept of Christian humility. 'In lowliness of mind let each esteem other better than themselves.' 'In honour preferring one another.' 'Put on humbleness of mind, meekness,' 'Be courteous.' I must add that I was occasionally reminded of these passages, during my stay in the United States, and sometimes also in remote corners of Canada." But never, we presume, in aristocratic England!

<sup>30</sup> "Our Antipodes; or, Residence and Rambles in the Australian Colonies, with a Glimpse of the Gold Fields." By Lieut.-Colonel Mundy. 3 vols. Bentley. 1852.

<sup>29</sup> "Notes on Public Subjects, made during a Tour in the United States and in Canada." By H. S. Tremmenheere. Murray. 1852.

of the discovery, and conscious of the revolution which it will create in the colony, no indication is given of such an impression until the close of the work, which would consequently seem to have been prepared for the press before the golden news came to change the course and colour of all his previous anticipations. It has now, therefore, less reference to Australia as it is than to Australia as it was—twelve months ago; but this does not, in our judgment, detract from its value as a historical register of events as they happened and of impressions as they were formed at the time. And if our readers feel inclined to accompany the colonel in his antipodal excursions, they will find themselves in the company of a gentleman of equal intelligence and politeness, whose rank gives him the power, as his obliging nature gives him the disposition, to introduce them to all grades of colonial society—to all aspects of colonial life—and to nearly all varieties of colonial scenery. For, though in the spirit of a conscientious public officer he craves the reader to consider him “as part and parcel of his office-desk, plodding through returns and reports, records and regulations, warrants and articles of war,” he is an “excellent whip,” and enjoys long excursions into the interior, telling stories by the way, or detailing his views on emigration, transportation, and such topics as come within the range of colonial discussion. Whatever the topic, he is always well-informed, generally lively, and occasionally humorous. Although Colonel Mundy intends his volumes as “a light work,” he has the manliness to state that he has shunned neither “trouble nor care” to render it worthy of public favour.

As a nation of civilized tea-drinkers like ourselves, the Chinese are the most curious people out of Christendom; and a “Journey to the Tea-Countries,”<sup>1</sup> with well-authenticated information about the culture of the tea-plant, is to an Englishman only inferior in interest to the latest report from the gold-regions of Australia. Mr. Fortune’s book widens, in a general way, the geographical horizon, but it does not add anything important to the stock of Chinese facts previously accumulated. As an ambassador not to Peking but to Sung-lo and the Bohea mountains, nature had more attractions for our author than society. To get good tea-plants was his first object; to increase his acquaintance with, and, if possible, enlarge the contents of the “Flora Sinensis” was his second;

<sup>1</sup> “A Journey to the Tea-Countries of China.” By Robert Fortune. Murray. 1852.

and to get a view from some hill-top of a landscape that would remind him of his own highland home was his third. So far he was perfectly successful. In reference to his narrative, he says, “My object is to give a peep into the Celestial empire, to show its strange hills and romantic valleys, its rivers and canals, its natural productions, whether in the field, on the hill-side, or in the garden, and its strange and interesting people, as they were seen by me in their every-day life.” This promise is well fulfilled. It is truly a book of nature. Throughout the volume he never loses an opportunity of describing, as, throughout his journey, he never lost an opportunity of examining, all the gardens and floral phenomena that came in his way. His style is lively and picturesque; and his remarks evince shrewdness and good sense. His observations on tea-cultivation in India hold out encouraging prospects both for that country and our own. He is opposed to its cultivation in Australia—now turning its hills to better account; but the objections which he urges against its introduction into America should be read in connexion with Mr. Bonyng’s book on the same subject, for a notice of which we refer the reader to the section on American Literature.

Neale’s “Residence in Siam,”<sup>2</sup> forming one of the volumes of the “National Illustrated Library,” does no credit either to the author or the publishers. None to the author, for, in anticipation of the only possible verdict which his work must receive from honourable criticism, he states, in “self-defence,” that, at the period of his visit to that country, he was “quite young both in years and understanding,” and has accordingly composed his narrative with what he calls “the steel pen of modern authorship”—an inclusive crimination, which, in his own case, should have been supplemented with “the scissors and paste of modern book-making.” On the other hand, the “Illustrated London Library,” another series issuing from the same house, has made an auspicious commencement with Bonomi’s “Nineveh and its Palaces.”<sup>3</sup> This is a book of sterling worth, beautifully and profusely illustrated, substantially got up, and remarkably cheap. It brings up the report of the latest proceedings and discoveries to within a fortnight of the day of publication, the last item of intelligence being taken from the “Literary Gazette” of the 18th of March last, while the work itself was in our hands about a week after. If the succeeding volumes of this

<sup>2</sup> “Narrative of a Residence in Siam.” By F. A. Neale. “National Illustrated Library.”

<sup>3</sup> “Nineveh and its Palaces.” By Joseph Bonomi. “London Illustrated Library.”

series prove as reputable as the first, its projectors will secure an enduring public appreciation of such a well-directed effort to bring the best books within reach of the greatest number—pre-eminently one of the most important enterprises of the age!

Though carelessly designed, and hastily executed, "Adam Graeme of Mossgray,"<sup>10</sup> gives evidence of qualities as rare as they are essential in works of this class. The material is drawn fresh from nature and social life; the descriptive sketches are easy, natural, and life-like; the style is rich and rhythmical; while the tone is at once tender and humorous—a characteristic feature of any tale, which, like this, truthfully depicts "the lights and shadows of Scottish life," and in which the native dialect is introduced in its native purity. The Scottish tale, indeed, is the species of fiction best suited to the author's genius, which is more lyrical than epical, more creative than constructive. One source of the faults of the present work is the inconsiderate attempt to spin out the materials of a short and simple tale into the length, breadth, and thickness of the conventional three-volume novel, and even to eke out the deficiency by piecing it at both ends with an autobiography which harmonizes neither in form nor spirit with the main design. For it is not Adam Graeme, but Helen Buchanan, that is really the prominent figure in the picture; and it is only that portion of it which finds in her its vital centre that is marked either by symmetry of arrangement, or by dramatic power in the development of the story. When it is remembered (as it is invariably felt) that, in a fiction, time is reckoned by pages, the re-appearance of Adam Graeme in the second book (after he had all but recorded his own death in the first) and his prolonged existence through successive generations, give him a ghostly antediluvian aspect which removes him out of the reach of our sympathy. This might have been avoided by making an episode of the autobiography, or, at least, of its essential points, in the body of the tale. As it is, the reader feels that two good tales, or what might have been two good tales, have been jumbled into one, which coheres so badly, that one skilled in what is called the higher criticism would find little difficulty in making a divarication which of the one would make two again! And for no other reason that we can see, than by way of apology for this want of dramatic unity, a local unity is given to the unshapely narrative by

a supplementary title which gives the credit of its odds and ends to the "Chronicles of the Borough of Fendie." Some of the characters are remarkably well developed. Helen Buchanan and Hope Oswald are never to be forgotten. William Oswald is intended to be a hero, and is described as such; but his heroism is mere matter of report, and we fail, therefore, to see the ground of Helen's devotion to him. Her own career is an illustration of the "gentlewoman born," sustaining the contest of inherent worth against the conventionalisms and caste-distinctions of social life. On the other hand, Adam Graeme's career is intended to show that "resolutions are made only to be broken," and no higher moral purpose is there in it. The moral confusion, indeed, detracts seriously from the merits of the work, and is due partly to the want of concentration in the narrative, and partly to the conflicting currents of moral sentiment in the author's views. Retribution overtakes the false ones; but the iniquities of the fathers are *not* visited upon the children. Its operations, however, are capricious. Lillias and others atone in their own persons for their early errors; but George Oswald—the man who injured Helen Buchanan's father—remains to the last "an elder of the kirk," and a prosperous man of business. To be sure his son weds the injured man's daughter, but the same poetical justice should have arranged a similar compensation between the children of Charlie Graeme and Lucy Murray. It was surely not so difficult to get Halbert Graeme appropriately disposed of, that he must be allowed to settle down, like his uncle, into a perpetual bachelorship.

In the "School for Fathers,"<sup>11</sup> there is a very successful attempt to depict the town and country manners, and town and country gentlemen of the eighteenth century. The reader is carried back to the old times and old ways of old England, "when fox-hunters were fox-hunters, when fox-hunting was their life, and they were a race apart." The structure of the story is very simple, as an "old English story" ought to be. Jack Warren has been brought up to fox-hunting as a sort of profession, and has just reached man's estate when his father, a pompous, pedantic baronet, returns from abroad, and has his son and heir up to town to be manufactured by French tutors, French tailors, French perruquiers, and French dancing-masters into "a statesman and fine gentleman." Jack does his best, but his best is not very bright. The more he tries to improve, the more his misfortunes multiply, till at last, in compliance

<sup>10</sup> "The Memoirs and Resolutions of Adam Graeme, of Mossgray, including some Chronicles of the Borough of Fendie." By the Author of "Margaret Maitland." 3 vols. Colburn & Co. 1852.

<sup>11</sup> "The School for Fathers: an Old English Story." By T. Gwyn. Smith, Elder & Co. 1852.

with the rules of etiquette, he accepts a challenge to fight a duel, and falls, mortally wounded. Two or three duels had been contemplated by the old gentleman, as an essential part of his son's education, but, of course, without anticipating the possible issue. Sir Thomas Warren is by no means an exaggerated type of the Frenchified, frivolous fool of fashion into which the courtly cavalier had degenerated at the date of this story. Nor is Jack a caricature of the fox-hunter of that period, though his jolly, red-faced, good-hearted uncle, the "Squire," is a more authentic representative of the full-grown old country gentleman. The contrast between Sir Thomas and his son, though not too wide, is too uniform. Each exhibits a characteristic phase;—that is developed fully, and becomes unreal because too nakedly individualised, and appearing, on that account, too intensified and inflexible. Sir Thomas *never* relaxes the daily torture to which he subjects his victim, and Jack's rough and ready address *never* takes on the slightest polish. The former is nothing but an incarnation of petulance and peevishness, and the latter of mere blundering boorishness. A father who had been so long neglectful of his son was not likely all of a sudden to apply himself so pertinaciously to his improvement; and a lad who was clever enough to be foremost in the chase, and romantic enough to write love-letters to the parson's pretty little daughter, might have managed, once or twice in his life, to be both manly and polite. Jack is an expansion of the "bashful man," and, as such, the portrait answers to reality; but Mr. Gwyn has not met with the reality itself, else he would know that those who labour under that infirmity do *sometimes* acquit themselves very creditably.

The author of the "Lily of St. Paul's"<sup>28</sup> has every qualification for writing fiction save the essential genius for the work! He draws his outline, and fills it up with almost geometrical precision. The *dramatis personæ* are carefully selected; their costume is accurately adjusted; and their whole appearance, from "top to toe," minutely described. They play their respective parts very appropriately, and take their turn in conversation very punctually. They are never guilty of making grammatical blunders, and they are equally guiltless of making tedious speeches. The plot is skillfully arranged, and opens out with slow and progressive pace, like a panorama. It

is very stale, however; and equally stale are the incidents which it enucleates. We have read the whole with unusual care, but neither the historical nor fictitious characters have left upon our mind any distinct impression of their individuality. They are dim, bloodless, colourless shadows. They do not live: they are hardly even visible. The "Lily," although the heroine of the story, and apparently a very interesting creature, has not sufficient self-development to win our sympathy or admiration. Gaunt only suggests that Sir Walter Scott would have given him a soul and body that would not have vanished so easily from our recollection. We have been through Gaunt's palace, but can give no account of it. Dr. Wicliffe seems to have his antitype in Dr. Croly, or Dr. Cumming. The story belongs to the fifteenth century, but fails to carry the imagination so far back. It is the production of a conventionalized mechanical mind, which has neither the wizard power of raising the dead, nor the artist power of giving birth to new creations, and does not promise, therefore, to achieve high success in the field of fiction.

Whoever can dramatise with effect what has come within his own observation or experience, is almost sure to be a popular and useful writer; but when he essays to delineate aspects of society in which he has never mingled, or phases of life through which he has never passed, nothing but failure can be the result. Such is the case with "Castle Deloraine."<sup>29</sup> It is an attempt to describe aristocratic life by a lady who evidently never breathed an aristocratic atmosphere, but who imagines that middle-class ladies and gentlemen can be passed off as peers and peeresses by ticketing them with titles, and assigning them a residence in Belgravia. My Lord Deloraine must at one time have been a shopkeeper. His son Harry we should take to be a draper's assistant, and Conyers we could fancy to be an attorney's clerk, while the Honourable Frederic Fitzakerly is a species of animal vulgarly called a gent! Ellen Maynard is intended to be the embodiment of a high ideal of intellect and art, but we have a dissection of her rather than a portrait. Miss Smith should have used her knowledge of human nature as an artist, in giving naturalness to the story, instead of exhibiting it as a moral anatomist in diaries and dissertations. Hartwell's long monologues on the social and political questions of the day are equally out of place in a fiction, which ought to dramatize *life*, not *opinion*.

ART. XI.—CONTEMPORARY LITERATURE  
OF AMERICA.

In a neat little volume bearing the unpretending title of "Lectures and Miscellanies, by Henry James," thoughtful inquirers will find some very original and profound speculations on the fundamental questions of religious philosophy. We first became acquainted with this writer in the pages of the "Massachusetts Quarterly Review," which contained an article from his pen on the "Divine Man," subsequently reprinted in his work called "Moralism and Christianity." But he was obviously of a different school, and of a different turn of mind from the conductors of that journal—evincing a stronger sympathy with the sentiments of Swedenborg than with New England transcendentalism. Rejecting on *a priori* grounds the Baron's claims to a supernatural revelation, and repudiating as mere ecclesiastical quackery the attempt to make him the founder of a sect, he finds in the main principles of his philosophy the key which opens the book of life. Though occupying pretty nearly Swedenborg's point of view, he establishes himself on a more scientific basis, and evinces no less strength of understanding than depth of mysticism. The emotional and logical faculties are both powerfully developed in him, so that he is as far removed from rationalistic sterility on the one hand, as from visionary extravagance on the other. What Swedenborg professed to receive by special inspiration, and Andrew Jackson Davis by natural clairvoyance, is taught by Mr. James as the result of logical and scientific demonstration. We know of no one to whom he bears so close a resemblance as to Mr. Wilkinson, author of a recent work on the "Human Body in its connection with man," but he is less fanciful, and more Catholic than that ingenious writer. Perhaps we should say more eclectic, for in these lectures we have Berkeleyan Idealism and Spinozistic Pantheism pouring their refining influence into the muddy waters of Swedenborgianism. But we have faith in Mr. James's capacity to work out for himself greater comprehensiveness of outline, and consistency in detail, than he has hitherto attained. One is strongly impressed, when reading a work like the present, with the reality of the religious sentiment, and with the rich harvest which will be reaped by the free inquiries of spiritual minds.

The subjects of the "Lectures" are :

<sup>1</sup> "Lectures and Miscellanies." By Henry James. 1852.

"Democracy and its Issues," "Property as a Symbol," "The Principle of Universality in Art," "The Old and New Theology," "The Scientific Accord of Natural and Revealed Religion;" and of the "Miscellanies:" "The Laws of Creation," "Berkeley and his Critics," "God," "Man," "Responsibility," "Morality," "A very Long Letter," "Spiritual Rappings," "Intemperance," "Christianity."

An "Essay," by James Freeman Clarke (one of the early friends of Margaret Fuller, and recently, together with Emerson and Channing, one of her Biographers), on "The Christian Doctrine of Forgiveness of Sin,"<sup>2</sup> commends itself, in a literary point of view, as a model of perspicuous exposition and methodical arrangement. As a theological treatise, it aims to be both scriptural and philosophical. The subject is evidently a favourite one with the writer, and as the production of a mind rich with Catholic culture and human sympathies, it is divested of all technicalities, and so treated that its scripture quotations form rather the complement than the foundation of his theory. That theory is substantially coincident with Arminianism, as may be seen from the following extract, which fully represents the character and sentiments of the book :—

"Christianity shows that the Divine being is also a personal being; not a mere collection of laws; something more than the order of the universe. In him are united both law and love; an immutable moral nature, which is the basis of all moral distinction, and a perfectly free will, not bound by the laws of this nature, but perpetually originating new movements. The miraculous character of the New Testament history consists essentially in this. The great miracle, underlying all the rest, is the new manifestation of God's character which is made in Christ. But this manifestation was not a single act, beginning and ending with the life of Jesus, but is a constant, continued manifestation made in every age to the believing soul. *The work of God in forgiveness, therefore, is a positive, real communication of himself through Christ to the human soul.*"

If any of our readers have the impression that the American Indians are a neglected, and by this time, a nearly extinct and forgotten race, a sight of Schoolcraft's great national work,<sup>3</sup> now in progress of publication, would soon correct their mistake. The Indian tribes have always been objects of interest and solicitude

<sup>2</sup> "The Christian Doctrine of Forgiveness of Sin: an Essay." By James Freeman Clarke. 1852.

<sup>3</sup> "Information respecting the History, Condition, and Prospects of the Indian Tribes of the United States." By H. R. Schoolcraft, LL.D. Illustrated by S. Eastman, Capt. U.S.A. Published by Authority of Congress. Part II. 4to. 1852.

both to the people and government of America, as much so as the Highland tribes of Scotland have been to ourselves. The ethnologist and archaeologist, the historian and the missionary, have for years been prosecuting their researches among the red men of the forest under the impulse of individual or national enterprise. But of all the works which have thence resulted, none can rival the present in fulness of information or in costliness of production. Here is a volume of which the American press may well be proud, and upon which even an Englishman, familiar as he is with royal quartos and imperial folios, cannot look without astonishment and delight. The variety of matters discussed may be gathered from the following sectional divisions: General History of the Tribes; Manners and Customs (subdivided under such heads as the "Constitution of the Indian Family," "Forest Teachings," "War and its Incidents," "The Wigwam and its Mates," "Birth and its Incidents," "Death and its Incidents," &c.); Antiquities; Physical Geography; Tribal Organization, History, and Government; Intellectual Capacity and Character (entering very minutely into their different systems of Numeration, their skill in Pictography, and progress in Alphabetic Notation, with a few legendary gleanings as illustrations of their oral literature); Topical History; Physical Type of the American Indians (including Physical Characteristics by Dr. S. G. Morton, Author of the *Crania Americana*, and Cranial Admeasurements of the Principal Groups by Mr. Phillips); Language (including a Plan of Thought of the American Language, by Dr. Francis Lieber, with Essays on their Grammatical Structure, and copious vocabularies of the different dialects); State of Indian Art; Future Prospects; Statistics and Population. To illustrate this rare and rich accumulation of materials for the savant and historian, the volume contains 78 exquisite plates, overlooking nothing in scenery, costume, or antiquities, that could come under the power of the pencil.

It would appear that the notions generally entertained in regard to the extent of the Indian population previous to the colonization of the country are very erroneous. Only half a million of gipsy-like wanderers occupied the territory which has since given a home to twenty millions of Europeans, and could as easily as not find room for all that Europe still contains. They still number 200,000, but the present ratio of decline will extinguish the entire race in 200 years, if, indeed, impending circumstances do not effect their destruction within a much shorter period; for in less than ten years there will not remain unoccupied territory between the two

oceans sufficient for a hunting-field, without which, or without adopting industrial habits, they must necessarily perish. Already they are all moved westward of the Mississippi, and will soon meet the tide rolling eastward from the Pacific. We are impressed, however, with a thorough conviction of the justice and humanity of the course pursued towards them by the American government. Their decline is the natural result of their savagism, aided, in recent times, by the immense sums of money paid to them for lands, to which they had after all so little claim. It is encouraging, at the same time, to be able to add that the civilizing operations set on foot in 1824 have been highly successful. "The Cherokees, the Choctaws, the Chickasaws, and the Muscogees or Creeks, are the living monuments of rescued nations, who are destined to take their places in the family of man." In these cases, it was the acquisition of property which first loosened the bonds of barbarism;—Mammon has some claim to consideration as an agent of civilization!

Schoolcraft's great work has sometimes been confounded with a smaller one, which he has also recently published, entitled "Thirty Years with the Indian Tribes," which consists of personal memoirs, with notices of passing events, and opinions taken from his "Running Journal," preceded by a sketch of the author's life. In reference to the character of his notes, and the period to which they refer, the author himself remarks:—

"It is the thirty years that succeeded the declaration of war, by the United States, in 1812, against Great Britain, and embraces a large and important part of the time of the settlement of the Mississippi valley, and the great lake basins. During this period, ten States have been added to the Union. Many actors who now slumber in their graves are called up to bear witness. Some of the number were distinguished men, others the reverse. Red and white men alike express their opinions; anecdotes and incidents succeed each other without any attempt at method. The story these incidentally tell is the story of a people's settling in the wilderness; it is the Anglo-Saxon race occupying the sites of the Indian wigwams. It is a field in which plumed sachems, farmers, legislators, statesmen, speculators, professional and scientific men, and missionaries of the Gospel, figure in their respective capacities. Nobody seems to have sat down to compose an elaborate letter; and yet the result of the whole, viewed by the philosophic eye, is a broad field of elaboration."

Military journals are perhaps not Topography. attractive to the general reader, but

\* "Thirty Years with the Indian Tribes, A.D. 1812—A.D. 1842." By H. R. Schoolcraft. With a Portrait. 1851.

here is one<sup>a</sup> full at least of curious pictures relating to a country about which curiosity has never been very active. In the course of 1849, a body of topographical engineers, accompanied a body of troops with the view of extending the boundaries of science contemporaneously with the boundaries of the state in the Navajo country, somewhere on the eastern frontier of California. From the pictorial illustrations, seventy-five in number, tinted and plain, given in this official report of the expedition, we get a much better idea of the country than from the report itself, which is drawn up without any attempt to render it attractive to general readers; and the incongruity, in this instance, between the plates and the letter-press, suggests the propriety of always attaching to such an expedition not only the artist of the pencil, but the artist of the pen. We certainly see no consistency in providing the one without securing the other. Lieutenant Simpson, however, though not an attractive writer, is a man of high scientific accomplishments; and has accumulated in his "Journal" much valuable scientific information, geological, botanical, and archæological, such as a fresh country always affords to its first observer. In the numerous ruins of *pueblos*, or Indian towns, to be met with there as elsewhere in America, additional confirmatory evidence is obtained of the existence of an aboriginal race further advanced in civilization than those found on the soil at the era of the conquest. A curious discovery also was made of an immense rock, covered with nearly half an acre of inscriptions, some in hieroglyphical, and others in European characters, and one of them dating as far back as 1606, all of them very ancient, and several of them very beautifully engraven. Twelve plates are occupied with fac similes of these primæval records. A singular linguistic fact is stated in this volume—viz., that among the 10,000 Pueblo Indians in New Mexico, as many as six distinct *dialects* obtain, no one showing anything more than the faintest, if any, indications of cognate origin with the other.—The "doubling of the Cape," and "a voyage round the world," will soon be obsolete phrases in the nautical vocabulary; and "a trip across the globe" will become the familiar mode of speech. Interoceanic communication continues to excite intense enthusiasm in America; and its achievement, in some form or other, seems now to be no longer doubtful. Several routes have been proposed at different times—viz., the Isthmus of Nicaragua, the Isthmus of Panama, the

Isthmus of Darien, the Isthmus of Tehuantepec, and the isthmus between the Rio Atrato, on the Atlantic side, and the Rio Choco, on the Pacific side—in all five different routes, accessible by canal or railway. That by Nicaragua, as a canal, is most important, but, apparently, not so practicable as we had been led to suppose. That by Tehuantepec, as a railway, is the most pressing and the one most popular in America. If not the most practicable of the whole, it is the only one whose practicability has really been ascertained. A survey of the line has been made by a scientific commission, and the results are now before us in a volume, drawing its uncouth title from the name of the district to which it refers.\* It appears that, in 1842, Don José de Garay presented a memorial to the President of the Mexican Republic, requesting permission to organize an effort for opening a communication by this route; which was granted by General Santa Anna, the most sagacious statesman which Mexico has ever produced. But America has had her eye upon the project, and the place for long years, and has manœuvred to get the entire control of the affair into her own hands. By looking at the map of the American Continent, it will be seen that this isthmus is the *shortest* route of any from the United States, or Europe, to the Pacific. In the Indian, and even in the Pacific trade, England has the advantage at present in point of distance; but were this railway opened, then instead of meeting America in all the markets of the world, except those of the Gulf and Caribbean Sea, with the advantage of ten days' sail and upwards, the scales would be turned, and England would have the disadvantage of some twenty or thirty days, thus making a difference in favour of America of thirty or forty days under canvas. "The American continent will then become the *entrepôt* for the commerce of the universe, and the United States the mistress of the seas." Such is the vision of commerce now dawning upon America, and which even disturbs with its dazzling brilliance the statistical brain of our engineer, whose figures grow, unconsciously, into "figures of speech," as he sums up the results of his labours. The work is divided into two parts—the first giving a plain history of the survey, and an account of the results obtained by it; and the second giving a résumé of the geology, climate, geography, productive industry, Fauna and Flora of the country, illustrated through-

\* "Journal of a Military Reconnaissance from Santa Fé, New Mexico, to the Navajo country." By J. H. Simpson, A.M., First Lieut. Corps of Topographical Engineers. 1852.

\* "The Isthmus of Tehuantepec: being the results of a Survey for a Railroad to connect the Atlantic and Pacific Oceans, made by the Scientific Commission under the direction of Major Barnard, U.S. Engineers." With numerous Maps and Engravings. 1852.

out with beautiful plates, and accompanied with a portfolio of maps. It is an able and important work, possessing many claims upon the attention of scientific readers, but especially upon merchants and capitalists.

Another work of equal importance, we think, to the commercial classes of this country, as bearing upon the future prospects of the cotton trade, is Mr. Bonyng's "Future Wealth of America." It is the production of a practical planter; and though we do not much admire the blustering style in which it is written, we admit the force, and have the means, in most instances, of testing the accuracy of his statistics. Its general object is to show that cotton cultivation, though it has contributed so powerfully in the past to the wealth of America, is now irrecoverably on the decline, and must be abandoned for the cultivation of tea, coffee, indigo, and other plants. From the statistics furnished, it appears that cotton, in twelve years, has declined in price 30 per cent. yearly; rice, in nine years, in quantity and quality, 15 per cent.; tobacco, in quantity, the last five years, 2½ per cent.; that bread-stuffs are returning to the same amount of exports that they were prior to the failure of the potato crop in Europe; and that sugar cultivation is not advancing. Under the present prices of labour in America, there is no possibility of extending these articles; and, except tobacco, it is feared that they will all greatly decline. Cotton cannot be cultivated under 5½ cents per lb.; whereas India can produce it and land it in Liverpool at 7 cents per lb. After a fourteen years' residence (as a planter) in the East, and after a tour through South Carolina and Georgia, he is constrained to admit that India has every means of producing as good cotton, and much cheaper than America. And he asserts, that had it not been for the potato failure, and the timely aid of California, America could never have borne the decay of her principal staple for the last ten years. Other staples, therefore, must now be called in; and among the many which will be necessary to supply the place of cotton, the author pleads strongly for the introduction of the tea-plant. This leads him into a survey of the tea trade, and into a comparison between China and America in regard to soil, climate, and price of labour, which brings him to a very different conclusion from that reached by Mr. Fortune in his recent work on the same subject, noticed in

\* "The Future Wealth of America: being a Glance at the Resources of the United States, &c." By Francis Bonyng. 1852.

another part of this "Review." The probable quantity of tea consumed in China itself is estimated at 1,140,000,000 lbs. A very moderate estimate considering the extent of the population, and the universal demand for that beverage. Instead of the 100,000,000 lbs. at present consumed in all Europe, America, and all the English colonies, Europe would as readily consume 600,000,000, and America 500,000,000, could it be procured at a reasonable price. But it is pretty certain that were the English duty reduced, *China could not supply more tea than she is doing at present.* In America, says Mr. Bonyng, *it could be produced for from 2½ to 3½ cents per lb.* As his work is addressed to southern-interests, he touches upon the slavery question, shows that the ratio of slave increase is alarming, and most philanthropically advocates colonization as a means of getting rid of the surplus slave stock, but universal emancipation—that would raise the price of labour, and therefore cannot for a moment be entertained. The concluding section, on "The United States' place in America," is a magnificent prophecy of the extension of conquest and commerce. Mr. Bonyng is the very incarnation of American mammonism. His programme of annexation leaves nothing further to annex. The one republic reaches from Greenland to Cape Horn, washed by the ocean all round. Kindling into sublimity at the prospect, he rivals the Tehuantepec engineer in the fervour of his peroration.

"Progress must be the order of the day, unless designing knavish demagogues divide and subdivide this union into miserable paltry governments, when, in such events, the debris of these glorious states will become the contempt and prey of vagabonds and pirates. Disunionists and abolitionists are the poisonous reptiles that lie hid in the grass: both must be exterminated, must be rooted out, and this great continent become one family (!) governing themselves by Christian doctrines (!!) Love God above all things, and your neighbor as yourselves (!!!)"

"The Wanderer in Syria,"\* dis-claims any intention of repeating the work already so well done by Richardson, Clarke, and "a Xerxes-host" of quartos, octavos, and duodecimos, but, referring the reader to a guide-book for statistical information, aims to impart fresh personal impressions of man and nature. Eothen is his model-book of Oriental travel, in imitation of which he throws off a series of sketches, mingling scenes and sentiments, in a style of great vivacity, quaintness, and brilliancy. "The highest value of travel,"

\* "The Wanderer in Syria." By G. W. Curtis, author of "Nile Notes." London: Bentley. 1852.

he justly observes, "is not the accumulation of facts, but the perception of their significance. It is not the individual pictures and statues we saw in Italy, nor the elegance of Paris, nor the comfort of England, nor the splendour of the Orient in detail, which are permanently valuable. It is the breadth they give to experience, the more reasonable faith they inspire in the scope of human genius, the dreamy distances of thought with which they surround life. In the landscape which we enjoy as a varied whole, what do we care for the branching tree or the winding river, although we know that without tree and river there would be no landscape? When Italy, and Syria, and Greece have become thoughts in your mind, then you have truly travelled." With such a perception of a traveller's function, the "Wanderer" should have taken a still higher aim, and endeavoured, in his own work, to place that function on a level with that of the historian and poet; for if it be the function of the historian to rehabilitate the dead and deserted past, and that of the poet to people with the creations of his own fantasy the unborn future, it is the function of the traveller to breathe the fresh atmosphere, to recognise the inspiring genius, and picture the living realities of the present. Such a vindication of his own calling (which seems, indeed, to be that of a "Wanderer") would have been a valuable contribution to literature, which, in all its departments, is seeking for a clearer definition and higher elevation of its functions. Though tourists, like rhymesters, threaten to be a nuisance, yet *the* traveller, like the poet, will have his place in the world of letters so long as the countenance of nature continues to smile, and the progress of nations invites observation.

**Fiction.** Fiction and female authorship at present rule the book-market in America. The "Wide, Wide World," by Elizabeth Wetherell, and "Uncle Tom's Cabin," by Mrs. Harriet Beecher Stowe, have had a sale quite unprecedented in the United States. Our attention has thus been drawn a little more closely than before to this department of American literature.

The "Wide, Wide World"<sup>9</sup> belongs to the Hannah More and Charlotte Elizabeth school of religious fiction. But, though a class-production, it is not sectarian; and, though "evangelical" in its tone, it is not dogmatic. It exhibits the growth of a child's mind with childlike simplicity and truthfulness. Ellen Montgomery is intro-

duced to us the only child of an American captain compelled by pecuniary embarrassments to break up house and home in New York,—sending Ellen to stay with his half-sister in a distant, outlandish settlement up the country, while he embarks with his invalid wife for Europe. Mrs. Montgomery is a loving and loveable woman united to a cold, selfish, unfeeling husband, and does not long survive her separation from her child, who is hurriedly packed off in charge of some friends of the family who had known them in better circumstances, and whose cold charity makes Ellen feel that she is now in the wide, wide world! The aunt to whom she is committed is a sober-looking, but well-to-do middle-aged spinster—a cankered uncomely creature, snapping and snarling with every motion of her lips; always boasting of doing her duty, and yet never doing it in a dutiful way; priding herself upon her prim house and thrifty habits, and yet always complaining of her poverty; standing well with herself, and enjoying the comfortable delusion that she stands equally well with her neighbours; frugal in her fare, and homely in her apparel, yet, on set occasions, brisking herself out with finery, and making a vast parade of hospitality. Not a church-goer, in general, for that would be an extravagant waste of time; nor a professor of religion at home, for it presents no attraction to her stiff and sterile soul. A woman of business habits, looking after her farm, doing the work of a dozen ordinary people, and pushing out of her way now her quiet old mother, and now the gentle girl to whom more by necessity than choice she had opened the door. Under this termagant Ellen feels in all its bitterness what it is to be an orphan in the wide, wide world! In that lone upland she resembles Mungo Park's tuft of moss in the desert; but soon the desert itself becomes one of the green places of the earth where her assimilative spirit draws out its natural beauty and its social wealth. Eventually she is adopted into a clergyman's family, where her gushing sympathies find their congenial element. The very monotony of the tale is musical, and onward to the close its simplicity should have been preserved unbroken; but with the view of introducing a little more variety of character and incident, and in order to get Ellen's education completed at Edinburgh, a prosaic fancy discovers some of her mother's relatives in Scotland, and, for a season, sends her thither; but she finally returns "to spend her life with the friends whom she best loved." The spell, however, is broken. The whole

<sup>9</sup> "The Wide, Wide World." By Elizabeth Wetherell. 2 vols. 1851.

charm of the story consists in its local concentration and microscopic intensity. Ellen is beautiful only where she grew: she is no longer the same being in Scotland that she was in her own place and among her own people. In the end she disappoints us. The womanly child has grown a childish woman. There is nothing ideal about her. The author has found her antitype in the Sunday-school, not in the wide, wide world. She has not aimed at developing womanhood, and here it is that her religious opinions have spoiled her success as an artist. Ellen Montgomery is the embodiment of religious conventionalism, that is to say, she is a whining, whimpering, "pious and accomplished" *young lady!*

Miss Wetherell's subsequent work, which bears the queer title of "Queechy,"<sup>10</sup> is so nearly a repetition of "The Wide, Wide World," that the same remarks apply to both. Fleda is certainly made of stronger stuff than Ellen; but this is the only improvement which we can discover. Upon the whole, these works show great poverty of invention, and a faculty for dialogue rather than dramatic action. The conversations are conducted with ease and naturalness, but spun out to a tiresome length. They are alike deficient also in perspective, each day's details being given with equal minuteness. "Queechy" (so called from the name of the village which forms the *locale* of the chief incidents of the tale) will hardly sustain the reputation of its predecessor; and neither will attain to more than a class popularity.

Mrs. Stowe comes into the field of fiction with a riper genius, and at once wins richer laurels than Miss Wetherell. In "Uncle Tom's Cabin"<sup>11</sup> she has hit the nail on the head, not only as a *littérateur*, but as an abolitionist. No Senator in Congress, no editor in a leading article, can come round the subject and round the reader, and into the heart of both so effectively, as this book—so superior is dramatic representation (where it can be employed) to the sharpest weapons of logic and the loudest thunders of oratory. To its employment in the present instance many objections will be made; but slavery, besides being an abstract theory of human relations, and as such debateable, is a concrete reality of human life, and, as such, dramatizable. Since Miss Martineau published her "Game Law Tales," specific social evils have suc-

cessively adopted this method of laying their grievances before the world. The factory system and slop system have found living embodiment in "Mary Barton" and "Alton Locke;" and even the Chancery system finds its judgment drawing nigh with the periodical progress of "Bleak House." With such suggestive precedents, it is surprising that a system so urgently requiring this kind of treatment, and so suitable in many respects for it as slavery, should not till now have received it. As one of the "peculiar institutions" of the luxurious South, it had become positively picturesque. In the North, it had become a question of law and logic, to be settled by the policeman and the parson with their fugitive warrants and passages of "holy writ." How was this to be remedied? By representing it as a question of humanity, by reproducing the forgotten or concealed realities of the system—thereby dispelling the haze of romance which in the course of years gathers about the most hideous corruptions, and transferring it, if possible, to the side of righteousness and truth. Such has been the aim of "Uncle Tom's Cabin;" and it is due to the author to say, that she has achieved her difficult and delicate task without falling into either vulgarity or exaggeration—the two dangers most imminent in the treatment of such a subject. It is not necessary, in order to pass this opinion, that we should witness the working of the system with our own eyes: it is enough if we are competent to judge of the accuracy of the picture as a translation of the slave statutes into slave-life—it is enough that we can see that the darkest part of it is *possible within the law*, to say nothing of what is possible *beyond*. And it is rather amusing to find an American reviewer so forgetful of the function of the critic on the one hand, and the privilege of the artist on the other, as "to assure Mrs. Stowe that the planters are neither in the habit of severing families, selling infants, nor whipping their best hands to death." It may be as this omniscient witness testifies; but the slave-code *authorizes these very enormities*, and no guarantee can be given that such sordid sensualists as Legree shall *not*, when it suits them, take full advantage of their "rights." "Uncle Tom," however, is not exclusively a book of horrors; and it cannot be accused of presenting a one-sided picture: it is remarkable rather for its breadth of view, its variety of character and incident, its genial charity—tracing the evils of the system rather to its essential nature than to accidental circumstances, and showing that its worst features sometimes grow out of the mildest conditions in which it can

<sup>10</sup> "Queechy." By Elizabeth Wetherell. 2 vols. London: Nisbet & Co.

<sup>11</sup> "Uncle Tom's Log Cabin; or, Life among the Lowly." By Harriet Beecher Stowe. 2 vols. 1852.

possibly exist. Mrs. Selby is a good woman, and does her best to put her principles into practice; but her educated negroes feel all the more bitterly the perils of their position. When the curse comes, she is powerless to prevent it, and Uncle Tom, carrying with him the esteem of nearly all Kentucky, is sent down the river to New Orleans. St. Clare is a humane and cultivated gentleman, as indulgent to his slaves as to his own family, but his death and the disposal of his estate once more send Tom to the auction-block. Poor Tom! we have not space to follow him through his vicissitudes, or to describe the singular attachment—so full of playful mirth and holy aspiration—which grew up between him and Eva St. Clare. Neither can we linger by Eva's death-bed, while through her attenuated frame heaven shines into her soul, giving to the weak words of a child an intensity equal to life's longest labours. Eva is an angelic apparition, "whether in the body or out of the body we cannot tell;" Tom is the hero of the tale—a *bonâ fide* man—worthy of Eva's friendship—but a SLAVE! Honest and intelligent, cheerful and devout, the contrast between the nobility of the old man's character and his social degradation is well sustained—exciting a continuous feeling of sympathy, which cures the prejudiced reader of his negrophobia, and rouses him at last to the highest pitch of wonder and indignation, to find that such a man, in such a country as America, could become, in this easy way, the property (soul and body) of such a beast as Legree!

From negro life in America, we turn to "human life" in England, as exhibited in a tale called "Thorpe,"<sup>10</sup> written by William Mountford (author of "Martyria," "Euthanasia," &c.) who some time ago removed from England to America, where we understand he is now permanently settled. As a man of antique tastes, fond of old books, old times, and old towns, we surmised from the title of his tale, that he had sought relief from a qualm of home-sickness in recording his reminiscences of the old country as it appears to him now from his New England abode; and we were expecting to find, as we are sure there was to be found, in that "quiet English town" such an exuberance of human life, as would confirm the experience of that worthy knight, who said that he had "learned more in a dark corner of the Tower than in travelling round Europe." But Thorpe is a *very* quiet town, and the

people in it seem very quaint. It is a town of Quakers and Quietists. The minister "opens his mouth in parables," and his housekeeper "utters dark sayings of old." Mrs. Satterthwaite, indeed, can pour forth a pageful of proverbs at a time; and even the errand-girl unwittingly replies to her mistress in apothegms! Thorpe is not a tale, but rather a series of dialogues—a form of instruction which, like Plato and Jean Paul, Mr. Mountford invariably and, in his own case, wisely prefers to the monologue in more ordinary use. The principal interlocutors are a Presbyterian minister, a Manchester manufacturer, an Oxonian heretic, and an American farmer, whose sympathies and sentiments all flow in one direction, but whither it is difficult to discover. The author is an eclectic—reads the Fathers and the Puritans, the Quakers and the Rationalists—and, without respect of persons, appropriates what strikes his fancy. "Thorpe" is, consequently, a book of beautiful thoughts expressed in chaste language, and promotive of a serene and catholic piety.

A metaphysical romance is as rare as an epic poem, and for a like reason; but Miss Caroline Chesebro does not appear to have duly estimated the hazard of such an adventurous flight as she aims at in "Isa, a Pilgrimage."<sup>11</sup> To analyze a character by way of showing its greatness is like dissecting a butterfly by way of showing its beauty. Any phrenological chart will furnish you with qualities sufficient to constitute a great man, but to present great qualities in such a concrete shape that the greatness is felt and not merely invoiced requires a creative power which we do not discover in "Isa." You are here introduced to a remarkable man, and to a very extraordinary woman, or, rather, they introduce each other, after the following fashion. You first read a paper written by Isa, containing an analytical appreciation of Weare, and then a paper by Weare appreciative of Isa. You are supposed then to have made their acquaintance, and to be prepared for the transcendental talk which follows. Weare is a divinity student whom Isa adores as the ideal of manhood. Isa herself had been a workhouse girl, rescued by Weare's mother, and adopted into the family. They grow up to manhood and womanhood, but, as it turns out, the man's growth is more of the heart, and the woman's more of the head. They avow a passionate attachment for each other; but in Isa a passion stronger than love develops itself, viz., the ambition

<sup>10</sup> "Thorpe, a quiet English Town, and Human Life therein. A Tale." By William Mountford. 1852.

<sup>11</sup> "Isa: a Pilgrimage." By Caroline Chesebro. 1852.

of intellectual empire! She makes a literary engagement which brings her into contact with an intellect still greater than her own, to whom she eventually surrenders her head, heart, and hand. Alanthus Stuart is an Atheist and a Socialist; but to Isa he is an intellectual deity; and, like William Godwin and Mary Woolstoncroft, they heroically sacrifice their conventional reputation upon the altar of conviction. The intended moral of the tale is not very palpable. The author's theological sentiments are decidedly "evangelical," and we anticipated nothing less than a terrific storm at the close; but Isa's death is as peaceful and heroic as her life was pure. Stuart asks her if she anticipates annihilation. "As (she replies) there is no annihilation, I have never for a moment imagined that there is. I am going within the veil—you will follow me. I shall wait just beyond the point on which your eyes are fixed now. I will not go further until you join me, Alanthus." "Isa (says Stuart), I will meet you there. In the daytime and the night, in bitterest need, in loneliness, in desertion, in danger, wherever I go, whatever I do, you will be with me! I am above the world!" Pretty fair parting this for two Atheists! But by connecting it with a dream in another part of the volume, we believe that the author would have this farewell to be taken as a specimen of the cold comfort which philosophy ministers to its votaries. The metaphysics of the tale account for Isa's serene confidence by attributing it to the influence of Stuart's *will*; and with this pledge of their eternal doom the Nemesis of orthodoxy would seem to be satisfied!

It will now be necessary for us to make a summary disposal of the works before us that still remain unnoticed. The Biblical student will be pleased to hear that Dr. Palfrey's "Academic Lectures on the Jewish Scriptures and Antiquities," are at length completed in four volumes. The two first were published in 1840, and, after an interval of twelve years, the remaining two have appeared. The work bears a high reputation for learning and liberality. "The Approaching Crisis," by A. J. Davis, is a tedious reply from his peculiar point of view to a course of lectures recently delivered by Dr. Bushnell on the "Naturalistic theories of Religion as opposed to supernatural revelation." "Immortality Triumphant," by J. B. Dods, might be appropriately termed the Electrical Evidences of Christianity! "New Themes for the Protestant Clergy" is of the Elihu Burritt school of Christian philanthropy. Its only value consists in some dissertational notes at the end on the literature of charity, population, pauperism, political economy, and Protestantism. Brewster's "Philosophy of

Human Nature" is not a systematic treatise, but a sort of classified common-place book, containing all the accumulated thoughts, original and selected, of a long life, on education, manners, marriage, &c. It contains many curious ideas, and is published as "a beacon-light for the young, and an incentive to the aged for *their* contributions to a work which shall successfully solve the dark and wonderful problems of the human heart." "The Life of Dr. Samuel Worcester" is a class biography. He was the brother of Dr. Noah Worcester, the apostle of the peace question. Samuel and Noah were respectively editors of the "Panopolist" and the "Christian Disciple," the former the champion of orthodoxy, and the latter of liberalism. A new "Life of William Penn," by S. M. Jauney, was written, but not published, before Mr. Hepworth Dixon's Biography appeared in America. He has had access to "original materials," which enable him to furnish "a more full and accurate account of the founder of Pennsylvania than has hitherto been given to the world." (He objects to Dixon's representation of him as a disciple of Algernon Sydney, and corrects other mistakes into which that writer has fallen.) The "Memorial of James Fenimore Cooper" is a report of the great meeting held in New York in honour of his memory, and, besides Bryant's Discourse on his Life and Genius, contains the speeches delivered on the occasion by Webster, Bancroft, and others, with letters from the most distinguished American literati. It is embellished with a portrait of the great novelist, and a view of his country seat. "The History of the Second Church in Boston," which has had among its pastors Cotton Mather, Henry Ware, and Ralph Waldo Emerson, is on that, and on other accounts, a work of some value and interest. On the principle of Townsend's "Accusations of History against Popery," Miss Elizabeth P. Peabody has collected a volume of "Crimes of the House of Austria against Mankind," an ingenious but necessarily exaggerated kind of argument against despotism. Nathaniel Green's "Improvisations and Translations" is a beautiful book, by which is to be understood, not the poetry, which is worthless, but the paper and typography, which are exquisite. On the other hand, there is some excellent poetry in "Lyra and other Poems," by Alice Carey, who seems to have the genius necessary for her vocation. To lawyers and legislators the "Works of Daniel Webster," edited by Edward Everett, in six volumes, will be a welcome accession to their libraries. The first two volumes contain his speeches on public occasions; the three succeeding volumes embrace the greater part of the

speeches delivered in the Massachusetts legislature, and in the two houses of congress; and the sixth and last volume contains his legal arguments, addresses to the jury, diplomatic papers and letters addressed to various persons on important political questions.

ARTICLE XII.—CONTEMPORARY LITERATURE OF GERMANY.

**Philology.** THE knowledge of the German language will doubtless receive an important increase from the elaborate and learned dictionary of the venerable brothers Grimm, who have just published their first number. The research which they display is something marvellous. Scarcely any words are given without authorities, and these are found in the earliest as well as in the most recent authors. Latin equivalents are added to German meanings, and when there is a corresponding expression in a provincial dialect, it does not pass unnoticed. What the size of the book will be when it is completed, we cannot conjecture. The first number, which contains 120 pages, royal octavo, with double columns, closely printed, does not get beyond the word "Allverein." It should, however, be observed that every word, compound as well as simple, has a separate head, and generally a separate authority. What we miss, regarding the book from an English point of view, is an indication of conjugation and declension, which seems to us as necessary as the indication of gender. Perhaps, however, to Germans—and it is for Germans that the dictionary is made—the omission may not seem a deficiency. The plan of the work, and the principles on which it is conducted, are not yet explained, but a full explanation is promised in the preface to the first volume.

Another contribution to the study of modern languages is a German edition\* of the "Historical View of the Languages and Literature of the Slavic Nations, with a Sketch of their Popular Poetry," written in English by a German lady, under the

\* The works named in this article have been furnished by Messrs. Williams & Norgate and Mr. David Nutt.

<sup>1</sup> "Deutsches Wörterbuch." Von J. und W. Grimm. Leipzig. 1852.

<sup>2</sup> "Uebersichtliches Handbuch einer Geschichte der Slavischen Sprachen und Literatur." Von Talvi. "Deutsche Ausgabe." Von Dr. B. K. Brühl. Leipzig. 1852.

assumed name of *Talvi*, and published at New York in 1850. Dr. Brühl, who regards political Pan Slavism as a notion worthy of Bedlam, but would further any endeavour on the part of the various tribes of the large Slavonic family to render their language—or rather languages—a vehicle for the expression of the highest ideas, was looking out for a book that would render knowledge on the subject generally accessible to the Germans. A learned work, stuffed with dull citations, and written with minute philological criticism, would not have answered his purpose; but he wanted a tolerably short work, which, written with some love of the subject, would serve to amuse as well as to instruct. Such a work presented itself in Talvi's "View," which, in a condensed form, contains a complete history of the Slavonic literature in all its branches to the recent year, 1850; and which, moreover, was honoured with the strong commendation of Dr. Schaffarik, librarian of the University of Prague. These favourable antecedents, added to a report from the publisher, M. Geibel, that Dr. Brühl would undertake a translation, produced the German book now before us. Perhaps the knowledge of the fact that the American book is so highly esteemed by continental scholars, including a *savant* of one of the chief Slavonic cities, may cause it to be better known in England, where, notwithstanding that it is written in our vernacular, we fear it is but little appreciated.

**History.** Dr Eugen Huhn, who brings out a new history of the German literature, seems rather a bold man, when he declares in his preface, that he comes before the public neither with apologies for placing himself by the side of other writers on the same subject, nor with the assumption that he has studied more deeply, or knows more, than his predecessors, and then avows that he has not striven to add anything new. The reader is tempted to ask, "Then why did you come at all?" and will scarcely be satisfied with the hint, that he may *perhaps* find more novelty than he was led to expect. Nor can we altogether accept the explanation, that this book is adapted for a more general public than the numerous books already in existence; for surely it gives us a very poor notion of German cultivation, to suppose there is an educated public incapable of reading Gervinus—while the public which desires more detail respecting the earlier literature than Gervi-

<sup>3</sup> "Geschichte der Deutschen Literatur." Von Dr. E. Huhn. Stuttgart. 1852.

nus gives, must be a very special public indeed.

Dr. Huhn's statement that he brings the history down to the present day, whereas it is customary to leave off with the death of Göthe, certainly seems at first sight to indicate a special value in this book. But on rubbing up our memories a little, we discover that it has not been altogether so customary to leave off with the death of Göthe. Dr. Biese, for instance, whose manual of the history of the German literature was published in 1846, has come far beyond the Göthe landmark; and that he has done his task just as well as his successor, we can show by parallel extracts on the subject of Lenau, who of course belongs to the recent portion of the book, and whom we select merely as the first name that occurs.

Biese says:—

“Nicolaus Lenau (Niemsch von Strehlenau,) born in 1802, at Chutad in Hungary, first came forward as poet at the time when the Poles succumbed to the superiority of foreign strength. His lyric poems appeared in 1832, and in 1838 there was an edition of ‘newer poems’, which were further increased in the last edition of 1844. Enthusiasm for national liberty, and a pure sympathy with the fate of the unhappy Poles, together with a living devotion to nature, with whom he hopes to find internal peace and a consolation for the disappointment of his hopes in man,—these were the fundamental elements which excited Lenau's poetical talent. (‘Abschied der Gefangene’—‘Abschied von Galizien’—‘Der Polenflüchtling.’)\* Penetrated with the proud spirit of his nation, which in earlier times, after its migration, had victoriously maintained its position in many contests, he is able to depict, in fresh and lively colours, the peculiarities of his land and people (‘Die Haideschenke’—‘Die Werbung’—‘Mischka.’) He plunges with love into the phenomena and phases of nature, clothing them with inner life, while he animates them with the wealth of his own mind (‘Lenz’—‘Liebesfeier,’ ‘der Gefangene.’) although an unconquerable discord in the poet's breast causes a tone of deep melancholy to predominate. The beautiful world of faith which blessed his youth is destroyed; the fruits from the tree of knowledge afford him no refreshment; his fatherland—the lofty goddess Germania—cannot console him; she is dead, and wanders in the realms of shade. Destructive doubt is his comrade, and allows him to see nothing but the perishable. Pain, with whom he holds converse, is his only confidant. That universal agony paralyzes the native freedom of the mind and destroys lyrical facility, often clothing itself in the most violent images, and being unable to utter the simple speech of natural feeling. Lenau was particularly attracted by the story of the ‘Wandering Jew’ (‘Der ewige Jude’—‘Ahasver der Jude.’) and the tradition of Faust, the latter of which he treated in an epico-dramatic poem (1836,) alternating narrative with dialogue. This poem is the expression

of Lenau's internal desolation; it contains many beauties, but misses the deep import of the legend. Here the desire of Faust for knowledge appears as the sin which summons Mephistopheles. We are not struck as in Göthe's poem by the tragic despair of Faust, who, in the midst of his sensual riot, still preserves his mental elevation, but we merely find bitter scorn at the failure of his efforts. Faust's weariness of life appears as the last element; despising everything terrestrial, he flies the earth and seeks that grey infinity, the sea. After he has been shipwrecked, and has learnt in the midst of the rough sailor's life an energetic contempt for death, he kills himself in the conviction that his own proper essence is a portion of the divinity, and that his earthly happiness is but a dream of his higher being. Having thus in his ‘Faust’ represented a desire for knowledge as sinful in its origin, he afterwards, in his ‘Savonarola’ (1837,) opened a decided war against knowledge, and entered into a didactic contest against modern science, by which he sank from the elevation of poetry. Within the last few years he has unfortunately lost his reason, but his friends still entertain hopes of his recovery.”

Now, considering that Biese treats of the whole compass of German literature within a limit of about 700 pages, this notice of Lenau, who, be it remembered, did not make his appearance till just upon Göthe's death, is as satisfactory a bit of characteristic literary biography as could be desired. Let us now see how Dr. Huhn, who especially boasts of his post-Göthian literature, treats of the same poet:—

“Born in Hungary, Lenau understands how to introduce the peculiarities of his home into his poetry, which is pervaded by the elegiac tone of universal agony, while many of his poems—as, for instance, his Polish songs, are sustained by a sense of national freedom. His fame chiefly rests upon his lyric poems, many of which are most felicitous, and far exceed the other productions of the present age. He also attempted the epic region in his ‘Albigenses’ and ‘Savonarola,’ but with small success, as he was deficient in plastic imagination and objectivity. With his ‘Faust’ he entered the dramatic region, and his success was the less on account of its inferiority to Göthe's work. Moreover, the poetical value even of his lyric poems is without deep foundation, for his universal agony—a state of mind in itself opposed to æsthetical production—drove him to forced images and expressions; preventing a free play of real feeling, while reflection was everywhere intruded, and the elegiac tone which appears as an under-current, gave his lyrical poems a certain degree of monotony, coldness, and constraint. All this arose from the unhappy tendency of his mind, which at an early period indicated the insanity of his later years. In some single instances he succeeded, as in his ‘Klara Hebert,’ ‘Der Abschied von Galizien,’ ‘Die Nächtliche Fahrt,’ ‘Der Polenflüchtling,’ ‘Die Werbung,’ ‘Die Haideschenke,’ ‘Die drei Zigeuner,’ &c., and his name is one of the most respected in the present day.”

\* The words in parenthesis are the titles of poems cited by Biese to illustrate his remarks.

A comparison between these two extracts will at once show that whatever is good in Dr. Huhn, is likewise to be found in Biese, and that every difference between them is a change for the worse in the latter historian. As for the recent death of poor Lenau, we hear no more about it in the book of 1852 than in the book of 1846, when it had not occurred.

There is still, however, a value in Dr. Huhn's history—a value which it derives from its form. The general remarks on the various authors are interspersed with statements in smaller print, not only of the dates of each author's birth and death, but in many instances of the dates of his various publications, with some of the principal events of his life. Thus a great deal of valuable historical information is conveyed at a single glance.

A "History of Antiquity," by Max Düncker, promises well as a clearly-written and very agreeable book, on a subject which will always be interesting. His first volume—the only one which has yet appeared—is occupied with the Egyptians and the various nations of the Semitic race, including the Hebrews, the Assyrians, the Babylonians, &c. In dealing with the Jewish records, the author seems to be mildly rationalistic, connecting miraculous phenomena with natural antecedents. For instance, when treating of the plagues with which Moses afflicted Pharaoh, he calls attention to the fact that these plagues derive their peculiar character from the nature of the country. To the present day the waters of the Nile become red and foetid, and frogs are abundant after an overflow of the waters, when "boils and blains" are likewise not unfrequent. Snakes and snails are to be found in great numbers in the neighbourhood of Sinai, and use is made of the circumstance when the benefits of the Deity to his chosen people are to be extolled. The tendency of all this it is easy enough to see; but the work is written in a style so completely the reverse of polemic, and contains so much well-arranged information, that no rational person could well object to it, on account of its discrepancy with his religious convictions. It is a book completely adapted to the general reader, for the chain of narration is pursued without fear of telling at length what has been told before; and here it differs from the many productions of the German *savants*, which presuppose a general knowledge of the subjects which they illustrate with a mass of critical details.

A controversy has arisen between the two

\* "Geschichte des Alterthums." Von Max Düncker. Berlin. 1852.

distinguished scholars, Gruppe and Böckh. The former, a short time ago, published a treatise on the cosmic systems of the Greeks, in which he endeavoured to refute Böckh's opinion, that Plato in the "Timæus" evinced no knowledge of the earth's diurnal motion round its axis. This has produced, on the part of Böckh, a reply,\* in the shape of a letter to Alexander Von Humboldt, whom he conceives to be included in Gruppe's attack. We need hardly say that Böckh adheres to his original opinion.

M. Christoph T. Schwab has made use of a tour in Greece to take observations of the nature, history, and antiquities of Arcadia. The tour was made in the latter part of the autumn of 1848, which is the pleasantest time for travels in the classic region. The result of the combined erudition and research of M. Schwab is contained in a pamphlet,† which gives a literally full description of the country, suited rather to the scholarly professor than to the general reader.

Political Science. M. Hugo Eisenhart is a politician who has been greatly disgusted by the results of the recent movements in Germany, and would seek a remedy for disorder in the establishment of a permanent hereditary peerage. He owns that for a long time he could not at all understand the legitimate functions of a nobility in a perfectly organized state. The agriculturist, the manufacturer, the tradesman, have their respective offices in producing and preparing raw material, and putting it, prepared or not, into circulation; the artist employs his material to embody an idea; the man of learning instructs through the medium of words; the priest sanctifies all with his general blessing; but what is left for the noble to do? This question not a little puzzled M. Eisenhart; but after he had reflected, that with all our tendency to equality there is a sort of instinct which prevents the *citoyen* in the carriage from classing himself with the *citoyen* behind it, he began to perceive that above the other social strata there should be a class, far removed from the ordinary cares of obtaining a subsistence, and therefore capable of more independent devotion to the service of the state. He would form his German peerage partly from the ancient nobility, and, as these would be insufficient, would fill up the number, not with men who have performed ordinary official services, but the highest position should be the reward of "great deeds acknowledged by history; deeds which in stormy times have guided the state with heroic strength, and

\* "Untersuchungen über das Kosmische System des Platon." Von A. Böckh. Berlin. 1852.

† "Arkadien." Von C. T. Schwab. Stuttgart und Tübingen. 1852.

which in one great resolve have founded anew the honour, the freedom, and the happiness of millions." His treatise<sup>7</sup> is written in a declamatory, turgid style, and though it is not long, arithmetically measured, it is still diffuse, compared with the amount of thought it conveys.

A "System of Statistics," by M. L. Stein, which is designed to form part of a system of general political science, is an admirable specimen of methodical arrangement and clearness in treating of a branch of knowledge less familiar to the Germans than to the English and French. The principle of division which he has adopted seems to argue an Hegelian influence, but his work may be read without reference to a school, and he lays down his general laws with a precision that makes them intelligible even to the least initiated.

The geological literature of Germany is increased by a small treatise,<sup>8</sup> written by Louis Vertisch, pastor of Satow in Mecklin, who ascribes the most important changes in the aspect of the earth to the influence of an unknown cosmic mass, which passed along in such a direction that the line of strongest attraction fell into the plane of the equator, and this mass was powerful enough to attract from the earth a portion of its atmosphere. "Comparative Geography," a science named, by analogy, from "Comparative Anatomy," receives the benefit of a dissertation by the illustrious geographer, Carl Ritter, who adds several treatises on important subjects, such as the form of the earth's crust, the historical element in geographical science, &c., which have already appeared in another shape.<sup>10</sup>

Dr. G. F. Taute<sup>11</sup> favours the world with a most portentous-looking work on the philosophy of religion, professing to take "Herbart's Philosophy," as his point of view. He is a theologian of the orthodox school, and, as far as we can see, might have gone on after his own fashion, without reference to Herbart or anybody else. He regards the French encyclopædists and the modern German philosophers and rationalists as "all in a tale," deriving their common origin from Spinoza, and the emancipation of the world from Spi-

nozism and absolute idealism he regards as his loftiest aim. We have no inclination to follow out his bulky polemics, in which pietistical declamation often supplies the place of argument; but as the view taken of the miracles mentioned in the Bible may be viewed as a fair test of a German theologian's results, we give Dr. Taute's interpretation of the marriage-feast at Cana as a specimen of his mode of proceeding, that our readers may decide whether they will read his 1600 pages, which he has now published, and which, for all we can see to the contrary, may be followed by 1600 more:—

"At the marriage-feast held at Cana, the Redeemer turned water into wine—certainly a great divine miracle—a miracle which is opposed to all the phenomena of our experience, and breaks the chain of them without remorse. But we can always make experiments for ourselves, and see what will result from them. We know the vine; we know that under present circumstances it puts forth leaves and blossoms, which afterwards become fruit and ripen. Berries, with their seeds in groups, which we call clusters, are the fruits of the vine, and, when pressed, yield must; this, exposed to the air and the warmth, undergoes the process of saccharine and vinous fermentation, and becomes wine, properly so called. However, we know more than this; we know the essential nature of wine; we know its chemical elements, carbon, hydrogen, oxygen, which, combined with various kinds of vegetable matter, constitute the real substance of wine. We know that to produce fermentation in the must, a fermenting matter is required which contains nitrogen, and that this is foreign to the vinous substance. We know that as the wine becomes older it also becomes better, inasmuch as during the quiet state of fermentation in which the wine continues, it constantly throws off tartar, while the slimy and saccharine particles are thrown off. What follows from these experiences, which, within certain variable limits, always accompany the making of wine? It is certain that the natural process through which the wine has to pass aims at nothing more than to bring the essential elements of wine—viz., carbon, hydrogen, and oxygen, into a state, the result of which is the vinous quality. Now suppose there was some other process besides the natural one, by means of which it was possible to bring the elements of wine into the same essential condition. In that case we should not require the vine, the press, or the fermentation. The supposition of such an artificial process is opposed to all that we know by experience of the natural process, but the absolute necessity of this natural process is not in the least proved by the fact that it actually takes place. Propositions attained by induction are without necessity and universality; and, in the face of all the facts of experience, the possibility yet remains that the same result may be attained in another and perhaps a shorter way. That nature has not attained perfect mastery in her works she shows us everywhere, or whence should we have so much that is abnormal and repulsive? If she has to bring

about anything safely, quickly, and surely, art must come to her assistance. Thus it is in agriculture, in the rearing of cattle, in the various trades, and in the cultivation of man, and in diseases. Art and science always aim at an improvement of mere naturalism, both in quantity and quality. Even real natural products are produced by art more easily and speedily than by nature. What preparations must nature make, what a combination of favourable circumstances must she await before she can produce mineral water! Art, by the employment of natural elements, produces it by a shorter way, and, if fortune favours, equals the natural production. With nature there is a great expenditure of force to create the water that falls from heaven, out of oxygen and hydrogen. She brings into action violent electrical and magnetic processes, while it is very questionable whether these will assist at the right time, and bring about the desired result; whether light and caloric will sufficiently co-operate. On the other hand, art produces water—as, for instance, in Lichtenberg's apparatus—easily and quickly, nay, in an instant, by means of the electric spark. Now the very thing that occurs with respect to the electric spark in the production of water, took place with respect to the divine spark in the production of the miraculous wine at Cana. It was by means of the divine spark that the raw elements of wine, dispersed throughout the atmosphere, were suddenly so combined as to produce natural wine. Now this very divine spark, which was neither chemical nor electrical, was in the power of the Redeemer; for he never performed his miracles without his heavenly Father. The Gospel tells us that water was turned into wine; but it does not maintain that the surrounding air, the warmth and the light of heaven were cut off from all communication with the water. Neither was there any want of carbon or nitrogen, especially when so many persons were assembled as at a wedding, to cause the wine to ferment. All the elements of wine are to be found in the atmosphere, in which they float freely, so that it was a great condescension on the part of the Redeemer that he did not cause wine at once to rain down from the air, but had it fetched in vessels."

And so on—and so on—and so on; what a waste of ingenuity, and what a world of sophistry is here! The simple man who believes that actual water was converted into actual wine, has got just as far as this learned doctor, who believes that vinous elements were supernaturally brought together by a divine spark. If it is conceded that a supernatural power can modify the ordinary operations of nature, what does it matter whether it shows itself in the form of conversion or acceleration? A tension of the natural muscles that will enable a man to leap from Dover to Calais, is just as miraculous as a pair of wings pointing from his heel. The great question respecting miracles is simply this: "Whether we have evidence enough to assume that the chain of natural events exhibited by experience has been interrupted by

a foreign power?" and it is idle to attempt an answer to this question by the substitution of one miracle to another. Dr. Taute's depreciation of nature, for the sake of working out his miracle, is not a little amusing. The orthodox theologian has stumbled into a heterodox path; and we fear that those worthy men in our own country, who so kindly load our book-shelves with volumes of physico-theology, and who clutch at plants, stars, minerals, human hands—anything, in short, that they may procure new documents in favour of the teleological system—will find in Dr. Taute an indifferent ally.

A strange-looking book,<sup>13</sup> printed in a biblical form, and professing to be the "Newest Testament," makes a conspicuous appearance among more temperate publications. The author, who is styled the "Advocate Clément," has no small opinion of his own mission. He addresses the wiser and the better among mankind in the name of God; and says that with this, his Newest Testament, he has accomplished true salvation for time and eternity. It is to be the divine touchstone for the present generation; and will show who is of God and who is not. So he goes on, blending a sort of crude science with his ravings, and making the most startling assertions with all the show of divine inspiration. For instance, he says, without the slightest hesitation:

"Every quarter of the globe, Africa, America, Australia, and Europe, had, like Asia, their patriarchal pair, created, not born of woman, placed by God, distant-wise in ten or twenty spots, more or less distant from each other in each quarter of the globe, a society of ten, twenty, thirty, forty pairs, more or less being placed in so many paradises corresponding with the various localities."

Books of this description are the most useless in the sphere of literature. If they contain anything of value from a scientific point of view, that value is destroyed by a form which, of all others, is repugnant to science, while to the generality of cultivated mankind they are simply offensive.

The first business of a biographer is to "show cause" why a biography should be written: the second, to explain the relation in which he has stood to his subject, and the means he has had of executing his task. To an inquiry on the first of these points the name of Thorwaldsen will mostly be thought a sufficient answer; on the second, Professor Thiele is able to afford

<sup>13</sup> "Neuestes Testament testirt im Namen Gottes des heiligen Geistes." Von Advocaten Clément. Stuttgart. 1852.

us full satisfaction." He was an intimate friend of the "Danish Phidias," and as one of those appointed by him to execute his will, he was, in the year 1844, the year of Thorwaldsen's decease, despatched to Rome by king Christian VIII. to assert the claims of Denmark to the works left behind in his studio. While awaiting some of the legal formalities necessary for their transport, and lingering in the departed sculptor's desolate abode, he made an almost accidental discovery of an immense mass of biographical materials, the existence of which had been previously unknown. Loitering in contemplative mood about the Palazzo Tomati—a gloomy abode in its best days, and now tenfold more dreary—amidst remnants of decayed furniture, rickety chairs and tables, bits of packing cases, sawdust and straw, which covered the floors, he amused himself by picking up and arranging fragments of letters, visiting cards, &c., many with rough sketches on the backs of them, that lay scattered about amongst the manifold *débris*. Further rummaging discovered a large pocket-book, black, old, mouldy and venerable, the aspect of which carried the thoughts of the Professor back to the Icelandic home of the sculptor's ancestors; and on opening it, there appeared, carefully wrapped up, some letters from his father and mother. Pursuing his researches, and recollecting that it was a habit of Thorwaldsen—though he would toss letters about in a reckless manner, and even use bunches of them to help in packing his marbles—never wilfully to destroy any, Professor Thiele became convinced that a great quantity of them must be in existence somewhere. It now occurred to him that on a former visit to the sculptor he had noticed a flight of steps leading down from one of the rooms to the door of a cellar apparently long disused, and blocked up with planks and rubbish. This he determined now to explore. A lantern was fetched, the planks and rubbish cleared away, when lo! in the dark damp cellar, the abode of snakes and scorpions, were discovered several casks of letters, papers, and drawings, hidden under lumps of clay, bricks, and fragments of sculpture purposely laid over them—stowed away apparently for years, and it may be afterwards forgotten. Great was the labour imposed upon his biographer by the discovery of this hidden treasure, in the airing, drying, and arranging of the papers half destroyed by damp; but it seems to have

been performed as a labour of love, and most of these documents have been since arranged and mounted, and may now be seen at the Thorwaldsen Museum at Copenhagen. They relate of course principally to the period of the artist's residence in Italy, and it is much to be regretted, that of the earlier period of his life—the seed time of the future harvest—such scanty notices are to be found. From what can be gathered, it appears that he was in his childhood and youth steeped in poverty to the lips. His father, who was employed in the dock-yards, was not only an indifferent workman, but addicted to drinking; and in his infancy his poor mother was often seen with her baby in a garret wanting the common necessaries of life. Subsequently the domestic circumstances improved a little, but never advanced beyond a very narrow and disorderly condition. Of education for the boy there appears to have been no question beyond what little help his mother could afford; but his attempts at drawing, whether assisted by his father or not, were soon such as to attract the attention of a friend of the family, who procured him a presentation to the Academy of Arts when he was eleven years old. His progress here seems to have been rather less rapid than might have been expected; probably because a great part of his time was occupied in helping his father, who, relying on his talents, had now undertaken to make figure-heads for ships. In 1793, however, when he was twenty-three, he gained the great gold medal to which a travelling pension was attached; and shortly afterwards, in pursuance of the advice of friends rather than his own inclination, left his family and his country never to return except for one brief visit. It is somewhat mournful to hear of the home made desolate by the withdrawal of the hopeful son, its pride and its support; of the helpless tears of the mother, displaying his parting gifts, and kissing the old waistcoat that he had left behind: but,

" Things like this you know must be  
In every famous victory,"

and the battle of life, like other battles, demands its victims. Thorwaldsen did gain the victory as an artist; yet all through his biography we are haunted by the sense of want of harmony between the man and his position—a sculptor born in a country which can afford no education to a sculptor, no maintenance for him when educated. One after another his works are sent home, pronounced excellent, but lie mouldering in

"Thorwaldsen's Leben." Von Just Matthias Thiele. Leipzig. C. B. Lorch. 1852.

warehouses, vexing the souls of the artist and his friends with their charges for freight and so forth, which nobody is willing to pay.

From the period of his establishment in Rome, the biography of Thorwaldsen is principally occupied with an enumeration of the various works ordered and executed for sundry noble patrons and the correspondence concerning them, with occasional mention of financial difficulties, and here and there of embarrassments of a tenderer nature, of which the most serious was a project of marriage with a Scotch lady of fortune—a Miss Mackenzie. The affair was broken off solely from the volatile behaviour of Thorwaldsen; yet he appears to have been really attached to the lady, and even many years afterwards exhibited signs of strong emotion, on her accidentally entering a room where he was. The conduct of Miss Mackenzie in the trying situation in which she was placed was admirable. In a touching farewell she says, "If you enjoy all the good that I wish you, you will be happier than I could have made you in our happiest days." She never returned to her own country, or formed any other attachment. On the whole we feel some disappointment that Professor Thiele should not, with the materials at his disposal, have brought us to a closer view of the great sculptor. Of the details of his daily life—of the thousand minute traits that mark a character, and call up a living image before us—we have almost nothing.

As "My Life and Acts in Hungary"<sup>14</sup> has already been translated, besides being extensively noticed by the daily and weekly press, our readers are, in all probability, sufficiently acquainted with its contents, to make any further mention of them superfluous. The amount of credit to be given to its statements cannot of course be accurately determined till the publication of the replies which it will doubtless call forth. It is obvious, however, that it has been skillfully timed to take advantage of the moment when Kossuth is floating rapidly down the ebb tide of popular favour.

The "History of Gustavus Adolphus,"<sup>15</sup> though complete in itself, is intended to form a part of a domestic historical library (*Historische Hauss Bibliothek*), of which we believe twelve or thirteen numbers have already appeared. These publications are

not so common in Germany as with us. A stronger line of demarcation has usually been drawn between the learned and unlearned public; and while historical works addressed to the one, have been mostly so bulky in form, and so profound and critical in their contents, as to alarm all but professed students—others have been too trivial to merit the attention of cultivated general readers, being in fact merely intended for school abridgments. The present work is intended to occupy a middle rank between those two classes; and for this it seems to be well adapted. This choice of a subject necessarily involves the writer in the disadvantage of frequently passing over familiar ground; but the character of Gustavus Adolphus is one that must always attract popular sympathy—rising like a star above the dust and smoke of the tremendous strife with which his fortunes, fame, and life were so intimately connected. The principal danger for the historian of the "Lion of the North," is that of falling into indiscriminating panegyric. It would have been perhaps well if the recent attacks on the great Protestant hero by Catholic writers had not been passed quite without notice.

"The Book of Crimes"<sup>16</sup> is, as may be conjectured from its title, a contribution to the knowledge of the morbid anatomy of the human mind. The present volume, which is the first of a new series, contains a full discussion of the case of Professor Webster, and of other remarkable criminals, in all the hideous varieties of the species, and, from the nature of its subject, of course much that is painful and disgusting. To do the author justice, however, he seems to have had a better object in view than that of ministering to a depraved appetite for horrors—namely, that of preparing the way for the introduction of the trial by jury into his country, by instructing his countrymen in the nature of evidence in criminal cases, and developing their psychological tact, "by laying bare the secret laboratory of crime in the breast of the criminal;" showing how the germ of the criminal intention first took root, developed itself, and gained strength, till the better impulses existing in every human breast were finally vanquished in the struggle. It has also been the author's purpose to point attention to certain judicial murders, which have originated in the weakness, narrow-mindedness, or passion of judges, or the secret, malicious, inquisitorial mode of procedure customary in Germany, or in many cases

<sup>14</sup> "Mein Leben und Wirken in Ungarn in den Jahren 1848-1849." Von Arthur Görgei. Leipzig. Brockhaus. 1852.

<sup>15</sup> "Geschichte Gustav Adolphs." nach Andreas Fryxell. Leipzig. Lorch. 1852.

<sup>16</sup> "Das Buch der Verbrechen: Ein Volksbuch." Von Dr. W. L. Demme. Leipzig. Arnold. 1852.

the unwillingness on the part of official persons to own to a mistake—the diabolical impulse rather to do wrong than to appear to the world to have done it. By way of appendix, Dr. Demme also gives some short essays, or rather hints, which he denominates “Blocksberg Meditations”—on the nature of what is called superstition—on the origin of the personification of the evil principle—on the proceedings of heathen enchantresses, and their historical connexion with the witches of Christendom, &c.—subjects, we must suggest, which are of too much importance to be compressed into little more than twenty pages.

“Paris,” by Frederick Szarvady, *Travels*. a series of sketches of those features in the physiognomy of the French capital which most readily strike the eye of a stranger—the boulevards, the salons, the artists, the newspapers, the ball at the grand opera, &c., all matters which have been already chronicled in a hundred various modes, and with which most of our readers, we presume, are more or less personally acquainted. The author starts with an assertion partly true, that every great town has among its streets or public places some one that may be regarded as the résumé or index of all that it contains; but when he selects Regent Street as the miniature mirror of London, we must demur, if not to the truth of his position, at all events to the propriety of his illustration. If we were required to select one street that emphatically is not London, and contains less than any other of what is characteristic of London, we should certainly name Regent Street. In his chapter on the Parisiennes, M. Szarvady, like most foreigners, takes cognizance of the French woman solely in her relation to dress and coquetry.

Now we have the strongest impression that, however skillful in these exercises, the French woman frequently has other objects in life—that she is often possessed of no small amount of virtues of the sober and thrifty order, and that, all appearances to the contrary notwithstanding, such a thing as domestic life does exist in Paris, concerning which we should be glad of more accurate information. Of the mere froth or scum of its social existence, we have heard more than enough. We should not, however, omit to mention among the contents of his volume some clever biographical notices of the leading politicians of the day, and the *yesterday*, and of the late newspaper press.

Miss Lewald’s *Travels in England and Scotland*,<sup>10</sup> of which the first volume was published a year ago, though addressed of course to the authoress’s compatriots, to whom alone it can afford any novelty of information, will probably be dipped into at least by many English readers; for in spite of the proverb, that “listeners hear no good of themselves,” most people have a strong inclination to listen when others are talking of them, and the desire is as strong in nations as in individuals. The general impression made on this occasion by “England and the English,” appears to have been highly favourable; and though the style of these remarks is perhaps somewhat less piquant than might have been expected from the vivacious authoress of *Diogena*, we cannot but be struck by the candour and truthfulness of her judgments concerning things that must have contradicted many of her preconceived notions.

Among the most interesting points in the journal to us, are the passages which lead us to form inferences concerning the state of things in Germany, from the subjects and character of the authoress’s remarks on England. The surprise she expresses at the social consideration, the independence of movement, and the intellectual culture of women in this country, affords a rather melancholy inference concerning the position and character of the sex in Germany. And her admiration of the habits of self-government formed in our people by our parochial and municipal institutions, remind us of one of the most mischievous effects of the perpetual meddling of German governments with what we regard as private affairs.

In the variety of subjects touched upon in a hasty tour of this kind some mistakes are perhaps unavoidable; but we were rather surprised to learn on Miss Lewald’s authority, that it is the custom for guests staying in an English house to address the servants of the establishment as “Sir,” or “Miss,” and that the ordinary wages of an English maid of all work was forty pounds a year. Still droller is the misconception in the criticism on Dickens’s *Dombey*, where she supposes that the author had intended to reconcile us to the amiable Mrs. McStinger, by representing her as seating her infants upon the cold flagstones, “after whipping them with true housewifely briskness,” in *order to cool their heated limbs*. Overlooking the satirical meaning, Miss Lewald takes this additional atrocity of the flagstone applica-

<sup>10</sup> “Paris: Politische und Unpolitische Studien und Bilder, 1848–1852.” Von Frederick Szarvady.

<sup>10</sup> “England und Schottland: Reise Tagebuch.” Von Fanny Lewald, 2 bände. Braunschweig, 1852.

tion for a proof of motherly tenderness. But in spite of some trivial blunders of this kind, her compatriots could not readily find among the recent accounts of England one more worthy of reliance. We trust, however, that the statement concerning the servant-maids' wages may be corrected, lest it should tend to disturb domestic relations in the kitchens of her fatherland, and confer on England some of the dangerous attractions of the "gold diggings."

"Travels in Cos Halicarnassus and Rhodes"<sup>1</sup> is by the well known Professor of Archæology at Athens, one of the most distinguished champions of the old school of profound German erudition. He appears to have regarded it almost as a duty to confine himself to what we may call his professional department of research, which in the present state of the world is one that can hardly be expected to occupy the attention of more than a very limited class of readers beyond the limits of colleges. Nine-tenths of the volume are taken up with accounts of inscriptions and other relics of antiquity, but the casual hints dropped here and there excite our regret that the author did not bestow more of his space on the characters and mode of life of the inhabitants of places lying so entirely out of the reach of any of the great thoroughfares of the world, and so seldom visited by any competent observer. Sometimes a few words will throw a considerable light on the present mournful condition of what were once the most illustrious foci of art and civilization. In visiting, for instance, the ancient fortress of Ammochostos, in the Island of Cyprus, the author says:—

"Between the court of the castle and the front of St. Sophia was a small space containing fountains, and enclosed with antique granite columns, which, to judge from what now remained, must have rivalled the finest market-places of mediæval Italy. Now, there wander about it a race which, in its degeneracy, cannot even comprehend the magnificence of these remains—nay, *wander* is much too noble a word. The crooked-legged sons of Mahomet (crooked from eternal sitting and crouching) do not wander, but sink and *wabble* about in ragged breeches and shoes trod down at heel."

"A Return Journey from Java"<sup>2</sup> is by a Dutch resident of thirteen years' standing, revisiting Europe to recover the health which had been damaged by the heat of the climate; after having previously, for the

sake of a lower temperature, occupied a rather retired summer residence on the edge of the crater of a volcano at the height of more than six thousand feet. His course lay through the Straits of Sunda and Malacca, thence to Ceylon, Aden, Suez, to Trieste, and stopping by the way at many ports to change steamers, or to take in coals or mail bags, and being never more than eleven days together at sea. The author appears to be generally a well informed man, and pays particular attention to the geology of the regions through which he passes. The first part of the voyage lay through a perfect labyrinth of islands, almost all covered to the water's edge with dark woods, and so excessively alike, that even the inhabitants often have to fix signals on the shores, or on high trees, in order to know them again. The water was in general as smooth as a mirror, and the navigation through these narrow winding channels, often not broader than a river, extremely intricate. Many of these islands are uninhabited, and do not appear to have been ever visited. At Ceylon, the traveller exchanged the steamer *Braganza*, in which he had come from Singapore, for the *Ben-tinck*—a magnificent vessel belonging to the Oriental Steam Navigation Company, in which he found himself surrounded by so many conveniences and luxuries, that he could hardly, he says, fancy himself on board a ship. The whole voyage from Batavia to Suez, including all stoppages, took only six weeks and two days.

"Old English and Scotch Popular Poetry. Ballads,"<sup>3</sup> appear almost as much at home as in the original, so faithfully have they been rendered, and so well is the nervous simplicity and homely pathos of the German suited to their character.

"Kaiser Karl"<sup>4</sup> is a connected series of romantic ballads on legends of the Carlovingian race—in some measure an imitation of the Frankish poetry of the eleventh and twelfth centuries—but displaying both originality of conception and beauty of execution.

We are indebted to Mr. Gutzkow for a pleasant book, his "Recollections of Boyish Days,"<sup>5</sup> but we cannot but wish he had not thought it necessary to hang round these recollections so many fan-

<sup>1</sup> "Reisen in Cos Halicarnassus Rhodos und der Insel Cypern." Von Ludwig Ross. Halle. 1852.

<sup>2</sup> "Rückreise von Java nach Europa: mit der Englischen Oberland post." Von Franz Junghatur, aus dem Holländischen. Leipzig. Arnold, 1852.

<sup>3</sup> "Alt Schottische und Englische: Volks Balladen nach den Originalien verarbeitet." Von W. Doeniger. München. 1852.

<sup>4</sup> "Kaiser Karl: Eine epische Trelogie." Von O. L. Gruppe. Berlin: Rieme. 1852.

<sup>5</sup> "Aus der Knabenzeit." Von Karl Gutzkow Frankfurt: Literarische Anstalt. 1852.

ciful garlands and arabesques, that it is sometimes almost as difficult to make out what they actually are, as to unriddle the story of one of Mr. Dickens's novels from the allegorical illustrations of the frontispiece. His sentences, too, are often so encumbered with epithets, that it is not easy to assign to subject, object, and predicate, their due share—and it becomes necessary to stop and clear away some of them before we can ascertain which way we are going. In describing the scenes in which his childhood was passed, the author has found occasion to afford us some valuable glimpses into the character and mode of life of the working classes of his native city, Berlin, and the interest of the picture would have been still stronger had he felt sufficient confidence in its attraction to have left it in the unadorned simplicity of truth.

In the department of professed fiction, the work of the highest pretension among those before us is called by the not very promising title of "Tranquillity is the first duty of a Citizen,"<sup>33</sup> which gives an animated representation of the state of society, literary, political, and fashionable, in Berlin, during the latter part of the last century, when the temporary blaze kindled by Frederick der Ernzigte had become extinguished, and left behind it only foul and noxious vapours.

"Heloise"<sup>34</sup> is a tale of considerable merit; the principal defect of which is in the ambiguous position of the heroine, and the nature of her attachment to one whom, we are told, she has all her life been taught to consider as her brother, but who does not really stand in that relation to her. Had she, up to the moment of the discovery, looked on him with merely sisterly affection, one cannot well see how the nature of her sentiments could have been changed on so short a notice.

The "Stories of Old Jacob the Smith,"<sup>35</sup> is a collection of popular tales, in a style of rustic simplicity, the longest and best of which, "The Emigrants to America," may be considered as a sermon on the old German saying—"Bleibe im lande und nähre dich redlich," or, stay in your own country, and get your living honestly.

In "German House Fables,"<sup>36</sup> adventurous princes, princesses, the "fairest under the sun," giants, enchanters, and, above all, clever little tailors, are shifted about in such a manner as to give always the effect of something new—like the figures of a kaleidoscope, but which, on examination, we find to consist of various combinations of the same pieces. To juvenile readers, however, for whom such collections are intended, absolute novelty is by no means requisite.

The "Treasury of Italian Novels"<sup>37</sup> gives a series of specimens arranged in a chronological order, commencing with the year 1300, but omitting Boccaccio, of whom a complete translation has already been given in the "Library of Foreign Classical Writers," of which these volumes form a part. The original idea of the novel, it will be recollected, was that of some piece of news, amusing anecdote, or occurrence of the day, related in a light and graceful manner, and intended for social entertainment. It is in this sense only, that the word must be understood here. One of the chief difficulties of the translator lay in the licentious character of many of these productions, especially as the fault was not so much in particular expressions or descriptions, which might have been omitted, as in depraved and sophistical moral theories, which, as his object was to afford literary historical specimens, he could not pass in silence. He therefore gives his readers warning that his book "is not intended for young ladies and gentlemen," a limitation, perhaps, which the young ladies and gentlemen have small reason to regret, for the "Treasury" contains coin that has a value merely as a literary curiosity.

In Germany, as will be seen, the modern school of novel-writing differs widely from the old. Instead of metaphysical subtleties, fantastic theories of character and action, equivocal morals, wild unearthly fancy and grotesque humour, we have scenes and characters of every-day life and real history, average men and women, and, in general, a tone of morality not only sound, but keeping within the limits of what they themselves term the "home-baked,"—a kind of diet which, if occasionally somewhat heavy, is not unwholesome, and there is always hope in a return to truth and nature.

ART. XIII.—CONTEMPORARY LITERATURE OF FRANCE.\*

Ours is a light budget this quarter. Whatever else may flourish at this moment in imperial France, it is not literature. The sale of Victor Hugo's furniture, library, and *objets d'art*, is emblematic of the whole condition of authorship. Exile, silence, servility, or penury—those are the issues open to men. With gagged mouths, crippled means, and deep uneasiness as to the future social condition, how can men write? Hugo sells his furniture, Auguste Comte lives upon the generous subscription of friends and admirers! Poetry and Philosophy are *thus* represented! Among the works that have appeared, exclusive of new editions and translations, we will name the most attractive.

**Philosophy.** The greatest of modern thinkers, Auguste Comte, is unhappily by no means one of the best writers; he obscures his popularity by an unwieldy verbosity of style which adds greatly to the fatigue of following his long chains of reasoning. It is, therefore, a matter of no little importance to such a philosopher to find a disciple so able, so entire in his devotion, and so capable of popular exposition as M. Littré undoubtedly is. Comte's two best known English disciples separate from him on too many points, and those often essential points, to be properly regarded as apostles of his doctrine; but Littré accepts his master with unhesitating and implicit confidence, taking upon himself the labour of interpreting the doctrine to the masses. The three series of articles which at different periods since 1844 he has published in the *National*, on the positive philosophy, (two of which have already been collected into separate little treatises, viz., "De la Philosophie Positive," and "De l'application de la Philosophie Positive au Gouvernement des Sociétés,") are now united into one volume under the title "Conservation, Révolution, et Positivisme," which, as it may be had for a couple of shillings, no serious thinker should be without. In the first treatise he gives a rapid but luminous sketch of the main outlines of the Positive philosophy, a sketch that will greatly facilitate the study of the original work; in the second, written just after the Revolution of 1848, and à propos to Comte's "Discours sur l'ensemble du positivisme," he shows the application of the doctrine to the solu-

tion of social problems, which is still further worked out in the third treatise—"Des Progrès du Socialisme."

**History.** In history we have only two works to name—"Histoire des Protestans de France," by G. de Felice; and "Histoire de la Convention Nationale," by Barante, the fourth volume of which embraces the Reign of Terror, and closes with the death of Robespierre. On the general qualities of this history we have already spoken; the fourth volume continues in the same style. It is abundant in details, yet symmetric in its ensemble; the various questions which the events brought forward are touched succinctly, if not impartially; and the whole tone is remarkable for its moderation. To read the Reign of Terror in these pages after the emphasis and declamation, the search for picturesque effects, and for "words that burn," with which we have been treated by so many writers, is like listening to a debate in the House of Lords, after a turbulent discussion in the London Tavern. This moderation, this sobriety of style, is not without a charm; and among the books on the revolution worth possessing, de Barante's "Convention Nationale" will always count. M. Felice's "History of French Protestants" is a work written by a Protestant, to set forth the persecution to which his sect has been subjected by French governments ever since the Reformation, and one which proves, if proof were needed, that the great outbreak of 1789 was not altogether without permanent fruits, if only in its vindication of those principles of freedom which the French philosophers had so emphatically demanded. The orgies of liberty are painful enough to contemplate; the Reign of Terror, as we read of it, may suggest some suspicion that perhaps the "good old times" were, after all, not so bad; and that the philosophers who were so eager to *écraser l'infâme*, who spoke so bitterly against priests, and so eloquently of toleration, were not justified. But when this doubt arises we need only turn back the page of history to see a thorough vindication of the revolution. M. Felice alone will satisfy us. He will tell us how men were hanged in France for their religion as late as 1760; and his volume is filled with details of odious intolerance. His account of the measures of Louvois, and the edicts of Louis XIV., is appalling; and the latter are historical facts which admit of no dispute, and cannot be said to take their colouring from the historian.

**Belles Lettres.** In this department there are more works to notice. Charles

\* The works named in the course of this article have been furnished us by Mr. Jeffa, of the Burlington Arcade.

Magnin, the erudite author of the "Origines du Théâtre Moderne," and formerly one of the choice band of critics who opened a literary revolution in *le Globe*, has published a work of great learning and unflinching interest on Marionnettes—"l'Histoire des Marionnettes en Europe depuis l'antiquité jusqu'à nos jours." He commences his survey with the *priestly* marionettes—for he rightly detects the religious origin of this as of every other form of dramatic entertainment—in Egypt, Greece, and Rome. The images of the gods, especially those made to move their eyes and to speak, justly claim precedence. He then traces the marionette in familiar life, describing its position in feasts and in children's games; thus showing a descent from the idol to the doll; and his piquant erudition enables him to gather together many an amusing detail of Egyptian, Grecian, and Roman life. He next describes the structure of ancient marionettes; and every reader will be astonished at the evidence there adduced of the mechanical perfection displayed by these puppets. An inquiry into the ancient Marionette Theatre of the ancients concludes this portion of the work. We now come to the Middle Ages, where, as in the drama, a somewhat similar march is observed. In the third part, that of Modern Times, M. Magnin enters elaborately into the minutiae of his subject. All that erudition can do has been done to make clear to us the history and variety of marionettes in Italy, in Spain, and Portugal, in France, in England, and in Germany. While treating of the last-named country, he naturally encounters the name of Goethe, who was himself the most illustrious of *puppenspieler*, and the name of Faust, the most illustrious of puppets; these lead him into an entertaining survey of the Faust legend, and of the pieces by Lessing and Heinrich Heine (*Mephistophela*, a ballet composed for our opera in 1851). We have said enough to indicate to amateurs the contents of this volume.

Perhaps the most charming work in this department we could name is the "Cause-ries du Lundi," of Sainte Beuve, a fourth volume of which has appeared. It is a collection of "studies" of the great names of the eighteenth century, varied by an occasional portrait taken from the galleries of the seventeenth and nineteenth centuries. No man in France has a more accurate and extensive acquaintance with the literature of these epochs; and to this erudition, both varied and solid, Sainte Beuve adds the sagacity of a man of the world, the sympathy and style of a poet, with the contemplative

spirit of a moralist. In this fourth volume we have Mirabeau, Marie Antoinette, André Chenier, as a politician, De Maistre, Madame de Lambert, Madame de Necker, l'Abbé Maury, the Duc de Lauzun, Buffon, M. de Bonald, Marmontel, Mallet du Pan, Chamfort, and Rulhière; with Montaigne, Amyot, Mdlle. de Scudéry, St. Evremond, and Ninon, Mary Stuart, Madame de Maintenon, and Jasmin, Pierre Dupont, and Lamartine. The series, it will be seen, is sufficiently varied and entertaining, nor is it too much to say that Sainte Beuve's knowledge is equal to all the variety requisite. The article on Buffon, for example, although not that of a naturalist, is nevertheless a valuable contribution, and implies in the writer a philosophic insight, for which we did not give him credit. Buffon is painted more as a man and as a writer, it is true, and yet his position as a thinker is modestly, but clearly indicated. In the two articles devoted to Mirabeau we have a study of the most piquant biographical kind. M. Sainte Beuve has had in his possession the manuscript of some unpublished "Dialogues," written by Mirabeau, in which the whole story of his amour with Sophie is told in detail. By judicious extracts, and a running commentary of remarkable finesse, Sainte Beuve reproduces this story, and almost obliterates our regret that such dialogues should remain unpublished, so graphic is the picture he has given. Well worth reading also, are his remarks on Mirabeau, as a writer. Montaigne and Mademoiselle Scudéry are two portraits, the one of a writer dear to every reader, the other of a writer once read by all, now known only as a name, except to the curious. St. Evremond and Ninon give Sainte Beuve an opportunity for showing his finesse and talent in a delightful kit-cat sketch. Lamartine's "Histoire de la Restauration" is reviewed with incisive severity, Marmontel with indulgent sagacity. Altogether, as we have already said, these four volumes are the pleasantest collection of essays and reviews we can name.

In direct contrast stands the collection of reviews made by Cuvilier Fleury, from his contributions to the *Débats*, under the title of "Portraits Politiques et Révolutionnaires." These two volumes of polemical vehemence are rendered something more than mere newspaper articles by the substantial historical merit which they possess, in the shape of facts and opinions on the two revolutions of '89 and '48. Although the passion of a partizan is as apparent in the elaborate studies Cuvilier Fleury has given

of Barère, St. Just, Rousseau, Camille Desmoulins, and "Les Vierges de Verdun," as in those of Lamartine, Louis Blanc, Proudhon, Sue, Daniel Stern, Ledru Rollin, and Victor Hugo, yet in the former series there is a more serious tone and a truer appreciation of motives. The volumes certainly are not deficient in force either of sarcasm or invective. The style is trenchant, personal, arrogant, clear, rapid, and lively; the criticism frequently as just as it is severe, and to those *esprits chagrins* who delight in seeing great reputations worried by the small dogs in the street, the volumes will be decidedly agreeable. The most successful, because the most justifiable of these attacks, is the article on "Love as seen in the life and works of M. Lamartine." Those who have been disgusted with the love narratives of "Les Confidences" and "Raphael," will see the cruel coxcombry mercilessly exposed. M. Cuvillier Fleury hates Lamartine, but hates him apparently more for his participation in the "surprise" of Fleury than for anything else. He has not recovered from that "surprise." Revolutions have become things of inexpressible disgust to him ever since; and he solaces himself by vilifying every one concerned in revolutionary proceedings. On the other hand, he has no eloquence too abundant and exalted for Louis Philippe and the Orleans family. The first half of his first volume is devoted to the February "surprise," and is worth consulting as the energetic expression of the Orleanist view of the affair.

Quite as trenchant, still more impertinently arrogant, but without the honest fervour of conviction which animates Cuvillier Fleury, the "*Œuvres Littéraires de Granier de Cassagnac*" are only worth looking at as specimens of French journalism; not because of any intrinsic worth, but because Granier de Cassagnac has recently crawled into notoriety by the prostitution of his pen to Louis Napoleon, these essays of his have been gathered from the journals, where on their appearance, they excited attention and infinite contempt, and now come forth as *œuvres littéraires*. There is no denying them a certain vivacity and audacity of expression; but they are worthless at bottom. If a man of ordinary thews and sinews finds that he cannot outstrip his fellows in the race, but is unobserved in the crowd of hurrying mediocrity, he can at all times break through this obscurity by standing on his head, or by throwing summersaults; people are certain to regard him *then*; and if to attract attention be his aim, though the attention may be but a more definite form of contempt, his aim is reached. Granier

de Cassagnac may flatter himself with having reached that aim. By attacking Corneille and Racine during the great romantic fracas, he attracted attention. Since then he has never lost ground for want of a paradox or an insolence. As the most conceded of writers, even among French writers, and as one of the most intrinsically worthless, he is known to all persons attending to these matters.

Gay and attractive in style, though perfectly French in the subordination of all things to effect, Gérard de Nerval is always worth reading. His last work, "*Les Illuminés ou les Précurseurs du Socialisme*," under a vague, misleading title, contains some "romances of real life" and curiosities of literature well worthy of being thus collected into durable form. The biography of Restif de la Bretonne—the Sue of the eighteenth century—is one of the most interesting stories and curious pages in literary history easily named; although fact and fiction are inextricably intermingled. Cazotte is a strange study; the chapter on "*Le Mysticisme Révolutionnaire*" offers curious details on a portion of revolutionary history never touched except by Michelet and Louis Blanc. Altogether the volume is remarkable.

The "*Mémoires d'Alexandre Dumas*" have reached a seventh volume, and not yet commenced his career as an author. Nothing that Dumas writes can be dull, but nothing that he has ever written can approach these Memoirs in impertinence of book-making. He seizes upon every trivial pretext, and if need be invents pretexts, for long detailed digressions having nothing to do with his life. If he has an interview with some insignificant person he gives a sketch of the whole conversation, and not unfrequently a short biography of the person spoken with. If he goes to the theatre he devotes three chapters to an analysis of the play, varied by conversations which he says were held with his neighbour at that play. The garrulity of garrulous age summoning the past once more before it, never exceeded these Memoirs. And observe, that when age is giving way to the crowding memories of former days, you listen with some feeling that the truth is told, whereas with the great romancist there is no moment of moderate belief; if he is not incessantly inventing facts, you feel that he is incessantly arranging them as he would in a romance, and all faith in his narrative disappears. Two more remarks are called for. First, that the crudity of expression he not unfrequently permits himself, surpasses even the licence of French writers; and secondly,

that of late he has insisted upon his religious pretensions in a style that must excessively amuse all his readers. Far be it from us to decide upon Dumas's religious sincerity. After such examples as we find in Italian history of undoubted and undoubting faith in Christianity, accompanying lives that are a perpetual outrage upon Christianity, we see no reason for questioning the possibility of the gay, dissipated, reckless, but generous and honourable Dumas being a sincere Catholic. But it is one thing to admit thus much, another to accept such pretensions as those he has of late put forth. For example, here is a passage in the seventh volume of these Memoirs.

"I do not know what good I have done, either in this world or the other worlds in which I have lived before, but God has shown me special favours, and in all the difficult situations of my life he has visibly come to my assistance.

"Therefore, oh! my God! do I loudly, yet most humbly proclaim your name, in the presence of believers as well as of unbelievers, and I have not even in so doing the merit of faith, but simply that of truth.

"For, if you had appeared to me at the time when I invoked your presence, oh, my God! and if you had said to me, 'Child, tell me fearlessly what thou dost want,' I never should have ventured to implore of your infinite goodness one half of the favours you have granted me."

Who can read that with gravity? In the preface to his novel, "*La Comtesse de Charny*," he speaks with comical indignation of the proposal made to him by the proprietor of some journal to write the history of papal crimes: "*On vient me proposer à moi, l'homme religieux par excellence, l'histoire des crimes des papes!*" After that we shall not be surprised if he claim canonization as a saint of domestic respectability!

This "*Comtesse de Charny*" is a continuation of "*Ange Pitou*," which was abruptly terminated by the new press laws which affixed a stamp on the *roman feuilleton*. The whole of the preface in which Dumas relates this is worth preserving as one of the veritable pages in his Memoirs. Besides "*La Comtesse de Charny*," Dumas has published four volumes of an amusing novel, "*Olympe de Cleves*," which one finds it impossible to lay down unread, although it is not precisely adapted to *family* reading. A young Jesuit bitten with a love of dramatic reading—the more enchanting because forbidden—makes his escape from his reverend fathers and hurries to the theatre to see a play performed: by a series of comical incidents he finds himself on the stage as an actor, is applauded, falls in love with the great tragic actress Olympe, runs

away with her, and thus begins a life of incessant adventure, told with all the nerve and ease of Dumas. In another novel, "*Conscience l'Innocent*," Dumas has with incomparable coolness appropriated materials, and even language, of Michelet and the Flemish novelist Conscience, and spun them out into a somewhat feeble story.

Alphonse Karr is one of the wittiest and pleasanter of French novelists, and the collection of his short stories, "*Contes et Nouvelles*," will be acceptable to many. He has only published one new work, "*Agathe*," and that we have not yet had time to read, but are disposed to accept it on the faith of his signature.

The day of French novels seems over. George Sand is silent; Balzac and Soulié are dead; Eugène Sue has fallen into inanity and wearisomeness; Paul de Kock has exhausted his gaiety; Madame Reybaud is silent; Dumas alone is as active as ever, but he writes no "*Mousquetaires*," "*Monte Christos*," or "*Guerres des Femmes*." The vein seems exhausted. But may one not say the same of all literature just now?

---

#### NOTE.

In the article on the Commerce of Literature in our last number, among other illustrations of the state of our literary relations with America, there occurs the following:—

"The second case has reference to the mutilation and transformation of English books in America, which is as notorious as it is vexatious to English authors. Haydn's '*Dictionary of Dates*' and Latham's '*English Language*,' are good examples; but we will dwell only on the former. . . . This work is deprived of its unpretending name: its beginning and end are obliterated by preliminary and supplemental matter, either selected or from an American pen, and the book is then rebaptized '*The World's Progress*,' &c., &c. Haydn's name, though mentioned in the preface, is exchanged for that of the American editor in the title-page."

Mr. G. P. Putnam, of New York, who is at once the editor and publisher of "*The World's Progress*," complains that the above statement is an unfair representation of the facts, and he has forwarded to us the following vindictory explanations, which he has since published in the *New York Evening Post*.

"I must protest against the reference in the *Review* to the '*World's Progress*,' because it is unjust, and founded on an essential mistake. The reviewer intimates that I had misused Haydn's book by erasing some matter at the beginning and end, substituting some other selected matter, and disguising the whole by a new title. This is untrue. In the first place, my own book was first

published in 1832, six or eight years *before* Haydn's. I was engaged diligently and faithfully for no less than three years, at intervals, upon the tables at the beginning and end of my book, nearly every page of which was compiled by myself from many original sources, and carefully copied two or three times in manuscript. And these tables (which form the important feature of the volume) are referred to by the reviewer as 'selected,' or thrust in, to disguise Mr. Haydn's work! I might, with equal propriety, assume that the plan of Mr. Haydn's work was copied from mine, as mine had several years' priority.

"It is true that, in the new edition of my book, I have copied largely from his very valuable compilation; and I have stated so, fully and frankly, in the preface. I may have been wrong in not giving Mr. Haydn's name more prominence—but I had no intention to disguise an iota of the credit which was justly his due. It is, of course, self-evident, that any volume of this kind must necessarily be a compilation. Historical facts are public property, and originality can only be claimed for the modes of arranging and presenting them. The usefulness of such compilations as those in question must depend a good deal upon their being adapted to their intended meridian, and not encumbered too much with local details which belong specially to other countries. The question in this case is simply whether my book is a disguised reprint of Haydn's, or whether it is an original compilation, with a distinctive plan and character, in which no unusual or unacknowledged use has been made of other works. I am quite content that this should be decided by any one who will take the trouble to examine and compare the two books in question. Of course, it was never intended that the 'World's Progress' should be sold in London. Not a copy was ever sent there with my knowledge."

We did not impute any dishonourable intention to Mr. Putnam. So long as America refuses to accord to our authors an American copyright in their works, so long is the practice of reprinting English books in America, whether in a separate or incorporated form, duly sanctioned by law, and what the law sanctions soon comes to be regarded as right. Our statement of facts bearing on the literary relations of England with America, was intended, not as an accusation of individuals, but as an exposure of the evils resulting from the want of an international copyright law. We are happy to quote from the *New York Evening Post* some further observations of Mr. Putnam, which show that on the general question—the injustice of withholding such a law as the above—his opinion is in accordance with our own.

"The practice of copying American books either entire or in detachments without any acknowledgment whatever, and even with positive disguises, has been so long common in England, that a

reference to it would not have been amiss in this 'Westminster' article, but on *that* point it is silent. I do not say this to offset or excuse one wrong by another, but, so far as my knowledge goes, *this* practice has not found *many* imitators on this side. In the absence of international law, foreign works are *freely* claimed by publishers on *both* sides; and in the relative proportion of reprints, the London publishers appear to be rapidly gaining on the Americans. Of the cheap *serials* now publishing in England, I believe fully one-half are American works reprinted without copyright.

"As a matter of policy, as well as of courtesy, if not equity, I, for one, have always wished and still wish to see a proper international arrangement; and I believe it would be better for all parties if we could have such a one as would secure to both English and American authors a suitable return for the sale of their works in *both* countries. I am willing to do anything in reason to promote this object. If our rulers still refuse to sanction such a protection, is it to be expected that foreign books should be held in abeyance and not reprinted at all!"

As to Mr. Putnam's allegation that the practice of copying American books, "*without any acknowledgment whatever, and even with positive disguises,*" has long been common in England, we can easily believe it, and only desire that each case may meet with the wholesome exposure which it deserves. The most glaring instance of the kind which we are cognizant of is,—that of Muzzey's "Young Maiden." This little volume was reprinted in London, by H. S. Clarke, under the title of "The English Maiden;" the name of Muzzey was omitted from the title-page, and an advertisement was prefixed to the work announcing some slight alterations "as having been made by *the author* in the hope of rendering the volume more acceptable to the maidens of England." Mr. Muzzey complains that the wrong is aggravated by the fact that another volume, issued by the same publisher, under the title of "The English Wife," is said to be "designed as a sequel to 'The English Maiden.'" In the preface to this book, thus presenting itself with false credentials, it is said: "In the following pages, the author has made the *morality of the Bible* his standard of excellence; and he trusts that every sentence will be found to breathe the genuine spirit of practical Christianity." This is superadding Pecksniffian impudence to fraud, and certainly were the wrong even solitary of its kind, in England, it would still be enough to outweigh any case of Transatlantic annexation within our knowledge. For the rest, assuming that our writers and publishers are less given to plagiarism and piracy than those of America, it is obvious that the fact admits of explanation on other ground than that of England's moral superiority.

THE  
WESTMINSTER REVIEW,

No. CXIV.

FOR OCTOBER, 1852.

ART. I.—THE OXFORD COMMISSION.

*Report of Her Majesty's Commissioners appointed to inquire into the State, Discipline, Studies, and Revenues of the University and Colleges of Oxford, together with the Evidence, and an Appendix.* London: Printed by William Clowes and Sons, Stamford-street, for Her Majesty's Stationery Office. 1852.

WHOEVER wishes to throw stones at Oxford will find material in plenty in the Report of the Commissioners; the usual abuses of corporate bodies, the perversion of trust placed in their hands for public purposes to narrow and personal interests, aggravated in this case with systematic and serious perjury, may with more or less justice be charged against it; and we may amuse ourselves, if we please, with the spectacle of a body clinging convulsively to the statutes of its founder, while it lives in habitual violation of every part of them which do not serve its present convenience. There will probably be many persons, however, who will be ready to do work of this kind, and for ourselves, from the position which we hold towards the Church and the establishments connected with it, it will be more graceful to abstain from commenting on the exposure of their weaknesses. . . . After all is said, the colleges appear no worse offenders than a thousand others who for the present go on peacefully with their misdoings; their members are at least equal to, if not superior to their average standard; they are as good as public opinion has required them to be, and at any rate they are far better than they were fifty years ago. Literal obedience to the statutes is impossible; we have no right to be hard on men who only conform to human weakness in giving themselves the

benefit of doubts which may arise on the mode of disobeying them; and in fact several of the most glaring instances of disobedience are endorsed by the commissioners as wholesome and valuable changes.

At the same time, that statutes of such impracticable kind should remain unrepealed, and even continue to find eager defenders, is no more than the parallel of our political experience. In all well organized human institutions the letter of obsolete laws remains as long as possible untouched; custom is recognised as the legal exponent of their meaning, and in all cases repeals them by neglect before they are blotted off the statute book. The oaths of obedience to college statutes may indeed appear to lend a more grave complexion to the infringing these; but even here there is an extensive and important precedent. The members of the Established Church pray weekly that the magistrate may have grace to maintain orthodoxy with the civil sword, and that the queen may govern according to the divine ordinances as having authority thereto from God, while yet they abhor persecution, while they will not allow their queen the free choice even of her own household, and would hold themselves emancipated from their allegiance if she ventured to impose a tax or punish a heretic without consent of Parliament.

Insincerity in prayer is as serious as insincerity in an oath, if either deserve to be so called—but, in fact, there is no insincerity in one or the other: time has washed out from the words their historical meaning, and they are interpreted as subject to the limitations and changes to which all human things are liable.

The universities, like the establishment, reflect the temper of the nation; they follow the will of the power by which they exist,

and it is idle to blame them for being what the nation has chosen them to be, and this appears to be the generous attitude to assume on the present inquiry; unless, or until, the subjects of it by any short-sighted wilfulness of their own, shall compel us into less lenient feelings. If it should so turn out, as the manner in which the commission has been generally received, and the haughty refusal to furnish evidence, with which its questions have in some instances been answered give us reason to fear that it may, that the heads and fellows of the various societies intend in a defence of convenient monopolies to fall back upon the letter of the statutes, to declare that times are not changed, that human nature and its necessities remain the same, and that ingenuity can devise nothing better than the system which the statutes embody; or, if not so, yet that the wills of founders are sacred, that the perpetual application of their bequests in statutable manner is guarded by anathemas which they may not encounter; then, indeed, their manifold perjuries must fall with full weight upon them, and they must take the consequences of the position into which they thrust themselves. It is not that we have any fear that by this or any other process they can seriously obstruct the reform which the nation requires; the question is only of the moral position in which a large body of educated gentlemen are to stand. The commissioners urge, and prove with great minuteness of illustration, that the property of corporate bodies' bequeathed for charitable purposes is always in a peculiar and especial manner subject to the national will, and as it is this will only which gives effect to all testamentary dispositions, so in dispositions of this kind it always has and always will claim a right when necessary to control or alter them.

The arrangements of the founders of the colleges are already evaded for private advantage; and the nation is at least equally at liberty to revise the existing interpretations, and consider whether the public good is not of as much importance as the comforts and luxuries of a few hundred private persons. There can be no doubt of this, and there can be no doubt that this revision will take effect precisely at the moment when the nation pronounces it necessary. It is for those at present in authority at Oxford to consider whether they will render an opposition ridiculous by resting it on a ground so futile, when, if they would state their real objection to the proposed reform, they might perhaps render real service to it; and at least our respect would be commanded by a straightforward antagonism. No one believes that founders' wills are

their true difficulty. They are afraid of change, not for itself, but for what it may bring. They are afraid of Liberalism, Rationalism, Germanism, which they seem to see gathering behind it—and who shall blame them? certainly not we, if they will only be honest. It is a fair ground of fear. The wisest man cannot leave the familiar ground of custom for an untried element without misgiving; and if misgiving become active resistance, it is no more than what experience has taught us both to look for and to respect; only do not let them make themselves contemptible by calling in a spectral legion of founders to their assistance, whom they and we alike know to be no more than phantoms.

This aspect of the question was in fact settled long ago by the Reformation. One of the most important duties of the fellows of colleges was the saying masses for the souls of their benefactors. Saying mass became illegal, and this duty could therefore be no longer performed. The law of the land superseded the minor laws of these small corporations; and it is nothing less than absurd to evade the obvious conclusion. We are aware that a mode of evasion has been discovered, but it is scarcely creditable either to the ingenuity or to the candour of the inventors. It is urged that the practice of the colleges has changed, not because the English law is changed, but because it is to be supposed that in teaching Anglicanism instead of Romanism and neglecting their religious obligations, the present governing bodies are only doing what the founders, if they had lived, would have desired; respect for the memory of such great men forbidding them to believe that they would have declined the blessings of the Reformation.

It is strange that they should miss seeing that if this argument is good for anything at all (which we do not think it is), it will justify any change whatever which altered circumstances require. Do they believe that if Puritanism had maintained itself on the ground which Cromwell won for it, the Parliament of England would have listened to the pretence that the founders would have become Anglo-Catholics and nothing more? that they would have halted precisely there? Or perhaps it is more likely that, if the Stuarts had restored Catholicism, they would have permitted Catholic bequests to be diverted from the purposes for which they were bestowed, on a theory of hypothetic apostasy.

Whether there be or be not a *right* in individuals to determine the uses to which their property shall be applied after death

has concluded all their concern with it, it is at least certain that, let the right be what it will, no nation ever has given or ever will give effect to such bequests, except as subject to its own revision, and if it find them obviously contrary to the public advantage, it will use its power to cancel or to modify them.

We propose to follow the Commissioners in taking rather a reasonable than a polemic view of the subject before us; and assume, without further question, that whatever attention the existing moral and political condition of the country has made desirable, will as surely take effect, as the trees will change their foliage with the changes of the seasons. And now to trace the causes by which the present state of things has been brought about.

The historical period of Oxford discloses to us, on its opening in the thirteenth century, a system of unknown antiquity, which appears already on its decline. The university, like most other long-lived institutions, is rooted out of sight in a mythology, which, when submitted to criticism, yields only that at some time or other subsequent to the union of the northern and southern kingdoms, a republic of students formed itself by voluntary association on the banks of the Isis. The central situation of Oxford may have led to its selection, although this is no more than conjecture; but we find it in the thirteenth century filled with students who selected their own teachers, determined their own rule of life, and either lived in the town in private lodgings of their own, or grouped themselves in bodies under the superintendence of a master of their own choice in large houses, which were called inns, hostels, or halls. The system was one of unrestrained liberty. They were subject to no authority except what was derived from themselves; and we are to suppose that at Oxford and Cambridge were gathered together all persons in the country who desired to become students in law, medicine, or theology, or any other extant form of knowledge, who either simply disliked, or desired to combine in active opposition to, the dominant ecclesiastical system. The monasteries had probably become indolent. Education hung fire in their hands; or was rather supposed to consist in a formal routine of life than in the acquirement of positive knowledge; at any rate, the constitution of the university previous to the foundation of the colleges was as unmonastic as possible. The masters of the houses and the public teachers were very likely all of them in orders; but orders in the days of Abelard did not any more necessarily imply

ecclesiastical sympathies than in the days of Hampden or Maltby. There can be no doubt, both from tradition and from the entire absence of any rule of life or discipline among the students, that the English universities owe their origin to the same spirit which passed the Mortmain Act and the Premunire Statute; and it is not a little singular that after two hundred years of constitutional government, and three hundred of a reasonable and enlightened religion, we should now be struggling to wrest out of the control of the ecclesiastics a liberty which grew freely and thrived nobly under the imagined despotism of the Plantagenets and in the supposed impenetrable mist of bigotry and superstition.

However, wholesome as that first liberty was in itself, those who had it forgot at last to make wholesome use of it. The students plunged into the political confusion of the country. Faction, anarchy, and other evil matters made their appearance; and according to the natural laws of alternation in all human affairs, a revolution commenced in the thirteenth century which transferred the power to hands better able to wield it.

It is a law as old as the world, that only those shall be free who can use freedom nobly; and when freedom has become licence, they must pass under a despotism and be flogged into a better mind.

The first innovation was in the year 1264. Walter de Merton, wishing to provide a certain number of young men with a means of education where they would be free from the influence of the ultra party among the ecclesiastics, and yet be protected against the moral dangers of the university, such as then it was, founded a college, where, with liberty of choosing their own immediate superior, yet under severe episcopal supervision, they might live and study together in the practice of such rule of life as was then considered salutary. The period of study demanded by the Druids before admittance to the sacred order was twenty years. The scarcely less laborious course on which Walter de Merton's scholars were to enter would occupy from sixteen to nineteen; and the origin of the income of the present fellows, who are now their representatives, was the humble endowment which he provided for their maintenance during this long period. The mass of students remained as before in their lodgings or their halls; scarcely profiting, unhappily, from the better example which was set them by Walter de Merton's charity boys; but with the latter, or immediately after them, arose, with a similar purpose and similar institutions, Balliol, Queen's, Oriel, New

College, Magdalen University, and the rest, where the relations, neighbours, or townspeople of the founders might study to godly purpose.

In describing any one of these institutions we describe the whole; the differences between them, although in some respects significant, do not affect the general character, which in all important features is identical. There was no idea (and it is well to remember this) when they were established of their absorbing the university, or constituting anything except small bodies within it. The founders limited the application of their charities to particular localities or particular families, because they were under no obligation to comprehend any wider interests; they simply wished to give a few persons with whom they were connected, the "benefit of a university education," without exposing them to the temptations which were attached to the ordinary system; and to give to themselves in return the benefit of the students' prayers.

Residence commenced at a very early age. Boys were chosen for an anticipated rather than a realized proficiency; and when in the society the occupation of their lives was prayer and study—study, not teaching—in virtue of which distinction, the fellowships are now sinecures. They were to live together in common, bound to reside in Oxford all the year round, except when extraordinary occasions required leave of absence; the younger members sleeping in the rooms of the older. They were all to talk Latin, to hold weekly exercises in the college halls, to keep the canonical hours, and chant masses for the souls of founders and benefactors. In some cases they were to wear a uniform, and make daily processions; in all they were under strict regulation as to diet, dress, and conduct. Silence was enjoined at meals, when one of their body was to read the Bible; they were not permitted to walk out alone, or to enter any of the houses of the townspeople; and for their commons, *i. e.*, for their maintenance, a weekly sum was allowed, varying with the price of wheat, from a shilling to eighteenpence, and in times of extreme scarcity, reaching to two shillings.

Foreseeing that the lands with which these institutions were endowed would in all probability increase in value, and yield a surplus after these expenses were supplied, the founders forbid the fellows under serious penalties to divide such surplus among themselves; either it was to be applied to the common uses of the college, or else they were to increase their number; an important injunction, by the nonfulfilment of which, the coun-

try has been directly and formally injured, and is therefore entitled, even on statutable grounds, to enter its complaint. The superiors of these establishments were to be ecclesiastics, and their marriage, therefore, was not contemplated as a possibility; yet it is indirectly forbidden in a general prohibition of the introduction of women inside the college gates.

Such, in outline, is the collegiate character as embodied in the several statutes—statutes by which, with few exceptions, the colleges profess to be governed—and to which the fellows swear obedience on admission, under penalty of expulsion and anathema. The old knights and bishops, to whom they owe their origin, drew up their institutions as they built their churches, to outlast the world. The earth, with its changes and its dreams of progress, was nothing to them, except a stage on which the devil and his friends played out their foolish game. As there was but one God, the same yesterday to-day and for ever, the services which should please Him to-day would be alike grateful to him to-morrow. The world might change, but He did not change. Christ was what He had been from eternity, and as into eternity he would continue. There was not one service for the first century, and another for the tenth, and another for the twentieth—one for one nation, and another for another; but God was one, and His services were one, and what was good and acceptable once, was good for ever. They did not conceive that a time might come when luxury and self-indulgence, and elegance, and polish, and literary ease, would be found better suited for the exigences of humanity than their uncouth barbarities, and they omitted to provide for necessities which they did not anticipate. The statutes are obligatory for ever; the visitors who are to see them enforced have no power to repeal them; the fellows, under pain of anathema, are to seek no dispensation from, and accept no alteration of, them; and the last end when it came was to find them praying the same prayers, wearing the same dress, speaking the same language, disputing the same disputations—and so on and on, from age to age, the same in body and in mind, in word and action, life and manner; as the nightingale sings the same song which it sang a thousand years ago; or as the mountain brook straggling down its bed among the rocks repeats its one old form from century to century, and glides, and breaks, and foams, and eddies, the same to-day as when human eye first gazed upon it.

It is a theory of life which, whether true or not, has passed away out of belief, and the system which arose out of it, and which be-

longed to it, must cease as it has ceased. But if those who once believed it, and who worked so nobly with it, could return for a few days or hours to life, and witness the metamorphosis which has passed over their institutions; if they could hear the chapels echoing with the service of a religion which they abhorred; if they could see the heads with their carriages and their families, the fellows, their poor charity boys, "dividing the surplus," carrying it, two-thirds of them, far away from the university, and living on it as easy, self-indulging gentlemen; we cannot but think that although perhaps it might teach them that there were more things in heaven and earth than were dreamt of in their philosophy, and that it was not for man to realize in time the unchanging forms of eternity; yet that they would turn with shame and sorrow from the solemn farce in which the words with which they attempted to realize it are repeated year after year inside the chapels, and the cowardly evasion with which the abuse of them is justified. A law is but a form; a law becomes obsolete, it is disobeyed, and it is repealed, and there is an end of it. But the wills of the founders of sacred institutions, reflecting as they do the hopes and fears and deepest convictions of earnest, God-fearing men,—surely it is an ungenerous thing to drag these through the dirt, and soil and twist them with "non-natural interpretation," as if they were spiritual prisons from which we might escape like pick-locks and break-gaols.

And yet we all live in glass-houses, and cannot afford to be intolerant. The college rule of life is not more inconsistent with the life itself, than the Sermon on the Mount and the Church Catechism, our vows to abjure the world and love our brother Christians as ourselves, are inconsistent with our palaces, and workhouses, and political economy. The colleges have but followed and exemplified the spirit of the time, from which may God deliver us and them.

To return to the history of Oxford.

Institutions founded with the views which we have described continued to increase in Oxford through the succeeding centuries. The collegiate and the open system for a time flourished together, and as the Reformation drew nearer, a larger form of thought is to be discovered in the statutes of the successive foundations—larger and more liberal, not in the sense of modern latitudinarians, but as showing the effect of the political growth of the country. The new sciences as they appeared were recognized as necessary objects of study. Astronomy was to be taught in one college, and the moral and natural sciences in another, with lectureships on the seve-

ral subjects established for the benefit of the entire university. In a still larger spirit, the founder of Corpus, in establishing such lectureships, limits the choice of persons who shall fill them, not to his own college, or to Oxford, or to England—but only within the limits of the wide world, out of which his trustees are to select the ablest men that they can find. And the evils of a limitation of the choice of fellows to particular counties had begun to be distinctly perceptible. Archbishop Rotheram, in founding Lincoln college, excuses the restriction of choice which he imposes, on the ground of the carnal blindness of others, who, as he had observed, "not without amazement of heart," cared only to provide for their own, and had left the county of Lincoln unprovided for at all.

At the same time, and particularly subsequent to the teaching of Wickliffe, which had largely infected Oxford, the peculiarly Roman-catholic observances are imposed with greater stringency than ever; and thus the ecclesiastical spirit more and more determined the university into the form which it has ever since borne. So far from betraying an inclination towards the reforming party or the Reformation, the object was to stem rather than to foster the causes which were leading to it. And even in the two colleges which were founded subsequent to the final change, Jesus and Wadham, the constitution is still in many features anti-Protestant. The celibacy of the principal and the warden, lest the permission to marry given generally to the clergy might be construed to extend to them, is solemnly enjoined and insisted upon; and is so fenced round with oaths and ordinances, that it must have required no little ingenuity and boldness to venture on the existing violation of them. One of these poor suffering celibates applied for and received the help of parliament in his distress; being willing enough to admit its jurisdiction where it subserved instead of threatening a private interest.

So constituted, however, with so clear and definite an organization, as the times grew more anarchic, the influence of the colleges became necessarily more decided, and their independent foundation held them up through the convulsions of the sixteenth century. The body of students exterior to the colleges grew less important; and at last statute enacted what custom had almost established, and all members of the university were driven inside the college walls. This important step was first taken in Lord Leicester's chancellorship in 1569; and was subsequently and more formally enacted by the Caroline statutes of Archbishop Laud—the code to which at present the oath of obedience is taken at matricula-

tion, and by which the university is now governed.

To sum up this rapid sketch.

The university originally existed independent of colleges, with a free republican constitution; the principals of its halls freely chosen by the students, and the system of life and study generally, if not entirely, determined by their own pleasure. Such a method can prosper only in healthy times, and with healthy natures. The students became infected with the disorders of the country; and the free system was gradually superseded by, and at last wholly extinguished before, the disciplined drill of the colleges. The university retains a shadow of its old life. It has its own statutes, teachers, government, officers, revenue, and privileges. But its revenues are comparatively small; its government is monopolised by the heads of the colleges; its professors lecture to vacant benches, and its examinations are conducted by the tutors of the colleges. The colleges, to all practical purposes, are the university. The wealth is in their hands—the teaching is in their hands. Every undergraduate is obliged to belong to one or other of them (or else to one of five remaining halls, which are assimilated to them in management); and when we know the constitution, practice, and character of these corporations, we understand in all its important features the present state of the University of Oxford—into which it was determined by the wisdom of Archbishop Laud and the Caroline statutes.

Since the present commission was issued, the heads of houses, in deprecation of change, have appealed to these statutes as models of educational wisdom; it is as well, therefore, before proceeding further, to notice briefly some of their provisions, and the manner in which they are at present observed. They were framed, as the Board declares, in a liberal spirit; at a time when the constitution of the human mind was as well understood as it is now; and the functions and faculties towards which they are directed have not changed nor are likely to change. Now we must remember that the usual age for beginning residence at that time was twelve or thirteen years. The statutes relating to the conduct of undergraduates are constructed with a view to their being no more than boys. They are to be flogged if they misconduct themselves; they are forbidden to play marbles in the streets; they are to be in their rooms by nine o'clock at night, &c., &c. Let us look then at the course of study prescribed for them.

In their first year, they are to learn Aristotle's rhetoric. In their second, his ethics, politics, economics, and logic. In their third, general logic, moral philosophy, geometry, and the Greek language. And the first ex-

amination was then to be passed in these subjects, and the degree of Bachelor of Arts conferred. The next three years were to be spent in a similar preparation for the degree of master, in geometry, astronomy, metaphysics, natural philosophy, ancient history, Greek, and Hebrew: and as soon as all this was finished, the professional course was entered, either in theology, law, or medicine.

It will be seen, therefore, that in this course is included all forms of knowledge then extant; the university was determined to deserve its name, and the limits of its teaching were the limits of human acquisition. We do not know whether to be more surprised at the appeal of the heads of houses to this ancient programme, as if it were the prospectus of their present system; or at their so gravely enunciating as an axiom the unchanging character of the human mind; when, if the human mind with which Laud had to deal was held capable, after no more than fourteen years' presence upon this earth, of understanding Aristotle's ethics and politics, and at the end of twenty of having made the full circuit of the immense area which we have described, either it was a very different sort of mind from ours, or else Laud knew exceedingly little of what he was prescribing to it.

Nor was the organization which was to put the system into force much better. Professors were to teach, and masters of arts were to examine; but there were no honours by which the abler candidates could earn distinction, no publicity was given to the examinations; and, strangely, the students were at liberty to choose, not their teachers, but their examiners—an arrangement of more convenience than utility. A few text-books on the various subjects, containing thirty or forty questions and answers, comprised the sum of the required knowledge; and as both examiner and examinee were equally dependent on the same sources of information, and equally ignorant of what lay beyond them, all went smoothly. The degrees became a farce. The college fellowships were given away as matters of private patronage; and for one instance of what became of the professorships:—"The chair of Moral Philosophy (the presentation to which lay in the two proctors, and three of the heads of houses) was virtually suppressed from 1673 to 1829, by the custom of giving it to the senior proctor, himself being one of the electors."

Change of circumstances, and their own inherent badness, have brought the Laudian, as well as the collegiate statutes into abeyance. The letter sticks, but the education is altered, and the discipline cannot be enforced. The course of study, lasts three

years instead of seven. The bachelor's degree is the last for which an examination is required. The degree of master is only a matter of standing and of money payment; and there is no professional education at all. Many statutes seem only to exist because their perpetual dispensation is a source of perpetual fees. Twelve o'clock at night, instead of nine, is the hour at which the students must be in college: fees for the last three hours being a fine upon a privilege, which is the source of the porter's salary. The subjects of examination are either changed or freshly adapted. The statutes survive, but strained at all points to the full extent of non-natural interpretation; and though the violation of them is of a less flagrant kind than that of the statutes of the college; and liberties taken with the lucubrations of Archbishop Laud are less offensive to our moral sense than the trifling with the convictions and the beliefs of men like Walter de Merton and Archbishop Chichele: yet every member of the university is forced into a steady obligation of perjury; and we most heartily agree with the Commissioners that it is an immoral piece of business, and the sooner the bondage is terminated the better.

A modern bishop, not long ago, congratulated his clergy on the general improvement in their order, when compared with the pictures preserved by Fielding out of the last century. It was a congratulation for which there was serious reason. From the restoration of the Stuarts to the French revolution, the upper classes of this country, the aristocracy, the country gentlemen, and the clergy, exhibited all the symptoms of a rapid moral consumption. The first were vicious, the second brutal, the third ignorant and vulgar; and, if they had been left to themselves, they would have followed the course on which they had so long been travelling to its natural and only termination. Happily for them and for all of us, another destiny was in store for the English nation. Side by side with them, forms of thought and action and life had been springing into being alien to them, if not antagonistic, yet beyond their influence, and to which the portents of the American and the French revolution imparted a fearful significance.

Although the industrial temper in the modern English representatives of this movement made it less immediately threatening than it had been under its earlier form of Puritanism, yet there was so much moral resoluteness about it, so much of the old English character, which was lost by those who once possessed it, had taken refuge

there, that the so-called upper classes were roused by danger, and by the stern eye which now they felt upon them, and, conscious that their existence depended upon it, they were driven into a reformation, the progress of which is now before us. Too late, indeed, to save the exclusive predominance of their order, yet in time to save their own souls, which is, happily never too late, the clergy have at least endeavoured no longer to be a disgrace to the name, and the noblemen and country gentlemen have felt the necessity of a real education.

The direct victories of the people in this modern struggle have been so far only political. The church and the education remain in the old hands; but an indirect and far nobler victory has been gained over the vices of their rivals. With the awakening of those to whom they belonged, the universities shook off their sleep; and fifty years ago, the demand for something more substantial than what already existed there, brought about the internal regeneration which has ever since been in steady movement. It is not to be supposed that such improvement will preserve them to their present monopolists. The improvement in character in the aristocracy, though it had commenced long before 1832, did not save them from being compelled to share their power with those to whom, in fact, they owed that improvement; and as the altered system does its work, and suffuses society with another temper, the people are now demanding an analogous share in the intellectual to what they then obtained in the political advantages of the country. So far the universities have belonged to the old orders; they have improved themselves, but only for them, and in their direction, and they are now defined in the evidence before us as "finishing schools for the higher classes." Yet the exclusiveness which is preserved in form and in general tone has not been proof against opinion; and, as in 1832, large portions of the aristocracy went over to the opposition, and assisted them in winning their privileges, so in this report before us, we have the happy spectacle presented to us of a large-minded body of gentlemen, who, although trained by Oxford, and keenly and fully alive to her excellences, have dared to open their eyes to the imminent and inevitable changes which are coming on her, and are ready, with heart and hand, to guide and to assist.

With this preface then, we will now pass to the University of Oxford as it is, such as fifty years of progress, or rather, we should say, conscientiousness, have made it; not of absolute conscientiousness, but of certain

features of that virtue as it has gradually awakened in a few minds which have dragged the rest after them.

The university possesses of its own an income of something under 18,000*l.* a year, a moiety of which is derived from the monopoly of printing Bibles at the Clarendon Press. The expediency of this monopoly is doubtful, and its continuance is, therefore, precarious; but whether it is maintained or is abolished, this is not a large sum; the appropriation of it can be fairly accounted for, and against the *university*, misapplication of funds is not a charge which can be sustained. The number of undergraduates at present receiving education there is something over 1300; moral and intellectual philosophy, ancient history, scholarship, with a small modicum of divinity, forms the substance of what they are taught, and is comprehended in a course which is concluded in three years. It is an education adapted to the requirements of the clergy, and of gentlemen whose employment, if they choose to undertake any, shall be in the public service of the state. An economical training is a recent necessity for English statesmen; a graceful elegant scholarship, a moral insight into human nature, and an acquaintance with the histories of Greece and Rome, which are supposed to contain a complete epitome of politics, have been hitherto all-sufficient qualifications for them; and Oxford has, therefore, furnished everything which has been acquired by the privileged classes. She has answered their purposes, and therefore she is what she is. To these subjects others have been recently added. Pressure from without has at last driven the authorities, after a long struggle, to permit the natural sciences, modern history, and law, to be introduced into the course; but the jealousy with which these studies have been admitted will steadily operate for their discouragement, unless the same force which compelled the formal acknowledgment of them, compel the form to become a reality.

The 1300 undergraduates are distributed among nineteen colleges, and five unendowed halls. The income of these colleges is conjectured (for in most cases they have declined to furnish information on this point) at 150,000*l.* a year. It is the revenue of the estates which were bequeathed for the support of poor scholars during their many years of study, and which the foundations were allowed to receive or retain by a suspension of the Mortmain Act in their favour. But the money answers very imperfectly the ends for which it was bestowed. The number of fellows (there are in all 540) remains what it was; but they have changed their

character; they are no longer poor working scholars. In all cases, or almost all, they have finished their university course before their election; their statutable duties have become illegal or obsolete, while no others have arisen in their place; and in virtue of their position as fellows, the holders of these endowments, with incomes averaging above 200*l.* a year, do literally nothing at all. Merit, in the vast proportion of instances, has little to do with their election; and the colleges, instead of being places in which the foundation members are to study, have become places of education for younger men, who reside in them at their own cost, and receive instruction from such of the fellows as are capable of giving it; for which, of course, they have to pay. These undergraduates, if they are troublesome, are sometimes reminded that they are only received upon sufferance; but Mr. Jowett is probably right in saying, "that it is to the performance of this voluntary duty that both those colleges which do, and those which do not undertake it, owe their present existence." It might be expected that some portion of the immense sum which we have named would be employed at least to lighten the expenses of the present students; but such an expectation, however natural, would prove ill-founded. The students, as we shall presently see, are forced to bear an increased rather than a diminished burden, and not only pay enormously for the permission to reside in the colleges, but swell the income of the fellows by direct and indirect contributions.

First, however, for the fellows themselves. On their admission, as we said, they swear obedience to their statutes; we will repeat the duties required of them, and contrast the practice with the obligation.

They are to say daily masses for the souls of the founders. The echo of the old service is to be heard in the Latin thanksgiving grace which precedes the hall dinner, the form and sound of which are contrived to bear the nearest permissible resemblance to the enjoined supplication; but masses themselves are forbidden by the law of the land.

They are to reside in the university, in most cases under penalty of forfeiture. Two-thirds of them never come near the place, except to receive their dividends; and their absence is pronounced better than their presence; their idleness at a distance from the university less injurious to it than their idleness within its walls. They are to study; "yet nothing," it is said, "can be more absurd than to call them students," except, perhaps, the endeavour to make them such.—

Last of all, the worst, most grievous sin, the most seducing, and therefore most enveloped in anathemas, the dividing the surplus revenues; this is universal. Is it possible to conceive anything bearing smaller resemblance to what was contemplated in the wishes of the founders? Yet these are the gentlemen who cry sacrilege on the attempt to interfere with the single statute which they observe—the statute which secures them in their monopolies.

And here it is as well that we should notice the one instance of unfairness with which this otherwise excellent and remarkable liberal report is disfigured; and by what accident it could have found its way there it is difficult to conceive. We will hope that it was no more than a momentary provocation with these oaths and statutes, which have led to so much mischief, that betrayed the Commissioners into self-forgetfulness.

“The oaths were imposed,” they say, sarcastically, as if unwilling to believe that there was ever more reality in them than there is at present, “at a time when the obligations to observe them might be dispensed with by ecclesiastical authority,” and they adopt as their own the narrow insolence of Archbishop Laud. “Probably,” say the Caroline statutes, “no great exertion was requisite on the part of the men of that age to disembarass themselves of the nets and toils of statutes; inasmuch as they had at hand a cheap and easy remedy, and the sanctuary of Innocence would open at their bidding, seeing that in those days the pope superseded innocence by the courtesy and kindness with which he indulged impunity to sin. The Tiber succeeded to the Jordan for the cleansing from all the leprous guilt contracted by the constant obligation to commit perjury.”

Surely, if it was ever reasonable to impose oaths at all, it was so at a time when there was an existing authority which could dispense with them on pressing occasions; when they were taken with an implicit acknowledgment that they could and would be so dispensed with; and taunts of perjury came with an ill-grace from men who, acknowledging no such authority, yet confess themselves abundantly guilty of it.

Such, however, are the present fellowships; out of the entire five hundred and forty of these sinecures, only twenty-two are open to public competition and the reward of substantial merit; the remainder fall to founders' kin, to the natives of particular counties, towns or dioceses, to boys brought up at particular schools, or to the personal friends of men high in place in the

university. “Elections of this latter kind,” Mr. Jowett believes, “are a disgrace peculiar to Oxford;” but we must remind ourselves that we have no right to expect of Oxford a higher standard than the average morality of the country requires; and as long as members of parliament are elected under the existing method, and the government sets an example so notorious in the distribution of the patronage of the crown, we may almost congratulate ourselves that no baser element than personal favour has as yet made its appearance in the elections at the universities.

That, however, the possession of a fellowship at Oxford is any *prima facie* evidence of capacity, is a misconception of which the country should as soon as possible be disabused. By far the larger number of the fellows are neither distinguished nor likely to become so; and are incompetent to contribute anything even to the existing education. Being seldom in possession of higher knowledge than what is necessary for an ordinary degree, and not seldom having experienced difficulty in passing that simple ordeal; they are unserviceable either for learning or for teaching; and by a general consent of all parties, it is felt better to dispense with the residence of almost three-fourths of their number. Among those who remain, there are many really good and really able men; yet we are told by Mr. Pattison, that “It is to be feared that a pious youth coming up from a religious home to Oxford would gain but little good from habitual intercourse with the senior common room in certain of the colleges;” and where this significant allusion is inapplicable, the resident authorities everywhere fall into another error as destructive to their moral influence.

“Donnism,”\* says Mr. Wilkinson, is a blight on all classes from the highest to the lowest. Between the head and fellows of the same society there is a distance, between the fellows and the undergraduates an impassable gulf.”

But those who profit by these endowments consider themselves bound by the conditions of their statutes; and being unable to fulfil the duties therein imposed on them, decline to substitute others in their place; yet the country generally regarding Oxford as a place of education, and the colleges as the means of conducting it, are wholly unable to take this view of the matter, and are anxious to see some substantial

\* This word is defined by Fuller, “a mysterious carriage of the body to cover the deficiencies of the mind.”

results arising out of all this expenditure. If the legend of the 30,000 students who were to be found in Oxford in the time of the third Edward be only half correct, when the revenues, after all deductions from the altered value of money, were less than a tithe of what they are at present, it is difficult to know why, with the present England and the English empire, some 1300, or 1400, should now be the outside of its numbers; and it is to the causes of this remarkable anomaly that the inquiries of the Commissioners have been particularly directed. They are found to lie generally in the moral and intellectual life of the young men who are at present in training there. The evidence on these points is remarkably uniform—and, in fact, is in many ways remarkable. Those who have furnished it, are for the most part the fellows and tutors of the college, men whose quiet habits have disqualified them from recognising or understanding the ordinary lives of average undergraduates: who, as Mr. Wilkinson says, are cut off from opportunities of observing them by an impassable gulf; and the disorder must have become serious indeed to have become conspicuous to eyes short-sighted as theirs. College tutors are supposed in theory to exercise some sort of surveillance over their pupils; but to the proctors or university magistrates only, the real state of things is known: and a personal friend of our own, who had been many years resident, first as an undergraduate and then as a fellow and tutor, told us that it was not till he became proctor that he had the least idea of the profligacy with which undergraduate life was saturated.

We said that the education at Oxford was such as on the whole the country gentlemen and the clergy required, and it is the increasing susceptibility of these classes in such matters, the higher standard which they impose upon themselves, and the growing objection at least to such vices as are coarse and conspicuous, which have made it impossible to permit the longer continuance of the existing disorders.

The complaints from the clergy, and from the old conservatives, as they take definite form, are of the increasing cost, of extravagance, idleness, and moral vitiation of character; while the other classes of English society who ought to send their sons to the university, and who would send them if they dared, echo the complaint of the expense, and of the many bad influences which pervade it, while the education itself seems to them narrow, unbusiness-like, and likely to lead to nothing. In the list of subjects which have hitherto formed the material of

instruction, they see nothing which promises to be of service in practical life; and they are unwilling to place young men for three or more valuable years in a situation where they will contract expensive and undesirable habits, with nothing to compensate for it in the least, except a few barren accomplishments and unsubstantial honours.

Sir Charles Lyell has a few powerful sentences on this point in his very valuable evidence:—

“I speak from personal experience,” he says, “of what has happened within the circle of my own friends and acquaintances, when I affirm that parents possessing ample pecuniary means are often deterred from sending their sons to Oxford, by a well-grounded apprehension, that after a residence of a few years they will contract from the social atmosphere of the place notions incompatible with the line of life to which they are destined, although that professional line may be one peculiarly demanding a liberal education. They wish, for example, to bring them up as attorneys, publishers, engineers, surgeons, or as merchants in some established house, and naturally turn their thoughts to Oxford as a safe and good training place, till they are warned by those who know the working of the system, that the youth, however well satisfied with the honourable calling proposed for him, which perhaps he has chosen himself, will discover at the end of a few terms that such occupations are vulgar and beneath his dignity.”

Sir C. Lyell speaks of matter of fact. People do think in this way, with at least some justice: at all events, no proportionate advantage can be safely anticipated by any one to make up for the time which must be lost, and the enormous sum of money which must be expended. And this is really the most serious question for the country. A few hundred fellows wasting their incomes in idleness and ignorance, is an unlovely spectacle; but accustomed as we are to ecclesiastical establishments and idle country gentlemen, and holders of property regardless generally of the duties which belong to it, there is nothing in such a sight merely in itself to affect us with any peculiar anxiety. But a university is another matter. The entire future of the country depends on the training which it provides for such intellect as is born into it; and if we miseducate those whom we take in hand, and refuse education, by a blundering and misconstrued system, to such as have a right to receive it, it is the one neglect which is most certain to revenge itself. The clever and detestable literature of atheism and revolution, which is poisoning the towns of the north, is the work of men whom we have flung aside to hunger and

hatred, and who are thus frightfully retaliating their injuries upon us. It is here that the Commissioners show a sense so high and patriotic of the true business of Oxford; and raise themselves above the narrow interests which so deeply taint the existing tone of thought there, and which betray themselves in the evidence in this very volume. The desire that a poorer class of men than can now come to Oxford should be enabled, if they have shown real ability, to profit by it, calls out a sneer from Mr. Mansell at such philanthropic "ptochogony" (we should be glad to make him swallow down his word, and rid the language of the recollection of it); but the Report thus finely rebukes such vulgar exclusiveness:—

"We have no wish to encourage poor scholars to come to the university merely because they are poor. If we look to the wants of the country and of the church, we must believe that what is needed is not a philanthropic scheme for counterbalancing the inequalities of fortune, but rather enactments which will provide that neither the rich nor the poor, if they have the necessary qualifications, shall be debarred or deterred from following the course in which they can be most useful. What is needed is encouragement to merit and industry, so that every promising youth, however poor, shall be able to command assistance to support him at the university."

In what manner best to diminish the expenses, therefore, has been a question which the Commissioners have most anxiously considered; and, as it seems to us, they have hit off most exactly the cause of the mischief, and well indicated the direction in which we are to look for a remedy. Hitherto, in order to screen themselves, the authorities have only darkened this matter. "The public statement," as Mr. Melville says, "of what a man may live for, stands in strong contrast to what he does and almost can." And the unfortunate undergraduates, with sins and follies enough of their own to answer for, are made to bear the blame of an expenditure which is forced upon them by the carelessness or most culpable ignorance of the administrators of the colleges. A thousand pounds for the three years and a half of residence, or over 250*l.* a year, is a sum considerably under the average of the cost of a degree to an ordinary commoner; and seeing that the residence at the university is but for twenty-six weeks in each year, that tuition, as it appears in the bills, is charged but sixteen guineas, and that the remainder of this serious sum, therefore, must be swallowed up in the mere expenses of living, this singular

and questionable state of things has long called for explanation. But we have to thank this present inquiry for having at last produced it, and for having exposed the abominable dishonesty of the schedules, behind which the Board of Heads have hitherto sheltered themselves. Thirty-nine pounds a year, they ostentatiously declare, will more than cover all necessary expenses of a prudent young man. The colleges, immaculate as they are, so far from making a profit, supply all necessary articles at cost price, or often at a loss to themselves; and when the long bills appear, and the long faces are made at them, they shake their heads in sorrow and sympathy, but declare that it is no work of theirs. Now, if the case which can be proved against the colleges could be made out against any lay corporation, it would be called by very ugly names indeed; but ecclesiastics, from their supposed ignorance of the affairs of this world, have a claim of long standing on a more lenient judgment—and we are not disposed to refuse it them, if we can only have the truth out, and be rid of lies, voluntary or involuntary. If the undergraduate were to confine his wants to such articles as are considered in their schedules, he would live within four bare walls, without lights, breakfast, tea, or creature to wait upon him—he must be content with a floor to lie upon, and with his dinner commons to keep him alive.\* Though charges for servants appear in the published bills, some one to bring him a plate of meat in the hall is all that is implied by it. Furniture, glass, linen, plate, china, grocery—all these, if he require such things, he must provide for himself. Private payments to servants, if he is to have his bed made, his boots cleaned, or his room attended, are equally indispensable; and by the time that he has furnished himself with the ordinary comforts in the way of board and lodging, which he could obtain at any English town for a pound a week, leaving a profit to those who supply him, he has found himself forced to pay a sum nowhere less than fifty-four shillings a week, and varying from that to eighty and even more. Three and four pounds a week for board and lodging he is compelled to pay in these great wholesale establishments, "which are liable to no loss, for caution-money is a payment in advance, which are subject to no parochial rates, and are avowedly conducted without a view to profit." The unfortunate boys, too credulous

\* Breakfast commons ought to be included. But they consist only of bread and butter, tea, sugar milk, and extras.

to suspect, and too careless to provide against such treatment, are mulcted for every article which the college supplies from its kitchen a hundred per cent. beyond cost price, for the maintenance of a rascal crew of cooks, manciples, and scouts, and in some cases, as the Commissioners see reason to suspect, with a per centage added for the benefit of the fellows themselves.

Such is the direct result of the monopoly which the present statutes of the university confer upon the colleges. And above and beyond all this, in many of them private bills with the kitchen are permitted for the supply of private breakfast parties and supper parties—a system so profitable to the cooks of Christchurch, Oxford, and Trinity College, Cambridge, that they send, or have sent, their sons respectively to the sister university; and the cook of Christchurch, a short time since, used to drive into Oxford in his carriage from his villa in the country. Such at least was the Oxford mythus. For matter of fact, we can state from our own knowledge, that he was paid by one man seventeen pounds for woodcocks alone, supplied in a single term.

But the great expenses of the students lie, we are told, beyond the college walls, and are not subject to college control; and this is in a measure true. Let all the backs bear the burden which is theirs; and if the authorities have hitherto shirked their fair share, we must not give them an extra load for a punishment. Even for their kitchen bills they are only responsible as permitting what they ought not to have permitted; and it must be distinctly understood that we *directly* accuse them only of enormous overcharge in matters of board and lodging, and with a dishonest concealment of the truth in the accounts which they produce before the public. The out-college expenses still remain the most serious items in the cost of a university education. But it appears to us that the absence of all care and economy in such parts of the expenditure as are under control, is certain to encourage extravagance in everything else. The young men know that they are not looked after, that they may act as they please, that no inquiry will be made; and they take the hint, and do act as they please. One of the supposed benefits of college life is the easy intercourse of the students with each other, the friendships which are formed in a cultivated and agreeable society. It sounds all very pretty, and that it is very pleasant there is no doubt either; but the substantial result of it is, that the standard of the common life is fixed by those who have most money; and if a young man coming up to the uni-

versity wishes to have the advantage of this so very valuable society, he must live like the rest. We do not mean that there are not gradations of expense; of course there are; but the lowest average of the amusements and the entertainments is pitched far beyond what the position of the sons of the clergy and the poorer gentlemen are entitled to; the style of life altogether is quite above what is necessary for them or for any one; and in all cases the facilities for incurring debts are so great, and the temptations arising from the extravagance and folly of half the undergraduates in every college are so immediate and pressing, that however fair on paper the discipline may look, with its caps, and gowns, and chapel-goings, and academic brotherhood, and paternal supervision—this very juxtaposition as equals of young men of all degrees of fortune, and the perpetual presence before the eyes of the less wealthy among them, of indulgences which they have only to stretch out their hands to reach, make the life in college a harder ordeal than they are likely to meet with again wherever they may be thrown. Can it be wondered at, that, surrounded with wine parties and breakfast parties, billiards and horses, prints and perfumery, and all sweet things in which the youthful imagination and the youthful five senses take delight, so many of them should take the plunge into this tempting elysium? Mr. Donkin says that there are no temptations at Oxford beyond what a young man may be fairly expected to overcome; either he has never known, or he has forgotten the position of nineteen out of twenty undergraduates. They come up from home with characters altogether unformed, or they have been at a public school, in which, as in some river Styx, they have been steeped in the knowledge and practice of all grossest and filthiest things, that they may learn early to fight their way in the world; and then they come up to the university, where every facility for indulgence is thrust upon them. In the world a man's credit is limited by his means, and his society is determined by his position. At college, unlimited credit is offered and even obtruded, and whether they can afford it or not, they must mix with the society which they find. It is less than fair, as the Commissioners see, to submit any young man to such an ordeal. The authorities cannot help it, or will not. If they are pressed, they pretend that things are mending of themselves. But unhappily this is not true. It is not in the nature of bad things to mend of themselves. The grosser vices are disappearing, but only to give place to others more refined and effeminate; and

gloves, and scents, and walking-sticks, and jewellery, and other such fantastic trash, are scarcely an improvement upon drunkenness and debauchery. Tobacco is an enormous modern item. The commissioners say that they know of a case, and that not a solitary one, in which a tobacco bill has run to 40*l.* a-year. We could have told him of cases not solitary, where they have reached 70*l.* in a single term. But enough of this. We have spoken of the follies of the place, rather than its vices, leaving these as an invidious topic, on which it is more easy to speak noisily than wisely; two quotations from the "Evidence" shall be all which we will here permit ourselves.

"The three great temptations of the place," says Mr. Pattison, "I suppose to be fornication, wine, and cards or betting. Without exaggerating the turpitude of the first-named vice, whoever is aware of the amount of moral and intellectual prostration traceable to it here, must wish that every protection should be provided to the weak and the unsteady."

Mr. Jelf we shall quote at greater length, his authority being of serious value. Till very recently he was tutor at Christ Church, and intimately conversant with the habits of the higher circles in that college. He was proctor, and earned for himself a laudable unpopularity by the resolution with which he executed what he conceived to be his duty; and in what he writes here, it will be seen that he calls things by their plain names, and does not attempt to make vice less detestable by mincing his words about it.

"The scenes which take place, and the songs which are sung at the dinners of the Bullingdon Club—(a cricket club to which, from its exclusive and aristocratic character, it is the privilege among fast undergraduates to belong)—are a curse and a disgrace to a place of Christian education. Nor are these clubs and supper-parties evils merely as being occasions of intoxication to men already depraved, but they are violations of a principle which, to my mind, ought always to be kept in view by university and college authorities—viz., to keep the atmosphere as clear as possible from whatever may lead astray those entering on their academical life. Take the case of a young man coming up from home with good intentions of living regularly and working hard, and I firmly believe most men do come up with such feelings, looking to the university as a place where, by God's grace, he may carry out the solemn promises of making progress in religious and useful learning with which he gladdens his father's heart as he left home; he is invited by an old school-fellow to meet a few friends at supper—(remember that these suppers are almost always in college);—he goes, in ignorance of what a supper-party is; the result is, that if not made drunk

himself, he sees others drunk; he hears conversation and songs which no one can hear without pollution; he forms an impression of university life and habits very different from what he expected; and unless he is of more than ordinary firmness, he becomes entangled, and then, in his turn, entangles others. I do not know how the Bullingdon Club is managed now, but I know that shortly before I left Christ Church school-boys who came up to matriculate were taken up there and made drunk."

So much for the evidence of Mr. Jelf. It will be pretended that such cases are exceptions, that they are exaggerated, &c., &c.; may the good credulous English parents this time keep wax in their ears, and not listen to the sirens who would persuade them so. Their money goes, at any rate: let them find out how it goes. It will surely be a tragical spectacle if, after these exposures, the gentlemen of England, the upholders of the church, the maintainers of orthodoxy, those who hold the power and administer the government of this great country, shall stoop to throw a shield over such abominations; and leave it to the reviled and despised radicals to sweep them out: if, after all their efforts to identify liberalism with destruction of religion and morals and all good things which honest men value, it really and truly should come to this.—If it should, and we have all reason to fear that it will.

One more illustration of the hollowness which underlies the heads of houses' defence of themselves. At least they will appeal to their tuition—their tuition! That is excellent; cheap, dirt cheap—sixteen guineas a year; and three hours a day from the ablest man who can be found in the university—there indeed is an example of liberality which all the world may wonder at. It has a very pretty sound: yet, not to waste our time on an analysis of the method of its working, let us look at the results of it; first, by the bye, observing that the undergraduate has to pay four years' tuition fees, as well as four years' room rent, although he is not permitted either to attend lectures or occupy rooms for more than three; so that in fact the sixteen guineas are twenty-one, and the accounts are 'cooked' to suit the simplicity of the public. Eighty undergraduates then pay twenty-one guineas each for the year's lecture which they attend, making in all something over 1,700 pounds. Now, in order to make the tuition more than a name, ten pupils is as many as any tutor could successfully manage; and the 1,700 pounds would be divided between eight tutors. Rating his fellowship at 200 pounds additional, a college

tutor would thus receive 412 or 413 pounds a year for six months' work, an income which might be thought very sufficient for all reasonable wants. So however do not think the heads of houses; and to convert the tutorships into valuable pieces of patronage, they give each tutor twenty pupils, thus doubling his income, and turning the office into a sinecure, from the impossibility of an adequate discharge of the duties of it. Consequently, according to the common consent of all the evidence before us, the tutors are comparatively useless, and the substantial teaching of the university is given by private tutors, whom the poor fleeced undergraduates are obliged to provide for themselves at a cost of fifty pounds a year.

Such is an outline of the condition of the Oxford student, as he now lives and learns in that venerable institution. The subject matter of what he is taught is too long a question to enter upon here: it is the moral aspect of him which is really serious, and which is felt to be no longer tolerable. Many remedies have been suggested; that which hitherto has found most favour being the establishment of cheap halls, the inmates of which may retain the benefits of "our admirable discipline," at the price of being marked out as an inferior order. When we remember the intention of the founders of the present colleges, and the statutes under which foundation members continue to be bound, we cannot but smile at the naïveté of the proposal. We should say, begin with yourselves; you are under vows of poverty—fulfil them, and we will listen to you.

The Commissioners offer no objection to the proposal; they are ready to encourage anything which may put a stop to the present extravagance. But they are too wise to feel sanguine at the prospect of leaving the improvement in the hands of men whose folly, or whose selfishness, have brought about the present confusion, knowing well that, after this exposure, the country will not trust them any longer; and that if an undefined misgiving has kept people hitherto from sending their sons to college, less than ever will they dream of doing so now. They have ventured on recommending what we have long felt to be the only possible method; and stigmatized though it be, with the name of revolution—though the "Edinburgh Reviewer" turns pale at it—and the majority even of those who have furnished evidence cry out against it in dismay, yet it has the support of a few men whose names are the highest in the university, and the tone of whose language marks them as belonging to the small class, whose words are

golden. The colleges were founded for the poor; they are saturated with the vices of the rich. They were designed as a check upon licentiousness; their discipline is as incapable of preventing as their habits preposterously foster it. The evils have grown in colleges, and while the college monopoly remains they will continue to grow. It is proposed, therefore, that things shall return to their ancient condition; and that poor men, or rich, or any, shall be permitted, if they please, to reside in private lodgings, unattached to college or to hall. The full importance of such a change can be understood by no one who is without personal experience of the university. We will here enumerate a few of the advantages which it is proposed to secure by it. It is called a revolution; we will not quarrel with the word—there are revolutions which are necessary and beneficent.

At present the number of men who can avail themselves of the benefits of Oxford is limited by the number of rooms in the colleges. This difficulty will at once disappear, and the university may be immediately and indefinitely extended. Free to adapt his mode of life to his means, the student coming up in this way will choose his own lodgings, and live as he has lived elsewhere. He will be called upon for no outlay for fees, or caution money, or equipment of rooms, or visionary tuition; the leeches of the kitchen and the buttery will not be able to fasten upon him; he will find his place as he would find it in any other town in England; and from a variety of instances it is proved that lodging-house keepers will supply him with all necessaries and all comforts for eighteen shillings a week. No curious eye will be upon him if he is poor, to make him conscious of his poverty, he will choose his own society among his own friends, and on his own level.

It is difficult to measure the indignation with which this apparently innocent proposal has been received. It is no more than to introduce into Oxford a system which is found to answer exceedingly well in other places, and in other professions. We are fortunate, however, in having answers to all serious objections most ably provided in the evidence attached to the Report; and we will state briefly both the one and the other.

First, it is urged that a number of persons are notoriously able to live more cheaply together than singly, and that, therefore, college life *must* be more economical than out-lodging. We can only reply, look on this bill and on this. It is quite true that men *may* live more cheaply to-

gether; and no doubt boarding-houses would soon spring up on the competitive principle, enabling them to live for very little indeed; but that careless and ill-managed corporations, without conscience or competition to keep them in check, are necessarily economical, by no means follows. As Mr. Pattison says: "There can be no doubt that men can live in common for less than they can live on separately, but only where free competition acts to beat down rent, service, and supplies, and where the domestic economy is under the management of an experienced person."

The discipline appears to offer a graver difficulty. We will hope that the anxiety which is betrayed about it is not, after all, an acknowledgment of peculiar liabilities to immorality; but a keener sense of the discredit which attaches to it. On this subject let us hear Mr. Wall:—

"It will be said that the admission of a number of unattached members would first destroy the discipline, and corrupt the morals of the present students; and, secondly, would leave the new-comers destitute of the two greatest advantages of the present system—the personal superintendence of a college tutor, and the daily chapel.

"Now truth must not be obscured by romance; a useful measure must not be sacrificed to a theory. I have resided in Oxford for the last twenty-two years, and I have had some experience (Mr. Wall is Fellow and Bursar of Balliol, Vice-Principal of St. Alban's Hall, and Prælector of Logie). I wish I could say that the discipline of Oxford had much capacity for becoming worse; I wish I could say that immorality had yet to be introduced among our students. As to the personal superintendence of college tutors, if any parent thinks that when he enters a son at a college he necessarily places him where his moral and intellectual training will be carefully watched over by a tutor, I can only assure him that he is under a pleasing delusion. As to daily chapel, I do not think that it does any very extensive spiritual good. It is a very effectual means of breaking up wine parties, and making men rise early in the morning. It is also in some colleges used as a means of punishment. Can all this do good? I believe that the obligation to attend chapel does more harm than good. There are plenty of churches in Oxford where there is daily service, and there is nothing to prevent students who live in the town from going every day to church, if they wish it. If they do not wish it, they had better not be compelled. I must, on the other hand, observe, that there are disadvantages and temptations attending a residence in college, which would not belong to a residence in private lodgings. Many a youth who comes up well disposed, is ruined by bad society in his college,—(the italics are Mr. Wall's)—society which he was not likely to have known had he been in private lodgings."

In every way the poor man will be a gainer. He will gain in being free of college extortion. He will gain in privacy, and his self-respect will not be wounded by the slights of wealthier companions, with whom, at present, he is forced into unnatural contact. Their insolence will not reach him, and their example will not injure him. Those parents who still value the discipline of licentiousness or of morality, as they please to consider it, may still send their sons to the colleges. But the only discipline really effective in repressing vice, is that of the proctors and university officers, which will extend equally over every one who is resident in *statu pupillari*.

There is but one important difficulty. How are these out-students to be taught? A full answer is supplied by the Commissioners; and it will lead us to the consideration, which must now be brief, of the remaining suggested changes. On all sides the university must be reconstructed as it was before it was absorbed into the colleges. The ancient method of teaching was through professors' lectures, illustrated and developed by further catechetical instruction given by all or any of the ordinary graduates. The college tutor drove out the professor, and is now, in his turn, already superseded by a revival of the teaching of the old graduates in the person of the private tutors. The latter do the work, and while they do it, they are, for the present, wholly abnormal and unrecognised. We have but to return openly to what we have already in silence adopted; we have but to convert the formal licence to teach now conveyed by the degree, into a reality, and all will be done. The out-students will be spared the fees to official teachers who are useless to them. They will command the real service of private tutors of their own choice, and, therefore, the ablest which they can find, while, at the same time, the revival of the professorate will place higher instruction within their reach on all subjects, than any which is now given in Oxford.

A few general reflections will assist us in understanding the bearing of all this. The tendency of the present time is not towards the establishment of forms of belief external to the National Church, but to extend the terms of communion in the Church itself. The Dissenters, as a body, are waning, while men of all opinions, from the virtual Roman Catholic to the free-thinker, remain formally within the Establishment. They are able to remain, as it grows more clear to them that it has no claim to teach any precise doctrine; that it is in fact no more than an establish-

ment. There is no doubt that this is the direction in which the current is at present setting. All men would sooner avoid singularity and conform, if their conscience would let them; and consciences are becoming more easy about it every day. A movement of this kind will go on for a long time under the surface before it takes effect in a formal change; but indications break through from time to time to let us know what is passing—and one of the most remarkable of these is to be seen in the present views of the Oxford Reformers. The university which once existed independent of ecclesiastical control they desire to restore to its liberty; to take from it its exclusively theological character, and enable it to be of efficient service for universal education. Thus a large extension of studies has lately been forced upon it. Modern history, physical science, and law, are again to enter the examinations; and now lay students are invited to come up to profit by them, free from the vexations and ineffectual discipline of ecclesiasticism, which they may either dislike, despise, or disapprove.

Forbidden to entertain the question of the admission of Dissenters, neither the Commissioners nor many of those who have sent their evidence have been able to conceal their feelings that at least subscription to the Articles is mischievous in the highest degree; and if any test is to be required, they would rather have it a general declaration of adherence to the National Church. We shall presently find them arriving at the same conclusion by another process. It is not to be expected that the new studies, physical science and modern history, which Oxford has so reluctantly accepted, will thrive without better assistance than what in her present state she can furnish. Tutors cannot teach what they do not know, and do not care to know; and the students who aim at substantial rewards for their labour, will not waste time on subjects which will not assist them in getting fellowships. It is not without intention that the Commissioners have gone so carefully through the history of the colleges, and contrasted their existing condition with that which was contemplated in their statutes. Institutions which have already changed their characters so largely for private convenience, must submit to be further altered for the benefit of the country. If poor men are to come to Oxford, they must have a better chance laid open to them than they would find now; and inasmuch as out of five hundred and forty fellowships, only twenty-two are at present fairly rewards of merit, and even those twenty-two are subject to vexatious conditions, it is proposed at one blow to throw open the whole number, and abolish all restrictions and

conditions of whatever kind; especially to encourage the new subjects, particular fellowships are to be appropriated to those; and thus any deserving student in any line of knowledge would be certain of obtaining a provision for himself.

Further, as in several instances the founders of colleges contemplated that the university should derive also some advantage from their liberality, it is thought no injustice to confiscate in the richer or more useless foundations a given number of fellowships for the endowment of sixteen new professorships, and an equal number of lectureships; and, in order to secure the services of the ablest men who can be found, to attach to all the professorships, new and old, salaries of not less than 800*l.* a year. The crown is for the present to appoint to these chairs, and to choose the best men that can be found to accept them out of any nation and of any profession. "It will be of little service," say the Commissioners, "to have a chair of chemistry, if such men as Liebig and Faraday are liable to be excluded from it; and no conditions at all are to be desired, except a general promise to abstain from interference with the established forms of the university. We look with curiosity to see whether the once ultra-liberal Cambridge will dare to propose anything so loftily liberal as this. They are wise enough, too, to recommend the precautions which will be necessary to ensure honest dealing; bigotry and want of principle at present unite in maladministration, and these professors are to have a position as fellows in the colleges out of whose revenues they are endowed—under their eyes, the abuses which have hitherto concealed themselves behind the oaths of secrecy taken by the present fellows, cannot be any longer perpetrated.

And this is not all. There are many young men at the country training schools who show talents that deserve cultivation, but which are at present paralysed by poverty. Under the new system, it is calculated that 50*l.* annually may cover all expenses at the university; and to assist such persons of availing themselves of the education there, 500 scholarships of that annual value are proposed to be founded out of the revenues of the present sinecurists, tenable for five years; a hundred of which will therefore fall open to competition every year. This is a truly magnificent suggestion, and if carried out will give attractions to Oxford which no place of education in the world can parallel. We have but one fault to find with the manner in which such scholarships are to be awarded, and that is probably only an oversight; a similar difficulty in the fellowship elections being foreseen and provided against.

It is felt that out-lodging students will be regarded with jealousy by the colleges, and that they run a risk of being hardly treated in competing for fellowships; the visitor is therefore empowered to investigate, and if necessary to remedy, such acts of unconscious injustice. The same jealousy will operate in the case of scholarships, and to meet this, no precaution is suggested; and further, it is hard that a poor hard-working student living out of college should be compelled by a successful competition into an expensive community, where his new compulsory style of living will more than absorb the little income which he has earned. If out-college students are to be permitted at all at the university, the scholarships should be transferred from the control of the colleges altogether; the professors, or persons delegated by them, should examine and elect; and all members of the university should be eligible, whether belonging to a college or not.

To recapitulate these important provisions. Many others are contained in the Report, but of less universal interest, and more concerning those already belonging to Oxford, than those who under a better system desire to belong to it, and to whom we are mainly addressing ourselves. The college monopoly being destroyed, the expenses will be reduced to a third of what are at present necessary. An obnoxious subscription to obsolete formulas will no longer be insisted on. If professors of all opinions are to be allowed to teach, students of all opinions will very speedily follow. The university will offer a substantial education in literature and history of all ages and countries—in philosophy, law, medicine, in everything which can be required as a preparatory education for the various employments of life. Physical science will be taught by the most competent professors of it in the world; even theology may be converted from a shadow into a substance; and a scientific school of it arise which may allay the panic of the Edinburgh reviewer. The material inducements to study in the shape of substantial rewards attached to proficiency in any one department will be worthy of the first university of the first nation in the world. No longer fettered by partialities, monopolies, and ecclesiastical narrowness, it will recruit its staff of officials from the ablest men whom it can raise; while we may fairly hope that such other great men as may rise to eminence elsewhere will find no inducements more tempting, either substantially or as a position of honour, than what the Crown may offer them at Oxford. The universities of England will then only be what they have

a right to be, when the wisest men in England or in the world are engaged in their service.

Is it all but idle wind? Are all these hopes but dreams? It may well be thought so. We cannot work an institution at an elevation above the level of the character of those who are to conduct it; and reformation of form no more involves reformed practice, than a clean face involves an honest mind.

In this scheme of reform we depend so much on help from government. Physician, heal thyself! In this very volume there is a sentence, let fall as it were by accident, by Mr. Jelf, who is evidently unconscious of the irony of his words, which teaches us what to expect from thence:—

“I wish to be allowed to add, that I think the hands of the university would be very much strengthened, if in cases where undergraduates are obliged to leave Oxford for extravagance, vice, or insubordination, the government would examine into the circumstances of each case previous to immediate admission to government employment. I am convinced that the knowledge that expulsion from the university might operate unfavourably on prospects of immediate employment or advancement, would supply a most powerful check to extravagant or vicious or idle tendencies.”

So it stands written; and not one instance, or two, or three, but a too universal practice has provoked the exposure. Comment on it would be wholly superfluous; and behind it lie revolutions deeper than academical. Between us and any wholesome university reform hangs a cloudy interval of politics into which we are in no haste to enter. Sufficient for the day is its own evil.

---

#### ART. II.—WHEWELL'S MORAL PHILOSOPHY.

1. *Lectures on the History of Moral Philosophy in England.* By William Whewell, D.D., Master of Trinity College, and Professor of Moral Philosophy in the University of Cambridge. 1 vol. 8vo. 1852.
2. *Elements of Morality, including Polity.* By the same Author. 2 vols. 8vo. 1845.

If the worth of Dr. Whewell's writings could be measured by the importance and amplitude of their subjects, no writer of the age could vie with him in merit or usefulness. He has aspired to be not only the

historian, but the philosopher and legislator, of almost all the great departments of human knowledge; reducing each to its first principles, and showing how it might be scientifically evolved from these as a connected whole. After endeavouring, in his *History and Philosophy of the Inductive Sciences*, to place physics, and incidentally metaphysics, on a philosophic foundation, he has made an almost equally ambitious attempt on the subjects of morals and government, of which the two works before us are the results. He is thus entitled to the praise of having done his best to wipe off from the two endowed universities, in one of which he holds a high place, the reproach to which they have so long been justly liable, of neglecting the higher regions of philosophy. By his writings and influence he has been an agent in that revival of speculation on the most difficult and highest subjects, which has been noticeable for some years past within as well as without the pale of Oxford and Cambridge. And inasmuch as mental activity of any kind is better than torpidity, and bad solutions of the great questions of philosophy are preferable to a lazy ignoring of their existence, whoever has taken so active a part as Dr. Whewell in this intellectual movement, may lay claim to considerable merit.

Unfortunately it is not in the nature of bodies constituted like the English universities, even when stirred up into something like mental activity, to send forth thought of any but one description. There have been universities (those of France and Germany have at some periods been practically conducted on this principle) which brought together into a body the most vigorous thinkers and the ablest teachers, whatever the conclusions to which their thinking might have led them. But in the English universities no thought can find place, except that which can reconcile itself with orthodoxy. They are ecclesiastical institutions; and it is the essence of all churches to vow adherence to a set of opinions made up and prescribed, it matters little whether three or thirteen centuries ago. Men will some day open their eyes, and perceive how fatal a thing it is that the instruction of those who are intended to be the guides and governors of mankind should be confided to a collection of persons thus pledged. If the opinions they are pledged to were every one as true as any fact in physical science, and had been adopted, not as they almost always are, on trust and authority, but as the result of the most diligent and impartial examination of which the mind of the recipient was capable; even then, the engagement under penalties always to adhere to the opi-

nions once assented to, would debilitate and lame the mind, and unfit it for progress, still more for assisting the progress of others. The person who has to think more of what an opinion leads to, than of what is the evidence of it, cannot be a philosopher, or a teacher of philosophers. Of what value is the opinion on any subject, of a man of whom every one knows that by his profession he must hold that opinion? and how can intellectual vigour be fostered by the teaching of those who, even as a matter of duty, would rather that their pupils were weak and orthodox, than strong with freedom of thought? Whoever thinks that persons thus tied are fitting depositories of the trust of educating a people, must think that the proper object of intellectual education is not to strengthen and cultivate the intellect, but to make sure of its adopting certain conclusions: that, in short, in the exercise of the thinking faculty, there is something, either religion, or conservatism, peace, or whatever it be, more important than truth. Not to dilate further on this topic, it is nearly inevitable, that when persons bound by the vows and placed in the circumstances of an established clergy, enter into the paths of higher speculation, and endeavour to make a philosophy, either purpose or instinct will direct them to the kind of philosophy best fitted to prop up the doctrines to which they are pledged. And when these doctrines are so prodigiously in the arrear of the general progress of thought, as the doctrines of the Church of England now are, the philosophy resulting will have a tendency not to promote, but to arrest progress.

Without the slightest wish to speak in disparagement of Dr. Whewell's labours, and with no ground for questioning his sincerity of purpose, we think the preceding remarks thoroughly applicable to his philosophical speculations. We do not say the intention, but certainly the tendency, of his efforts, is to shape the whole of philosophy, physical as well as moral, into a form adapted to serve as a support and a justification to any opinions which happen to be established. A writer who has gone beyond all his predecessors in the manufacture of necessary truths, that is, of propositions which, according to him, may be known to be true independently of proof; who ascribes this self-evidence to the larger generalities of all sciences (however little obvious at first) as soon as they have become familiar—was still more certain to regard all moral propositions familiar to him from his early years, as self-evident truths. His "Elements of Morality" could be nothing better than a classification and systematizing of the opi-

nions which he found prevailing, among those who had been educated according to the approved methods of his own country ; or, let us rather say, an apparatus for converting those prevailing opinions, on matters of morality, into reasons for themselves.

This, accordingly, is what we find in Dr. Whewell's volumes ; while we have sought in vain for the numerous minor merits, which gave a real scientific value to his previous works. If the "Philosophy of the Inductive Sciences" was, as we think, an erroneous philosophy, it contained much that was not unfit to find place in a better, and was often calculated to suggest deeper thoughts than it possessed of its own. But in the "Elements of Morality" he leaves the subject so exactly as he found it,—the book is so mere a catalogue of received opinions, containing nothing to correct any of them, and little which can work with any potency even to confirm them,—that it can scarcely be counted as anything more than one of the thousand waves on the dead sea of commonplace, affording nothing to invite or to reward a separate examination. We should not, therefore, have felt called upon to concern ourselves specially about it, if Dr. Whewell had not, in his more recent publication, "Lectures on the History of Moral Philosophy in England," undertaken to characterize and criticize, from his own point of view, all other English writers on moral philosophy ; and particularly those who derive their ethical conclusions, not from internal intuition, but from an external standard. So long as he contented himself with giving what we think bad reasons for common opinions, there was not much inducement to interfere with them ; but assaults on the only methods of philosophizing from which any improvement in ethical opinions can be looked for, ought to be repelled. And in doing this it is necessary to extend our comments to some of Dr. Whewell's substantive opinions also. When he argues in condemnation of any external standard, and especially of utility, or tendency to happiness, as the principle or test of morality, it is material to examine how he gets on without it ; how he fares in the attempt to construct a coherent theory of morals on any other basis. We shall make use of his larger work in so far only as it is evidence on this point.

Even with the "Lectures," considered as giving an account of English speculations on moral philosophy previous to the age of Bentham and Paley, it is not necessary to meddle : Hobbes, therefore, and Locke, must be left in the hands of Dr. Whewell, without any attempt either to correct his estimate of their opinions, or to offer any

judgment of our own. This historical sketch suggests, however, one remark of an historical character, not new to any one who is conversant with the writings of English thinkers on ethical subjects. During the greater part of the eighteenth century, the received opinions in religion and ethics were chiefly attacked, as by Shaftesbury, and even by Hume, on the ground of instinctive feelings of virtue, and the theory of a moral taste or sense. As a consequence of this, the defenders of established opinions, both lay and clerical, commonly professed utilitarianism. To the many writers on the side of orthodoxy, of the utilitarian school, mentioned by Dr. Whewell, might be added several, of at least equal note, whom he has omitted ; as John Brown, the author of "Essays on the Characteristics ;" Soames Jenyns, and his more celebrated reviewer, Dr. Johnson ; all of whom, as explicitly as Bentham, laid down the doctrine that utility is the foundation of morals. This series of writers attained its culmination in Paley, whose treatise, proclaiming without evasion or circumlocution, not only expediency as the end, but (a very different doctrine) simple self-interest as the motive, of virtue, and deducing from these premises all the orthodox conclusions, became the text-book of moral philosophy in one of the two universities of the Church of England. But a change ensued, and the utilitarian doctrine, which had been the favourite theory of the defenders of orthodoxy, began to be used by its assailants. In the hands of the French philosophers, and in those of Godwin, and of Bentham,—who, though earlier than Godwin in date, was later in acquiring popular influence,—a moral philosophy founded on utility led to many conclusions very unacceptable to the orthodox. For a whole generation, so effectual a fight was kept up against those conclusions, by bayonets in the field, and prosecutions in the courts of justice, that there seemed no necessity for taking much concern about the premises : but when those carnal weapons fell into disuse, and the spirit that had wielded them was laid—when the battle of established opinions in the church and state had again to be fought by argument, a demand arose for metaphysics, and moral philosophy, of the kind most remote from that which appeared so full of danger to received opinions. Utility was now abjured as a deadly heresy, and the doctrine of *a priori* or self-evident morality, an end in itself, independent of all consequences, became the orthodox theory. Having once entered into this course, and gone in search of a philosophical system to be extracted from the mind itself, without any external

evidence, the defenders of orthodoxy were insensibly led to seek their system where it exists in the most elaborate shape—in the German metaphysicians. It was not without reluctance that they found themselves engaged in this path; for German metaphysics in Germany lay under as grave a suspicion of religious scepticism, as the rival philosophy in England or France. But it was found on trial, that philosophy of this cast admitted of easy adaptation, and would bend to the very Thirty-nine Articles; as it is the essence of a philosophy which seeks its evidence in internal conviction, that it bears its testimony with equal ease for any conclusions in favour of which there is a predisposition, and is sceptical with the sceptical, and mystical with the mystical. Accordingly, the tone of religious metaphysics, and of the ethical speculations connected with religion, is now altogether Germanized; and Dr. Whewell, by his writings, has done no little to impress upon the metaphysics of orthodoxy this change of character.

It has always been indistinctly felt that the doctrine of *a priori* principles is one and the same doctrine, whether applied to the *δν* or the *δέον*—to the knowledge of truth or to that of duty; that it belongs to the same general tendency of thought, to extract from the mind itself, without any outward standard, principles and rules of morality, and to deem it possible to discover, by mere introspection into our own minds, the laws of external nature. Both forms of this mode of thought attained a brilliant development in Descartes, the real founder of the modern anti-inductive school of philosophy. The Cartesian tradition was never lost, being kept alive by direct descent through Spinoza, Leibnitz, and Kant, to Schelling and Hegel; but the speculations of Bacon and Locke, and the progress of the experimental sciences, gave a long period of predominance to the philosophy of experience; and though many followed out that philosophy into its natural alliances, and acknowledged not only observation and experiment as rulers of the speculative world, but utility of the practical, others thought that it was scientifically possible to separate the two opinions, and professed themselves Baconians in the physical department, remaining Cartesians in the moral. It will probably be thought by posterity to be the principal merit of the German metaphysicians of the last and present age, that they have proved the impossibility of resting on this middle ground of compromise; and have convinced all thinkers of any force, that if they adhere to the doctrine of *a*

*priori* principles of morals, they must follow Descartes and Hegel in ascribing the same character to the principles of physics.

On the present occasion, it is only with the moral branch of the subject that we have to deal; and we shall begin by showing in what manner Dr. Whewell states the question between us:—

“Schemes of morality, that is, modes of deducing the rules of human action, are of two kinds:—those which assert it to be the law of human action to aim at some external object, (external, that is, to the mind which aims) as, for example, those which in ancient or modern times have asserted pleasure, or utility, or the greatest happiness of the greatest number, to be the true end of human action; and those which would regulate human action by an internal principle or relation, as conscience, or a moral faculty, or duty, or rectitude, or the superiority of reason to desire. These two kinds of schemes may be described respectively as *dependent* and *independent* morality. Now, it is here held that independent morality is the true scheme. We maintain, with Plato, that reason has a natural and rightful authority over desire and affection; with Butler, that there is a difference of kind in our principles of action; with the general voice of mankind, that we must do what is right, at whatever cost of pain and loss. We deny the doctrine of the ancient Epicureans, that pleasure is the supreme good; of Hobbes, that moral rules are only the work of men's mutual fear; of Paley, that what is expedient is right, and that there is no difference among pleasures except their intensity and duration; and of Bentham, that the rules of human action are to be obtained by casting up the pleasures which actions produce. But though we thus take our stand upon the ground of independent morality, as held by previous writers, we hope that we are (by their aid mainly) able to present it in a more systematic and connected form than has yet been done.”—*Introductory Lecture*, pp. ix. x.

There is in this mode of stating the question, great unfairness to the doctrine of “dependent morality;” as Dr. Whewell terms it, though the word independent is quite as applicable to it as to the intuition doctrine. He appropriates to his own side of the question all the expressions, such as conscience, duty, rectitude, with which the reverential feelings of mankind towards moral ideas are associated, and cries *I am* for these noble things, *you are* for pleasure, or utility. We cannot accept this as a description of the matter at issue. Dr. Whewell is assuming to himself what belongs quite as rightfully to his antagonists. We are as much for conscience, duty, rectitude, as Dr. Whewell. The terms, and all the feelings connected with them, are as much a part of the ethics of utility as of intuition. The point in dispute is, what acts are the proper objects of those feelings? whe-

ther we ought to take the feelings as we find them, as accident or design has made them, or whether the tendency of actions to promote happiness affords a test to which the feelings of morality should conform! In the same spirit, Dr. Whewell announces it as *his* opinion, as the side *he* takes in this great controversy, "that we must do what is right, at whatever cost of pain and loss." As if this was not everybody's opinion: as if it was not the very meaning of the word right. The matter in debate is, what is right, not whether what is right ought to be done. Dr. Whewell represents his opponents as denying an identical proposition, in order that he may claim a monopoly of high principle for his own opinions. The same unfairness pervades the whole phraseology. It is not only Dr. Whewell who "maintains, with Plato, that reason has a rightful authority over desire and affection." Everybody maintains it; only, what is reason? and by what rule is it to guide and govern the desires and affections! The description of Bentham, as obtaining his rule of conduct by "casting up the pleasures which actions produce," ought to be "casting up the pleasures and pains which actions produce:" a very different thing.

As might be expected from the historical character of the Lectures, the discussion of opinions mostly assumes the form of criticism on writers. Dr. Whewell's objections to utility, or the "greatest happiness," as the standard of morals, are chiefly contained in his animadversions on Paley and on Bentham. It would be quite open to a defender of the principle of utility, to refuse incumbering himself with a defence of either of those authors. The principle is not bound up with what they have said in its behalf, nor with the degree of felicity which they may have shown in applying it. As for Paley, we resign him without compunction to the tender mercies of Dr. Whewell. It concerns Dr. Whewell more than ourselves to uphold the reputation of a writer, who, whatever principle of morals he professed, seems to have had no object but to insert it as a foundation underneath the existing set of opinions, ethical and political; who, when he had laid down utility as the fundamental axiom, and the recognition of general rules as the condition of its application, took his leave of scientific analysis, and betook himself to picking up utilitarian reasons by the wayside, in proof of all accredited doctrines, and in defence of most tolerated practices. Bentham was a moralist of another stamp. With him, the first use to be made of his ultimate principle, was to erect on it, as a foundation, secondary or middle principles, capable of serving as premises for a body of ethical doctrine not

derived from existing opinions, but fitted to be their test. Without such middle principles, an universal principle, either in science or in morals, serves for little but a thesaurus of commonplaces for the discussion of questions, instead of a means of deciding them. If Bentham has been regarded by subsequent adherents of a morality grounded on the "greatest happiness," as in a peculiar sense the founder of that system of ethics, it is not because, as Dr. Whewell imagines (p. 190), he either thought himself, or was thought by others to be the "discoverer of the principle," but because he was the first who, keeping clear of the direct and indirect influences of all doctrines inconsistent with it, deduced a set of subordinate generalities from utility alone, and by these consistently tested all particular questions. This great service, previously to which a scientific doctrine of ethics on the foundation of utility was impossible, has been performed by Bentham (though with a view to the exigencies of legislation more than to those of morals) in a manner, as far as it goes, eminently meritorious, and so as to indicate clearly the way to complete the scheme. We must at the same time qualify our approbation by adding, not that his practical conclusions were often wrong, for we think that as far as they went they were mostly right; but that there were large deficiencies and hiatuses in his schemes of human nature and life, and a consequent want of breadth and comprehension in his secondary principles, which led him often to deduce just conclusions from premises so narrow as to provoke many minds to a rejection of what was nevertheless truth. It is by his *method* chiefly that Bentham, as we think, justly earned a position in moral science analogous to that of Bacon in physical. It is because he was the first to enter into the right mode of working ethical problems, though he worked many of them, as Bacon did physical, on insufficient data. Dr. Whewell's shafts, however, seldom touch Bentham where he is really vulnerable; they are mostly aimed at his strong points.

Before commencing his attack on Bentham's opinions, Dr. Whewell gives a sketch of his life. In this there is an apparent desire to be just to Bentham, as far as the writer's opinions allow. But there is in some of the strictures a looseness of expression, not excusable in an extemporaneous lecture, and still less in a printed book. "He (Bentham) showed very early that peculiar one-sidedness in his mode of asserting and urging his opinions, which made him think all moderation with regard to his opponents superfluous and absurd," (p. 189.) What is here called "one-sidedness in his mode of asserting and urging his opinions," must mean one-sidedness in the

opinions themselves. It could not be Bentham's "mode of asserting his opinions," that "made him think" whatever he did think. This is as if any one should say, "his speaking only English made him unable to understand French," or his "peculiar habit of fighting made him think it superfluous and absurd to keep the peace." Again (p. 190), "Bentham appears to have been one of those persons to whom everything which passes through their own thoughts assumes quite a different character and value from that which the same thing had when it passed through the thoughts of other persons." If a thought in a person's own mind did not assume a different character from what the same thought had in other minds, people might as well think by deputy.

A more serious injustice to Bentham is that of citing, as is constantly done in this volume, the book called "Deontology," as the authentic exposition of Bentham's philosophy of morals. Dr. Whewell would, no doubt, justify this by saying that the book in question is the only treatise expressly and exclusively on morals, which we have from Bentham. It is true that we have no other; but the "Deontology" was not, and does not profess to be, written by Bentham. We cannot acknowledge any one as the authorized expositor of Bentham's unwritten opinions. Still less ought that book to be represented as the embodiment of the opinions and mental characteristics of all who share Bentham's general conception of ethics. After charging the compiler of the "Deontology" with profound ignorance, and saying that it is almost "superfluous to notice misstatements so gross and partiality so blind," Dr. Whewell adds that "such misrepresentations and such unfairness are the usual style of controversy of him (Bentham) and his disciples; and it is fit that we, in entering upon the consideration of their writings, should be aware of this." Who are the persons here included under the name of Bentham's "disciples," we are not enabled to judge; nor are aware that Bentham ever had any disciples, in Dr. Whewell's sense of the term. As far as our means of observation have gone, which are considerably greater than Dr. Whewell's, those who, from the amount of their intellectual obligations to Bentham, would be the most likely to be classed by Dr. Whewell as Benthamites, were and are persons in an unusual degree addicted to judging and thinking for themselves; persons remarkable for learning willingly from all masters, but swearing blind fealty to none. It is also a fact, with which Dr. Whewell cannot be altogether unacquainted, that

among them there have been men of the widest and most accurate acquirements in history and philosophy, against whom the accusation of ignorance of the opinions which they controverted would be as unfounded as the imputation of blind partiality. We protest against including them and Bentham in an imaginary sect of which the "Deontology" is to be considered the gospel. Bentham's merits or demerits must stand on what is contained in the books written by himself.

Among these, the one in which the doctrine of utility is expressly discussed, and contrasted with the various ethical doctrines opposed to it, is the "Introduction to the Principles of Morals and Legislation," published in 1789. On this Dr. Whewell comments as follows:—

"The first chapter of this work is 'On the Principle of Utility;' the second 'On Principles adverse to that of Utility.' These adverse principles are stated to be two: the Principle of Asceticism, and the Principle of Sympathy." (Bentham calls it the Principle of Sympathy and Antipathy, which is already a considerable difference). "The principle of asceticism is that principle which approves of actions in proportion as they tend to *diminish* human happiness, and, conversely, disapproves of them as they tend to augment it. The principle of sympathy is that which approves or disapproves of certain actions 'merely because a man finds himself disposed to approve or disapprove of them, holding up that approbation or disapprobation as a sufficient reason for itself, and disclaiming the necessity of looking out for any extrinsic ground.' And these two principles are, it seems, according to Bentham's view, the only principles which are, or which can be, opposed to the principle of utility!

"Now it is plain that these are not only not fair representations of any principles ever held by moralists, or by any persons speaking gravely and deliberately, but that they are too extravagant and fantastical to be accepted even as caricatures of any such principles. For who ever approved of actions because they tend to make mankind miserable? or who ever said anything which could, even in an intelligible way of exaggeration, be so represented? . . . But who then are the ascetic school who are thus ridiculed? We could not, I think, guess from the general description thus given; but from a note, it appears that he had the Stoical philosophers and the religious ascetics in his mind. With regard to the Stoics, it would of course be waste of time and thought to defend them from such coarse buffoonery as this, which does not touch their defects, whatever these may be," &c.—p. 202.

Not solely for the due estimation of Bentham, but for the right understanding of the utilitarian controversy, it is important to know what the truth is, respecting the points here in issue between Bentham and Dr. Whewell.

Undoubtedly no one has set up, in opposition to the "greatest happiness principle," a "greatest unhappiness" principle, as the standard of virtue. But it was Bentham's business not merely to discuss the avowed principles of his opponents, but to draw out those which, without being professed as principles, were implied in detail, or were essential to support the judgments passed in particular cases. His own doctrine being that the increase of pleasure and the prevention of pain were the proper ends of all moral rules, he had for his opponents all who contended that pleasure could ever be an evil or pain a good in itself, apart from its consequences. Now this, whatever Dr. Whewell may say, the religious ascetics really did. They held that self-mortification, or even self-torture, practised for its own sake, and not for the sake of any useful end, was meritorious. It matters not that they may have expected to be rewarded for these merits by consideration in this world, or by the favour of an invisible tyrant in a world to come. So far as this life was concerned, their doctrine required it to be supposed that pain was a thing to be sought, and pleasure to be avoided. Bentham generalized this into a maxim, which he called the principle of asceticism. The Stoics did not go so far as the ascetics; they stopped half-way. They did not say that pain is a good, and pleasure an evil. But they said, and boasted of saying, that pain is no evil, and pleasure no good; and this is all, and more than all, that Bentham imputes to them, as may be seen by any one who reads that chapter of his book. This, however, was enough to place them, equally with the ascetics, in direct opposition to Bentham, since they denied his supreme end to be an end at all. And hence he classed them and the ascetics together, as professing the direct negation of the utilitarian standard.

In the other division of his opponents he placed those who, though they did not deny pleasure to be a good and pain an evil, refused to consider the pain or the pleasure which an action or a class of actions tends to produce, as the criterion of its morality. As the former category of opponents were described by Bentham as followers of the "principle of asceticism," so he described these as followers of "the principle of sympathy and antipathy;" not because they had themselves generalized their principle of judgment, or would have acknowledged it when placed undisguised before them; but because at the bottom of what they imposed on themselves and others as reasons, he could find nothing else; because they all, in one phrase or another, placed the test of

right and wrong in a feeling of approbation or disapprobation, thus making the feeling its own reason and its own justification. This portion of Bentham's doctrine can only be fairly exhibited in his own words:—

"It is manifest that this [the principle of sympathy and antipathy] is rather a principle in name than in reality; it is not a positive principle of itself, so much as a term employed to signify the negation of all principle. What one expects to find in a principle is something that points out some external consideration as a means of warranting and guiding the internal sentiments of approbation and disapprobation: this expectation is but ill fulfilled by a proposition which does neither more nor less than hold up each of these sentiments as a ground and standard for itself.

"In looking over the catalogue of human actions (says a partisan of this principle) in order to determine which of them are to be marked with the seal of disapprobation you need but to take counsel of your own feelings; whatever you find in yourself a propensity to condemn, is wrong for that very reason. For the same reason it is also meet for punishment: in what proportion it is adverse to utility, or whether it be adverse to utility at all, is a matter that makes no difference. In the same proportion also is it meet for punishment: if you hate much, punish much; if you hate little, punish little: punish as you hate. If you hate not at all, punish not at all: the fine feelings of the soul are not to be overborne and tyrannized by the harsh and rugged dictates of political utility.

"The various systems that have been formed concerning the standard of right and wrong, may all be reduced to the principle of sympathy and antipathy. One account may serve for all of them. They consist, all of them, in so many contrivances for avoiding the obligation of appealing to any external standard, and for prevailing upon the reader to accept of the author's sentiment or opinion as a reason for itself. The phrase is different, but the principle the same.

"It is curious enough to observe the variety of inventions men have hit upon, and the variety of phrases they have brought forward, in order to conceal from the world, and if possible from themselves, this very general, and therefore very pardonable self-sufficiency.

"One man says he has a thing made on purpose to tell him what is right and what is wrong, and that it is called a *moral sense*; and then he goes to work at his ease, and says, such a thing is right, and such a thing is wrong—why? 'because my moral sense tells me it is.'

"Another man comes and alters the phrase; leaving out *moral*, and putting in *common* in the room of it. He then tells you, that his common sense teaches him what is right and wrong, as much as the other's moral sense did: meaning, by common sense, a sense of some kind or other, which, he says, is possessed by all mankind; the sense of those, whose sense is not the same as the author's, being struck out of the account as not worth taking. This contrivance does better than the other; for a moral sense being a new thing, a man may feel about him a good while without

being able to find it out; but common sense is as old as the creation; and there is no man but would be ashamed to be thought not to have as much of it as his neighbours. It has another great advantage; by appearing to share power, it lessens envy: for when a man gets up upon this ground, in order to anathematize those who differ from him, it is not by a *sic volo sic jubeo*, but by a *velitis jubeatis*,

"Another man comes, and says, that as to a moral sense indeed, he cannot find that he has any such thing; that, however, he has an *understanding*, which will do quite as well. This understanding, he says, is the standard of right and wrong: it tells him so and so. All good and wise men understand as he does: if other men's understandings differ in any point from his, so much the worse for them; it is a sure sign they are either defective or corrupt.

"Another man says, that there is an eternal and immutable rule of right; that that rule of right dictates so and so; and then he begins giving you his sentiments upon anything that comes uppermost; and these sentiments (you are to take for granted) are so many branches of the eternal rule of right.

"Another man, or perhaps the same man (it's no matter) says, that there are certain practices conformable, and others repugnant, to the fitness of things; and then he tells you, at his leisure, what practices are conformable and what repugnant; just as he happens to like a practice or dislike it.

"A great multitude of people are continually talking of the law of nature; and then they go on giving you their sentiments about what is right and what is wrong; and these sentiments, you are to understand, are so many chapters and sections of the law of nature.

"We have one philosopher who says, there is no harm in anything in the world but in telling a lie; and that if, for example, you were to murder your own father, this would only be a particular way of saying, he was not your father. Of course, when this philosopher sees anything that he does not like, he says, it is a particular way of telling a lie. It is saying, that the act ought to be done, or may be done, when, *in truth*, it ought not to be done."—(chap. ii.)

To this Dr. Whewell thinks it a sufficient answer to call it extravagant ridicule, and to ask, "Who ever asserted that he approved or disapproved of actions merely because he found himself disposed to do so, and this was reason sufficient in itself for his moral judgments?" Dr. Whewell will find that this by no means disposes of Bentham's doctrine. Bentham did not mean that people "ever asserted" that they approved or condemned actions only because they felt disposed to do so. He meant that they do it without asserting it; that they find certain feelings of approbation and disapprobation in themselves, take for granted that these feelings are the right ones, and when called on to say anything in justification of their approbation or disapprobation,

produce phrases which mean nothing but the fact of the approbation or disapprobation itself. If the hearer or reader feels in the same way, the phrases pass muster; and a great part of all the ethical reasoning in books and in the world is of this sort. All this is not only true, but cannot consistently be denied by those who, like Dr. Whewell, consider the moral feelings as their own justification. Dr. Whewell will doubtless say that the feelings they appeal to are not their own individually, but a part of universal human nature. Nobody denies that they say so: a feeling of liking or aversion to an action, confined to an individual, would have no chance of being accepted as a reason. The appeal is always to something which is assumed to belong to all mankind. But it is not of much consequence whether the feeling which is set up as its own standard is the feeling of an individual human being or of a multitude. A feeling is not proved to be right, and exempted from the necessity of justifying itself, because the writer or speaker is not only conscious of it in himself, but expects to find it in other people; because instead of saying "I," he says "you and I." If it is alleged that the intuitive school require, as an authority for the feeling, that it should *in fact* be universal, we deny it. They assume the utmost latitude of arbitrarily determining whose votes deserve to be counted. They either ignore the existence of dissentients, or leave them out of the account, on the pretext that they have the feeling which they deny having, or if not, that they ought to have it. This falsification of the universal suffrage which is ostensibly appealed to, is not confined, as is often asserted, to cases in which the only dissentients are barbarous tribes. The same measure is dealt out to whole ages and nations, the most conspicuous for the cultivation and development of their mental faculties; and to individuals among the best and wisest of their respective countries. The explanation of the matter is, the inability of persons in general to conceive that feelings of right and wrong, which have been deeply implanted in their minds by the teaching they have from their infancy received from all around them, can be sincerely thought by any one else to be mistaken or misplaced. This is the mental infirmity which Bentham's philosophy tends especially to correct, and Dr. Whewell's to perpetuate. Things which were really believed by all mankind, and for which all were convinced that they had the unequivocal evidence of their senses, have been proved to be false: as that the sun rises and sets. Can immunity from similar error

be claimed for the moral feelings? when all experience shows that those feelings are eminently artificial, and the product of culture; that even when reasonable, they are no more spontaneous than the growth of corn and wine (which are quite as natural), and that the most senseless and pernicious feelings can as easily be raised to the utmost intensity by inculcation, as hemlock and thistles could be reared to luxuriant growth by sowing them instead of wheat. Bentham, therefore, did not judge too severely a kind of ethics whereby any implanted sentiment which is tolerably general may be erected into a moral law, binding, under penalties, on all mankind. The contest between the morality which appeals to an external standard, and that which grounds itself on internal conviction, is the contest of progressive morality against stationary—of reason and argument against the deification of mere opinion and habit. The doctrine that the existing order of things is the natural order, and that, being natural, all innovation upon it is criminal, is as vicious in morals, as it is now at last admitted to be in physics, and in society and government.

Let us now consider Dr. Whewell's objections to utility as the foundation of ethics:—

“Let it be taken for granted, as a proposition which is true, if the terms which it involves be duly understood, that actions are right and virtuous in proportion as they promote the happiness of mankind; the actions being considered upon the whole, and with regard to all their consequences. Still, I say, we cannot make this truth the basis of morality, for two reasons: first, we cannot calculate all the consequences of any action, and thus cannot estimate the degree in which it promotes human happiness; second, happiness is derived from moral elements, and therefore we cannot properly derive morality from happiness. The calculable happiness resulting from actions cannot determine their virtue; first, because the resulting happiness is not calculable; and, secondly, because the virtue is one of the things which determine the resulting happiness.”—p. 210.

The first of these arguments is an irrelevant truism. “We cannot calculate *all* the consequences of any action.” If Dr. Whewell can point out any department of human affairs in which we can do *all* that would be desirable, he will have found something new. But because we cannot foresee everything, is there no such thing as foresight? Does Dr. Whewell mean to say that no estimate can be formed of consequences, which can be any guide for our conduct, unless we can calculate *all* consequences? that because we cannot predict

every effect which may follow from a person's death, we cannot know that the liberty of murder would be destructive of human happiness? Dr. Whewell, in his zeal against the morality of consequences, commits the error of proving too much. Whether morality is or is not a question of consequences, he cannot deny that prudence is; and if there is such a thing as prudence, it is because the consequences of actions *can* be calculated. Prudence, indeed, depends on a calculation of the consequences of individual actions, while for the establishment of moral rules it is only necessary to calculate the consequences of classes of actions—a much easier matter. It is certainly a very effectual way of proving that morality does not depend on expediency, to maintain that there is no such thing as expediency—that we have no means of knowing whether anything is expedient or not. Unless Dr. Whewell goes this length, to what purpose is what he says about the uncertainty of consequences? Uncertain or certain, we are able to guide ourselves by them, otherwise human life could not exist. And there is hardly any one concerned in the business of life, who has not daily to decide questions of expediency, far more knotty than those which Dr. Whewell so coolly pronounces insoluble.

But let us examine more closely what Dr. Whewell finds to say for the proposition, that “if we ask whether a given action will increase or diminish the total amount of human happiness, it is impossible to answer with any degree of certainty.”

“Take ordinary cases. I am tempted to utter a flattering falsehood: to gratify some sensual desire contrary to ordinary moral rules. How shall I determine, on the greatest happiness principle, whether the act is virtuous, or the contrary? In the first place, the direct effect of each act is to give pleasure, to another by flattery, to myself by sensual gratification; and pleasure is the material of happiness, in the scheme we are now considering. But by the flattering lie I promote falsehood, which is destructive of confidence, and so, of human comfort. Granted that I do this in some degree—although I may easily say that I shall never allow myself to speak falsely, except when it will give pleasure; and thus I may maintain that I shall not shake confidence in any case in which it is of any value. But granted that I do, in some degree, shake the general fabric of mutual human confidence by my flattering lie,—still the question remains, *how much* I do this: whether in such a degree as to overbalance the pleasure, which is the primary and direct consequence of the act. How small must be the effect of my solitary act upon the whole scheme of human action and habit! how clear and decided is the direct effect of increasing the happiness of my hearer! And in the same way we may rea-

son concerning the sensual gratification. Who will know it? Who will be influenced by it of those who do know it? What appreciable amount of pain will it produce in its consequences, to balance the palpable pleasure, which, according to our teachers, is the only real good? It appears to me that it is impossible to answer these questions in any way which will prove, on these principles, mendacious flattery, and illegitimate sensuality, to be vicious and immoral. They may possibly produce, take in all their effects, a balance of evil; but if they do, it is by some process which we cannot trace with any clearness, and the result is one which we cannot calculate with any certainty, or even probability; and therefore, on this account, because the resulting evil of such falsehood and sensuality is not calculable or appreciable, we cannot, by calculation of resulting evil, show falsehood and sensuality to be vices. And the like is true of other vices; and, on this ground, the construction of a scheme of morality on Mr. Bentham's plan is plainly impossible."—p. 211.

Dr. Whewell supposes his self-deceiving utilitarian to be very little master of his own principles. If the effect of a "solitary act upon the whole scheme of human action and habit" is small, the addition which the accompanying pleasure makes to the general mass of human happiness is small likewise. So small, in the great majority of cases, are both, that we have no scales to weigh them against each other, taken singly. We must look at them multiplied, and in large masses. The portion of the tendencies of an action which belong to it not individually, but as a violation of a general rule, are as certain and calculable as any other consequences; but they must be examined not in the individual case, but in classes of cases. Take, for example, the case of murder. There are many persons to kill whom would be to remove men who are a cause of no good to any human being, of cruel physical and moral suffering to many, and whose whole influence tends to increase the mass of unhappiness and vice. Were such a man to be assassinated, the balance of traceable consequences would be greatly in favour of the act. The counter consideration, on the principle of utility, is, that unless persons were punished for killing, and taught not to kill; that if it were thought allowable for any one to put to death at pleasure any human being whom he believes that the world would be well rid of, nobody's life would be safe. To this Dr. Whewell answers—

"How does it appear that the evil, that is, the pain, arising from violating a general rule once, is too great to be overbalanced by the pleasurable consequences of that single violation? The actor says, I acknowledge the general rule—I do

not deny its value; but I do not intend that this one act should be drawn into consequence.—p. 212.

But it does not depend on him whether or not it shall be drawn into consequence. If one person may break through the rule on his own judgment, the same liberty cannot be refused to others; and since no one could rely on the rule's being observed, the rule would cease to exist. If a hundred infringements would produce all the mischief implied in the abrogation of the rule, a hundredth part of that mischief must be debited to each one of the infringements, though we may not be able to trace it home individually. And this hundredth part will generally outweigh any good resulting from the individual act. We say generally, not universally; for the admission of exceptions to rules is a necessity equally felt in all systems of morality. To take an obvious instance, the rule against homicide, the rule against deceiving, the rule against taking advantage of superior physical strength, and various other important moral rules, are suspended against enemies in the field, and partially against malefactors in private life: in each case suspended as far as is required by the peculiar nature of the case. That the moralities arising from the special circumstances of the action may be so important as to overrule those arising from the class of acts to which it belongs, perhaps to take it out of the category of virtues into that of crimes, or vice versa, is a liability common to all ethical systems.

And here it may be observed that Dr. Whewell, in his illustration drawn from flattering lies, gives to the side he advocates a colour of rigid adherence to principle, which the fact does not bear out. Is none of the intercourse of society carried on by those who hold the common opinions, by means of what is here meant by "flattering lies?" Does no one of Dr. Whewell's way of thinking say, or allow it to be thought, that he is glad to see a visitor whom he wishes away? Does he never ask acquaintances or relatives to stay when he would prefer them to go, or invite them when he hopes that they will refuse? Does he never show any interest in persons and things he cares nothing for, or send people away, believing in his friendly feeling, to whom his real feeling is indifference, or even dislike? Whether these things are right we are not now going to discuss. For our part, we think that flattery should be only permitted to those who can flatter without lying, as all persons of sympathizing feelings and quick perceptions can. At all events, the

existence of exceptions to moral rules is no stumbling-block peculiar to the principle of utility. The essential is, that the exception should be itself a general rule; so that, being of definite extent, and not leaving the expediencies to the partial judgment of the agent in the individual case, it may not shake the stability of the wider rule in the cases to which the reason of the exception does not extend. This is an ample foundation for "the construction of a scheme of morality." With respect to the means of inducing people to conform in their actions to the scheme so formed, the utilitarian system depends, like all other schemes of morality, on the external motives supplied by law and opinion, and the internal feelings produced by education or reason. It is thus no worse off in this respect than any other scheme—we might rather say, much better; inasmuch as people are likely to be more willing to conform to rules when a reason is given for them.

Dr. Whewell's second argument against the happiness principle is, that the morality of actions cannot depend on the happiness they produce, because the happiness depends on the morality.

"Why should a man be truthful and just? Because acts of veracity and justice, even if they do not produce immediate gratification to him and his friends in other ways (and it may easily be that they do not), at least produce pleasure in this way, that they procure him his own approval and that of all good men. To us this language is intelligible and significant; but the Benthamite must analyze it further. What does it mean according to him? A man's own approval of his act, means that he thinks it virtuous. And therefore the matter stands thus. He (being a Benthamite) thinks it virtuous, because it gives him pleasure; and it gives him pleasure because he thinks it virtuous. This is a vicious circle, quite as palpable as any of those in which Mr. Bentham is so fond of representing his adversaries as revolving. And in like manner with regard to the approval of others. The action is virtuous, says the Benthamite, because it produces pleasure; namely the pleasure arising from the approval of neighbours: they approve it and think it virtuous, he also says, because it gives pleasure. The virtue depends upon the pleasure, the pleasure depends upon the virtue. Here again is a circle from which there is no legitimate egress. We may grant that, taking into account all the elements of happiness—the pleasures of self-approval—of peace of mind and harmony within us, and of the approval of others—of the known sympathy of all good men;—we may grant that, including these elements, virtue always does produce an overbalance of happiness; but then we cannot make this moral truth the basis of morality, because we cannot extricate the happiness and the virtue the one from the other, so as to make the first, the happiness, the foundation of the second, the virtue."—p. 215.

In Dr. Whewell's first argument against utility, he was obliged to assert that it is impossible for human beings to know that some actions are useful and others hurtful. In the present, he forgets against what principle he is combating, and draws out an elaborate argument against something else. What he now appears to be contending against, is the doctrine (whether really held by any one or not), that the test of morality is the greatest happiness of the agent himself. It argues total ignorance of Bentham, to represent him as saying that an action is virtuous because it produces "the approbation of neighbours," and as making so "fluctuating" a thing as "public opinion," and such a "loose and wide abstraction as education," the "basis of morality." When Bentham talks of public opinion in connexion with morality, he is not talking of the "basis of morality" at all. He was the last person to found the morality of actions upon anybody's opinion of them. He founded it upon facts, namely, upon the observed tendencies of the actions. Nor did he ever dream of defining morality to be the self-interest of the agent. His "greatest happiness principle" was the greatest happiness of mankind, and of all sensitive beings. When he talks of education, and of "the popular or moral sanction," meaning the opinion of our fellow-creatures, it is not as constituents or tests of virtue, but as *motives* to it; as means of making the self-interest of the individual *accord* with the greatest happiness principle.\*

\* It is curious that while Dr. Whewell here founds the Happiness theory of morals with the theory of Motives sometimes called the Selfish System, and attacks the latter as Bentham's, under the name of the former, Dr. Whewell himself, in his larger work, adopts the Selfish theory. Happiness, he says, (meaning, as he explains, our own happiness), is "our being's end and aim;" we cannot desire anything else unless by identifying it with our happiness. (Elements, i. 359.) To this we should have nothing to object, if by identification was meant that what we desire unselfishly must first, by a mental process, become an actual part of what we seek as our own happiness; that the good of others becomes our pleasure because we have learnt to find pleasure in it: this is, we think, the true philosophical account of the matter. But we do not understand this to be Dr. Whewell's meaning: for in an argument to prove that there is no virtue without religion, he says that religion alone can assure us of the identity of happiness with duty. Now, if the happiness connected with duty were the happiness we find in our duty, self-consciousness would give us a full account of this, without religion. The happiness, therefore, which Dr. Whewell means, must consist, not in the thing itself, but in a reward appended to it: and when he says, that there can be no morality unless we believe that happiness is identical with duty, and that we cannot believe this apart from "the belief in God's government of the world," he must mean

Dr. Whewell's remark, therefore, that the approval of our fellow-creatures, presupposing moral ideas, cannot be the foundation of morality, has no application against Bentham, nor against the principle of utility. It may however be pertinently remarked, that the moral ideas which this approval presupposes, are no other than those of utility and hurtfulness. There is no great stretch of hypothesis in supposing that in proportion as mankind are aware of the tendencies of actions to produce happiness or misery, they will like and commend the first, abhor and reprobate the second. How these feelings of natural complacency and natural dread and aversion directed towards actions, come to assume the peculiar character of what we term *moral* feelings, is not a question of ethics but of metaphysics, and very fit to be discussed in its proper place. Bentham did not concern himself with it. He left it to other thinkers. It sufficed him that the perceived influence of actions on human happiness is cause enough, both in reason and in fact, for strong feelings of favour to some actions and of hatred towards others. From the sympathetic reaction of these feelings in the imagination and self-consciousness of the agent, naturally arise the more complex feelings of self-approbation and self-reproach, or, to avoid all disputed questions, we will merely say of satisfaction and dissatisfaction with ourselves. All this must be admitted, whatever else may be denied. Whether the greatest happiness is the principle of morals or not, people do desire their own happiness, and do consequently like the conduct in other people which they think promotes it, and dislike that which visibly endangers it. This is absolutely all that Bentham postulates. Grant this, and you have his popular sanction, and its reaction on the agent's own mind, two influences tending, in proportion to mankind's enlightenment, to keep the conduct of each in the line which promotes the general happiness, Bentham thinks that there is no other true morality than this, and that the so-called moral sentiments, whatever their origin or composition, should be trained to act in this direction only. And Dr. Whewell's attempt to find anything illogical or incoherent in this theory, only proves that he does not yet understand it.

Dr. Whewell puts the last hand to his supposed refutation of Bentham's principle,

that no one would act virtuously unless he believed that God would reward him for it. In Dr. Whewell's view of morality, therefore, disinterestedness has no place.

by what he thinks a crushing *reductio ad absurdum*. The reader might make a hundred guesses before discovering what this is. We have not yet got over our astonishment, not at Bentham, but at Dr. Whewell. See, he says, to what consequences your greatest happiness principle leads! Bentham says that it is as much a moral duty to regard the pleasures and pains of other animals as those of human beings. We cannot resist quoting the admirable passage which Dr. Whewell cites from Bentham, with the most naïf persuasion that everybody will regard it as reaching the last pitch of paradoxical absurdity:—

“Under the Gentoo and Mahometan religion the interests of the rest of the animal kingdom seem to have met with some attention. Why have they not, universally, with as much as those of human creatures, allowance made for the difference in point of sensibility? Because the laws that are, have been the work of mutual fear; a sentiment which the not less rational animals have not had the same means as man has of turning to account. Why ought they not? No reason can be given. The day may come when the rest of the animal creation may acquire those rights which never could have been withholden from them but by the hand of tyranny. It may come one day to be recognised that the number of the legs, the villosity of the skin, or the termination of the *os sacrum*, are reasons insufficient for abandoning a sensitive being to the caprice of a tormentor. What else is it that should trace the insuperable line? Is it the faculty of reason, or perhaps the faculty of discourse? But a full-grown horse or dog is beyond comparison a more rational, as well as a more conversable animal, than an infant of a day, a week, or even a month old. But suppose the case were otherwise, what would it avail? The question is not, can they reason? nor, can they speak? but, can they suffer?”

This noble anticipation in 1780, of the better morality of which a first dawn has been seen in the laws enacted nearly fifty years afterwards against cruelty to animals, is in Dr. Whewell's eyes the finishing proof that the morality of happiness is absurd!

“The pleasures of animals are elements of a very different order from the pleasures of man. We are bound to endeavour to augment the pleasures of men, not only because they are pleasures, but because they are human pleasures. We are bound to men by the universal tie of humanity, of human brotherhood. We have no such tie to animals.”

This then is Dr. Whewell's noble and disinterested ideal of virtue. Duties, according to him, are only duties to ourselves and our like.

“We are to be *humane* to them, because we

are human, not because we and they alike feel animal pleasures. . . . The morality which depends upon the increase of pleasures alone, would make it our duty to increase the pleasures of pigs or of geese rather than that of men, if we were sure that the pleasures we could give them were greater than the pleasures of men. . . . It is not only not an obvious, but to most persons not a tolerable doctrine, that we may sacrifice the happiness of men provided we can in that way produce an overplus of pleasure to cats, dogs, and hogs."—pp. 223-5.

It is "to most persons in the slave States of America not a tolerable doctrine that we may sacrifice any portion of the happiness of white men for the sake of a greater amount of happiness to black men. It would have been intolerable five centuries ago "to most persons" among the feudal nobility, to hear it asserted that the greatest pleasure or pain of a hundred serfs ought not to give way to the smallest of a nobleman. According to the standard of Dr. Whewell, the slave masters and the nobles were right. They too felt themselves "bound" by a "tie of brotherhood" to the white men and to the nobility, and felt no such tie to the negroes and serfs. And if a feeling on moral subjects is right because it is natural, their feeling was justifiable. Nothing is more natural to human beings, nor, up to a certain point in cultivation, more universal, than to estimate the pleasures and pains of others as deserving of regard exactly in proportion to their likeness to themselves. These superstitions of selfishness had the characteristics by which Dr. Whewell recognises his moral rules: and his opinion on the rights of animals shows that in this case at least he is consistent. We are perfectly willing to state the whole question on this one issue. Granted that any practice causes more pain to animals than it gives pleasure to men; is that practice moral or immoral? And if, exactly in proportion as human beings raise their heads out of the slough of selfishness, they do not with one voice answer "immoral," let the morality of the principle of utility be for ever condemned.

There cannot be a fitter transition than this subject affords, from the Benthamic standard of ethics to that of Dr. Whewell. It is not enough to object to the morality of utility. It is necessary also to show that there is another and a better morality. This is what Dr. Whewell proposes to himself in his Introductory Lecture, and in the whole of his previous work, "Elements of Morality." We shall now, therefore, proceed to examine Dr. Whewell's achieve-

ments as the constructor of a scientific foundation for the theory of morals.

"The moral rule of human action," Dr. Whewell says, is that "we must do what is right." ("Lectures," p. xi.) Here, at all events, is a safe proposition; since to deny it would be a contradiction in terms. But what is meant by "right?" According to Dr. Whewell, "what we must do." This, he says, is the very definition of right.

"The definition of *rightful*, or of the adjective *right*, is, I conceive, contained in the maxim which I have already quoted as proceeding from the general voice of mankind: namely this, that we must do what is right at whatever cost. That an action is right, is a reason for doing it, which is paramount to all other reasons, and overweighs them all when they are on the contrary side. It is painful; but it is right: therefore we must do it. It is a loss; but it is right; therefore we must do it. It is unkind; but it is right: therefore we must do it. These are self-evident" [he might have said identical] "propositions. That a thing is right, is a *supreme* reason for doing it. *Right* implies this supreme, unconquerable reason; and does this especially and exclusively. No other word does imply such an irresistible cogency in its effect, except in so far as it involves the same notion. What we *ought* to do, what we *should* do, that we *must* do, though it bring pain and loss. But why? *Because it is right.* The expressions all run together in their meaning. And this *supreme* rule, that we must do what is right, is also the *moral* rule of human action."—pp. x., xi.

*Right* means that which we *must* do, and the rule of action is, that we must do what is right; that we must do that which we must do. This we will call vicious circle the first. But let us not press hardly on Dr. Whewell at this stage; perhaps he only means that the foundation of morals is the conviction that there is *something* which we must do at all risks; and he admits that we have still to find what this something is. "What *is* right; what it is that we ought to do, we must have some means of determining, in order to complete our moral scheme." (p. xi.)

Attempting then to pick out Dr. Whewell's leading propositions and exhibit them in connexion, we find, first, that "the supreme rule of human action, Rightness," ought to control the desires and affections, or otherwise that these are "to be regulated so that they may be right." (xii. xiii.) This does not help towards showing what *is* right.

But secondly, we come to a "condition which is obviously requisite." In order that the desires and affections which relate to "other men" may be right, "they must

conform to this primary and universal condition, that they do not violate the *rights* of others. This condition may not be sufficient, but it is necessary." (p. xiii.)

This promises something. In tracing to its elements the idea of Right, the adjective, we are led to the prior, and it is to be presumed more elementary idea, of Rights, the substantive. But now, what are rights? and how came they to be rights?

Before answering these questions, Dr. Whewell gives a classification of rights "commonly recognised among men." He says, they are of five sorts, "those of person, property, family, state, and contract." (xv.) But how do we discover that they are rights? and what is meant by calling them rights? Much to our surprise, Dr. Whewell refers us, on both these points, to the law. And he asks, "in what manner do we rise from mere legal rights to moral rightness?" and replies, "we do so in virtue of this principle: that the supreme rule of man's actions must be a rule which has authority over the whole of man; over his intentions as well as his actions; over his affections, his desires, his habits, his thoughts, his wishes." We must not only not violate the rights of others, but we must not desire to violate them. "And thus we rise from legal obligation to moral duty; from legality to virtue; from blamelessness in the forum of man, to innocence in the court of conscience."

And this Dr. Whewell actually gives as his scheme of morality. His rule of right is, to infringe no rights conferred by the law, and to cherish no dispositions which could make us desire such infringements! According to this, the early Christians, the religious reformers, the founders of all free governments, Clarkson, Wilberforce, and all enemies of the rights of slaveowners, must be classed among the wicked. If this is Dr. Whewell's morality, it is the very Hobbism which he reprobates, and this in its worst sense. But though Dr. Whewell says that this is his morality, he presently unsays it:

"Our morality is not derived from the special commands of existing laws, but from the fact that laws exist, and from our classification of their subjects. Personal safety, property, contracts, family and civil relations, are everywhere the subjects of law, and are everywhere protected by law; therefore we judge that these things must be the subjects of morality, and must be reverently regarded by morality. But we are not thus bound to approve of all the special appointments with regard to those subjects which may exist at a given time in the laws of a given country. On the contrary, we may condemn the laws as being contrary to morality. We cannot frame a morality without recognising property, and property

exists through law; but yet the law of property, in a particular country, may be at variance with that moral purpose for which, in our eyes, laws exist. Law is the foundation and necessary condition of justice; but yet laws may be unjust, and when unjust ought to be changed."—p. xvii.

The practical enormities consequent on Dr. Whewell's theory are thus got rid of; but when these are gone, there is nothing of the theory left. He undertook to explain how we may know what is right. It appeared at first, that he was about to give a criterion, when he said that it is not right to violate legal rights. According to this, when we want to know what is right, we have to consult the law, and see what rights it recognises. But now it seems that these rights may be contrary to right; and all we can be sure of is, that it is right there should be rights of some sort. And we learn that, after all, it is for a "moral purpose" that in Dr. Whewell's opinion "laws exist." So that while the meaning of *ought* is that we ought to respect rights, it is a previous condition that these rights must be such as *ought* to be respected. Morality must conform to law, but law must first conform to morality. This is vicious circle the second. Dr. Whewell has broken out of the first; he has made, this time, a larger sweep; the curve he describes is wider, but it still returns into itself.

An adherent of "dependent morality" would say that, instead of deriving right from rights, we must have a rule of right before it can be decided what ought to be rights; and that, both in law and in morals, the rights which ought to exist are those which for the general happiness it is expedient should exist. And Dr. Whewell anticipates that some one may even do him what he thinks the injustice of supposing this to be his opinion. He introduces an objector as saying, "that by making our morality begin from rights, we really do find it upon expediency, notwithstanding our condemnation of systems so founded. For, it may be said, rights such as property exists only because they are expedient." Dr. Whewell hastens to repel this imputation; and here is his theory. "We reply as before, that rights are founded on the whole nature of man, in such a way that he cannot have a human existence without them. He is a moral being, and must have rights, because morality cannot exist where rights are not." Was ever an unfortunate metaphysician driven into such a corner? We wanted to know what morality is, and Dr. Whewell said that it is conforming to rights. We ask how he knows that there are rights, and he answers, because other-

wise there could be no morality. This is vicious circle the third, and the most wonderful of the three. The Indians placed their elephant on the back of a tortoise, but they did not at the same time place the tortoise on the back of the elephant.

Dr. Whewell has failed in what it was impossible to succeed in. Every attempt to dress up an appeal to intuition in the forms of reasoning, must break down in the same manner. The system must, from the conditions of the case, revolve in a circle. If morality is not to gravitate to any end, but to hang self-balanced in space, it is useless attempting to suspend one point of it upon another point. The fact of moral rules supposes a certain assemblage of ideas. It is to no purpose detaching these ideas one from another, and saying that one of them must exist because another does. Press the moralist a step farther, and he can only say that the other must exist because of the first. The house must have a centre because it has wings, and wings because it has a centre. But the question was about the whole house, and how it comes to exist. It would be much simpler to say plainly, that it exists because it exists. This is what Dr. Whewell is in the end obliged to come to; and he would have saved himself a great deal of bad logic, if he had begun with it.\*

So much as to the existence of moral rules: now as to what they are:

"We do not rest our rules of action upon the tendency of actions to produce the happiness of others, or of mankind in general; because we cannot solve a problem so difficult as to determine which of two courses of action will produce the greatest amount of human happiness: and we see a simpler and far more satisfactory mode of deducing such rules; namely, by considering that there must be such rules; that they must be rules for man; for man living among men; and for the whole of man's being. Since we are thus led directly to moral rules, by the consideration of the internal condition of man's being, we cannot think it wise to turn away from this method (!) and to

\* In Dr. Whewell's larger work, we find him resorting, after all, to an "external object" as the ultimate ground for acknowledging any moral rules whatever. He there says, that "the reason for doing what is absolutely right, is that it is the Will of God, through whom the condition and destination of mankind are what they are."—(Elements, i. 225.) In the Lectures, however, he admits that this renders nugatory the ascribing any moral attributes to God. "If we make holiness, justice, and purity, the mere result of God's commands, we can no longer find any force in the declaration that God is holy, just, and pure; since the assertion then becomes merely an empty identical proposition."—(p. 58.) We hope that this indicates a change of opinion since the publication of the earlier work.

try to determine such rules by reference to an obscure and unmanageable external condition, the amount of happiness produced."—p. xx.

If these were not Dr. Whewell's own words, we should expect to be charged, as he charges Bentham, with caricature. This is given as a scientific statement of the proper mode of discovering what are the rules of morality! We are to "deduce such rules" from four considerations. First, "that there must be such rules;" a necessary preliminary, certainly. If we are to build a wall, it is because it has been previously decided that there must be a wall. But we must know what the wall is for; what end it is intended to serve; or we shall not know what sort of wall is required. What end are moral rules intended to serve? No end, according to Dr. Whewell. They do not exist for the sake of an end. To have them is part of man's nature, like (it is Dr. Whewell's own illustration) the circulation of the blood. It is now then to be inquired *what* rules are part of our nature. This is to be discovered in three things: that they must be "rules for man; for man living among men; and for the whole of man's being." This is only saying over again, in a greater number of words, what we want, not how we are to find it. First, they must be "rules for man;" but we are warned not to suppose that this means for man's benefit; it only means that they are for man to obey. This leaves us exactly where we were before. Next, they are for "man living among men," that is, for the conduct of man to men: but *how* is man to conduct himself to men? Thirdly, they are "for the whole of man's being;" that is, according to Dr. Whewell's explanation, they are for the regulation of our desires as well as of our actions; but what we wanted to know was, *how* we are to regulate our desires and our actions? Of the four propositions given as premises from which all moral rules are to be deduced, not one points to any difference between one kind of moral rules and another. Whether the rule is to love or to hate our neighbour, it will equally answer all Dr. Whewell's conditions. These are the premises which are more "simple and satisfactory" than such "obscure and unmanageable" propositions, so utterly impossible to be assured of, as that some actions are favourable, and others injurious, to human happiness! Try a parallel case. Let it be required to find the principles of the art of navigation. Bentham says, we must look to an "external end;" getting from place to place on the water. No, says Dr. Whewell, there is a

“simpler and more satisfactory” mode, viz. to consider that there must be such an art; that it must be for a ship; for a ship at sea; and for all the parts of a ship. Would Dr. Whewell prevail on any one to suppose that these considerations made it unnecessary to consider, with Bentham, what a ship is intended to do?

This account is all we get from Doctor Whewell, in the Lectures, of the mode of discovering and recognising the rules of morality. But perhaps he succeeds better in doing the thing, than in explaining how it ought to be done. At all events, having written two volumes of “Elements of Morality,” he must have performed this feat, either well or ill; he must have found a way of “deducing moral rules.” We will now, therefore, dismiss Dr. Whewell’s generalities, and try to estimate his method, not by what he says about it, but by what we see him doing when he carries it into practice.

We turn, then, to his “Elements of Morality,” and to the third chapter of that work, which is entitled “Moral Rules exist necessarily.” And here we at once find something well calculated to surprise us. That moral rules must exist, was, it may be remembered, the first of Dr. Whewell’s four fundamental axioms; and has been presented hitherto as a law of human nature, requiring no proof. It must puzzle some of his pupils to find him here proving it; and still more, to find him proving it from utility:—

“In enumerating and describing, as we have done, certain desires as among the most powerful springs of human action, we have stated that man’s life is scarcely tolerable if these desires are not in some degree gratified; that man cannot be at all satisfied without some security in such gratification; that without property, which gratifies one of these desires, man’s free agency cannot exist; that without marriage, which gratifies another, there can be no peace, comfort, tranquillity, or order. And the same may be said of all those springs of actions which we enumerate as mental desires. Without some provision for the tranquil gratification of these desires, society is disturbed, unbalanced, painful. The gratification of such desires must be a part of the order of the society. There must be rules which direct the course and limits of such gratification. Such rules are necessary for the peace of society.”—Elements, i. 32.

This is a very different mode of treating the subject from that which we observed in the Lectures. We are now among reasons: good or bad they may be, but still reasons. Moral rules are here spoken of as means to an end. We now hear of the peace and

comfort of society; of making man’s life tolerable; of the satisfaction and gratification of human beings; of preventing a disturbed and painful state of society. This is utility—this is pleasure and pain. When real reasons are wanted, the repudiated happiness-principle is always the resource. It is true, this is soon followed by a recurrence to the old topics, of the necessity of rules “for the action of man as man,” and the impossibility to “conceive man as man without conceiving him as subject to rules.” But any meaning it is possible to find in these phrases (which is not much) is all reflected from the utilitarian reasons given just before. Rules are necessary, because mankind would have no security for any of the things which they value, for anything which gives them pleasure or shields them from pain, unless they could rely on one another for doing, and in particular for abstaining from, certain acts. And it is true, that man could not be conceived “as man,” that is, with the average human intelligence, if he were unable to perceive so obvious an utility.

Almost all the *generalia* of moral philosophy prefixed to the “Elements” are in like manner derived from utility. For example: that the desires, until subjected to general rules, bring mankind into conflict and opposition; but that, when general rules are established, the feelings which gather round these “are sources not of opposition, but of agreement;” that they “tend to make men unanimous; and that such rules with regard to the affections and desires as tend to control the repulsive and confirm the attractive forces which operate in human society; such as tend to unite men, to establish concord, unanimity, sympathy, agree with that which is the character of moral rules.” (i. 35.) This is Benthamism—even approaching to Fourierism.

And again, in attempting a classification and definition of virtues, and a parallel one of duties corresponding to them. The definitions of both one and the other are deduced from utility. After classing virtues under the several heads of benevolence, justice, truth, purity, and order, Benevolence is defined as “desire of the good of all men;” and in a wider sense, as the “absence of all the affections which tend to separate men, and the aggregate of the affections which unite them.” (i. 137-8.) Justice, as “the desire that each person should have his own.” (p. 138.) Truth is defined “an agreement of the verbal expression with the thought,” and is declared to be a duty because “lying and deceit tend to separate and disunite men, and to make

all actions implying mutual dependence, that is, all social action and social life, impossible." (p. 138-9.) Purity is defined "the control of the appetites by the moral sentiments and the reason." Order, as a conformity of our internal dispositions to the laws and to moral rules (why not rather to good laws, and good moral rules?) All these definitions, though very open to criticism in detail, are in principle utilitarian.\* Though Dr. Whewell will not recognise the promotion of happiness as the ultimate principle, he deduces his secondary principles from it, and supports his propositions by utilitarian reasons as far as they will go. He is chiefly distinguished from utilitarian moralists of the more superficial kind, by this, that he ekes out his appeals to utility with appeals to "our idea of man as man;" and when reasons fail, or are not sufficiently convincing, then "all men think," or "we cannot help feeling," serves as a last resort, and closes the discussion.

Of this hybrid character is the ethics of Dr. Whewell's "Elements of Morality." And in this he resembles all other writers of the intuitive school of morality. They are none of them frankly and consistently intuitive. To use a happy expression of Bentham in a different case, they draw from a double fountain—utility and internal conviction; the tendencies of actions, and the feelings with which mankind regard them. This is not a matter of choice with these writers, but of necessity. It arises from the nature of the morality of internal conviction. Utility, as a standard, is capable of being carried out singly and consistently; a moralist can deduce from it his whole system of ethics, without calling to his assistance any foreign principle. It is not so with one who relies on moral intuition; for where will he find his moral intuitions? How many ethical propositions can be enumerated, of which the most reckless as-

serter will venture to affirm that they have the adhesion of all mankind? Dr. Whewell declares unhesitatingly that the moral judgment of mankind, when it is unanimous, must be right. "What are universally held as virtues, must be dispositions in conformity with this [the supreme] law: what are universally reckoned vices, must be wrong." This is saying much, when we consider the worth, in other matters nearly allied to these, of what is complimentarily called the general opinion of mankind; when we remember what grovelling superstitions, what witchcraft, magic, astrology, what oracles, ghosts, what gods and demons scattered through all nature, were once universally believed in, and still are so by the majority of the human race. But where are these unanimously recognised vices and virtues to be found? Practices the most revolting to the moral feelings of some ages and nations do not incur the smallest censure from others; and it is doubtful whether there is a single virtue which is held to be a virtue by all nations. There are, indeed, some moralities of an utility so unmistakeable, so obviously indispensable to the common purposes of life, that as general rules mankind could no more differ about them than about the multiplication table; but even here there is the widest difference of sentiment about the exceptions. The universal voice of mankind, so often appealed to, is universal only in its discordance. What passes for it, is merely the voice of the majority, or failing that, of any large number having a strong feeling on the subject; especially if it be a feeling of which they cannot give any account, and which, as it is not consciously grounded on any reasons, is supposed to be better than reasons, and of higher authority. With Dr. Whewell, a strong feeling, shared by most of those whom he thinks worth counting, is always an *ultima ratio* from which there is no appeal. He forgets that as much might have been pleaded, and in many cases might still be pleaded, in defence of the absurdest superstitions.

It seems to be tacitly supposed that however liable mankind are to be wrong in their opinions, they are generally right in their feelings, and especially in their antipathies. On the contrary, there is nothing which it is more imperative that they should be required to justify by reasons. The antipathies of mankind are mostly derived from three sources. One of these is an impression, true or false, of utility. They dislike what is painful or dangerous, or what is apparently so. These antipathies, being grounded on the happiness principle, must

\* The enumeration of duties does not always follow accurately the definition of the corresponding virtues. For example, the definition of Purity is one which suits Temperance, "the control of the appetites by the moral sentiments and the reason;" but the scheme of duties set forth under this head is rather as if the definition had been "the conformity of the appetites to the moral opinions and customs of the country." It is remarkable that a writer who uses the word purity so much out of its common meaning as to make it synonymous with temperance, should charge Bentham, ("Lectures," p. 208,) because he employs the word in another of its acknowledged senses, with arbitrarily altering its signification. Bentham understands by the purity of a pleasure, its freedom from admixture of pain: as we speak of pure gold, pure water, pure truth, of things purely beneficial or purely mischievous: meaning, in each case, freedom from alloy with any other ingredient.

be required to justify themselves by it. The second class of antipathies are against what they are taught, or imagine, to be displeasing to some visible or invisible power, capable of doing them harm, and whose wrath once kindled may be wreaked on those who tolerated, as well as on those who committed, the offence. The third kind of antipathies, often as strong as either of the others, are directed towards mere differences of opinion, or of taste. Any of the three, when nourished by education, and deriving confidence from mutual encouragement, assumes to common minds the character of a moral feeling. But to pretend that any such antipathy, were it ever so general, gives the smallest guarantee of its own justice and reasonableness, or has any claim to be binding on those who do not partake in the sentiment, is as irrational as to adduce the belief in ghosts or witches as a proof of their real existence. I am not bound to abstain from an action because another person dislikes it, however he may dignify his dislike with the name of disapprobation.

We cannot take our leave of Dr. Whewell's strictures on Bentham without adverting to some observations made by him on Bentham's character as a jurist rather than as a moralist. In this capacity Dr. Whewell does more justice to Bentham than in the department of moral philosophy. But he finds fault with him for two things: first, for not sufficiently recognising what Dr. Whewell calls the historical element of legislation; and imagining "that to a certain extent his schemes of law might be made independent of local conditions." It is true, Dr. Whewell admits it to be part of Bentham's doctrine, that different countries must to a certain extent have different laws; and is aware that he wrote an "Essay on the Influence of Time and Place in Matters of Legislation;" but thinks him wrong in maintaining that there should be a general plan, of which the details only should be modified by local circumstances; and contends, that different countries require different ground plans of legislation:—

\*There is in every national code of law a necessary and fundamental historical element; not a few supplementary provisions which may be added or adapted to the local circumstances after the great body of the code has been constructed: not a few touches of local colouring to be put in after the picture is almost painted: but an element which belongs to law from its origin, and penetrates to its roots; a part of the intimate structure; a cast in the original design. The national views of personal status; property, and the modes of acquisition; bargains, and the modes of concluding them; family, and its consequences;

government, and its origin; these affect even the most universal aspects and divisions of penal offences; these affect still more every step of the expository process which the civil law applies to rights in defining penal offences."—(Lectures, p. 254.)

What Dr. Whewell designates by the obscure and misleading expression, "an historical element," and accuses Bentham of paying too little regard to, is the existing opinions and feelings of the people. These may, without doubt, in some sense be called historical, as being partly the product of their previous history; but whatever attention is due to those opinions and feelings in legislation, is due to them not as matter of history, but as social forces in present being. Now Bentham, in common with all other rational persons, admitted that a legislator is obliged to have regard to the opinions and feelings of the people to be legislated for; but with this difference, that he did not look upon those opinions and feelings as affecting, in any great degree, what was desirable to be done, but only what could be done. Take one of Dr. Whewell's instances, "the national views of personal status." The "national views" may regard slavery as a legitimate condition of human beings, and Mr. Livingston, in legislating for Louisiana, may have been obliged to recognise slavery as a fact, and to make provision for it, and for its consequences, in his code of laws; but he was bound to regard the equality of human beings as the foundation of his legislation, and the concession to the "historical element" as a matter of temporary expediency; and while yielding to the necessity, to endeavour, by all the means in his power, to educate the nation into better things. And so of the other subjects mentioned by Dr. Whewell—property, contracts, family, and government. The fact that, in any of these matters, a people prefer some particular mode of legislation on historical grounds—that is, because they have been long used to it,—is no proof of any original adaptation in it to their nature or circumstances, and goes a very little way in recommendation of it as for their benefit now. But it may be a very important element in determining what the legislator can do, and still more, the manner in which he should do it: and in both these respects Bentham allowed it full weight. What he is at issue with Dr. Whewell upon, is in deeming it right for the legislator to keep before his mind an ideal of what he would do if the people for whom he made laws were entirely devoid of prejudice or accidental prepos-

session: while Dr. Whewell, by placing their prejudices and accidental prepossessions "at the basis of the system," enjoins legislation not in simple recognition of existing popular feelings, but in obedience to them. The other objection made by Dr. Whewell to Bentham, as a writer on legislation, (for we omit the criticism on his classification of offences, as too much a matter of detail for the present discussion,) is, that he does not fully recognize "the moral object of law." (p. 257.) Dr. Whewell says, in phraseology which we considerably abridge, that law ought not only to preserve and gratify man, but to improve and teach him; not only to take care of him as an animal, but to raise him to a moral life. Punishment, therefore, he says, "is to be, not merely a means of preventing suffering, but is also to be a moral lesson." But Bentham, as Dr. Whewell is presently forced to admit, says the same; and in fact carries this doctrine so far, as to maintain that legal punishment ought sometimes to be attached to acts for the mere purpose of stigmatizing them, and turning the popular sentiment against them. No one, more than Bentham, recognises that most important, but most neglected function of the legislator, the office of an instructor, both moral and intellectual. But he receives no credit for this from Dr. Whewell, except that of being false to his principles; for Dr. Whewell seems to reckon it an impertinence in anybody to recognise morality as a good, who thinks, as Bentham does, that it is a means to an end. If any one, who believes that the moral sentiments should be guided by the happiness of mankind, proposes that moral sentiments, so guided, should be cultivated and fostered, Dr. Whewell treats this as a deserting of utilitarian principles, and borrowing or stealing from his.

As an example of "Bentham's attempt to exclude morality, as such, in his legislation," Dr. Whewell refers to "what he says respecting the laws of marriage, and especially in favour of a liberty of divorce by common consent." As this is the only opportunity Dr. Whewell gives his readers of comparing his mode of discussing a specific moral question with Bentham's, we shall devote a few words to it.

Having quoted from Bentham the observation that a government which interdicts divorce "takes upon itself to decide that it understands the interests of individuals better than they do themselves," Dr. Whewell answers, that this is an objection to all laws: that, in many other cases, "government, both in its legislation and adminis-

tration, does assume that it understands the interests of individuals, *and the public interest as affected by them*, better than they do themselves." The words which we have put in italics, adroitly change the question. Government is entitled to assume that it will take better care than individuals of the public interest, but not better care of their own interest. It is one thing for the legislator to dictate to individuals what they shall do for their own advantage, and another thing to protect the interest of other persons who may be injuriously affected by their acts. Dr. Whewell's own instances suffice us. "What is the meaning of restraints imposed for the sake of public health, cleanliness, and comfort? Why are not individuals left to do what they like with reference to such matters? Plainly because carelessness, ignorance, indolence, would prevent their doing what is most for their own interest." (p. 258.) Say, rather, would lead them to do what is contrary to the interest of other people. The proper object of sanitary laws is not to compel people to take care of their own health, but to prevent them from endangering that of others. To prescribe, by law, what they should do for their own health alone, would by most people be justly regarded as something very like tyranny.

Dr. Whewell continues:

"But is Mr. Bentham ready to apply consistently the principle which he thus implies, that in such matters individuals are the best judges of their own interests? Will he allow divorce to take place whenever the two parties agree in desiring it? . . . Such a facility of divorce as this, leaves hardly any difference possible between marriage and concubinage. If a pair may separate when they please, why does the legislator take the trouble to recognise their living together?"

Apply this to other cases. If a man can pay his tailor when he and his tailor choose, why does the law take the trouble to recognise them as debtor and creditor? Why recognise, as partners in business, as landlords and tenants, as servants and employers, people who are not tied to each other for life?

Dr. Whewell finds what he thinks an inconsistency in Bentham's view of the subject. He thus describes Bentham's opinions:—

"Marriage for life is, he [Bentham] says, the most natural marriage: if there were no laws except the ordinary law of contracts, this would be the most ordinary arrangement. So far, good. But Mr. Bentham having carried his argument so far, does not go on with it. What conclusion

are we to suppose him to intend? This arrangement would be very *general* without law, therefore the legislator should pass a law to make it *universal*? . . . No. The very next sentence is employed in showing the absurdity of making the engagement one from which the parties cannot liberate themselves by mutual consent. And there is no attempt to reduce these arguments, or their results, to a consistency."—p. 259.

Dr. Whewell's ideas of inconsistency seem to be peculiar. Bentham, he says, is of opinion, that in the majority of cases it is best for the happiness of married persons that they should remain together. Is it so? (says Dr. Whewell) then why not force them to remain together, even when it would be best for their happiness to separate?

Try again parallel cases. In choosing a profession, a sensible person will fix on one in which he will find it agreeable to remain; therefore, it should not be lawful to change a profession once chosen. A landlord, when he has a good tenant, best consults his own interest by not changing him; therefore, all tenancy should be for life. Electors who have found a good representative will probably do wisely in re-electing him; therefore, members of parliament should be irremovable.

Dr. Whewell intended to show, into what errors Bentham was led by treating the question of marriage apart from "moral grounds." Yet part of his complaint is, that Bentham does consider moral grounds, which, according to Dr. Whewell, he has no right to do. If one married person maltreats the other to procure consent to a divorce,—

"Bentham's decision is, that liberty should be allowed to the party maltreated and not to the other. . . . Now to this decision I have nothing to object: but I must remark, that the view which makes it tolerable is, its being a decision on moral grounds, such as Mr. Bentham would not willingly acknowledge. The man may not take advantage of his own wrong: that is a maxim which quite satisfies us. But Mr. Bentham, who only regards wrong as harm, would, I think, find it difficult to satisfy the man that he was fairly used."

Mr. Bentham would have found it difficult to conceive that any one attempting to criticise his philosophy could know so little of its elements. Dr. Whewell wonders what the reason can be, on Bentham's principles, for not allowing a man to benefit by his own wrong. Did it never occur to him, that it is to take away from the man his inducement to commit the wrong.

Finally, Dr. Whewell says, "No good rule

can be established on this subject without regarding the marriage union in a moral point of view; without assuming it as one great object of the law to elevate and purify men's idea of marriage; to lead them to look upon it as an entire union of interests and feelings, enjoyment and hopes, between the two parties. We cannot agree in the doctrine that it should be an object of the law to "lead men to look upon" marriage as being what it is not. Neither Bentham nor any one who thinks with him would deny that this entire union is the completest ideal of marriage; but it is bad philosophy to speak of a relation as if it always *was* the best thing that it possibly can be, and then infer that when it is notoriously not such, as in an immense majority of cases, and even when it is the extreme contrary, as in a large minority, it should nevertheless be treated exactly as if the fact corresponded with the theory. The liberty of divorce is contended for, because marriages are not what Dr. Whewell says they should be looked upon as being; because a choice made by an inexperienced person, and not allowed to be corrected, cannot, except by a happy accident, realize the conditions essential to this complete union.

We give these observations not as a discussion of the question, but of Dr. Whewell's treatment of it; as part of the comparison which he invites his readers to institute, between his method and that of Bentham. Were it our object to confirm the general character we have given of Dr. Whewell's philosophy, by a survey in detail of the morality laid down by him, the two volumes of "Elements" afford abundant materials. We could show that Dr. Whewell not only makes no improvement on the old moral doctrines, but attempts to set up afresh several of them which have been loosened or thrown down by the stream of human progress.

Thus we find him everywhere inculcating, as one of the most sacred duties, reverence for superiors, even when personally undeserving (i. 176-7), and obedience to existing laws, even when bad. "The laws of the state are to be observed even when they enact slavery." (i. 351.) "The morality of the individual," he says (i. 58.), "depends on his not violating the law of his nation." It is not even the spirit of the law, but the letter (i. 213), to which obedience is due. The law, indeed, is accepted by Dr. Whewell as the fountain of rights; of those rights which it is the primary moral duty not to infringe. And mere custom is of almost equal authority with express enactment. Even in a matter so personal as marriage, the usage and practice of the country is to be a paramount law. "In some countries, the marriage of the child is a

matter usually managed by the parents; in such cases, it is the child's duty to bring the affections, as far as possible, into harmony with the custom." (i. 211.) "Reverence and affection" towards "the constitution of each country," he holds (ii. 204) as "one of the duties of a citizen."

Again, Dr. Whewell affirms, with a directness not usually ventured on in these days by persons of his standing and importance, that to disbelieve either a providential government of the world, or revelation, is morally criminal; for that "men are blameable in disbelieving truths after they have been promulgated, though they are ignorant without blame before the promulgation." (ii. 91-94.) This is the very essence of religious intolerance, aggravated by the fact, that among the persons thus morally stigmatized are notoriously included many of the best men who ever lived. He goes still further, and lays down the principle of intolerance in its broad generality, saying that "the man who holds false opinions" is morally condemnable "when he has had the means of knowing the truth" (ii. 102); that it is "his duty to think rationally," (i. e. to think the same as Dr. Whewell): that it is to no purpose his saying that he has "done all he could to arrive at truth, since a man has never done *all he can* to arrive at truth." (ii. 106.) If a man has never done all he can, neither has his judge done all he can; and the heretic may have more ground for believing his opinion true, than the judge has for affirming it to be false. But the judge is on the one side of received opinions, which, according to Dr. Whewell's standard, makes all right.

It is not, however, our object to criticise Dr. Whewell as a teacher of the details of morality. Our design goes no farther than to illustrate his controversy with Bentham respecting its first principle. It may, perhaps, be thought that Dr. Whewell's arguments against the philosophy of utility are too feeble to require so long a refutation. But feeble arguments easily pass for convincing, when they are on the same side with the prevailing sentiment; and readers in general are so little acquainted with that or any other system of moral philosophy, that they take the word of anybody, especially an author in repute, who professes to inform them what it is; and suppose that a doctrine must indeed be absurd, to which mere truisms are offered as a sufficient reply. It was, therefore, not unimportant to show, by a minute examination, that Dr. Whewell has misunderstood and misrepresented the philosophy of utility, and that his attempts to refute it, and to construct a moral philosophy without it, have been equally failures.

#### ART. III.—PLANTS AND BOTANISTS.

1. *The Vegetable Kingdom*. By John Lindley, Ph. D. London: Bradbury and Evans. 1846.
2. *The Antarctic Flora*. By Joseph Dalton Hooker, M.D., R.N., F.R.S., &c. London: Reeve. 1847.
3. *Report of the Twenty-first Meeting of the British Association for the Advancement of Science*. London: John Murray. 1852.
4. *Annals and Magazine of Natural History for June, 1852*.

SOLOMON, DIOSCORIDES, LINNÆUS!—three full-sounding names, names with a presence. We utter them as an incantation, an "open sesame!" intending in a few pages to show, for the benefit of the uninitiated, a glimpse of the pleasures and intellectual profits of botanical science, and a passing glance at the kind of men who enjoy them. The ways of botanists and the discoveries that they are gradually evolving out of Nature's plant-garden, are little known except within the limited sphere of naturalists. Were we addressing adepts exclusively, we should add another name to our spell—the name of a living man, and, we are proud to say it, a Briton—Robert Brown. The mention of this honoured name among botanists calls forth sensations of reverence and admiration comparable, to assimilate things essentially unlike, with those that arise in the breasts of warriors, when the name of Wellington is spoken. The great soldier has the advantage in the extent and popularity of his fame. The meanest intellects among the vulgar, be they poor or rich, noble or ignoble—and the essentially vulgar are diffused through all kinds and classes—can appreciate the merit of a military victory. The half-trained, coarse-minded, but sagacious spirit advances a step further, and sees the manifestation of a grander power in the inventor of a steam-engine. But ripe knowledge, clear insight, and refined thought, are requisite for the comprehension of philosophical conquests, for these make no show and impress themselves by no tangible force. A great philosopher, be he metaphysician, physicist, or naturalist, must be content with the admiration of an enlightened few. If he care for popular sympathy—a failing not worthy of his high calling, yet apt to adhere to the humanity of his nature—he must bide his time like some far-off planet, whose mighty proportions can only be fully and generally discerned after centuries of invention have endowed men with the means of perceiving and understanding them.

Each of the names we have pronounced

has a power of its own. Solomon is still the botanist of the people. To them he still speaks "of trees, from the cedar-tree that is in Lebanon, even unto the hyssop that springeth out of the wall." The scholar, clinging to old traditions, fondly cherishes his ideal of a complete herborist in Dioscorides. Linnæus is the patron saint of systematic naturalists, who never forget the masterly skill and generalship with which he marshalled in orderly array the swarming multitude of organized creatures. The physiologist, whose aim, difficult and toilsome to attain, is the obtaining an insight into the hidden springs and workings of the machinery of life, and a clear comprehension of the laws to which they are obedient, knows how large are the obligations of all investigators to those who show the way and open out new roads to truth, and feels deeply grateful to Robert Brown accordingly.

Each of these four names marks an epoch in advance. The first two belong to the heroic ages of science. Solomon is, botanically, a myth; Dioscorides, an innocent of the golden age. The last two typify the fulness and actuality of Science. Linnæus represents the systematized knowledge of the multiplicity of facts, and Robert Brown the interpretation of their secret meanings.

Among botanists, as among zoologists, the systematist and the physiologist pursue different though interlacing paths. To be great in either department, the student—and men of science are necessarily students as long as they live in science—must be good in both. The value of the classifications and schemes of affinities proposed by the systematist must in a great measure depend upon his perception of the right value, structure, office, and morphology of the organs which serve to furnish him with characters. The physiologist who professes to describe the intimate structure and functions of vegetable organisms, and yet ignores accurate determinations of the affinities of the subjects of his researches, is furnishing but vague, fragmentary, and unsatisfactory information. The systematist who pretends to disregard the results of physiological inquiries is an empiric. The physiologist who sets at nought the determinations of specific affinities is a half-informed pedant. Fortunately these censures are almost inapplicable at present. They cannot be fixed either upon our living botanists of old standing, or those that are rising into deserved fame and authority. In the writings of the latter an elevated spirit of true philosophy is clearly and delightfully evinced. They eschew trifling, and have a right-minded appreciation of essentials. To illustrate

the direction taken and results developing through this tendency truthwards of our rising botanists, we shall select a few instances out of many; first from the systematic, and then from the physiological aspects of true science. Hence the very different themes of the books and memoirs which serve us for our text.

And first of all a word about the number of kinds of plants. Exactly a hundred years ago, Linnæus instituted a census of the vegetable kingdom, and proclaimed the number of species known to himself and his brother botanists. Five thousand nine hundred and thirty-eight distinct and different kinds was the seemingly prodigious amount. Out of these, a few more than six hundred were flowerless kinds. Half a century afterwards the estimate had increased fivefold. Five years ago, Dr. Lindley, in his most valuable and, to the working botanist, indispensable volume, entitled "The Vegetable Kingdom," announced ninety-two thousand nine hundred and twenty known species of plants! Since then a considerable amount of new forms has been described, so that in round numbers we may fairly say that our knowledge of the types of vegetable life has been increased twenty-fold during the last hundred years. There are whole geographical provinces as yet very imperfectly explored by botanists, and some few regions altogether unknown. In many whose floras have been subjected to diligent scrutiny, there still remains much more to do. Taking all deficiencies into account and probabilities of future discovery, we may fairly accept Meyen's calculation of two hundred thousand species as about constituting the entire vegetation of our planet in its present state. And even this estimate, large as it may seem, is, not improbably, under the mark, if we bear in mind how little has yet been done comparatively towards the examination and description of microscopic beings, claiming to rank as vegetables.

The memories of botanists are proverbially strong. They had need be so, if such myriads of kinds of plants are to be called at sight by their proper names. Every species has a name of its own, by which it is styled in the language of the science, the Latin of the vegetable kingdom. As this name itself is composed of two words, the one significant of the genus, and the other of the species, or kind, twice as many words as there are distinct kinds of plants must be borne in mind by the complete botanist. But who, and where is he? Nowhere. The feat is impossible, unless by a witting, or human parrot, such as we sometimes meet,

gifted with the power of recalling sounds without recollection of their meanings. Still it is surprising what a vast number of names of plant-species an expert systematic botanist can pack into his brains, and call up when inspecting fresh or dried specimens of the objects to which they appertain. We could mention men of repute able, at sight, to designate by their specific appellations, with ease, some 10,000 or 15,000 species, and to state particulars of consequence respecting each. To every one of the 100,000 described kinds of plants a "character," or short formula, expressive of the points in which it differs from all its congeners, and consequently from all the remaining 99,000 sorts, is attached. This diagnosis is stated in as few words as consistent with a clear expression of its distinctive marks. Such, at least, should be the specific character; and such, we hope, it is in the majority of instances. There are dullards, however, among botanists as among wise men of all categories, slow to perceive essentials, and ponderous in their expressions of what they suppose to be such. These cannot fail to add some dross to the heap of sterling ore. There are niggers and hair-splitters, too, who will seek for differences without concern about their relative value, thus parting asunder what God joined together. There are "fast" botanists, who, anxious for the rather dubious glory of becoming the name-givers of new species at any price, care not whether their vegetable *protégés* go forth to the world with a good or a bad character, content that, for a time, they should attract the world's notice. But all the errors and stupidities perpetrated by the thickheads, who cling to the skirts of every science, inevitably become righted sooner or later; and in the worst of them there is some little crystal of truth, that will shine bright when the mud about it has been washed away. Let no man condemn minute research in any shape as trifling. The surest foundations of science are minute observations, faithfully and clearly recorded. Let it not be supposed that, to any science, there is a royal road, the course of which meanders through the level plains of vague generalities. Through the apparently dry and dreary toil involved in the minute study of species, lies the only path to sound generalizations in natural history—one so long and winding, that few naturalists ever reach the goal; not, however, because they become disheartened on the way, but because a journey so seemingly wearisome to those who have never attempted it, is full of detaining attractions and delightful novelties for those who travel by it.

For the successful examination and accurate definition of vegetable types, abundant knowledge and sound judgment are required. It is easy to describe, but difficult to define, or even to describe with sufficient fulness and clearness, and freedom from prolixity. The power of distinguishing between important and unimportant details is a gift much rarer than is commonly supposed; and equally rare is the capacity for precise observation, which is the foundation of accurate description. If to the requisite faculties of an able diagnost be added a far-seeing spirit of generalization, then the systematist becomes a philosophic naturalist; he is then enabled to perceive and develop new relations, and determine the true value of those that have long been noted, but not duly appreciated. We cannot illustrate our position better than by referring to a recent work of acknowledged merit, one that has done much towards maintaining the high position of British botanists—viz., the "*Flora Antarctica*."

The author of this *opus magnum* is Dr. Joseph Hooker, a young, indefatigable, enthusiastic, truthful, and thoroughly-trained botanist. As the son of Sir William Hooker, the illustrious director of our national gardens at Kew, his studies were pursued under all possible advantages. The instruction and advice of his father, the constant association with all the ablest botanists of our time, and the innappreciable facilities afforded by a library and herbarium of pre-eminent completeness, were not thrown away upon this young botanist, who, if we are not greatly mistaken, will hereafter occupy a foremost place in the ranks of his chosen science. To all these advantages are added an amount of personal experience in the exploration of foreign countries, such as has rarely fallen to the lot of naturalists; for already he has investigated in person the floras of the frigid and temperate regions of the southern hemisphere, and those of the plains of India and the greatest mountain region in the world.

The "*Flora Antarctica*" contains part of the scientific results of the voyages of the *Erebus* and *Terror*, during Sir James Ross's memorable expedition towards the South Pole. The region selected for illustration in this beautiful work is one in which the proportion of sea is enormous as compared with the extent of land. The consequence of this arrangement is a climate becoming almost uniform throughout the year, as we proceed southwards. Wherever conditions favorable to vegetation are present, it becomes luxuriant, but is deficient in variety. *A priori*, so far as species are concerned, we

might predict either a close similarity combined with prevailing identity between the floras of all the tracts of land included within its bounds ; or else a distinct and entirely different flora for each island, or group of islands, and for the small amount of mainland. We could scarcely anticipate, by any stretch of imagination, the extraordinary, but inevitable conclusion, at which Dr. Hooker has arrived, after thoroughly sifting an ample amount of evidence.

He distinguishes two distinct floras within the antarctic zone. One of these includes the vegetation of Lord Auckland's Group and Campbell's Island. It is in some measure a continuation of that of New Zealand, and exhibits distinct Polynesian characteristics. The second embraces Fuegia and part of the southwest coast of Patagonia, the Falkland Islands, Palmer's Land, and the adjoining groups, as the South Shetland, South Georgia, and (proceeding eastwards) Tristan d'Acunha and Kerguelen's Land: The flora of the last-named locality is distinctly linked with that of Fuegia, although 140 degrees of longitude separate them, and is altogether distinct from that of Lord Auckland's Islands, though nearer to the latter by fifty degrees ! The flora of the Fuegian type characterizes isolated groups of islands for 5000 miles to the eastward of Terra del Fuego, some of them closer to the African and Australian continents, whose vegetation they do not assume, than to the American. Moreover, they are placed under conditions eminently unfavorable to the migration of species. The direction of the winds, which are violent, and prevailing westerly, might account for a few identical forms, whose seeds may be capable of transportation by that agency, but cannot explain the identity of *facies*, the consanguinity, so to speak, of types, or even the majority of cases of positive identity. There is but one hypothesis that can be assumed for the explanation of the phenomenon. This has been foreseen by Dr. Hooker, who has indicated the probability of these floras of the Fuegian type being the relics of the vegetation of an ancient antarctic continent that has long since disappeared, and whose former existence is made known to us by a few humble wild-flowers.

Equally interesting is the fact of a representation by the antarctic flora of the aspect, and even species, of the vegetation of the Arctic Regions ; plants of the south so closely simulating the aspect of plants of the north, that to the inexperienced eye they would be the same. And yet, when closely inspected by the scrutinizing glance of the

botanist, marked and permanent differences of organization are detected, and they are seen to be likenesses of each other, adapted for existence under similar conditions. That they are not mere modifications of identical forms, is evident in the fact that these representations are in several instances maintained by plants of entirely different genera.

In the course of his researches, Doctor Hooker reached what he believed to be the *ultima Thule* of southern vegetation. On a small islet in latitude 64°, 12' south, and longitude 57° west, he found a few lichens and mosses growing upon the hard frozen soil. There was no flowering plant whatever ; the southernmost of flowers is a small grass (the *Aira antarctica*), which grows in the South Shetlands.

The beginning of a creature, whether animal or vegetable, is a mystery seemingly unfathomable. Nevertheless, continued and careful microscopic research is gradually revealing indications, dim yet not uncertain, of the phenomena that are grouped around the genesis of the germ. Every new fact brought to light through the laborious perseverance of indefatigable observers, raises more and more our astonishment at the mingled simplicity and complexity of procreating nature. Within the last ten, or rather within five years, great advances have been made in the study of embryology. German botanists have especially chosen this line of research, and their endeavours have been rewarded with no small amount of success. The scientific naturalist, to whom their writings, mostly in the form of scattered memoirs and short papers, may be inaccessible, will find an excellent digest of the results arrived at in two very able reports by Mr. Henfrey, a young English botanist, who is earning well-deserved laurels by his zealous labours in this difficult department. We have given their titles at the head of this article. It is not easy to make clear to the general reader the particulars of such inquiries, although the conclusions which have been induced from them are of remarkable interest. We shall endeavour, nevertheless, to present, in plain and untechnical shape, one of these curious histories, and tell the story of the beginning of a pine-tree, for the benefit of lovers of Nature whose time and tastes are so employed as to prevent their seeking personally for these flower-born truths.

Plants that have distinct and unmistakable flowers produce their eggs (ovules) either within a nursery-cradle (ovary or germen), constituted out of metamorphosed leaves, or unprotected and exposed—foundling fashion. Among the latter are firs, pines,

cedars, junipers, yews, cypresses, and similar cone-bearing trees; these cones being whorls of scale-like leaves arranged to serve as screens to the little eggs that are the essence of the cone, or else to the little anthers that originate the potent dust or "pollen," which is destined to fertilize the eggs and convert them into seeds. The grains of pollen-dust, though microscopic in their dimensions, are by no means simple in their structure, for there is, as it were, organ within organ included within their diminutive frames. Each consists of an outer coat and an inner one, the latter endowed with a marvellous ability of growth and extension; elongating, when set free, its filmy membrane into delicate tubes that grow with magical quickness, and transmit through their cavities the still minuter vivifying particles that live within them. The poet sings a libel when he makes his talking tree

"Languidly adjust  
Its vapid vegetable loves  
With anthers and with dust."

Not until the pollen grain has fallen upon the ovule (in anglo-spermous plants, upon the stigma or viscid disc that crowns the ovary) does the embryo of the future plant begin in any way to be manifested. The former event may be said invariably to precede the latter, the relation between them being one of cause and effect. The cases, apparently exceptional and evidently anomalous, are obscure and exceedingly few, so that they cannot be accepted as objections to this rule. So far we are repeating what every youth, acquainted with the rudiments of botany, knows. This knowledge was the starting point for those who would investigate the mystery.

The egg of the pine is an assemblage of minute cells forming a kernel enveloped in a single cellular coat. Deep in its substance is a row of cells that combine to make a special sac or cavity. When the grains of pollen have fallen upon the egg, they burst, and their inner linings protrude in the shape of tubes, and penetrate its substance. Soon after, the sac that lies within it becomes filled up with new-born cells. A year rolls away in the life of the parent tree; the cells of various kinds—those external to the central sac and those of its interior—have multiplied abundantly, and enlarged their several dimensions. The sac itself has become twenty times as large as it was formerly, and is filled with lesser cells, among which a change commences. Certain of them (the number varying in different tribes) grow larger than the others,

and those that are between their larger cells (corpuscles) and the wall of the containing sac divide themselves each into four by transverse vertical partitions. The purpose of this division is the construction of an avenue of approach, guarded by four new cells, and leading to the greater cell or corpuscle that lies below.

All this cell-making, and changing, and re-arranging, is preparatory to the inauguration of the germ of the future pine-tree. But other changes must be effected before that germ can begin. In the cavity of each corpuscle new free cells are produced, among which one—the lowermost—has a special mission of its own. After the pollen tubes have forced their way, guided by unerring instinct, through the substance of the egg-mass, through the wall of the included sac, and through the canal formed by the four cells that separate each corpuscle from that wall, this one begins to enlarge. *Against* the membrane of the corpuscle itself the extremity of the pollen-tube lies. It is then that the lowermost of the new-born cells within the corpuscle begins to grow and to produce within itself a new generation of cells, commencing with a free cell that divides itself into two; these re-dividing, make four, from which, by a fresh operation of division, result eight. Of these eight, the four lower ones divide again, until, by force of pressure, the mother-cell is burst, and its matricidal progeny, combined among themselves, lodge in the dissolving membrane of the egg-mass.

This is the beginning of the end. The mass of cells thus lodged has a fourfold constitution, being made up of four rows that separate from each other like so many filaments. And now the end is in view. For the lowermost cell of each of these filaments (suspensors) becomes, by a new process of division and multiplication, the embryo, the germ of the future pine-tree.

But Nature, after an intricate and seemingly tiresome series of proceedings, having at length given birth to the germ—there being as many stages in its manufacture as in a complicated machinery process devised by inventive man for some very simple through profitable result—is not content with her labours of multiplication and germ creation. No sooner is the beginning of the new being perfected, than a work of fearful destruction commences.

Four times as many germ-plants have been produced as there were "corpuscles" in the sac within the egg. For each of the cells so styled has resulted in giving origin to a body that has divided into four sections, and each of its four filamentous segments

has developed a true germ at its extremity. In some of the pines there are as many as five corpuscles formed in every egg-mass; in some of the junipers, as many as eight of these bodies. The result of the fertilization of the egg is, therefore, the production in the former of as many as twenty pine-germs—in the latter, of as many as thirty incipient junipers. But the world is not destined to have the benefit of these baby plantations. Out of the twenty germs in the pine-eggs, and the thirty in the juniper-egg, one only, in each case, is intended to survive. One favoured infant, although as yet a microscopic embryo, is nurtured and reared at the expense of all its brethren. That tyrant one arrests their growth, and pushes them rudely aside. They waste away, and soon cease to exist: the chosen one only has a chance of growing up into a tree.

Such are the lately announced fruits of the minute researches of Hofmeister, a German botanist, who is worthily following in the wake of Robert Brown. The complexity of the changes, the simplicity of the operations and organs by which they are brought about, and the strangeness of the result, leave an impression of amazement on the mind of the botanist, knowing, as he does, that in many plants, yet higher in the scale of vegetable organization, the process of reproduction is comparatively simple, though sufficiently wonderful and mysterious. By endeavouring to describe these phenomena in unscientific language, we cannot but fail to convey anything like a full sense of their singularity. Our attempt may, however, serve to show, by example, how wondrous are the minute secrets into which the microscopic observer endeavours, not wholly without success, to penetrate.

And now a word about the investigators of plants.

Of all orders of naturalists, that of botanists is most prolific in individuals. There is scarcely a town of moderate dimensions in Europe which is not the home of one or more votaries of the graceful and gentle science. The same, we believe, may be said of North America, or, at least, of the United States. Natural history is a religion, and Botany is one of its sects. But, unlike the sects of most religions, there is neither hate nor jealousy between them. The botanist, the zoologist, and the geologist can all worship side by side, and offer homage to the same Great God, according to their several faiths and forms, without seeking to close the doors of Nature's temple against each other. Biology is a religion of love. It is

the life so beautifully defined in the moral of the "Ancient Mariner:"—

"He liveth best who loveth best  
All things both great and small;  
For the great God who loveth us,  
He made and loveth all."

If moroseness, or viciousness, or indigestion, or envy, (for naturalists being mortals are afflicted occasionally with these original sins,) will sometimes work in the brains or stomachs of its devotees and make an occasional delinquent prick the soul of his neighbour with the stiletto of harsh and galling criticism, it is not on account of that neighbour's shade of belief. That, at least, matters not. But though a Schleiden, intellectually athletic, yet ill-regulated in his strength, may delight in striking out at random,—or a Watson, indefatigable and deservedly illustrious in statistics, but grown misanthropic by working overmuch when in ill humour, find a melancholy pleasure in attributing evil motives to his fellow-labourers—the great congregation of botanists is at peace with itself and friendly with its philosophical neighbours. The wanderer among them who shares in their tastes needs no introduction, not even the mention of his name, to ensure a warm welcome. His fame may have spread among the gatherers of flowers in all climates, and he may find his physiognomy framed and glazed, occupying an honourable place among the Lares and Penates of his entertainer—or he may be utterly undistinguished, the author of neither book, nor paper, nor communication, as yet undignified by having genus or even species named after him—famous or obscure, provided that he show proof of the true faith of a botanist—and all, who trust in the same creed, will cherish him as the early Christians did a stranger-believer. Let him only exhibit his vasculum and folio, and he will be joyously received, nay, in many instances, find bed and board freely offered. We speak from experience. More than once, in countries where we could ill express our wants in intelligible language, our damp sheets of drying paper spread out on the bench by the inn doors, and our well-filled vasculum, have served us in good stead and secured for us hospitable entertainers, workers in the same pleasant field, who now, after a lapse of years, are numbered among our firm and valued friends.

Nor is Botany the science only of a class, even though, perhaps, on the whole the doctors have the best of it. In its train are representatives of all ranks and all profes-

sions—monarchs and artisans, priests and soldiers. There is one king in Europe who is a good practical botanist, and who must look back upon the hours spent in the arrangement of his fine herbarium with far more pleasure than upon those wasted in a vain and retrograde course of politics. The monarch in question is his Majesty of Saxony, who, in his scientific career at least, has gained honour and respect. Many is the story told by his subjects of their ruler's adventures when following his favourite and harmless hobby;—how, more than once, astray from his yawning courtiers, he had wandered in search of some vegetable rarity, across the frontier of his legitimate dominions, and on attempting to return was locked up by his own guards as a spy or a smuggler, since he could produce no passport, nor give any more probable account of himself than the preposterous assertion that he was their king! Fifteen years ago he made a famous excursion to the stony and piratical little republic of Monte Negro. It was literally a voyage of botanical discovery, and the potentate sailed down the Adriatic in a steamer, fitted out with all the appliances of scientific investigation. On its deck he might be seen busily engaged in laying out his plants, ably and zealously assisted by his equerries and aid-de-camps, and guided by the advice of eminent botanists, who accompanied him as members of his suite. Such a kingly progress had surely never been seen before, unless Alexander the Great may have relieved the monotony of conquering by making occasional natural history excursions with his quondam tutor, Aristotle. The Monte-Negriotes, on ordinary occasions very troublesome and by no means trustworthy people—folks who still keep many of the worst habits of the old Scottish highlanders—were mystified into tranquillity by the peculiar proceedings of their royal visitor and his noble attendants. Resolved, however, to render due honour to so distinguished and unusual a guest, they furnished a guard of state to accompany him in all his peregrinations, and wherever his botanical Majesty stooped to gather a new or rare species, the soldiers halted, and with much ceremony presented arms!

Were some mighty member of England's over-proud peerage to be told this true tale of kingly amusement, it would probably be received with a smile of mingled pity and scorn, and an expression of compassion for such "sad trifling." Give credit where credit is due, whether to king or caitiff. Which is the real trifier?—the man who, fortunate in having leisure hours and months of vacation, degrades the healthful exercise he seeks

by tainting it with the barbarous pleasure of torturing the beasts of the chase and the birds of the moor, multiplied and cherished through a demoralizing system of "preservation," protected by vicious one-sided laws:—or he who gains exercise as healthful when seeking to extend his knowledge of the wondrous variety of creation, and to delight his eye and improve his mind by searching out in their native wilds the living evidences of the exquisite beauty and curious workings of Nature?

We may suppose the hypothetical opposite of an absolute king to be embodied in a journeyman tailor. In a diagram constructed like that made by Mr. Owen Jones for the department of Practical Art, these personages would hold much the same relative places as the "primary red" and "secondary green"—if, indeed, our tailor might not be better paralleled by "tertiary russet." The relations in this instance would be rather inharmonious than harmonious, and the colours anything but "complimentary." However different in their respective compositions, the pleasant tint of happiness may be given to the lives of both kings and tailors by the same pure ingredient. If royalty grows earnest and simple in the pursuit of herbery, so also can similar tastes make a poor tailor as happy as a king. In a town far north, many years ago, we were present at the anniversary of a Mechanics' Institution, and had to say a few words about flowers and trees. It was well on towards midnight ere the proceedings closed, when a dapper wiry little man rushed out from among the crowd, and invited us, as one naturalist invites another, to visit his humble home, and share his frugal supper. Gladly was the invitation accepted; for the earnest and intellectual look of our evidently poor host excited no small interest and some curiosity. He led his guest through long, dreary, tortuous, and unsavoury alleys, and then up an interminable stair, faintly illuminated by the moonlight that seemed to ooze through loopholes. In the story nearest the sky was the home of this student of nature—a journeyman tailor, with a wife and innumerable children, the eldest of whom was a fine intelligent lad verging upon manhood, assisting in the work, and sharing in the tastes of his father. Their favourite studies were manifested by the conversion of an old cupboard into the case of a well-arranged herbarium, by a glazed cabinet filled with stuffed birds and rows of impaled insects, and by a shelf of well-selected scientific books, the purchase of which must have absorbed the profits of many a close day's work. The matron of the family, a

smiling, courteous dame, seemed to participate in the evident delight of her husband and first-born, and to take pride in a heartfelt approval of their studies. On the round deal table a clean white cloth was spread, with simple food to grace it; and two pleasant hours were spent in lively discourse, larded with hard scientific names, well understood, though strangely pronounced. The happiness of the whole family was, we believe, visibly increased when, a few weeks afterwards, it became our duty to announce to the head of it that he had been elected honorary member of a distinguished scientific society.

Who that has read the story of "Mary Barton," does not recollect the admirable picture of the quaint old artisan-naturalist, Job Leigh? There are literally hundreds of such men scattered over the land—and they are a blessing to it. At almost every meeting of the British Association for the Advancement of Science, some worthies of this class may be seen enjoying the happiest day of their lives, by listening to dry and seemingly abstruse discourses in the Natural History section. Most welcome are they when they appear; and there is no more thoroughly hearty welcome, unspoiled by offensive savour of social inequality than that given by philosophers of fame to their brethren of humble worldly position.

"The nature of flowers Dame Physic doth shew:  
She teacheth them all to make known to a few."

Such was the homely view of botany taken by most of our ancestors, and set into rugged rhymes by quaint old Tusser. The chivalrous Lord Herbert of Cherbury entertained more exalted notions of the fair science, for, writes he in his delightful "Life," "it is a fine study, and worthy of a gentleman," who, according to his lordship, ought "to know the nature of all plants, being our fellow-creatures, and made for man." We maintain the same position, and humbly submit that even the few instances of the fineness of the study, and its worthiness for gentlemen—our king and our tailor both deserve that often-abused though most honorable of titles—which our space has permitted us to cite, are unsailable evidences of its truth.

#### ART. IV.—OUR COLONIAL EMPIRE.

1. *Twelfth General Report of the Colonial Land and Emigration Commissioners.* 1852. Presented to both Houses of Parliament by Command of Her Majesty.
2. *The History of the United States of America, from the Discovery of the Continent to the Organization of Government under the Federal Constitution.* By Richard Hildreth. In 3 vols. New York: Harper and Brothers. 1849.

THE efflux of our population, which has recently received so large an increase, is one of the most striking features of the times, and has attracted not less than its due share of attention. For years emigration was urged as a remedy for our pauperism and vice: urging however did little to augment it. Facts under no control, and inducements coming through no device of man, have set it in motion, with a stream so full and constant, that some are now alarmed lest it should drain away all our strength. A few words on the wishes and objects of the former period, and on the fears of the latter may fitly introduce the principal purposes of our present article.

How should the thinning of our home population reduce our pauperism? To take away a man who works is also to take away a fellow contributor to our public expenses, and, still more a partner in providing the aggregate conveniences which can be obtained in dense communities alone. Are the scanty populations of the world the best provided for, that we wish to approach to their condition? Or as to contentment; do we not raise the point which divides content from discontent, just as we raise the circumstances around us? Will not the labourer who could not buy a cotton gown for his wife fifty years ago, soon be just as uneasy if he cannot buy her a silk one? If we now think of nothing less than wheaten bread even for our paupers, are we individually more satisfied than our fathers were who rarely ate anything better than barley and rye? No doubt while increased comforts are new to us, we rejoice in them with content; but as soon as the novel increase is incorporated with our insensible habits, and mingled in our imaginations with our natural rights, we look forward to matters yet beyond our reach, and are discontented if we cannot obtain them, whatever may be the amount of wealth behind us. If content is to come of external comfort, we shall need perpetual increase of comfort, and of the means of effecting that increase. Surely then there

is nothing in emigration, even if it did raise our material condition, to put an end to discontent, nor to that comparatively smaller command of enjoyments which we often call poverty, nor even to that want of the physical means of sustenance and health which more truly deserves the name. Or as to morals; will an improvident, dissolute, or dishonest man be less likely to bring himself and his children to want and shame because he can buy five shirts where his grandfather bought one? Or will the ambitious be less likely now than a hundred years ago to resort to undue means to rival his wealthier neighbour because he now has carpets, china, silks, and wines, (which he could not have had then,) his neighbour however still having them finer, richer, and more plenteously than he? Will fatal temptations to deceptive courses, each ending in a moral and social fall, be got rid of by the mere extrusion of those who have already fallen? Or, if that were possible, could we send away the lowest and worst of our people, without still leaving a lowest and worst class to lament over?

These considerations go not against emigration, but against false expectations of its public consequences. In thousands of instances, emigration has been an undoubted good to the individual emigrants themselves. Industry and charity have often nobly struggled by means of it against the most depressing ills of life; and industry and charity ever best fulfil their functions in the general system of things, when, without waiting for the calculations of the politician or the economist, they go straight to the unconstrained, unpatronized, but judicious accomplishment of the object before them. Mrs. Chisholm, Mr. Sidney Herbert, the Earl of Shaftesbury, and the thousands of strong hearts who win their own way to the antipodes or the west, have our full sympathy, although we do not believe we shall find a moral or political panacea in emigration.

But if emigration will not leave Britain a paradise to those who remain, it is equally unlikely to take away any serious proportion of our real strength. The exodus of our greatest year of emigration, (that is, the last,) was not quite so great as our annual increase: and that exodus consisted far more of those whose removal was to their own advantage and ours, than of those whom we should much regret to lose. In 1851, the emigration amounted to 335,966 persons; our increase is from 360,000 to 390,000 persons per annum. If then the emigrants had been drawn proportionately from all parts of our population, we should

have remained nearly as before; we should merely have failed to realize an increase. But of these 335,966 emigrants, from a population of twenty-seven and a half millions, Ireland contributed, say the Emigration Commissioners, 257,372 out of her population of six and a half millions: that is, our Irish population of one-fourth of the whole, supplies three-fourths of the total emigration: and the Commissioners further remark that the emigration from Ireland is four times its annual increase; a rate of depopulation which has already strikingly shown its effects, and will probably yet show them more impressively still. Now we are moved by no spirit of disparagement, still less of hostility, in remarking that such an emigration is a vast benefit to those who go, while it leaves us who remain all the stronger. The Irishman, between his priest and his landlord, is little likely to rid himself, while in Ireland, of those traditional recollections and chronic matters of discontent, which tend much more to keep up a wasting fever of irritation, than a healthy and improving dissatisfaction with things as they are. Flourishing everywhere but in Ireland, it is far better that he should go where he will no longer restrain his powers from their natural activity and effect, or foster animosities which consume his self-reliance and his hope, than stay where he is at once his own worst enemy and our most dangerous weakness. True it is that the Irish go almost universally to the United States; it is however much better for us that they should become citizens of the republic, to their own conscious emancipation, than remain where, rightly or wrongly, they are resolved ever to think themselves enslaved. The really dangerous enemy is he who, left to brood over wrongs, rises up in craft or fury to revenge them: for whether they be real wrongs, or only those fashioned in his own exclusive world of imagination, free there from the rough test of facts, he is equally unconvinced, implacable and mad. The same man eagerly engaged in the actual business of life, may retain his belief of having been wronged, but his enmity is then comparatively harmless; for his strength is healthily exhausted on other matters than revenge, and his complicated interests, ever before his eye, are so many bonds to keep the peace. The Irishman had far better for us be an alien or even an enemy, where he is restrained by the benignant influences of industry and thrift, than a fellow-citizen where he gloomily converts every fact into an exasperating wrong: and if three-fourths of Ireland were vacated next year, the va-

cancy would only be an advantageous field for the expansion of the rest of our population, and would probably be filled up from various quarters in less than twenty years. The Irish part of the emigration is then, we think, no real loss to us, however we may regret the state of things which renders it so.

Deducting the numbers from Ireland, the rest of the emigration for 1851 amounts to but 78,594 persons, about one-fourth of the annual increase of the population of Great Britain, exclusive of that of Ireland. No doubt, that of the present year will be found much greater. But the drain must increase very much, *and continue*, to check very materially the growth of our strength, or even of our population. Against the likelihood of its continuance is the probability that, with increase of the population of the gold colonies, the extraordinary inducements which now present themselves there will diminish; and the still greater probability that the working of our own new system of commercial freedom will lessen the pressure at home on numbers who would otherwise have been disposed to go. The Emigration Commissioners already apologize for their delay in finding suitable emigrants for Australia, by saying (p. 21):—"In most parts of Great Britain the labourers were generally so well off that they were little inclined to leave home, and their richer neighbours little anxious to get rid of them."

It is worth consideration whether to send our people away, by the aid of artificial inducements, more rapidly than they would naturally go, is really the best mode of dealing with our increase. Emigration, although perhaps not a positive evil, may be, as a lesser good, a comparative one. The choice,—for the limited extent to which the government can exercise a choice,—lies between employing our people at home, and sending them for employment abroad. Hitherto, the former has been so difficult as to suggest recourse to the latter; but the removal of arbitrary obstructions (nearly all a government can do, beyond providing justice) has already much diminished that difficulty; and if our industrial courage were but equal to rendering India available in full and due measure, (which is perfectly practicable,) that difficulty would probably entirely disappear. Now an Englishman in the colonies, on the average, employs us, that is, takes goods from us, only at the rate of about 2*l.*, or, in the most favourable instances, only at that of 4*l.* or 5*l.* per head per annum; say from 9*d.* to 1*s.* 6*d.* per week; all else he wants is provided on the spot, or, in small part, obtained

from other countries. Although at this rate he is by far the best customer we have beyond the seas, we can scarcely believe that in this comparative view every strong and independent emigrant is not a loss to us; it is, however, quite true that many a man is lifted from abject poverty, and rendered a customer to us by emigration, who, but for it, would never have been a customer of any appreciable value.

The 2*l.* per annum, however, which the colonist disburses in England, goes chiefly to the manufacturer; the loss of his consumption falls chiefly on the landed interests. The emigration question is, in fact, one of competition between the owners of land in Britain and the facilities for well-doing offered by unappropriated or thinly-peopled lands abroad; and also between the government of England and the governments, colonial or foreign, abroad. It seems not a little strange that they who most of all depend for accustomed profits on the density of the population—viz., the landowners and governing classes of England—should have been the most anxious to send away the people.

It is, indeed, one of the services which mechanical science has done, however unintendedly, to social progress, that facility and cheapness of communication are bringing all lands into the arena of competition. The German peasant or artificer escapes from the political tyranny or industrial restraints of his own country, with an alacrity quite equal to that with which our own unemployed poor have sought the uncrowded communities of the south and west. Governments, landowners, and employers, all who are fixed to the soil of any particular land, have now a new element to deal with; and it is only by justice and moderation equal at least to those to be had elsewhere, that they can escape desertions, less stunning, indeed, than a revolution, but far more difficult to deal with, and far more fatal to their power. Now that, to a considerable extent, men can practically choose under what government they will live, it will be madness in those who affect to govern to blind themselves to the necessity of conforming, however unwontedly, to the new conditions of the market.

Emigration and colonies may have their accidents, and at different special times their different special facts; but they do not derive their existence and vitality from schemes of governments. The vigour of our colonising progress arises evidently from other causes, and not from any remarkable excellence in our colonial system. Our people go to confront the forest or the

savage because they must or will go, and not because the government makes it particularly pleasant or even easy to do so. To reach his new home, indeed, the government, if he be poor, professes to give the emigrant some assistance. But, like everything else which falls into the hands of a government for its management, this proffered aid seems woefully spoilt in the giving. In many cases it is not available at all, and in many others the emigrant had far better trust to his own manly breasting of the stream, than swim against it with these official bladders, which hinder at least as much as they sustain him. Nor can it be doubted that with the exceptions of children and some classes of females, most of those who need help to reach a colony, are amongst the least likely to be serviceable there.

We have sometimes been urged to *systematic* colonisation—just as though any power of ordering the numbers, route, destination, or pursuits of our people, would not be altogether alien, and of another order of thought, from that on which our peculiarities, our glory, our progress, and even our existence depend; or as if such battalionising could or ought to stand for a moment, for more than a cobweb before the right worshipful wilfulness of true humanity. Of late indeed we have heard little of systematic colonization: its advocates are now alarmed at the vastness of the stream which fills and overflows the channel into which they would have pumped a regulated rill. Probably these who so distrust justice and charity, nature and providence, will next be heard calling aloud for some arbitrary legal sluice to stop the current.

We colonise by the innate force of tendencies, which need only suitable external natural circumstances to give them opportunity of effect. Some of the hopeful place their brightest visions abroad; and some of the downcast seek to leave behind them the land of their sorrows. They who wish for activity may look for it beyond the ocean; and they who wish for quiet may, with equal reason, try to find it there. The father has to provide for his children; the young have the world before them. The thousand embarrassments of the smoothest and most thriving community inflict bruises and abrasions on some who wish to escape from the crowd; and prosperity itself only furnishes means to the sanguine for attempting elsewhere to be still more prosperous. Even if the world were of equal comfort everywhere, there would not be wanting frequent motives to change; how much more then, when industrial conditions vary as they do at every remove, and the differ-

ing temperaments or capabilities of men find so many grateful resting-places of hope, so many appropriate fields of action? It is neither by forethought or counsel of governments that men are impelled to fill up the void places of the habitable earth, however governments may have their duties in relation to the movement; nor is it by deep calculation for the public good that individuals so seek each his own advantage, however in so seeking each may really advance, as he could not otherwise advance, that public good. Where governments have colonized in all the marshalled pomp of wisdom, their works have been puny and decrepit, or have otherwise failed: where the strong though sorrowing heart has carried its own destinies to other and wilder shores, the tear-watered acorn it has committed to the earth has become the sheltering oak of many generations. The best of our own early colonists fled from governments in England too hateful to them, or too careless of them, to be asked for more than leave to tread the soil of the wilderness (a leave commonly sold to them), the consequent duties of the government to the new community being rarely considered, and as rarely fulfilled.

Before we enter on the chief questions suggested by the perplexities and failures of our colonial government, let us briefly estimate the extent to which our colonizing tendencies have carried us. Our colonists, spread over large continental tracts, or dotted over many seas, possess a population which is probably somewhat over-estimated at five and a half millions: perhaps half of these are British in birth or pure descent, and half of various indigenous or mingled races. The British element exists in very different proportions in the different colonies, being generally large and preponderating in the temperate, small but controlling in tropical climates. Ceylon (if it may be called a colony) contains 1,500,000 inhabitants; British North America about 1,750,000 inhabitants; the West Indies and tropical America less than 1,000,000; the Cape of Good Hope not 200,000; and Australia, with Van Diemen's Land and New Zealand, perhaps by this time 500,000 souls. The rest are distributed over our other scattered possessions, chiefly in the Mediterranean Sea. These loose figures may serve, in the absence of the recent and specific information requisite for more exact statements. For comparison, we may say that as to numbers (carefully and broadly distinguished from wealth, morals, and intelligence), Ceylon has as many inhabitants as the West Riding of Yorkshire; and Bri-

tish America as many as Lancashire. The West Indies and tropical America do not overmatch the counties of Cornwall and Somerset united; the Cape of Good Hope, which costs us so much in wars, is not equal in population to Leicestershire, and is far its inferior in wealth; Australasia, including New Zealand, may rank with Norfolk; and the rest, all taken together, are hardly equal to a couple of medium English counties. Or, to put the matter in another view, the population of our colonies, British, mixed and native, is less than that of the presidency of Bombay, leaving 95,000,000 in the vast territories of India unbalanced; or it is about one-fifth of the home population of Great Britain and Ireland.

These colonies take from us goods of the value of nine or ten millions sterling per annum, including, however, some considerable amount of re-exports. This is about as much as we sell to four times the population of the United States, and almost twice as much as we export to the one hundred millions of India. They vary much in the rate at which they consume British goods; but we may say in general, that while each inhabitant of India employs us at the rate of 1s. 1d. per annum, of South America at that of 8s. per annum, and of the United States at 10s. per annum, each inhabitant of a British colony affords us employment at the rate of nearly 2l. per annum. This greater rate is calculated from the entire population of every class; but the consumption of British goods is no doubt chiefly due to persons of British birth or descent. Our trade with Ceylon varies little in its character from that with India, and is kept at an extremely low point by much the same causes; while our exports to British North America reach nearly to the general average of 2l. per head per annum, and those to Australia are much higher still.

It is not, however, from these figures, or from the present magnitude of the colonies, or of any of their interests, that we can draw true measures either of their real value to ourselves, or of the gravity of the questions which will necessarily arise out of the connexion. The whole of our former North American colonies, now constituting, as far as they go, the United States, contained in 1700 not a greater population than now inhabits our Australian dependencies, say 400,000; in the middle of the century they had reached to 1,000,000; at the time of the separation from Great Britain, 1783, they approached to 3,000,000, or, perhaps, half the population of the whole of our present colonies taken toge-

ther. They are now 23,000,000. Every considerable cause which has operated to increase the population of the countries now forming the United States, with some in addition, is likely to operate to equal effect in the case of our present colonies. Australia itself is practically not more distant, and is certainly much better known to our industrial population now, than the continent of North America was fifty years ago. Gold now beckons on the adventurous, while only reclaimable woods, or virgin prairies, offered formerly the principal inducements. Multitudes now seek from the down-trodden countries of Europe the freer rule of the Anglo-Saxon, whether under the crown of England or the stars of America, who last century bore the iron yoke of a decrepit feudalism, in hereditary and unawakened submission.

In twenty years, therefore, or in ten, we shall probably have not strippling communities, but strong states to deal with. In 1783, the United States were able to separate from us, they numbering 3,000,000, and we 13,000,000. Our colonies have now not quite 6,000,000, and we are 27,000,000. They have not, indeed, the advantage of mutual contiguity, and, therefore, of acting together, which the Americans had; nor have they that local military organization and experience which the Americans had been left to acquire; but, in other respects, they are equally capable of becoming independent; and, in one important circumstance, the chance of effecting such a change is greater now than then: public opinion in England long supported the British government in its contest with the Americans, but it certainly would not now endure either the cost of a serious contest with colonists on doubtful grounds, or even the putting of a severe strain on admitted principles to their serious umbrage. If we are to retain any supremacy over our colonial congeners, it cannot now be by force; it can only be by a just and judicious working out of concurrent interests, through a clear appreciation and admission of common rights.

It is, indeed, a disputed point whether England gains or loses by her colonial empire. Strict economists, reasoning from tangible interests alone, say that we should be as well without it; others, professing to take a wider view of the subject, affirm, that it brings us many advantages besides those which can be computed, and that these incomputable advantages turn the scale greatly in its favour. This seems to be one of many questions of which the determination gives us little control over events. Profitable or not, as we have seen,

we shall have colonies, by force of tendencies which do not wait for calculation of public effects, unless, indeed, we abandon principles held sacred by every civilized community, and which are not less essential to our own coherence and mutual confidence as a people at home, than to the case of our fellows who form colonies abroad. All that seems to be left to us is to inquire into the true nature of colonial relations, and to conform in practice to what we may thus learn.

It is not the termination of former disputes, nor even the surrender on our part of the points on which they turned, that will afford us immunity from future disagreements. Time evolves new and unanticipated questions, and some old ones may be taken up reversely by former disputants. Some questions are still obscure; many, probably, are not yet raised. Without going over our whole colonial experience for examples, we may gather enough for our present purpose of caution from the history of the main question on which, ostensibly at least, our American colonies separated from us.

The important communities which now form part of the United States, had ever admitted, while they were British colonies, the right of the British Parliament to bind them; and to the authorities in England they often appealed in their internal disputes, as well as for external defence. Amongst other powers which they acknowledge to reside in the parliament, was that of regulating, restricting, and limiting their commerce. However they might complain of the pressure, or however, as in Sir Robert Walpole's time, their irregularities might be judiciously connived at, they never denied the right of parliament to impose such laws upon them;—but they resisted to the death the attempt to tax them. Commerce was restricted, and manufactures, to a great extent prohibited; but they took such relief as smuggling could afford, without any serious constitutional questioning of the power under which they were suffering.

The men who resisted to blood and severance a tax too light for any purpose but a test of principle, sanctioned by recognition, when not by obedience, restraints which crippled and embarrassed the whole course of their industry. The loftiest claims of parliamentary supremacy in the regulation of trade, and the most selfish exclusiveness of manufacturing jealousy, were often found side by side in England with the most energetic denial of the right of parliament to tax the colonies. The same strange association of contraries was equally found in

the colonies themselves; and they who bowed, however stiffly, to the law which in necessary effect deprived them of 50*l.*, rose in deadly indignation against the tax which took from them but a poor five shillings.

Now, if we compare the state of opinion then prevailing with that of the present time, we can hardly fail to be struck with the change in the relative importance assigned to these two questions. Except, perhaps, amongst the more constant or least reflecting of the protectionist remnant, there are few now who will not assert that assurance of commercial freedom is at least as important in its effect on the general welfare, as perfect formal constitutional immunities in respect of taxation; and some will assign to it by far the greater weight. To have given up the right of taxing the colonies, supereminent as the question once seemed, is now by no means a security against the recurrence of differences as fatal to the colonial relation as those which separated from us the United States; and while growing experience and new interests work irresistible changes in public opinion both here and in the colonies, we are concurrently warned by this pregnant instance that whole classes of questions may arise whose importance we cannot estimate beforehand, and possibly of whose nature we have yet no conception.

It is worth while, in this view, to pursue the American question somewhat further. The colonies were partly settled by, and they received their chief impress from, men who had shared in England in the vehement disputes respecting the taxing power of the crown. Taxation seemed to those generations the great and almost only question of political right; and they who justly resisted the arbitrary imposts of Charles, could see the most violent interferences with industry and private right, as now understood,—nay, they could even endure the remaining existence of personal slavery in England,—without deeming them more than questions of mere policy and regulation. This question was settled at the Revolution in respect of England as against the crown; from the date of that event the public mind was occupied with other matters, until the American disputes revived the debate; and then "taxation without representation," was adopted both in England and America as the great formula of grievance;—just as though a government, whatever its form, may not infringe natural right in many other matters quite as flagrant as in that of taxes, and to far greater practical injury. So tenacious, however, is the vitality of dogma, that to this day an American fires

up at the bare idea of a contribution to common expense under the name of taxes, while he hugs delightedly the chains of his commerce.

To point out the accident by which this pre-eminence was given to the question of taxation, is also to show the unfitness of that question as a test of colonial liberty, and of its settlement as a sufficient cause of colonial contentment. Our kings, who outstretched in expense their dilapidated feudal revenue, sought to govern as they pleased against the will of the opulent classes, who then called themselves the people. To limit the purses of these kings was to limit their power; and hence the prominence of taxation in English domestic politics and English theories of government. But the cause is essentially altered when the power of England over the colonies is considered, instead of the power of the king in the local transactions of England. To refuse the colonial purse to the mother country is not, as in the case of the king, to cut off the resources of evil rule. Those resources may be, and in fact are drawn, in the case in question, from other quarters; and by means of wealth and power thus independent in their origin, immense injustice may be inflicted on the colonies, or any one of them. The check which is effectual in one case, is no check at all in the other. "Taxation without representation" was a formula omnipotent in the American case only by chance; it was really very inferior to the occasion, and moreover somewhat out of place.

"Somewhat out of place;" for, at a period not very long before their own uprising, some of the men most conspicuous in it were parties or witnesses in proceedings at least as incompatible with liberty as "taxation without representation" could be. They suppressed by public force all discussion inimical to the views of the local party in possession of the colonial government at the time;—they had as yet little or no true religious liberty;—they were ever ready to pledge the wealth of their fellow citizens to sustain paper issues lent in great part to favourites, and to murmur at English interference, when this baneful practice was restrained by orders from home;—the separation of the legislative from the executive functions, and the permanence and independence of the judicial authorities, they either did not value, or at least took no care to preserve;—their colonial constitutions, framed very much according to their own views, did not make representation co-extensive with taxation amongst themselves;—in short, in everything but the one matter of taxation, they had no clearer views of liberty,

or no greater care for it, in subjects entirely under their own control, than that which may be supposed to have actuated any British functionary set over them. This, however, is judging them in part by the standard which our own experience, as well as theirs, has since set up; and this reservation is of great importance to our argument.

"Out of place" again,—for the refusal to bear a share of the imperial taxation was in fact a refusal to bear a share of expenses incurred in great part for the advantage of the colonists themselves. They deemed the French at least as much their enemies in America, as England did hers in Europe; and from them they suffered much encroachment and annoyance on their frontiers: moreover, they were as tenacious of questions of boundary even amongst themselves, as any old and aristocratic country could be, and frequently appealed to England in those disputes; much more did they look to England for repression of French intrusions. The war of 1756 was undertaken in great part for that purpose, although after the usual fashion of troublous times, other causes of quarrel soon clustered round the original difference. In this war, which ended in the entire and final deliverance of the colonists from these old and dreaded enemies, England spent some 240 millions sterling; and although the colonists made, in addition, considerable exertions on their own behalf, yet in a case where they had called on a parliament in which they were not represented, for aid which was rendered them at vast expense, it can hardly be said that they had the most fitting occasion for the assertion of the traditional dogma which limited taxation to the extent of the representation. And so it seems the public of England at that time thought; for, smarting with unaccustomed burdens, they supported, through the mere impulse of common sense, the ministries who successively endeavoured without effect (and certainly, indeed, with little of either skill or kindness) to obtain some adequate contribution from those who had been specially benefited by the outlay. It might not be technically constitutional, but it at least looked just and natural, that, represented or not, the colonists should assist in paying for what they had so earnestly solicited, and then so largely enjoyed; and no doubt, but for the influence, as in all other cases of violent disagreement, of exasperating incidents, foreign in nature to the original difference, the dispute would have been settled on rational grounds.

Yet the Americans had their side of the question also; for there was no amount of interference with their liberties which might not be rendered easy, if the imperial govern-

ment were permitted to tax the people of the colonies at its pleasure. It is true the British parliament was admitted to be supreme in legislation; but this theoretical power of controlling the internal economy of the colonies, as well as their external relations, was checked by the impossibility of obtaining funds for executing unpopular measures, except by taxing the people of England, who would thus be stirred to take (advantageously for the colonies) a part in the dispute; but if unlimited funds could be drawn from the colonies by the power of the same distant parliament which claimed to legislate for them, there seemed to be no limit to the control which might be exercised where the colonists had no voice but that of half-informed, irregular, and fleeting political friends, or of agents who had no arena in which, of *right*, to debate their case on facts as they arose.

Moreover, if the case of the colonists was incongruous and imperfect, it was not, as far as it went, untrue. They had much to learn, of which, like their English cotemporaries, they were yet unconscious. The co-extensiveness of taxation and representation, if not the chief or exclusive mark of free government which it then seemed, is at least one principle amongst those of which any sufficient and permanent system of government must eventually come to be composed; and if practical liberty, as affected by the colonial authorities themselves, was scarcely so far advanced at that time in the colonies as even in England, still the energetic practical use, on so great a scale and with so conspicuous a result, of the one chief lesson they had up to that time learned, was the best possible beginning of the advance which America has since made in further principles of freedom, and of that in which England itself has proceeded, to the same intent, with more than equal steps.

Deducing from these facts no moral disparaging to the revolutionary fathers of our transatlantic compeers, we draw from them an emphatic caution to ourselves. Neither similarity of race, nor close personal connexions widely ramified through both countries, nor a strong party in favour of the pretensions of the mother country, nor, in some views, the obvious justice of those pretensions, nor a near agreement in general principles of government, nor a strong disinclination to separate existing at the beginning of the contest,—none of these things, nor all of them, sufficed to withstand the disruptive forces which a single question and its concomitants brought into play. We can hardly, indeed, attribute the effect to that one question: much more likely does it seem that the interference of England

with the trade and manufactures of the colonies, ever felt in detail as a wrong, though formally admitted as constitutional in the gross, gave to separation its reconciling advantages. The perpetual galling of even recognised authority, in matters which the inner sense of men assures them no such authority should trammel, is sure to obliterate in time the outward acknowledgment of merely conventional powers.

Sentimental influences, respectable and potent in their way, did still less than substantial interests to preserve the unity of the empire. Loyalty to the crown (once as rife in America as in England), the dignity of forming part of the wide-spread British dominion, the hereditary glory of arms or literature, identity of tongue or community of science,—these may either be so far preserved under new circumstances as to offer little impediment to separation, or they will give way before grievances and interests, real or supposed, which affect men's actual affairs. They have all given way under pressure, and we may expect them to give way again.

The American revolutionary war, indeed, left on our colonial system traces of its action too deep to be disregarded. Yet these, instead of securing us against dissension, seem rather likely to promote it, only in a contrary sense. We have given up the power of taxing the colonies, but we retain the obligation of defending them; and, it is no unreasonable question for the Lancashire spinner or the Kentish farmer to ask, why he and his fellows are to pay for defending the Cape Territory from Caffres, or for preserving fishing bays for the Canadian against the Yankee. Where is the community of interest to require community of cost? Nay, what is the speciality of interest on the side of the English taxpayer, that on him should be laid the chief or only contribution? Questions like these, acquiring magnitude and weight from the extension of the colonial interests to be defended, can hardly fail, if left unanswered, to lead the mother country to seek a separation, rather than, as heretofore, the offshoot.

From experience, then, we have not yet elicited the devices which may hold a colonial empire together. On questions already debated, we may have, as on slavery and transportation, complete transformations of opinion or reversals of interest. The unfoldings of the future may confront us with questions not yet encountered, perhaps of kinds not yet even imagined. All hope of governing the colonies by formulæ seems futile, while practical statesmen of every party fail in the oft-tried task. The Whigs

lost us America notwithstanding their principles,—the Tories must have lost it by the very virtue of theirs. Both Whig and Tory, probably acting with unimpeachable intentions, alike leave in Downing-street the memorable marks of their colonial failures.

If a course of policy has so long been fruitful chiefly in disappointments, while the great stream of progress on which it attends has derived its strength mainly from other causes, it cannot be too soon to review our principles, and to ask whether there be not some active fallacy, or the omission of some necessary truth, at the bottom of all this. Where we have failed, it may be, for anything we yet know, as much from what we have neglected as from what we have done. Our object, then, should be to examine the subject in its more general aspects,—to ascertain, if we can, what is the relation which ought to subsist between England and her colonies,—what the influences affecting that relation,—and what the ultimate results to which that relation ought to lead.

What are the rights and duties of a British emigrant colonist? We mean not those which may happen to be defined or confused by acts of parliament, or by decretals of any kind, but those naturally attaching to him. It is altogether in vain to appeal on such questions to what has been enacted or commanded. Universal tendencies disregard all such restraints, except as mere hindrances; and in the end they break down, or break through, every law which is not merely a means or channel for the better exercise of some natural right.

The converse of the question just put is, what is the nature and extent of our obligation to defend the colonies, and the rights which entitle us to interfere in their concerns? To this question we have already, in one sense, adverted; but we may here ask, if America were to divert her Japanese expedition to the attack of Port Philip, why ought we to take up the quarrel? and why should Jamaica or Newfoundland be exposed to the hazard of invasion in a war following an outrage at the antipodes? Or if New Zealand and South Australia, in their future pride of youth, should choose to quarrel with each other, what empowers or requires us to be the umpire? Questions like these—never without importance—can hardly fail to become of serious moment. While colonies are small and weak, and the world is in comparative peace, they may sleep; but when these rising nations come to have interests large enough to touch other interests at many debateable points, to be rich enough to be worth the trouble

of aggression, or to think themselves strong enough to indulge in the rash vanity of quarrels with each other or with other states, it may come to be a momentous practical doubt whether, on the one hand, England is bound to protect their interests or to back their ire at her own cost—or, on the other hand, has practical authority enough to keep them out of difficulties and differences of their own creating. So, indeed, the colonies may well ask on their side, whether, if England embroil herself in Europe, are they to bear the penalty of an invaded territory, an interrupted commerce, or severed national connexion?

To say that all this comes of the colonies belonging to the crown of England, is to repeat a dogma which did not hold in unity our former colonial empire; or, at best, it is to give an account of the connexion which is so obscure and metaphorical as to be altogether insufficient for practical guidance. Neither reverence nor romance can now be made to render the abstract homage to the crown a bond capable of resisting the disruptive forces which great interests or passions may again call into play, and to which the wild independence of frontier life imparts its own energy of action.

No doubt the advent of these difficulties will be to some extent postponed, and their urgency mitigated, by an increased spirit of caution and forbearance in the imperial government; and we may hope that the adverse tendency of rude colonial life will be checked by an influx of a British-born population, and of metropolitan ideas, easier and larger than was formerly practicable. But we have still to remember that these are the dangers which have shaken or destroyed every system of European colonisation. We have already shown how much they did towards the severance from us of America; and, besides the chance of unexpected questions arising, we may easily lose Australia, New Zealand, and the Cape, from causes not yet remedied, however in nature they were made patent during the term of our former colonial connexion.

“The natural end of all this,” say some, “is the independence of the colonies. As each colony grows strong enough to disagree effectually with the mother country, it proves by that fact that it is strong enough to take care of itself. Let us not repine that a day will come when Canada and Nova Scotia, the Cape and Ceylon, Australia and New Zealand, will be as Carolina, Pennsylvania, or Maine.” Our answer is, that while we look without regret or dismay at any degree of advance by which the colonies may become strong

enough for independence, we are not quite willing that all the good should be sacrificed which better management and a truer following of nature and experience might achieve. Let it be remembered that, since the separation of America from us, we have had a bloody war with our own kindred, we have had imminent risks of repeated quarrels with them, and we have always operating against the chances of peace the chronic, subacute irritation of races, tariffs, party spouting, and diplomacy. Let us remark the yearning for the abolition of war, which grows sick in seeing no practicable substitute for it. Let us count the dangers which come of the coarse immaturity of young and scattered communities. Let us imagine how many struggling tribes, beyond those of our own kindred, would welcome, as their life, a combination in which they could peacefully and freely grow out of their own oppressive and hereditary barbarism into our civilization and light. And then let us ask ourselves whether it is not at least worth some effort to lay in our own colonial dominion the basis of the first confederation in which strong-handed peace and perfect equality shall be the joy and defence of all ends of the earth alike; whether that and more, which the Union is for the several sovereign states of North America, may not be provided for states as numerous and mighty as they, and better fitted by their dispersion—perhaps even by their principles—to influence the rest of the world for good; and whether any means of accomplishing these great objects is likely to arise at all comparable to the federalisation of the British colonies. And if, after a careful survey of the case, we can draw a line through our own past footsteps of constitutional progress which shall run forward, beyond our present most advanced point, so as to guide the adventurous design through the great difficulties which might beset it, why should we hesitate to enter on so beneficent, though so anxious a task? If there be a chance of light enough by which to see our way, it must be in carefully, but comprehensively, looking at the great natural principles which rule the case, and in applying our experience to the using of them.

We return, then, with redoubled interest, to the natural relations of the colony and the mother country. They are doubtless to be determined primarily by the fundamental principle that protection and allegiance are reciprocal. But protection and allegiance have their practical limits, although the law or crown of England claims an allegiance indefeasible on the part of the subject by any act of his own. The pro-

tection of the government cannot follow an Englishman into the wilds of Africa, nor will a strong colonial community obey the imperial authority where a general feeling prevails against its rule. It would be interesting to follow up this subject by inquiring into the just extent of these limits, and not the less so because governments commonly evade or fulfil their side of the reciprocity (which ought to bind both parties with equal strictness) according to political or party convenience at the time. We must content ourselves, however, with a very few general remarks.

The principle on which the incidence of law is determined is by no means everywhere alike. The nomadic system, that of the lowest and rudest communities, carries the law with the tribe wherever it may go. The fixed system makes all liable to one uniform law who dwell or come within a certain geographical boundary: this is the usage of the most advanced societies. There is a third or mixed system in which each tribe or section of the population within the general geographical limit has its own law; this prevails where, as in India, there have been repeated superventions of different races, or there are strongly marked social or religious divisions of the same race; and it is also found where the political power being weak or depraved, universal law has no energy, so that the needful protection of individuals is left to the imperfect and partial operation of the social powers. None of these meet the requirements of the present case, which is that of a man leaving his own country of fixed law to betake himself to another. If the other be one of fixed law also, he is amenable to its authorities while within its limits; but then that is not colonizing. If he, with his fellows, plant himself where there is no law, or confessedly insufficient or inappropriate law, how does he stand with his former associates? Clearly, if they follow him with protection, and he accept it, he is bound thereby to his former obedience, within whatever constitutional limits it might have been circumscribed. But whether they will so follow him, or he so accept protection, depends on other considerations.

The national relation, essentially different from that of the family, is, in fact, a conventional and not a necessary one; and hence, by the way, the non-appearance of patriotism, in its ordinary sense, in the catalogue of Christian virtues. That is, a man remains just as much and truly a man, with all the powers, susceptibilities, duties, and enjoyments of a man, although he change his national connexion. Their is neither self-

reproach, nor occasion for it, in a change of citizenship on sufficient prudential grounds; and communities of men, even of identical origin, will not separate or unite politically, except with some view to advantage, as they understand advantage. For what benefit, then, does England undertake the protection of the colonies, or the colonies conform to the policy and share the risk of the entire empire?

No doubt, the merely personal purposes of the authorities of the day—or, at best, fallacious advantages sought in the interest of some classes at home—were long the objects for which England was induced by her leaders to keep up a colonial empire; and so long as these surreptitious objects gave character to our proceedings, a continual accumulation of discontents might well prepare the colonial mind for final separation. We may now, however, set aside such considerations, in favour of the very probable operation of more honest as well as more general views; and, so far, we may hope that dissolution is not the necessary end of colonial increase.

If the whole world were proceeding on one system of policy—open, equal, and free—it would be perfectly supererogatory for any one state to care for extending its influence: for no merely municipal differences, in a system so radically uniform and stable, could affect the practical exercise of those rights of humanity in general, security in which every state is bound, within limits, to provide for its members. Nor, wherever a citizen went beyond the bounds of incidence of his own law, could there be anything in other law to injure his own just interests, or those of his compatriots in connexion with him. If the radical principles of France were like those of England, it would be a matter of no importance to us whether England or France had colonies: for we could travel in, reside in, deal with one just as well as the other. But since very different principles of policy prevail in different states, and with different races, we have to consider the effect of abandoning distant communities, springing from ourselves, to the influence of systems different from our own, forced on them perhaps against their will, before we decide on ridding ourselves of risk and trouble by giving up our colonial connexions. One fact may show the importance of this view, even to our own material interests, and that in a case where highly favourable circumstances of other kinds have probably reduced the effect to a minimum. The United States, with twenty-three millions of inhabitants, take from us goods to the amount of twelve or thirteen

millions sterling, say ten or eleven shillings per head per annum; the inhabitants of British North America, numbering about one million and three quarters, are our customers to the amount of about three millions sterling, or nearly two pounds per head per annum. There is little besides difference of public policy to account for this difference in our dealings with the two countries. If the United States had been comprehended with ourselves within the same system of free commercial policy for any considerable period, they would probably have dealt with us to the same extent as our own American colonies—or to the amount of forty-five or forty-six millions—and that as much to their advantage as to ours.

It is true that under varying systems of restrictive and artificial commercial policy little advantage is to be predicated of association with any of them; but, in the free system of England, everything is to be gained by comprehension, or rather by preventing the exclusion in which other systems consist. Free trade, so far from leading to the dissolution of our colonial connexions, should lead to the confirmation of them, until perfect freedom of commerce is secured by the common consent and judgment of mankind.

The advantages afforded by allied bodies, actuated by a like general polity, with whatever municipal differences, are as great to many individual members of the parent body as to the interests of that body more generally considered. They afford a resort free from the difficulties which old countries appear to many to present to them, and, what is much more important as well as more nearly true, they supply that variety of circumstance and occupation which gives the best chance for the right use and exercise of the varied qualifications of different men; and the reserved consciousness that there are lands, under the same general law and participating in the same general influences, where new and unworn fields may give labour, competency, and quiet to the unfortunate or the oppressed at home, favours greatly the growth of that sturdy though not irregular independence of personal character which is indispensable alike to individual happiness and sound natural strength. But a different general policy restricts to narrow limits the advantages which would induce the members of a more advanced community to share in the labours and difficulties of one less matured. Few Englishmen settle in Egypt, fewer still in Morocco or Pegu, and not many even in the slave states of America. The smallness of our numbers in India, notwithstand-

ing our political pre-eminence there, seems to be occasioned by the still preponderating influence of native principles, much more than by any adverse peculiarity of climate. If there were many Englishmen in some African or Asiatic countries, we should probably be compelled either to abandon, in respect to them, the duty of protection and its correlative allegiance, or to wage almost continual war on their account. The degree in which our colonies attract our countrymen more than those countries do, is to be attributed, in great part, to a similarity of policy which, because it is attractive, or, in another word, advantageous to them, is of great importance to be preserved.

If the tendency to travel, to colonize, or in some way or other to seek advantages abroad, be as natural and irrepressible as we conceive it to be, there can be no escape from the duty of protecting our people in it, as in the exercise of any other just and lawful tendency;—no escape, that is, except by renouncing at the same time, the fealty. If one man exercise his industry at home in gratification of his love of home, and another exercise his abroad in equally laudable gratification of his love of novelty or adventure, the two men have obviously an equal right to protection, if equal obedience be required of them; and to refuse it to one man beyond the local bounds of home, is to bring doubt on its being made available to any other, however beneficial to great general interests his wandering may be. To claim redress for Mr. Mather at Florence, and to protect our New Zealand colonists, are but different forms of the same duty, and both arise from general principles, which if damaged in application in one case are seriously imperilled in the other. Are we so independent of external relations that we can afford to shut ourselves up like Japan? or must we take the risks as well as the advantages attendant on our people scattering themselves for innumerable purposes, and in every variety of connexion, over the face of the earth?

If our people, in going abroad, are denied our protection, they will defend themselves, and we can have no right to restrain them. Under the cover afforded by this irregular exercise of an undoubted natural right, may easily grow up a state of lawless violence. It is not very easy to divest ourselves of obligations towards other states, in respect of those who go out from us and bear our name. If an ill-conducted body of Englishmen were to establish themselves on an island in the Pacific, we might have some difficulty of ridding ourselves practically of

responsibility for their acts towards others, however little we might have had to do with them; and our own doctrine of an infeasible allegiance would of course be made to fix on us, still more firmly, the natural liabilities of the case. We have then to consider, not whether we will have colonies or not, but under what arrangements we shall retain so much of the duties of a continuing relation with our errant members, as will entitle us to an effectual exercise of its rights.

Whatever weight may be given to each of these separate considerations, their concurrence seems to show that we are not wrong when we follow the general tendency of advanced communities, in retaining within our political system those bodies of our fellow-countrymen who seek their subsistence, fortune, or pleasure, abroad. But to render such a connexion of any value to the parent state, or its members, the same general principles of legislation and policy must pervade the whole system and every part of it, however widely dispersed; and the constitutional arrangements must afford the means of promoting, if not ensuring, this identity of principles and purpose in all the details, as well as in the great measures of every separate subordinate government. All the advantages, for the sake of which the parent state involves itself in the affairs of the dependency, flow from this identity of views, and can flow from nothing else; and all the responsibilities of the central state, and through it of all the colonies, towards other states, require that each member of the confederacy conform practically to the general course. How this is to be reconciled with the just power and independent influence of the local legislatures is one of the chief problems of the case.

If the central state find advantages in maintaining a colonial system, no less do colonies profit by keeping up an intimate connexion with their original stock. A newly-settled colony is necessarily weak and defenceless; the allied force of a powerful cognate community is the ready and natural resource of such a body. That such a safeguard may not be needless, even in the nineteenth century, we may easily conceive by imagining the piratical invasion of Cuba to have alighted on Jamaica, or the swoop of the Gallic bird, eagle or cock, which once fell on Tahiti, to be directed, as it might with equal justice, and much more equal temptation, on New South Wales.

The immigration of denizens of the older country contributes too obviously to the prosperity of a colony to be obstructed, or for any measures tending to its encouragement to be

intentionally neglected. But a colonist is, perhaps, not in the best position for estimating aright the force of the circumstances which may discourage immigration, or the value of the principles which a large immigration from the more cultivated mother country would strengthen in the colony. A colonial community, of which a great proportion is ever in contact with savage or semi-savage tribes, is necessary lower and coarser in moral feeling, and in regard both for natural rights and for the artificial regulation and protection of them, than are the members of an older, more settled, and more quiet national body. Habits of feeling, and, what are much dependent on them, habits of thought, are mainly influenced by the facts of daily life; and they who have often to repel the attacks or circumvent the craft of the savage,—they who, with little of the refining influences of society, literature, or religion, are every day exercising and strengthening their own hardihood on the very edge of the wild world they are continually pushing before them,—these are not the men to agree spontaneously, in spirit and detail, with a legislation dictated by the advanced but subdued experiences of the central community. And yet, if these more advanced experiences be not listened to,—if the savage have not his trial instead of the prompt, though, perhaps, just revenge of the bloodhound and the rifle,—if men are not led, even at the frontiers, to hope for something from the success of kindness, forbearance, and moral example,—if patience have not her share in the work as well as courage, there can be no alternative between the extermination of the black man, and the recession of the white; neither can the colony, in the general tone of its morals and legislation, afford to such a metropolitan emigrant as is best fitted to serve colonial interests, a sufficient inducement to encounter the really inevitable ills of colonial life.

Nor is contact with savagery the only influence which deteriorates colonial feeling: mere sparseness of population, which plentifulness of land always induces in a colony, contributes to the same effect. A scattered people soon lose the impress of the advance to which men in denser bodies stimulate each other, and for which combination and matured resources can alone provide the means; unchecked by censure, men begin to indulge in what they would not otherwise have ventured on, and soon set up for themselves a new and inferior standard.

The power of opinion, little believed in and almost always undervalued, stands for least of all, perhaps, in the estimation of a member of a young and scattered colony. Force and authority are his daily resort, and he knows

of no influences which are soft and noiseless while they are also great. He may despise opinion as a social force, but how great its energy he may learn from this: the citizen of Alabama keeps quiet his bowie-knife, and the Italian his stiletto, in the streets of London.

Those considerations seem to afford two practical suggestions. First; since legislation and general policy, in their character and aims, are always what the people are, and a coarse and violent legislation is the most certain of all checks to real and permanent prosperity, the colonist has a strong interest in such an immigration as, by counteracting the unavoidable tendency of colonial circumstances, shall tend to keep up in the colony the tone of moral feeling and the spirit of general intelligence: such an immigration he can only have from the mother country, and only indeed from the best part of even her population. Secondly; as far as legislation and policy are concerned, only agreement in great general principles, and arrangements for their conservation, can work out such a state of things as will offer satisfactory inducements to such an improved and improving immigration from the mother country.

Whether, then, we consider the more patent necessities of defence and advantages of augmented population, or the less obvious, but not less important, considerations connected with the tone and spirit of colonial society and legislation, it appears that the interests of the colony, equally with those of the mother country, require a firm and unvarying concurrence in certain great fundamental maxims of government; and they require, with equal urgency, the establishment of practical means for perpetuating that concurrence, for supervising the application of general principles to the detail of particular measures, and for reviewing the course and objects of the whole confederation.

The necessity for local legislative power has been admitted from our earliest days of colonial enterprise, whether out of deference to the unradicable constitutional predilections of Englishmen, or from conviction of its value as an instrument of practical administration. We may, therefore, with few words, note the necessary incorporation of this element into any system of colonial government. The need of it may be plainly deduced from the discontent with which men of right feelings and true mould must ever view a constant and blundering interference of distant and half-informed officials, in matters of local moment, dependent on local understanding. Conformity to general principles, however, the whole confederated

community have a right to expect; and the interference requisite to this, graduated from urgent discussion to mere remark, except in extreme cases, is all that either prudence or right requires. That this might be necessary, we can easily believe; or if not so easily, the singular step recently taken by one of our colonial legislatures of America, in giving bounties to their fishermen, may well convince us: for although the falling of such a weight on the exclusive resources of the colony, will probably soon lead to the correction of an error so alien to our general policy, the proceeding is still a proof that our colonial legislatures have not yet outgrown the tendency of young communities to the quirks and contrivances of over-legislation. Subject, however, to the supervision requisite for limiting the effects of such aberrations, local legislative authority for local purposes is an essential part of any just and stable system of colonial government and confederation.

Let us look now at the nature and consequences of our present colonial system, and the general character of the remedy required by its admitted inefficiency. At present the condition of most of our colonies is for many purposes little short of independence. It is true that in some matters, apparently relating to imperial or perhaps British interests, we sometimes attempt a control which seems rather to provoke discontent than to answer any valuable purpose; but, generally speaking, the colonies which have local legislatures (and they are the most numerous and important,) govern themselves. They have to a great extent, the power of the purse; they lack only that of arms, (of little importance just now,) to have no other than a merely nominal connexion with the imperial government. As things stand, it would save much, in all but appearances, to declare all the colonies independent at once. A system local in power and effects, while imperial in form and name, can lead only to expectations on the part of the colonies which cannot be fulfilled, and embarrassments in foreign relations in which England and every colony, may suffer seriously for the uncontrollable fault of one. That the system must be changed is evident,—or will England be content to pay for the defence of the colonies, when, as ten years hence, they may number twelve or fifteen millions of souls?

So much of our system as is central, if quite adequate to make the colonists feel the yoke, is evidently insufficient for its just duty. It is not strong enough to govern the colonies for im-

perial purposes; it is not locally influential and well informed enough to decide with acceptance on colonial questions. With British prepossessions, it can bring only knowledge and doctrine to its colonial resolves. If a colony were to choose to depart ever so widely from the principles of imperial legislation, or to adopt any course sacrificing the advantages which the central state has a right to expect from the connexion, there is no power short of parliament which can advise with effect; and parliament, except in matters of local British interest, will not stir for less than political earthquakes. Downing-street, when acting alone, is little more than the titular centre of a weak and embarrassing association, or the incompetent and ever vexing director of interests it can never thoroughly comprehend. Nor is the imperial headship sufficiently adapted to its purpose, when to Downing-street we add parliament. Much, both for good and ill, is done respecting the colonies which, being in detail, cannot come before parliament at all; but which may lay up an ever increasing store of adverse consequences. A few greater, or perhaps only more pungent questions, force indeed their way to our senate, as, for instance, a New Zealand constitution, or the trickery of a New Zealand company, a Caffre war, Australian gold finding, or Cape Town resistance to our system of transportation; but, even in respect of these, it is only a small share of the attention of 654 gentlemen, and 450 or 460 lords, who have much else of all sorts to do, that can be devoted to them; and that little runs many risks of not being devoted to them at all. Next to Indian questions, none are so unwelcome to parliament as those which affect the colonies.

It is not in a few great embarrassments which parliament will take up, that the danger lies; but in that ever coming business of common interests and administration, which, if not adjusted as it occurs, in accordance with the universal feeling of right, sets up a chronic disturbance in many minds of which the greater political occasions are only the crises. It is true, we are most struck with the cure of a raging evil, or the surrender or settlement of some great dispute; but it is much more in the noiseless rectifications and *prévoiant* order of current affairs, that the real value of government is to be found. Our head or limbs remind us of their existence only when disordered, and not during the happy play of activity and health: so also a government is best fulfilling its functions when we forget its powers in the established

enjoyments of its results: the great occasions of its being remembered are for the most part the marks and consequences of its own errors. Parliament it is true, deals with the crises of our colonial affairs when their imminence can no longer be ignored; but it did nothing, either by healthful reaction against the disease or by alterative treatment of it, to prevent the separation of the American colonies, or to avert the rebellion of Canada; nor will it probably supply, although it may adopt, the remedy for the ills of Australia or the Cape. Parliament, except as a sovereign arbiter, seldom to be called on, is a most unfitting instrument of colonial government.

The colonies have their full reason for complaint as well as England. We have already shown that they are subjected to a rule which is necessarily meddlesome without being efficient, and intimate without being well informed. Met with a semi-alien treatment in the offices of the imperial government, they are called on for a full obedience; and when they complain of removable ills, flowing from imperial determinations, they find they have no hearing except through importunity within the walls where reform awakens its latest echoes, or by favour of some painstaking patriot who speaks for them, by favour, where a thousand voices are struggling for equal audience. Disheartened, if not disgusted, they remember they once were Englishmen, and they fear to believe the time must come when they can be Englishmen no more. The constitution, slowly expanding to the necessities of successive ages, has not yet opened widely enough to receive them, and the solemn question now waiting for solution is,—will it receive them before they must otherwise retire?

But what is the occasion of these complaints?—complaints equally urgent, equally reasonable, and equally without necessary foundation on both sides? The British people have no lack of right national fraternity towards their brethren of the colonies. Parliament is not hostile or even cold; it is only over-occupied in its attention and forestalled in its feelings. Even the Colonial Office has no ill-will in the matter, nor is it for a moment to be suspected of corruption; its most sluggish or most opinated inmates have no worse faults than ordinarily come of the very nature of office, and of long exposure to its influences, where open debate does not continually modify them. Nay, the faults of Downing-street are not such as are exclusively derived from office; they are common to all cases of long continuance in one pent-

up occupation, be it of what kind it may,—not inherent, but accidental and remediable, though potent present causes of estrangement. On the other hand, the colonists of British descent have not lost their love of fatherland. Our constitutional and traditional glories still glow in their thoughts as their own inheritance; our intellectual and moral progress they still delight to share. To call them anything but Britons they deem a libel, and to the same appellation, men of every descent and every hue associated with them, unanimously aspire. What then, in the absence of every symptom, and certainly of every necessary cause of real alienation of feeling, is the occasion of these patent and continually repeated complaints?

The chief occasion we believe to be the absence of a constitutional arrangement for the public discussion in England of colonial questions, under which, like British questions in the British parliament, they can be opened and debated *as of right*. The want of such an arena of discussion is in fact that one defect which essentially vitiates all anti-popular systems of government; and the defect in our own government, in respect of colonial affairs, in their imperial sense, is as real, if not as great, as in those of Russia, Austria, or Turkey, as to every branch of their administration. It may be said, indeed, that the colonies have local legislatures, and that they can resort to parliament. But their local legislatures, however liberal the constitutions under which they exist, are necessarily confined in their powers to local subjects, and are essentially incompetent to deal with the matters external to each colony, or relating to the whole, which threaten the coherency of the body; while to the British parliament the colonists have no such access as will ensure their interests being debated at their time, or their interests represented in their spirit, or with their earnestness and information. It is true, the press is open to them; but the press, like parliament, is subject to a thousand other influences, and encumbered with a thousand other objects: it will admit or exclude colonial or other matters of debate, only as the temper and occupation of the public mind will permit. The quiet but constant pursuance of right, in the spirit of conciliating hope, is evidently not yet provided for in respect of colonial affairs, and can hardly be provided for by any means short of an assembly specially dedicated to them.

We may well believe that such an assembly would effectually remedy colonial discontents, while it filled up an important de-

fect in our own system. The constitutional student has long known that the dissatisfactions and active disorders of our own country have diminished, under equal provocation, just in proportion as the intelligent power and legal right of discussion have been extended. Nor, in the somewhat less important matter of administrative facility, can we fail to observe, with regret, that more than one opening might have led to a settlement of the American contest, without separation or even collision, had a platform existed on which the parties could have met for discussion, *as of right*.

To place representatives of the colonies in the House of Commons, besides being open to objection on British grounds, presents small chance of supplying colonial wants. That body would be as little at leisure, and as little able, then as now, to discuss colonial questions in their requisite variety and detail: nor, for the most part, could representatives of the colonies be more than so many additional spectators of the multifarious struggles on local and often on little matters which now so much engross the time and weary the attention of the legislature. Besides,—a central and supreme authority is wanting, competent to deal finally with general interests and inter-colonial questions, under enlightenment derived from the debates and resolutions of a colonial house, but in a spirit uninfluenced by local feelings, and guided by the richer experience of an older country: and for this purpose, which on great occasions it would well fulfil in the interest of all, it would be necessary to reserve the overruling power of the British parliament.

Such a colonial representative body, however, to be admitted safely into our system, needs to be restricted in its functions to discussion and advice. The necessity of preserving unity in the central authority, the impossibility of admitting a colonial veto on matters of domestic British legislation, the difficulty of separating in all cases between British and imperial subjects, and the danger arising from further increasing the bulk and complexity of our machinery of decree, render it obvious that to give another house a share in the actual power of legislation, would be fraught with risks too great to permit the attempt to be made. But these difficulties disappear, for the most part if not entirely, when the power of the colonial house is limited, as proposed, to the free public discussion of all subjects, and the recording of its views.

Subject to this limitation, however, every proceeding of the British government, and every proposed enactment of the British

parliament, relating to the colonies, together with every act, whether of the legislature or executive of every colony, would be liable to examination. Errors of policy, abuses, extravagance, oppression, failure of duty, or need of improved laws, wherever existing in connexion with colonial interests, would meet with independent denunciation, inquiry, or advocacy, in such an assembly, as well as by that general concurrence in them which could not fail to flow from the investigation of them with all the helps attainable at the central seat of intelligence and of empire, and from habits of concerted action on their basis.

The objection most likely to be made is that such an assembly, being only advisory, will be neglected, insignificant, and therefore inefficient. This, however, is far from having been the result in other instances. Our parliament itself was originally only advisory, as is testified by the form of its enactments still preserved, and by the incidents of its early and middle history. The substantial enacting power has passed, by a very slow transition, from the king to the parliament, and is now as slowly passing chiefly into the hands of that house which was originally far the weakest, the Commons. Our public meetings and our press are only advisory; but the boldest minister shrinks from disregarding them. A council of war is only advisory; but a commander, when once he has consulted it, is under a double necessity of being able to justify any course opposed to its opinion. The councils of our Indian government are in strictness only advisory; but scarcely, for that, less powerful when actually consulted. It would be easy to multiply parallels, political and other. Where no disparagement is implied in the absence of power, and no responsibility for consequences exists if advice given be not followed, men in general are quite willing to fill a position which confers influence, although not accompanied by the actual right to command.

The employment of an advisory assembly has this safety and advantage—the strength of such a body must generally be in proportion to its wisdom and prudence. A despot, although a fool, inspires awe, and therefore obedience, by the magnitude of the immediate consequences of his acts, whatever their folly; but an adviser can earn respect, and therefore power, only by the value of his advice; and an adviser with continued existence, like our House of Commons, gains slowly, in time, the substantial power which it could not at first have wielded to any good purpose, and which would on no terms have ever been directly given to it.

If it prove itself not worthy of this success it sinks, and probably expires. A foolish colonial house could effect no greater harm than a little inconvenience; a wise one would become a second right arm of the empire.

It is true that a merely advisory assembly does not fill up the established formula of constitutionalism: it may, nevertheless, be an institution of great practical value. Liberties are not established by formulæ, although formulæ do good service in their own way. A deliberative assembly of representatives under a constitution commonly fulfils three functions,—it discusses, it counts heads on either side of a question, and it decrees. Of these three functions, an advisory assembly fulfils two; and the remaining one, the power of decree, in whatsoever hands it may be actually lodged, always follows the right exercise of the other two. Even a single reformer, still more an assembly, is amply armed if only he have full liberty and sufficient facilities of discussion.

The colonies represented for imperial purposes in only an advisory assembly, would however have a long noviciate before them. This collective agency exercised in public, it is true, would be from the first a safeguard against gross injustice or neglect, and, so far, a valuable addition to their present apparatus of right; but the colonial mind could only acquire its proportionate weight in the general councils of the empire as time should show its value. Growth would be pre-eminently the principle of such an institution; and the colonies would doubtless be content with the present advantages and attainable influence it would be capable of affording them.

This proposal involves no change different in principle from the several extensions by which our constitution has adapted itself to the growth of our interests. When our commonalty became too important to be overridden by kings and nobles, they were called into council by the institution or enlargement of the House of Commons. When the growing intelligence of the people required it, the full publication of parliamentary proceedings, and the right to discuss them, were conceded. When the colonies grew too extensive to be a part of the charge of one secretary of state, another was appointed to that especial duty. And so on. Change, far from unknown to us, is at least exempt from the charge of novelty or rashness, when it proceeds on principles already tried. A colonial assembly in London, advising the supreme central powers, would be little more than a

revised copy, for modern use, of the rudimentary parliament which supplied the basis of our present legislature. The parallel holds further. Looking forward to the period when the colonies will contain a serious proportion of the whole British population, the alternative is evidently that of suffering them to abandon us one by one, or to admit them, as the people were admitted in the middle ages, to a modified voice in the general councils of the empire.

England may now safely venture on such a measure. We have renounced for ourselves all presumed artificial advantages, and have adopted a policy of simple and equal justice; and although we may have yet but inadequately carried that policy into effect, we have at least rid ourselves of the turmoil and danger attending the complicated bickerings of insatiable factitious interests. In proportion as we approximate to making impartial right the simple standard of our policy, may we admit all parties to counsels which can only have for their object the details by which a purpose so universally and permanently to be approved may be accomplished. Differences there will be; but the great causes of dangerous dissension hitherto revealed by experience our present principles have abolished, or may soon abolish; and we may even now establish a confederation greater, more pacific, and safer at once to those with and without it, than the state of the world has ever before permitted.

The first step towards the establishment of such a confederation is, the indication of the general principles which are to form its bond of similarity and interest, and for the maintenance of which the confederation itself is to exist. A positive definition of the powers and duties of government, *and of their limits*, would doubtless be the natural and most successful basis of such a union; but no such definition yet exists, or at least is sufficiently admitted. We are still defining the powers of government exceptively; cutting off from the ill-understood range and area of government action, those parts in which we find that action to be injurious. The positive, primary, and as we should say *only*, duties of government, are indeed recognised universally to be of such urgency as to obtain admission into every system. If we are not much in error, the exceptive process will continue, until it has cut down the action of government to its positive and primary duties.

Meanwhile the following seem to be the principles which at the present time form the British platform, as distinguished from that of any other country or federation.

Included with them are doubtless some common at once to our system and to some others the nearest in character to our own, but which are required here to define the platform as against different principles in another direction.

1. Fixity of law, and uniformity of its application to all British subjects alike, of whatever colour, race, or religion, and to all foreigners, as to all British subjects, with only the differences required by their different allegiance.

2. Separation of the judicial from other functions, trial by jury, and the independence and inviolability of judges and juries.

3. The right of personal liberty equally secured to all by habeas corpus, without distinction of religion, race, or colour.

4. Subordination of the military to the civil power.

5. Freedom of discussion by printing, writing, and spoken words.

6. Publicity of legislation, justice, taxation, and government accounts, under whatever forms these may be locally effected or administered.

7. Freedom of enterprise, commerce and locomotion, exempt from protective or discriminative duties.

8. Religious equality as to civil rights, eligibilities, privileges, and liabilities of law, together with exemption, in all colonies, from compulsory payments for religious purposes.

9. Permanence and equality of the rights of all British subjects in every part of the empire alike, subject to the local laws.

We have not included representative government amongst the above, for two reasons; 1st, because in fact it is not so much a principle involving immediate practical consequences of government, as a security for the maintenance of accepted principles; and 2ndly, because in some cases, as in that of a young and small colony, or of a non-British community desiring admittance into the confederation, it might not be practicable at first to carry this condition into effect. Under the influence of free discussion, fostered by incorporation into a free political body, and secured by the other principles of the platform, no colony capable of using representative government could fail to obtain it.

The principles just stated carry with them security for all other advance. Time will doubtless evolve other objects as conditions of federation, just as we have gradually established these. Of late years, fresh and striking instances have occurred in the prominence given to religious and commercial freedom. The gradual incorporation of new

principles into the public sentiment, will ensure to them due rank in the considerations which affect the proceedings of the general body and of its permanent head, the central British nation, by the same process that has given fixity and strength to the several principles on which our constitutional liberties at home now depend. We may now proceed to suggest, approximatively, the practical arrangements required.

1. The local constitution of each colony, and its relative position to the imperial government, to be left on their present footing, subject always to such improvements as may be made under the ordinary operation of the new arrangements.

2. An assembly, or colonial house, to sit in London, composed of representatives from every colony, (chosen by their representative assemblies, where such exist,) together with the colonial secretary of state, two under-secretaries, and such other persons, not exceeding one-fifth of the entire body, as her Majesty may appoint. This assembly to be entitled to discuss all colonial subjects, and particularly those which follow, viz. :—

All acts of colonial legislature, and legislative acts of colonial governors, more particular, but not exclusively, during the period reserved for imperial disallowance;

All matters of taxation and expenditure in any and every colony;

All Bills in the British parliament affecting colonial interests, at some certain stage or stages of their progress;

All acts of the executive and judicial authorities in the colonies, in the same manner as acts of the like kind affecting Britain may be discussed in the imperial parliament;

And all motions on colonial affairs made by members, in like manner as on British affairs in the British parliament.

The resolutions of the assembly to be communicated to the Queen's ministers, or to either house of parliament, as the case may be, but to have no other than a declaratory or advisory effect.

3. Supreme authority to reside in the crown and legislature of Great Britain, in all matters requisite for maintaining both the general constitutional law of England and "the platform," where a local legislature or government may have neglected or violated either of them: this authority not to be exercised in respect of legislative acts until after the erring colony has been called

on to discuss the matter complained of in the assembly.

4. Inter-colonial differences, when matters of fact or law, to be adjudicated conclusively by the British tribunals in England, in the same manner as suits or actions between parties; other matters of difference to be determined by parliament or her Majesty's ministers, as the nature of the case may require.

5. Six months residence in any colony to entitle any British subject to local, political, and municipal rights of every kind, in as full a manner as they are enjoyed by the other inhabitants.

6. The chief judicial functionaries to be appointed directly by the crown. Legal processes and adjudications in one colony, not repugnant to the general law of the empire, and certified and approved by sufficient authority in the colony whence they issue, to have effect in every other colony, in manner according to the local law where effect is prayed. Legal practitioners qualified in England, or in any colony, to be eligible in all.

7. Each colony to maintain troops in such proportion to the general force of the empire, as shall be determined by parliament from time to time, after discussion in the assembly. Part of the troops of each colony to be for local, part for general service; each colony to have the right of raising and officering its troops from its own population, so that they be raised, but subject to general regulations for efficiency: the local troops to be embodied under local mutiny acts and regulations, those for general service under the general Mutiny Act of the empire. The officers to be commissioned by the local executive representative of the Queen's government, and those for general service to bear also brevet Queen's commissions of the same rank. The whole to be under the authority of the British commander-in-chief, so as to form one imperial force. The troops for general service to circulate through the empire as British troops, as far as climate and other necessary limitations will permit. Each colony to maintain a naval force also, under regulations analogous to those just described for the army. The troops and ships of each colony to bear the British flag, with a distinguishing device for each on its field.

8. External relations for the whole, and for each part of the confederation, to be under the control of the crown.

9. Where a colony abuts on other territory, its limits, within which the principles are to be kept and the imperial obligations

to run, to be defined, and, if needful, altered from time to time by the Queen in council; and all acts done beyond those limits, to be at the risk of the persons engaged in them.

9. Attack on any point within the defined limits of the empire, to be resisted with the whole force of the empire; and wrong done to any British subject, whether within or without the limits, to be treated in an imperial sense.

10. A colony adjudicated in England to have unjustly offended a foreign power or tribe, to bear the cost of reparation from its own resources, but to be defended from attack except it resist or evade the award.

11. All colonies now under the authority of the British crown to be admitted to the confederation on their sending representatives to a meeting of the assembly convened by her Majesty for a certain day: all who do not send representatives to be liable to severance from the empire, at any time when the imperial authorities shall so determine. In future, communities of British origin or descent, free from other allegiance, to be admitted into the confederation by act of parliament, after declaration of willingness and proof of competency to keep the principles.

12. A colony contumacious after being admitted, to be liable either to coercion, or to expulsion and annulling of its allegiance, as may be determined in the case.

13. Any colony to be at liberty to withdraw on fulfilling all obligations to the British crown, and public obligations to British subjects, up to the date of withdrawal.

These arrangements are suggested merely with the view of showing that no insuperable impracticability exists to defeat the design; the object with which any such are devised must necessarily be to render the empire one in spirit and action, to hold it together only by the conviction of each of its parts of the benefit of the connexion, and, therefore, to combine the necessary unity of imperial counsel and action with the fullest means of discussion and content.

We wish India could be included; we apprehend, however, that there are difficulties enough to prevent it. The case of India is generally misapprehended: it is not so much one of abnormal sociology as one of stunting, stereotyping, mummifying, at an early period of growth: hence, alone, its perplexing strangeness to us. Nevertheless, this very state of the case prevents India at present from being capable of keeping "the platform." And then, its magnitude renders it almost impracticable to influence it sufficiently by any mere teaching or example that can be bestowed

on it, so as to fit it at present for association with our colonies. Nor could its vast interests be rightly discussed in an assembly devoted to colonial affairs. For a beginning, indeed, its presidential cities might have seats in the colonial house until other plans became practicable; but it needs a like representative house of its own, and is well worthy of it.

One point remains;—is it practicable to incorporate with the British empire, on the footing of colonies, tribes of non-British descent and organization? We hopefully believe it is. We entertain, indeed, the conviction, more earnestly than it is commonly held, that the laws and government of every country are always the reflex, moral and intellectual, of its people; and, by the aid of this principle, we conclude that most untrained and unlettered communities would be found incapable of keeping “the platform.” But some who are now struggling against ignorance and adverse circumstances, might, if aided and encouraged, succeed in the attempt; and their success would be the true test of fitness for entering the confederation. It might require in most cases a period of assistance and probation,—in all a period of inquiry; but the vast amount of good so expansive a principle would accomplish, if it could be made practically effective, would justify not a little both of hope and outlay, before the attempt to bring it into action was abandoned. The particular form of the internal constitution of the candidate community need scarcely be an obstruction: for even, in the extreme case of its being a kingdom, a local and subordinate allegiance to a local king is not necessarily incompatible with a supreme allegiance to the British crown, so long as the connexion continues, as the subinfeudations of the middle ages, if we have need of precedents, sufficiently show. Each of these cases however, would require careful consideration on its own merits, and probably a special adaptation of the administrative terms to suit its circumstances. The employment of British advisory commissioners during the period of probation, and perhaps in most cases afterwards, at the request of the native authorities, might prove necessary and sufficient for enabling a willing community, anxious to escape from barbarism, to qualify itself to take and retain a place in our system.

We shall venture, then, romantic as it may seem, to add another to the thirteen foregoing articles of administration, as follows:—

14. Communities of foreign descent to be eligible to admission on terms to be set-

led by parliament in each several case, the general object being security for keeping the principles, and the means ordinarily being the employment by the native authorities, and for their aid, under the direction of the British government, of advisory British commissioners. Continuance in the confederation to be dependent on continued conformity to its principles. Subordinate allegiance to a local king to be held not incompatible with supreme allegiance to the British crown, so long as the colonial relation subsists.

Let us now imagine our colonies so confederated, and the government of India placed on a similar basis. What would be the results? 1st, we apprehend, the admitted evils of our colonial government, with its causes, would be stated, discussed, and remedied. 2nd, The means would be in constant operation of maintaining satisfaction, confidence, and internal quiet in the government, through the constant adoption, in detail, of needful improvements and reforms. 3rd, Taking Great Britain, the colonies, and India together,—140 millions of souls at least,—one-sixth of the earth’s population, would be held in perpetual peace amongst themselves, with an efficient apparatus of arbitration provided against every contingency,—the nearest approach which yet seems practicable to a general abolition of war. 4th, A confederation so varied and extensive in its interests, and presenting so many points at which it might be made to suffer, would be under the strongest inducements to keep the peace towards others, while the overwhelming force at its command would render it extremely unlikely that others should wantonly or hastily attack it. 5th, Indefinite extension might be given to the empire of Britain, without dangerous weakness at the circumference, or overpowering burdens at the centre. 6th, The most advanced and most successful principles of government the world has yet seen might be carried into practice by many communities of our own race, placed so as to influence beneficially by their example the largest populations of the world not included in the confederation. 7th, Through communities less advanced than our own, the direct action of the same principles might be gradually extended far beyond our own power of colonization. 8th, Free and unimpeded intercourse would be established and secured from legal infringement between countries of every climate and every variety of product, under one general system of law, and by right of one pervading citizenship. 9th, A feeling of fraternity, no less than a consciousness of com-

munity of material interests, seems to be the sentiment to animate spontaneously a confederacy whose only object would be to secure impartially the freedom and the rights of all.

Few of our readers would blame us for indulging in the luxury of such anticipations, even if they believed them to be of no stronger stuff than a day-dream. But has not the question, even in its philanthropy, a rational and sober side? Surely the earth is not doomed to everlasting discord! But how is it to be raised and purified? Never did a country hold, in relation to the rest of the world, the position now held by England. It is not a eulogium on ourselves, but a tribute to the influences which have operated upon us, to say that, with all our faults, never was power so extensive held with so strong a disposition to use it beneficially. We are placed by parts, in every region, and at opposite ends of the earth, dispersed yet closely knit, with highly diversified conditions and pursuits, yet of one mind and tradition. Every tribe we touch admits our superiority, and looks to us either in the conscious fear of weakness, or with the brightening hope of participating in our elevation. Have we this high station for nothing? Or shall we not rather hope that some such use of our powers as the federalization of the British colonies, on principles sanctioned by our own constitutional history and experience, may prove one of the means of fulfilling the high purposes for which our pre-eminence has been given to us?

Of the two books whose titles are placed at the head of this article, one is a history of the struggles, vicissitudes, endurances, errors, revenges, and progress of our American colonies from their earliest days; the other is one of the latest expositions of our now elaborated system of colonisation. The former is a full and impartial repository of facts, neither unfaithful to the true glory of the American patriots and their predecessors, nor yet to the higher interests of truth. The latter is a valuable collection of recent documents, which presents a view of emigration and immigration not only in respect of Great Britain, but of all the colonies, together with interesting notices of Chinese, native Australian, and other labourers. The contrasted state of facts exhibited by these two books, and the details with which each is filled, supply the liveliest illustrations of the principles on which the foregoing discussion has proceeded; and while we can warmly recommend Mr. Hildreth's book for its own

merits, we feel additional interest in it as a clear, copious, and faithful narrative of a career eminently fitted to suggest to us the evils which beset, and caused the loss of, our former colonial empire, and the measures requisite to the preservation of the wider and more important dominion by which it has been replaced.

---

#### ART. V.—THE PHILOSOPHY OF STYLE.

1. *Elements of Rhetoric.* By Richard Whately, D. D., Archbishop of Dublin. John W. Parker.
2. *Lectures on Rhetoric and Belles Lettres.* By Hugh Blair, D. D.
3. *The Philosophy of Rhetoric.* By George Campbell, D. D.
4. *Elements of Rhetoric.* By Lord Kaimes.

COMMENTING on the seeming incongruity between his father's argumentative powers and his ignorance of formal logic, Tristram Shandy says:—"It was a matter of just wonder with my worthy tutor, and two or three fellows of that learned society, that a man who knew not so much as the names of his tools, should be able to work after that fashion with them." Sterne's intended implication that a knowledge of the principles of reasoning neither makes, nor is essential to, a good reasoner, is doubtless true. Thus, too, is it with grammar. As Dr. Latham, condemning the usual school-drill in Lindley Murray, rightly remarks:—"Gross vulgarity is a fault to be prevented; but the proper prevention is to be got from habit—not rules." Similarly there can be little question that good composition is far less dependent upon acquaintance with its laws, than upon practice and natural aptitude. A clear head, a quick imagination, and a sensitive ear will go far towards making all rhetorical precepts needless. He who daily hears and reads well-framed sentences, will naturally more or less tend to use similar ones. And where there exists any mental idiosyncrasy—where there is a deficient verbal memory, or but little perception of order, or a lack of constructive ingenuity—no amount of instruction will remedy the defect. Nevertheless, some practical result may be expected from a familiarity with the principles of style. The endeavour to conform to rules will tell, though slowly. And if in no other way, yet, as facilitating revision, a knowledge of the thing to be achieved—

a clear idea of what constitutes a beauty, and what a blemish—cannot fail to be of service.

No general theory of expression seems yet to have been enunciated. The maxims contained in works on composition and rhetoric are presented in an unorganised form. Standing as isolated dogmas—as empirical generalizations, they are neither so clearly apprehended, nor so much respected as they would be were they deduced from some simple first principle. We are told that “brevity is the soul of wit.” We hear styles condemned as verbose or involved. Blair says that every needless part of a sentence “interrupts the description and clogs the image;” and again, that “long sentences fatigue the reader’s attention.” It is remarked by Lord Kaimes, that “to give the utmost force to a period, it ought, if possible, to be closed with the word that makes the greatest figure.” That parentheses should be avoided, and that Saxon words should be used in preference to those of Latin origin, are established precepts. But, however influential the truths thus dogmatically embodied, they would be much more influential if reduced to something like scientific ordination. In this, as in other cases, conviction will be greatly strengthened when we understand the *why*. And we may be sure that a perception of the general principle of which the rules of composition are partial expressions, will not only bring them home to us with greater force, but will discover to us other rules of like origin.

On seeking for some clue to the law underlying these current maxims, we may see shadowed forth in many of them, the importance of economizing the reader’s or hearer’s attention. To so present ideas that they may be apprehended with the least possible mental effort, is the desideratum towards which most of the rules above quoted point. When we condemn writing that is wordy, or confused, or intricate—when we praise this style as easy, and blame that as fatiguing, we consciously or unconsciously assume this desideratum as our standard of judgment. Regarding language as an apparatus of symbols for the conveyance of thought, we may say that, as in a mechanical apparatus, the more simple and the better arranged its parts, the greater will be the effect produced. In either case, whatever force is absorbed by the machine is deducted from the result. A reader or listener has at each moment but a limited amount of mental power available. To recognize and interpret the symbols presented to him requires part of this power: to ar-

range and combine the images suggested requires a further part; and only that part which remains can be used for the realization of the thought conveyed. Hence the more time and attention it takes to receive and understand each sentence, the less time and attention can be given to the contained idea; and the less vividly will that idea be conceived. How truly language must be regarded as a hindrance to thought, though the necessary instrument of it, we shall clearly perceive on remembering the comparative force with which simple ideas are communicated by mimetic signs. To say “Leave the room,” is less expressive than to point to the door. Placing a finger on the lips is more forcible than whispering, “Do not speak.” A beck of the hand is better than “Come here.” No phrase can convey the idea of surprise so vividly as opening the eyes and raising the eyebrows. A shrug of the shoulders would lose much by translation into words. Again, it may be remarked that when oral language is employed, the strongest effects are produced by interjections, which condense entire sentences into syllables. And in other cases, where custom allows us to express thoughts by single words, as in *Beware*, *Heigho*, *Fudge*, much force would be lost by expanding them into specific verbal propositions. Hence, carrying out the metaphor that language is the vehicle of thought, there seems reason to think that in all cases the friction and inertia of the vehicle deduct from its efficiency; and that in composition the chief if not the sole thing to be done, is to reduce this friction and inertia to the smallest possible amount. Let us then inquire whether economy of the recipient’s attention is not the secret of effect, alike in the right choice and collocation of words, in the best arrangement of clauses in a sentence, in the proper order of its principal and subordinate propositions, in the judicious use of simile, metaphor, and other figures of speech, and even in the rhythmical sequence of syllables.

The superior forcibleness of Saxon English, or rather non-Latin English, first claims our attention. The several special reasons assignable for this may all be reduced to the general reason—economy. The most important of them is early association. A child’s vocabulary is almost wholly Saxon. He says, *I have*, not *I possess*—*I wish*, not *I desire*; he does not *reflect*, he *thinks*; he does not beg for *amusement*, but for *play*; he calls things *nice* or *nasty*, not *pleasant* or *disagreeable*. The synonyms which he learns in after years never becomes so closely, so organically connected with the ideas signi-

fied, as do these original words used in childhood; and hence the association remains less powerful. But in what does a powerful association between a word and an idea differ from a weak one? Simply in the greater ease and rapidity of the suggestive action. It can be in nothing else. Both of two words, if they be strictly synonymous, eventually call up the same image. The expression—it is *acid*, must in the end give rise to the same thought as—it is *sour*: but because the term *acid* was learnt later in life, and has not been so often followed by the thought symbolized, it does not so readily arouse that thought as the term *sour*; If we remember how slowly and with what labour the appropriate ideas follow unfamiliar words in another language, and how increasing familiarity with such words brings greater rapidity and ease of comprehension, until, from its having been a conscious effort to realize their meanings, their meanings ultimately come without any effort at all; and if we consider that the same process must have gone on with the words of our mother tongue from childhood upwards, we shall clearly see that the earliest learnt and oftenest used words, will, other things equal, call up images with less loss of time and energy than their later learnt synonyms.

The further superiority possessed by Saxon English in its comparative brevity obviously comes under the same generalization. If it be an advantage to express an idea in the smallest number of words, then will it be an advantage to express it in the smallest number of syllables. If circuitous phrases and needless expletives distract the attention and diminish the strength of the impression produced, then do surplus articulations do so. A certain effort, though commonly an inappreciable one, must be required to recognise every vowel and consonant. If, as we so commonly find, the mind soon becomes fatigued when we listen to an indistinct or far removed speaker, or when we read a badly written manuscript; and if, as we cannot doubt, the fatigue is a cumulative result of the attention required to catch successive syllables; it obviously follows that attention is in such cases absorbed by each syllable. And if this be true when the syllables are difficult of recognition, it will also be true, though in a less degree, when the recognition of them is easy. Hence, the shortness of Saxon words becomes a reason for their greater force, as involving a saving of the articulations to be received.

Again, that frequent cause of strength in Saxon and other primitive words—their imi-

tative character, may be similarly resolved into the more general cause. Both those directly imitative, as *splash, bang, whiz, roar, &c.*, and those analogically imitative, as *rough, smooth, keen, blunt, thin, hard, crag, &c.*, by presenting to the perceptions symbols having direct resemblance to the things to be imagined, or some kinship to them, save part of the effort needed to call up the intended ideas, and leave more attention for the ideas themselves.

The economy of the recipient's mental energy into which we thus find the several causes of the strength of Saxon English resolvable, may equally be traced in the superiority of specific over generic words. That concrete terms produce more vivid impressions than abstract ones, and should, when possible, be used instead, is a current maxim of composition. As Dr. Campbell says, "The more general the terms are, the picture is the fainter; the more special they are, the brighter." We should avoid such a sentence as:

— In proportion as the manners, customs, and amusements of a nation are cruel and barbarous, the regulations of their penal code will be severe.

And in place of it we should write:

— In proportion as men delight in battles, tournaments, bull-fights, and combats of gladiators, will they punish by hanging, beheading, burning, and the rack.

This superiority of specific expressions is clearly due to a saving of the effort required to translate words into thoughts. As we do not think in generals but in particulars—as, whenever any class of things is referred to, we represent it to ourselves by calling to mind individual members of it—it follows that when an abstract word is used, the hearer or reader has to choose from among his stock of images, one or more, by which he may figure to himself the genus mentioned. In doing this, some delay must arise—some force be expended; and if, by employing a specific term, an appropriate image can be at once suggested, an economy is achieved, and a more vivid impression produced.

Turning now from the choice of words to their sequence, we shall find the same general principle hold good. We have, *à priori*, reason for believing that there is usually some one order of words in a sentence more effective than every other, and that this order is the one which presents the elements of the proposition in the succession in which they may be most readily put together. As in a narrative, the events should be stated in such sequence that the mind may not have to go backwards and forwards

in order to rightly connect them; as in a group of sentences, the arrangement adopted should be such, that each of them may be understood as it comes, without waiting for subsequent ones; so in every sentence the sequence of words should be that which suggests the component parts of the thought conveyed, in the order most convenient for the building up that thought. To duly enforce this truth, and to prepare the way for applications of it, we must briefly inquire into the mental process by which the meaning of a series of words is apprehended.

We cannot more simply do this than by considering the proper collocation of the substantive and adjective. Is it better to place the adjective before the substantive, or the substantive before the adjective? Ought we to say with the French—*un cheval noir*; or to say as we do—a black horse? Probably, most persons of culture would decide that one is as good as the other. Alive to the bias produced by habit, they would ascribe to that the preference they feel for our own form of expression. They would suspect those educated in the use of the opposite form of having an equal preference for that. And thus they would conclude that neither of these instinctive judgments is of any worth. There is, however, a philosophical ground for deciding in favour of the English custom. If “a horse black” be the arrangement used, immediately on the utterance of the word “horse,” there arises, or tends to arise, in the mind, a picture answering to that word; and as there has been nothing to indicate what *kind* of horse, any image of a horse suggests itself. Very likely, however, the image will be that of a brown horse; brown horses being equally or more familiar. The result is that when the word “black” is added, a check is given to the process of thought. Either the picture of a brown horse already present in the imagination has to be suppressed, and the picture of a black one summoned in its place; or else, if the picture of a brown horse be yet unformed, the tendency to form it has to be stopped. Whichever be the case, a certain amount of hindrance results. But if, on the other hand, “a black horse” be the expression used, no such mistake can be made. The word “black” indicating an abstract quality arouses no definite idea. It simply prepares the mind for conceiving some object of that colour; and the attention is kept suspended until that object is known. If, then, by the precedence of the adjective, the idea is conveyed without the possibility of error, whereas the precedence of the sub-

stantive is liable to produce a misconception, it follows that the one gives the mind less trouble than the other, and is therefore more forcible.

Possibly it will be objected that the adjective and substantive come so close together, that practically they may be considered as uttered at the same moment; and that on hearing the phrase, “a horse black,” there is not time to imagine a wrongly coloured horse before the word “black” follows to prevent it. It must be owned that it is not easy to decide by introspection whether this be so or not. But there are facts collaterally implying that it is not. Our ability to anticipate the words yet unspoken is one of them. If the ideas of the hearer kept considerably behind the expressions of the speaker as the objection assumes, he could hardly foresee the end of a sentence by the time it was half delivered; yet this constantly happens. Were the supposition true, the mind, instead of anticipating, would be falling more and more in arrears. If the meanings of words are not realized as fast as the words are uttered, then the loss of time over each word must entail such an accumulation of delays as to leave a hearer entirely behind. But whether the force of these replies be, or be not admitted, it will scarcely be denied that the right formation of a picture will be facilitated by presenting its elements in the order in which they are wanted; and that, as in forming the image answering to—a red flower, the notion of redness is one of the components that must be used in the construction of the image, the mind, if put in possession of this notion before the specific image to be formed out of it is suggested, will more easily form it than if the order be reversed; even though it should do nothing until it has received both symbols.

What is here said respecting the succession of the adjective and substantive is obviously applicable, by change of terms, to the adverb and verb. And without further explanation, it will be at once perceived, that in the use of prepositions and other particles most languages spontaneously conform with more or less completeness to this law.

On applying a like analysis to the larger divisions of a sentence, we find not only that the same principle holds good, but that the advantage of respecting it becomes marked. In the arrangement of predicate and subject, for example, we are at once shown that as the predicate determines the aspect under which the subject is to be conceived, it should be placed first; and the striking effect produced by so placing it

becomes comprehensible. Take the often quoted contrast between—"Great is Diana of the Ephesians," and—Diana of the Ephesians is great. When the first arrangement is used the utterance of the word "great" arouses those vague associations of an impressive nature with which it has been habitually connected; the imagination is prepared to clothe with high attributes whatever follows; and when the words—"Diana of the Ephesians" are heard, all the appropriate imagery which can, on the instant, be summoned, is used in the formation of the picture: the mind being thus led directly, and without error, to the intended impression. When, on the contrary, the reverse order is followed, the idea—"Diana of the Ephesians," is conceived in any ordinary way, with no special reference to greatness; and when the words—"is great," are added, the conception has to be entirely remodelled—whence arises a manifest loss of mental energy, and a corresponding diminution of effect. The following verse from Coleridge's "Ancient Mariner," though somewhat irregular in structure, well illustrates the same truth.

"Alone, alone, all, all alone,  
Alone on a wide wide sea!  
And never a saint took pity on  
My soul in agony."

Of course the principle equally applies when the predicate is a verb or a participle. And as effect is gained by placing first all words indicating the quality, conduct, or condition of the subject, it follows that the copula should have precedence. It is true, that the general habit of our language resists this arrangement of predicate, copula, and subject; but we may readily find instances of the additional force gained by conforming to it. Thus in the line from "Julius Caesar"—

"Then burst this mighty heart:"

priority is given to a word embodying both predicate and copula. In a passage contained in "The Battle of Flodden Field," the like order is systematically employed with great effect.

"The Border alogan rent the sky!  
A Home! a Gordon! was the cry;  
Loud were the clanging blows;  
Advanced,—forced back,—now low, now high,  
The pennon sunk and rose;  
As bends the bark's mast in the gale  
When rent are rigging, shrouds, and sail,  
It wavered 'mid the foea."

Pursuing the principle yet further, it is

obvious that for producing the greatest effect, not only should the main divisions of a sentence observe this sequence, but the subdivisions of these should be similarly arranged. In nearly all cases, the predicate is accompanied by some limit or qualification called its complement; commonly, also, the circumstances of the subject, which form its complement, have to be specified: and as these qualifications and circumstances must determine the mode in which the ideas they belong to shall be conceived, precedence should be given to them. Lord Kaimes notices the fact, that this order is preferable; though without giving the reason. He says,—“When a circumstance is placed at the beginning of the period, or near the beginning, the transition from it to the principal subject is agreeable: is like ascending or going upward.” A sentence arranged in illustration of this may be desirable. Perhaps the following will serve.

—Whatever it may be in theory, it is clear that in practice the French idea of liberty is—the right of every man to be master of the rest.

In this case were the first two clauses up to the word "practice" inclusive, which qualify the subject, to be placed at the end instead of the beginning, much of the force would be lost; as thus:

—The French idea of liberty is—the right of every man to be master of the rest; in practice at least, if not in theory.

The effect of giving priority to the complement of the predicate, as well as the predicate itself, is finely displayed in the opening of "Hyperion."

"Deep in the shady sadness of a vale  
Far sunken from the healthy breath of morn  
Far from the fiery noon and eve's one star  
Sat grey-haired Saturn, quiet as a stone."

Here it will be observed, not only that the predicate "sat" precedes the subject "Saturn," and that the three lines in italics constituting the complement of the predicate, come before it, but that in the structure of that complement also, the same order is followed; each line being so arranged that the qualifying words are placed before the words suggesting concrete images.

The right succession of the principal and subordinate propositions in a sentence will manifestly be regulated by the same law. Regard for economy of the recipient's attention which, as we find, determines the best order for the subject, copula, predicate and their complements, dictates that the subordinate proposition shall precede the

principal one when the sentence includes two. Containing, as the subordinate proposition does, some qualifying or explanatory idea, its priority must clearly prevent misconception of the principal one; and must therefore save the mental effort needed to correct such misconception. This will be clearly seen in the annexed example:

—Those who weekly go to church, and there have doled out to them a quantum of belief which they have not energy to work out for themselves, are simply spiritual paupers.

The subordinate proposition, or rather the two subordinate propositions, contained between the first and second commas in this sentence, almost wholly determine the meaning of the principal proposition with which it ends; and the effect would be destroyed were they placed last instead of first.

The general principle of right arrangement in sentences which we have traced in its application to the leading divisions of them, equally determines the normal order of their minor divisions. The several clauses of which the complements to the subject and predicate generally consist, may conform more or less completely to the law of easy apprehension. Of course with these as with the larger members, the succession should be from the abstract to the concrete.

Now however we must notice a further condition to be fulfilled in the proper combination of the elements of a sentence; but still a condition dictated by the same general principle with the other; the condition, namely, that the words and expressions most nearly related in thought shall be brought the closest together. Evidently the single words, the minor clauses, and the leading divisions of every proposition, severally qualify each other. The longer the time that elapses between the mention of any qualifying member and the member qualified, the longer must the mind be exerted in carrying forward the qualifying member ready for use. And the more numerous the qualifications to be simultaneously remembered and rightly applied, the greater will be the mental power expended and the smaller the effect produced. Hence, other things equal, force will be gained by so arranging the members of a sentence that these suspensions shall at any moment be the fewest in number, and shall also be of the shortest duration. The following is an instance of defective combination.

— A modern newspaper-statement, though probably true, would be laughed at,

if quoted in a book as testimony; but the letter of a court-gossip is thought good historical evidence, if written some centuries ago.

A re-arrangement of this, in accordance with the principle indicated above, will be found to increase the effect. Thus:

— Though probably true, a modern newspaper-statement quoted in a book as testimony, would be laughed at; but the letter of a court-gossip, if written some centuries ago, is thought good historical evidence.

By making this change some of the suspensions are avoided and others shortened; whilst there is less liability to produce premature conceptions. The passage quoted below from "Paradise Lost" affords a fine instance of sentences well arranged, alike in the priority of the subordinate members, in the avoidance of long and numerous suspensions, and in the correspondence between the order of the clauses and the sequence of the phenomena described, which by the way is a further prerequisite to easy comprehension, and therefore to effect.

"As when a prowling wolf,  
Whom hunger drives to seek new haunt for prey,  
Watching where shepherds pen their flocks at eve  
In hurdled cotes amid the field secure,  
Leaps o'er the fence with ease into the fold:  
Or as a thief bent to unhoard the cash  
Of some rich burgher, whose substantial doors,  
Cross-barr'd, and bolted fast, fear no assault,  
In at the window climbs, or o'er the tiles:  
So clomb the first grand thief into God's fold;  
So since into his church lewd hirelings climb."

The habitual use of sentences in which all or most of the descriptive and limiting elements precede those described and limited, gives rise to what is called the inverted style; a title, which is, however, by no means confined to this structure, but is often used where the order of the words is simply unusual. A more appropriate title would be the *direct style*, as contrasted with the other, or *indirect style*—the peculiarity of the one being that it conveys each thought into the mind step by step with little liability to error, and of the other that it gets the right thought conceived by a series of approximations.

The superiority of the direct over the indirect form of sentence, implied by the several conclusions that have been drawn, must not, however, be affirmed without limitation. Though up to a certain point it is well for all the qualifying clauses of a period to precede those qualified, yet, as carrying forward each qualifying clause costs some mental effort, it follows that when the

number of them and the time they are carried become great, we reach a limit beyond which more is lost than is gained. Other things equal, the arrangement should be such that no concrete image shall be suggested until the materials out of which it is to be made have been presented. And yet, as lately pointed out, other things equal, the fewer the materials to be held at once, and the shorter the distance they have to be borne, the better. Hence in some cases it becomes a question whether most mental effort will be entailed by the many and long suspensions, or by the correction of successive misconceptions.

This question may sometimes be decided by considering the capacity of the persons addressed. A greater grasp of mind is required for the ready comprehension of thoughts expressed in the direct manner, where the sentences are anywise intricate. To recollect a number of preliminaries stated in elucidation of a coming image, and to apply them all to the formation of it when suggested, demands a considerable power of concentration and a tolerably vigorous imagination. To one possessing these, the direct method will mostly seem the best; whilst to one deficient in them it will seem the worst. Just as it may cost a strong man less effort to carry a hundred-weight from place to place at once, than by a stone at a time; so to an active mind it may be easier to bear along all the qualifications of an idea and at once rightly form it when named, than to first imperfectly conceive such an idea, and then carry back to it, one by one, the details and limitations afterwards mentioned. Whilst, conversely, as for a boy the only possible mode of transferring a hundred-weight, is that of taking it in portions; so for a weak mind the only possible mode of forming a compound conception may be that of building it up by carrying separately its several parts.

That the indirect method—the method of conveying the meaning by a series of approximations—is best fitted for the uncultivated, may indeed be inferred from their habitual use of it. The form of expression adopted by the savage as in “Water—give me,” is the simplest type of the approximative arrangement. In pleonasm, which are comparatively prevalent among the uneducated, the same essential structure is seen; as, for instance in—“The men, they were there.” Again, the old possessive case—“The king, his crown,” conforms to the like order of thought. Moreover, the fact that the indirect mode is called the natural one, implies that it is the one spontaneously employed by the common peo-

ple—that is, the one easiest for undisciplined minds.

Before dismissing this branch of our subject, it should be remarked that even when addressing the most vigorous intellects, the direct style is unfit for communicating thoughts of a complex or abstract character. So long as the mind has not much to do, it may be well able to grasp all the preparatory clauses of a sentence, and to use them effectively; but if some subtlety in the argument absorb the attention—if every faculty be strained in endeavoring to catch the speaker's or writer's drift, it may happen that the mind, unable to carry on both processes at once, will break down, and allow all its ideas to lapse into confusion.

Turning now to consider figures of speech, we may equally discern the same general law of effect. Underlying all the rules that may be given for the choice and right use of them, we shall find the same fundamental requirement—economy of attention. It is indeed chiefly because of their great ability to subserve this requirement, that figures of speech are employed. To bring the mind more easily to the desired conception, is in many cases solely, and in all cases mainly, their object.

Let us begin with the figure called *Synechdoche*. The advantage sometimes gained by putting a part for the whole is due to the more convenient, or more accurate, presentation of the idea thus secured. If, instead of saying “a fleet of ten ships,” we say “a fleet of ten *sails*,” the picture of a group of vessels at sea is more readily suggested; and is so because the sails constitute the most conspicuous part of vessels so circumstanced: whereas the word *ships* would very likely remind us of vessels in dock. Again, to say “All *hands* to the pumps” is better than to say, “All *men* to the pumps;” as it suggests the men in the special attitude intended, and so saves effort. Bringing “*grey hairs* with sorrow to the grave,” is another expression, the effect of which has the same cause.

The occasional increase of force produced by *Metonymy* may be similarly accounted for. “The low morality of *the bar*” is a phrase both briefer and more significant than the literal one it stands for. A belief in the ultimate supremacy of intelligence over brute force, is conveyed in a more concrete, and therefore more realizable form, if we substitute *the pen* and *the sword* for the two abstract terms. To say, “Beware of drinking!” is less effective than to say, “Beware *the bottle!*” and is so, clearly because it calls up a less specific image.

The *Simile*, though in many cases em-

ployed chiefly with a view to ornament, yet whenever it increases the *force* of a passage, does so by being an economy. Here is an instance.

— The illusion that great men and great events came oftener in early times than now, is partly due to historical perspective. As in a range of equidistant columns, the furthest off look the closest, so the conspicuous objects of the past seem more thickly clustered the more remote they are.

To construct, by a process of literal explanation the thought thus conveyed, would take many sentences; and the first elements of the picture would become faint whilst the imagination was busy in adding the others. But by the help of a comparison all effort is saved; the picture is instantly realized, and its full effect produced.

Of the position of the Simile,\* it needs only to remark, that what has been said respecting the order of the adjective and substantive, predicate and subject, principal and subordinate propositions, &c., is applicable here. As whatever qualifies should precede whatever is qualified, force will generally be gained by placing the simile before the object to which it is applied. That this arrangement is the best, may be seen in the following passage from the "Lady of the Lake:"—

"As wreath of snow, on mountain breast,  
Slides from the rock that gave it rest,  
Poor Ellen glided from her stay,  
And at the monarch's feet she lay."

Inverting these couplets will be found to diminish the effect considerably. There are cases, however, even where the simile is a simple one, in which it may with advantage be placed last; as in these lines from Alexander Smith's "Life Drama:"—

"I see the future stretch  
All dark and barren as a rainy sea."

The reason for this seems to be, that so abstract an idea as that attaching to the word "future," does not present itself to the mind in any definite form, and hence the subsequent arrival at the simile entails no reconstruction of the thought.

Nor are such the only cases in which this order is the most forcible. As the advantage of putting the simile before the object

\* Properly the term "simile" is applicable only to the entire figure, inclusive of the two things compared and the comparison drawn between them. But as there exists no name for the illustrative member of the figure, there seems no alternative but to employ "simile" to express this also. The context will in each case show in which sense the word is used.

depends on its being carried forward in the mind to assist in forming an image of the object, it must happen that if, from length or complexity, it cannot so be carried forward, the advantage is not gained. The annexed sonnet, by Coleridge, is defective from this cause.

"As when a child, on some long winter's night,  
Affrighted, clinging to its grandam's knees,  
With eager wond'ring and perturb'd delight  
Listens strange tales of fearful dark decrees,  
Mutter'd to wretch by necromantic spell;  
Or of those hags who at the witching time  
Of murky midnight, ride the air sublime  
And mingle foul embrace with fiends of hell;  
Cold horror drinks its blood! Anon the tear  
More gentle starts, to hear the beldame tell  
Of pretty babes, that loved each other dear,  
Murder'd by cruel uncle's mandate fell:  
Ev'n such the shiv'ring joys thy tones impart,  
Ev'n so, thou, Siddons, meltest my sad heart."

Here, from the lapse of time and accumulation of circumstances, the first part of the comparison becomes more or less dim before its application is reached, and requires re-reading. Had the main idea been first mentioned, less effort would have been required to retain it, and to modify the conception of it in conformity with the comparison, than to retain the comparison, and refer back to the recollection of its successive features for help in forming the final image.

The superiority of the Metaphor to the Simile is ascribed by Dr. Whately to the fact that "all men are more gratified at catching the resemblance for themselves, than in having it pointed out to them." But after what has been said, the great economy it achieves will seem the more probable cause. If, drawing an analogy between mental and physical phenomena, we say,

— As, in passing through the crystal, beams of white light are decomposed into the colours of the rainbow; so, in traversing the soul of the poet, the colourless rays of truth are transformed into brightly-tinted poetry;—

it is clear that in receiving the double set of words expressing the two portions of the comparison, and in carrying the one portion to the other, a considerable amount of attention is absorbed. Most of this is saved, however, by putting the comparison in a metaphorical form, thus:

— The white light of truth, in traversing the many-sided transparent soul of the poet, is refracted into iris-hued poetry.

How much is conveyed in a few words by the help of the Metaphor, and how vivid the effect consequently produced, may be

abundantly exemplified. From "A Life Drama" may be quoted the phrase

"I spear'd him with a jest,"

as a fine instance among the many which that poem contains. A passage in the "Prometheus Unbound," of Shelley, displays the power of the Metaphor to great advantage :

"Methought among the lawns together  
We wandered, underneath the young grey dawn,  
And multitudes of dense white fleecy clouds  
Were wandering in thick flocks along the moun-  
tains  
Shepherd'd by the slow unwilling wind."

This last expression is remarkable for the distinctness with which it realizes the features of the scene ; bringing the mind as it were, by a bound to the desired conception.

But a limit is put to the advantageous use of the Metaphor, by the condition that it must be sufficiently simple to be understood from a hint. Evidently, if there be any obscurity in the meaning or application of it, no economy of attention will be gained ; but rather the reverse. Hence, when the comparison is complex, it is usual to have recourse to the Simile. There is, however, a species of figure, sometimes classed under Allegory, but which might perhaps, be better called Compound Metaphor, that enable us to retain the brevity of the metaphorical form even where the analogy is intricate. This is done by indicating the application of the figure at the outset, and then leaving the mind to continue the parallel itself. Emerson has employed it with great effect in the first of his "Lectures on the Times":—

"The main interest which any aspects of the Times can have for us, is the great spirit which gazes through them, the light which they cast on the wonderful questions, What we are ? and Whither do we tend ? We do not wish to be deceived. Here we drift, like white sail across the wild ocean, now bright on the wave, now darkling in the trough of the sea ; but from what port did we sail ? Who knows ? Or to what port are we bound ? Who knows ? There is no one to tell us but such poor weather-tossed mariners as ourselves, whom we speak as we pass, or who have hoisted some signal, or floated to us some letter in a bottle from afar. But what know they more than we ? They also found themselves on this wondrous sea. No ; from the older sailors nothing. Over all their speaking-trumpets the gray sea and the loud winds answer—Not in us ; not in Time."

The division of the Simile from the Metaphor is by no means a definite one.

Between the one extreme in which the two elements of the comparison are detailed at full length and the analogy pointed out, and the other extreme in which the comparison is implied instead of stated, come intermediate forms, in which the comparison is partly stated and partly implied. For instance :

— Astonished at the performances of the English plough, the Hindoos paint it, set it up, and worship it ; thus turning a tool into an idol : linguists do the same with language.

There is an evident advantage in leaving the reader or hearer to complete the figure. And generally these intermediate forms are good in proportion as they do this ; provided the mode of completing it be obvious.

Passing over much that may be said of like purport upon Hyperbole, Personification, Apostrophe, &c., let us close our remarks upon construction by a typical example. The general principle that has been enunciated is, that the force of all verbal forms and arrangements is great in proportion as the time and mental effort they demand from the recipient is small. The special applications of this general principle have been severally illustrated ; and it has been shown that the relative goodness of any two modes of expressing an idea may be determined by observing which requires the shortest process of thought for its comprehension. But though conformity in particular points has been exemplified, no cases of complete conformity have yet been quoted. It is indeed difficult to find them ; for the English idiom scarcely permits the order which theory dictates. A few, however, occur in Ossian. Here is one :—

"As autumn's dark storms pour from two echoing hills, so towards each other approached the heroes As two dark streams from high rocks meet and mix, and roar on the plain ; loud, rough, and dark in battle meet Lochlin and Inisfail. \* \* \* As the troubled noise of the ocean when rolls the waves on high ; as the last peal of the thunder of heaven ; such is the noise of the battle."

Except in the position of the verb in the first two similes, the theoretically best arrangement is fully carried out in each of these sentences. The simile comes before the qualified image, the adjectives before the substantives, the predicate and copula before the subject, and their respective complements before them. That the passage is more or less open to the charge of being bombastic proves nothing ; or rather proves our case. For what is bombast but

a force of expression too great for the magnitude of the ideas embodied? All that may rightly be inferred, is, that only in very rare cases, and then only to produce a climax, should *all* the conditions of effective expression be fulfilled.

Passing on to a more complex application of the doctrine with which we set out, it must now be remarked, that not only in the structure of sentences, and the use of figures of speech, may economy of the recipient's mental energy be assigned as the cause of force, but that in the choice and arrangement of the minor images, out of which some large thought is to be built, we may trace the same condition of effect. To select from the sentiment, scene, or event described, those typical elements which carry many others along with them, and so by saying a few things but suggesting many, to abridge the description, is the secret of producing a vivid impression. Thus if we say:—Real nobility is "not transferable;" besides the one idea expressed several are implied; and as these can be thought much sooner than they can be put in words, there is gain in omitting them. How the mind may be led to construct a complete picture by the presentation of a few parts, an extract from Tennyson's "Mariana" will well show.

"All day within the dreamy house,  
The door upon the hinges creaked,  
The fly sung i' the pane; the mouse  
Behind the mouldering wainscot shrieked,  
Or from the crevice peered about."

The several circumstances here specified bring with them hosts of appropriate associations. Our attention is rarely drawn by the buzzing of a fly in the window, save when everything is still. Whilst the inmates are moving about the house, mice usually keep silence; and it is only when extreme quietness reigns that they peep from their retreats. Hence, each of the facts mentioned presupposing numerous others, calls up these with more or less distinctness, and revives the feeling of dull solitude with which they are connected in our experience. Were all these facts detailed instead of suggested, the attention would be so frittered away, that little impression of dreariness would be produced. And here, without further explanation, it will be seen that, be the nature of the sentiment conveyed what it may, this skilful selection of a few particulars which imply the rest, is the key to success. In the choice of component ideas, as in the choice of expressions, the aim must be to convey

the greatest quantity of thoughts with the smallest quantity of words.

Before inquiring whether the law of effect, thus far traced, will account for the superiority of poetry to prose, it will be needful to notice some supplementary causes of force in expression that have not yet been mentioned. These are not, properly speaking, additional causes, but rather secondary ones, originating from those already specified—reflex manifestations of them. In the first place, then, we may remark that mental excitement spontaneously prompts the use of those forms of speech which have been pointed out as the most effective. "Out with him!" "Away with him!" are the natural utterances of angry citizens at a disturbed meeting. A voyager, describing a terrible storm he had witnessed, would rise to some such climax as "Crack went the ropes, and down came the mast. Astonishment may be heard expressed in the phrase, "Never was there such a sight!" All which sentences are, it will be observed, constructed after the direct type. Again, every one will recognise the fact that excited persons are given to figures of speech. The vituperation of the vulgar abounds with them; often, indeed, consists of little else. "Beast," "brute," "gallows rogue," "cut-throat villain,"—these, and other like metaphors and metaphorical epithets, at once call to mind a street quarrel. Further, it may be remarked that extreme brevity is one of the characteristics of passionate language. The sentences are generally incomplete; the particles are omitted, and frequently important words are left to be gathered from the context. Great admiration does not vent itself in a precise proposition, as "It is beautiful," but in a simple exclamation, "Beautiful!" He who, when reading a lawyer's letter, should say, "Vile rascal!" would be thought angry; whilst "He is a vile rascal," would imply comparative coolness. Thus we see that alike in the order of the words, in the frequent use of figures, and in extreme conciseness, the natural utterances of excitement conform to the theoretical conditions of forcible expression.

Hence, then, the higher forms of speech acquire a secondary strength from association. Having, in actual life, habitually found them in connexion with vivid mental impressions; and having been accustomed to meet with them in the most powerful writing; they come to have in themselves a species of force. The emotions that have from time to time been produced by the strong thoughts wrapped up in these forms, are partially aroused by the forms themselves. They create a certain degree of

animation ; they induce a preparatory sympathy ; and when the striking ideas looked for are reached, they are the more vividly realized.

The continuous use of these modes of expression that are alike forcible in themselves and forcible from their associations, produces the peculiarly impressive species of composition which we call poetry. Poetry, we shall find, habitually adopts those symbols of thought, and those methods of using them, which instinct and analysis agree in choosing as most effective, and becomes poetry by virtue of doing this. On turning back to the various specimens that have been quoted, it will be seen that the direct or inverted form of sentence predominates in them, and that to a degree quite inadmissible in prose. And not only in the frequency, but in what is termed the violence of the inversions will this distinction be remarked. In the abundant use of figures, again, we may recognise the same truth. Metaphors, similes, hyperboles, and personifications, are the poet's colours, which he has liberty to employ almost without limit. We characterize as "poetical" the prose which repeats these appliances of language with any frequency ; and condemn it as "over florid" or "affected" long before they occur with the profusion allowed in verse. Further, let it be remarked that in brevity—the other requisite of forcible expression which theory points out, and emotion spontaneously fulfils—poetical phraseology similarly differs from ordinary phraseology. Imperfect periods are frequent, elisions are perpetual, and many of the minor words which would be deemed essential in prose are dispensed with.

Thus poetry, regarded as a vehicle of thought, is especially impressive partly because it obeys all the laws of effective speech, and partly because in so doing it imitates the natural utterances of excitement. Whilst the matter embodied is idealized emotion, the vehicle is the idealized language of emotion. As the musical composer catches the cadences in which our feelings of joy and sympathy, grief and despair, vent themselves, and out of these germs evolves melodies suggesting higher phases of these feelings ; so the poet develops from the typical expressions in which men utter passion and sentiment, those choice forms of verbal combination in which concentrated passion and sentiment may be fitly presented.

There is one peculiarity of poetry conducing much to its effect—the peculiarity which is indeed usually thought to be its cha-

racteristic one—still remaining to be considered: we mean its rhythmical structure. This, unexpected as it may be, will be found to come under the same generalization with the others. Like each of them, it is an idealization of the natural language of emotion, which is known to be more or less metrical if the emotion be not violent ; and like each of them it is an economy of the reader's or hearer's attention. In the peculiar tone and manner we adopt in uttering versified language may be discerned its relationship to the feelings ; and the pleasure which its measured movement gives us is ascribable to the comparative ease with which words metrically arranged can be recognised. This last position will scarcely be at once admitted ; but a little explanation will show its reasonableness. For if, as we have seen, there is an expenditure of mental energy in the mere act of listening to verbal articulations, or in that silent repetition of them which goes on in reading—if the perceptive faculties must be in active exercise to identify every syllable—then any mode of combining words so as to present a regular recurrence of certain traits which the mind can anticipate, will diminish that strain upon the attention required by the total irregularity of prose. In the same manner that the body, in receiving a series of varying concussions, must keep the muscles ready to meet the most violent of them, as not knowing when such may come ; so the mind in receiving unarranged articulations must keep its perceptive active enough to recognise the least easily caught sounds. And as, if the concussions recur in a definite order, the body may husband its forces by adjusting the resistance needful for each concussion ; so, if the syllables be rhythmically arranged, the mind may economize its energies by anticipating the attention required for each syllable. Far-fetched as this idea will perhaps be thought, a little introspection will countenance it. That we do take advantage of metrical language to adjust our perceptive faculties to the force of the expected articulations, is clear from the fact that we are balked by halting versification. Much as at the bottom of a flight of stairs, a step more or less than we counted upon gives us a shock, so, too, does a misplaced accent or a supernumerary syllable. In the one case, we know that there is an erroneous pre-adjustment ; and we can scarcely doubt that there is one in the other. But if we habitually pre-adjust our perceptions to the measured movement of verse, the physical analogy lately given renders it probable that by so doing we economize

attention; and hence that metrical language is more effective than prose, simply because it enables us to do this.

Were there space, it might be worth while to inquire whether the pleasure we take in rhyme, and also that which we take in euphony, are not partly ascribable to the same general cause.

A few paragraphs only can be devoted to a second division of our subject that here presents itself. To pursue in detail the laws of effect, as seen in the larger features of composition, would exceed both our limits and our purpose. But we may fitly indicate some further aspect of the general principle hitherto traced out, and hint a few of its wider applications.

Thus far, then, we have considered only those causes of force in language which depend upon economy of the mental *energies*: we have now briefly to glance at those which depend upon economy of mental *sensibilities*. Indefensible though this division may be as a psychological one, it will yet serve roughly to indicate the remaining field of investigation. It will suggest that besides considering the extent to which any faculty or group of faculties is tasked in receiving a form of words and realizing its contained idea, we have to consider the state in which this faculty or group of faculties is left; and how the reception of subsequent sentences and images will be influenced by that state. Without going at length into so wide a topic as the exercise of faculties and its reactive effects, it will be sufficient here to call to mind that every faculty (when in a state of normal activity) is most capable at the outset; and that the change in its condition, which end in what we term exhaustion, begins simultaneously with its exercise. This generalization, with which we are all familiar in our bodily experiences, and which our daily language recognizes as true of the mind as a whole, is equally true of the senses to the most complex of the sentiments. If we hold a flower to the nose for long, we become insensible to its scent. We say of a very brilliant flash of lightning that it blinds us; which means that our eyes have for a time lost their ability to appreciate light. After eating a quantity of honey, we are apt to think our tea is without sugar. The phrase, "a deafening roar," implies that men find a very loud sound temporarily incapacitates them for hearing faint ones. Now, the truth which we at once recognise in these, its extreme manifestations, may be traced throughout; and it may be shown that alike in the reflective faculties, in the imagination, in the perceptions of the beautiful, the ludicrous, the sublime, in the sentiments, the instincts, in all

the mental powers, however we may classify them—action exhausts; and that in proportion as the action is violent, the subsequent prostration is great.

Equally, throughout the whole nature, may be traced the law that exercised faculties are ever tending to resume their original state. Not only, after continued rest, do they regain their full power—not only do brief cessations partially reinvigorate them—but even whilst they are in action, the resulting exhaustion is ever being neutralized. The two processes of waste and repair go on together. Hence, with faculties habitually exercised as the senses in all, or the muscles in a labourer, it happens that, during moderate activity, the repair is so nearly equal to the waste, that the diminution of power is scarcely appreciable; and it is only when the activity has been long continued, or has been very violent, that the repair becomes so far in arrear of the waste as to produce a perceptible prostration. In all cases, however, when, by the action of a faculty, waste has been incurred, *some* lapse of time must take place before full efficiency can be re-acquired; and this time must be long in proportion as the waste has been great.

Keeping in mind these general truths, we shall be in a condition to understand certain causes of effect in composition now to be considered. Every perception received, and every conception realized, entailing some amount of waste—or, as Liebig would say, some change of matter in the brain—and the efficiency of the faculties subject to this waste being thereby temporarily, though often but momentarily, diminished—the resulting partial inability must affect the acts of perception and conception that immediately succeed. And hence we may expect that the vividness with which images are realized will, in many cases, depend on the order of their presentation; even when one order is as convenient to the understanding as the other. We shall find sundry facts which alike illustrate this, and are explained by it. Climax is one of them. The marked effect obtained by placing last the most striking of any series of images, and the weakness—often the ludicrous weakness—produced by reversing this arrangement, depends on the general law indicated. As immediately after looking at the sun we cannot perceive the light of a fire, whilst by looking at the fire first and the sun afterwards we can perceive both; so, after receiving a brilliant, or weighty, or terrible thought, we cannot appreciate a less brilliant, less weighty, or less terrible one, whilst, by reversing the order, we can appreciate each. In Antithesis, again, we may recognise the same general truth. The opposition of two

thoughts that are the reverse of each other in some prominent trait insures an impressive effect; and does this by giving a momentary relaxation to the faculties addressed. If, after a series of images of an ordinary character, appealing in a moderate degree to the sentiment of reverence, or approbation, or beauty, the mind has presented to it a very insignificant, a very unworthy, or a very ugly image—the faculty of reverence, or approbation, or beauty, as the case may be, having for the time nothing to do, tends to resume its full power; and will immediately afterwards appreciate a vast, admirable, or beautiful image better than it would otherwise do. Improbable as these momentary variations in susceptibility will seem to many, we cannot doubt their occurrence when we contemplate the analogous variations in the susceptibility of the senses. Referring once more to phenomena of vision, every one knows that a patch of black on a white ground looks blacker, and a patch of white on a black ground looks whiter, than elsewhere. As the blackness and the whiteness must really be the same, the only assignable cause for this is a difference in their action upon us, dependent on the different states of our faculties. It is simply a visual antithesis.

But this extension of the general principle of economy—this further condition of effect in composition, that the power of the faculties must be continuously husbanded—includes much more than has been yet hinted. It implies not only that certain arrangements and certain juxtapositions of connected ideas are best; but that some modes of dividing and presenting the subject will be more effective than others; and that, too, irrespective of its local cohesion. It shows why we must progress from the less interesting to the more interesting; and why not only the composition as a whole, but each of its successive portions, should tend towards a climax. At the same time, it forbids long continuity of the same species of thought, or repeated production of the same effects. It warns us against the error committed both by Pope in his poems and by Bacon in his essays—the error, namely, of constantly employing the most effective forms of expression; and it points out that as the easiest posture by and by becomes fatiguing, and is with pleasure exchanged for one less easy; so the most perfectly constructed sentences will soon weary, and relief will be given by using those of an inferior kind. Further, it involves that not only should we avoid generally combining our words in one manner, however good, or working out our figures and illustrations in

one way, however telling, but we should avoid anything like uniform adherence, even to the wider conditions of effect. We should not make every section of our subject progress in interest: we should not always rise to a climax. As we saw that, in single sentences, it is but rarely allowable to fulfil all the conditions of strength; so in the larger portions of composition we must not often conform entirely to the law indicated. We must subordinate the component effects to the total effect.

In deciding how practically to carry out the principles of artistic composition, we may derive help by bearing in mind a fact already pointed out—the fitness of certain verbal arrangements for certain kinds of thought. The constant variety in the mode of presenting ideas which the theory demands will in a great degree result from a skilful adaptation of the form to the matter. We saw how the direct or inverted sentence is spontaneously used by excited people; and how their language is also characterized by figures of speech and by extreme brevity. Hence these may with advantage predominate in emotional passages, and may increase as the emotion rises. On the other hand, for complex ideas, the indirect sentence seems the best vehicle. In conversation, the excitement produced by the near approach to a desired conclusion will often show itself in a series of short, sharp sentences; whilst, in impressing a view already enunciated, we generally make our periods voluminous by piling thought upon thought. These natural modes of procedure may serve as guides in writing. Keen observation and skilful analysis would, in like manner, detect many other peculiarities of expression produced by other attitudes of mind; and by paying due attention to all such traits, a writer possessed of sufficient versatility might make some approach to a completely organized work.

This species of composition which the law of effect points out as the perfect one, is the one which high genius tends naturally to produce. As we found that the kinds of sentence which are theoretically best are those generally employed by superior minds, and by inferior minds when excitement has raised them; so we shall find that the ideal form for a poem, essay, or fiction, is that which the ideal writer would evolve spontaneously. One in whom the powers of expression fully responded to the state of mind would unconsciously use that variety in the mode of presenting his thoughts which Art demands. This constant employment of one species of phraseology, which all have now to strive against, implies an undeveloped faculty of language. To have a specific

style is to be poor in speech. If we glance back at the past, and remember that men had once only nouns and verbs to convey their ideas with, and that from then to now the growth has been towards a greater number of implements of thought, and consequently towards a greater complexity and variety in their combinations, we may infer that we are now, in our use of sentences, much what the primitive man was in his use of words, and that a continuance of the process that has hitherto gone on must produce increasing heterogeneity in our modes of expression. As now in a fine nature the play of the features, the tones of the voice and its cadences, vary in harmony with every thought uttered; so in one possessed of a fully developed power of speech, the mould in which each combination of words is cast will similarly vary with, and be appropriate to, the sentiment. That a perfectly endowed man must unconsciously write in all styles, we may infer from considering how styles originate. Why is Addison diffuse, Johnson pompous, Goldsmith simple? Why is one author abrupt, another rhythmical, another concise? Evidently in each case the habitual mode of utterance must depend upon the habitual balance of the nature. The predominant feelings have by use trained the intellect to represent them. But whilst long, though unconscious, discipline has made it do this efficiently, it remains, from lack of practice, incapable of doing the same for the less powerful feelings; and when these are excited, the usual modes of expression undergo but a slight modification. Let the powers of speech be fully developed, however—let the ability of the intellect to convey the emotions be complete—and this fixity of style will disappear. The perfect writer will express himself as Junius, when in the Junius frame of mind; when he feels as Lamb felt, will use a like familiar speech; and will fall into the ruggedness of Carlyle when in a Carlylean mood. Now he will be rhythmical and now irregular; here his language will be plain and there ornate; sometimes his sentences will be balanced and at other times unsymmetrical; for a while there will be considerable sameness, and then again great variety. From his mode of expression naturally responding to his state of feeling, there will flow from his pen a composition changing to the same degree that the aspects of his subject change. He will thus without effort conform to what we have seen to be the laws of effect. And whilst his work presents to the reader that variety needful to prevent continuous exertion of the same faculties, it will also

answer to the description of all highly organized products both of man and of nature; it will be, not a series of like parts simply placed in juxtaposition, but one whole made up of unlike parts that are mutually dependent.

---

ART. VI.—THE POETRY OF THE ANTI-JACOBIN.

*Poetry of the Anti-Jacobin.* New and Revised Edition. Willis, Covent-garden.

THE quotation which at once rises to the lips of the educated Englishman who reads the above title, is the well-known remark in Selden's delightful "Table Talk," that "libels" are like "straws," which serve to show how "the wind is." But we hope that it is scarcely necessary to fortify ourselves with this respectable observation. The great literary reputation of the "Anti-Jacobin,"—the interest attaching to such well-known names as those of Canning, Frere, Gifford, Wellesley, will induce the reader, we willingly believe, to glance with us at their revised productions. Whatever has been famous in its day has some claims on posterity's curiosity. What were the real merits of those writings which a society calling itself cultivated, and having a wide range for comparison, agreed to consider of unparallel brilliance, and pronounced to be highly influential on public opinion? This is a kind of question which in an age of republication is constantly urging itself. And ours is an age of republication. We are continually summoned to discharge the duty which devolves, under the Mahometan dispensation, upon the two angels named *Monker* and *Nakir*. "When a corpse is laid in the grave," Sale tells us, "they say he is received by an angel, who gives him notice of the coming of the *examiners*; which are two black livid angels of a terrible appearance. . . . These order the dead person to sit upright, and examine him, &c."

We are called on repeatedly to come in this ferocious capacity, and put dead literary bodies to the question. For there are "clubs" which employ their whole corporate existence in providing us with the opportunity. Authors of every period of history do in these later times come out of their graves, and walk abroad, to the astonishment of the literary sentinel. We believe that the British Museum is arranged, and arranging itself, expressly so as to

accommodate the labours of "Dryasdust." And nothing can be more certain than that material of all sorts is accumulating—quite in over-proportion to the increase of that faculty which sees into the spirit and meaning of the said material for the benefit of the living, whom that, and that only, can in any way serve. We confess, we rather wonder that the contents of the book before us waited so long for an intelligent and admiring editor. But Mr. "Charles Edmonds" comes forward at last, duly apportioning to each writer his fragment of satire, impartially divides parodies among their proper creators, and is indeed the "Old Mortality" of Tory libellers. Mr. Edmonds has done what he undertook—which, as Mr. Jarndyce remarks, is of itself a decided merit. "Coavins" would sit on a post for his twelve hours, if he said he would; and all honour to the literary Coavinses whose merit is similar! It is only natural, and surely not to be harshly treated in any case, that Mr. Edmonds should participate in the editorial weakness of a too great admiration for the object of his labours. He is inclined to talk of such productions as the "Knife-grinder" and the "Loves of the Triangles," as one might expect to hear a young gentleman, with a manuscript in his hand on his way to Moxon, talk of Keats's "Hyperion" or of "Christabel." He has apparently no qualms in calling such productions "poetry." But when he makes a special point of asserting on behalf of Canning, as distinguished from other writers of satire, that he "knew how to respect the decencies of life," we are forced to ask him if he never heard of Canning's describing a political opponent as "the revered and ruptured Ogden?" and if he is not aware that Sydney Smith has especially described him as one "who spares nobody"? However, we have no wish to be harsh on the pious credulity of editors; only they would do well to be discreet in their laudations, and not manage to remind one so often of those Indians who torture their victims by smearing them with honey to bring down the wasps on them!

The "Anti-Jacobin's" reputation is certainly, as we said above, and as Mr. Edmonds is correct in believing, very considerable. And it is a reputation of a peculiar, highly respectable, English, and orthodox character. Very grave and decorous people—people who speak of "Punch" as a "facetious contemporary"—admire the "Anti-Jacobin." Priggish gentlemen, like the "Ranville Ranville" of "Mrs. Perkins's Ball," smirk pleasantly at the mention of it. Serious people class it among those instances in which the

"faculty of ridicule that has been conceded to us" has been "lawfully" used. Its quotations are bandied about the orthodox press, when a man of dangerous views is to be held up to proper contempt and ridicule. Now all this, and the fact that it was one of the "straws" (to recur to old Selden's saying) which served to show how the stormy winds of the French Revolution time blew, makes it well worthy of a notice in these pages. The treatment of it, and of the men and deeds which its name suggests, will naturally bring the period before us, and we shall be able to see, in some measure, how English ways of thinking have altered since the days when Coleridge and Southey were the butts of ridicule, and when Byron submitted his productions to the approval of Gifford.

Naturally enough, satirical literature is always referred to—and in all the stages of its development—when one wants to form a warm and vivid picture of the life of a people. Satire grows out of the natural humour of the popular heart. It makes its appearance in the very earliest ages of history; comes dancing out of the primeval woods with laughter, and crowned with wild flowers. You hear its laugh at the earliest festivals of the race, when they met together for religion and revelry; and after Tellus had had his offering, and Silvanus his milk, and the Genius his wine and flowers, why then, the—

"Agricolæ prisci, fortes parvoque beati,"

pelted each other with jests fresh as the turf below them, with a smack of hard humour rough as their early wine. The first old satirists would be good-natured, and fun would be the main element of their *fescennina licentia*. For hate would express itself in those early times by weapons at once. It requires *civilization* to produce iambs that slay as surely as steel, or a *Junius* letter, that will reduce its object to living on potatoes for a week! And these early *carmina*—for it was the natural tendency of the large-hearted early man to wing his sarcasm with song—would be the first rude assertions of literature proper against force—of the value of the intellectual element as a redeeming feature in the social conditions produced by political movements—far-off gleams of ideas afterwards to be developed in the world's history. If we turn from early southern to early northern life—we leave the warm regions of taunting *fescennine* song, and we find our Scandinavian ancestors, in their different way, lacerating each other with

"*nothing-verses.*" Everywhere satire, in one or other of his various garbs, is found doing his duty in his station. With the car of the victor of civilization, he marches to remind him of his mortality. He follows at the funeral of dead institutions as the mime who burlesques the gestures that characterized them living. He jeers in the wake of Cæsar's Gallic triumph, at the baldness below the laurel—at the vice that disfigures the greatness. He is found pitching "sacred chickens" overboard, to see if they will drink when they decline to eat. He is wise in the fool's garb, and rings a moralizing knell from those bells of his. Many duties devolve on satire in the ever-varying world-history. But when satire is genuine, when it comes from the heart, and is the voice of nature, appealing to man's instincts against the falsities, hypocrisies, corruptions of a time—surely then we may admit it amongst the grander products of the human faculty, and may speak, without impropriety, of the Satiric Muse. It certainly is *not* true that "ridicule is the test of truth," in the sense in which that *dictum* is commonly used; but when men heartily join in the scornful laugh of the satirist, it may be presumed that the reverence which he is labouring to destroy, has already begun to stand on a false foundation. Would Paris have seriously delighted in the "Tartufe," had it not been well known that hypocrites of the same *genus* infested the town? When old Sir David Lindsay, with his deep Scotch humour, made the friars laughable—was he not really appealing to every man's experience of their impudence, falsity, hypocrisy, and godless laziness? Men may laugh loudly, but they will not laugh long at ridicule of the truly venerable. The godless jester has his hour and his knot of *claqueurs*; but when the real satirist—who is at once humourist and moralist—makes his appearance, he is hailed as a brother by more generations than his own. He plants himself on the common instincts of mankind, and when he exposes the solemn impostures of the world, he is appealing to the genuine, healthy sense of the people, and his laughter wakes them from the enchanted sleep they have been bewitched into. "What think you of Luther?" says the good Elector to Erasmus. "Why—hem!"—the careful scholar, who loves his lettered quiet, hesitates; suddenly the eye brightens: "he has attacked the pope's crown and the monks' bellies!" The laugh echoes over Europe—"the pope's crown and the monks' bellies! Yes, that is it—the rascals!" chuckle the deep-hearted northerners. "*Ha-*

*bet!*" is the exclamation of the gazing world. Erasmus's satire was a thin and poor affair, compared with that of Burns, for example, yet how much it did for the good cause? Then, everybody has heard of despotisms "tempered by epigrams." The gloomy, hypocritical, keen, and knowing Tiberius—with his stiff neck, face blotched with dissipation, and big eyes that shrank from a fair glance, and had a cat-like faculty in the dark—had a dread of this darting light in particular. Tacitus, who saw everything, saw this, and well notes why Fufius is glanced at in the imperial letter—Fufius who is "*dicax, et Tiberium acerbis facietis inridere solitus;*" "*quarum,*" adds the historian, himself a king of satirists, if need be,—"apud præpotentes in longum memoria est!"

Genuine satire, then, we may well prize. There is a peculiar beauty in the white nettle-flower. And of its literature, as a means of enabling us to know a time, the value is indubitable. For Roman life, we go to Horace and Juvenal. For our own life in past ages, we go to our satirists—not, of course, without distinction of persons. But it may be said, further, that the great satirist is essentially of a genial nature—preeminently "a good fellow." We hear, every now and then, of the "black malignity" of one, the "bile" of another: as well talk of the mean anger of the bearer of the silver bow! Think you those arrows shall not be shot, because respectability is startled by the glitter? We could get up as good a band of cheerful, loveable friends from the ranks of satirists as heart could wish. The tenderness of Catullus, in spite of his "arrow shower" of satires, everybody knows, and wishes for his ashes the peace that his beautiful verses implore for those of his brother! Horace, high priest to the devotees of *savoir vivre*, chastises with rods of myrtle. And why do we hear so much of the "grossness" of poor old Juvenal? Sometimes we hear him described as a butcher; sometimes as an exhausted old voluptuary, turning to rail at vices which he had "used up." But his was not an age for using light weapons. It was a war like Thor's attack on the serpent, Midgard. His *fasces*, too, were always lowered before the old genius of his country: wherever a divine power came along, they bowed in due reverence. There are stray, sad gleams, too, of poetry, as in the passage ending with the mournful, musical, *plenæque sororibus urnæ*. But does not a hearty old Roman geniality breathe from the invitation to Persicus in the eleventh satire? Persicus is to come to that grim satirist's Tiburtine villa. No raw-

head-and-bloody-bones repast awaits him. There will be a plump kid, Persicus, my boy, fresh from the banks of Tiber—inno-cent of grass, and scarcely having cropped the willow—a most innocent kid, with more milk than blood in him—(Charles Lamb would have gone at once)—vegetables, eggs, excellent grapes. We will dine as our an-cestors used to dine. We will have a mo-dicum of modest wine, and we will hear the verses of the "Iliad" and of "Virgil."

"Quid refert, tales versus quâ voce legantur?"—

We cannot expect such cheerful feeling to prevail often in a heart sick with the con-templation of the brutal greed, cruelty, stu-pidity, and manifold baseness of the time. But it is pleasant to feel this cheerful breath, as from the old hills of Italy, in an at-mosphere redolent with smoke, foreign oint-ments, gigantic kitchens, and all sorts of sin. Sad and grim old Juvenal had the honest simplicity of one of the old rustic gods about him, and the bare manliness of his humour is not suited to the morbid squeam-ishness of effeminate respectability. Dry-den's genuine good-nature and geniality are apparent at the very first glance you cast at his character. Swift "had a great deal of love in him," said Thackeray, in his last year's lectures; while he spoke of the faith-ful friendships of the great men of that era. Pope was cursed with a morbid tempera-ment; but, after all, who really sympa-thizes with "Sporus," or gets up any genu-ine enthusiasm in favour of the herd of men whom he wantonly—say sometimes cruelly—attacked? In any case, Lord Her-vey was a miserable worldling and a cour-tier, with considerable Walpolean clever-ness, but nothing that a man heartily can sympathize with. Cibber was not a dunce. Was he anything? Has our English lite-rature gained anything from such as he and his fellow victims? They are at best mere sacrifices to the general cause of entomology. They were mercilessly whipped. Well, better they should roar than the author of the "Dunciad" keep silence. They only owe their remembrance to the fact of Pope's having satirized them; as you remember the existence of a beetle by the marks of its blood on the wall. Gay, who wrote satiri-cally enough, was as good-natured as a cherub. Churchill, who is, perhaps, our most violent satirist, inspired profound af-fection—so much so, that his friend Lloyd rose from the dinner-table, where he was sitting when the news of his death reached him, and died within a few days of the shock. Who doubts the kind-heartedness of Mo-

lière, or Voltaire, or old George Buchanan, who wrote the ferocious "Franciscanus," and the pungent "Fratres Fraterrimi," or of Butler, or Dr. Donne? There was no need of Coleridge's elaborate preface to the "Fire, Famine, and Slaughter," to convince us that literary bitterness does not come from malignity. The genuine satire is an utterance of scorn which may hate—as, in-deed, who ought not to hate—baseness; but hates without meanness, from the very love of the good and noble. We cheer on Apollo when he is attacking the serpent—Thor when his mallet is about to ring on the Frost-giant. We know that Cicero was one of the warmest-hearted men that ever lived; and it does not diminish our regard for him when we see him exhausting lan-guage to heap infamy on the plunderer of Sicily, or the miscreant Piso.

It would seem absurd to apply the rules derived from our ideal of satire to every concocter of political squibs, with an air of solemn measurement. This would be to practise a kind of hawking like that of the king who used to have sparrows trained to catch butterflies. The political squib is a favourite article of British manufacture; we are skilful in its concoction, as, in truth, in that of most other species of satire. Within the circle of a century, did we not produce Butler, Dryden, Swift, Pope?—four of the greatest satirists the world ever saw. Hudibras, unmatched for humour; Dryden, for a large, flowing, broad invective, with smart strokes of sharpest sense; Swift, whose irony is exquisite, who scents corrup-tion with morbid keenness, and lavishes on it his wit and scurrility, as a volcano sends up at once fire and mud; Pope, perhaps the most finished satirist of all—refining satire into an art, putting deliberately on, you may say, like the poisoner in Browning, a glass mask, to keep his features covered, while he prepares his subtle poisons. Yes; we have a talent for satire in England. Per-haps, to be sure, we never attain to the airi-ness of the French epigram—

. . . . "that masterpiece of man!"

which slays as with a sun-stroke. Our sa-tire has a tendency to be noisy. We *rattle* as well as sting. Thus, when an offender is to be lashed, much dust and hubbub is raised round him. The laws against which the unhappy fellow has rebelled are solemnly in-voked and repeated to him as at a military flog-ging. Who does not remember the "slash-ing article" of the "Quarterly," in its old day?—The public were always first re-minded of their duties as Britons, and their

moral position in Europe generally, and called on to rejoice sternly in the coming castigation. Of the two great branches into which satire divides itself—invective and ridicule—perhaps the first is our forte. Dryden confesses that he preferred Juvenal to Horace, for his private reading. He himself shows an example of merciless violence. Thus, we are unhesitatingly assured of Shadwell—really, by the way, a clever man—that—

“With all this bulk, there's nothing lost in Og,  
For every inch that is not fool is rogue!”

So Churchill solemnly commences, of a foe:—

“With that small cunning which in fools supplies,  
And amply, too, the place of being wise,  
Which Nature, kind indulgent parent, gave  
To qualify the blockhead for a knave.”

Again, Junius calls one great man “purely and perfectly bad.” And Swift opens a battery on the Irish public body (we are quoting from memory) with—

“Half a mile from Dublin college,  
Half the globe from sense and knowledge.”

It is our English way. A majestic severity seems to become our national seriousness; we feel that the *non temnere divos* is to be taught to some purpose, while we are about it.—To revert, however, to political squibs.

We enjoy the reputation, undoubtedly, of being the first caricaturists in Europe. Our Gilrays and H. B's are unmatched. And we have never been without our squib-writers. Tho ballads against the “Rump” alone, we believe, count by thousands. Cleveland, the royal satirist, went through edition after edition. Cowley's wit is as visible in his attack on the Puritans as in anything of his we have left. Villiers and Dorset's *carmina probrosa* were renowned. William the Third's diseases; Sir Robert Walpole's mistress; Queen Caroline's hate of her son; the Georges' affection for Hannover—their bad English—their queer ways—their amours—occupied a cycle of satirists. Walpole's letters are always registering the last “copy of verses,” which had aimed at inflicting misery on his king, his rivals, or his uncle. Pulteney wrote squibs, and so did Chesterfield. Bolingbroke's stately eloquence complains of the “flowerers” . . . “gathered at Billingsgate,” by his enemies, to annoy him. And to this hour, the orthodox reviewer of the day still thinks it the proper thing to mention Sir Charles

Hanbury Williams, the great gay libeller of the last century, an elegant, witty gentleman, always ready to embody the scandal of the hour in neat and flowing verses. It became an art to do this kind of thing—an art like that of the early poisoners, who conveyed death in perfumed soap, gloves, flowers. So that every period of political movement has its knot of libellers:—the “Rolliad” is succeeded by the “Anti-Jacobin;” then comes the era of the “Twopenny Post-Bag,” which is followed by the Tory triumph of the *John Bull*; till, at last—which was the upshot of the whole, and natural development of the system—it led to abysses of blackguardism (in the *Age, &c*), where not even the sturdiest critic can be expected to follow.

Just before the period of the “Anti-Jacobin,” the great squib-writer of the day was Dr. Wolcot, the famous *Peter Pindar*. The Doctor was a Devonshire man—had served as physician in Jamaica, under Sir William Trelawney—was afterwards in holy orders. He was a man of fair acquirements, amateur in art and music, and, as far as we can see, a much more respectable kind of person than you would expect from his reputation, or, indeed, from some of his writings: for the Doctor was decidedly coarse. To be sure, there are degrees of coarseness. We should perhaps be harsh, if we were to say that he was ever exactly *blackguardly*. One must remember the time, and one must judge a man of the world by the standard of his class. There is about Peter, then, a certain “after-dinner” kind of coarseness—a loose, rough way of talking, seasoned with *gros sel*—quite intolerable now, of course; but such as, there is good reason to believe, was once not unknown in circles of men well-born, bred, and educated, according to their time; and which, we dare say, is still known among bagmen, American slave-dealers, and thick-skinned talkers of many sorts. The Doctor was a libeller of immense fertility, and certainly had real humour. Perhaps some of our readers may be curious to see a specimen. We transcribe (from the respectable five volume edition of 1812) one of the many attacks which he made on George the Third. The peculiarity in that king's way of talking was a favourite subject of the writer. He is here narrating a visit paid by the monarch on a progress, in company with the Earl of Pembroke:—

“From Salisbury Church to Wilton House, so  
grand,  
Returned the mighty ruler of the land:  
'My lord, you've got fine statues,' said the king;  
'A few, beneath your royal notice, sir,'

Replied Lord Pembroke.—'Stir, my lord,  
stir, stir,  
Let's see them all, all, all, everything.'

"'Who's this?—who's this? Who's this fine  
fellow here?'

'Sesostris,' bowing low, replied the peer—  
'*Sir Sostis*, hey? *Sir Sostis*? 'pon my word!  
Knight, or a baronet, my lord?

One of my making? What, my lord, my  
making?

This, with a vengeance, was mistaking!

"'Sesostris, sire,' *so soft*, the peer replied;

'A famous king of Egypt, sir, of old.'

'Poh! Poh!' the instructed monarch snappish  
cried,

'I need not *that*, I need not *that* be told!

"'Pray, pray, my lord, who's that big fellow,  
there?—

''Tis Hercules,' replied the *shrinking* peer.

'Strong fellow, hey, my lord? strong fellow,  
hey?

Cleaned stables; cracked a lion like a flea:

Killed snakes, great snakes, that in a cradle  
found him:

The queen, queen's coming: wrap an apron  
round him.'

This is the kind of buffoonery which the Doctor produced, which everybody read, and which ministers stood in awe of. The sale of his "poems" was something enormous. His reputation brought down opponents enough. Isaac Disraeli fleshed his youthful weapon on him, but made the Doctor's acquaintance, and lived on good and friendly terms with him. Gifford, who was the Tory bully of his day, published an "Epistle to Peter Pindar;" but Gifford was no match for him. The Doctor had humour far beyond his assailant's, and made the most ferocious and personal attacks on him. How strange it seems to read, in grave biographical language, of two men—both fond of letters, both dear to their own friends, and with some qualities worthy of love,—"Gifford published his so-and-so against Wolcot; to which the Doctor replied by a 'Cut at a Cobbler!'"

The "cobbler" was, indeed, a capital point for a satirist. One of the greatest misfortunes that can happen to a man of talent in this country, is to be the son of a respectable tradesman! That fact, at all events, will never be forgiven him. "Vices" will be pardoned, for they were committed in hot youth. To renounce his early opinions, is perhaps the next most damning blot; still, it is sometimes conceded that this may be maturity of judgment, a ripener knowledge, and the "exercise of a sound discretion." But if he be sprung from the *taberna* of a "cobbler," or a grocer, or a

barber—the shadow of the parental establishment will darken his path through life. The Tory reviews will bring forward the fact, as a conclusive reply to his argument for a reform of the constitution—as an additional reason for rejecting the "emendations" in his edition of a classic. "Not that I think any the worse of him for it—but—" and Snob looks unutterable things. A reform may be in progress in such matters, now, but it was not so in the times of which we are writing. Indeed, we might draw up a list of rules derived from the party-satirists (the smallest of all satirists, of course), how to use this kind of reproach to the greatest advantage.

Gifford's autobiography, prefixed to his translation of Juvenal, is one of the most remarkable things in our language. It sets forth, with the plainest, barest, most business-like air, one of the most extraordinary stories of struggles and privations, ending in reputation and prosperity, that can be read anywhere. The poor, bowed, unhealthy boy—he had been rejected as "too small" at a storehouse; he had done menial work to the skipper of a coaster; he was "bound apprentice to a shoemaker" (the *satirical* for which is "cobbler"); and the imaginative eye may behold him at eighteen or nineteen years of age barely able to read and write, and "working out my algebra problems, on pieces of leather beat flat, with an awl." In all England there was not a more utterly forlorn boy than William Gifford in 1776. Other men have been as poor—Heyne, for instance; but to be so far behind in culture, so late, was the worst part of the business. In 1795 he was the most popular satirist in England; he published his "Juvenal" in 1802, and in 1809 he was chosen to edit the "Quarterly." Byron spoke of him, at a time when Byron was the most popular writer of his country, as his "literary father."

This was the man who, next to George Canning, occupies the most notable place in the history of the "Anti-Jacobin." A benevolent Cookesley had taken him up; a magnificent Grosvenor had pushed him on. He had been to Oxford. He had been drilled and developed into being the sturdy defender of the old British ideas in politics and literature. They made him "Paymaster of the Gentlemen Pensioners." There he was—the precise man that "hide-bound Toryism" needed; a pedant, by nature and by culture; enveloped in a suit of spiritual leather, and impervious to everything new, everything original, within and without. Here was just the man—Vaucauson could not have made a better one to

order—to denounce the “enormities” of the French Revolution from the fire-side point of view, to abuse and deride the Coleridges, the Shelleys, the Keatses.

Leigh Hunt, in his “Autobiography,” looking back kindly and charitably to those early days, and desirous of taking a solemn and peaceful farewell of contemporaries, good or bad, can find in that large heart of his no corner for William Gifford. We cannot wonder at that; though indeed when, at this distance of time, one comes fresh and without bitter recollections to look at the dead old reviewer of the “Quarterly,” one recognises something of the stuff of humanity—something in the patient, sturdy, wooden energy of the man, which impresses one with a not unpleasant idea of him. One thinks of him as of some ancient gravedigger working away in digging graves for, it may be, the young and the beautiful—faithful to the post, with no sort of spiritual perception of the nature of the employment—but still faithful, tough,—with glimpses of a rude humor, and dim consciousness that here is his work anyhow, and that he will labour to the last in it. You may study him as a genuine Briton of his kind. And, though his sea experiences had not been of the romantic yachting kind, God knows, thirty years found him still with a “love of the sea,”—though up to his ears in commentaries on Juvenal, and “brushings away” of “literary flies!” Nay, it is on record, that he could not sit down to compose those diatribes which enraged Hazlitt, unless there sat in the room to cheer him, with her presence, an ancient plebeian female, to whom he had a “Platonic” attachment! So he had a heart then, and had not expended it all in ferocious iambs! We would ask that ancient female, were she still in the flesh, whether there was not a better William Gifford, than the bowed, keen-eyed, grim, wooden man, who scowled at Hunt in the room where he was first pointed out to him.

Hunt is right in denying him “genius.” His “Baviad” and “Mæviad” are very poor productions. A vigour of abuse, with now and then a glimpse of grim humour, distinguishes them; all the rest is imitation of Pope, and personal violence. It looks very absurd now, that ferocious onslaught on the poor clique of “Della Crusicans,” from Mrs. Piozzi downwards. Fancy—

“Weston! who slunk from truth’s imperious light,  
Swells like a filthy toad with secret spite;”

and—

“Reptile accursed!”

What crime had been perpetrated by the object of this vituperation? He had written ridiculous verses! Poor Mrs. Piozzi figures as “Thrale’s Grey Woman,” and her and her colleagues’ verses are described as—

“The ropy drivel of rheumatic brains.”

The triumph of such satires was the triumph of the old repute of our heroic metre—which, when it marched abroad with decent energy, bore about it the respectable air of olden times, like an ancient carriage glittering with armorial bearings. For the satirist always bore in England something dignified and ministerial in the way of reputation. He was looked on as a public officer, and called himself Censor: till he passed into beadledom, like other great officials.

Gifford has credit given him, in the edition before us, for a share in the “Loves of the Triangles” and the “New Morality;” but the most memorable things in the poetry of the “Anti-Jacobin” are from a different hand. For example, the parody on Southey’s “Inscription” for the cell where Henry Marten was confined, and the thrice-famous “Knife-grinder,” bear the joint names of “Canning” and “Frere.” The names have different degrees of celebrity, indeed. “Whistlecraft” may still be read with pleasure by an idle man; and an old age of peaceful literature in the island of Malta has associated the name of “Frere” with that of the scholars of his day. But the name of “Classic Canning” gives to the “Anti-Jacobin” the lustre by which it lives, and raises its fiery squibs into literary constellations.

“Classic Canning” had come up to London—the handsome, gentlemanly youth, with his noble brow and his fine dexterous intellect—the model “young gentleman” of his time. He had been the very cleverest boy that had perhaps ever appeared in a public school, and the author of a Latin “prize poem,” which excited the wonder of mankind,—at Oxford. He was a master of debating weapons. If the highest ideal of a life be parliamentary success, and the best qualities those which ensure that triumph, never was a candidate better fitted for the career. While a “House of Commons” was a debating assembly, in which two bodies of gentlemen contended for mastery under traditional flags, the people looking on from afar with admiration, and a convulsed Europe affording the grandest speculative subjects to discuss—why, what could he, as a gifted youth, do better than go in and cry, “Here am I!”

"Skillful in ethics and logic, in Pindar, and poets, un-rivalled."

"I, too, can fight, and make my way like the best of you!" The time required a very good fighter too, for it was now becoming a very sore problem, and destined to occupy some considerable time in its solution—how long this kind of debating assembly, which was called the "House of Commons," could be expected to go on without entirely new conditions of action and modes of proceeding; so that you had not only to fight, if you were ministerial, the band who desired to be ministerial, but you had to keep what they call at sea your "weather-eye" looking out during the time, for the general safety of the establishment, threatened by "deluges" abroad, and a general thunder-muttering every where. Canning's memory is affectionately regarded in this country—partly for his fine genial qualities, the heat and the light, that radiated from him, and made him loveable among mere politicians; chiefly, however, for the holier light of hope, which played round him, just when he was taken from us. But it is assuredly difficult to get at his real convictions on the great problem of the day, when he entered public life, or to see what was the notion of duty which he had laid to heart, and determined to act on; or how far, indeed, his moral position was higher than that of a young Macedonian prince, who, having proved his descent, enters to combat in the great Olympic games of the world. His "opinions" were always known to be liberal in his youth; and he enters public life a squire of Tory Pitt's.\* However, our special business is not with that question, strictly relevant as it is. Canning had peculiarly a fighting man's qualities; in particular, he had a vein of pleasantry, native and genial, in him, and which descended fresh as dew on that hot and dry assembly.

The "Anti-Jacobin" was started in 1797, and the first number appeared on the 20th November of that year, under the title of the "Anti-Jacobin Review." Gifford did the "heavy business"—the general butchering and slaughtering department; Canning and John Hookman Frere the elegant and vivacious satire, and the only satire worth remembering. The Marquis of Wellesley, a scholarly and able man, contributed occasionally, particularly Latin verses. The other *collaborateurs* are not worth the recording ink. The purport of the work is

\* The weakest part of Mr. Bell's agreeable biography is that relating to this phase of Canning's life.

signified in its title. It was to make war on the French Revolution, and all that pertained thereto; on the French Directory, and the English sympathizers; on all new literature from suspicious quarters; on German dramatic importations. This was comprehensive enough. The full force of the lash fell, of course, on the French "miscreants." The terror of the orthodox at that time, and the wild agitation on one side and the other, of old and young Europe, we, who only read of it, can just dimly fancy, as we can fancy the Lisbon earthquake. It certainly was not from Giffords, and such-like heavy or light writers of satirical squibs, that you could expect a deep glance or an earnest laying to heart of the meaning of the Revolution. Few knew, few were great enough to know, that in that storm, awful as it was, the "Lord was abroad!" But most people could judge of the outward phenomena, more or less, by the standard of their own parish, or their own House of Commons. Let it be said at once, that the "Anti-Jacobin" poetry can have no value as a *protest*—does not rank with high satire, but properly with conventional and squib-satire. For such cleverness and veracity as it had, we would give it all due credit. And let us begin accordingly by quoting the reputed gem of the collection—the "Knife-grinder."

There were at that time, of course, plenty of republican converts in this country, and doubtless they were ready enough to make proselytes. Here was a good subject; and Mr. Southey, then a young man of very different views from those which he subsequently held, happily supplied a satiric form, by his introduction of "Sapphics."

#### SAPPHICS.

#### THE FRIEND OF HUMANITY AND THE KNIFE-GRINDER.

##### FRIEND OF HUMANITY.

"Needy Knife-grinder! whither are you going!  
Rough is the road, your wheel is out of order—  
Bleak blows the blast; your hat has got a hole  
in't,

So have your breeches!

"Weary Knife-grinder! little think the proud ones,  
Who in their coaches roll along the turnpike-  
road, what hard work 'tis crying all day 'Knives  
and

Scissors to grind O!

"Tell me, Knife-grinder, how you came to grind  
knives!

Did some rich man tyrannically use you?  
Was it the squire! or parson of the parish?  
Or the attorney!

"Was it the squire, for killing of his game? or  
Covetous parson, for his tithes distraining?  
Or roguish lawyer, made you lose your little  
All in a lawsuit?"

"(Have you not read the 'Rights of Man,' by  
Tom Paine?)  
Drops of compassion tremble on my eyelids,  
Ready to fall, as soon as you have told your  
Pitiful story."

KNIFE-GRINDER.

"Story! God bless you! I have none to tell, sir,  
Only last night a-drinking at the Chequers,  
This poor old hat and breeches, as you see, were  
Torn in a scuffle.

"Constables came up for to take me into  
Custody; they took me before the justice;  
Justice Oldmixon put me in the parish-  
-Stocks for a vagrant.

"I should be glad to drink your Honour's health in  
A pot of beer, if you will give me sixpence;  
But for my part I never love to meddle  
With politics, sir."

FRIEND OF HUMANITY.

"I give thee sixpence! I will see thee d——d  
first—  
Wretch! whom no sense of wrongs can rouse  
to vengeance—  
Sordid, unfeeling, reprobate, degraded,  
Spiritless outcast."

[Kicks the knife-grinder, overturns his wheel,  
and exit in a transport of Republican en-  
thusiasm and universal philanthropy.]

Such is the famous "Knife-grinder," which convulsed the Whigs of England with comic delight. Our editor thinks it "unnecessary to speak" of it, and subsides into rapturous silence. Not only did it make the hit implied in its frequent quotation, but it has had a continued influence on the question of the employment of "sapphic" metre in English. We doubt not that it deterred many an aspirant from following Mr. Southey in his metrical experiment. This, however, is not all. Writers on the great question of classical metres consider it to have injured our appreciation of the real Horatian sapphic itself. Mr. Clough conceives it to have confirmed our habitual "misreading" of that metre ("Classical Museum," vol. iv., p. 347); and over its "well-known jingle" the learned Donaldson has shed erudite tears! (See "Varronianus," note to p. 276.)

Now, allowing for all this hubbub, is it anything more than a rather smart copy of verses, such as our comic publications of the day often enough furnish us with? We doubt if a reader pampered with modern pleasantries would, on coming to it for the

first time, fresh from "Punch," think it anything but a squib of ordinary cleverness. As a burlesque of Southey's "Widow," however, it was fair enough. We could hardly wish such lines as the following to be spared:

"Cold was the night wind; drifting fast the snow  
fell;  
Wide were the downs, and shelterless and naked;  
When a poor wanderer struggled on her journey,  
Weary and waysore.

"Drear were the downs, more dreary her reflections;  
Cold was the night wind, colder was her bosom:  
She had no home, the world was all before her,  
She had no shelter."

The radical objection to this sort of versification is, not that it is founded on a misapprehension of the metre it imitates (and it is only an ear-imitation of the ordinary jingle), but that it is an altogether unsuitable vehicle of the thought and feeling it is intended to convey. The "poor wanderer" is made to *trof*, and weary and bore us, without exciting our sympathy at all. This exotic metre has none of the magic force which belongs to our native rhythm, and which deepens tenfold the impression of a fact or a sentiment. The parody on the "inscription" mentioned above is certainly clever. We give the reader the benefit of it, prefixing the "inscription" itself:—

"INSCRIPTION"

For the Apartment in Chepstow Castle, where  
Henry Marten, the Regicide, was imprisoned  
thirty years.

"For thirty years secluded from mankind  
Here MARTEN linger'd. Often have these walls  
Echoed his footsteps, as with even tread  
He paced around his prison; not to him  
Did Nature's fair varieties exist;  
He never saw the sun's delightful beams,  
Save when through yon high bars he pour'd a  
sad  
And broken splendour. Dost thou ask his  
crime?  
He had REBELL'D AGAINST THE KING, AND SAT  
IN JUDGMENT ON HIM; for his ardent mind  
Shaped goodliest plans of happiness on earth,  
And peace and liberty. Wild dreams! but  
such  
As Plato loved; such as with holy zeal  
Our Milton worshipp'd. Blessed hopes! awhile  
From man withheld, even to the latter days  
When Christ shall come, and all things be  
fulfill'd!"

\* "[By Southey.—Ed.]"

## [IMITATION.]

## " INSCRIPTION

*For the Door of the Cell in Newgate, where Mrs. Brownrigg, the Prentice-cide, was confined previous to her execution.*

"For one long term, or e'er her trial came,  
Here BROWNRIGG linger'd. Often have these  
cells

Echoed her blasphemies, as with shrill voice  
She screamed for fresh Geneva. Not to her  
Did the blithe fields of Tothill, or thy street,  
St. Giles, its fair varieties expand;  
Till at the last, in slow-drawn cart, she went  
To execution. Dost thou ask her crime?

SHE WHIPP'D TWO FEMALE 'PRENTICES TO  
DEATH,

AND HID THEM IN THE COAL-HOLE. For her  
mind

Shaped strictest plans of discipline. Sage  
schemes!

Such as Lyncurgus taught, when at the shrine  
Of the Orthyian goddess he bade flog  
The little Spartans; such as erst chastised  
Our Milton when at college. For this act  
Did Brownrigg swing. Harsh laws! But time  
shall come,

When France shall reign, and laws be all  
repeat'd!"

We know few parodies superior to this. Still our admiration keeps on this side idolatry. We are tempted to inquire mildly, with Leigh Hunt in his "Autobiography," whether an "undue amount of fame" has not been allotted to Canning for these *jeux d'esprit*? Perhaps it is, that there is little wit and humour among our public men: assuredly epigrams make a tremendous sensation in St. Stephen's, which seem flat and ponderous to common people out of doors.

Gifford did not contribute much to the humorous attractions of the periodical. His fun is like the fun of a Squeers—a savage and ghastly pleasantry. This was the weapon he used afterwards in the "Quarterly Review" against critics like Hazlitt, and poets like Keats. The "Anti-Jacobin's" judgments have of course turned out badly enough. It attacked Coleridge, and called Godwin and Holcroft "creeping creatures." To see how Gifford fails in humour, it is only needful to glance at those parts of his "Juvenal" which required that quality—to compare, for instance, his rendering of the account of the *ménage* of Codrus with that of Dryden.

Few people read the "Loves of the Triangles," in which Canning's hand was employed, for few have read Darwin's "Loves of the Plants," which it burlesques. The parody grows flat, after a few lines have put you in possession of the idea of the

burlesque. The ingenious notion of Darwin was to "enlist imagination under the banners of science." To this end, he devotes a long poem, in which the Popian verse is painfully echoed and re-echoed, to describing the "sexual systems of Linnæus," and so endeavours to impersonate poetically the flower as divided and classified by the botanist. E. G. "Galantha nivalis. The Snowdrop. Six males, one female." Such is the scientific description of that well-beloved flower. Here comes the worthy Doctor's *poetic* one:—

"Warm with sweet blushes bright GALANTHA  
glows

And prints with frolic step the melting snows:  
O'er silent floods, white hills and glittering  
meads,

Six rival swains the playful beauty leads."

He would be a clever fellow who could see the poetry of the snowdrop here! The doctor's attempt was indeed a difficult one. He had to take the flower, after science had divided it, put the *disjecta membra*, Medea-fashion, into the cauldron of his imagination, and bring out a poetic unity! His book is the failure, the monotonous failure, of a gifted man. Accordingly, it too was fair game for the satirists; and so the "Loves of the Triangles" brought in a happy enough ridicule of it, in which—

"The obedient pulley, strong MECHANICS ply  
And wanton OPTICS roll the melting eye."

Canning also wrote the greater part of the "Rovers"—a happy burlesque of the imitations of the German sentimental drama, then having a great run in London. To this parody we are indebted for the inexhaustible joke—"A sudden thought strikes me! Let us swear an eternal friendship!"

The weakest part of the Anti-Jacobin poetry is that which is intended to be serious, and to express the indignation of the Satiric Muse. "New Morality," which is attributed to Canning and Frere, we consider the worst poem in the collection. The assumption of moral sternness does not sit well on the authors of the "Knife-grinder." Happy cuts of ridicule occur, but the effect of the whole is that of "tedious malignity," to quote a significant expression of old Johnson's. And after all, has not "Time, the avenger," convinced most sincere and thinking people that the revolutionaries—even some of worst repute—had at bottom an ardent sincerity in their souls during that terrible struggle, which is more honourable and respectable than the quasi-epicurean position of the orthodox lampooner, who

laughs at them from his Rabelaisian "easy chair." Canning's satire sometimes erred against good taste, but oftener against good feeling; and in this poem he speaks of—

"ROLAND the just, with ribands in his shoes,  
And ROLAND's spouse," . . . .

in a tone of ungenerous ribaldry, and verging on the simious—the lowest form that satire can assume.

A great satirist, as we have indicated above, is a large-hearted man. Burns and Dr. Johnson—both men who perpetually emitted satire—are admirable instances. And a great satire enjoys the vitality of great poetry, and has its verdict to give, its protest to make, to all generations. But of course there is every variety of degrees in this as in other literary departments, and so we are perpetually seeing the name of satire applied to mere squibs and ephemeral productions, and the character of satirist and censor assumed by men who have neither its moral position nor its intellectual qualities.

If we ask, then, as the world at last asks of every production, what is the moral upshot of the "Anti-Jacobin's" achievements? the answer must be, that it cleverly ridiculed what was laughable on the surface of public movements which were true at bottom! One can scarcely preserve one's gravity, by the by, while one weighs this kind of manufacture in the critical scales. But this "Anti-Jacobin" poetry has been so long cried up, applauded, roared at, chuckled over, that it is by no means a superfluous task to give a hint or two as to its real value. The big-wigs that it shook are gone to the limbo of old wigs. The ideas, institutions, prejudices, passions, which it maintained and supported, have lost immensely since its time in power and importance. The writers whom it ridiculed, and whom its contributors ridiculed for long years, have emerged from behind the clouds of ignorance and prejudice and hate, and shine in our literature as the permanent ornaments of their age. Canning's memory itself is chiefly loved as that of one who was advancing to be a reformer. Poor old Gifford sleeps tranquilly—his cobbling of all kinds finished!—and—*opera sequuntur!*

We gave above, in a rapid paragraph, a sketch of the "developments" which our political libelling underwent after the "Anti-Jacobin's" time. Moore is incomparably the first performer in this line that our literature possesses. His light airy satire effervesces like the poison in the Venetian glass. We shall see nothing so brilliant, so subtle,

so searching, so Figaro-like, again. Theodore Hook's verse we always thought overrated. Up and down our Tory literature of the last quarter of a century, is scattered plenty of brilliant squib-writing, the work of such geniuses as Maginn, and other "Fraserians,"—a peculiar school—satiric, bacchanalian, classical—a school which prided itself apparently on violence, classical literature, and punch-drinking; which delighted to brew its punch with the water of the Aganippe!

The good old classic satire is apparently defunct, for the "New Timon" we cannot consider a successful specimen. Our political and literary wars now go on, too, with decorum and moderation. Problems, involving matters too solemn for squib-writing, engage our statesmen. Comic publications, having no party interests, make their fun and satire of the harmless nature which does not startle "families." Dulness rules in high places. Meanwhile the genius of satire embodies itself in the novel, and in that sphere has the thousand-fold varieties of cant to war against. Real satire is perhaps recurring to its early origin, and becoming dramatic. At all events, a Gifford or a Mathias, or any solemn old censor of an abusive turn, would now pass for a "bore," and that only. Their kind of weapon is as out of date as the catapult. Indeed, why should we retain the solemn ancient form? The spirit of satire will always live in the hearts of the enemies of baseness, dulness, cant, nonsense, and will work successfully in forms suited to each age. The "English Bards" is but a school exercise; the real satirical work of Byron was done in the "Juan," where he held up a glass to the age with a vengeance—showed it what a languid, empty, false thing it was; how it sneered at everything as a "bore," and was yet perishing, "bored" by its own spiritual and moral inanition. "Don Juan" is *the* satire of the time.

As for our defunct friend thus brought before us—the "Anti-Jacobin"—it may still be read with interest, as a curiosity. At best, however, it can only be a curiosity; and we feel as if we had been discoursing speculatively on the mummy of some long dead mime.

## ART. VII.—GOETHE AS A MAN OF SCIENCE.

1. *Goethe's Werke*. 40 vols. Stuttgart. 1840.
2. *Œuvres d'Histoire Naturelle de Goethe, comprenant Divers Mémoires d'Anatomie Comparée, de Botanique et de Géologie*. Traduits et Annotés, par Ch. F. Martins. Avec Atlas. Paris.

THE antithesis to Poetry, as Wordsworth felicitously said, is not Prose, but Science. Therefore have Poets and Men of Science, in all times, formed two distinct classes, and never, save in one illustrious example, exhibited the twofold manifestation of Poetry and Science working in harmonious unity: that single exception is Goethe. There have been philosophic poets, and men of science with poetical tastes, but the absolute fusion of high scientific capacity with the highest poetical power has, we believe, been limited to the single example just cited. One might, indeed, put in a claim for Leonardo da Vinci, that great artist having anticipated discoveries which made Galileo and Kepler, Mœstlin and Maurolycus, Castelli, and even some modern geologists, famous; not to mention his clear insight into the Baconian Method of experiment and observation as the guides to just theory in the investigation of Nature.\* Yet, in answer to such a claim, as an exception, we might show how Science was necessary to a painter's education, and how his very materials, as it were, lead him into some superficial acquaintance with scientific processes; whereas, so far from Science forming the necessary preparation to a poet, it is radically opposed, both in method and detail, to all our ideas of his education. Indeed, the antithesis between Poetry and Science is so marked, that when Goethe claimed a hearing on abstruse and comprehensive questions of positive science, the world at large very naturally prejudged the matter, and somewhat superciliously regarded his efforts as those of a poet dabbling in science; while professional men, with professional contempt, shrugged their shoulders at the "amateur." They did so then, they do so now. It is true, that the great comparative Anatomists and Botanists of our day are too sensible of Goethe's immense services, not to speak of him with respect; and Isidore Geoffroy St. Hilaire mentions, with no slight exultation, the conformity of Goethe's views with those of his illustrious father. Yet even the men who alone do him justice, because alone competent to appreciate the importance of his la-

bours, would, we may safely assert, rank him still higher as a Naturalist, were they not also somewhat under the common prejudice as regards the Poet. It is difficult in considering the Metamorphosis of Plants, the Unity of Composition, and the essays on Comparative Osteology, to forget that the cunning hand which holds the scalpel also wrote "Faust," "Goetz von Berlichingen," "Meister," and Iphigenia." The same difficulty has been felt with regard to Buffon, in whom the majority still refuse to see the great thinker beneath the splendid writer. Buffon was a stylist, *ergo*, not a philosopher: that is the unconscious reasoning. Goethe was a poet, *ergo*, he could not have been a scientific thinker: that is said openly.

It is time to dissipate such errors, and to examine more strictly into Goethe's pretensions. Even those best informed on this point are not thoroughly informed, for the materials demand extensive and minute search.

Let us first quote three unexceptionable authorities, *not* German, to prove that the subject is worthy of serious investigation, and that Goethe is accepted as a man of science by competent persons. He takes his rank among the few great Naturalists whose biographies follow in the "Dictionnaire des Sciences Naturelles," the writer very justly remarking, that "pour Goethe en effet l'étude de l'histoire naturelle ne fut pas un simple caprice, ou une distraction à ses innombrables travaux; ce fut une œuvre sérieuse et dans laquelle il a marqué l'empreinte de son génie. . . . Il s'y appliqua non en amateur qui se contente de notions générales, mais en savant qui n'arrive à la généralisation qu'à force de détails."

We must also give Isidore Geoffroy St. Hilaire's emphatic verdict; its importance will excuse the length of the extract, and we leave it untranslated, in order that the actual expressions may be weighed:—

"En outre, et sans parler ici de ses mémoires non moins nombreux sur la physiologie végétale, de ses notices géologiques sur plusieurs contrées de l'Allemagne, et surtout de son ouvrage sur l'optique et les couleurs, qui restent tout à fait en dehors de mon examen, on doit à la jeunesse de Goethe plusieurs autres travaux zootomiques que l'auteur n'a point lui-même mis au jour, mais qui, communiqués par lui à divers anatomistes Allemands, et honorablement cités par eux, sont un peu plus tard entrés dans la science. Il en est ainsi, par exemple, des recherches de Goethe sur le crâne des mammifères, dont les résultats, publiés en partie par Loder et Sæmmering, ont surtout contribué à fixer l'attention des anatomistes sur une pièce tour-à-tour appelée os transversal, pariétal impair, épactal, os de Goethe, et

\* Hallam, "Literature of Europe," vol. i. p. 304.

interpariétal. En présence de faits qui attestent des études préliminaires, solides, pratiques et poursuivies avec persévérance pendant quinze années—en présence de travaux aussi nombreux et continués par l'auteur presque jusque sur son lit de mort, les droits de Goethe au titre de naturaliste ne sauraient être un instant douteux.

"Assurément, si l'homme qui a fait tout cela, n'eût pas été en même temps l'un des plus grands poètes—le plus grand peut-être de l'Allemagne—l'idée ne fût venue à personne de n'attribuer à Goethe que des vues poétiques sur la nature, ou bien, selon les expressions employées par lui-même pour caractériser quelques pensées jetées dans ses premiers ouvrages littéraires, *des désirs de connaître qui s'évaporaient en vagues et inutiles contemplations*. Et surtout, si la vie de Goethe, cette vie dans toutes les phases de laquelle la science a eu une si belle part, eût été plus complètement connue, nul n'eût admis cette erreur, encore partagée par plusieurs, que les travaux scientifiques de Goethe se réduisent à quelques brillants essais de jeune homme et à quelques reminiscences de vieillard.

"Toutes ces opinions préconçues, que j'avoue avoir conservées très long-temps, et qui ne sont tombées que devant un examen approfondi des faits, sont nées du sentiment, exagéré peut-être, que nous avons tous, sans même y avoir réfléchi, sur l'immense différence des conditions psychologiques qui tendent à constituer le poète et le naturaliste, et des facultés par lesquelles ils se distinguent."\*

To this we will add the authority of the greatest living comparative anatomist—Richard Owen—who, in his celebrated work "Archetype and Homologies of the Vertebrate Skeleton," (page 3,) says, "Goethe, indeed, had taken the lead in inquiries of this nature in his determination, in 1787, of the special homology of that part of the human upper maxillary bone, which is separated by a more or less extensive suture from the rest of the bone in the foetus; and the philosophical principles propounded in the great poet's famous anatomical essays, called forth the valuable labours of the kindred spirits, Oken, Bojanus, Neckel, Carus, and other eminent cultivators of anatomical philosophy in Germany."

The mere versatility of intellect implied by these scientific labours in a poet, ought not astonish us in one who, with Shakespeare, certainly deserved the epithet "myriad-minded," but should be accepted as a fact. He notes the disinclination of the public to accord praise to any man who aims at success in different spheres, and while finding it perfectly natural, wisely adds, that an energetic nature feels itself brought into the world for its own development, and not for the approbation of the public: "it declines fatiguing and exhaust-

ing itself by always doing the same thing, and seeks elsewhere relaxation." If, therefore, Goethe passed from the elaboration of great anatomical laws to the composition of a comic opera, the reason was that his versatile nature demanded *varieties* of activity.\*

It should not be forgotten, however, that one very active cause of the disrespect with which men consider his scientific labours, is the bad taste of his polemics with Newton. He laboured for years to replace the Newtonian theory of colours by a theory of his own, carefully elaborated from original experiments. It is quite beyond our competence to decide upon the truth of his theory—*non nostrum est tantas componere lites*—and in the servility of ignorance we naturally range ourselves on the side of authority. But even as historians we cannot help the remark, that not only has Goethe's theory against it the immense authority of Newton, and all physical enquirers since Newton's day—a body of compact, demonstrable doctrine, incessantly proving its truth by fresh discoveries deduced from its principles; but over and above this it has against it Goethe's own conduct, which, to our minds, is very suspicious. The remark was originally made to us by Charles Kingsley, who, commenting on Goethe's well known irritability on this subject, and this alone, alluded to the notorious fondness of authors for their weak points.† Goethe had a vague feeling that his conclusions were not sound, and had the jealousy incident to imperfect conviction. We have to compare his conduct on the other points, and the force of the remark will make itself felt. If the opposition with which his theories were met by scientific men was enough to justify the tone he assumed, and to explain his sensitiveness on that point, how was it that, although his discovery of the intermaxillary bone was forty years before it was accepted (and when he first propounded it to Camper, the only answer he received was a compliment on the beauty

\* A friend of the writer's confessed that, to escape from the absorbing interest of his physiological researches, he wrote a comedy, and returned to his studies refreshed.

† Liston thought that tragedy was his forte. Eckermann tells us that Goethe would repeatedly say, "As for what I have done as a poet I take no pride in it whatever. Excellent poets have lived at the same time with myself—more excellent poets have lived before me, and others will come after me. But that in my century I am the only person who knows the truth in the difficult science of colours—of that, I say, I am not a little proud. There I have a consciousness of a superiority to many."—*Conversations with Goethe* (Oxenford's translation), ii. p. 145. See also vol. i. p. 109.

\* "Essais de Zoologie Générale," 139. Supp. à Buffon, tome 81.

of his handwriting); although his "Metamorphosis of Plants" was treated as a poetical fiction; although his views on comparative anatomy were only accepted when taken up by others,—how was it, we ask, that in these cases he maintained a dignified attitude, and never showed more than a moderate and reasonable sensitiveness to neglect and opposition? On the "Farbenlehre" he could bear no contradiction; Eckermann relates a curious conversation, wherein he brings forward a fact he has observed which contradicts the theory; and Goethe not only grows angry, but refuses to admit the fact.

To speak our whole mind with the frankness demanded by truth—and no one will accuse us of want of respect for Goethe—we must say that not only is the "Farbenlehre" his *very* weak point, and his whole demeanour in the controversy that of one painfully conscious of being in the wrong; but if there is one department wherein he shows himself to disadvantage as a man of Science it is in Optics. We do not deny the value of many of his observations, nor do we question the testimony of Artists so freely given as to the value and suggestiveness of his book to them: we are not unaware of the labour of years which furnished him with materials; but we think his optical researches and theories show that whatever rank he may hold in Science, it is not as an experimentalist that he shines. And this leads us to a more specific exposition of his peculiar attributes as a philosopher.

In Science there are Hodmen and Architects; men who assemble materials, and men who organize materials; men who make small discoveries, and men who point out the paths where great discoveries may be made. The Hodmen are of all degrees of capacity, from plodding dullness to a mastery which almost claims a place among the Architects; but with them we have no concern here, our purpose is only with the Architects, the Thinkers of the great thoughts which are to occupy generations and widen the horizon of philosophy. Among these there are two classes, types of the two Methods, Analytical and Synthetical, Inductive and Deductive. These two are so well described by Goethe in his parallel of Cuvier and Geoffroy St. Hilaire, that we avail ourselves of the description to throw light on his own position.

"Cuvier is never weary of observing and describing accurately what falls under his own observation, and thus extending his empire over an immense surface; Geoffroy St. Hilaire studies in silence the analogies of organized beings and their mysterious affinities: the former starts from

Individuals in order to arrive at a Whole which is pre-supposed, although considered unattainable; the latter carries within himself the image of this Whole, and lives in the persuasion that little by little the Individuals will be deduced from it. Cuvier gratefully adopts all Geoffroy's discoveries in the field of observation, and the latter is far from rejecting the isolated but decisive observations of his adversary; neither is conscious of this reciprocal influence. Cuvier, for ever analyzing and distinguishing, always using observation as his starting point, does not believe in the possibility of an intuition—a prevision of a part in the whole. A desire to know and distinguish what cannot be seen by bodily eyes, or touched by hands, seems to him exorbitant. Geoffroy, resting on fixed principles, abandons himself to his lofty inspirations, and does not submit to the authority of this method.

"No one will blame me for repeating, after this preparatory *exposé*, what I have said above, that here may be seen the contest of two opposite forces of the human mind, almost always isolated and scattered, so that they are now as rarely combined among scientific as among other men. Their heterogeneity renders a connexion between them difficult, and it is with regret that they mutually help one another. Long personal experience added to the teachings of the History of Science, make me fear that human nature will never be able to resist the contest. I will go still further: analysis requires so much perspicacity, such sustained attention, such aptness at tracing variations of form in the smallest details, and such talent for nomenclature in naming these differences, that one can scarcely blame the pride of a man gifted with all these faculties, if he looks upon this method as the sole true and rational one. How could he make up his mind to share a fame so painfully acquired by laborious efforts with a rival who has had the art of reaching without difficulty a goal where the prize should be given only to industry and perseverance?"

"Assuredly, the man who starts from an Idea has a right to feel proud of having conceived a leading Principle; he will confidently repose on the certainty that isolated facts will verify what he has pointed out in the general fact. A man in such a position has naturally a legitimate pride caused by the consciousness of strength, and we cannot be surprised if he refuses to yield any of his advantages, and protests against insinuations tending to lower his genius in order to exalt that of his adversary."

In describing Geoffroy, he has sketched the broad outlines of his own Method. Although the greater part of his life was varied by scientific researches, and the last pages he ever wrote were devoted to a review of Geoffroy's "Philosophie Zoologique," yet he never had a *special* scientific education, and only manipulated scientific ideas, so to speak: for although he spared no labour in research, his researches were always undertaken to discover in analysis that which in synthesis had already been made present to him. Hence the accidents of his education

operated with the tendency of his mind to keep him rather in the domain of Philosophy than in that of inductive science. He viewed nature from the heights, and descended into the plains merely to verify the truth of his observation. He was an Architect, but he *sought* his materials. Hence, we believe, the failure of the "Farbenlehre."

It will be greatly to misunderstand the drift of the foregoing, if from it the reader conclude that Goethe was a "German Metaphysician"—a man who played with symbols, and neglected facts—a man who tried to supply the slow process of Observation by the facile rapidity of Reasoning. Goethe was eminently a positive thinker. Whatever may have been his deficiencies as an experimentalist—whatever may have been the defects of his various theories—the attitude of his mind, the organic tendency of his nature, was eminently scientific; and it is owing to *that* tendency that he made great discoveries, and deserves his place beside the Geoffroy St. Hilaire, whose character he describes, and whose great discoveries were made by them both simultaneously.

His scorn of Metaphysics breaks out in various parts of his works. "A man who speculates is like an animal led round in a circle by some malignant spirit on a dreary heath, while *beyond* the circle lies the beautiful pasture."

Ein Mensch der spekulirt  
Ist wie ein Thier, auf dürrer Heide  
Von einem bösen Geist im Kreis herum geführt  
Und rings herum ist schöne, grüne Weide.

No one conversant with his poetry, and the intense feeling for concrete reality which animates it, will suspect him of any predilection for vague speculation. "*Für Philosophie im eigentlichen Sinne hatte ich kein organ*—I had no capacity for that which we Germans call philosophy," he confesses in a little essay on the "Influence of the New Philosophy;" and his remarks on Kant are curiously illustrative of his mind. He read Kant's two great works and appropriated therefrom certain formulas suitable to his own views. "I could very well accept his *à priori* knowledge, as also his *à priori* synthetical judgments, for my own life had been passed in creating and observing, in synthesis and analysis: *the systole and diastole of human thought were to me like a second breathing process—never separated, never pulsating.*" It is, however, in his admirable essay on "Experiment as the Mediator between the Object and Sub-

ject,"—"Der Versuch als Vermittler von Object und Subject, 1793,") that we gain the most formal expression of his views on Method, an essay that may be read with advantage by every thinker, with sympathy by every positivist.

"Man," he says, "at first regards all external objects with reference to himself, and rightly so. For his whole fate depends on them, on the pleasure or pain they cause him, on their utility or danger to him." This, which is the initial stage of all speculation, and has for Method the determination of external things according to analogies drawn from within, is essentially metaphysical, and gains its definite formula in the axiom of Des Cartes, that "*all clear ideas are true.*"\* Goethe passes on to the subsequent or positive stage, by remarking how much more difficult is the task of discerning objects as related among each other, and not as related to us; for here the term of comparison disappears. We give up our touchstone of Pleasure and Pain, Use and Danger, and with godlike indifference becoming *spectators*, we seek *that which is, not that which touches us*—"Als gleichgültige und gleichsam göttliche Wesen suchen und untersuchen was ist, und nicht was behagt." Thus shall the real Botanist consider neither the Beauty nor the Use of Flowers, so much as their laws of growth and their relations to the rest of the vegetable world; and as the sun shines on them and develops them all, so must he with calm contemplative eye regard them, taking the terms of comparison—the data for his judgment—not from within his own mind, but from the circle of the things he contemplates. Goethe continues to develop this theme; but we have done enough to indicate with precision his attitude as a positivist. He gives to Observation and to Reason their respective functions; and while, on the one hand, insisting on the necessity of due regard to facts and experiments; on the other, vindicates the claim of the deductive method. What he taught he practised. Although, as before hinted, his proper domain is that of general ideas—his eye never for a moment ceases to observe reality.

In a note inserted among the fragments at the end of the "Farbenlehre" is one entitled—"Important assistance derived from a single felicitous phrase." It alludes to an epithet used by Dr. Heinroth as characteristic of his mind. The epithet is *gegenständlich*, by which Goethe says, "is

\* "Quicquid tam clarè ac distinctè percipitur quàm istud verum est."—*Princip. Phil.*, p. 4.

meant that my thoughts are never independent of the objects," or, to express it in more familiar language, instead of his thoughts wandering off into vagueness, they are always inseparably connected with concrete realities. By this the old antagonism of Metaphysics and Science is again illustrated; luminously so in the following comment Goethe makes upon the phrase.

"Here let me confess that the grand oracular phrase, *Know thyself*, always presented itself suspiciously to my mind, as a cunning term of a secret Priesthood, desirous of perplexing man by the ambition of insoluble questions, and thus perverting his active contemplation of the outward world into a sterile contemplation of the inward world. *Man only knows himself in as far as he knows external nature, which he knows only in himself and himself only in it.*"

If that phrase about priestly cunning be meant seriously, it is a serious error; but the meaning of the whole passage is a profound one, and the closing sentence might form the epigraph to Comte's "Philosophie Positive." Goethe proceeds to show, in reference to his poems and his science, how truly the epithet *gegenständlich* characterizes his mind.

Let us descend from these general to particular considerations; and first to the history of his scientific studies, which—written in various parts of his works—presents not the least instructive aspect of his career, showing, as it does, the constancy underlying all his versatility—the unity animating the variety of his life.

A child of seven, we find him arranging on a music-stand ores, weeds, and other natural productions, as types to form an Altar, on the apex of which a pastille is lighted, symbolical of the aspiration of man's soul! As a youth, we find him herborising and theorising. As a student at Strasbourg, we find him neglecting jurisprudence for Spielman's "Lectures on Chemistry" and Lobstein's "Lectures on Anatomy." In his note-book of that period, we see traces of the study of physics, especially electricity, and the first dawn of chromatic investigations is here noticeable. These are but incidental studies, it is true; yet we find him in all his voyages actively observing, and speculating on every fact, geological, meteorological, botanical, or zoological, which he meets with: thus silently and unconsciously amassing a store of material for after use. Shakspeare, Spinoza, and Linnæus, are the three men who, he says, exercised the most constant influence over his mind—then hesitating between poetry, philosophy, and science.

In 1780, under the guidance of his friend

Loder, he studied anatomy with a direct and serious object. The conception of the Metamorphosis of Plants had not, he says, then germinated in his mind; but the parent thought, the *idée mère*, as the French happily style it, must have been in his mind, for we find him then endeavouring to construct his osteological Type; and this notion of a Type, with its collateral notions of modification and development, lies at the basis of biological philosophy. According to his notion of an osteological Type, every portion of an animal was to be traced in all other animals; and the anatomical difficulty was that of detecting the identity amidst such diversities of form and position. In this search he made his first anatomical discovery, and the discovery, though of no great importance, is illustrative of his philosophical mind. We allude to the intermaxillary bone, which was then supposed to belong to the ape and lower animals, and by its absence in the human skull to establish a point of difference between human and simial structure. His studies in comparative anatomy had convinced him that men were without a compass on that vast ocean—they wanted a Method; so he pushed aside all treatises, and turned to Nature. "I chose the skeleton of a quadruped, the horizontal position being the most characteristic, and I proceeded to study it piecemeal from head to tail." The intermaxillary bone being the first in that order, he followed its modifications through the animal series, and then he came to man, who was said not to have the bone. "But that bone being remarkable as containing the incisor teeth, I could not well understand how man possessed incisor teeth and not the bone in which they are fixed." Guided by this light, he soon discovered unmistakable traces of the existence of this bone, which in the fetus is as visible as in animals. He intended publishing this discovery in an essay, accompanied by plates, which were to represent this bone in a continuous series from its simplest form to its most developed, and thence to its concealment in man, "where it seems afraid lest it should reveal the voracity of the wild beast."

Although the fact is now beyond dispute, when first Goethe announced it—even to men so eminent as Camper and Blumenbach—it met with contemptuous rejection; for, as he truly says—"The phrases men are accustomed to repeat incessantly end by becoming convictions, and *ossify the organs of intelligence*," and it having been constantly repeated that man was distinguished from the monkey by the absence of the intermaxillary, no discovery could be entertained if it contradicted that phrase. Loder, Spix, and

Sömmering willingly recognised the discovery, but it was forty years before Goethe saw it generally accepted.

This discovery was made in 1785, and, although not published, was communicated to several anatomists; in 1787, Loder mentions it in his "Compendium." We give these dates for the purpose of making more evident that simultaneity of discoveries, so often leading to unjust charges of plagiarism in matters of science, and which we shall see curiously illustrated in the course of this article. In 1786, the great Vicq d'Azir published his "Traité d'Anatomie," wherein he not only gives a distinct *aperçu* of the presence of this bone in man, but adduces it in support of his conception of a *type* according to which Nature works;\* thus showing a coincidence of discovery which is self-explained, because the discovery in both cases was a deduction from a general principle, and that general principle was in the air, so to speak, breathed by philosophic anatomists of the day.

"My long and conscientious studies of the metamorphosis of plants," Goethe says, "revealed to me many luminous points of view from whence to study the organization of animals." And, indeed, one sees throughout his biological speculations the same parent thought everywhere lighting up the manifold obscurities, and reducing the diversities of Nature to unity in the laws of growth. His celebrated theory of plant-metamorphosis, as we are told by a considerable authority, Auguste de St. Hilaire, was for a long while neglected—"et depuis dix ans (written in 1838) il n'a peut-être pas été publié un seul livre d'organographie ou de botanique descriptive qui ne porte l'empreinte des idées de cet écrivain illustre."†

Linnæus, indeed, had an *aperçu* of this doctrine, as we see in his phrase *Principium florum et foliorum idem est*, but the development and establishment of this *aperçu* into a theory was Goethe's own. "His book," says M. Auguste de Saint Hilaire, "met the same lot as the phrase of Linnæus—it was neglected. The savans did not read it, imagining that, coming from the pen of a poet, it could be nothing more than a reverie, written in the false poetic style of the 'Loves of the Plants.' How ill they understood the genius

\* "Peut on s'y refuser enfin, en comparant les os maxillaires antérieurs que j'appelle *incisifs* dans les quadrupèdes avec cette pièce osseuse qui soutient les dents incisives supérieures dans l'homme, où elle est séparée de l'os maxillaire par une petite fêlure très remarquable dans les fœtus, à peine visible dans les adultes, et dont personne n'avait connu l'usage."

† "Comtes Rendus de Séances de l'Académie," vii. 487. See also "Morphologie Végétale," i. p. 15.

of Goethe, that flexible genius which assumed every form, and always selected that which suited best his subject . . . . . When Goethe wrote upon science, he was grave as science itself. He had given the models of several kinds of literary composition, and he gave one for scientific composition. If his work was not at once accepted it was because it appeared too soon for his contemporaries—he had anticipated the coming era."\*

Most readers will remember Goethe's account of his first interview with Schiller, who irritated him by calling his conception of metamorphosis an *Idea*, by which he meant a metaphysical notion, such as German philosophy revels in. The immense intellectual difference between them, which that remark implied, Goethe felt to be a chasm which only great friendship could bridge over. It separated them for years. But Schiller might be excused for not seeing the truth of a doctrine only admissible into minds previously trained in studies of comparative anatomy. Take the leaf, the flower, and the stamen of a rose, and present them to the most intelligent man you know, out of the circle of physiologists, telling him that they are three forms of the same organ variously modified, and await his answer.

Although Germany and France have applied Goethe's morphological ideas with great success, yet England—true to her antimetaphysical instinct, unhappily no more than an instinct with the majority—has been very chary of giving them admission, because the real philosophic method which underlies them is not appreciated. While we write, the *British Association for the Advancement of Science* holds its annual sitting in Belfast; and before Section D., Professor McCosh has read an admirable paper on the "Morphological Analogy between the Disposition of the Branches of Exogenous Plants and the Venation of their Leaves," founded upon Goethe's theory. We beg particular attention to this extract from the Report published in the "Literary Gazette" (No. 1861), wherein the present state of scientific thought is not inaptly characterized:—

"Professor McCosh, 'On the Morphological Analogy between the Disposition of the Branches of Exogenous Plants and the Venation of their Leaves,' endeavoured with great ingenuity to generalize and reduce to a common law the peculiarities which are manifested in the branching of exogenous plants, starting with the theory propounded by Goethe, that all the appendages of plants, whether leaves, bracts, sepals, petals, or stamens, are formed after a common type, and that that type is the leaf. Professor McCosh

\* "Morphologie Végétale," i. p. 15.

attempted to show that this theory might be extended further, and that the type of the leaf is not only that of all the appendicular organs, but of the buds and of the branches, and therefore eventually of the whole plant itself. The leaf is to the plant as the microcosm to the macrocosm—it is the plant in miniature—a common law governs the two, and therefore whatever disposition we find in the parts of the leaf, we may expect to find in the parts of the plant, and *vice versa*. Now, the veins of the leaf are the analogue of the branches of the plant, and therefore the venation and ramification must essentially harmonize with one another. In illustration of the law, the Professor pointed out that, in reticulated leaved plants (to which alone he referred) there is a correspondence between the distribution of the branches along the axis and the distribution of the venation of the leaf. In some plants the lateral branches are disposed pretty equally along the axis, whereas in others a number are gathered together at one point, and the plant becomes, in consequence, verticillate or whorled. The Professor stated, that wherever the branches are whorled, the leaves of the plant, as in the rhododendron, or the veins of the individual leaf, as in the common sycamore and lady's mantle, are also whorled. When the leaf has a petiole the tree has its trunk unbranched near the base, as in the case of the sycamore, apple, &c.; and when the leaf has no petiole the trunk is branched from the root, as in the common ornamental low shrubs, the bay, laurel, holly, box, &c. Professor McCosh exhibited an instrument for the measurement of the angles at which branches, &c., go off, and in 210 species of plants he found the angles of the branches with the stem and those of the veins with the midrib to coincide. The Professor stated in conclusion, that he believed there was a similar unity running through linear-leaved plants and monocotyledons. If substantiated, these views will give greater exactness to our distinctions of genera and species, and will lend more exactness to our ideas of the physiognomy of plants; they will at the same time exhibit an unity of design in the skeleton of the plant, similar to that which exists in the animal world, and so subserve the purpose of the natural theologian. In the discussion, a very interesting one, which ensued, while all acknowledged the value of the Professor's memoir, some, among whom were Professors Arnott and Balfour, appeared to doubt whether the theory would hold good if extended to more numerous cases. Professor Allman again drew attention to the question of method. He considered that development demonstrates the vein and the branch to be altogether dissimilar organs; that therefore the fundamental position of Dr. McCosh, the homology of vein and branch, was not proved, and consequently that any apparent resemblances between such dissimilar organs must be received with great caution. Dr. Lankester maintained that the paper before the Section was an admirable exemplification of the results to be obtained by the *à priori* methods of the school of Goethe, Carus, and Oken; while Mr. Huxley made a strong reclamation against any such doctrine, asserting that the *à priori* method, however useful as a stage of the scientific

method, as a means of what Dr. Whewell has called *colligating* the facts, not only cases to be useful if we stop here, but becomes absolutely hurtful. In reply, Professor McCosh repudiated the *à priori* method, and declared himself to be in all respects a Baconian. 'Who shall decide,' &c., says the old adage. It is at any rate not our affair in this place, and if we have specially indicated this discussion, it is only because we consider it to be an indication that the important question of the proper nature of a true scientific method is *beginning to agitate the minds of naturalists*. When it is fairly worked out, we may expect a new era in the annals of scientific biology."

The loose conceptions of Method which are implied in these objections to *à priori* reasoning, show how excessively imperfect is the philosophic education current in England. The vice of the *à priori* method, when it wanders from the right path, is *not* that it *goes before* the facts, and anticipates the tardy conclusions of experience; but that it rests contented with its own verdicts without seeking the verification of facts, or seeking only a partial hasty confrontation with facts—what Bacon calls "*notiones temerè à rebus abstractas*." The confusion we are alluding to, arises from not distinguishing between Metaphysical and Philosophic Methods. Englishmen, alarmed at the absurdities which *à priori* speculations have elaborated, learn to look with suspicion on every employment of the *à priori* method. But because men cut their fingers we need not relinquish knives; and this *à priori* weapon which alarms the pretended Baconians is one of the most effective in the armoury of Science, as indeed the history of Science abundantly testifies; but it must not be used incautiously.

The doctrine of Morphology is doubtless an *à priori* doctrine, and one not easily accepted by minds unfamiliar with its application. It is difficult to understand how all the bones of the body are but modifications of the vertebral column, how the skull is but a congeries of four or more vertebræ, and the hands and arms, upon which so much of our superiority depends, are but "diverging appendages of the costal or hæmal arch of the occipital segment of the skull;" yet difficult as these homologies may be to trace, there is no doubt of their truth in the minds of those who have carefully examined the evidence; and they do but show us, in a higher stage, the same Law of Development through modification of form to meet different circumstances, that lies at the basis of Goethe's theory of metamorphosis. How thoroughly he had grasped this Law, may be seen in the fol-

lowing extract, the great interest and importance of which must excuse its length :—

“That we may the more easily understand organized beings, let us glance at minerals. Always homogeneous in their constituent principles, they seem susceptible of a thousand different combinations determined by fixed laws. Their elements separate easily to form fresh combinations: these can be destroyed again, and the body which seemed destroyed be recomposed anew. The elementary principles separate and reunite therefore, not arbitrarily, but only in a very varied manner; and the constituent elements of inorganic substances are, notwithstanding the affinity which unites them, in a state of reciprocal indifference; for an affinity, either stronger or acting at a shorter or the shortest distance, can withdraw them from their combinations, in order to form a new body of which the elements are unvarying, it is true, but seem always ready to be recomposed, or to form, according to circumstances, fresh combinations.

“The forms of minerals vary according to their chemical composition, but it is precisely this influence of the *elements* over the *form* which proves that the combination is imperfect and temporary.

“Thus certain minerals owe their existence to the presence of foreign substances, the loss of which causes their own dissolution. Beautiful transparent crystals fall to dust if they lose their crystallizing water; and (to cite a more far-fetched example) the mass of iron filings which imitate hair round the loadstone attracting it, resolves itself anew into small fractions as soon as the action of the attractive force ceases.

“The distinctive character of minerals on which we are now insisting, is the indifference of their constituent principles, as to their union, co-ordination and subordination. They have, however, according to their destination, affinities more or less strong, of which the manifestation resembles some sort of choice; therefore chemists appear to grant them a power of election in their combinations; and yet for the most part it is only external circumstances, which, by driving or leading them here and there, determine the formation of mineral bodies. Far be it from us, however, to deny them their share of the general vivifying breath which animates the whole of nature.

“How different are organized beings, even the most imperfect! One portion of the nourishment they have taken is elaborated and assimilated with the substance of the different organs, the other is rejected. In a word, they grow by intussusception. They give, therefore, to this food, eminent and entirely special properties; for at the same time that the closest combinations are taking place, they give it *form*, that index of complete life, which, once destroyed, cannot be reconstructed from the remains.

“Compare the inferior with the perfect organisms; you will see that the former, even whilst completely elaborating the elementary bodies in order to assimilate them, are unable to bring the organs resulting from the process, to that high degree of perfection and unvaryingness which is observed in the superior animals. Thus, on descending still lower in the scale of beings, we find the plants developing in a fixed gradation,

and presenting to us the same organs under the most varied forms.

“An exact knowledge of the laws by virtue of which this metamorphosis takes place, will not only advance descriptive botany, but also our acquaintance with the physiology of plants. Let us only remark, that the leaves and blossoms, the stamens and pistil, the various envelopes, and all the other forms, are identical organs, modified by a series of vegetative processes, so as to be unrecognisable.

“The compound leaf and the stipule are the same organ, either developed or brought back to its most simple condition. According to circumstances, we see a flowering sprout or a sterile branch appear; the calyx, if it advances a step too far, becomes a corolla, and an undeveloped corolla remains like a calyx. The most varied transformations become possible in this way, and the knowledge of these laws renders research more easy and more productive. The necessity of studying the striking transformations of insects has long been felt, and the conviction exists that the entire economy of that class reposes on the idea of transformation. A parallel between the metamorphoses of insects and those of plants would be interesting; for the present it will be sufficient if we indicate it here in a succinct manner.

“The vegetable only becomes an individual at the moment when it separates from the parent plant in the shape of seed. As soon as germination commences, it becomes a being in which not only the identical parts reproduce themselves, but in which they are successively modified to such an extent that we fancy that we behold an unique whole composed of very different parts.

“But observation, and even intuition alone, prove that this whole is composed of parts independent of one another; for plants divided into fragments and entrusted to the earth grow again under fresh forms.

“With the insect it is quite different; the egg which comes from the mother has all the characteristics of individuality; the worm that issues from it, all those of distinct unity. Not only are its rings connected together, but they are also arranged according to a determined order, and subordinate to one another; they appear to be, if not animated by one will, at least to be led by the same appetite. One can distinguish a head and a tail, a superior and an inferior surface; the organs occupy a definite place, and one cannot be substituted for another. Yet the caterpillar is nevertheless an imperfect being, incapable of the most important of all the functions, Reproduction; it is only after a series of transformations that it attains to that function.

“In plants we observe successive stages co-existing in the same individual; the stem and root exist when the blossom is developing; fecundation is accomplished whilst the pre-existing and preparatory organs are still full of life and strength. The plant fades only at the moment when the fecundated seed attains its maturity.

“In the insect it is quite different. It abandons one after the other the various envelopes which it throws off, and from the last comes forth an evidently new being. Each successive stage differs from the preceding, a step backward is impossi-

ble. The butterfly emerges from the chrysalis and leaves it; the blossom is developed from the stem and on the stem. Compare the caterpillar and the moth; the former is composed, like all articulated worms, of analogous parts, the head and tail being alone different, the front feet varying but little from the hind feet, and the body divided into a number of rings resembling each other. The caterpillar sheds its skin several times during its growth; every covering seems intended to tear and fall off as soon as its elasticity is insufficient to the growth of the animal's body. The caterpillar becomes larger and larger without changing its form, and at last attains a limit it cannot exceed. An important change then occurs; it seeks to rid itself of the cocoon which formed part of its economy, and thus to free itself from all which is useless or injurious to the transformation of its grosser elements into more subtle and perfect organs.

"The body, whilst thus developing itself, diminishes in length without widening proportionably; and when the last covering falls off, there emerges an animal no longer resembling the preceding, but a perfectly different being.

"In order to complete the history of insect transformation, we ought to enter into greater details respecting the characteristics of both stages. Let us take the caterpillar and moth as an example: the body of the latter is no longer formed of parts resembling one another; the rings are grouped to form systems of organs; some have disappeared completely, others are still visible. Three sections exist,—the head and its appendages, the thorax which bears the limbs, and the abdomen with the organs it contains. We are far from denying the individuality of the caterpillar; but it appears to us to be imperfect, from the very fact that its parts were in a state of relative indifference, one having as much value and power as another, from whence it followed that the secondary functions of nutrition and secretion could alone be accomplished; whilst all those secretions of elaborated juices which produce a new being were quite impossible. But when, by means of an internal, slow, and gradual process, the organs susceptible of transformation have attained the highest degree of perfection; when, under the influence of a heightened temperature the body has discharged and freed itself from the juices that clogged it, the parts first become distinct, then divide, and acquire, notwithstanding their secret analogy, fixed and marked characteristics; they group themselves by systems, and thus assist in the accomplishment of those varied and energetic functions which, as a whole, constitute life.

"Although the moth is a very imperfect and transitory being compared with mammalia, yet it shows, by the transformations which take place before our eyes, the superiority of a perfect animal over an imperfect one. The parts are distinct, no one could be confounded with another, each has its determined functions to which it is inseparably bound. Let us recall those experiments which prove that among certain animals, limbs which have been cut off can grow again. This, however, takes place only among those animals whose limbs resemble each other sufficiently to allow of one performing the functions of another, and acting as a substitute; or in those whose organ-

ization is more flaccid, less positive and more easily modified by the element in which they live, such as the amphibious animals.

"The marked distinctions which indicate the limbs, point to the high grade which the most perfect animals, and man in particular, occupy in the scale of creation. In those regular organizations, every part has a determined form, place, and number; and whatever may be the anomalies produced by the creative activity of the vital forces, the general balance is never destroyed.

"It would not have been necessary for us to consider the transformations of plants and insects in order laboriously to attain this point of view, if we had not hoped thereby to find some light thrown on the forms of the perfect animals.

"After admitting that the idea of a *successive or simultaneous transformation of identical parts* is the basis of all studies of plants or insects, our researches about animals will be singularly facilitated, if we admit that all their organs undergo a simultaneous transformation already prepared at the moment of conception. In fact, it is evident that all the vertebræ are identical organs, and yet any one who should compare the first cervical vertebra with a caudal vertebra would not find a trace of analogical form between them. Here then are parts, the affinity of which is undoubted, and which are yet very different; and it is only by examining their organic connexion, their points of similarity, and their mutual influence, that we have arrived at a satisfactory result.

"The organic whole presents that perfect harmony which we admire, because it is composed of identical parts, insensibly modified. Really homogeneous, they appear not only heterogeneous, but antagonistic; so different are their forms, destination, and functions. It is thus, by the modification of organs which resemble each other, that nature can create systems of the most varied kinds, which sometimes remain distinct, sometimes unite and amalgamate.

"Metamorphosis takes place among the most perfect animals in two ways; sometimes, as in the vertebræ, it makes an identical organ pass through a series of degradations. In this case, the type is easily found. Sometimes the isolated parts of the type are modified by passing through the whole animal series without losing their characteristics. The vertebral column, taken in its whole, is an example of the first kind. The first and second vertebræ are a proof of the reality of the second. In fact notwithstanding the incredible modifications which they undergo in each animal, a conscientious and attentive observer will follow them through all their transformations.

"From whence we may conclude, that universality, constancy, and the limited development of simultaneous transformation, permit the establishment of a type; but the versatility, or rather the elasticity, of that type in which nature can follow its own vagaries, on condition of preserving to each part its individual character, explains the existence of every genus and variety of animal with which we are acquainted."

The law of development here illustrated is that to which the efforts of Lamarck, and

Geoffroy St. Hilaire pointed; and it may be mentioned, in passing, that Lamarck was like Goethe, a botanist before he was a zoologist, and he was doubtless led to his celebrated hypothesis by the influence of his botanical studies. For the sake of keeping dates before the reader's eye, we may mention that Lamarck's "Philosophie Zoologique" was published in 1809.

Although Goethe did not push this development hypothesis to anything like the extent we see it in Lamarck, it is unquestionable that he had distinctly conceived *evolution*, as opposed to the old idea of *creation*, to be the organic process of the world; and the stages of this evolution he conceived as a *series of modifications of simpler beings into more complex beings*. Hence the resemblance of his speculations to those of Geoffroy St. Hilaire is more specific than to those of Lamarck. Indeed, the remarkable son of the illustrious anatomist, speaking of Goethe's anatomical labours, says they present so striking an analogy, and sometimes so complete an identity, with those of his father, that he feels some hesitation in speaking of them. And not the least curious part of this is the perfect unconsciousness each was in as to the other's labours. "L'un en Allemagne," says M. Isidore St. Hilaire, "l'autre en France, n'ont cessé de marcher parallèlement, et souvent de front, sans le savoir, et même sans qu'il fût possible de le savoir, vers une semblable rénovation de l'anatomie comparée."

M. Isidore St. Hilaire here alludes to the conception of the true Method of Comparative Anatomy, and the elaboration of a Type, or, to use the French phrase, that Unity of Composition, which philosophy detects in the structure of animated beings. To any one conversant with the history of science, we need not remark on the capital importance of method; to say that Goethe was among those who first established the true Method of Comparative Anatomy is therefore to say, that he claims a place beside the great legislators of science.

His essay on Comparative Anatomy ("Erster Entwurf einer allgemeinen Einleitung in die vergleichende Anatomie, 1795,") points out the essentially sterile nature of the comparison then made, not only in respect of comparing animals with men and with each other, but also (and this arrow flies straight at Cuvier) in the foolish and unscientific resource of *final causes*.\*

\* Elsewhere he ridicules those seekers of final causes by saying they would have you believe cork trees were made to stop ginger-beer bottles.

He does more than expose the poverty of the reigning Method, he substitutes a true one.

The conception of an anatomical Type or universal pattern (*allgemeines Bild*) according to which all organized beings are constructed, although to men of purely analytic minds it has ever been repulsive, was a truly scientific conception. This Type, must not be confounded with a Platonic Idea. It is no metaphysical entity, it is simply a scientific artifice. Goethe expressly says, we are not for an instant to believe in the existence of this Type as an objective reality, although it itself is the generalized expression of realities. It is not an *a priori* assumption, like the mathematical line and point, though it serves as a basis to anatomy in a manner somewhat similar to that of the point and line to mathematics. It is a Type gradually and carefully elaborated from an inspection of existing organisms. "Observation reveals to us the parts that are common to all animals, and in what they differ among each other; the philosophic mind must embrace this *ensemble*, and deduce from it an abstract type."

The great battle between Cuvier and Geoffroy respecting this type—or Unity of Composition, as Geoffroy called it—was of immense service to Zoology, if only in the stimulus it gave to philosophic observation. The battle rages still, though the opposition to the doctrine of Unity becomes feebler and feebler. How intensely it interested Goethe, even in his eightieth year, may be seen in this *very* curious page in Eckermann.

"Monday, August 1, 1830.

"The news of the Revolution of July, which had already commenced, reached Weimar to-day, and set every one in a commotion. I went in the course of the afternoon to Goethe's. 'Now,' exclaimed he to me, as I entered, 'what do you think of this great event. The volcano has come to an eruption; everything is in flames, and we have no longer a transaction with closed doors!' 'A frightful story,' returned I. 'But what could be expected under such notoriously bad circumstances, and with such a ministry, otherwise than that the whole would end in the expulsion of the royal family?' 'We do not appear to understand each other, my good friend,' returned Goethe. 'I am not speaking of those people, but of something quite different. I am speaking of the contest, so important for science, between Cuvier and Geoffroy de Saint Hilaire, which has come to an open rupture in the Academy.' This expression of Goethe's was so very unexpected, that I did not know what to say, and for some minutes felt my thoughts perfectly at a standstill. 'The matter is of the highest importance,' continued Goethe, 'and you can form no conception of what I felt at the intelligence of the sitting

of the 19th July. We have now in Geoffroy de Saint Hilaire a powerful and permanent ally. I see how great must be the interest of the French scientific world in this affair; because, notwithstanding the terrible political commotion, the sitting of the 19th of July was very fully attended. However, the best of it is, that the synthetic manner of treating nature, introduced by Geoffroy into France, cannot be kept back any more. The affair is now become public, through the free discussion of the Academy, and that in the presence of so large an audience.

"It is no longer referred to secret committees, and arranged and got rid of, and smothered behind closed doors. From the present time, mind will rule over matter in the physical investigations of the French. There will be glances of the great maxims of creation, of the mysterious workshop of God! Besides, what is all intercourse with nature, if, by the analytical method, we merely occupy ourselves with individual material parts, and do not feel the breath of the spirit, which prescribes to every part its direction, and orders or sanctions every deviation by means of an inherent law!

"I have exerted myself in this great affair for fifty years. At first I was alone, then I found support, and now at last, to my great joy, I am surpassed by congenial minds. When I sent my first discovery of intermediate bones to Peter Camper, I was, to my infinite mortification, utterly ignored. With Blumenbach I fared no better, though, after personal intercourse, he came over to my side. But then I gained kindred spirits in Sommering, Oken, Dalton, Carus, and other equally excellent men. And now Geoffroy de Saint Hilaire is decidedly on our side, and with him all his important scholars and adherents in France. This occurrence is of incredible value to me; and I justly rejoice that I have at last witnessed the universal victory of a subject to which I have devoted my life, and which, moreover, is my own *par excellence*."

We are afraid ardent politicians will be terribly shocked at this preference of the old man for Science over Revolutions, and will regard it as an evidence of his "coldness." We prefer regarding it as an evidence of his sincere and absorbing love of great ideas; he knew that a whole revolution in thought, far deeper and far more important to Humanity than twenty July Days in France, were germinating in that doctrine.

Although this Unity of Composition must be admitted as an admirable artifice for the better exploration of the homologies and analogies of organized structures, yet when it is no longer used as an artifice, but presented as an ascertained *plan* according to which the structures were composed—a *scheme* of creation subsequently realized, then indeed the positive philosopher demurs, and declines to see in this Unity of Composition anything more than the limitation of organic processes. One might as well

talk of the unity of composition of crystals, whose forms are identical because the limitations are identical; indeed Professor Owen has hinted at this *rapprochement* in saying, "The repetition of similar segments in a vertebral column, and of similar elements in a vertebral segment, is analogous to the repetition of similar crystals as the result of polarizing force in the growth of an inorganic body."\*

This Law of Repetition, which is the first law of organic growth, must be coupled with another law distinctly announced by Goethe in a very remarkable passage, and subsequently taken up by Schelling, and various other philosophers, including Von Baer, whom Dr. Carpenter improperly credits with the discovery: the law we speak of is by Coleridge named the *Law of Individuation*, and may be more intelligibly explained as the principle of "division of labour" in organisms. Here is Goethe's statement:—

"The more imperfect a being is, the more do its individual parts resemble each other, and the more do these parts resemble the whole. The more perfect the being, the more dissimilar are the parts. In the former case the parts are more or less a repetition of the whole; in the latter case they are totally unlike the whole. The more the parts resemble each other, the less subordination is there of one to the other. Subordination of parts indicates high grade of organization."

These pregnant sentences should be placed at the introduction to every treatise on Zoology, for they express the highest generalization of the organic series. Specialization of function is consequent upon specialization of structure, as the homogeneous mass becomes heterogeneous, as the simple cell by spontaneous fission becomes an aggregation of cells, as the cellular tissue becomes by gradual condensation fibrous, cartilaginous, and osseous, and finally the muscular and nervous tissues become developed; in the ascending series the "division of labour" follows, so that instead of each part performing several functions, the separate functions are localized in separate organs; and according to the *ratio of the specialization* is the *grade of the organization*.

Not only did Goethe clearly perceive that the march of Nature was always from the simple to the complex, from the homogeneous to the heterogeneous; but he also saw that in studying nature we should follow the same Method, and not "proceed as men have done hitherto to detect the traces of human structure in animals, but we must commence from below and rise gradually, and detect in the

\* "Homologies of the Skeleton," p.171.

complex organization of man that of the simpler animals."

By thus bringing together the various conceptions Goethe had elaborated, we prove, even better than by dates, that his opinions were the natural results of his method of looking at Nature, and were arrived at by him independently of all contemporary efforts in the same direction. Indeed, strange as is the coincidence between his notions in comparative anatomy and those of Geoffroy St. Hilaire, yet it is impossible—and Geoffroy's son has shown it—that either of these philosophers could have been cognizant of the labours of the other. Dates prove it. Goethe's essays were written in 1795, though not published till 1820. Geoffroy did not publish till 1796—1806. Yet that Goethe's manuscript essay of 1795 was not *subsequently* altered is sufficiently evident in these three discoveries: *the metamorphosis of plants*; the discovery of the intermaxillary; the discovery of the vertebral structure of the skull: all three being special applications of the general doctrine.

The coincidences, then, must be accepted as coincidences, similar to the one previously noted respecting the discovery of the intermaxillary by Vicq d'Azyr; and the one now to be mentioned respecting the vertebral structure of the cranium. It has been often discussed, Who really was the originator of this vertebral theory? and a few years before his death, Oken wrote an article in the "Isis" (1847, Heft vii.), in which he accused Goethe of mendacious vanity, declaring that he, Oken, was the sole discoverer. We will give the substance of this protest, because it has undoubtedly influenced Professor Owen, and it made a great impression on our own minds when we first read it; the more so as we confess to an uncomfortable suspicion of plagiarism somewhere, having stolen into our thoughts on observing the similarity in the manner of the discovery.

Goethe, during one of his rambles in the Jewish cemetery near Venice, picked up the skull of a ram which had been cut longitudinally, and, on examining it, the idea occurred to him that the face was composed of three vertebrae: the transition from the anterior sphenoid to the ethmoid was evident at once. Oken, during one of his rambles in the Harz mountains, picked up the skull of a deer; on examining it, says Carus, he exclaimed, "That is a vertebral column!"

Oken's statement is as follows. He made the discovery in 1806, and in 1807 wrote his academic programme as *privat docent* in Göttingen, "at a time therefore when Goethe certainly knew not of my existence." The reader is requested to note this avowal that

Goethe knew nothing of Oken at that period. He sent this dissertation to Jena, where he had just been appointed professor, and had it printed as his inaugural discourse. Goethe, be it observed, was curator of that university: a fact thought to be sufficient to establish Oken's claim, as Goethe, it is supposed, would at once have remonstrated against such a claim had he not recognized its justice. This fact, however, we shall presently see to have no such bearing. Goethe had his own reasons for silence. "I naturally sent Goethe a copy of my programme. This discovery pleased him so much that he invited me at Easter, 1808, to spend a week with him in Weimar, which I did." But he does not say whether Goethe then mentioned having conceived the same idea: he does not say that Goethe credited him with priority. He adds, however, that as long as the notion was ridiculed by men of science, Goethe was silent; but no sooner had it attained some renown through the works of Meckel, Spix, Ulricks and others, "than there grew up a murmur among Goethe's servile admirers that this idea originated with him. About this time Bojanus went to Weimar, and hearing of Goethe's discovery, half believed it, and sent the rumour to me, which I thoughtlessly printed in the "Isis." [1818, p. 509.] Whereupon I announced that I made my discovery in the autumn of 1806, during a journey through the Harz." True; but he did not throw any doubt upon Goethe's claim to priority; he only asserted his own claim to originality. "Now that Bojanus had brought the subject forward, Goethe's vanity was piqued, and he came afterwards, thirteen years subsequent to my discovery, and said that he had held the opinion for thirty years."

Oken not only speaks with profound contempt of Goethe's "fantastic and foolish osteological essays—*ganz verwirren und ideenlosen osteologischen Aufsätzen*," which "prove that he could know nothing" about the matter; but plainly charges him with having attempted to usurp the claim to a discovery he, Oken, had made. And at first we were quite prepared to side with him, and to hold Goethe guilty of the charge. A long and minute investigation has convinced us that the charge is completely groundless, and very foolish when properly stated. The independence of both is clear enough. There has been no plagiarism—there has not even been identity of discovery. Goethe had an *aperçu* of the truth; Oken laid the basis of a demonstrative theory. Goethe did not work out his *aperçu*, and cannot therefore be considered as the discoverer; he only saw the truth like a philosopher—Oken proved it like a

man of science. It was with Goethe one among many applications of a fundamental conception of organic evolution and transformation—a detail of the unity of composition. It was with Oken the special anatomical problem which a young anatomist devoted himself to solve. That Oken had never heard of Goethe's discovery, we may reasonably assume; for although it was freely discussed among Goethe's friends, it was not published till many years afterwards. But recalling the fact of the two discoverers being at that time unknown to each other, let us adduce *proof positive* that Goethe had spoken of this discovery before Oken's publication.

In his essays on Comparative Anatomy, speaking of the vertebral structure of the skull, he says—

"I must confess, with pleasure, that I have been convinced of this secret affinity for the last thirty years, and have always continued to study it. But such an *aperçu*, notion, conception, or intuition, or whatever it may be called, is always somewhat esoteric. It can be expressed in a general formula, but cannot be proved; it can be exhibited in detail, without our being able to produce anything complete and finished. Two persons thoroughly possessed of the idea, would not agree on its detailed application: moreover, I assert that the single observer, the quiet friend of nature, is not always in accordance with himself; and from day to day the subject is clear or obscure before his eyes, according to the greater or less activity and energy of his intellectual powers.

"I will make my meaning more intelligible by a comparison. Some time ago, I was interested in reading manuscripts of the fifteenth century, which are full of abbreviations. Although I had never applied myself to the deciphering of manuscripts, I set to work with great energy, and, to my astonishment, read off without hesitation unknown characters which ought to have been riddles to me. My pleasure did not last long. Some time afterwards, when I wished to resume this occupation, which had been interrupted, I found that I should seek in vain to accomplish by labour and attention a task I had begun with love and intelligence, lucidity and independence, and I resolved to await the return of those fortunate and fugitive inspirations.

"If we find such differences in our facility of reading old parchments, the letters of which are fixed, how much the difficulty must be increased when we strive to guess the secrets of Nature, who, incessantly varying, hides from us the mystery of the life she bestows? Sometimes she indicates, by abbreviations what would have been comprehensible if written in full; sometimes she causes unbearable labour by a long series of narratives in running hand; she unveils what she had concealed, and conceals what she had only the moment before unveiled. What man can boast that he is gifted with that wisely-measured sagacity, with that modest assurance, which ren-

der Nature manageable at all times and in all places? But if, with a problem of this nature, the solution of which is denied to all exoteric treatment, a man stands forth in a busy and egotistically occupied world, it will be vain to do so even with measured, well-reasoned, ingenious, and, at the same time, reserved audacity: he will be coldly received, perhaps repulsed; and he will feel that so delicate, so intellectual a creation is out of place in such a vortex. A grand and simple idea, whether original or rediscovered, may make some impression; but it never is continued and worked out in its primitive purity. The author of the discovery and his friends, the masters and his disciples, the pupils among themselves, not to mention its adversaries, perplex the question by their disputes, lose themselves in useless discussions; and this because each one wants to adapt the idea to his own mind and intellect, and because it is more flattering to be original in a mistaken way, than to acknowledge, by the admission of a truth, the power of a superior intelligence."

The allusion in the concluding passage is certainly pointed at Oken; we find proofs of it in three distinct passages. Here is one from a note headed *Das Schädelgerüst aus sechs Wirbelknocken aufgebaut* (vol. xxxvi., p. 271). After alluding to his recognition of three, and subsequently six, vertebræ as composing the skull, which he spoke of among his friends who set to work to demonstrate it, he says:—

"In the year 1807 this theory appeared tumultuously and imperfectly before the public, for it naturally awakened great disputes and some applause. How seriously it was damaged by the incomplete and fantastic method of exposition, History must relate." *Die unreife Art des Vortrags* is a sentence to be appreciated only by those who have read Oken.\* Goethe's antipathy to metaphysics made Oken's exposition as disagreeable to him as it was to Cuvier, from whom it concealed the profound truth that lived behind it.

In his "Tag und Jahres Hefte," Goethe mentions that *while he was working out this subject with his two friends Voigt and Riemer*, they "brought me, with some surprise, the news that this idea of vertebral structure had just been brought before the public in an Academic Programme, a fact which they, being still alive, can testify to." This seems to us conclusive evidence. It was published many years before Oken made his charge; and it accused him in the most formal way of prematurely venturing to disclose Goethe's discovery, and it appealed to two honourable men as witnesses. Oken

\* It may be taken as a set-off against Oken's qualification of "the fantastic and foolish 'Osteological Essays.'"

said nothing to this when it could have been settled. He says, indeed, that he made no answer to the first passage we have quoted, because, after all, he was not named in it, and he did not wish to involve himself in a host of "disagreeables." But the second passage does name him as plainly as if the letters of Oken were printed; and it adduces *living* testimony to the fact that Goethe had conceived the idea long before Oken, and that his friends heard of Oken's lecture with *surprise*.

Why, it may be asked, did not Goethe speak? In the passage following the one last quoted he answers the question: "I told my friends to keep quiet, for that the idea was not properly worked out in the Programme, and that it was not elaborated from original observations would be plain to all scientific men. I was frequently sought to speak plainly on the subject; but I was firm in my silence."

To these very strong testimonies let us add that contemporary anatomists, Carus and Bojanus, have no hesitation whatever in making the true distinction, and in assigning to each the merit due. They regard Goethe as unquestionably the originator, and Oken as the demonstrator, of this theory. Carus says—"Still more remarkable is it that the greatest of anatomical ideas relating to the development of the skeleton was first conceived by Goethe—and this is the structure of the skull, which first appeared to his mind as a development of the vertebral column. It is true this discovery was published later, and to Oken belongs the great merit, in 1807, of having the first given a scientific demonstration of the theory in public. Nevertheless, it is beyond a doubt, that Goethe had this luminous idea many years before." Bojanus—the friend of Oken, too!—is still more explicit.

We are only defending Goethe from the frivolous charge made by Oken of an endeavour to claim what was not his due. That Oken, as the demonstrator, is entitled to the claim of a discoverer is plain; or if Goethe's *aperçu* be allowed to claim this, then we may give to Linnæus the merit of having discovered the *Metamorphosis of Plants*, his phrase (previously quoted) standing in pretty much the same relation to that theory as the phrase, "The skull is a vertebral column," does to the theory of Oken. Instead of treating it as an undignified case of plagiarism, we should see in it another suggestive lesson of the truth Goethe himself propounds, that Discoveries belong to the Age, and not men. Curiously enough, while investigating the case of simultaneous discovery, we came upon a third

trace of the same contemporaneous idea. M. Duméril read a paper before the Institute, in 1808, on the Analogy which exists between the bones and muscles of animals, the second section of which is entitled *De la tête considérée comme une vertèbre*.\* and this paper is sufficient to show how the idea of the vertebral composition of the skull was "in the air"—how all science tended that way.

It is rare, indeed, that a discovery of any importance is made by one man alone; and on this point we borrow the words of Professor Owen:—

"As the truth of Oken's generalization began to be appreciated, it was remembered, as is usually the case, that something like it had occurred before to others. Autenrieth and Jean-Pierre Frank, had alluded, in a general way, to the analogy between the skull and the vertebral column. Ulrich, reproducing formally Oken's more matured opinions on the cranial vertebræ, says—'Kielmeyerum præceptorem pie venerandum quamvis vertebram tanquam caput integrum considerari posse in scholis anatomicis docentem audivi.' And the essential idea was doubtless present to Kielmeyer's mind, though he reversed M. Duméril's proposition, and instead of calling the skull a vertebra, he said each vertebra might be called a skull. But these anticipations detract nothing from the merit of the first definite proposition of the theory. It would rather be an argument against its truth, if some approximative idea had not suggested itself to other observers of nature, who only lost the merit of developing it, from not appreciating its full importance. He, however, becomes the true discoverer who establishes the truth; and the sign of the proof is the general acceptance. Whoever, therefore, resumes the investigation of a neglected or repudiated doctrine, elicits its true demonstrations, and discovers and explains the nature of the errors that have led to its tacit or declared rejection, may calmly and confidently await the acknowledgments of his rights in the discovery."†

Oken's claim, therefore, is in no way impugned by Goethe's; nor is any doubt possi-

\* The following extract will sufficiently indicate his point of view: "Le trou occipital correspond au canal rachidien des vertèbres dont il est l'origine: l'apophyse basilaire et très souvent le corps du sphénoïde sont semblables par la structure et les usages au corps des vertèbres, les condyles représentent leur facettes articulaires. Les protubérances occipitales et les espaces compris au-dessous sont les analogues des apophyses épineuses et de leurs lames osseuses, enfin les apophyses mastoïdes sont tout à fait conformes aux apophyses transverses." He deduces that the whole skull is one gigantic vertebra—a conclusion which was rendered ridiculous by a phrase, *vertèbre pensante*, and, as usual with Frenchmen, disregarded because ridiculed.

† Owen "On the Homologies of the Vertebrate Skeleton," p. 76.

ble in our minds of the rightfulness of Goethe's claim to priority.

In taking a final survey of the grounds upon which Goethe's claim as a man of science rests, it will be apparent, even from the brief indications afforded by this paper, and disregarding the geological, mineralogical, and meteorological inquiries which variously occupied him, that he was no mere amateur dabbling superficially in scientific matters, but one of the Great Naturalists to whom Science is seriously indebted. He had that *facilité de penser en grand qui multiplie la science*, which Buffon recognises in Pliny, and which leaves a rich inheritance to after generations. The most advanced thinkers of our day are only now beginning thoroughly to appreciate the reach and grandeur of his leading ideas; and, while he may thus be compared with Bacon in legislative capacity, he has shown, by his discoveries and by his researches, that he was fully penetrated by the spirit of positive philosophy. And, before concluding, we must call attention to one admirable point in his speculation—the constant presence of what may be called the embryological point of view. He studies nature in her ascending phases of *growth*, not as others habitually do, contenting himself with noticing the already grown. It is thus he traces the secret of transformations, catching Nature "in the act," so to speak, and thus brings the whole diversity of forms within the unity of Life.

We have endeavoured to show that he was a great Man of Science, no less than a great Poet. "For half a century," he says, "I have been known as a poet in my own country, and even in other lands, so that my talent in this respect is not disowned. But it is not generally known, and has not been sufficiently considered, that I have seriously, and for years, devoted myself to science, that I have observed phenomena with that silent perseverance only possible to a real passion. Thus, when my Morphological Essays on the Metamorphosis of plants, though published forty years before, began to attract attention in Switzerland and France, people could not contain their surprise that a poet, occupied habitually with sentiment and imagination, should for a moment have left his path, and made so important a discovery. But this is a complete mistake. I have devoted a great part of my life to natural history, led thereto by a dominant passion. I have not made discoveries by 'inspiration,' by the 'flash of genius,' but by steady and serious research. Certainly, I might have accepted the honour paid to my sagacity and 'genius,' but as it is equally hurtful in science to attend exclusively either to mere observation or to abstract theories, I have considered it my duty

to write the history of my botanical studies for the appreciation of serious men."

We close this attempt to place his scientific position in its true light, with two biographical details:—During the *Campaign in France*, he was steadfastly pursuing his theory of Colours; and, while the cannon-balls were whirling around him, he, not being a soldier, observed their phenomena as a philosopher! The second detail is scarcely less significant. The very last pages he ever wrote were the review of Geoffroy St. Hilaire's "Philosophie Zoologique." He was then eighty-two years old! Truly did he say, that with him Science was a passion!

---

#### ART. VIII.—THE PROFESSION OF LITERATURE.

*The Autobiography of William Jerdan, F.R.S.L., &c., with his Literary, Political and Social Reminiscences, and Correspondence during the last Fifty Years.* Hall, Virtue, and Co.

WHEN a man undertakes to write his own life, he should be able to assign some satisfactory excuse for stopping the public on the highway, and holding it by the button, while he delivers himself of a full and particular account of his private affairs. He should have something to tell, and a sufficient reason for telling it. He has acted a great public part, and comes forward to explain and vindicate his conduct; or he has been mixed up in the remarkable events of the day, and possesses the means of contributing to their history; or he has associated with men of wit, learning, and renown, and has intimate revelations to make concerning them; or, perhaps, he is distinguished by some speciality, which people may be supposed to be curious to hear about: like the young woman at Ipswich, who has been lately occupying so large a space in the newspapers, perhaps he is endowed with the miraculous gift of being able to live without food; or he is a practical juggler, and can show how swords may be swallowed, and red-hot coals taken into the stomach with impunity; or he has accomplished some one marvellous feat that lifts him above the ordinary level of humanity—walked a thousand miles in a thousand hours on his head, or gone round the world in a washing-tub. Something unusual there must be in his life to justify him in writing it. We do not lay down any very strict conditions as to the limits within which this

peculiar class of books should be confined ; but it is obviously necessary to draw a line somewhere, or we should incur the risk of having our literature overrun by the plague of autobiographies. If a man insists upon blowing his own trumpet, it is not too much to exact from him, that he should blow it to some tune worth listening to. We dare not contemplate the consequences that would ensue, were every man, who had worked himself up into a hero in his own conceit, to consider his sayings and doings of so much consequence to the world, that he must needs put them into print.

We have looked carefully through Mr. Jerdan's volumes, and must candidly avow that we have not been able to discover the particular necessity there existed, so far as the public is concerned, for the trouble the author has taken in recalling the incidents of his career. Nothing uncommon appears to have happened to him ; nor has he disclosed to us anything very remarkable which he has done. The most memorable event, as affecting himself, recorded in the book is his birth. To that influential circumstance, we are no doubt indebted for all the rest ; but, although it was a matter of considerable importance to him, we do not think that the consequences it entailed are of sufficient importance to the world, to render the publication of them indispensable, or even desirable. We are not insensible to the variety of matters Mr. Jerdan has collected into his volumes, and can see that his experiences, commonplace as they are in the relation, must have been abundantly exciting, and, for the most part, highly entertaining in the reality. But they neither interest nor instruct us. We are not much edified or amused by the information that Mr. Jerdan was in the lobby of the House of Commons when Bellingham shot Percival ; that he went to the coronation of George IV. in the private carriage of Mr. Trotter ; that he was confidentially consulted by Mr. Owen touching that notable scheme of parallelograms upon which, at the same time, Mr. Owen was taking the opinion of the whole British public, by the most indefatigable circulation of printed prospectuses ever put into motion in an age of experiment and speculation ; that he was also taken into council on the establishment of the Soho Bazaar ; and many other small facts, by no means to be distinguished in the eyes of posterity from the multitudes of trivial passages that occur every day in the life of Mr. Jones—the honoured representative of the obscure mass of mankind. Mr. Jerdan was not famous in his day, in any large or suggestive sense of the word ;

he enjoyed no higher distinction than that of being known about town by his convivial ubiquity, and his connexion with the "Literary Gazette." He had done nothing in literature by which he was individually marked out from the crowd of periodical writers ; and we need scarcely remark that the reputation a man acquires as the editor of a weekly paper, being founded mainly on the anonymous writings of others, is a sort of reputation which requires to be authenticated by some original and avowed labours of his own, before it can be recognised as entitling him to a definite position. It is true that in his *Autobiography*—in which he has delineated himself, and asserted his pretensions with no unshrinking hand—Mr. Jerdan gives us the opportunity of testing his title to that distinction ; upon which the reader shall be enabled presently to form his own judgment. But in virtue of the "Literary Gazette," the claim is too slender to admit of discussion. It would carry us out of our way to pronounce any opinion on the merits of the "Gazette," as an organ of sound and independent criticism ; but it is much to the purpose of Mr. Jerdan's *Autobiography*—the publication of which seems to argue a foregone conclusion as to the estimate in which the "Gazette" was held under his management—that we should ignore the assumption of literary eminence which throughout these volumes is founded upon that journal. If we were to admit such an assumption in this case, we should deprive ourselves of all decent excuse for refusing to concede a similar ovation to nine-tenths of the gentlemen who "do" the fine arts, theatres, and literary reviews of the hebdomadal press.

Let us now turn to the *Autobiography*. The actual thread of this many-coloured life may be coiled up in a very small compass.

Mr. Jerdan was born at Kelso in 1782. His father, the laird of a few fields, and an idler in the world, died when he was thirteen years old. He frankly tells us, that he was spoiled up to his manhood, and judiciously leaves us to infer whether or not he was spoiled afterwards. The effect of the juvenile petting and indulgence was to pamper his self-will, to the manifest detriment of his progress in life. If we get no more in the way of a moral from the book than this, we may congratulate ourselves on getting so much. "I naturally grew petulant and self-willed," he observes, "and it is only extraordinary that the process did not render me also vicious and selfish." It seems that the "easiness of his disposition," which he inherited from his father, preserved him from those greater evils—to plunge

him, however, into others hardly less to be lamented.

Mr. Jerdan's destination in life is not very clearly stated; but we gather that he was originally intended for the law. While he was prosecuting his education with that view, the three brothers Pollock paid a visit to Scotland, on which occasion he formed an acquaintance with them, which was subsequently renewed, and ripened into friendship. We learn that there was a special "natural affinity or sympathy" between him and Mr. Frederick, now Baron, Pollock, which developed itself in a singular manner. "On this basis," says Mr. Jerdan, "a friendship of more than half a century has been built, and during that time the feeling I have described has often been so exact and powerful upon me that I have listened and listened to *what* my friend was saying, and, so true were the sentiments to my own, *have* almost fancied that I must *be* the speaker, and *was* delivering my individual thoughts!"

Tempted by his intercourse with the Pollocks, Mr. Jerdan came up to London, and engaged himself as clerk at an insurance broker's. His movements about this period were somewhat erratic, for we find him returning to Edinburgh to resume the study of the profession he had relinquished a few days before, and then shortly afterwards coming back to London without any "fixed plan, and only vague notions, and wishes floating in his imagination, among which the pursuit of a literary life was the most prominent and the least understood." This "literary life" appears to be the vagrant resource of all unsettled young men who are afflicted with vague notions and wishes in their imaginations; and it is not very surprising that, coming to it so ill prepared, it should prove so barren of profitable results. Under all the circumstances, Mr. Jerdan, however, has no reason to complain of having betaken himself to the occupation of literature.

His first experience of London on this occasion was to get into debt; whereupon he moralizes:—

"Debt," says Mr. Jerdan, "is the greatest curse that can beset the course of a human being. It cools his friends, and heats his enemies; it throws obstacles in the way of his *every* advance towards independence; it degrades him in his own estimation, and exposes him to humiliation from others, however beneath him in station and character; it marks him for injustice and spoil; it weakens his moral perceptions, and benumbs his intellectual faculties; it is a burthen not to be borne consistently with fair hopes of fortune, in that peace of mind which passeth all understanding, both in a worldly and eternal sense."

Starting with this homily at the outset of his career, we might naturally look for an instructive sequel. But alas! for the vanity of all human affairs—we find the very reverse. Surely, with these premonitory sentences written in his own book by his own hand, he cannot be much at a loss for the key to the moral of his own story.

We next find him falling into ill-health and acting as surgeon's clerk for a few months at Portsmouth, under his uncle, who was surgeon in a guard-ship there, and who placed him in that nominal position for the sake of taking charge of him. After this he became a reporter in a newspaper called the *Aurora*, started by the hotel-keepers at the West End, for what ostensible purpose it is not easy to divine. The hotel-keepers were jolly fellows, and understood good living better than newspaper management, and so the *Aurora* soon ceased to illuminate the West End. For seven years Mr. Jerdan pursued his useful labours as a reporter on different papers, the *Pilot*, the *Post*, the *British Press*. His alliances in the way of journalism were as various as, we apprehend, they must have been perplexing; for, between reporting, and writing "articles," and editing country newspapers, all at once, besides a stray magazine or two of rather equivocal character, he not only had his hands full, but must have found his head considerably obfuscated. From the gallery to the editorial chair is a step of some importance in the life of a reporter; and the transition to the editorship of the *Sun* newspaper marks the next great era in the life of Mr. Jerdan. From the *Sun* he transferred his services to the "Literary Gazette, which had been recently established by Mr. Colburn; and during the period of his editorial relations with these journals, he enjoyed an extensive intercourse, out of the memories of which he supplies the miscellaneous materials of his "Autobiography." The second volume conducts us to the opening of the marvels of the "Gazette," and we are promised two volumes more, which will bring us to their close.

The reader may be curious to learn how Mr. Jerdan contrives to occupy two volumes with matters that yield, upon analysis, such very slight results. The puzzle is capable of obvious explanation. The volumes are filled out, in a surprising manner, by a detailed account of his connexion with the papers; his squabbles with his partner, Mr. Taylor; his vexations about a house he had in the Strand, which was let to a milliner and an agent of a mining company, from whom he never could get any rent; and no end to repetitions about the contributors to the "Gazette," whose

names and services are recorded over and over again, as if the public had a vested interest in their forgotten glories, and could never tire of hearing them revived. Every item and particle of an item of things that were said and done by Mr. Jerdan and others in the daily routine of newspaper business, is sedulously remembered and brought into the narrative. It may be easily conjectured how a book can be made on this plan, when the maker thereof lacks the requisite judgment to discriminate between topics of public and permanent interest, and topics that are of no interest to any human being—except, perhaps, to the retailer of them, although even their interest to him, at such an interval of time, might be reasonably supposed to have faded. Incidents purely personal to Mr. Jerdan himself, furnish no mean portion of the whole. He meets an accident in the street—a news-boy comes up to him, and cries, “Hurrah!” for the escape of Buonaparte—he is disturbed by the chimes of a neighbouring church—anything, everything, however insignificant, is suggestive of its page of frothy anecdote. The appendices are eked out in the same unconscionable way, by extracts, we cannot say without rhyme, but certainly without reason; such as a life of Thomson, the poet, written for another purpose, and reprinted here; and a dramatic romance by Hood, which, we fear, will not enhance his reputation.

It is the calamity of all autobiographies of people who possess no established title to public regard, that the writers of them overrate and exaggerate the importance of everything relating to themselves, as if they were struggling to make out a case, and to create a justification for usurping a prominence that does not properly belong to them. This is exactly Mr. Jerdan's predicament. He finds himself writing his life, and having once placed himself in the position of the hero of a book, he falls into the belief that everything personal to the actor who monopolizes the foreground must possess a certain value and attraction. Thus he is constantly lamenting that all his fugitive writings, even to temporary articles in newspapers, and squibs in the *Satirist*, are not at his command that he might quote them; and he is perpetually promising the reader to endeavour to get them, that he may be able to gratify public curiosity by ample selections. Assuredly the reader has no cause to regret their omission; and, from the specimens with which Mr. Jerdan has already favoured us, we should say that the said reader has, on the contrary, much reason to rejoice that he could not put his hands on any more.

But this book, which might be described as a book dedicated by the author to himself,

is not without a purpose, to which these culled samples of “My Writings” (the title of one of the chapters) are intended to contribute; and that purpose is to show that the profession of literature is sterile and unprofitable, and that the man who devotes himself to it must be shipwrecked in the end. The argument and the illustration are equally questionable. Literature is hopeless because Mr. Jerdan has failed. As this is really the only point in Mr. Jerdan's biography that possesses the slightest public interest, or, indeed, that warrants us in noticing the work at all, we will make no apology for going a little at length into the subject. Mr. Jerdan is an excellent instance of literary failure; and if he cannot be cited as one who has adorned the story, he is at least an unexceptionable example of those whose self-frustrated progress points the moral, of the literary profession.

Retracing his early London associations with incipient lord mayors and lord chancellors, and chief barons, he marvels at his own fate in the comparison. He is here speaking of a club, where he and his friends used to meet for the purpose of reading their MS. compositions:—

“David and Frederick Pollock, and Thomas Wilde, were the most active and distinguished contributors; and when I reflect on the circumstance [what circumstance?], and that the first died Sir David and Chief Justice of Bombay; the second is Sir Frederick and Lord Chief Baron of England; and the third, Lord Truro, the other day Lord High Chancellor of England, the foremost civil subject of the realm, I cannot but marvel at the fate of their fourth, and their *not very unequal competitor*. My prospects were apparently as bright as theirs; my cleverness (not to use a vainer phrase) was only too much acknowledged; and my career has not been altogether fruitless in the service of my country and fellow-creatures. I have laboured, too, as constantly and severely, and produced effects which have had beneficial contemporary influence, and may, I trust, secure for my name a remembrance in times to come. Yet look I, with my aspirations crushed, from the clouded bottom of the hill, rejoicing in, and admiring, not envying, my early comrades, who, having bravely climbed the summit, *they* range along the height, and in happiness enjoy the brilliant region, in which, humanly speaking, warm and eternal sunshine settles.”

We will not deal with this as a piece of egotism, but take it on its naked merits, as a mere matter of fact. Can Mr. Jerdan discover no good reason for his fate? Yes; he has discovered a reason, and a remarkably convenient one. He transfers to literature the whole responsibility of leaving him at the “clouded bottom of the hill.” He asks why his competitors outstripped him?

"For why? I unsteadily forsook the choice of a profession, and, within a few years, found myself leaning for life on the fragile crutch of literature for my support."

Sir Walter Scott did a vast deal of mischief in launching that unlucky image of a crutch; but Sir Walter is always misquoted by the small fry of writers, who seek to shelter their failures under the authority of a sage remark, which, in fact, he never made. He applied the observation exclusively to *poetry*, and no more intended to include the whole region of literature in that prudent admonition, than law, physic, or divinity. But let that pass; we will give Mr. Jerdan the benefit of the crutch.

When Mr. Jerdan assigns as the sole reason why he was distanced by his competitors, the choice of literature as a profession, does he honestly state the whole case? Has he ever thought of comparing his life with theirs?—his wasteful habits with their persevering industry and self-denial? Does he believe that they achieved their several distinctions by dining out; by the indulgence of idle pleasures; by dallying with time and fortune; and living for to-day without a thought of to-morrow? Does he conscientiously believe that if he had pursued a different course, it would not have secured to him different results; and that whether a literary man is prudent or improvident, earnest or indifferent, strict and upright or negligent and lax, it is all the same—he must still come to the same end of poverty and discredit? Does he see no practical difference between men who pursue a given line of labour sedulously, concentrating their energies upon the attainment of a given result, whatever it may be, who never suffer themselves to be diverted from their object by vanities and profligacies—and men who turn work into pastime, and, to speak mildly, dissipate the opportunities of their position upon vice and folly? Mr. Jerdan forces these comparisons upon us, and must not be wounded by the issues to which they inevitably lead. He tells us that he has written his book partly for the purpose of bequeathing a lesson to the world. We accept the lesson, and extract the moral. If we find it diametrically opposed to the moral he desires to impress, the fault is not ours.

He marvels that he is not as prosperous as his friends; it would be a much greater marvel if he were. But literature is clearly not answerable for his adversity. Had he followed the profession in which they have won their high and well-merited honours, Mr. Jerdan would still be at the clouded

bottom. Success in that profession, even more than in literature, demands continuous labour and abnegation of social temptations—sacrifices which, judging from his own portrait of himself, he was never much disposed to make. He tells us that he had the choice of a profession; that he was sent to study law at Edinburgh; that he "never liked it;" and that if it had not been for such "collateral inducements" as the "superb" daughter of the writer of the signet, under whom he was placed, and other daughters and cousins who "possessed female attractions which could hardly be surpassed in the British empire," he "should never have stuck even nominally to the profession" as he did. And if he did not stick to the profession, how could he expect that he should emulate the success of those who did? Why should he complain of his failures, and cast upon literature the blame that belongs solely to himself? The secret of all the disasters that have befallen him is unconsciously betrayed in a picture he gives us of his mental idleness and incapacity for work, thrown into the shape of a reverie addressed to a fountain. "Oh! happy fountain," exclaims this gentleman, who reproaches fortune for not being more liberal to him, "would that I were like you, and had nothing to do but to play!" Mr. Jerdan is not the only man who has been haunted by similar wishes. The best of us might wish to have nothing to do but to play, were we not actuated by some more useful ambition. But we must submit to the penalty of doing nothing, if we choose to imitate fountains. Man is not a fountain; and if he acts like a fountain, and stands still, and lets the waters of life flow on in idleness, all that can be said is, that he has no right to protest against the consequences.

Even Mr. Jerdan himself is not quite insensible to this prosaic fact. He looks back with "deep and vain regrets" at the "precious hours" he "irretrievably wasted and misspent." Why, then, does he not candidly acknowledge, and save others the disagreeable office of pointing out, that his own wilful neglect and culpable self-indulgence are the true and only cause of the condition in which he finds himself in the evening of life? If his reviewers descend into these personal matters—which, in all cases, are approached with reluctance—he must remember that he has invited, or rather challenged, them to the investigation. He has set up a piteous complaint against the inadequate rewards of literature, and made his own life the evidence by which we are to try its justice. Now as it is impossible to examine the validity of the com-

plaint, without sifting the evidence by which it is supported, the whole of the following passage, in which he takes his critics to task for the way in which they have treated his work, is absolutely false in principle.

"In legitimate criticism, the main and proper business of the reviewer is with the writings before him; and unless the writer dogmatically parades himself, or inculcates dangerous doctrines, there is not a syllable out of the work, either about him or his history, which *are* within the sphere of justifiable remark. Whether an author has been gay or irregular, or a saint and a pattern, has very little to do with his text. In teetotalism, the most shocking drunkard always becomes the greatest apostle of temperance; and the old proverb says, "the greater the sinner the greater the saint!" It is an unwholesome principle, therefore, to attempt the rebuke of virtuous precepts, merely because they may be uttered by some one who may not have fulfilled the duties of the Decalogue; it is a mode of judging that must be condemned."

The author of this canon of "legitimate criticism" must not be allowed to escape under so plausible a pretext. He is writing his own life, and his own life is, therefore, the obvious subject for the "legitimate criticism" of his reviewers. It is a transparent subterfuge to say that not a syllable out of such a work is open to remark. Do not the omissions and suppressions of a biographer form as "legitimate" a ground of criticism as his statements, and the inferences he chooses to draw from them? What becomes of the judicial functions of the critic if he is compelled to accept the facts that are put before him, however partial or falsely coloured he may find them? Is he to take the biography for granted? Is he to adopt implicitly a man's own estimate of himself? Is he not to be allowed to travel out of the book for the means of correcting its errors, testing its veracity, and, it may be, exposing its falsehood?

If this passage were meant as a confession in full of the imprudences and transgressions with which Mr. Jerdan has been charged, it would deprive his critics of all right to impeach him or his arguments. They would be bound to look upon his book as a repentant offering of a misspent life, full of "virtuous precepts" drawn from fatal experiences, and published for the benefit of mankind. But his book is no such thing. Instead of being an avowal of the wrongs he has done to himself, and a warning to others to avoid the courses by which he has suffered, it is an accusation and invective against the profession of literature for the wrongs he asserts it has heaped upon him, and a warning to all young men against trusting their fortunes to

it. His book says plainly and loudly—shrieks in the ears of the public over and over again—"See, here am I, after upwards of forty years of literary labour, stranded in my old age; here am I, the early companion of judges and generals and lord mayors, who have all outstripped me in the world, although I had as good abilities as any of them, left destitute and struggling for subsistence in my declining days. Behold! here is another victim to the snares of literature—let all men take example by my fate, and keep clear of those treacherous quicksands in which ninety-nine out of a hundred who venture upon them are sure to be swallowed up!"

That we may not be supposed to magnify Mr. Jerdan's view of the certain obloquy and misery that attend the unhappy wight who embraces literature as a profession, we will trespass on the reader's patience with a single passage in his own words, extracted from whole pages of reproach and lamentation:—

"Let no man be bred to literature alone, for, as has been less truly said of another occupation, it will not be bred to him. Fallacious hopes, bitter disappointments, uncertain rewards, vile impositions, and censure and slander from the oppressors, are *their* lot, as soon as ever they put pen to paper for publication, or risk their peace of mind on the black, black sea of printers' ink. With a fortune to sustain, or a profession to stand by, it may still be bad enough: but, without one or the other, it is as foolish as alchemy, or desperate as suicide."

To say the least of it, this is very ungrateful in Mr. Jerdan. According to his own showing, literature elevated him to associations which, without its help, he would not now be in a position to boast of.  
*Ex. gr. :—*

"My juvenile associates numbered, among others not unknown to fame, such individuals as the late Lord High Chancellor of England, Lord Truro, and the Lord Chief Baron, [these people literally dance through the volumes]—the years of my middle life were past in *confidential intercourse with the statesmen of the day*, such as Lord Farnborough, Huskisson, Arbuthnot, Cook, and, still later, with many of the eminent characters who have held high places in the government of the country; and, both in the preceding and later periods of my course, I enjoyed the friendship and unreserved intimacy of George Canning, and the regard and familiar acquaintance of *almost every person of celebrity in the land*—political, scientific, artistic, literary, or otherwise remarkable."

He was admitted on the most familiar terms to the social intercourse of Tabley House and Drummond Castle, the family

parties of Lady Caroline Lamb, and the intimate reunions of many other great people. Yet Mr. Jerdan exclaims that literature is neither rewarded nor appreciated! What, after all these personal favours, delightful friendships, and rare honours it procured for him? What claim on earth had he upon these memorable associations—the Cannings, the Kinnairds, the Pollocks, the Buchans, the Lambs, and what not, except the claim he derived from his very slender connexion with the current literature of the day? Mr. Jerdan has evidently taken the wrong side of his own case, and, instead of making an appeal *ad misericordiam*, against the insufficiency of literature to float a man through life in a most delectable and luxurious fashion, he ought to have exulted in the conspicuous magnificence with which it surrounded him. His book, even if it must be regarded as a kind of funeral oration, should be attended by the circumstantial pomp and state that have graced the obsequies of other highly-favoured individuals who, after a life of ambrosial enjoyment in the highest circles, have gone out of the world poor. Even if the relentless bailiff should “seize his last blanket to-day,” he ought to indulge in the satisfaction of feeling that “his pall will be held up by nobles to-morrow.” The argument to be drawn from his example is, not that literature should be avoided by stray youths who come up to London without any definite object, but that it is the most flattering pursuit to which they can attach themselves. The white hands that flung bouquets in the path of Mr. Jerdan, and the great people that delighted to honour him, ought to operate as an incentive, and not as a discouragement. The matter resolves itself, in a manner, into a plain question in the rule of three. If Mr. Jerdan, who, as the reader may by this time have perceived, is not pre-eminently distinguished by his literary accomplishments, won all these proud distinctions in virtue of his relations with the periodical press, what amount of distinction may Messrs. X., Y., and Z. look for, whose accomplishments, we will venture to suppose, are of a somewhat higher order?

But Mr. Jerdan is not content with being admitted to the confidential intercourse of the greatest statesmen, and being smiled upon by the sweetest eyes that ever traced their lustre to the Flood; he desires something more. It is not enough for the writer of volatile criticisms and evanescent *jeux d'esprit*, that he should play at forfeits with ladies of quality, and crack jokes over his own champagne with distinguished members of the aristocracy; he desiderates an income equal to the fine company with

which he mixes. His position, we own, is an unfortunate one; let us say at once, plainly, it is a false position. We know of no situation in which a man can be placed more distressing than that of being thrown into associations which bring his pecuniary resources—although they may be ample for all the modest requirements of his real *status*—into humiliating contrast with the lavish expenditure of his acquaintances. He strains in vain—discontent grows upon disparaging comparisons—and, forgetful of the circumstances that carried him up to the rarified heights where he can scarcely breathe at ease, and incapable of asserting the self-dignity of his true calling, he picks a quarrel with fortune, and vents upon the unequal dispensation of rewards (retributive punishments never enter into his theory), the rage of disappointment which ought to fall upon his own head alone. After a life of pampered indulgence in great houses, and amongst people with whom he has not a single domestic association in common, he finds himself isolated and reduced to adversity in the end. This is a bitter lesson to learn when it is too late, but it is strictly just; and good for others flows out of the evil he has brought upon himself. The moral it teaches is severe, but it is sound and healthy nevertheless.

In the last extremity, seeking everywhere but where alone it is to be found, the sinister cause of his calamities, Mr. Jerdan turns round upon the profession to which he is actually indebted for the sunshine in which he has been basking so many years, and charges it roundly with his misfortunes—if misfortunes they can properly be called. He goes farther, and, in the face of a hundred testimonies to the contrary, somewhat egotistically paraded in his own person, he has the boldness to assert that the literary man is shunned and despised, and treated as a species of *loup-garou*!

“The fact is, that the profession of literature is neither honoured nor encouraged in England as in other civilized countries. The professors are suspected (and not untruly) of being in a way of unprofitable exertion, which is likely to lead to the curse of needing help. Such people are not wanted by the majority of well-to-do folks. There is a sort of *noli me tangere* about them which causes avoidance as of contagion. And if they are really plunged into certain poverty, bell, book, and candle-light would be too kind for them, and the sentence of excommunication is passed.”

A literary man who boasts in every alternate page of having enjoyed the friendship and confidence of the highest and most

distinguished in the land, and who inter-leaves his anecdotes of the great and eminent people he has known, with assertions to the effect that literary men are avoided like a contagion, transfixes himself on the horns of a dilemma, where we should be quite willing to leave him without a word of commentary, if there were not larger considerations at issue than Mr. Jerdan's consistency.

What, after all, is his complaint against literature? That it is not as productive of money as the cotton-mill or the smelting-house. Does he perceive no difference in the cases? The latter supply a constant want—the former ministers to an intellectual luxury, or to wants that do not wear out the supply with such rapidity as to keep up a high and incessant demand. Both must be regulated, to some extent, by the vulgar law of supply and demand, and their profits, by the same law, cannot be forced beyond the natural level of cost and competition. The latter combine the joint action of capital and labour; they feed a continual competition; they are not dependent upon the humour or the accidents of the time; no prosaic transition of the public taste converts their productions, like poetry, into a drug; however people may become indifferent to books, they are never likely to dispense with shirts, or to decline the advantages of the steam-engine; and although the writer to whose merits the age is insensible, or whose merits are of no utility to the age, may be left to starve, the manufacturer will thrive. Is it reasonable to protest against a state of things which has been inevitable from the beginning of the world, and which will continue to be inevitable so long as the material wants of the world must be served, let its intellectual wants shift as they may? The aims of the two classes are essentially different, and each has its own rewards. The literary man has a glory which is denied to the manufacturer, nor would he envy him his wealth if he knew how to appreciate his own position at its true value. He has fame, if he deserves it—honour, if he merits it—nor need he doubt of achieving the highest social distinctions, if he asserts his right to them as he ought, and maintains them with integrity and self-respect; while the other may be left to the unenvied possession of wealth and obscurity. We cannot reverse the results, without reversing the elementary conditions upon which they repose.

We are far from asserting that literature is paid as it ought to be, that its pecuniary compensations bear any adequate proportion to its rack of brain, and wear and tear

of spirit, or that it occupies that rank as a profession (for which, however, some excellent reasons might be given) it is justified in claiming; but there are other compensations in it of a higher kind, which should not be overlooked in the estimate of its good and its evil—the power it wields over society, its boundless influence in the extension of education and the diffusion of knowledge. The literary man may be justly proud of his mission, even should it not prove the most bountiful of paymasters. Mr. Jerdan, at all events, has little justification for complaints on that score, since he appears to have been in the receipt of a much larger income, for a long series of years, than the great bulk of the order to which he belongs. If it was not sufficient for the rank he assigned to his expenditure, let the blame fall upon himself, and not upon the destroying influences which, in the following entangled passage, he ascribes to the literary profession:—

“I am anxious to demonstrate the differences [between the literary and other professions], by showing the evils to which the author, the man dependent upon literature, is exposed, the enjoyments and the disappointments which await his career—the injustice and wrongs he is doomed (and must lay his account) to meet with—the trials and troubles which attach to him only as the consequence of his pursuits—the abstraction of his mind from the needful details of accurate business, and its aptness to seek refuge in the brighter idealities of imagination as the result; and his often blameable inattention, *impunctuality*, and want of order, which leave him almost a helpless prey, to be preyed upon by the sordid, the grasping, the scheming, and the rascally, who are not slow to take full advantage of their opportunities to plunder and defame their victims.”

Why, it is only in the preceding page that Mr. Jerdan maintains almost indignantly—and, we fear, with equal unreasonableness—that literary men are fit to be called into the councils of the state, and that they possess all the qualifications of “knowledge of mankind, admirable penetration, and astute discrimination,” which are requisite for the discharge of the most onerous and responsible functions. Yet here, before the ink is dry with which he has accredited them to the highest offices in the country, he tells us that, by the very nature of their pursuits, they are helpless and disorderly, apt to run away from practical affairs and take refuge in idealities, and are upon the whole such weak and credulous mooncalfs, that they become the easy prey of the meanest and basest rogues! We deny the fidelity of the portrait, unless Mr. Jerdan has drawn it from himself. Why must the literary man

be necessarily "impunctual," and exhibit such extraordinary aberrations in the conduct of life? Why must he necessarily be a victim to the "scheming" and the "rascally?" Why must he, merely because he has a better capacity than other people, be therefore a spendthrift, thoughtless, improvident, unprincipled? Mr. Jerdan's experiences amongst men of letters must have been of a singularly exceptional character, to have led to such conclusions.

But it is not the reckless day-dreamers and squanderers of money and opportunity alone who fail. There is a case to be made out against literature, and it would not be complete unless it embraced the ruin of all—the careful and steady in common with the heedless and the idle.

"If only the improvident and misconducted fail, let them show me the provident and the discreet who have succeeded. A catalogue of such would, indeed, astonish me. Surely it cannot be contended that all the unsuccessful are careless, extravagant, reckless, vicious! Thousands, and tens of thousands, of aching hearts and broken-down fortunes, alas! are but too easily to be found to vouch for the truth of my description, and the dismal force of my opinions."

Of course there are thousands of very worthy and estimable people who have failed in literature—people who are as punctual as the sun, and whose lives are morally irreproachable. What then? What inference are we to draw from so notorious a fact? They failed as writers; whereupon Mr. Jerdan lays the whole responsibility upon literature. He cannot discern the possibility of any other cause. A man fails at the bar—the bar is in fault. Let no man go to the bar. A man fails in the church—abolish the church at once. A man fails in medicine—let there be no more physicians. We do not hazard much risk of exceeding the truth in saying, that of a hundred men who fail in literature, ninety-nine of them had no business to meddle with it. Literature is a fascination very much like the stage; and of the multitude who fancy they have "a soul above buttons," who throw up "Coke upon Littleton" to strut their hour in print, who despise the honest trade of their fathers, and believe themselves destined to make a figure in the world, the number is incredibly small that are endowed with the attainments indispensable to success. There is no profession so crowded with men so deficient in the qualifications required for their work. In other professions, men rapidly find their level; but in literature, sustained by a vanity which eternally whispers in their

ears that they are ill-treated, and fed by a restless ambition which grows by what it does not feed upon, they are a long time before they find out their own incapacity, if they ever find it out. How many such men are there clinging to the skirts of newspapers and periodicals, bitterly complaining of the rejection of articles, the neglect of the public, the caprice and want of judgment of editors, and of everything above the earth and under the earth except their own unfitness for the sphere they have chosen, who might have earned a decent competence in obscurity if they had been brought up to some useful occupation instead of being cast upon that occupation which, of all others, exacts the severest toil, the most varied powers, the greatest self-denial, the most earnest labour and vigilance, uprightness and perseverance. Every youth who has perpetrated doggerel in a weekly paper, or obtained, in an unlucky moment admission for a fantastical article in a magazine, considers himself ill-used, and a martyr of genius, if he does not command a position for which neither nature nor education has qualified him. The question is, whether such instances should be cited as examples of anything but an egregious misdirection of human energies, and whether they should not be held out to admonish others from falling into the same mistake, instead of being quoted as evidences of the inadequate rewards of literature.

What result other than disappointment can be anticipated from the inveterate folly of a man who persists in a pursuit which he has taken up without the least previous training of his faculties, without study or preparation of any kind? The meanest calling requires some qualifications, and literature most of all. Can a man instruct others who is ignorant himself? or guide the taste of the public if his own be uneducated? Looking rationally at means and ends, what can he expect from persevering in so hopeless a course, but to be baffled in the long run? He hunts a phantom which eludes his grasp at every turn. He is like a child crying for the moon, or a boy chasing a butterfly. Trace the course of a literary adventurer of this numerous class, and wonder no more at the sequel.

A youth comes up to London to "seek his fortune." He has been brought up to no business or profession, and his head is, consequently, full of dreams and indefinite desires. Casting about for occupation, the floating work connected with the newspapers in the way of paragraphing and reporting, presents an easy opening to him, which

suits the desultory turn of his mind. The *agrémens* attached to this skirmishing employment captivate his senses, and flatter his vanity. He has access to a newspaper office, where he picks up the jargon of politics, and acquires an off-hand familiarity with the labels of public questions, the names of public men, and the doings of authorship; he has the run of the theatres, and speedily becomes an adept in the vocabulary, or slang, of criticism; he enjoys the free-and-easy intercourse of the loose *convives* of the press, and, emerging boldly from his chrysalis state, he begins to set up pretensions in the newspaper world as a night-man about town. Living, as the French say, *au jour le jour*, every day supplies its own expedients and excitements; facility in scribbling grows upon irresponsibility in publication, and thus, having dropped into the stream of vagrant journalism, he is swept on by the force of the current, and may be said to be only learning to swim when he finds himself buffeting the waters. Whatever chance he might originally have had of obtaining a safe and respectable livelihood is gone by. He is no longer capable of applying himself to any of the inglorious, plodding tasks in which diligence and system are compulsory. His habits are broken up; his views are scattered; he has tasted just enough of the pleasures of this gypsy and tramping life to be unfitted to settle down in quiet drudgery. He extends his connexion with the papers; he writes in half-a-dozen at a time; he ascends from paragraphs to leading articles; nothing comes amiss to him; he is ready to undertake any variety of subjects, from the highest problem in political science to the lowest conundrum in the column of scraps; the range of his miscellaneous and comprehensive powers includes every conceivable topic that can be compassed by the scissors and pen. But it is as a critic that he displays his versatile agility by the most marvellous feats; the art of reviewing comes to him by intuition; books of history and philosophy, travels and biography, poetry, fiction, and science, fly like chaff before him; and the whole field of literature is mowed down with the indiscriminate celerity of a reaping machine. The Jack of all trades who is master of none, is not a flourishing man after all. He sows his multifarious labours on the winds, and they scarcely escape from his hands when they are blown away for ever. His receipts are irregular and precarious, but his mode of living is prodigal. His incomings are slow, but his outgoings are fast. He hears on all sides that literary

men are not expected to be provident, and he thinks he is licensed to be a spendthrift. With a little care over his exchequer, and regularity in his expenditure, he might manage to maintain a satisfactory position; but he wastes his resources in ways for which there is nothing to show, and spends one half of his life in fighting against embarrassments which the other half is actively engaged in multiplying. After years of universal production and promiscuous dissipation, the utmost he can do is to live from hand to mouth; even that fails him sometimes, and is sure to fail him altogether in the end. He has not made good an inch of solid ground to plant his foot upon. He is even worse off than he was at the beginning; for now at the close of his career, when it is too late to mend or retreat, he discovers that he has spent his life in vain, and that instead of having secured something to fall back upon, he is worn out, dilapidated, and discarded. And what has become of that prodigious heap of foam he had slavered over so many printing-presses in his time? It melted away long ago. It answered its fugitive purpose, and was forgotten in four-and-twenty hours. It has not left a trace of its existence behind.

The picture is by no means overcharged. Such cases are numerous, diversified by an infinite variety of circumstances. Literature is to blame for it all!—for the misapplication of time, the false pretensions, the defeat, the ruin; and a man who might have gone through the world creditably and safely, had he addressed himself at first to some avocation for which he was qualified, thinks himself warranted in attributing to the profession of letters the misfortunes he has brought upon himself by the grievous error he committed in adopting it. But the last thing most of us are disposed to admit, is, that we are ourselves the chief cause of our own failures in life.

Mr. Jerdan, indeed, probably without intending it, settles the question himself by a comparison of the fate of the broken-down writer with that of "gentlemen, perhaps retired officers from the two services, who may be induced, at a matured period of their lives, to enter upon trade."

"Who have ever witnessed one among fifty of them succeed in business? I have not; but, just on the contrary, have seen them as unlucky and squeezeable by their more cunning competitors to the manner born, as the literary man. Acute, clever, diligent, they have not been brought up to it, and are unaware of what its profitable occupation requires."

We are not acquainted with any instances

of gentlemen from the two services who have ruined themselves in trade; but the moral has an exact application to the class of *littérateurs* we have selected as an example from amongst many other classes who founder from a similar cause. "They are unaware of what its profitable occupation requires." This is the whole case in a nutshell. They believe writing to be a matter of inspiration. If they can write, no matter how loosely, coarsely or incoherently—if they can only fling reams of manuscript at poor Priscian's head, and, having neither conscience nor knowledge to check their headlong course, run a muck at literature—they fancy themselves entitled to the honours and rewards which the world pays only to genius and to learning. But the world does not look for leviathans in shadows, nor expect to discover in the works of writers who are "unaware" of *what* their work requires, the unexpected treasures of Mr. David Fallen's miraculous region—

"Where golden ore lies mixed with common sand."

Mr. Jerdan's sole test of literature, as a profession, is the ledger. He sees nothing else in it. From the first page to the last of his two volumes, there is not a solitary elevating or ennobling aspiration welling up out of his long life of literary labour. It is one continuous wail about pay and poverty. He never asks the question, did such or such a writer *deserve* a great reward?—he only inquires, did he *get* it? The desert never enters into Mr. Jerdan's calculations. The test is, *Did he die rich?* He puts this finishing interrogatory to Scott, Moore, Campbell, Hook, and others; and, without stopping to reflect whether there were any special circumstances to be taken into consideration in any of their cases, he triumphantly settles the matter by demanding, seriatim, *Did he die rich?* It might be a sufficient answer to remind Mr. Jerdan of the generals, judges, and statesmen who, living in their elevated spheres lives of abstinence and toil, and living for higher objects than wealth, died comparatively poorer than the poorest of the literary cases he has cited; but we reject the test altogether. If the aim and end of literature were to accumulate money—as it is of cotton-spinning and glass-blowing—it would be rightly applied, and Mr. Jerdan's lamentations would have a curious grain of truth in them. The problem why authors do not die rich is solved by the fact, that the aims of litera-

ture do not lie in that direction; and that it would be utterly impossible so to shape them as that literary men should make fortunes like men engaged in commerce and manufactures. The answer to the inquiry lies on the very threshold; and Mr. Jerdan mistakes the nature of the profession to which he belongs, and its actual and inevitable conditions, when he tries it by a standard which is applicable only to pursuits of a wholly different character.

We do not apprehend that we shall be misunderstood on this matter. We state the case of literature as it is, and not as we should wish it to be. We, too, deplore that its material rewards are not on a level with its honours; but as we know not by what process that desirable result is to be attained, we think we take a more judicious course in laying down the chart faithfully, than in tossing our pens frantically in the air, and exclaiming against this island because it is not a continent, and that lake because it is not an ocean. Surely it behoves a man who sets out on the choice of a profession, to ascertain beforehand, first, whether he possesses the requisite talents and acquirements, and secondly, whether the course he proposes to embark upon is profitable, if profit be his object. Such salutary precautions are advisable in respect to all professions, but in literature they have an especial weight. In other professions there are definite advantages, offices, and gains, which ability, perseverance, and vigilance in the seizure of favourable opportunities, may ultimately hope to achieve. Every man who goes to the bar has a *chance* of being Lord Chancellor. It is a common joke at college. The medical profession teems with hospital and other appointments. In the church there are bishopricks, and deaneries, and stalls, and livings to slumber in, for him who is fortunate enough to obtain them. But literature presents none of these temptations in prospect; it has no offices to give away, no sinecures, no pluralities, no snug retreats from work and poverty, for the idle, the profligate, and the incapable; interest can do nothing, connexion can do nothing, patronage can do nothing in literature; the appeal lies direct from the author to the public, and distinction must be won and carved out by merit alone. It may be that all this is wrong; that literature ought to have its easy cushions and patent privileges; but so it is, and every man knows it, or ought to know it, before he risks his fortunes on so arduous and doubtful a venture. He ought to know that he has nothing to expect from adventitious helps. He ought to examine his chances of success, and look prudently to the consequences of failure;

submit his qualifications to a severe scrutiny, and, if he comes to his labours with the knowledge and attainments which alone can command attention, he has as little reason to fear the issue, in its noblest aspects, as any man who trusts to his own exertions and fitness in any other walk of life. Let him rightly appreciate the true dignity and usefulness of his vocation; let him show that strict dealing and unimpeachable integrity are not incompatible with the cultivation of letters; let him vindicate his honourable pursuits from the conventional slur of negligence and slattern dissipation, by setting an example of rectitude and steadfastness, instead of making literature an excuse for the violation of moral duties and social obligations, and he may seek with confidence, and wear with pride, honours which the richest may envy, and the loftiest in birth and station will not be slow to recognise.

We entirely concur with Mr. Jerdan in not recommending literature as a profession to the multitude of aspirants. But we arrive at our conclusion by a different route. We should hesitate in recommending any profession unconditionally. If the church, have you interest? If law or medicine, have you connexion? When Mr. Jerdan complains that literature does not pay, wringing a peculiar hardship out of its small gains, he overlooks the fact that other professions are pretty much in the same predicament, so far as the bulk of their members are concerned. Every profession is overstocked. Such is the condition of medicine, that there is scarcely a single physician of eminence at the present moment bringing up his son to the profession. A medical man looks out for a fortune with his wife, as an indispensable ground-work to build upon. Most medical men begin life with a little capital, or a resource of some kind, or they would be compelled to abandon their calling before they had fairly got into it. The law, with the exception of its magnates, who absorb nearly all the business, is bankrupt. Ask solicitors what they think of the law as a lucrative profession. The church, with its golden benefices on one side, and its miserable stipends on the other, presents a hopeless prospect to him who enters it without a living in his family, or a patron among his friends. The pecuniary statistics of the church are not very encouraging to young men in search of a provision. If Mr. Jerdan were to apply his test, *Did he die rich?* to the population of the working clergy, does he believe that the result would be more cheering than in the case of literature? The ordinary attachés of the newspapers make considerably larger incomes than the great body of the clergy;

and if they do not die rich, they are at least not worse off, and have less to complain of, than a class of men who are doomed, on the scantiest means, to the most painful privations and humiliating struggles.

Of the volumes that have carried us into this digression, it may be expected that we should give a more particular account than we have entered into. We imagine, however, we have already sufficiently indicated their character. Their contents consist chiefly of miscellaneous gossip and personal reminiscences. From one living, as Mr. Jerdan did, amongst celebrities and great people, we looked for some interesting, or, at all events, lively memorabilia. But we were disappointed. Mr. Jerdan is neither a Spencer nor a Selden. We could forgive the lack of permanent value in the materials he has collected; but we believe it is an established maxim with critics never to forgive dulness. And to confess the plain, but disagreeable truth, these volumes are singularly dull and flat. Take, as a prominent example, the anecdotes about Mr. Canning. Mr. Jerdan was so intimate with Mr. Canning, that every Sunday, after church, he was expected to pay a visit at Gloucester Lodge; yet he has nothing of higher moment to reveal about the great man than such items as the following:

"At this time I had experienced a peculiar trait of Mr. Canning, which it may be amusing to record, and deemed somewhat characteristic. Near the beginning of our acquaintance, when we met in the Old Brompton lanes, he used, in giving his hand, to place in mine only one, or occasionally two, of his fingers, and this I have reason to know, was his general habit with those with whom he was not on more intimate terms; for Mr. Dundas observed to me, that I was becoming a great favourite, and had already got to three fingers! Such had been the case till now; when having found out the value of the prize, I was not a little delighted to have the whole hand of the man I so esteemed shaken with mine. I assure you I was proud enough of the distinction, which few shared, except the *Huskissons, the Freres, the Ellises, the Backhouses, and other faithful and attached friends,*" &c.

Or the following, which, perhaps, will be considered a little more attractive, as there is a lady in the case—no less a person than the Princess of Wales:—

"On going to the Lodge, on a Sunday afternoon, as customary, I observed the princess's carriage at the door; I was hesitating whether I should go in or not, when Mr. Canning led her out, and handed her to her seat, beckoning me to enter by another passage. A glance informed me that something of unusual interest had taken place, for the princess appeared flushed to crim-

son, and Mr. Canning exceedingly moved. I proceeded into the room, and, walking up to the fire-place, stood leaning my arm on the chimney-piece, when the latter [the chimney-piece!] returned in a state of extreme excitement and agitation, exclaiming (in a manner more resembling a stage-effect than a transaction in real life). 'Take care, sir, what you do! You arm is bathing in the tears of a princess!' I immediately perceived that this was the truth, for her royal highness had been weeping plentifully over the very marble spot on which I rested!"

Either Mr. Jerdan did not know how to take advantage of his opportunities, or nothing very brilliant fell in his way during his intercourse with distinguished people. The names of his celebrities flit through his pages, and scarcely leave an impression on them. We learn nothing of their ways of life, their conversation, their specialities; and, in lieu of traits of character and illustrative facts, we are regaled with such *morceaux* as the following:—

"At a small evening party, *sans etiquette*, the almost obsolete pastime of Games and Forfeits, and other ancient humours, came into play. In the process I was victimized to be blindfolded, and in that *kilted of seven years old condition* was compelled to kneel upon the carpet, and with my head bent into Lady Caroline Lamb's lap, to give such answers as I could to such questions as might be proposed to me. It was late, and I had been persecuted very cleverly; when I was asked what I would do if an injured ghost approached to assault me for wrongs done in the flesh I was about to reply, when a smart cuff on the side of my head proved to me that it was no ghost-story. I pulled off the silken bandage, and looking up from his laughing lady's knee, found William Lamb, just released from a late sitting in the Commons, taking me thus abroad, in his way to take his wife home."

Mr. Jerdan is quite unconscionable in falling out with literature. Why, he has led the most enviable of lives. Are the privileges of shaking the whole hand of Canning, of having his arm bathed in the tears of a princess, and reposing his head in the lap of Lady Caroline Lamb, to go for nothing in his estimate of the advantages of the literary profession?

From the specimens we have given, the curiosities of the style in which this work is written will be tolerably apparent. But as this is a matter which bears rather significantly upon the main topic Mr. Jerdan has invited us to discuss, we must make room for a few select samples. Having set up his own test of literary success, he must indulge us in the application of ours.

Mr. Jerdan is at Paris, and relates what he saw there:

"Why should I speak of the opera, where the noble aristocratic presence of Lord and Lady Castlereagh eclipsed every other box, and were admired specimens of the Island race."

He bears testimony to the merits of the editor of the *Standard*, after having spoken of certain singularities in the character of that gentleman's father:

"His son, Dr. Giffard, is now one of the ablest political writers of the age; and, educated under such a father, it is not surprising that he should be as zealous as he is powerful; as is testified by the *Standard* newspaper, and everywhere else where his pen is wielded."

An apophthegm on duelling;

"Party spirit rages, as it too generally does in Dublin at this time, and was attended by constant duels, in superseding which there is undoubtedly some improvement."

He bewails the fate of the poetical contributions to the *Sun*:—

"If the day of poetry were in the *ascendant*, I should say that a sweet volume might be culled out of their productions; but, as it is, they must be left to the dispersion of their first birth, and, perhaps, the only recognition of them be found in this brief notice, by an old friend, who has to mourn them, nearly all, among the lost, from his earlier affections."

Of Mr. Chalmers he tells us that—

"He was able, laborous, good-humoured, and had a thorough enjoyment of the good things of social life, to which his conversation contributed the appendages of pleasureable intelligence and instruction."

His "proximate neighbour" at Little Chelsea, the exiled Princess of Condé, "with whom the Duchess d'Angoulême frequently stayed," furnishes occasion for a royal portrait.

"The establishment was upon a very moderate scale, and the daughter of the murdered king of France dressed little better than a milkmaid, which rank, indeed, she much resembled in form, and walking about in thick-soled boots."

A sequitur:

"Barry Cornwall, I believe, made his *début* in print, or very nearly so, at the same time in the 'Literary Gazette,' and his genius was so vivid, that I think I can put my finger on some twenty of his pleasing contributions in the year 1818."

The next passage confounds us. Perhaps our readers may be able to unravel it. We

can make nothing out of it, except that Mr. Jerdan fancies himself a peacock.

"An autobiographer being, like a peacock, the hero of his own tale, may be pardoned for the hope that he has created, or may create, some interest in the beholders, by the spread and rustling of his shivering quills. In my case, especially in this volume, the analogy holds tolerably together, for though the bird displays a perfect shower of radiant Suns, and I had only one of a fog-covered appearance to exhibit, yet there is Sun in both cases, and that is enough for any fanciful resemblance."

Here is a little pleasantry about Mr. Jerdan's connexion with the "Literary Gazette," which, we are informed, "had not made great way" before that event.

"Without boast, my accession seemed to put a little heart into it, and if it were up-hill work for a long while, still it was UP, and, but for a few incidental or accidental crosses, would have been UP-PER!"

Not being able to obtain copies of some articles he wrote; he expresses a hope that his friends in "Notes and Queries" will "help him to repair some of his vacuities;" and he tells us an anecdote of Turner, the painter, who took so great a fancy to a boon companion that he "invited him to travel together, and treated him in a princely style, without costing him a shilling." An amiable young lady dies, and Mr. Jerdan says: "Soon after, I spoke my feelings in the following lines, on the affecting event." Of these lines, one of the many examples Mr. Jerdan quotes of his poetical powers, we will make room for a specimen. The first verse states that there are some woes that point to the sky for consolation, and the poem then proceeds—

"Vain, then, to hope, with human dross  
To bid such griefs be o'er;  
Friends can but feel thy fatal loss,  
Thy fatal loss deplore;  
And He who gives and takes away,  
Tell thee is now thy only stay.

"Yet fain would I some comfort shed  
Upon this hour of pain.  
Alas! I cannot! She is dead,  
And will not come again!"

The whole closing with this comforting reflection—

"Who bless'd us in this world shall be  
Bless'd with us in eternity!"

To which might be advantageously added—

"Hallelujah! Hallelujee!"

A line of which, however, we beg to disclaim the paternity. It is the exulting wind-up of a well known epitaph.

Between Mr. Jerdan's prose and Mr. Jerdan's verse, it is difficult to choose; but we cannot dismiss his volumes without observing that we have not quoted these choice specimens from them for the mere sake of provoking a smile. We hope they will be understood to have been culled for a better and a graver purpose. When literature is charged with bestowing inadequate rewards upon its professors, it is desirable to look a little into the claims of the complainants.

Scattered over the volumes are some questionable passages, which, upon reflection, Mr. Jerdan himself will see occasion to regret. Such are the allusions to the wretched fate of the daughters of an old friend (vol. i. p. 18), the introduction of unnecessary details respecting the origin of distinguished persons yet living, and the publication of a letter (vol. i. p. 244), which contained the strict injunction of the writer that it should be destroyed. Mr. Jerdan frequently speaks of his own "genial" disposition and "kindliness of heart," and of the services he rendered to various persons. Whatever we may think of his taste in recording these excellent qualities, we are by no means indisposed to give him full credit for the possession of them; but we must not, therefore, let them pass as excuses for the neglect or violation of social duties. Few men connected with current literature have enjoyed better opportunities than Mr. Jerdan of attaining a final position of credit and security; and if he have not succeeded, we must seek the cause in other sources of misfortune than his overflowing good nature, and the imputed ingratitude of the world.

#### ART. IX.—THE DUKE OF WELLINGTON.

1. *Wellington's (The Duke of) Despatches during his various Campaigns in India, Denmark, Portugal, Spain, the Low Countries, and France.* Compiled from Official and other Authentic Documents. By Colonel Gurwood, C.B. A new and enlarged edition, 8 vols. 8vo. John Murray.
2. *History of the War in the Peninsula and the South of France.* By Major-General Sir W. F. P. Napier. 6 vols. 8vo. T. and W. Boone.
3. *History of the British Empire during the First Half of the Nineteenth Century: being an Introductory Narrative of Events*

*from 1800 to 1815, and the History of the Peace from 1815 to the Present Time.*  
By Harriet Martineau. Embellished with Portraits. 2 vols. Charles Knight.

THE world, like the individuals which compose it, would seem to have alternations of sleeping and waking, of activity and repose. Sometimes long years glide over it in dull and languid monotony; at other times it arouses, like a strong man after sleep, shakes off its lethargy, and condenses a century into a lustrum. Occasionally, for whole generations, History has nothing to record; then suddenly events and vicissitudes of such startling magnitude crowd upon her in such quick succession, that she can hardly keep pace with them. It sometimes happens that one member of the great commonwealth of nations awakes into vivid life, while all around her slumber in a deathlike stillness; and it would seem as if the aggregate energies of humanity were concentrated within her narrow boundaries. Sometimes, on the contrary, an electric shock appears to run through the world, and startle every country into simultaneous activity. In casting our eye back over the pages of the past, we find their interest comprised in the small territory of Greece, and almost in that of Attica, and in the single century which began with the battle of Marathon and ended with the death of Socrates. Then Rome "takes up the wondrous tale," and attracts all attention to herself in the crowded period between the appearance of Hannibal and the disappearance of Augustus. After the commencement of Roman decline, a long interval of monotony succeeds, during which history records little to compel our interest, except the progress and gradual establishment of a mutilated Christianity. For a short time, the Italian Republics of the middle ages throw a strange and lurid lustre over the page. But the first great awakening of Europe took place between the end of the fifteenth and the middle of the sixteenth century, when sciences, religious fervour, literary genius, and sometimes discovery, with all its unforeseen results, combined to irradiate the western world. Since then, the old torpor has never quite crept over us; but in the last quarter of the eighteenth century, an upheaving both of the political and the intellectual world began, greater even than that inaugurated by the Reformation, and is still convulsing society and thought to their inmost depths.

All these epochs have been as prolific in great men as in great events; and none have been more prolific than the last. The peculiar character of the greatness developed

has varied with the nature and requirements of the time. Some periods have been more rich in warriors, some in statesmen, some in artists, in poets, or in thinkers; and the warriors, statesmen, and writers of one epoch have been markedly distinct from those of another. But each greatness has many phases, and rarely, if ever, reproduces itself. We can scarcely compare Pericles with Richelieu, with Burlleigh, or with Oxenstiern; yet we do not know that he had essentially a higher order of intellect. It would be idle to draw a parallel between Sophocles and Shakspeare; yet assuredly we cannot concede the palm of genius to the ancient dramatist. We cannot compare Thucydides and Tacitus with Grote, Gibbon, or Macaulay; yet we would not willingly place the latter on a lower level than their great prototypes. Alexander, Hannibal, and Cæsar, were in the old world what Gustavus Adolphus, Marlborough, Napoleon, and Wellington have been in our modern days; but were probably gifted with no grander genius. And though many of us know more of Aristides and Phocion than of Hampden and of Washington, yet the former characters were assuredly no purer or loftier than the latter.

The three-quarters of a century which has elapsed from 1775 to 1850, has been one of almost ceaseless excitement over the whole civilized world. It has seen, at least seven revolutions,—three in France, one in Belgium, one in Greece, and two in America. It has witnessed the sweeping away, and the replacing, of the landmarks of nearly all the European states. Spain, Holland, England, and France, have lost many of their colonies. Russia and America have made vast strides both in civilization and strength. But the excitement and activity have not been confined to the region of politics alone: Religion, Literature, Art, and Science, have all participated; and every department of intellect and effort has sent forth its conquerors and its grandees. Religion has awakened greater earnestness, and created deeper interest, than at any period since the Reformation. Literature has been preternaturally active, and its productions, as a whole, may bear comparison with those of any preceding period; while Science has made vaster progress, and Art has accomplished grander achievements than in all previous centuries combined.

It is not easy to award the crown of pre-eminence among men of genius, who have followed different walks of intellect; nor is it always possible for contemporaries to estimate correctly the relative greatness of those who have lived and acted among them.

The more hidden idiosyncrasies of their nature, the deeper secrets of their character, are often disclosed only after they themselves have long passed off the stage; and the remote and more signal consequences of their actions, the comprehensiveness and accuracy of their foresight and their insight, and the degree in which they have impressed their stamp upon the age, and influenced its features and its destiny, it sometimes requires generations fully to develop and explain. Often, too, though we may know accurately what a statesman or a warrior has done, we are only imperfectly acquainted with the obstacles which had to be overcome, the exertions which had to be made, or the sacrifices which had to be encountered, in doing it; and it is from a comparison of the deed with its difficulties that we can alone judge truly of the greatness of the actor. Sometimes, too, for long years, brilliancy and good fortune, when combined, will usurp the admiration which belong to solidity and worth, even when less strikingly successful; and a nation is commonly more ready to worship the qualities which dazzle than the qualities which save.

There are cases, however, in which, from a variety of concurring circumstances, these difficulties in pronouncing a sound judgment on the merit of contemporary celebrities do not apply;—in which all the facts and documents needed for forming an opinion are as fully known to us as they can be to our successors; and in which the actions were too remarkable, and their consequences too immediate and vast, to leave us much to learn on this head from the future. Such is the case with regard to the events and actors in the great struggle which immortalized the first quarter of the present century. Such is peculiarly the case with regard to the Duke of Wellington. Every action of his life has been vehemently canvassed both by friends and foes; every part of his career has been described by the ablest historians from the most authentic documents; his own despatches are on record to portray him; he bore the principal share in those transactions which led to the great settlement of Europe; and, lastly, he survived his own great achievements by nearly half a century.

The two men whose names will in after ages stand out in bold relief from the history of the first half of the nineteenth century, are Napoleon and Wellington. Both were eminently GREAT: but in our judgment the Englishman was the greater of the two. Nor do we judge thus from any narrow national partiality, or from any grounds which men of all countries would not equally ad-

mit to be valid. It has, we know, been the fashion of late to depreciate Napoleon—to speak lightly of his genius—to speak harshly of his fame. We do not sympathize with those who write in this tone. Those who grudge the title of “great” to that wonderful man must be either strongly blinded by their animosities, or culpably ill-read in his history, or they must measure him by some fanciful and peculiar standard of their own. If Alexander, if Cæsar, if Hannibal, were great men, Napoleon was a great man too. If the most consummate military genius, if the most profound knowledge of strategic art, if the most comprehensive and far-seeing power of combination, if the most masterly grasp of every subject which he handled, if a faculty of civil organization which has never been surpassed, and a capacity of exciting the enthusiasm and devotion of his followers which has never been equalled, if, in a word, the most magnificent and dazzling success—owed not to fortune, but won by genius, extorted by energy—and a rise from obscure poverty to wider empire than any modern autocrat has wielded,—if the union of all these do not make a man great, of whom can greatness be predicated? It is true he had no conscience; it is true he had no unselfish virtue, and little disinterested affection; it is true that his ambition had no limits, and his moral nature neither loftiness nor purity; but to deny to a man so gloriously endowed and so marvellously sceptred, the epithet of *great*, because he was not also *good*, is a foolish and pedantic misuse of words.

Yet gifted as Napoleon was, and passing wonderful as were the deeds he wrought, we still think that, in the elements of the highest order of greatness, he was inferior to his rival and conqueror. If Wellington had had Napoleon's position, he would neither have committed his blunders nor have been tempted to his crimes. If Napoleon had been compelled to work against the obstacles, to endure the vexations, to encounter the embarrassments, to fight in the fetters, which were the lot of the Duke of Wellington from first to last, his mental defects and his moral weaknesses would have been insuperable barriers to his success. On two grounds, therefore, we assign the supremacy to the English hero. The first is that, while Napoleon was always selfish, Wellington was always conscientious: the Duke was invariably the master of his passions—the Emperor was frequently the slave of *his*. The second ground is, that whereas, Napoleon, as soon as his reputation was established, namely, from 1800 onward, was omnipotent and uncontrolled, and wielded, by his single will, the whole civil and military power of France,—the Duke was always

thwarted and crippled both by allies and countrymen, and was throughout in a position of mortifying, irritating, and incapacitating thralldom to men at home, who had neither ability to comprehend the grandeur of his plans, nor magnanimity to imitate his steady and unselfish patriotism. These points will come out in painful clearness as we proceed in our sketch of the great man whom we have lost.

Both these great men were born in the same year, 1769. The active professional careers of both of them were short. They began and ended in the same year. Their first real services were in 1795, their last in 1815. Both fought their last battle when they were forty-six years of age. Napoleon had gained his reputation when he was twenty-six, Wellington when he was thirty-four. Between the Duke's first great battle as an independent commander and his last—between Assaye and Waterloo—only twelve years elapsed. Both were fought against tremendous odds, and both displayed precisely the same qualities of character. Indeed, from first to last, the most marked peculiarity of the Duke was his consistent *individuality*: he was always himself; he never belied his antecedents, or disappointed those who knew him; he never acted otherwise than as you might have predicted that, under the circumstances, he would act. He displayed the same unshaken coolness and strategic skill in India and at Copenhagen as in Portugal and Belgium; and the same administrative genius and inflexible justice when Governor of Seringapatam, as afterwards when commanding the army of occupation in France. To the last his rigid and inexorable severity was the dread, but proved the salvation of his troops. His first demand, when appointed to rule in the conquered city of Tippoo Sul-taun, and to restrain a triumphant and disorderly army, was "Send me the Provost Marshal, and put him under my orders: till some of the marauders are hung, it is impossible to expect order or safety."

The battle of Assaye first made him celebrated. It is by the battle of Waterloo that his name is most widely known. But it is on his Peninsular Campaigns, from 1809 to 1814, that his fame with professional men, and his chief glory with prosperity, must rest. It was in that immortal struggle—of which we are happy in possessing a record, as immortal as itself—that he displayed that wonderful combination of the loftiest and rarest qualities, both of intellect and character, which entitle him to a place in the very first rank of those few luminaries of history, who have united the special genius of the warrior with the more comprehensive grandeur of the

statesman. The full merit and magnificence of that superb but painful conflict, can be appreciated only by those who read Colonel Napier's history of it in detail, and study there all the maddening vexations, all the countless privations, all the gigantic difficulties, which beset the English general, and the sublime patience, the indomitable firmness, the dauntless resolution, with which he encountered and overcame them all. The French army was the feeblest of his enemies; his conquest of the French marshals, the least and easiest of his victories. He had to uphold, to encourage, to advise, and to control three cabinets; to contend at once not only against the foe in arms, but against the selfishness, the cowardice, the vanity, the incapacity, the opposition, of the people whom he came to save; to struggle with the timidity and imbecility of one government, the weakness and falsehoods of another, the intrigues and ingratitude of a third. He had at one and the same moment—and this, not once or twice only, but habitually and for years—to fight and hold in check Napoleon's veterans, the Portuguese Regency, the Spanish Juntas, and, last and worst, the conceited, insincere, incapable government at home.

Throughout the contest, he was fearfully overmatched. The French had, during most of the war, nearly 400,000 men in the Peninsula, mostly veterans, and commanded by Napoleon's ablest generals. Wellington scarcely ever had more than 50,000, and often not above half this number, if we except the Portuguese regiments under Marshal Beresford, which, though often efficient, well-trained, and courageous, were not to be relied upon like English troops. While the French army was amply supplied with all the munitions and *matériel* of war, and while hundreds of thousands of muskets, swords, bayonets, and cartridge boxes, were sent to the Spaniards, who never used them, but stored them idly in their arsenals, to be taken by the French on the first opportunity; the English army, in spite of the strongest reiterated remonstrances of its commander, was left wretchedly supplied with artillery, and destitute even of a battering-train.\* While enormous subsidies were lavishly wasted by Mr. Canning, through numberless incapable agents, on the Spanish irregular troops, none of which was efficiently expended, and most of which merely fed the corruption of the Junta and their subordinates, our own soldiers were left many months in arrear of pay, and frequently their wants were so neglected by the ministry at home, that

\* The engineering tools sent out were so bad, that our men could do nothing with them, but were dependent on the French instruments which they chanced to capture.—Napier, vol. iv. p. 471.

the Duke had not even the means of purchasing provisions. While the Spanish and Portuguese armies were not only supported, but actually fed by English money, no entreaties could prevail on the English ministers to supply the wants of their own brave troops, who were sometimes furnished with food so bad, that the Duke thought it but just to return half their ration-money; and the splendid victory at Talavera was won by men who for twenty-four hours had tasted nothing save a few grains of corn in the ear. Horses died, and men went into the hospital by thousands, from no cause but insufficient or unwholesome nutriment. While the Spanish and Portuguese troops were clothed and shod at our expense, while our grasping and selfish allies were forwarding fresh applications to the British government, through British agents, for "500,000 yards of broadcloth, 4,000,000 yards of linen, and 300,000 shoes," our own Peninsular troops, though in a state of splendid discipline and warlike efficiency, were so scandalously neglected by those rulers who should have fostered them as the apple of their eye, that their marches were postponed "for want of shoes," and their "clothes so patched that not a single regiment could be known by its uniform." The English commander represented, complained, and remonstrated in vain: intrigue, vanity, and incapacity caused the government to turn a deaf ear to his expostulations; and over and over again the Duke was on the point of giving up the contest in despair and disgust at conduct which, even at this distance of time, makes our blood boil with indignation as we read the narrative.

Speaking of the first siege of Badajos, Colonel Napier writes:—"Thus, the first serious siege undertaken by the British army in the Peninsula was commenced; and, to the discredit of the English government, no army was ever so ill provided with the means of prosecuting such an enterprise. The engineer officers were exceedingly zealous, and notwithstanding some defects in the constitution and customs of the corps, tending rather to make regimental than practical scientific officers, many of them were very well versed in the theory of their business. But the ablest trembled when reflecting on their utter destitution of all that belonged to real service. Without a corps of sappers and miners, without a single private who knew how to carry out an approach under fire, they were compelled to attack fortresses defended by the most warlike, practised, and scientific troops of the age: the best officers and the finest soldiers were obliged to sacrifice themselves in a lamentable manner, to

compensate for the negligence and incapacity of a government always ready to plunge the nation into war, without the slightest care of what was necessary to obtain success. The sieges carried on by the British in Spain were a succession of butcheries, because the commonest materials and means necessary to their art were denied to the engineers." At the time when the ill-fated and ignominious Walcheren expedition was planned, "Sir Arthur Wellesley might have had eighty thousand British troops on the frontiers of Portugal, and he was a general capable of wielding them. He was forced to commence a campaign upon the fate of which the Peninsula—a quick triumph or a long protracted agony of twelve millions of people—depended, with only 22,000, while 60,000 fighting men, and ships numerous enough to darken all the coasts of Spain were waiting, in Sicily and England, for orders which were to doom them, the one part to scorn, and the other to an inglorious and miserable fate. Shall the deliverance of the Peninsula, then, be attributed to the firmness and long-sighted policy of ministers who gave these glaring proofs of improvidence? or shall the glory of that great exploit lighten round the head of him who so manfully maintained the fierce struggle under all the burden of their folly?"

If such were the difficulties heaped upon his path by the ministers who sent him, the obstacles the English General had to encounter at the hands of the people whom he came to defend, were greater still. When he commenced the war in the Peninsula, Spain might be said to be without a government. King Ferdinand was a prisoner in Bayonne; and the management of the usurped country was undertaken by a number of local Juntas, each acting independently, and obedient to no central power; and each making the most inordinate demands on their English allies for immediate and almost exclusive assistance. When a supreme Junta was at last established, in consequence of the remonstrances of the British Government and General, the case was little mended. The Junta was almost without authority; was bursting with corruption and distracted by intrigues. The authorities would organize no plan of defence in concert with the English Commander, or, if they agreed upon a plan, they never adhered to it; they never performed their portion of any contract; they utterly disregarded truth alike in their promises and their sentiments; they engaged to supply the British troops with rations and means of transport, yet habitually left them destitute of both. They monopolized

the contributions of the people, and expended them in rewarding their own creatures. They seized the horses of the peasantry under pretence of supplying the troops, and then left them to die in the sea marshes. They raised large armies, but left them unprovided either with clothes, arms, or ammunition. "At the period when the Marquis of Romana and the insurgents in Galicia were praying for a few stand of arms and five thousand pounds from Sir John Cradock, the Junta possessed many millions of money (mainly furnished to them by England), and their magazines in Cadiz were bursting with the continually increasing quantity of stores and arms arriving from England, *but which were left to rot as they arrived*; while from every quarter of the country not yet subdued, the demand for these things was incessant." Altogether, such a deplorable example of vanity, wickedness, and imbecility was probably never before presented to the world.

Then the army was as bad as the government. The generals would not co-operate, and the soldiers would not fight. By no persuasion or menaces could the Duke ever induce the Spanish commanders heartily and honourably to stand by him. The best and richest opportunities were constantly lost by their tardiness, insincerity, and falsehood. Time after time they placed the British troops in situations of the utmost peril, by breaking their promises and deserting their post. Time after time they were well fed while their English allies were left starving; yet they would not share with them. Time after time large Spanish armies stood by inactive, insubordinate, or panic-stricken, while a few English regiments fought their battle against overwhelming numbers. It was so at Talavera. It was so at Albuera. They abandoned the hospitals they had sworn to protect. They neglected the fortresses they had engaged to repair and provision. They refused even to assist the wounded after a battle, but they were always ready to plunder the dying and the dead. Destitute of truth, courage, or generosity, they were almost more dangerous to us than the open enemy. Lord Wellington at last entirely refused to act with them, or trust to them any longer. "There was," said he in one of his dispatches, "a more serious consideration, viz., the constant and shameful misbehaviour of the Spanish troops before the enemy. We in England never hear of their defeats and flights, but I have heard Spanish officers tell of nineteen or twenty actions of the description of that at the bridge of Arzo-

bispo, the accounts of which have never been published. In the battle of Talavera, in which the Spanish army, with very trifling exceptions, was not engaged—whole corps threw away their arms and ran off, when they were neither attacked, nor threatened with an attack. When these dastardly soldiers run away, they plunder everything they meet. *In their flight from Talavera they plundered the baggage of the British army, which was at that moment bravely engaged in their cause.*" After the awful carnage of Albuera, when of 6000 British only 1500 remained standing when the French were beaten off, Marshal Beresford, when his pickets were set, had scarcely any soldiers left to assist the wounded. In this cruel situation he sent Col. Hardinge to demand assistance from Blake, the Spanish general, who had taken little part in the battle, and to whose indolence and incapacity the frightful loss of the British was mainly attributable. The proud and selfish old ruffian *refused*, saying that it was customary with allied armies for each to take care of its own men! Such were the allies whom Wellington had both to fight for and to contend with.

The Portuguese were nearly as intolerable. It is true that their peasantry were far more generous and friendly; their soldiers, being led by English officers, behaved far better under fire; and their Regency, though to the full as dishonest and intriguing as the Spanish Junta, was not quite so incapable. But the authorities were utterly impracticable; they would neither furnish transports for the commissariat, nor keep the promises they had made, nor supply faithfully the provisions for which they had contracted, and for which they had been paid. The English General was at one time obliged to feed, from the rations collected for his own troops, the Portuguese militia, whose sustenance had been utterly neglected by their own authorities; and this, too, at a time when England was not only fighting the battle of Portugal, and had just freed her from a wasting enemy, but was supporting her government by enormous subsidies. The plans of the English Commander were perpetually thwarted by the opposition, and his best-laid enterprises rendered abortive, by the incurable delays and inveterate faithlessness of the Regency; his remonstrances were unheeded; his orders disobeyed; and on more than one occasion vast stores of provisions and munitions of war, which he had repeatedly ordered the authorities to destroy or remove to Lisbon, were left for the French, who were thus enabled to maintain their position in the country,

and defeat Wellington's most sagacious and laborious combinations. In 1810, when he retired to his lines, having arranged everything for compelling the French to evacuate Portugal, he writes thus: "The French are stopped effectually: in front all the roads are occupied, and they can get nothing from their rear; but all the military arrangements which have been made are useless if they can find subsistence on the ground which they occupy. Now the inhabitants, in flying, *have left behind*, in spite of repeated orders and ample notice, *everything that could be useful to the enemy and could subsist their army*; accordingly they still remain in our front, notwithstanding that their communication with Spain, and with every other military body, is cut off; and if the provisions which they have found will last, they may remain till they are joined by the whole French army in Spain. *It is heart breaking to contemplate the chance of failure from such obstinacy and folly.*" In addition to all this, the Regency threw upon him the odium of every harsh order which military necessity required to be issued, and even desired, by way of increasing his unpopularity, to compel him to take into his own hands the punishment of offenders against their own decrees. Then the jealousy and hatred between the Spanish and Portuguese peasantry—which their respective governments took every means to foster—involved him in ceaseless annoyances; the Portuguese muleteers deserted if he passed the frontier; and the Spanish ones refused to carry stores or provisions for the assistance of the Portuguese troops.

Thus harassed on all hands, thwarted by three cabinets, and compelled to endure the follies and remedy the blunders of them all; reduced to attempt vast enterprises with insufficient means, and to make the blood of his soldiers atone for the incapacity of his superiors and the imbecility of his allies; sometimes obliged to act as a merchant, and often as a banker and financier, in order to supplement the neglect or inefficiency of those who should have served him; it would not have been surprising if he had sunk under the pressure, and resigned the unequal contest. That he did not do so, is perhaps the greatest proof of courage, constancy, and patriotism that could have been given. "Lord Liverpool's intimation (writes Col. Napier) that neither corn nor specie could be had from England, threw Lord Wellington on his own resources for feeding his troops. He had before created a paper-money by means of commissariat bills, which being paid regularly at certain periods, passed current with the people when the national bonds were at

an enormous discount. He now, in concert with Mr. Stuart (our minister at Lisbon), entered into commerce to supply his necessities. For, having ascertained that grain in different parts of the world, especially in South America, could be bought for bills cheaper than it sold for hard cash in Lisbon, and that in Egypt, though only to be bought with specie, it was at a reduced price; they employed mercantile agents to purchase it for the army account, and, after filling the magazines, sold the overplus to the inhabitants. As Mr. Stuart could obtain no assistance from the English merchants of Lisbon, in a traffic which interfered with their profits, he wrote circular letters to the consuls in the Mediterranean, and in the Portuguese islands, and to the English minister at Washington, desiring them to negotiate Treasury bills; to increase the shipments of corn to Lisbon, and to pay with new bills, to be invested in such articles of British manufacture as the non-importation law still permitted to go to America. By this complicated process he contrived to keep something in the military chest; and this commerce (which, Lord Wellington truly observed, was not what ought to have engaged his time and attention) saved the army and the people, when the proceedings of Mr. Percival would have destroyed both. Yet it was afterwards cavilled at and censured by ministers, on the representations of the merchants who found their exorbitant gains interrupted by it.

"Pressed by such accumulated difficulties, and not supported in England as he deserved, the General, who had more than once intimated his resolution to withdraw from the Peninsula, now seriously thought of executing it. Yet when he considered that the cause was one even of more interest to England than to the Peninsula; that the embarrassments of the French might be even greater than his own; and that Napoleon himself, gigantic as his exertions had been and were likely to be, was scarcely aware of the difficulty of conquering the Peninsula while an English army held Portugal; when he considered also that light was breaking in the north of Europe; that the chances of war are many, even in the worst of times; and, above all, when his mental eye caught the beams of his own coming glory,—he quelled his rising indignation, and re-tempered his mighty energies to bear the buffet of the tempest."\*

During the whole of this period, when his patience, which seemed absolutely inexhaustible, was so severely tried, not only by the faults of his own government and the inca-

\* Napier, vi. 474.

capacity of his allies, but by the carelessness and disobedience of too many of his own officers,—and while a temper, naturally stern and peremptory, was severely tried by every imaginable vexation, yet never disturbed or irritated for more than a few moments, or disproportionably to the exciting cause,—the Duke found time to look after and give his mind to the minutest details of the service. Nothing which could in any way contribute to the efficiency of his army or the welfare of his troops, was deemed too unimportant to engage his attention. Indeed few things are more remarkable in the character of this remarkable man than the power with which he could concentrate his whole thoughts upon the immediate matter before him, however critical or distracting were the circumstances around him. His despatches relating to the shoes of the infantry, the use of hair-gloves or the curry-comb by the cavalry, the mode of packing camp-kettles, and the most desirable size of kettle to employ, and many other matters, written during the pressure, hurry, and anxiety of actual warfare, are singular proofs of his indefatigable activity and watchfulness. He had, too, the most marvellous faculty of abstracting his mind from the difficulties and embarrassments of the moment, and bringing it to bear on distant subjects, the treatment of which would seem to require an undivided intellect and a heart at ease. Like those of Marlborough and Warren Hastings, some of his most remarkable despatches on points of general policy, and some of his ablest discussions with ministers at home on their various absurd schemes and proceedings, were penned amid his greatest dangers, and almost in the critical moments of actual conflict. "All these schemes," says Colonel Napier, after enumerating some of the most foolish, "were duly transmitted to Lord Wellington and Mr. Stuart; and the former had, while in the field, to unravel the intricacies, to detect the fallacies, and to combat the wild speculations of men, who, in profound ignorance of facts, were giving a loose to their imaginations on such complicated questions of state. It was while preparing to fight Marmont (at Salamanca) that he had to expose the futility of relying on a loan; it was on the heights of San Christoval, on the field of battle itself, that he demonstrated the absurdity of attempting to establish a Portuguese bank; it was in the trenches of Burgos that he dissected and exposed Funchal's schemes of finance, and exposed the folly of attempting the sale of church property; it was at the termination of the retreat that, with a mixture of rebuke and reasoning, he quelled the proposal to live by forced requisitions; and,

on each occasion, he showed himself as well acquainted with these subjects as he was with the mechanism of armies."

It is curious to compare this passage with the account given by Macaulay of the coolness of Warren Hastings after the deadly struggle with Nuncomar, the great Indian civil authority, which terminated in the defeat and execution of the latter. "The head of the combination against Hastings, the richest, the most powerful, the most artful of the Hindoos, distinguished by the favour of those who then held the government, fenced around by the superstitious reverence of millions, was hanged in broad day before many thousands of people. It is a remarkable circumstance that one of the letters of Hastings to Dr. Johnson bears date a very few hours after the death of Nuncomar. While the whole settlement was in commotion, while a mighty and ancient priesthood were weeping over the remains of their chief, the conqueror in that deadly grapple sat down, with characteristic self-possession, to write about the 'Tour to the Hebrides,' Jones's 'Persian Grammar,' and the history, traditions, arts, and natural productions of India."

Notwithstanding his splendid qualities as a commander, and his sedulous attention to the wants and necessities of those he led, the Duke of Wellington never gained the affection of his troops. Their confidence in his genius was unbounded, but they had no enthusiasm for his person. Though inflexibly just, yet to them he was unbending, ungenial, and severe. He had nothing of the histrionic art of Napoleon, none of the universal courtesy and gentleness of Marlborough. "It seems (says Napier) to be a drawback to the greatness of Lord Wellington's character, that while capable of repressing insubordination, either by firmness or dexterity, as the case may require—capable, also, of magnanimously disregarding, or dangerously resenting injuries, his praises and his censures are bestowed indiscriminately, or so directed as to acquire partisans and personal friends rather than the attachment of the multitude. He did not make the hard-working military crowd feel that their honest unobtrusive exertions were appreciated. In this he differs not from many other great generals and statesmen, but he thereby fails to influence masses, and his genius falls short of that sublime flight by which Hannibal in ancient, and Napoleon in modern times, commanded the admiration of the world."

His coolness in danger, his indifference to obloquy, his hardihood and firmness in adhering to his plans in spite of blame, oppo-

sition, and intreaty, and in suffering no transient schemes to divert his attention from his grand ultimate designs, were displayed in every incident of the Peninsular war. On the evening before the battle of Talavera, with an overwhelming enemy before him, worthless and half hostile allies on his flank, and little apparent prospect of extricating himself from a position in which defeat would have been ruin to his army and to his cause, and would have damaged his reputation irretrievably at home, he was as placid and careless as if he had a clear path and a certain victory before him. He had done everything, he said, that had to be done, or could be done, and he was indifferent to the rest. Notwithstanding the vehement entreaties both of Spanish and Portuguese authorities—notwithstanding the strong pleadings of his own feelings, he resolutely refused to succour Ciudad Rodrigo, because he could only do so at the price of risking the whole object and success of the campaign. Indeed, on most occasions of peril and of bloodshed—

“ in him there was an air  
As deep, but far too tranquil for despair :—  
A something of indifference, more than then  
Becomes the bravest, if they feel for men.”

On two occasions, however, his natural sympathies overpowered his acquired insensibility ; and the iron warrior was shaken by a passionate burst of grief—once was when he beheld the frightful butchery at Badajos ; the second time, when his aid-de-camp reported the irreparable losses at Waterloo. In both cases the carnage had been foreseen ; but the object was deemed worth the price.”

The Duke's noblest quality was his unswerving CONSCIENTIOUSNESS. In this he stands out in splendid contrast to nearly all the great captains in history. The motive spring of Cæsar, Napoleon, and Wallenstein, was personal ambition ; that of Charles XII. of Sweden was a boyish passion for glory ; the nobility of Hannibal was dashed by the vindictive hatred in which his enterprise originated ; the fame of Marlborough was tarnished by the low cravings of a mean and grasping avarice ; but the Duke of Wellington, though far from insensible to glory or reckless of character, seems throughout his consistent career to have listened solely to the voice of patriotism, and the sentiment of duty. He kept one object steadily in view ; amid all the difficulties and vexations of his Peninsular campaigns, he felt that he was there to do his duty, to defeat the enemy, to save his

country. No thought of self—no paramount preference for his own fame—none of that prudish sensitiveness to the purity of his own reputation, which is the form selfishness often assumes in able and honourable men, ever seemed to cross his mind. He never feared to encounter obloquy, if it lay in his way ; he never shrank from putting to hazard his own professional reputation, if the welfare of “ the cause ” seemed to require it. Over and over again he undertook enterprises where failure was probable, and when failure would have been fatal to his fame ; but where great political purposes rendered it desirable that the effort should be made. No general, tender of his character, would have ventured on the assaults of Badajos and Ciudad Rodrigo. The physical courage which he displayed in chasing the French from Portugal and Spain, was as nothing compared with the moral courage which he manifested in facing the ignorant and disgraceful clamours of the English opposition, and the weak, timid, and sometimes criminal suggestions of the English ministers—in fighting against desperate odds—in retreating in the face of still more formidable and malignant clamour. We question whether in the whole of his public career he ever once acted from any considerations except those of public duty. In this he was a marvellous contrast to the politicians whom he served. “ There was a ministerial person in 1810, who in his dread of the parliamentary opposition, wrote to Lord Wellington, complaining of his inaction, and calling upon him to do something that would excite a public sensation ; *anything provided blood was spilt*. A calm, but severe rebuke, and the cessation of all friendly intercourse with the writer, discovered the general's abhorrence of this detestable policy.”\*

This single minded conscientiousness is the more remarkable, inasmuch as the Duke was never addicted to the profession of any high-flown sentiments of morality. He did his duty without much protestation of his determination to do nothing else. But for simple, straightforward, disinterested devotion to principle, among leading statesmen, we can find his parallel in Washington alone.

The political qualifications of the Duke of Wellington were scarcely, if at all, second to his military ones. Indeed, he was often compelled to be more of a great politician than of a great general. His campaigning movements had frequently to be guided rather with reference to their po

\* Napier, iii. 218.

litical than to their military effects. He had to encounter risks, and undertake enterprises, which the common rules of generalship would have forbidden, out of considerations in which generalship had no share. He had to adventure bold strokes, which prudence would have condemned, in order to keep up the spirits of both the English and Portuguese people. He had to resign splendid chances, to endure vexatious delays, to submit to deplorable inaction, because such was the timidity and downheartedness of the English ministry, that he dared not risk the loss of a single brigade. Repeatedly he felt called upon to put to hazard his military reputation, lest the great political objects of the war should have been endangered. He had always to bear in mind the ultimate purpose of the great struggle, and to look beyond the actual battle, or the immediate campaign. Those who regard him only as a great captain will both judge him unjustly and appreciate him ill.\* He was, in fact, pre-eminently a statesman; and notwithstanding the imperfect success, short duration, and speedy overthrow of his two administrations in England, we consider that he was a truly great statesman. But his statesmanship was of the Administrative, not of the Parliamentary or Legislative order. He was one whose genius lay in action, not in words; and in a system in which dialectics and rhetoric bear sway, in which oratory opens the path to greatness, and covers every species of incapacity, he was over-matched and out of place.

Therefore, though a statesman of a first-rate order, he was not a statesman of the modern British order. "From the time of Charles II. to our own days, a peculiar species of talent, parliamentary talent, has been the most valuable of all the qualifications of an English statesman. It has stood in the place of all other acquirements. It has covered ignorance, rashness, and the most fatal maladministration. A great negotiator is nothing compared with a great debater; and a minister who can make a successful speech need trouble himself little about an unsuccessful expedition. This is the talent which has made judges without law, and diplomatists without French; which has sent to the admiralty men who did not know the stern of a ship from her bowsprit, and to the India Board men who did not know the difference between a rupee and a pagoda; which made a foreign secretary of Mr. Pitt, who, as George II. said, had never opened Vattel, and which was

very near making a chancellor of the exchequer of Mr. Sheridan, who could not work a sum in long division."\*

In such a system the Duke of Wellington, who knew how to govern but not how to argue and harangue, had no fair field, and could scarcely meet with due appreciation. He was a statesman not of the class to which Bolingbroke, Pitt, Canning, Peel, and Thiers belonged; but of the order of Richelieu, Alberoni, Oxenstiern, Hardenberg, abroad, and of Walsingham, Cromwell, Clive, and Hastings, at home. He was a statesman rather for Spain, Austria, or France, than for England; and in England would have been better placed under the House of Tudor than under the House of Hanover. He had a profound contempt for the popular capacity: † what he had seen of the abortive attempt at self-government, and of the miserable intrigues and imbecility of popular assemblies in Portugal and Spain, had fortified this contempt; and the proceedings of the English parliament, the language of the public press, and the conduct of popular orators, and of the liberal opposition, during his Peninsular campaigns, were assuredly not calculated to weaken it. Hence his opposition to parliamentary reform. Hence his sagacious estimate—exaggerated perhaps, but certainly not far astray—of the added difficulties which that measure would throw in the way of the king's government. He saw that such an organic change would render the government of the country a *new act*—and an act of no ordinary perplexity and labour. He did not know the extent to which the country could govern itself, and supplement the deficiencies of its rulers. But whenever the Duke was called upon to *act* as a statesman, all his native superiority stood forth. Whatever he did, he did well. His management of the army of occupation in France showed what he was a negotiator. His speeches and conduct at the period of Catholic emancipation showed his conception of the duty of an English minister. He was no party man. He considered solely what was best to be done under the circumstances—what course was most desirable for the country—what course would be most likely to ensure its welfare, and avert the evils which menaced it;—and this course he recommended simply and pursued steadily, without reference to its inconsistency with his previous opinions, or its obnoxiousness to the party whose leader he was com-

\* Macaulay, "Sir W. Temple."

† The Duke was essentially aristocratic in his notions of government. See Napier, vi. 444, (and in many other places.)

\* Napier, vi. 633; vi. 405—407.

monly considered. He regarded himself always as holding office merely to save his king and country. He looked at and treated each subject and each emergency as it came before him, not as a party chief, but as a British administrative statesman.

There are several remarkable points of similarity between Wellington's career and character, and those of three of the ablest English commanders of modern times. Like Clive, he was distinguished for the marvellous vigour, promptitude, and daring of his operations—for the steady and unswerving gaze which he fixed upon the special object he had in view—for his courage in encountering any odds and any obloquy. He showed a capacity for government and politics in no way inferior to that of Warren Hastings, with the same indomitable and indefatigable patience, the same impassive temper, the same sublime imperturbability. But he never stooped to the unscrupulous violence of Clive, or the enormous injustices of Hastings. It is between Wellington and Marlborough, however, that the parallel runs closest. Both had to struggle against incapable ministers and factious enemies at home. Both were constantly hampered, and often nearly ruined, by the results of parliamentary intrigues, and the inherent stinginess of a democratic government. Both were driven nearly distracted by jealous, faithless, and incompetent allies. Both found it a harder task to fight their friends than their enemies. Wellington had to contend with the "cat and dog" hatred of Spaniards and Portuguese, and the incapacity of both governments. Marlborough had perpetually to mediate between the Austrians and Dutch, to soothe their jealousies, pacify their pride, appease their unceasingly recurring quarrels, and endure their scandalous misbehaviour. Both were repeatedly obliged to forego their own wishes, and suppress their own feelings, for fear of endangering an insecure but indispensable alliance. Marlborough was offered the viceroyalty of the Netherlands, which would have given him the power and independence necessary to the carrying out of his plans; but he magnanimously declined it, to allay the exasperation of the Dutch. Wellington was offered the government of Portugal, which would have been invaluable to him as a general; but he feared the political mischief of such an arrangement, and he refused it. Both generals were repeatedly prevented from following up their victories by the most vexatious interferences at home, and the impracticable behaviour of the allied troops. Both were often compelled to merge the daring general in the

prudent and far-seeing statesman.\* In management of men, Marlborough was the superior. Everybody loved him, and nobody could resist him. His powers of fascination were unrivalled. He could persuade any one to anything. On the other hand, the fame of Marlborough is sadly chequered and tarnished by early vices and mean desires. That of Wellington has no drawback. And if true greatness consists in overcoming obstacles—and must, therefore, be measured by the amount of the obstacles overcome, in proportion to the means of surmounting them—the greatness of Wellington must be estimated far beyond that of Marlborough; for there was no comparison in the relative magnitude of the difficulties which they had to encounter. He has left behind him an enduring reputation, founded not on splendid days, but on painful years—not on the success of hazardous achievements, which might have been owing but to the inspiration of a happy moment, but on toilsome campaigns, won against heavy odds by skilful combination, by deliberate science, by fortitude which nothing could exhaust, by sublime daring, and still sublimer patience.

---

#### ART. X.—CONTEMPORARY LITERATURE OF ENGLAND.

*[Under the conviction that brief and incidental literary notices, such as have been hitherto appended to the more important portion of the "Westminster Review," are of little value in a quarterly periodical, it has been determined to substitute for them a connected survey of the chief additions made to our literature during the preceding quarter. The foreign department of the Review, which, since the incorporation of the "Foreign Quarterly" with the "Westminster," has been confined to notices of a few foreign publications, will also, in future, be conducted on a new plan. American, French, and German literature will be treated in separate articles of a like comprehensive character with the one on English literature. It may happen that, for various reasons, the works noticed in each article, especially in the department of foreign literature, will not fall strictly within the limits of the previous quarter; but it is intended that the entire series shall give as complete a retrospect of the course of literary production during the year as the prescribed space will allow.]*

#### Theology and Philosophy.

THE past quarter has turned out a few novels, and the usual, or probably more

---

\* For particulars, see Alison's "Life of Marlborough."

than the usual, quantity of travels, but it has not otherwise been characterized by activity or enterprise in the world of letters. In Theology there is nothing new, though there is what is perhaps more indicative of progress in that direction, a re-issue, in a new and cheaper form, of Parker's "Discourse of Religion"<sup>1</sup> and Newman's "Essay on the Soul."<sup>2</sup> These works are now within the reach of all classes, and, as the ripe fruits of genius and learning, their popularity is destined to increase, in proportion as they become accessible to the mass of the people. Parker's noble burst of prophetic utterance is still echoing within us, and has ineffaceably impressed itself on the mind of the age, as alike powerful to pull down a decaying superstition and to build up a new faith. Mr. Newman's treatise, though on the same subject as Mr. Parker's, resembles it only in its courageous tone. It is a calm philosophical inquiry into the positive foundations of natural religion. By the *soul* he understands "that side of human nature upon which we are in contact with the Infinite, and with God, the Infinite Personality." The spontaneous rudimentary developments of religious emotion; the spiritual phenomena which accompany our sense of sin; the struggling of the soul after a sense of its personal relation to God; its progress in spiritual growth; its hopes and aspirations concerning a future life, with concluding reflections on the state and prospects of practical Christianity: these are the topics successfully investigated. The present edition is supplemented with a chapter of Introductory Remarks, settling accounts between Mr. Newman and his critics, and a Preface, reiterating his maturest opinions on the Jewish and Christian Scriptures, which we here present to the reader.

"The books differ extremely in moral value, as also in literary importance. Nevertheless they form, in some sense, an organic whole, since the later books grew out of the earlier ones; the more puerile conceptions were gradually laid aside or transformed, and new ideas also were brought in gradually, and were grafted on to the old stock. We can therefore speak of the religion as having a certain unity of its own, in spite of the enormous diversity between Genesis, Leviticus, Isaiah, and John.

"This unity seems to me mainly to depend on

<sup>1</sup> "A Discourse of Matters pertaining to Religion. By Theodore Parker. (Catholic Series.) London: John Chapman. 1852.

<sup>2</sup> "The Soul; its Sorrows and its Aspirations: an Essay towards the Natural History of the Soul as the True Basis of Theology." By F. W. Newman. (Library for the People. No. 4.) John Chapman. 1852.

the belief of the SYMPATHY of the Most High with his devoted servants, and His desire of their moral perfection.

"In this belief I think that there resides a prolific germ, which makes the Bible a book of vast worth and a root of goodness to those who wisely venerate it. The doctrine may be found, *occasionally* expressed, in the best of the Greeks or Romans; but it *pervades* the Bible, and therefore is constantly re-appearing in every form of Christianity."

In Philosophy we have a new edition of "Tennemann's Manual," and a re-issue of "Fourier on the Passions of the Soul." A translation of the former by the Rev. Arthur Johnson, was published at Oxford in 1832. This Mr. Bohn has put into the hands of the Rev. J. R. Morell, who has revised, enlarged, and continued it to the present time, so that in this compact volume the stream of metaphysical speculation may be traced by the inquiring reader from Thales to writers so recent as Proudhon and Pierre Leroux in France; Emerson, Henry James, and Parker in America; Wilkinson, Charles Bray, and Newman in England. It incorporates the additions given by Professor Wendt in the last German edition, and continues the development of German philosophy to its latest manifestation,—“the Will's Phases” of Schopenhauer and Plancke. It gives a few of the latest divarication of the new Hegelian School, as exemplified in Strauss and Feuerbach. Chapters are added on Swedenborgianism, Animal Magnetism, Mystical Socialism, and Phrenology. There are, besides, the minor conveniences of a Kantian Vocabulary, a Chronological Table, and—what Bohn never neglects—an Index. By the way, we observe that this volume is the first of a new series bearing the title of "Philological Library," which, if not a misprint for "Philosophical," mis-classifies the work.

Mr. Morell is also the translator of Fourier's work, but how it ever came to be translated at all is a marvel. And yet such works are read and admired, on the principle, we fear, of *omne ignotum est pro magifico*. Swedenborg, Fourier, and Andrew Jackson Davis, have each thousands of disciples, who profess to understand and to believe all, and more than all, that those seers have propounded. Is there any deception on either side? We

<sup>3</sup> "A Manual of the History of Philosophy." Translated from the German of Tennemann, by the Rev. Arthur Johnson, M.A. Revised, enlarged, and continued by J. R. Morell. H. G. Bohn. 1852.

think not. Abnormal minds will always find abundance of other minds similarly constituted, who will sympathize with them. Great truths lie at the root of Fourier's theories, though people, who dig into them, do it less for the sake of the fundamental conceptions, than for the pleasure of floating in a wide expanse of speculation, amid airy "clouds of the mind," which twist themselves into fanciful images of familiar objects, and often reflect sudden beauties impossible to more substantial structures. Only such as feel a "passional attraction" toward mysticism, will find it a "*travail attrayant*" to peruse mystical books. In England they form a very small class: in Germany and France they are more numerous. The later mystical developments of the former country have been pantheistic; those of the latter socialistic. Fourier's advent happened at a fortunate epoch for his success as an author. For in spite of all the horrors of his logic and rhetoric he *did* succeed—he was popular—his books sold, and brought him profit! The people were intoxicated with Fourierism. "*Travail attrayant*," and bucketfuls of lemonade, formed a pleasant dream. For in the grand Fourieristic millennium the ocean was to be converted into that delectable beverage—so he promised them, and probably they believed it!

#### *History and Biography.*

It is gratifying to observe, that the example set by Dr. Andrew Combe, in divesting Physiology of its technicalities, and expounding the great laws of the science of popular language, is now becoming more extensively followed. Indeed, the popularization of science is one of the great intellectual characteristics of our age. Philosophers hitherto have been too prelatial, not condescending to teach the people, but only the people's teachers. As authors, too, their works have been always professional, never popular. But in proportion as the "dignity of labour" has been recognised and talked about, there has been a growing perception of the dignity of instructing the labourers. From the platform and the press, the working classes, and, consequently, *all* classes, have of late been directly addressed on theoretical or practical science, as well as on other subjects, by the men most eminent in their respective departments. Books of the very highest authority, combined with the greatest possible simplicity, are rapidly multiplying. Such a book is "*The Celt, the Roman, and the Saxon.*"

\* "*The Celt, the Roman, and the Saxon.*" By

It is a popularization of British Archæology, and comprises, in a neat portable volume, the results of extensive erudition and research lying scattered in numerous and costly works. One takes up such a book with satisfaction: it combines those two desirable elements which so frequently manage to shun each other's company—cheapness and goodness. A work like this on the pre-historic annals of Britain was much wanted, and the want is here supplied.

"Its object (says the author) is to give a sketch of that part of our history which is not generally treated of, the period before England became Christian England—the period, indeed, which, in the absence of much documentary evidence, it is the peculiar province of the antiquary to illustrate. Every article which is turned up by the spade or the plough is a record of that history, and it is by comparing them together, and subjecting them to the assay of science, that we make them tell their story."

In carrying out his plan, archæology and history are made to walk hand in hand. We are introduced to Britain at the time of the Roman invasion; and after a narration of its conquest and a description of its contemporaneous antiquities, we take a journey through *Roman* Britain—this is a geographical excursion; then we make a closer inspection of a Roman town—the walls, towers, and gates, the houses, baths, temples, theatres, &c.; after which, we take a walk into the country, to look at the villas and villages, the fields and forests; the manufacturing interest then presents itself, and potteries, glass-works, iron-works, &c., appear on the programme; immediately, other interesting topics are taken up, connected with religion, domestic life, or military organization. In this way we get a view of Britain under Celt, Roman, and Saxon. The author discards the new theory of dividing antiquities into metallic periods characterized by the use of bronze or iron, and treats them simply according to the races to which they belonged—clearly the most safe and satisfactory method. The work is profusely illustrated with plates and woodcuts—a useful, and, in fact, indispensable help to the clear understanding of the subject.

The "*Memoirs of Dr. Chalmers*"\* are at length completed; they form four bulky volumes, and contain much that is of general interest, with not a little that tends mere-

Thomas Wright, F.S.A. Hall, Virtue, and Co. 1852.

\* "*Memoirs of Thomas Chalmers, D.D., LL.D.*" By W. Hanna, LL.D. Vol. IV. Edinburgh: Constable. 1852.

ly to impede the progress of the narrative, which slowly winds its way amid the documentary deposits accumulated throughout its course, instead of darting onward with the directness, rapidity, and force of a cataract, like the life which it portrays. Chalmers was a man of *action* rather than of *thought*; and his writings will be forgotten before his works and labours of love. Physically and intellectually, he was born to be an agitator; and circumstances were singularly favourable to his success in that capacity. His concentration and courage always compelled him to adopt his own course of action, and his own style of writing. He necessarily, therefore, became a man of marked individuality and power. There was in him, too, such an intensity of vital force to drive the elementary, but well-constructed machinery with which body and mind were furnished, that his energy was irresistible. We were privileged to hear him speak on two of the grandest occasions in his career. The whole effect was produced by his earnestness; and our wonder was, how so much spontaneous vehemence could flow from so little originality or real brilliancy of thought. His originality merely consisted in declining to imitate Hume, Blair, or Robertson, and in expressing himself after his own fashion. It is not our intention, however, to discuss the *man*, but only to notice the *book*, which is mainly occupied with the chief event of his life—the Disruption of the Church of Scotland—an event mainly brought about by his influence, as a teacher of theology, upon the rising ministry at that time. It may be regarded, therefore, as the culmination of his labours, and gives an epic grandeur to his history. It happened in the seventh decade of his life, which he had long consecrated in his mind to sabbatic purposes; but it was his destiny to be an agitator to the last. The student who started an opposition Class, which threatened to be the ruin of a university chair, ultimately started an opposition Church, which, in strength and resources, at once rivalled the National Establishment!

The name of Thomas Chalmers is one of which Scotland may justly be proud, not more for his public services than for his private virtues. It is interesting to see the child-like simplicity and freshness which he preserved throughout. His concentration kept him so long in one line of thought, and in one phase of life, that the sources of human interest kept opening up around him even in old age. In the wide field of intellectual speculation he had hardly broken ground. He crept into new regions of

thought like a child learning to walk; and some of his exploits in that direction belong to the curiosities of literature! There is this to be said, however, that he was accessible to new influences, and that is rarely the case with men in his position. Chalmers in Scotland, Arnold in England, and Channing in America, have each impressed themselves upon the age in a remarkable manner, and are among the finest specimens of the clerical character which the world has ever witnessed.

The "Life of the Venerable Kirby,"<sup>†</sup> the entomologist, is an important work, but the biographer, though nominated by Kirby himself, has executed his task in a very indifferent manner. The materials seem to have been abundant enough, and he had the advantage of intimate acquaintance with the subject of his sketch, but he lacks the tact necessary for such a work. The researches of the naturalist are, to an unusual degree, encumbered with technicalities, and show rather *what* he observed than *how* he observed. *This* was the proper material for his *life*; the other we have in his *works*; and to print letters which were merely those works in embryo, is more curious than instructive. And such letters! Those to Mr. Spence (whose name is inseparably associated with that of Kirby as the joint author of the "Introduction to Entomology,") "were mostly written (says that gentleman) on sheets of large folio paper, so closely, that each would equal a printed sheet of sixteen pages of ordinary type. These we call our 'first-rates,' or, sometimes, 'seventy-fours,' the few on ordinary-sized paper being 'frigates;'" but one I find from Mr. Kirby, which he calls the 'Royal Harry,' written on a sheet nearly the size of a *Times* supplement."

The following simple incident was the occasion of directing his attention to what became the absorbing pursuit of his life. It is related by himself:—

"About half a century since, observing accidentally one morning a very beautiful golden bug creeping on the sill of my window, I took it up to examine it, and finding that its wings were of a more yellow hue than was common to my observation of these insects before, I was anxious carefully to examine any other of its peculiarities, and finding that it had twenty-two beautiful clear black spots upon its back, my captured animal was imprisoned in a bottle of gin, for the purpose, as I supposed, of killing him. On the following morning, anxious to pursue my observation, I took it again from the gin, and laid it on the win-

<sup>†</sup> "Life of the Rev. W. Kirby, Rector of Barham." By the Rev. J. Freeman. Longmans 1852.

down-sill to dry, thinking it dead, but the warmth of the sun very soon revived it; and hence commenced my further pursuit of this branch of natural history."

Kirby's genius consisted in a fine faculty of observation. Nothing escaped his small sharp eyes,—so small that they were a subject of ridicule at college, but the source, to him, of fortune and fame! What he saw he could describe, and confining himself to what suited his capacity, he may be said to have attained immortality by the mediocrity of his powers. He was an industrious student, but his mental processes were slow. He made no figure at the university, and not from idleness, but through sheer necessity, preached other people's sermons. He lived to the age of ninety, and was for sixty-eight years parish-priest of Barham; and it is questionable if, with his quiet plodding habits, he could have made the acquaintance of all the insects in his neighbourhood in a much shorter period. Botany and Entomology became his favourite studies, not as *branches of science*, but because flowers and insects were *visible* objects, presenting themselves to his organ of individuality in his daily walks. Having no faculty for abstract speculation, and no taste for science, *as such*,—situated, moreover, in a retired rural district in Norfolk, with plenty of leisure and little to occupy it—the extension of his friendship to spiders and butterflies was simply a gratification of social feelings otherwise objectless. His biographer estimates him after a very different fashion, and believes that he was a great entomologist in consequence of being a great man. The *real* life of Kirby would not have been sufficiently dignified for detailed description, nor could Mr. Freeman have stooped to describe it. He is not quite sure that his venerable friend's pursuits fitted his sacred vocation, and more than one apology is made for their impropriety. There is an eager desire to starch and stiffen the old man a little, by representing him as a high churchman; and such he was, if that character consists in an attachment to old-fashioned doctrine and discipline. But he was no partizan, and would not have sanctioned some occasional samples of clerical intolerance which disfigure his biography. Though his death occurred only two years ago, he belonged to the last century, and was old-fashioned in other things besides his churchmanship. We are told here of his continuing, to the last, to wear his shovel-hat, and of the antiquated cut of his coat. There were no modern innovations at Barham: the monotony of

insect life pervaded the entire parish; but the world outside was fast moving forward, and Mr. Kirby lived to travel by the Eastern Counties Railway, and to witness such a phenomenon as a reforming bishop! The spirit of progress, however, was not permitted to penetrate the vicarage, which was a picture of primitive simplicity. To the very last, came the toast of "Church and King," after dinner, then the "Royal Family," followed by the Conservative statesmen whom he delighted to honour, and finishing with one expressive of the full measure of his charity and goodwill to all mankind—viz., "The Bishop of the Diocese, and *the best of the Whigs!*"

If we have in Kirby a submissive son of the church growing up into the good old parish-priest—one after George Herbert's own heart—we have the other side of the picture in the "Life of William Sidney Walker,"\* whose tragic fate presents a striking contrast to the peaceful and prosperous career just sketched. Walker was a Cambridge student, religiously educated, whose prospects as a clergyman were destroyed by his doubts upon Christianity, and who, instead of achieving those brilliant results which his friends anticipated from his talents and acquirements, wasted his life in writing verses and essays for obscure periodicals; and, after suffering for years under a broken-down constitution, dropped into a premature grave, where he would have lain, buried in oblivion, had not the Rector of Rugby published his "Remains," with a memoir, which (as is somewhat usual now with clergymen who undertake this duty to their heretical friends), makes but a slight allusion to what was the permanent condition of his mind, and the key to his whole interior life. In all these particulars his history offers points of coincidence with that of John Sterling, but there are no others—none, at least, biographically developed—of sufficient vital affinity to afford a ground of comparison between them. Of the two, Sterling's mind was more richly endowed, Walker's more highly cultured. The one was a thinker, the other was a scholar: They differed still more in temperament: the spirit of the one being active, flexible, and buoyant; that of the other passive, stubborn, and desponding.

Walker's history is soon told. He was connected by birth with the Milners, the leaders at that time of the evangelical section in the church. He was physically of a delicate constitution, and somewhat deform-

\* "Poetical Remains of William Sidney Walker, with a Memoir." By the Rev. J. Moultrie, Rector of Rugby. J. W. Parker. 1852.

ed. His mental development was precocious. We are told that, when eighteen months old, he could repeat all the current nursery songs: that he learned to read after one lesson; that, when two years of age, he could read the history of England, and that in his fifth year he "had read history extensively, and poetry still more devotedly." In his tenth year we find him translating Anacreon into English verse as a private amusement, and soon after engaged in writing an epic poem, which was published while still in his teens. He had every line of Homer by heart, and could compose Greek verses himself perhaps much faster than Homer could. Being introduced to Sir James Mackintosh, it was stated that the young poet could "turn anything into Greek verse." "Indeed," said the baronet, "what do you think of a page of the 'Court Guide'?" The proposal was accepted, and the said page was turned into Greek hexameters! At Eton "he wrote satires, after the fashion of the 'Dunciad,' on particular boarding-houses; prologues to be delivered at Long-Chamber theatricals; pungent epigrams on masters and præpostors." Both at Eton and Cambridge, he obtained his full share of prizes and scholarships, becoming at last a fellow of Trinity, with which his promotion ended. A brilliant youth, this; but what preparation was there for manhood, and for buffeting the billows of the life-ocean on which he was about to launch forth? The storm had already begun to gather, and, though long averted, it burst upon him at last—Cambridge, and the classics serving him in no stead then!

He went to Cambridge under the auspices of the Evangelicals, and attached himself to Mr. Simeon, of low church celebrity, though lax enough in his notions of ecclesiastical propriety to attend occasionally the Baptist Conventicle to listen to the eloquence of Robert Hall. But, notwithstanding the protective influence of circumstances so favourable to his theological safety, his independent mind was led by inquiry to burst the bonds of traditionalism. It is admitted by his biographer, that "his mind had been, up to this time, what it indeed continued to the last, of an essentially religious character;" but that, "like some of the most distinguished heretics of the present day, he combined with a highly sensitive conscience, and with deep and pure religious affections, a morbidly sceptical understanding." This is termed a "disease." It would appear, indeed, to have been at that time a sort of university epidemic, which "few, probably, of his most intellectual contemporaries at

Cambridge—very few certainly of the academical generation immediately succeeding his—escaped;" but what in their case was cured by holy orders and matrimony, in his case became "chronic and incurable." He communicated his mental difficulties to Mr. Wilberforce, one of his patrons, who prescribed Paley and a chapter in his own work on Practical Christianity—a mixture which failed to relieve the patient. "The doubts which he entertained were apparently those of a rational and self-possessed scepticism," but in the end this scepticism becomes associated with insanity, which, though a source of regret, somewhat relieves the perplexity of his biographer. It is not asserted that the two things were related as cause and effect, but they were in mysterious juxtaposition. It is as evident, however, that the one was the result of intellectual strength, as the other was the effect of physical want and weakness and solitude. After holding his fellowship for ten years, he had to resign it, or take holy orders. In this crisis he held fast his integrity, and for the remaining sixteen years of his existence ate the bread of poverty in obscure lodgings in London. He was not without friends: under that designation he could reckon Moultrie, Malden, Præd, Townsend of Durham, Derwent Coleridge, Arnold, Bonany Price, and the Bishop of Manchester: but friends could do little for one so hopelessly incapable of taking care of himself or of his money. Præd, however, in particular, generously made a permanent provision for him; and Mr. Crawshay, of Newcastle, offered him a home in his own house, discharging his debts after his decease, besides undertaking the responsibility of publishing his works, which are said to be of some value.

The compositions in the present volume are the productions of a poetic mind accustomed to clothe its sentiments in chaste and classical language. Though the muse is not rich, there is a Cowperian sweetness in it which will redeem it from oblivion.

"The Life of Lord Langdale" is a prosaic picture of a somewhat prosaic man, if we are to judge either by any very high standard. It was his lordship's fortune to have greatness thrust upon him while living, and his misfortune to be condemned when dead for not achieving what should never have been expected of him. His own estimate of himself was modest and truthful. He was an able, plodding, conscientious man, adapted for routine work, well fitted

\* "Memoirs of the Right Hon. Henry Lord Langdale." By Thomas Duffus Hardy. 2 vols. Bentley. 1852.

for a legal practitioner, and making as good a judge as any on the bench; but he neither had the genius requisite for advancing legislative science, nor the force of character indispensable for urging forward legal reform. He had acquisitive abilities sufficient for anything to which he might turn his attention. He was a Senior Wrangler at Cambridge, and after studying Medicine betook himself to Law; and was such a hard, mechanical man, that when fatigued with law he relaxed himself with mathematics. By dint of punctuality, industry, perseverance, and those minor morals which depend upon a sober temperament and a good wearing brain, he became a rising man at the bar, where he seemed destined to spend his life, and to be honoured with a respectable obituary in the "Law Magazine;" but having become a devout disciple of Jeremy Bentham, he rose in the esteem of his teacher in proportion to the passivity of his intellect, and received from him the compliment—"that Bickersteth was of all his friends the most cordial to law reform, to its utmost extent." Thus accredited, it was naturally expected that he would do something to justify his reputation; and in 1836 he was elevated by Lord Melbourne to the Mastership of the Rolls, for the express purpose of carrying out those reforms (especially in Chancery) which the progress of opinion had forced upon the legislature. But not to say that little could be done by one man, however well intentioned, in a position which really required all his energies for the conscientious discharge of its immediate duties, Lord Langdale was about as ill-qualified for reforming Chancery as the present Archbishop of Canterbury for reforming the Church. The cleansing of an Augean stable is ever an Herculean task, and can never be performed by a man, who, in addition to sheer want of strength, is too fastidious to endure the stench and confusion which such an undertaking creates. A community may be gradually regenerated by some pleasant homœopathic process; but reform, where tithes and taxes, salaries and fees are concerned, is a surgical operation, which, when a bad case, requires an iron-nerved doctor for its performance, and is never submitted to by the patient but in desperation, lest something worse befall him.

But, as we have said, though Lord Langdale disappointed the expectation of his friends, he satisfied his own. He, at least, was not guilty of over-estimating his capacity or his achievements. His life was uneventful; but as a public man, his biography is interesting from its notices of

contemporary characters and circumstances, and will furnish a good deal of raw material for political historians.

### Law and Politics.

But while we are complaining that Law Reform makes such slow progress, here comes a Jeremiah, in sackcloth and ashes, deploring the destruction of law and lawyers altogether. In a work entitled "The Advocate,"<sup>10</sup> Mr. Cox tells Lord Denman, in a flattering dedication, "that the glory of the bar of England has departed, that its sun has set, and that it is doomed to destruction, or to a change of character and position that will be more lamentable than destruction." This is very alarming, and the reader may be ready to ask, "What is up?" Nothing, so far as we can see, but this County Court business, which causes the loss of a few fees, the effect of which will be that "hundreds, nay thousands, must go out of the profession." Which only shows that there are too many in it. Mr. Cox is not concerned for himself, but he patronizes his junior brethren, and makes a most feeling appeal in their behalf. He apprehends the same evils from law reform that the Tories did from parliamentary reform. Much they are reformed, after all! But as then it was the crown that was in danger, now it is the bench; for he argues, very cogently, that "if juniors cannot now live by the bar, whence are to come our future leaders—whence our judges?" The case is evidently desperate. Mr. Cox is "unable to discover any way of escape." With a Roman magnanimity, he encourages his lordship to meet his fate like a man. "If we must fall, let us fall with dignity."

Not so fast: may not this book avert the calamity? The author had been accustomed to contemplate Lord Denman, when at the bar, "as the ideal of an advocate," and proposes to give such directions as will guarantee a new generation of model advocates. We will not weary our readers with details as to the mode in which Mr. Cox discharges his office of Mentor to the incipient advocate; but we can safely recommend his work to such of them as may wish to explore the depths of duncedom in professional places.

While the book just dismissed is for lawyers, here is another for legislators, which is calculated to be useful to some

<sup>10</sup> "The Advocate: his training, Practice, Rights, and Duties." By E. W. Cox. Vol. I. Orosford. 1852.

member of parliament, not very clear about principles and parties, but anxious withal to do the state some service, if he only knew how. Let him, in that case, read Mr. Moseley's "Political Elements,"<sup>1</sup> the object of which is—

"To pass under survey and contemplation the events that have transpired in this country within the last thirty years—to try if there are not some truths, some principles, to be found, that may serve to explain the past and to enlighten the future. By events, I do not mean those facts that more commonly fill the pages of history. He who expects to find here a nice detail of the strife of interests, the manœuvre of parties, the violence of opposition, the subterfuge of ministers, the rumor of the clubs, and what the papers said, may pass on. There are other events, higher—the causes, the effects, the compounds, the abstracts, and the emanations of these—as these are but the compounds, the causes and effects, the abstracts and the emanations of others. The fact of the existence of a desire for political improvement—the fact of the existence of causes of that desire—the facts which give rise to those causes—the effects which the desire produces—how it operates—these, too, are events no less true than those we speak of. It is these we seek out, which we treat of here—the false, though it come from men of truth—and wisdom, though it come from fools."

The principal points expounded are, "The principle of reform," "The principle of conservatism," "Political parties," "Political progress," "Public opinion," "Legislative science," and "The functions of a legislator."

"The principle of reform" is shown to have its foundation in a constitutional element of human nature, viz., the desire of improvement—the yearning for perfection, which gives birth to an ideal of future glory, in the light of which we become dissatisfied with present attainments. "The principle of conservatism" is shown to be equally constitutional, arising, on the one hand, from the natural fear which men have for venturing upon paths which are new and untried, and, on the other, from the sentiment of veneration, or love of what is old and familiar to us. It is contended, consequently, that, as both principles are constitutional, they are universally operative, "affecting all functions—all orders—all parties—all classes; and if not all alike, or all adequately, still all to a powerful extent." And it is further shown that "a people that would progress in political institutions, would improve in political well-being, must adopt both these principles as its rules of legislat-

ive action, each in an equal degree—that if it does so adopt them it must progress, and that if it does not, it never can progress." It is proved that, practically, all "Political parties" are more or less influenced by both principles—the reformers manifesting a disposition to be conservative, and the conservatives manifesting a disposition to be progressive; and that both parties are thus useful as the representatives of principles which are respectively necessary to the equilibrium of the state, and to the progress of society. The author accordingly adopts the principle of "progress by antagonism." From the collision of parties, there come righteousness and truth, as light is produced by the neutralization of colours.

A similar antagonism presents itself between the government and the people. "Public opinion" puts itself forward as a power, but it cannot be an *absolute* power, any more than the principle of reform. Admitting its immense influence, the question is, how is it to be identified? Public meetings, petitions, the press, and individual observation, are all deficient and unsatisfactory. And, even when identified, public opinion can only form the raw material of legislation. "It is not till it has been operated upon by 'Legislative science,' till it has been sifted, sorted, refined, and mixed with other ingredients, that it becomes useful." But in the present imperfect state of legislative science, good government must depend, after all, upon the character and qualifications of the *men* who govern. "The functions of a legislator" become, therefore, the next subject of inquiry. Does he represent his constituency or the whole country? Is he a mere spokesman, through whom the country and his constituency express themselves, or how far is he bound to exercise his own judgment on the measures brought before him? It is maintained, in reply, that the elective franchise itself belongs to the *community*, though vested in the constituency, which is consequently bound to exercise it, not as a private right, but as a public trust—a trusteeship; and that, even under what is called universal suffrage, this would be, and must be, the case. It follows, that the representative, though appointed by the constituency, is the servant of the community, and owes his first duty to his country. His office is a public institution for public purposes; its functions are defined; and the electors have no power to alter them, but only the right of *presenting* the individual who is to perform them.

<sup>1</sup> "Political Elements: or, the Progress of Modern Legislation." By Joseph Moseley, B.C.L. J. W. Parker. 1852.

"The constituents (he says) are the best representatives of the feelings and wants of society

as to legislation, and the best judge of the fitness, general capacities, and political principles of the men who will make good legislators. And, therefore, the constituency should have, and has, full scope in exercising its functions to that end, and up to that extent. And there its powers do, and ought to cease. If it go further, and by extracting pledges, or by dictating, or in any other way interferes in the act of legislation, it interferes with what it has neither the right nor power of dealing with properly."

Mr. Moseley's book is rather a popular discourse than a scientific treatise, and would have answered its purpose much better had it been more condensed. The same ideas and the same illustrations are reiterated till they become tedious. The staple illustrations are Catholic Emancipation, the Reform Bill, and the Repeal of the Corn Laws—these three, always together, and generally in the same order. We venture to say, that they are introduced more than twenty times in this manner. The style, moreover, is loose and conversational, with a lawyer-like affectation of precision which keeps a sentence see-sawing through half-a-dozen clauses till it becomes equilibrious. So many words tend to suffocate rather than elucidate the few, but important ideas propounded.

A political treatise of a more elaborate character is comprised in a new work by Mr. Cornewall Lewis,<sup>12</sup> which aims to render the same service to legislative science that Bacon's "Novum Organum" did to physical science. As yet we have only acquired, by serving an apprenticeship to traditional skill, the *art* of legislating, as formerly we were familiar with the *art*—and *only with the art*—of money-making. But it did not long escape the observation of a scientific age, that it was both possible and desirable to ascertain the laws which regulate the production and distribution of wealth, the result of which is, that we are now equally familiar with the *science* of money-making. And it is not doubted, that a similar application of scientific methods to political questions will lead to a science or system of legislation, which all intelligent men will admit to be true, and not to be disobeyed with impunity. Eternal laws will then supersede individual caprice, and absolute decrees. It is impossible, therefore, to over-estimate the importance of endeavours in this direction, or the salutary influence which the mere recognition of such an extension of the empire of scientific investigation must exert upon the legislation of the country. A stronger tendency of the age than the absolutism of the Cossack, is the ab-

solutism of science. The publication of the "Novum Organum" may be said to have determined two centuries ago the destiny of Europe! The present treatise, however, does not profess to expound a system of politics, but merely the *logic* of such a system. Its object is—

"To survey this foreground of political philosophy, with the view of furnishing a guide to the political student who seeks to reason for himself, and to form an independent judgment upon any department of politics. On the one hand, it does not aim at establishing any political theory, or inculcating any system of political doctrine; on the other hand, it does not pretend to be a logical treatise, but it avails itself of logical rules, established by professed writers on logic, and is merely concerned with their application to politics. It makes no claim to novelty or invention; but it seeks only to extend to politics those methods of observation and reasoning which experience has proved to be most effectual, and which are employed with success in other departments of knowledge. Without proposing to determine truth, it proposes to be instrumental in promoting the determination of truth by others."

But though thus restricted in its object, the work is most comprehensive in its range of discussion, and exhaustive in its treatment. There are few political questions, or political facts, which are not, in some way or another, introduced; and taking the notes along with the text, there are few facts of *any* kind which are not to be found in this encyclopedic work. The preliminary chapters, beginning at the beginning of the subject, and showing the incapacity of the inferior animals to form a government, give as much information about their way of life as would form a history of animated nature. Anything in the text which is suggestive of anything else, whether of surplus facts or parallel passages in other writers, ancient or modern, is thus supplemented in the notes. *Apropos* of the taming of animals, we have a note on the *etymology* of the word. *Apropos* of the use of an almanac to a politician, there is a note on the *history* of almanacs, and on the derivation of the term, with a reference to an encyclopædia for further information! This may, with all propriety, be called pedantry. Except for the citation of authorities, the introduction of foot-notes indicates either an error of judgment, or an incapacity for good composition; and the multiplication of them not only proves an inconvenience to the reader, but is wanting in due respect for his intelligence and taste. For an author to introduce the sweepings of his brain into his book is an impertinence. It is unfortunate that this work is conceived and executed in a scholastic spirit more befitting a monk than a modern

<sup>12</sup> "A Treatise on the Methods of Observation and Reasoning in Politics." By G. Cornewall Lewis. 2 vols. J. W. Parker. 1852.

member of parliament, and that its influence will hence not extend greatly beyond what consists in the simple fact of its existence.

### Education.

Some important suggestions touching the work of practical education will be found in two little books, which we hail as indicative of the progress this great question is making in influential quarters. Of our two authors, one is a clergyman,<sup>13</sup> and the other an inspector of schools.<sup>14</sup> Both are enthusiastic educational disciples of the Dean of Hereford, and advocates of the principles and plans carried out by that dignitary in his famous school at King's Swinborne. Mr. Symons acknowledges that "a very extensive inspection of schools of all kinds, at home and abroad, for twenty years," has failed to give him so much insight into the subject as he has derived from the Dean's "hints," written and oral; while King's Swinborne furnishes to Mr. Zincke the model from which he constructs "the School of the Future." The two works, however, though thus derived from a common inspiration, differ widely in character, if not in tendency. "The School Economy" is "a practical book on the best modes of establishing and teaching schools, and of making them thoroughly useful to the working classes, by means of moral and industrial training." It is a book on the *machinery* of education. "The School of the Future" is "a sketch of the solution which time appears to be preparing for the different educational questions of the day." It is a book on the *character and conditions* of the educational provision demanded by the circumstances of the age and country. Mr. Symons, accepting the "Minutes of Council," gives his thoughts about the kind of *teaching* required. Mr. Zincke's observations refer rather to the kind of *school* required. The one turns his attention to the improvement of schools for the *working* classes; the other deprecates such schools altogether. For *class* schools he would substitute *territorial* schools; and for the poor he would substitute the *people*. Mr. Symons advocates government schools, and government aid; Mr. Zincke contends for *national* schools and *local* aid, either as subscriptions, rates, or fees—prefer-

ring the last as most in accordance with his main idea, which is that of having a school in which all the people of the district will have such a personal interest, that it will necessarily be well conducted, and well supported. This can only be secured where *all* classes unite to establish a *common* school, by which they will bring the best education to their children, instead of being compelled, as on the present system, to send their children from home for the best education. From the contiguity of the population this is now deemed a practical, while various other social considerations combine to render it a very desirable measure of educational reform. The term *revolution* will perhaps appear more appropriate when we have allowed Mr. Zincke to explain his scheme in his own words:—

"It may be as well to state at once what is meant when it is said that the schools to be proposed in these pages ought to be such as that the children of the middle, and even of those above the middle classes, might attend them with advantage. It is not supposed that many children from these classes would frequent them at first; nor, of course, would they ever do so, unless it became very manifest that to do so would be greatly to their advantage. What I shall endeavour to show is, that in these days we ought to have, and that we easily might have, schools in which a better education might be given to all, than the children of the upper classes are now receiving—at all events, for the first five or six years of their school career, at the schools now appropriated for their special use; and that we shall never have good schools, or make any great advances in popular education, as long as we adhere to the plan of establishing schools for the labouring classes exclusively."

Now on a government, or rate-supported system, it would be as practicable to establish schools for the whole community as for a particular class; and on the voluntary principle, a good school may be started as readily as a good omnibus; but Mr. Zincke's argument is, that till rich and poor alike patronise the omnibus—till the former cease, from motives of "interest" or duty, to keep their own coach and take their chance of a clean and comfortable seat in a common conveyance, there can be no "great advances made" in the improvement of public vehicles. He might as well argue that till we abolish first, second, and third class carriages, and adopt one class for all, as in America, we can have no good railway communication. A scheme like this involves a vast social revolution. A common school will be attended only by a common class. It is so in America, which excludes the slave population from her schools,—consistently enough, in this

<sup>13</sup> "Some Thoughts on the School of the Future; a Sketch of the Solution which Time appears to be preparing for the different Educational Questions of the Day." By the Rev. Foster Barham Zincke, Vicar of Wherstead. Longman. 1852.

<sup>14</sup> "School Economy: a Practical Book on the best modes of Establishing and Teaching Schools," &c. By Jelinger Symons, B.A. J. W. Parker. 1852.

respect, that she does not regard them as constituting a class at all: they are chattels—things. Mr. Zincke's complaint should be directed, not against the present constitution of our schools, but against the present constitution of society. His language implies, it is a pity that we are not all communists. It may be a very pleasant sight for a clergyman to see peers and peasants worship at the same altar, and this may suggest to him the desirableness (for his levelling doctrines have an ecclesiastical, not a political origin) of their children being taught in the same school-room: but we venture to think that the socializing influence of the church has been over-estimated. People meet there, as they meet on the street: the contact is remote and temporary. Not so that of the school. If in the former you have the *minimum* of social intercourse, in the latter you have the *maximum*. These difficulties may have been surmounted at King's Swinborne, but King's Swinborne is not England. Social equality among children is only possible or expedient where it is practically recognised among their parents; and before it can triumph in the school it must triumph in the community. So long as rich and poor exist, they will have different interests and institutions practically exclusive. The idea of one church and one school may satisfy the sense of parochial symmetry, but it does not satisfy the conditions of educational organization laid down by the author himself at the outset of his discussion. These conditions are, that all must be taught; that every one must have the means of acquiring that quality and quantity of education that will be most conducive specifically to his own and the general advantage; and that, further, we must take society as we find it, and adapt education to the demands of the present, so as to prepare the people for the destiny of the future. But instead of a *relative* system such as these conditions demand, he lays down an *absolute* system, which shall be the *ultimate* system, capable of being put into present operation—of working in harmony with present interests—of supporting itself by its own merits—of adjusting itself to our changing circumstances—of absorbing all anomalous institutions, till, finally, it reign without a rival! Why this, of course, would be a perfect system; but too perfect, we fear, to be practicable. By aiming to establish its relations with the future as firmly as with the present, it loses its relative character entirely, and becomes a mere Utopian dream. Like everything else Utopian, however, it is very fruitful of ideas of great practical value, leading to such radical results, that, but for their ideal origin, they would in all likelihood

never have been otherwise adopted, nor advocated with such clearness, directness, and unswerving consistency. It is a thoroughly liberal book to come from a clergyman, and its principal recommendation is the tone of earnest and faithful remonstrance in which he addresses the gentlemen of his own profession. Mr. Zincke is fully convinced of the democratic destiny of England; his sympathies are with the people; and all his efforts seem to be intensely directed to their elevation.

Mr. Symons concentrates his attention upon the school of to-day. The main design of the "School Economy" is to show "how to make schools thoroughly useful for poor children," and the main feature of his system is to associate mental and moral training with industrial labour, on which he remarks:—

"I am convinced not only from long observation of the existing shortcomings in the ordinary schools, but by practical experience of a different system at Quatt and other industrial schools, that efficient moral training can be best accomplished where industrial labour out of school is combined with religious and secular instruction in school; and I believe horticulture and farmwork by far the best adapted for the purpose. It seems to have these recommendations as regards moral training: first, the child is thereby taught to be useful, and receives perhaps his earliest lesson in labour. This is a great step in moral elevation, and herein does industrial employment distance the play-ground, which affords no such advantage. In the next place, the work done is of a kind to call into operation not only more of the faculties of mind and body, but also of the moral feelings and perceptions. Thirdly, horticulture has a tendency to turn the mind to God. . . . All this obviously points to a different order of schools than we at present possess, save in some exceptional cases. It also demands another order of teacher. It is by more intimate intercourse than that of the old style of mere master and scholar that faults are known and corrected, virtues developed and nursed, sympathies strengthened, minds opened, and knowledge improved. The field is a fine sphere for effecting this. I believe that schools without industrial and moral training fulfil but part, and that the least important part, of education. It is not too much to say that mere schools cannot educate. I believe this to be true even for the higher and middle classes of the people; but it is infinitely more true and forcible when we are dealing with poor children, who require both moral and physical régime."

It is not intended to form skilled workmen, but only to give boys "a handiness for work, and a habit of industry." The object is to educate simultaneously the *entire* nature—to let the boy begin as he will have through life to go on, and to have communities of children organized and governed on the same

principles that are recognised in the parent communities from which they have sprung, and into which they have to grow. The school is to be a colony, in which the institutions and laws of the old country are introduced, till the colony acquires the strength requisite for independent national existence. Not only, therefore, is reproductive employment introduced so as to train the young to habits of self-support, but "trial by jury" for all misbehaviour, so as to instil habits of self-government. The pandects for such miniature commonwealths are furnished in this little work, where any one ambitious of establishing a juvenile empire may learn "how to start and maintain schools," and "how to teach reading, writing, and cyphering;" with full details about "the building and organization of schools," "religious education and moral training," "industrial training," and "the school farm." He will, by perusing a page or two, be initiated into Mechi's method of manure-making, and shown how to manage the manure-cart, and handle the sub-soil prong, with other things "too numerous to mention."

On the subject of religious training, Mr. Symons distinguishes between religion and theology, yet pleads for the introduction of the Church catechism; thinks it "impossible to insist too strongly on the necessity for constant and zealous teaching of its full meaning;" and has even persuaded himself that Dissenters admit "the extreme merit of this composition." When a boy has done wrong, he would ask him which of the commandments he has broken! He would illustrate the doctrine of atonement "by the various modes in which men can make amends to men for wrongs done by them. *God only can make amends to God* (*i. e.*, one God to another), and hence a divine atonement in the blood of the Saviour was required." His industrial system will be a much more efficient method of infusing religion than this. Mr. Zinke would leave the religious question entirely to the decision of the school managers, "who will be fathers of families, and will have a greater interest in the character of the religious instruction given in their respective schools than any other parties can possibly have." And he justly adds, that "it will be far more easy to give a religious tone to the kind of instruction proposed for these schools, than either to our present system of classical education, or to that given in our commercial schools, or to the reading, writing, and arithmetic, accompanied with catechism and texts, of so many of our parochial schools."

### Travels and Topography.

The American expedition to Japan has reawakened, for the time, so much public interest in that island-empire, that a special supply of information has been provided to meet the demand. Besides the republication of Captain Golownin's amusing narrative of his romantic captivity in 1812, Mr. Charles MacFarlane has collected all the accessible information, ancient and modern; and whoever reads his book\* (which is well worth the reading) will find that we know perhaps everything that there is to be known, either about the country or the people, and that certainly we know as much about Japan as about any other Eastern nation. The country was once as open to foreigners as England is at this day. The books are even numerous which contain accounts of voyages thither, and travels in the interior. Mr. MacFarlane speaks of possessing "what might almost be called a Japanese library. These books are in Latin, Portuguese, Spanish, Italian, French, Dutch, German, and English. They vary in date from 1560 to 1850. The contributions furnished by the Dutch, or by the German medical officers in their service, are perhaps the best, as well as the most numerous." Of this possession the author has made good use in the compilation of his own work, which is intended to survive the immediate occasion which called it forth, and will at least serve the purpose till we get the narrative of the American expedition, and the report of the Topographical Engineers, who will be sent, by the authority of Congress, to survey the conquered country; for if America does not intend to "annex" Japan, it is quite expected of her, and she may as well do it now: she will not have the chance again. The game must be played out; England, Russia, and America must divide the unappropriated territories of Asia and Africa amongst them. Empires are once more to swallow up the nations of the earth, and Constitutionalism, Absolutism, and Republicanism will then draw nearer to their respective destinies. Having said thus much, we beg to express our entire approval of the avowed object of the American expedition, which is, to demand access to the ports and coal-mines of the country. This involves a doctrine which we are glad to see recognised—viz., that a government is not the absolute master, but only the *trustee* of

\* "Japan: an Account, Geographical and Historical." By Charles MacFarlane. With numerous Illustrations. Routledge and Co. 1852.

anything within its territory which Nature has placed there for the benefit of the whole world. To obstruct the development of steam-navigation in the Pacific, by refusing coals on equitable terms, and to make her seas the terror of seamen, by closing her harbours even against vessels in distress, or by confining the shipwrecked mariners in cages, is to place herself beyond the pale of toleration; and America, or any other power, has the right to tell her that she must either mend her manners, or cease to have the control of her own conduct.

Of travels in America there is no end. A voyage across the ocean has become as common as a trip across the Channel. Emigrants go over and perambulate the whole extent of "Uncle Sam's Farm," before fixing on a settlement; naval officers go ashore—take a run for a couple of thousand miles up the country, by river and rail, to the head of Lake Michigan—and are back to their ship while it has been filling its water-casks, and replenishing its stores; young gentlemen spend their summer holidays, shooting on the prairies; and ladies, in search of health and religious recreation, instead of going to Bath or Leamington, adventure on the waters of the Atlantic, and after a fortnight's purgatorial treatment at the hands of Father Neptune, they are ready for the excitement and fatigue of a twelvemonth's apostolic "visitation" of churches, prayer-meetings, and Faneuil Hall gatherings. In this way Mr. Casey,<sup>10</sup> Captain Mackinnon,<sup>11</sup> Mr. Sullivan, and Mrs. Duncan, have contributed their observations,—each of a different phase of American life. These are all good books, and none of them are superfluous. Mr. Casey's plea for publishing is, that "the views given of America, and the passage thereto, have usually been taken from the poop-deck, and Astor House—and are consequently hackneyed." His observations were taken from "'tween decks," and from "the byways as well as the highways." His remarks are shrewd, expressed in rough but often eloquent language. He is obviously a self-educated man, and is rather ostentatious of his acquaintance with poetry and philosophy. Though his book is written in *New York*, it is printed in *London*, and we "guess" that the author is from *Ireland*: it is, therefore, two-thirds English, and evidently written for English readers, but under the influence of a strong anti-English feeling. The woes

of Erin are not forgotten when her expatriated sons reach the land of promise. The sentiment of retaliation is deep and deadly in the Celtic race, and is not likely to remain inoperative, when once it is felt as a common consciousness in the breast of millions. Nor is it confined to the emigrants of the Exodus: it may be said to be an *American* feeling,—always excluding, of course, that portion of society whom culture has rendered cosmopolitan rather than national. Mr. Casey's language on this point is very strong. "It is impossible (he says) to mix in *general* American society and fail to observe that there is a feeling of implacable hatred to England, as a nation, pervading it." The two nations are the Jews and Samaritans of modern history. They have peculiar reasons for preserving peace; but they manifest, as we have recently seen, a strong disposition to make any trifling dispute the occasion of war. The Americans have the mistaken notion that the English of the year 1852 are the same as in the days of the "old king," and that it is but a necessary act of prudence on their part to maintain a reciprocity of opposition and contempt. The suspicion is altogether childish, both in its character and origin. As, for instance:—

"It is [was] an article of faith with the school-boys of England, that one Englishman can beat three Frenchmen, and there is not a schoolboy in the woods of Michigan or the cities of the coast, who will not tell you that the Austrians were beat by the French, the French defeated by the English, and the English were whipped by the Americans. In both cases, when the boy has grown a man, John Bull squares off with perfect confidence at any three frog-eaters, and Uncle Sam taps his rifle, and coolly 'calculates' he can rub out any three Britishers in creation."

But Captain Mackinnon was made the subject of a "calculation" still more cool, and, at the same time, more serious than this. Strolling, one day, on the beautiful prairies in Wisconsin, he encountered a tall, gaunt Yankee pioneer, who had been a soldier in Mexico and California, and bore the name and title of Captain Ezekiah Conclin Brum. The said captain had a proposal to make to the British government, through his brother officer. He took him into his log-hut, and showed him a British infantry musket, which he had recently got direct from England.

"Well, captain, did you ever see such a clumsy varmint in all your born days? Now, captain, look out of the doorway; do you see that *blased* stump? It is seven feet high, and broader than any man. It's exactly one hundred and fifty yards from

<sup>10</sup> "Two Years on the Farm of Uncle Sam." By Charles Casey. Bentley. 1852.

<sup>11</sup> "Atlantic and Transatlantic Sketches." By Captain Mackinnon, R.N. 2 vols. Colburn and Co. 1852.

my door. I have fired that clumsy varmint at the stump 'till my head ached, and my shoulder was quite sore, and have hardly hit it once. Now, then, captain, look'ee here" (taking up his seven-barrelled revolving rifle, and letting fly one barrel after the other), "I guess you will find seven bullets in the *blased* stump. I will, however, stick seven playing cards on the stump, in different places, and if you choose will hit them all." He then offered to exchange shots at one hundred and fifty yards, himself armed with his rifle, and the other with the musket. But this was prudently declined. The English officer was then asked, if he would be one of two, three, or even six, each with a musket, to encounter this single rifle, but even this challenge was not accepted. Now, came Captain Brum's offer to the British Government. He undertook to enlist five thousand Yankee marksmen, each armed with a rifle like his own, and kill all the "Injuns" at the Cape of Good Hope, within six months of landing, for the sum of five million dollars. "We should be ekal to thirty thousand troops with such tarnal, stiff, clumsy consarns, as them reg'lation muskets is. We should do it slick, right away."

This comical proposal gave rise in Captain Mackinnon's mind to grave reflections, not only as to land fighting, but naval engagements. It was Nelson's opinion that "small arms in tops, through fatal to a few men, never decided an action." And yet, what would have been the result if the tops of the "Redoubtable" had been manned by marksmen like our friend Ezekiah? The result would have been, that every man on the "Victory's" upper deck would have been killed in a few minutes. "This fatal result may be confidently anticipated in any future war with America or France. In America especially they are preparing rifles that can be discharged twenty-four times without loading." The calculations which the Author makes on this subject afford ground for grave apprehension to this country, and ought to occupy the serious attention of the government. But as there is no hope of improved railway management until after immolation of a bishop, so the loss of a battle may be necessary to open the eyes of those in authority. It is painful to find a British officer indulging in language of such bitter complaint against the Admiralty as occurs more than once in these volumes, and as could only escape from the pen of one meditating a transhipment of himself to the American navy, where his Celtic impulsiveness would certainly find a better field than in England.

His head, like his book, is full of "notions," which here subject him to ridicule, but which there would at least be taken up and tested. He saw many instances of this in the Brooklyn dock-yards, and other national establishments, where he found ex-British officers, gunners, and artificers, who had carried thither the fruits of their ingenuity and experience. If we are not mistaken, this report of his observations in those quarters, which only a naval inspector would think of looking so narrowly into, contains revelations of a nature to startle English readers. In this respect, these volumes are of more than ordinary value. Their Author is a man of sagacity and practical genius, suggesting improvements on most things that come in his way, and in all taking a lively interest. He is even too "cute" sometimes altogether to escape ridicule from Jonathan himself, who has no occasion to create so much disturbance in the Bay of Fundy, if he would only take our author's advice. For it is here asserted that "a greater quantity and more variety of fish may be found on the shores of the United States than in any other place I have ever visited. The reason why America is not as plentifully supplied as any other part of the world, is simply because the people do not use the means." On showing them what means they must use, they "ridiculed the 'Britisher' who should come over from Europe to teach the Yankees to catch fish." But he made a practical trial himself, and succeeded; and is not unwilling to offer his personal superintendence "to add a new and important branch of commerce to the United States." This would be a more rational and effectual method of terminating the fishery dispute than an international duel; and would, moreover, furnish another illustration of the failure of protection leading to efforts and giving birth to expedients productive of increased prosperity instead of apprehended ruin.

Another suggestion of some importance in connexion with the feebleness of our national defences is thrown out in the second volume, in the shape of a "Gunnery-Mate's Yarn." It relates to the arming of the smaller vessels of steam mercantile-marine with Congreve rockets. There are 750 steamers belonging to the various ports of the country, condemned by the Parliamentary report as useless for the defence of the coast, which, if properly equipped with these rockets, would be "more than a match for the largest fleets the world could muster to attack this country." Such is the subject of the "yarn," to which, not having space to spin it out, we simply call atten-

tion, regretting that every suggestion of importance is coupled with an expression of want of confidence in those at the head of affairs, and with an ominous threat of carrying it elsewhere. The recent commission appointed by the Duke of Northumberland is an auspicious indication of improvement for the future.

Mr. Sullivan,<sup>10</sup> as the son of a Rear-Admiral, is more becomingly patriotic and conservative. "I left England (he says) strongly biased in favour of our government and institutions; I returned with all my predilections strengthened by a comparison with those of our cousins in the West." He further admits that he had "a strong prejudice against the American people;" which vanished on acquaintance with them, having met "as agreeable women and as gentlemanly men in America as the world can produce." He has some other prejudices to get rid of before he can do justice to all parties. In Boston he sneers at the martyrs of Nonconformity, and at the puritanical traditions still cherished in that city. He finds that, as there is "no Established Church in America, dissent (?) and unbelief flourish in their rankest growth." Finding that the Episcopal church ranked only fifth or sixth in point of numbers, and not higher in point of respectability than the Baptists, he becomes "convinced that an Established Church is the only, certainly the best, means of ensuring the proper amount of order and decency in the conduct of Divine service." Boston is the manufactory of "new religions," among which he reckons Unitarianism and Transcendentalism. On the former he sagely remarks that, "as in arithmetical unity is next to nothing, so in religion the belief of a Unitarian is very close to no belief at all;"—a good arithmetical argument for polytheism. Of the latter it is observed, that "they find it very easy, after reasoning themselves with a great deal of labour into a disbelief in the existence of Two Persons of the Trinity, to extend the doubt to the Third Person;"—a sentence which displays at least as much discourtesy and theological ignorance as wit.

According to Mr. Sullivan's account, the "Reading for the Rail," which suits the American taste, is not of a very refined order. "The books which command immediate sale on the railroads, steamers, &c., are such works as 'The Mysteries of the Court of St. James,' 'Amours of the Children of George III.,' and novels of a highly

sentimental tendency, such as 'The Evil One unveiled,' 'The Frantic Footman, or the Prodigal Reclaimed,' and the trash contained in them is quite incredible, hardly worthy of the *Weekly Dispatch*, or the lowest journal in England." This is unquestionably exaggerated.

These "Rambles and Scrambles," however, are, upon the whole, excellent. The object of the author was pleasure, and in pursuit of this he visited localities which escape the notice of flying tourists. Besides going "far West," and down the Mississippi, there is the novelty of yachting in the West Indies, with descriptions of the forests of Guiana, the valleys of Chacao and the Aragua, and the Lake of Valencia,—all beautiful scenes, and sufficiently unhackneyed to admit of an exciting volume.

Our lady-traveller<sup>11</sup> devotes two chapters to slavery, and takes a very sensible and practical view of the subject. Liberia is like "baling out the ocean with a bucket." In Canada they are not in a climate that suits them. Nor would it do any good to let them spread among the white population on free and equal terms. She proposes, therefore, to give up to them a state for themselves at the south. This is not a bad idea; for though America cannot enact abolition, she can purchase it; and might turn her emancipated children to some account in furthering her policy of annexation, which is to colonize the territory (as in the case of Texas) with her own citizens, and to let the demand for annexation come from themselves.

We are, upon the whole, very much pleased with Mrs. Duncan's book. She has great tact in authorship. Her notes are arranged *topically*, not topographically. She begins with "The Children," "The Common Schools," "Sabbath Schools," "The Boys' Meeting" (Ragged Schools), "Collegiate Schools"—then proceeds with the "Churches" and ecclesiastical institutions—then comes to topics of more general interest, "The Cities," "Hotels," "Domestics," "Funerals," "Prisons," "Islands," "Railways," &c. Quite a cyclopedia of information about subjects which have an interest for those to whom a little pleasant gossip, on things sacred as well as secular, is not repulsive. The most interesting thing we have found in the volume, is a plan for well-placing (to use an Owenism) orphan children. The grand difficulty in social economics is to get all the shirts and

<sup>10</sup> "Rambles and Scrambles in North and South America." By Edward Sullivan. Bentley. 1852.

<sup>11</sup> "America as I found it." By the Author of "A Memoir of Mary Duncan." Nisbet and Co. 1852.

all the shirtless into proper relations: in America they are trying to bring together the fatherless and the childless on a plan of mutual accomodation. Two ladies in Boston have started an organ in which both parties may advertise their wishes. The advertisements are arranged in separate columns, the "Homes for children," on one side, and the "Children needing homes" on the other. Some of the advertisements are very touching. An orphan is wanted to fill up a blank in the family, and must have "light eyes and hair," as the case may be, to restore the image of the lost one. The scheme is meeting with general approbation, and is being carried out with success. It is a very ingenious way of establishing a Board of Supply and Demand in a new department of commerce. Mrs. Duncan expresses herself highly gratified with her transatlantic visit. She went thither "with cordial feeling and ardent expectation, and was not disappointed." And if her conclusions sometimes differ from those of other observers, she is, at least, entitled to say that this is "America as I found it."

Just one bit of quotation for those whom it may concern. It relates to the hotels—everybody has a remark about the American hotels.

"One day, being at leisure to observe the proceedings of my neighbours, I saw a very respectable-looking lady reduce one-half of an oval slice of bread to the shape of a horse-shoe by one goodly bite that she took out of the middle. This lady introduced herself to me in the saloon, and—O Dickens! O Trollope! can ye bear the dismal truth?—she told me she was a Londoner! A gentleman did tell me, that he saw at a New York hotel dinner, one person give his fork to another, with 'just stick that fork into that potato for me, will you?' His surly unneighbourly neighbour did as he was requested, and *left it sticking there!*"

We have heard of a clergyman who got a good collection from his congregation by telling them that they were already booked for a certain sum; and as an expedient which was so successful from the pulpit may not be without effect from the press, the public are politely informed by the author of the "Lands of the Messiah,"<sup>30</sup> that they are already booked for "ten thousand copies" of that work, and that "a handsome sum" has been given to him in anticipation of such an extraordinary sale. To a critic with any mischief in him, such in-

<sup>30</sup> "The Lands of the Messiah, Mahomet, and the Pope, as visited in 1851." By John Aiton, D.D., Minister of Dolphinton. Fullarton and Co. 1852.

formation might only have provoked an attack, while to one charitably disposed, it might have been rather perplexing. But our author was not concerned about contingencies: he knew that he had written a good book, and he was very glad to get a good price for it. The author of the "Life of Henderson" must now be an old man, but he writes with great spirit and enthusiasm. This "jaunt of about ten thousand miles" is evidently the great event of his life, and has moved every muscle of his body, as well as every faculty of his soul. He had accomplished "what from his earliest recollections had been the desire of his heart—a journey into the Bible-Lands of the East, into the once-stirring localities of Western Asia, and homeward through the classic countries of Greece, Sicily, and Italy." He has heard (as a *parliamentary* fact!) that "not one book of a season pays the publisher;" and he has heard, moreover, "of a worthy clergyman, who wrote a bulky commentary on the Revelations, being compelled to sell a house for every thick folio volume he produced." But none of these things move him. No man "who has the capacity of a pen should visit Palestine without writing a book about it." And "if no other human being ever peruse" it, he will do it himself, and thus re-traverse the ground "in his own easy chair," which he has experienced to be the cheapest way of doing it. "And whether the transaction pay or not, I am not the man in such an affair to sell a house at this time, in respect that I possess no such heritable property in my own right." If the reader feel disposed to join the author in his easy chair, he will find him as facetious and chatty all through as he is to begin with. He roughed it through "thick and thin;" and his talk is sometimes as rough as his travel. His denunciations of popery would have been better omitted in a book intended for general readers, many of whom may pay for it in the faith that it is exclusively a volume of travels, and not also, inclusively, a manual of Romish controversy. The imminence of his own conversion (or "*perversion*," as we believe it is called) should teach him charity. When in Rome, he says:—

"I trembled for a time at some of the sights and sounds; then I saw and heard them with complacency, then with pleasure and desire to see and hear them again. When I shut my eyes in the splendid Vatican, at one of the high masses, and listened to the gorgeous sounds of the grand music, verily I thought I was going by railway to Heaven in a first-class carriage, well cushioned, and, altogether, very comfortable. But I began to

feel that I had taken my seat in a down train, and I left Rome as fast as I could for fear!"

The country of Jung Bahadoor was little else than a *terra incognita*, till Jung himself visited this country a couple of years ago. Nepaulese travels are, therefore, a novelty in literature, and the two before us ought, at least, to possess the merit of freshness, and to be free from the suspicion of being compiled from "Murray." Nevertheless, one of them<sup>21</sup> is little else than a compilation. Captain Smith resided for five years in the country, and during that time *might* have gathered materials for a good work; but such does not seem to have been his object then, whatever may be his desire for authorship now. With the exception of the author's military testimonials, which, for some reason or other, are printed *in extenso*, and occupy several pages, these two volumes contain nothing but what could have been compiled from any good gazetteer and history of British India. To be sure, the anecdotes of Jung Bahadoor are not to be found in Mill or M'Culloch, but they are avowedly collected from newspapers and magazines. All that can strictly be connected with "a residence in Nepaul," is an account of some wild sports, in which the gallant captain showed the Nepaulese how to shoot elephants, and relieved them of one which had been the terror of the kingdom for half a century. More than half the work is occupied with the history of the Nepaulese war; and, not content with this, "he has deemed it indispensable to append a memoir of the late General Sir David Ochterlony; and "besides this memoir, it has been considered *expedient* to publish an account of the formation and services of the Sirmoor battalion." Being thus informed of the way in which the author has considered it expedient to make his book, the reader may now consider whether it is expedient for him to buy it.

We are happy to give a more favourable report of the "Journey to Katmandu."<sup>22</sup> Though less than half the size of the other, it contains more than double the amount of information about the country. It is not often that a traveller has such an inducement offered to him to undertake a journey, or write a book about it, as Mr. Oliphant, when invited by Jung Bahadoor at Ceylon, on his return from England, to accompany him to his highland home at the foot of the

Himalayas. He had, consequently, unrivalled opportunities of observation, and has made a more diligent use of them than the modest size and title of his book would seem to indicate. Though he does not wield a practised pen, he displays an excellent judgment and no small share of pictorial power. Jung figures prominently throughout the narrative; his reception on his return is described, and an intelligent estimate is formed of his position and policy as head of a Reform cabinet, if, indeed, we can apply such constitutional phraseology to one who exercises absolute power and has the exclusive administration of state affairs. Already he has introduced improvements in the laws; he is keeping his eye upon the development of the industrial resources of the country, and altogether seems more ambitious to lead it on in a career of civilization than of conquest. But dangers surround him. A change of ministry in Nepaul is brought about by assassination; and though he has provided himself with a good supply of Colt's revolvers, he fears the fate of his fourteen predecessors. A Conservative conspiracy, sanctioned by the king, and headed by one of his own brothers, was recently on the point of success, when it was discovered and crushed. And it deserves to be recorded, to the credit of English journalism, that the fear of the Press and of public opinion in this country induced him, in the case of the convicted conspirators, to substitute banishment for decapitation. "What would the *Times* say?" was his response to his wondering counsellors, who urged the adoption of the old *régime*, a fact which says much for the moral influence which England exerts among the nations of the East.

"Leaves from My Journal," &c.,<sup>23</sup> contains a portrait of the Author, of Toni, Queen of the Spindel Mädchen, and Babbi; also of the two ladies of Carlsbad, and a picture of the Elephant Coffee House. The reason for such a selection is more than we can tell: there is no accounting for taste. The "leaves" are pretty much like the pictures. Our ex-M.P. had a fit of gout, or something of that sort, and took a trip to the Continent, visiting and describing Hamburg, Leipsig, and Carlsbad, speculating a little in politics and religion, and not so badly either—for a legislator! The book (which is a very handsome one) reads like a long, smartly-written letter to a friend, and is good enough for an idle hour, if it happen to fall in one's way. It contains a fact or two worth noting, and among others,

<sup>21</sup> "Five Years at Nepaul." By Captain T. Smith, Assistant Political Resident at Nepaul from 1841 to 1845. 2 vols. Colburn and Co. 1852.

<sup>22</sup> "A Journey to Katmandu." By Lawrence Oliphant. Murray. 1852.

<sup>23</sup> "Leaves from My Journal, during the Summer of 1851." By a Member of the late Parliament. With Illustrations. Murray. 1852.

this,—that no Austrian that he spoke to seemed to doubt that the Papal bull, which gave us so much bother two winters ago, was the work of Austria and Naples; and that the price of it was the cession, on the part of Austria, of an important right, extorted from the Pope by Joseph II., and remaining in force to the present time, viz., that no papal bull could be *published*, or have any force in the Austrian empire, without the sanction of the emperor.

To these records of general travel, we have to add the reports of several exploratory journeys. Dr. Thomson\* comes first with his "Western Himalaya and Tibet," which is devoted to the Geography, Geology, and Botany of those romantic regions. In 1847, he was appointed by Lord Hardinge a member of a mission which was to proceed across the Himalayas into Tibet, and the present work is the result of his observations on that journey. It is not a work for general but exclusively for scientific readers; and, for the latter, it possesses those merits which they will deem most valuable, viz., careful observation, accurate description, and cautious induction. Most industriously the author has registered the height of each mountain, the breadth of each river, and the length of each road,—noting at the same time, the peculiarities of temperature, vegetation, and geological structure, all with such mechanical monotony, that, while it would be of excellent service to Mr. Wyld in constructing a model of the Himalayas, it does not assist the reader in forming a conception of the living splendours of any one scene which met the eye of the writer amid those majestic mountains. Humboldt and Hugh Miller have shown that scientific travels may be written with a poetic pen; but it can only be said that this is not Dr. Thomson's forte. Facts and figures, flowers, fossils, and fragments of abstract science were the sole fruits of his research. Of Nature, as the mother of all the sciences, he caught no glimpse, and her radiance kindled no enthusiasm in his soul.

#### Miscellaneous.

In the literature of the quarter a special notice is demanded of the "Reports of the Juries," connected with the Great Exhibition. The work is a huge record of the industrial history of the world, each of the

\* "Western Himalaya and Tibet; the Narrative of a Journey through the Mountains of Northern India, during 1847 and 1848. By Thomas Thomson, M.D. Reeve and Co. 1852.

thirty classes into which the Exhibition was divided, being reported by a gentleman intimately acquainted with the subject, who generally traces the rise and progress of a particular branch of industry, before recording the decisions of the jury on the individual articles in the section. Much valuable information is in this way accumulated; and a compiler would have little else to do than wash out the grains of gold-dust mixed up with the coarser material, and collect the rich nuggets of solid facts which lie thick in every sheet, in order to make a very serviceable industrial history for industrious classes, to whom the Report is a sealed book.—"Our Iron Roads," by F. S. Williams, forms the second volume of the "Illustrated London Library," and amply sustains the reputation of its predecessor, which we noticed in our last number. To use his own words, the author "has endeavoured to sketch the rise and progress of the railway system; to describe the various processes in the erection of the noble and wonderful structures which the formation of our iron roads has called into existence: to explain the arrangements which are necessary for their successful management; and to point out those social influences which have arisen from their establishment." It is a beautifully illustrated work—as substantial as it is attractive—and has our unqualified recommendation. Bohn's various Libraries continue to increase and multiply. His "Scientific Library" is in process of incorporating the "Bridgewater Treatises." Those by Kidd and Kirby—the one on "The adaptation of external nature to the physical condition of Man;" and the other on "The history, habits, and instincts of animals," are now in a shape which renders them both accessible in price, and more convenient for use. Other of the current volumes, such as "Humboldt's Travels," "Rome in the Nineteenth Century," and "Miss Bremer's Works;" translated by Mary Howitt, should be in the possession of all who wish for instructive and entertaining reading, in a readable form.—We have just space left to call attention to three volumes of poetry—the first containing "Specimens of old Indian Poetry," translated from the original Sanscrit into English verse, by R. T. H. Griffith, M.A., is a very successful attempt to win appreciation from the English reader for Oriental poetry. The other two—"The Village Pearl," by John Crawford Wilson; and "Poems" by the Hon. Julian Fane, both contain pieces of great promise, though manifesting the unavoidable characteristics of early efforts in the art of song.

*A Catalogue of the Library of the London Institution; systematically classed. Vol. IV. Additions from 1843 to 1852. [Not published.]*

THE appearance of a fourth volume of the Catalogue of this noble library affords us a very convenient opportunity for reviewing the progress of this branch of an institution which is an honor to the enlightened merchants of the city in which it stands. Of course, the compiler of the present volume is not responsible for the plan in which it is arranged; namely, the classification of the books by their subjects; in this he only follows what is laid down for him in the first volume. But the manner in which he has executed his task is highly creditable to him. The title of the books are given at considerable length. The contents of the several collections are, for the most part, set out in full. When the subject of a work requires it, it is mentioned in more than one of the classes into which the library is divided. An alphabetical index of authors' names relieves the reader from the difficulty of understanding the writer's classification of subjects. The compiler's knowledge of books is great, and he has made the most of his material. But he, perhaps unwisely, follows the example of Mr. Panizzi in his attempt to give the authors to the anonymous books, and he probably makes about the same proportion of mistakes. For example: "An Argument for the Plenary Inspiration of Scripture, by Arachnophilus," Mr. A. White, of the Insect Room in the British Museum, is given to Mr. W. H. Black, of the Rolls Office. The latter will hardly be thankful for this addition to his literary honours.

The first and second volumes of the catalogue, printed in 1835 and 1840, embrace the great bulk of the library. In the first, the titles of the books are abridged, and it presents us with a most valuable collection of 27,000 volumes. The second contains the collection of tracts and pamphlets. The third and fourth volumes show the additions since made to the library, and enable the proprietors to compare the results of the present management with the past. The comparison is by no means satisfactory, or complimentary to the present state of literature in the city. Learning does not seem to be valued on the east side of Temple Bar as it was half a century ago. The board of managers who elected a Porson and a Maltby for their librarians, placed on their shelves a large collection of Greek and Roman classics, of grammars, dictionaries, works on coins and antiquities, on moral

philosophy, and general literature. But few additions have been made to these classes. Nine years have added but six volumes to the Greek classics, and not one to the Latin classics, if we except the Delphin reprints by Valpy, which the library lately received as a present from a friend who possessed more generosity than knowledge of good editions. To recompense us for this oversight, the medical sciences seem to have been carefully attended to, and a very considerable addition has been made to the works on *Materia Medica* and diseases. Even in the lighter class of reading, which has chiefly engaged the attention of the managers, the books are not always of a very high order. Nine-tenths of them seem to be the new publications; and much has been done by the easy and often profitless task of subscribing to the Shakspeare Society, the Percy Society, the Camden Society, the Musical Antiquarian Society, and Mr. H. G. Bohn's several cheap and rapid issues. Under the head of Antiquities, we are amused with finding "Notes and Queries;" under the head of History, we find the names of Miss Strickland and Mr. G. P. R. James; and, lastly, we have eight pages of works on the Crystal Palace, lately standing in Hyde Park. Alas, alas, for the fate of all endowments! They do not always remain under the management of the generous and enlightened founders. The first board of managers contained the names of Baring, Angerstein, Harman, Thornton, Hibbert, and other patrons of art and letters, of whom the City was justly proud. But in the list at the beginning of the present volume, we see no similar names. It contains six medical men, and the rest are, no doubt, equally respectable. But none of them are known to literature, or are counted among our merchant-princes—except, indeed, Mr. Thomas Baring, who honours the institution and himself by being its president; and the committee probably think the name of Baring, like Charity, will cover a multitude of deficiencies.

But the noble collection of classical and historical works, which was got together by the first managers, still sheds its useful influence over the city youth. Many a reader has there first gained his knowledge of the treasures which have descended to us from the great minds of old. Not a few deep-read scholars look back with thankfulness to their first admission into the Library of the London Institution.

## ART. XI.—CONTEMPORARY LITERATURE OF AMERICA.

*Theology.*

IN our last number, we announced the completion of Dr. Palfrey's "Academical Lectures," and since that time, we have had an opportunity of examining the work. Its aim is to show what it is, in the ancient Jewish books, that a Christian is called upon to believe; and that all that he is called upon to believe is credible and well substantiated. In reviewing these ancient books, the object is to ascertain their authority, design, and sense. The Pentateuch he believes to be substantially the work of Moses, and to be the sole authoritative oracle of Judaism. He finds no evidence or trace of supernaturalism, in word or deed, from the time of Moses to the time of Christ. All inspiration in the old dispensation was confined to the Hebrew lawgiver; and all subsequent hagiographers bore the same relation to the Pentateuch that the Christian fathers bore to the New Testament. But the Jews in the one case, and the Catholics in the other, gradually overlooked the distinction. The Reformation, which asserted the exclusive authority of the Apostolic records among Christian writings, should have done the same for the Mosaic among Hebrew. The Prophets are thus excluded from the circle of supernatural teachers; and their supposed predictions of future events are affirmed to be "nothing of the kind." They misunderstood Moses in supposing that a Jewish golden age was promised in the law, in the same way as some Christian divines (such as Bishop Newton) have imagined that the New Testament teaches an earthly millennium. Their Messianic rhapsodies were strikingly inapplicable to Jesus of Nazareth, whose divine mission, however, is all the more powerfully sustained by these discrepancies, and by his own avoidance of all reference to the model Messiah, and of all attempts to resemble so fanciful a being. These are Dr. Palfrey's opinions, clearly stated in these Lectures (delivered at Harvard University), and supported with extensive erudition and bold criticism, though not, we think, with much philosophical discrimination or sagacity. People will with difficulty believe that inspiration produced Leviticus, but not the Psalms and Prophecies. The learned professor must surely

have been leading as cloistered a life at Harvard as would befit an Oxonian monk, to suppose that the canonization of the Pentateuch, and the excommunication of the seers and sweet singers of Israel would effect a compromise between the believer and the sceptic. He has long, he says, been "under the impression that no other cause obstructs so powerfully the intelligent reception of Christianity at the present day, as the mistaken notions which prevail concerning the Old Testament Scriptures and Dispensation, and their connexion with the New; and that the great service to be rendered to Christianity is that of relieving it by a careful, but not timid criticism, from the objections arising out of these errors." But while he would relieve Christianity by sub-relieving the Pentateuch of the prophets, Professor Norton\* seeks to attain the same end by relieving the prophets of the Pentateuch; and while Dr. Palfrey's Jewish motion is, "Not Isaiah, but Moses," he would refuse the analogous Christian amendment of "Not Paul, but Jesus." It is an ingenious, but arbitrary relation, which he establishes between the earlier and later writings of the Jews and Christians respectively. It is easy for Protestants to reply, that as he does not mutilate the *New Testament*, neither do they the *Old*—that as he retains the *Apostles*, so they the prophets—that as he finds the *Christian Fathers* outside the one canon, he might have found the *Apocrypha* correspondingly outside the other; and that the Reformation was consistent both in what it accepted and repudiated of either canon, as received from the Catholic Church. Dr. Palfrey must either believe more, or believe less, of what is ordinarily understood as sound Protestantism.

Professor Norton has not yet favoured the world with his concluding volume on the Evidences, or his translation of the Gospels, both long promised; but, in the meantime, we are presented with a very handsome edition of his collected "Tracts concerning Christianity." These consist of tracts (properly so called), contributions to periodicals, and academical discourses. They are seven in number, and bear the following titles:—"A Defence of Liberal Christianity;" "A Discourse on the extent and relations of Theology;" "Thoughts on True and False Religion!" "Views of Calvinism;" "A Discourse on the latest form of Infidelity;" "On the objections to Faith

<sup>1</sup> "Academical Lectures on the Jewish Scriptures and Antiquities." By John Gorham Palfrey, D.D., LL.D. Vol. III.—Prophecies. Vol. IV.—Hagiographa and Apocrypha. 1852.

\* See his "Genuineness of the Gospels," vol. ii. p. 402. (English edition.)

<sup>2</sup> "Tracts concerning Christianity." By Andrews Norton. 1852.

in Christianity, as resting on historical Facts and critical Learning." Mr. Norton is an extreme Rationalist of the Priestley school. His writings are always able, but there is nothing genial or suggestive in them. To his opponents he is hardly courteous; and upon theologians of the spiritualist school he is ungentlemanly enough to bestow epithets as false as they are opprobrious. The Spiritualists are *not* "infidels," except as not agreeing with Mr. Norton, whose faith in revelation consists in giving it as little as possible to reveal; and after all, taking only as much of it as suits his convenience. When men admit, or even boast, that they have *no* faith (and there are such), the term may be etymologically applicable; but it is what a generous man would avoid using. Mr. Norton himself was once the most ultra divine in America; and in one of these tracts he informs us that, in 1819, when he was elected Professor of Biblical Criticism at Harvard, Dr. Channing, who was then a member of its corporation, objected to giving him the title of professor, "on account of the injury it might be to the college, to make so conspicuous its connexion with one holding such opinions." And when the first article in this volume was published, forty years ago, Mr. Buckminster told him of a remark that had been made about it by a friend of Dr. Priestley—that it reminded him of what the English Unitarians had been called, namely, "The Sect of the Imprudent." It is instructive to find the imprudent young polemic, subsequently, from the professional chair, disparaging the intellectual powers of De Wette, grudging Spinoza the eulogium he received from Schleiermacher, and reproaching Schleiermacher himself for partaking of the sacrament as a Christian. But he is unwilling to believe that they possessed either gifts or graces; and though he reduces religion to two articles of belief (God and immortality), he speaks harshly of wise and good men who believe both of these points, and a great many more besides. Mr. Norton should remember the three points of practical Christianity, and which of them is the greatest.

Curiously enough, as a retributive incident, the next work we lay our hands upon is of an orthodox character; and among the first passages which catch our eye, is one which ranks together, after De Wette and Strauss, "such men as Channing, Norton, Parker, and Palfrey," &c. This work is somewhat patronizingly called "The Friend of Moses,"<sup>3</sup> and its object is "to vindicate

the authority of the Sacred Books, and more especially of the Book of Moses, against the sophistry of the Rationalist, the cavils of infidelity, against the objections urged on various scientific grounds, and against the difficulties presented in the alleged results of modern research and recent discovery among the archives of the east, and the monumental records of Egypt." Dr. Hamilton displays a respectable acquaintance with his subject, and, as "the friend of Moses," he eulogizes him in true Yankee style, as a man of "genuine patriotism—noble, pure, *as that of the immortal Washington.*" Consequently, Moses was a *very* great man.

A much abler work than the preceding, and of the same nature, will be found in the Virginia "Lectures on the Evidences."<sup>4</sup> The illustrious Jefferson, who founded the Virginia University in 1820, and framed its regulations, made no provision for theological instruction or religious worship, but left each sect at liberty to use the most appropriate means for propagating its peculiar opinions. At the same time, with a wise and generous consideration, he proposed to have a large building erected in a conspicuous part of the grounds, to be used, among other purposes, for religious worship, under such impartial regulations as the visitors shall prescribe." None of the sects, however, availed themselves of this accommodation for the purposes of religion till 1828, or for theological instruction till 1850, when a number of Presbyterian ministers determined to give the course of lectures since published in this volume. They are all elaborate productions; and their authors, fifteen in number, are above the average in talent and information. On inspiration, they attack Morell's "Philosophy of Religion;" and on mythology, they quote Mackay's "Progress of the Intellect." The lecture on the "Unity of the Human Race" is well-reasoned and eloquent; but it is noticeable that, in his peroration, when picturing the millennial congress of nations and races, though the orator remembers the "cannibal Zealander," the "fierce Malay," the "wild Camanche," the "gigantic Patagonian," the "grovelling Bushman," the "squalid Esquimaux," the "crouching Hindoo," and every other race he can think of, *he forgets the enslaved negro*—although it was doubtless "an article" of that kind that drove him to the lecture-hall an hour or

Pentateuch against the objections of Modern Scepticism." By W. T. Hamilton, D.D. 1852.

<sup>4</sup> "Lectures on the Evidences of Christianity, delivered at the University of Virginia, during the Session of 1850-'51." 1852.

<sup>3</sup> "The Friend of Moses; or, a Defence of the VOL. LVIII. 21

two before. The best lecture in Virginia on human brotherhood, or on Christian Evidences generally, would be a *practical* one.

### *History and Politics.*

The event of the year, if not of the age, for America, is Kossuth's visit. History, indeed, presents few spectacles more interesting than that of this exile crossing the Atlantic as the representative of the oppressed in one hemisphere to the freemen in the other—in a few months traversing thirty commonwealths, and addressing twenty millions of people; who all, as if by a pentecostal miracle, heard, in their own language, the wonderful words of the prophet of freedom.

The annals of agitation record no parallel instance of a stranger in a strange land, with only a few weeks' practice in the language, holding millions in thrall by the magic of his voice, and, as it were, shaking a mighty continent by an earthquake of enthusiasm! Here is a book called "Kossuth in New England," which no man can read without being impressed with the solemnity and earnestness pervading it. One continuous wail runs through every address, yet not a wail of despair. "Hungary is in bonds, but Hungary shall be free!"—this is the burden of all his speeches. And the response has been intensely enthusiastic. If Kossuth has returned disappointed, he must have had marvellous expectations. There are doubtless many, even in America, who are hostile, and more who are indifferent, to the cause of freedom in Europe; but the mass of the people are aroused, and in the event of another European revolution, they will not be inactive. The appendix to this volume contains an elaborate paper on Intervention, prepared by a committee appointed by the State to report on that subject. It declares for intervention, "and the Commonwealth of Massachusetts in Senate," passed eight resolutions, the seventh of which is—

"That it is the duty and the interest of all constitutionally-governed nations to cultivate the most intimate relations with each other, to the end that, should the emergency arise, they may the more easily combine their powers to repel the attack of despots."

Veteran politicians, who opposed this resolution in the Senate, were afterwards observed weeping in Faneuil Hall. The tide will turn: it is turning already. A noble impulse has been given to the best minds of

\* "Kossuth in New England: a full account of the Hungarian Governor's Visit to Massachusetts; with his Speeches, and the Addresses that were made to him." 1852.

the country; old and young have listened to a new version of the gospel of freedom; and while trafficking politicians have hid their heads in shame, every honest heart looks more hopefully to the future. What that future is likely to be, Kossuth pointed out, in Faneuil Hall, in his last and greatest speech on the condition of Europe. He spoke for two hours, detailing the course of revolutionary operations in the coming struggle, and, at the close, remarks, with becoming confidence and dignity:—

"Some take me here for a visionary. Curious, indeed, if that man who, a poor son of the people, has abolished an aristocracy of a thousand years old, created a treasury of millions out of nothing, an army out of nothing, and directed a revolution so as to fix the attention of the whole world upon Hungary, and has beaten the old well-provided power of Austria, and crushed its future by his very fall, and, forsaken, abandoned, alone, sustained a struggle against two empires, and made himself in his very exile feared by czars and emperors, and trusted by foreign nations as well as his own,—if that man be a visionary, then for so much pride I may be excused, that I would like to look face to face into the eyes of a practical man on earth!"

A romantic incident related in this volume deserves to be recorded in our pages. Our readers will recollect the danger to which Kossuth and his companions were exposed when they were offered the alternative of embracing Mahometanism, or of being surrendered to Russia. At this crisis, the unfortunate exile wrote to Lord Palmerston, and consulted with Captain Henningsen, an English officer, how the letter was to be sent. It must reach England in ten days. "This man will take it," said Henningsen, pointing to an Englishman in the room, who had come to see the refugees, and had sat in silence for hours with his umbrella under his arm, biting his finger-nails. Being informed of what was wanted, he merely said, "Where is the letter?" It was handed to him. He rose, said, "Good-bye, sir," and was gone. Palmerston received the letter within the specified ten days, and his reply was, that the sultan should be supported by the entire British fleet, if necessary, in case he gave unconditional protection to the exiles. The name of this prompt and generous Englishman was Roger Casement, formerly a British officer, who volunteered to carry to Kossuth resolutions of sympathy from friends in England, and had followed him through Hungary to Widdin for that purpose. While Kossuth was in New England, a man stepped up to the car in which he had taken his seat from Hartford to Springfield, and handed him a book, but, in the hurry of departure, he took little notice either of the book or its donor.

When, however, the train was in motion, he looked at it, and found it to be "Brace's Hungary in 1851," accompanied with the following note,—

"This is from the person who carried your letter from Widdin to Palmerston in ten days.—  
CASEMENT."

A man of generous deeds, but of few words. Kossuth was much affected by the note, and regretted that he had not met with the writer.

In one of his American speeches, Kossuth speaks of his having received "a very curious letter," which, he says, "tells me that I am doing a great mischief even here, to advocate the necessity of a republic in Europe; for many gentlemen, even out of those who addressed me, have not a love for their own republic, but would like to see her a constitutional monarchy, which this gentleman says is the happiest form of government in the world." Possibly this gentleman may be a member of the "Order of the Lone Star," or one of the Berkeley Men," who are the authors of a brilliantly-written work called "The Napoleon Dynasty." They profess to be Americans and republicans, but their speech "betrays" them. The "Idées Napoléoniennes" form their "philosophy of government." Louis Napoleon is called "the Emperor of the French Republic." He is spoken of, on his election to the Presidency, as "the only man in France who understood his own position—he alone understood the feelings, the wants, the desires of her forty million countrymen." The *coup d'état* is applauded. "His return from exile, his triumphant election as President of the Republic for four years, with his *coup d'état* of 2nd December, 1851, and the *absolution the nation passed on that act by seven millions of votes*—the apparent stability of his government, and the success which has attended every movement of his administration of power, have excited the wonder of mankind, and appeared to *baffle philosophical solution*." What is the solution? It is this: "The Napoleon dynasty is, and will be for some time to come, an inevitable government in France—it is the only possible compromise between Bourbonism or the past, and Republicanism or the future." The "Berkeley Men" admit that this is not the common opinion in America, and the reason assigned is that the Americans get their information through *English* sources.

\* "The Napoleon Dynasty: or, the History of the Bonaparte Family." An entirely new work. With twenty authentic Portraits. By the "Berkeley Men." 1852.

Their work is intended to counteract the prevailing impressions; its information is derived from French, and even, directly and avowedly, from *Bonapartist* sources; and its object must be either to enlist American sympathy on the side of Bonapartism, or to employ the history of "the empire" as a medium for propagating the sentiment of imperialism. Now that America is becoming a power in the earth, and destined to take an active interest in European politics, it is of importance to the present government of France not only to stand well with her, but, if possible, to effect an imperial-republican alliance, which, in the event of Louis Napoleon falling back upon the people for the defence of their *national independence* against the Holy Alliance, would not be an improbable occurrence. Such a war would be popular in France, and there are many politicians in America who would prefer to co-operate with a French emperor rather than with an English oligarchy,—on the ground both of present policy and past obligations. From personal residence, Louis Napoleon is well acquainted with the United States; he has many personal friends there, and may be sufficiently sanguine of success, in diplomacy or intrigue, to make the attempt. That Russia, also, should be at work is more than probable; and America may yet find that her foes are they of her own household. We apprehend no danger, but we anticipate a great amount of mischief.

The work is not the only one of the kind which has come in our way. In 1849, an American citizen wrote a series of articles in the "Democratic Review," giving an account of a visit paid by him to the "Prince Louis" during his captivity at Ham. He was in the confidence of the Bonaparte family, and was a believer both their dynasty and in their destiny. The sketches were republished in a volume, the preface of which, after some virulent abuse of England, thus indicates the object of the work:—

"With this double view, then, of essaying to rescue this country from its moral vassalage to England, and to spread abroad distinct and full ideas of the real sentiments which animate and direct the American heart and mind, I have begun a work which I intend hereafter perseveringly, inflexibly, and, to say it with due reverence, even religiously to pursue."

What work does he refer to? The work of an imperial propagandist. An *American democrat—a French Bonapartist*—his patronymic is *Russian* (Henry Wikoff), and his last whereabouts was *Constantinople*. We note this merely as a curiosity of Republic-

canism. His lively dramatic narrative of the history and opinions of "the Prince" were well adapted to propagate imperialism under a democratic guise. The same may be said of the "Napoleon Dynasty." It is an attractive book, both in appearance and literary execution. A rapid narrative, and a dashing style, carry the reader with railway speed over the battle-fields of the republic and the empire, and trace the fortunes of the whole family down to the present time. Some of the material is new. The correspondence between the Emperor and Pope Pius VII., requesting a divorce to be pronounced between Jerome and his American wife, which request the Pope flatly refused, is as creditable to his Holiness as it was disgraceful to his petitioner. Though brief, it is the most complete, and professes to be the most impartial history of that singular race hitherto published. As regards the life of Napoleon himself, this is apparently true; but there is an evident purpose in the sudden and decisive transference of sympathy to the repudiated Josephine, from whom it descends to her daughter Hortense, (who is held up as a pattern of all the virtues,) and through her to her son Louis Napoleon, upon whom all the glory of the family is entailed, and the sympathy of the reader concentrated.

The presidential struggle gives birth to an ephemeral literature in the shape of "Lives" and "Campaigns." A "*Life of General Pierce*," by Hermitage (not Hawthorne) and which has received the *imprimatur* of General Cass, furnishes a fair illustration of the character of such publications. The biographer, in this instance, has not only ransacked "documentary history," but has been favoured, at his request, with an explanation of the secret of the general's popularity from a lady in New Hampshire. This lady's account of him is, that "he is a fine looking man—all the ladies will testify to that, and *that goes a great way*." Upon which the author remarks, that "it is always amusing to see how much more philosophically women can generally explain such things, than any man whatever." The lady further testifies, that "one day he rode fifty miles with the thermometer below zero without feeling it, and then came and passed the whole evening chatting with me. He is not only a true-hearted Democrat whom all the people love, but *he is a real gentleman*." There can be no question after this of the general's fitness for the presidency. "The Life of

General Scott," (which we have not seen) is very likely composed of similar stuff. The best way of conducting the canvas would be to consign the rival candidates to the care of Barnum for exhibition through the States. A life of Pierce has been announced from the pen of Nathaniel Hawthorne (a fellow-student at College,) which will be of a different stamp.

### Fiction.

From fact we pass to fiction, and to the examination of Hawthorne's last production, in order to which we must brush aside the whole brood of negro tales now swarming amongst us. "Uncle Tom" has become a notoriety; and the success of the book is the great literary fact of the day. Sir Walter Scott and Charles Dickens never addressed as many readers, in the same space of time, as Harriet Beecher Stowe. The extraordinary sale in England, however, is due, first of all, to the *price*, secondly to the *subject*, and finally to the *novelty* of the thing. Meanwhile it is a hopeful omen for the slave, that a universal sympathy has been excited in his behalf. "The Blithedale Romance" will never attain the popularity which is vouchsafed (to borrow a pulpit vocable), to some of its contemporaries, but it is unmistakably the finest production of genius in either hemisphere, for this quarter at least—to keep our enthusiasm within limits so far. Of its literary merits we wish to speak, at the outset, in the highest terms, inasmuch as we intend to take objection to it in other respects.

"Blithedale" is an idealization of Brook Farm, where, about ten years ago, a few young and hearty enthusiasts, tired of moving on so slowly toward the millenium, took Destiny into their own hands, and set up "Paradise Regained," not by writing verses or romances, but by the more prosaic method of planting their own potatoes, baking their own bread, and cobbling their own shoes, as in the days before the Flood, when every man was his own master and his own servant, and political economy had not yet brought social death into the world, "and all our woe." How this modern Arcadia originated, how it thrived, and why it was abandoned, we do not know; but it may be taken for granted that hoeing turnips, feeding pigs, and milking cows, turned out less romantic than was anticipated. Its denizens accordingly went back

\* "The Life of General Franklin Pierce, with a Sketch of Hon. W. R. King." By Hermitage. 1852.

\* "The Blithedale Romance." By Nathaniel Hawthorne. 1852.

to the old ways of the world, most of them having since become conspicuous, in various walks of literature, and all of them the better for an experience so well paid for.

Of this experience Hawthorne, who was one of them, has availed himself, in writing this romance. With our limited space, we cannot pretend to give even a faint outline of a tale which depends for its interest altogether upon the way of telling it. Hawthorne's *forte* is the analysis of character, and not the dramatic arrangement of events. "To live in other lives, and to endeavour—by generous sympathies, by delicate intuitions, by taking note of things too slight for record, and by bringing his spirit into manifold acquaintance with the companions whom God assigned him—to learn the secret which was hidden even from themselves,"—this, which is the estimate formed of Miles Coverdale, has its original in the author himself. The adoption of the autobiographical form (now so common in fictions) is, perhaps, the most suitable for the exercise of such peculiar powers. Not more than six or seven characters are introduced, and only four of them are prominent figures. They have, therefore, ample room for displaying their individuality, and establishing each an independent interest in the reader's regards. But this is not without disadvantages, which become more apparent towards the close. The analysis of the characters is so minute, that they are too thoroughly individualized for dramatic co-operation, or for that graduated subordination to each other which tends to give a harmonious swell to the narrative, unity to the plot, and concentrated force to the issue. They are simply contemporaries, obliged, somehow, to be on familiar terms with each other, and, even when coming into the closest relationship, seeming rather driven thereto by destiny, than drawn by sympathy. It is well that the *dramatis personæ* are so few. They are always a manageable number, and are always upon the stage; but had there been more of them, they would only have presented themselves there in turns, which, with Hawthorne's slow movement, would have been fatal to their united action and combined effect. Even with a consecutive narrative, and a concentration of interest, the current flows with an eddying motion, which tends to keep them apart, unless as happens once or twice, it dash over a precipice, and then it both makes up for lost time, and brings matters to a point rather abruptly. But the main tendency is toward isolation—for the ruling faculty is analytic. It is ever hunting out the anomalous; it discovers more points of repulsion than of attraction;

and the creatures of its fancy are all morbid beings—all "wandering stars," plunging, orbitless, into the abyss of despair—confluent but not commingling streams, winding along to the ocean of disaster and death: for all have a wretched end—Zenobia and Priscilla, Hollingsworth and Coverdale—the whole go to wreck. The queenly Zenobia drowns herself in a pool; her ghost haunts Hollingsworth through life; and, as for Coverdale, he falls into a moral scepticism more desolating than death. Hear him at middle age:—

"As regards human progress, let them believe in it who can, and air in it who choose. If I could earnestly do either, it would be all the better for my comfort."

Is this the moral of the tale? It is but too appropriate, Poor Miles Coverdale! so genial, so penetrative, so candid—he begins by mocking others, and he ends with mocking himself! Hollingsworth's life teaches a solemn lesson to traffickers in humanity, and with due solemnity is it enforced. Priscilla's life is too shadowy and colourless to convey any lesson. She is a mere straw upon the current. And what of Zenobia? It is difficult to say what we may gather from her life—so many lives were in her! She discusses it herself with Coverdale (quite characteristic) on the eve of her fall. It is a wise point to settle, but she makes it out thus:—

"A moral? Why this: that in the battle-fields of life, the downright stroke that would fall only on a man's steel head-piece, is sure to light upon a woman's heart, over which she wears no breast-plate, and whose wisdom it is, therefore, to keep out of the conflict. Or thus: that the whole universe, her own sex, and yours, and Providence or destiny to boot, make common cause against the woman who swerves one hair's breadth out of the beaten track. Yes; and add (for I may as well own it now) that, with that one hair's breadth, she goes all astray, and never sees the world in its true aspect afterwards."

There is something very unartistic in such formal applications of moral or social truths, reminding us of the old homiletic fashion of making a "practical improvement" of a discourse to saints, sinners, and all sorts of folk. It indicates imperfection in the construction and colouring of the picture. So many morals—one a-piece for Coverdale and Hollingsworth, and two and a half for Zenobia—are symptomatic of weak moral power, arising from feebleness of moral purpose. Hawthorne has a rich perception of the beautiful, but he is sadly deficient in moral depth and earnestness. His moral faculty is morbid as well as weak; all his

characters partake of the same infirmity. Hollingsworth's project of a penitentiary at Blithedale is here carried out in imagination. Hawthorne walks abroad always at night, and at best it is a moonlight glimmering which you catch of reality. He lives in the region and shadow of death, and never sees the deep glow of moral health anywhere. He looks mechanically (it is a habit) at Nature and at man through a coloured glass, which imparts to the whole view a pallid, monotonous aspect, painful to behold. And it is only because Hawthorne can see beauty in everything, and will look at nothing but beauty in anything, that he can either endure the picture himself, or win for it the admiration of others. The object of art is the development of beauty—not merely sensuous beauty, but moral and spiritual beauty. Its ministry should be one of pleasure, not of pain; but our anatomist, who removes his subjects to Blithedale, that he may cut and hack at them without interference, clears out for himself a new path in art, by developing the beauty of deformity! He would give you the poetry of the hospital, or the poetry of the dissecting-room; but we would rather not have it. Art has a moral purpose to fulfil; its mission is one of mercy, not of misery. Reality should only be so far introduced as to give effect to the bright ideal which Hope pictures in the future. In fact, a poet is nothing unless also a prophet. Hawthorne is the former; but few poets could be less of the latter. He draws his inspiration from Fate, not from Faith. He is not even a Jeremiah, weeping amid the ruins of a fallen temple, and mourning over the miseries of a captive people. He is a Mephistophiles, doubtful whether to weep or laugh; but either way it would be in mockery. "It is genuine tragedy, is it not?" said Zenobia (referring to the fatal blow which laid her hopes prostrate), at the same time coming out "with a sharp, light laugh." Verily, a tragedy!—burlesqued by much of the same maniac levity. That "Blithedale" itself should end in smoke, was, perhaps, fit matter for mirth; that Hollingsworth's huge tower of selfishness should be shattered to pieces was poetically just; but that the imperial Zenobia should be vanquished, was to give the victory to Despair. Zenobia is the only one in the group worthy to be the Trustee of Human Right, and the Representative of Human Destiny; and she, at least, should have come out of all her struggles in regal triumph. But, after the first real trial of her strength with adversity, and when there was resolution yet left for a thousand conflicts, to throw her into that dirty pool, and not even to leave her there, but to send her

base-hearted deceiver, and that lout of a fellow, Silas Foster, to haul her out, and to let the one poke up the corpse with a boat hook, and the other tumble it about in the simplicity of his desire to make it look more decent—these, and many other things in the closing scene, are an outrage upon the decorum of art, as well as a violation of its purpose. That such things do happen, is no reason why they should be idealized; for the Ideal seeks not to imitate Reality, but to perfect it. The use it makes of that which is true, is to develop that which ought to be true; and it ought never to be true that the strong should be conquered by the weak, as Zenobia was by Priscilla; or, that the most buoyant spirit should sink soonest in the struggle of life, as did Zenobia, who was the first that found a grave in "Blithedale;" or, that all should be wrecked that sail on troubled waters, as were all who figure in this romance. It is a hard saying to proclaim to a fallen world, that the first false step is a fatal one. There was more truth in the words, and more beauty in the picture, of the man standing by the outcast, telling her to go and sin no more. From thence let Hawthorne draw his inspiration. Let him study that benignant attitude, and endeavour to realize it in himself toward a similar subject, and he might yet write with a prophet's power, and accomplish a saviour's mission.

We are cautioned, in the preface, against the notion (otherwise very liable to be entertained) that this is a history of Brook Farm under a fictitious disguise. "He begs it to be understood, that he has considered the institution itself as not less fairly the subject of fictitious handling than the imaginary personages whom he has introduced there. It is an ideal, not a real picture." It is what Brook Farm became in his own fancy, and, considering what that fancy is, there is no need for supposing that he has drawn largely upon his recollection. "It would indeed (considering how few amiable qualities he distributes among his imaginary progeny) be a most grievous wrong to his former excellent associates, were the author to allow it to be supposed that he had been sketching any of their likenesses." Imaginary as the characters are, however, the supposition that Zenobia is an apograph of Margaret Fuller, may not be so far wrong. That extraordinary woman could not have been absent from the mind of the novelist—nay, must have inspired his pencil, whilst sketching "the high-spirited woman busying herself against the narrow limitations of her sex." And, in so far as it is the embodiment of this sentiment or relation, we may have in the career of Zenobia (not

in its details, but in its essential features), a missing chapter in Margaret Fuller's life—unwritten hitherto, because never sufficiently palpable to come under the cognizance of the biographer, and only capable of being unveiled by the novelist, whose function it is to discern the intents of the heart, and to describe things that are not as though they were. We may, at least, venture to say that the study of Zenobia will form an excellent introduction to the study of her supposed prototype. There are problems both in biography and in history which imagination only can solve; and in this respect, "Blithedale," as a whole, may tell a truer tale with its fictions than Brook Farm with its facts. Hence it is that our author, while expressing an earnest wish that the word may have the benefit of the latter, felt that it belonged to him to furnish it with the former. A poetic soul sees more in history than it can reproduce in a historical form, and must, therefore, create a symbolism for itself, less inexorable in its conditions, and more expressive of his latest thought. The historical result of the experiment at Brook Farm, and its direct didactic value, may have been inconsiderable enough, but its reproductive capacity in a fruitful mind might have issued in a work which would have rendered that bubble a permanent land-mark in the progress of humanity.

But here, again, Hawthorne disappoints us, and again through his lack of moral earnestness. Everybody will naturally regard this, whether fact or fiction, as a socialistic drama, and will expect its chief interest as such to be of a moral kind. In "Blithedale," whatever may be its relation to Brook Farm, is itself a socialistic settlement, with its corresponding phases of life, and, therefore, involves points both of moral and material interest, the practical operation of which should have been exhibited so as to bring out the good and evil of the system. But this task he declines, and does not "put forward the slightest pretensions to illustrate a theory, or elicit a conclusion favourable or otherwise to Socialism." He confines himself to the delineation of its picturesque phases, as a "thing of beauty," and either has no particular convictions respecting its deeper relations, or hesitates to express them. It was necessary for him to pass judgment upon the theories of Fourier or Robert Owen. He had nothing to do with it as a theory; but as a phase of life it demanded appropriate colouring. Would he paint an ideal slave-plantation merely for the beauty of the thing, without pretending to "elicit a conclusion favourable or otherwise" to slavery? Could he forget

the moral relations of this system, or drop them out of his picture, "merely to establish a theatre a little removed from the highway of ordinary travel, where the creatures of his brain may play their phantasmagorical antics without exposing them to too close a comparison with the actual events of real life?" In respect of involving moral relations, the two cases are analogous, and the one may be rendered morally colourless with no more propriety than the other. "Blithedale," then, as a socialistic community, is merely used here as a scaffolding—a very huge one—in the construction of an edifice considerably smaller than itself! And then, the artist leaves the scaffolding standing! Socialism, in this romance, is prominent enough to fill the book, but it has so little business in it, that it does not even grow into an organic part of the story, and contributes nothing whatever toward the final catastrophe. It is a theatre—and, as such, it should have a neutral tint; but it should also be made of neutral stuff; and its erection, moreover, should not be contemporaneous with the performance of the play. But the incongruity becomes more apparent when we consider the kind of play acted in it. Take the moral of Zenobia's history, and you will find that Socialism is apparently made responsible for consequences which it utterly condemned, and tried, at least, to remedy. We say, apparently, for it is really not made responsible for anything, good, bad, or indifferent. It forms a circumference of circumstances, which neither mould the characters, nor influence the destinies, of the individuals so equivocally situated,—forms, in short, not an essential part of the picture, but an enormous fancy border, not very suitable for the purpose for which it was designed. Zenobia's life would have been exhibited with more propriety, and its moral brought home with more effect, in the "theatre" of the world, out of which it really grew, and of which it would have formed a vital and harmonious part. Zenobia and Socialism should have been acted in the ready-made theatre of ordinary humanity, to see how it would fare with them there. Having occupied the ground, Hawthorne owed it to truth, and to a fit opportunity, so to dramatize his experience and observation of Communistic life, as to make them of practical value for the world at large.

## ART. XII.—CONTEMPORARY LITERATURE OF GERMANY.\*

*Philology.*

THE German dictionary of the brothers Grimm is gradually progressing, and seems to be regarded by the countrymen of the learned authors as a boon particularly acceptable at the present day, when journalists and others are playing most fantastic tricks with the language of "Fatherland." The great facility of forming new words from a really Teutonic stock, and of introducing foreign ones by a peculiar description of verb, though on one side advantageous, has, on many occasions, led to a licentiousness which threatens to destroy the purity of the language altogether. The great sinners are the journalists, who, through their partiality for the verbs in "iren," introduce a language which is intrinsically more French than German; but there are also delinquents of an opposite class who, availing themselves of the German facility for compounds, are encumbering literature with a number of newly-coined words, where words already in existence answer every purpose. Berthold Auerbach, who has so pleasantly exhibited the life of the Black Forest, is by no means free from the latter fault. That the brothers Grimm, who know more of German than any body else in the world, having laboured at the philology of their country for nearly fifty (!) years, will act as efficient champions against the two-headed hydra, and fix the boundary-line between liberty and licentiousness, is the cordial hope of every Teuton who loves his native tongue. It is a great qualification in the *par nobile fratrum*, that, with a natural inclination towards purism, they are not such fanatics as to expel or prohibit foreign words which really enrich the language, and express shades of meaning more accurately than the home produce. What a book of German philosophy would look like without the words "Idee," "Absolut," "Subjectiv," "Objectiv," none of which are of German growth, we cannot so much as conjecture. Such a book would be as unreal as the universal lord mayor of whom we read in "Martinus Scriblerus," and from whom not only the year of mayoralty, but the robe and chain of office were abstracted.

The dictionary has not so completely absorbed the attention of Jacob Grimm as to prevent the publication of a valuable treatise on the origin of language,<sup>1</sup>—always a favourite topic with the Germans since the days

of Herder. To the two theories, that language is innate in man, and that it was revealed to him after his creation by the Deity, Grimm is decidedly opposed. He considers it a result of human thought—an invention in fact—improved in the course of human development. The three stages of language are the unwieldy monosyllabic, the flexional (in which the separate words are attenuated into terminations), and the modern stage in which inflexion gives way to the use of particles, and which some *dilettante* have regarded as a decline from ancient elegance. Grimm considers that the loss of this elegance is compensated by an increase of perspicuity, and he regards, with particular admiration, the English language, in which, above all others, the practice of inflexion is abandoned:—

"Among all modern languages" he says, "none has attained greater force than the English, through the abolition of old laws of euphony, and the banishment of nearly the whole system of inflexions. By its free middle tones, which are only to be learned, not taught, it has attained a force of expression which, perhaps, no other human tongue ever possessed. Its foundation and completion, so pregnant with intellect, and so marvellously felicitous, proceeded from a remarkable union of the two noblest tongues of Europe—the German and the Roman. The former, as is well known, supplying the sensuous foundation, while the latter furnished the more spiritual expressions. It was not without significance that the greatest modern poet, who, more than all others, can be placed in competition with the old poets of classical antiquity—of course I mean Shakspeare—drew his nurture from the English language, a language which has every right to be regarded as universal, and which seems, like the English nation, destined to prevail in every corner of the earth, even to a higher degree than at present. For in copiousness, sense, and conciseness, none of all the living languages is to be compared with it—not even our own German tongue, which is disorganized even as we are disorganized, and which must cast off many faults before it can enter boldly into competition."

Grammar and the love of political liberty are not necessarily connected by the laws of association, and the coolness with which they are blended in the minds of the brothers Grimm gives a remarkable character to their writings. Amid the distracted politics of their country they regard their language as the only common tie by which the German race is combined into one body, and this tie they are anxious to preserve in all its force. Thus, throughout their labours, we find the zeal of the scholar sharpened by the ardour of the patriot.

*Philosophy.*

A phenomenon of more than ordinary importance in the philosophical department of German literature is the reappearance of J. H.

\* The works named in this article have been furnished by Messrs. Williams and Norgate and Mr. David Nutt.

<sup>1</sup> "Ueber den Ursprung der Sprache." Von Jacob Grimm. Berlin. 1852.

Fichte's periodical,<sup>3</sup> which, after attaining the respectable number of twenty volumes, came to a stand-still through the troubles of 1848,—that terrible check to all speculative inquiry. It is now resumed under the joint editorship of Drs. J. H. Fichte, Ulrici, and Wirth, and absorbs into itself the little, ill-looking, but not talentless periodical commenced by the last-mentioned gentleman about a twelvemonth ago. The first number of the new series promises well. The writers are men of celebrity, and, while well acquainted with all the speculative tendencies of their age, write in a style more popular than that of those gigantic founders of sects who seem destined to have no successor. An article by Dr. Ulrici on Inductive Logic, chiefly directed against Mr. Mill's work, is well worthy the perusal of the English reader, since it shows at a glance the fundamental difference between the English and the German mind. English and German philosophers both start with a strong prejudice, which almost amounts to an instinct. The true Briton, who more or less directly derives all his metaphysics from Locke, shrinks instinctively from anything that bears the slightest approach to an innate idea, and clings to experience with the most exclusive devotion. The German, on the other hand—who, however he may differ from Kant in other respects, is never untrue to the belief that there is an *à priori* element of knowledge in the human mind—looks with absolute abhorrence at the English conviction that all knowledge is derived from experience. While reading Dr. Ulrici's refutation of Mr. Mill, we at once see how stringent his arguments will appear to his countrymen, and how little they can affect the English philosopher against whom they are directed. As might be expected, Dr. Whewell is mentioned as an honourable exception to the inductive sinners of England and France.

The periodical, according to the professions of its editor, will not be the organ of any party, but will be open to any contribution, even from a foreign hand, which bears the mark of an earnest love of truth, and is written in a temperate spirit. The actual questions of the day—political, social, or ecclesiastical which were regarded as fitting themes in the former series—they will leave untouched, on account of the confusion that has prevailed with respect to all practical subjects since the revolutionary year. Before taking leave of this promising periodical, we will give an extract from the editorial preface, showing the present state of German philosophy:—

<sup>3</sup> "Zeitschrift für Philosophie und Philosophischen Kritik." Halle. 1852.

"The question is now, not that of the maintenance, the improvement, or the domination of this or that philosophical system—such autocracies have generally done more harm than good—but it is the interest of all the sciences, without exception, that the true philosophical spirit of investigation does not die out in the scientific light of a nation. Unfortunately, it seems to us that the period of a one-sided preponderance of philosophical speculation over the so-called exact sciences, and over practical activity, has been followed by that nervous relaxation which usually follows excessive exertion. Because philosophy cannot give what it promised to give in its days of speculative arrogance—all philosophy is now rejected as useless, fruitless, and superfluous. Because, in its presumptuous desire to teach, it busied itself with things beyond its sphere—especially in the machinery of purely practical matters, such as the political, ecclesiastical, and social questions of the day, where it could only perplex instead of enlighten—all philosophical speculation is now regarded as dangerous, and every impulse in that direction is checked by all possible means. The theologians point out the danger incurred by faith and the church through philosophical studies; the friends of natural science express undisguised contempt towards anything which in the slightest degree bears the mark of a philosophical view or a philosophical treatment; the jurist, the historian, and the politician combat every impulse of the philosophic mind as if it were the sworn enemy of all law and all morality—the ruthless destroyer of all the historical foundations of every human society."

This is a remarkable change since the days, some twenty years back, when every department of science seemed to be in the hands of one dominating school of speculative philosophy; and an initiation into the mysteries of that school carried with it not only a share in a literary despotism, but was regarded as an introduction to court favour. So much for German philosophy in its outward relations: let us now hear our editor's report as to the home department:—

"Even in the region of philosophy itself, there now prevails a sort of apathy and indifference, or rather, perhaps, of careless security, which belongs to the most remarkable signs of the times. The most diverse principles, the most opposite tendencies, exist side by side—apparently at least—in the profoundest peace. Every school, every tendency, nay, we may say, every individual philosopher goes on building his house or cot in his own ground, just as if there was nothing else in the world worth the slightest attention. Even attacks in important critico-historical works, which are directed against the fundamental principle of a particular school, and maintain that they have clearly proved its fallacy, are wholly ignored by the party attacked. It seems as if an universal peace were proclaimed. Not only are all weapons put down, but there is an end of all contact, of all reciprocal influence. In this apathetic in-

difference stand the two sides of the Hegel school; the school of Herbart, with its various ramifications; the successors of Krause; the Schopenhauer tendency, with the various remains of the Kant, Fichte, Jacobi, and Schelling schools; Beneke, Günther, E. Reinhold, Trendelenburg, Fechner, Reiff, and others, in their several independent positions; the adherents of Feuerbach; the empirico-materialistic tendencies, &c.: all side by side, and in the face of the direction taken by ourselves."

### History.

From the wail of Dr. Fichte and Co., in the first of these two extracts, it might be supposed that the professors of positive science were all exulting at the exclusive attention bestowed upon them now the old despot, Philosophy, is dead. However, if we turn to an elaborate history of Pope Boniface VIII.,<sup>3</sup> written by Dr. Drumann, the celebrated Roman historian, we shall find the same dismal length of countenance on the part of the writer. These days, he thinks, are enough to scare any one from writing history who perceives how little its lessons are regarded; and he quaintly anticipates the question—"What is Boniface VIII. to us?" Nevertheless, he presently explains that Boniface VIII. is a great deal to us. The Roman church still claims supremacy over all the world. Gregory XVI. only recently asserted that it was impious to attempt any reformation of the Church; and Pius IX., with all his desire to amend the State, regards the Church as perfect. Where an existing structure, even in its tottering condition, is still so imposing, the history of its architects and fortifiers cannot be without interest, even to those who regard present affairs only. Boniface VIII., the doughty adversary of Philip the Fair of France, though less celebrated than some of his predecessors, is brought into unusual importance by W. Drumann, as the great perfecter of that work which was begun by Nicholas I., Gregory VII., Alexander III., and Innocent III. The bull entitled "Unam Sanctam," issued by Boniface, was the most unequivocal declaration of the superiority of the spiritual to the temporal authority that the most despotic temperament could originate. It declared that both the spiritual and the material were in the power of the Church—that one was used *by* her, the other *for* her; and that the weapon wielded by kings and soldiers was entirely subject to the permission of the priest. M. Drumann's work is, in every respect, most elaborate. He quotes documents, exhibits

the state of Europe at the time of the hero's occupation of the papal chair, and gives every event with the minutest detail. To the general reader, a work of this sort will possess no more interest than a volume of parliamentary debates; but to the student of mediæval history it will be found, no doubt, an important boon.

### Theology and Church History.

A work on the Genius of Christianity,<sup>4</sup> composed by Ludwig Noack for the edification of the cultivated (*gebildet*) laity, conveys, at the first glance, an impression that the great mass of pietistical literature has been blessed with an increase. The author talks pathetically, in the preface, about the death of his wife, expatiates on her virtues, and informs us that it was at her suggestion that the work was undertaken—all of which looks very like the prelude to a decidedly "good book." A quotation from such a pagan poet as Hölderlin, with which the preface concludes, raises, indeed, a doubt on the subject; and when we dive a little further, we find our pious instructor one of the most reckless wielders of heterodoxy that was ever produced by the fertile soil of Germany. He is, to be sure, a zealous advocate of "Christ," but then he is careful to explain that this Christ is by no means identical with the acknowledged founder of Christianity, whom he somewhat irreverently terms the "Man of Nazareth." The Nazarene, he admits, was the originator of the system which afterwards spread so widely; but he was a mere beginner, who had a very slight notion of the great results in his own work. In the same spirit, adopting a youthful view of Schelling's, he considers the New Testament all very well as a book containing information respecting the crudest and most imperfect form of Christianity; but as about the last authority in the world, if we would be instructed as to that grand universal idea of humanity to which he gives the name of Christ. His book is a sort of history of Christendom from the primitive age to the present day; but he has not that talent of seizing on characteristic points, and giving pregnant descriptions, which are the great qualifications of the philosophical historian; and we think the "cultivated laity" may more pleasantly derive the same amount of information from other sources.

"Christus," by A. Schumann,<sup>5</sup> is a learned compilation, intended to show how the person of the Redeemer is considered in the

<sup>4</sup> "Der Genius des Christenthums." Von Ludwig Noack. Bremen. 1852.

<sup>5</sup> "Christus." Von A. Schumann. Hamburg und Gotha. 1852.

<sup>3</sup> "Geschichte Bonifacius des Achten." Von W. Drumann. Königsberg. 1852.

Old and New Testaments, and is suited alone to the laborious biblical student, who brings a stock of Greek and Hebrew to assist him in his investigations. The style is that of an exegetical commentary; free use is professedly made of the productions of De Wette and others, and he uses De Wette's translation of the Bible, where he quotes the Scriptures in German. The result which he draws as to the Redeemer's view of his own person would be regarded as orthodox in Germany, but would be looked upon here as somewhat broad. Christ, he considers, feels and declares himself to be a real man, though free from all sin. He knows and declares that his spiritual nature is above that of all mankind, for he speaks of an existence with God before the creation of the world, and exhibits a preternatural power over nature and man. His earthly mission comes from God, and consists in the redemption of mankind, who, without him, would be lost to all eternity. Repentance and a perfect faith in his redeeming power, are the conditions of salvation. This series of results makes up a confession of faith that might as well belong to a pious Arian as to a Trinitarian; and Schumann, by his declaration that we ought not to inquire how the human and divine principles are combined in the person of Christ, shows that he is not anxious to entangle himself in sectarian niceties.

Another contribution to theological literature is a popular history of the church in the apostolic age, written in a strictly orthodox spirit, by Dr. Thiersch.\*

### Biography.

The Germans possess one virtue to a high degree, and that is a readiness to give a literary manifestation of their veneration for their great men. The great ecclesiastical historian Neander, who died in July 1850, and who, though one of the most zealous assailants of heterodoxy, was respected by all parties for his immense erudition and known honesty of purpose, has found a characteristic biographer in Dr. Otto Krabbe,<sup>7</sup> who has collected into one thin volume a series of articles published last year in the Lutheran periodical of Mecklenberg. A biographer is usually a panegyrist: and Dr. Krabbe follows up a tolerably elaborate account of Neander's labours with these remarks:—

“Thus did Neander, by the power of history, once more call to Christ the apostate race of his

time, and prepare a new birth of evangelical life and faith through the might of a sanctified learning. He conquered the old days, and by a breath of the love of Christ, drawn from the deepest knowledge of the historical life of man, he called forth a new generation of witnesses, who have been nourished by his spirit. He saw the approach of a period, the destructive tendencies of which ventured an open war with the church of the Lord. However, the church still stands amid the violent fermentations of the present, newly animated and inspired by the love of Christ. What will be the result of the contest, and what new developments it may produce in the church, is as yet concealed from our eyes; but this we do know, that the church has yet the power to bear witness to herself, and that when the history of our own days shall be written, all Christian historians will go back to Neander as to one whose life and learning proved an imperishable blessing to the church, and who belongs to those from whom she has to date a new epoch, and a new state of development.”

Of all the Goethianer, certainly none is so indefatigable as H. Düntzer, of Cologne. Under his inspecting eye, the last edition of Goethe's works was launched into the world. It seems but the other day that his book of “Studies,” in which so much light was thrown on the “Sorrows of Werther,” started into existence; and now we have a series of female portraits,<sup>8</sup> drawn from the period of the poet's youth, bristling with dates and small names, after the true Düntzer fashion. Frederike Brim, Cornelia Goethe, Lili, and Goethe's mother, are once more summoned from the shades; and a new apparition rises in the shape of Anna Sibylla Münch, who has never before been mentioned, either under her own or another name, by Goethe himself, or by any one else; but who nevertheless, it seems, exercised considerable influence upon him at the time when he resided at Frankfort, after his return from the universities. A new flame of Goethe's!—there is a *bonne bouche* for the biographical enthusiast. The misfortune of books of this sort is, that they force one to read so much that one has read before. Even to get at the fair Sibylla, we have to wade through copious extracts from the “Wahrheit und Dichtung,” which we almost know by heart. Could not the German contributors to biography assume, as a not very violent hypothesis, that persons who would dive into the minutest *minutiae* of Goethe's biography, usually have a copy of the poet's works on their own shelves, and have occasionally glanced at his autobiography?

Under the rather fantastic title of “House

\* “Die Kirche im Apostolischen Zeitalter.” Von Dr. Thiersch. Frankfurt. 1852.

<sup>7</sup> “August Neander.” Von Dr. Otto Krabbe. Hamburg. 1852.

<sup>8</sup> “Frauenbilder aus Göthe's Jugendzeit.” Von H. Düntzer. Stuttgart und Tübingen. 1852.

and World," we have a biography of George Forster the younger, who accompanied Captain Cook's first voyage of discovery, he and his father being naturalists to the expedition. This voyage, which occupied three years, is passed over by Mr. Koenig, as an account of it was published by Forster himself. On their return, father and son found themselves elevated to the rank of social "lions," but with little or no more substantial advantage. A family of seven children had to be maintained on occasional precarious earnings, translations, fugitive literary performances, or, what was still worse, by presents from German princes, to whom the circumnavigators had sent curiosities from the newly-discovered islands of the Pacific. As the English government had opposed the publication of his narrative of the expedition, the younger Forster returned to Germany, his native country, in search of a subsistence, and was received with great honour; for in those days, to have sailed round the world was a distinction. His acquaintance was sought through a wide circle of what were then celebrated names; and he continued, during the remainder of his life to follow, "for better for worse," the career of an author, besides holding, from time to time, various appointments. The last was that of librarian to the Elector of Mentz, where he remained till the French entered the city in 1792. As he had warmly embraced the principles of the revolution, their presence had no unfavourable influence on his fortunes; but when, shortly after, the city was recovered by the Prussians, he was compelled to leave it, and lost his entire property, including his books and papers. He died about two years after.

M. Koenig has kept himself clear of the ordinary fault of biographers—that of forming too partial an estimate of his hero; and indeed, poor Forster's character was not calculated to excite enthusiasm, and his history is one that leaves a dissatisfied and melancholy impression. He seems to be always drifting before the gale of circumstances, his will scarcely ever exercising any controlling power over events, except perhaps in the instance of his marriage, the most untoward event of his life. Living mostly from hand to mouth, a prey to many corporeal sufferings, the effects of disease contracted during the years passed at sea; unsupported by any strong principle, uncheered by religious hope, he was also unblest by the warmth of domestic affection; for the very moderate attachment on

which his matrimonial engagement was formed, though it might have held together in the fair weather of a prosperous life, was by no means strong enough to resist the wear and tear to which it was exposed in one of struggle and care. When he left Mentz, a ruined man, an amicable arrangement was entered into with his, or Madame Forster's friend, Huber, by which he resigned his conjugal position, but apparently without any interruption of "friendly relations" with either party. It should be recollected of this singular passage of Forster's life, that it took place in 1793, in France. A few months afterwards, the register of the municipality of Paris recorded the decease of George Forster—"domicilié à Paris, rue des Moulins—sa femme absente."

M. Koenig has not confined himself rigidly to the events of Forster's life, but made widely discursive rambles over the literary and political history of the time. In the chapter entitled "Verwirrung," he has given a striking picture of the spiritual confusion of Germany in the period immediately preceding the French Revolution, when the German mind seems to have sought a refuge from political tyranny in the twilight caves of Rosierucianism, and of every conceivable and inconceivable kind of fraud and folly that presented itself, with the pretension of spying into the mysteries of Nature, and gaining the command of her powers by a shorter and easier method than that of earnest and persevering study.

"The Poor Man in Tockenburg,"<sup>10</sup> is a curious and interesting autobiography of a peasant weaver, who lived, about the middle of the last century, in one of the most primitive pastoral districts of Switzerland, and who could devote to the account of his life only the scanty moments of leisure snatched after his day's work. The natural activity of his mind, resisting all the benumbing effects of poverty, privation, and the incessant care harassing the father of a large family, with the scantiest means of support, enabled him to attain by his own efforts, a considerable amount of mental cultivation. Among other writings, he has left behind him a series of criticisms on the plays of Shakspeare, of whom he was a passionate admirer. His acquaintance with our great poet, and, indeed, his entire stock of literary acquirement, was obtained by means of a reading society, called the "*Moral Association*," which was established in the little town of Lichtensteg, near his village. After he became a member, he was, we are told, seldom without several

\* "Haus und Welt: eine Lebensgeschichte." Von Heinrich Koenig. Braunschweig. Vieweg und Sohn. 1852.

<sup>10</sup> "Der Arme Mann im Tockenburg." Von Eduard Bülow. Leipzig. 1852.

volumes, and sometimes had the whole twelve in his hut. To possess a copy of his own was a wish fondly cherished for many years, but destined never to be fulfilled. Besides his thirst for knowledge and intellectual pleasure, Ulrich Bräker exhibits the most ardent love of nature, and a strong susceptibility to the charms of the exquisite scenery of his native country—a gift by no means common in Switzerland. In his youth he was kidnapped, to serve in the army of the great Frederick, in his attack upon Silesia, at the commencement of the Seven Years' War, and this was the only glimpse he ever obtained of the world beyond his native mountains. After the first battle, he contrived to make his escape, returned home poorer than he had gone, married (not, it would seem, with very happy results) a damsel in the Amazonian style of beauty, for which he had acquired a taste during his service in Prussia, and never afterwards emerged from the condition of poverty and hard labour in which he was born, and of which his love of literature and Nature, and his religious sensibility, formed the only consolations. It does not appear that, except a magnificent prize of one ducat, assigned to him for an essay on some rural subject, he ever made any profit of his literary pursuits; but they afforded him relief and comfort in many trying hours, and have preserved to us the picture of a mind of more than common endowment, and a state of society, of which there are few genuine records. Several of Bräker's writings have been published since his death, in various forms; but the German editor of the present volumes has, in almost every instance, resorted to the original manuscript.

#### Miscellanea.

The "Letters from Egypt and Ethiopia"<sup>11</sup> of Dr. Lepsius, were written to furnish an account of the proceedings of the great expedition sent out in 1842 by the King of Prussia, to collect Egyptian antiquities, and pursue, on the spot, the historical inquiries connected with them. The more purely scientific results have already been in part laid before the public in the "Preliminary Report" issued in 1849, and a great work, containing above eight hundred imperial folio plates, is now in preparation, on the subject. The letters, some of which have appeared in the *Preussische Staats*

*Zeitung*, have remained nearly in their original form; they are addressed to the King, to Chevalier Bunsen, W. Humboldt, to the Minister of Public Instruction, and other distinguished men, and contain the personal narrative of the expedition, the various incidents of the journey, the circumstances that hindered or forwarded the objects of the expedition, and information on the present state of the countries visited; though all these topics are treated as subordinate to those in which what is called the learned world will be chiefly interested. A man so thoroughly qualified for his task as Dr. Lepsius, and with such abundant means at his disposal, could hardly fail to reap an ample harvest in this wonderful field of historical "diggings." As an instance of his diligence we may mention that, in a spot where Champollion discovered only two tombs, and of which he says "*Il y a peu à faire ici*," the present traveller opened and examined forty-five. In the great pyramid he deciphered so many inscriptions in which the far-spreading families of Egyptian nobles, with their titles and offices, are named and described, that he would be in a position to draw up a "Court Calendar" for King Cheops, or present us with the genealogies of the distinguished personages who formed the chief ornaments of his court five thousand years ago. Besides this, he has filled up many considerable chasms in Egyptian chronology, and found satisfactory places in the seventh and eighth dynasties for kings who hitherto have not had where to lay their heads. The "account of the fifth dynasty, as the immediate successor of the fourth," Dr. Lepsius considers as "one of inestimable importance, and sufficient of itself to richly reward a several months' residence on this spot." People will differ, perhaps, in their estimate of the actual value of these results, and some readers may not be sensible of any great relief to their minds on being told that "it need no longer be doubted that the second pyramid belonged to King Chafra, the third to Menkera," and so forth; but without the scholarly enthusiasm which tends naturally to overrate such matters, our knowledge of the antique world must have remained considerably behind its present position. Among other really noteworthy particulars communicated by Dr. Lepsius, we may mention his solution of the riddle of the mode of building the pyramids, which was by forming a small one first, and then clothing it with repeated coverings of stone, of from fifteen to twenty feet in breadth. Every king, at the commencement of his reign, began his pyramid, and at his death only the covering then in progress was

<sup>11</sup> "Briefe aus Egypten, Ethiopien, und der Halb-insel Sinai, geschrieben in den Jahren 1842—1846." Von Richard Lepsius. Herz. Berlin. 1852.

completed; so that the size of the pyramid in most instances stands in a certain determinate proportion to the length of the reign. Another discovery was that of the tomb of the prince, the son of Cheops, who was "superintendent of all the king's buildings," and, in all probability, the architect of the great pyramid, which was already old when Abraham entered Egypt; and in the Temple of Isis, in the island of Philæ, he found a decree of the Egyptian priests, containing the same text as that on the Rosetta stone. Much attention was devoted by Dr. Lepsius to the languages of the Nubian races and of the Negroes of Darfoor, to their character and condition, and to the physical features of their country; nor are the letters wanting in such moving incidents as an attack of robbers, and the greater peril of being lost in the deserts of Sinai. One apparently rather frolicsome exploit for so erudite a party was the putting up, in the Great Pyramid, an inscription in Egyptian hieroglyphics in honour of his Majesty, Frederick William IV. of Prussia, the style of which it was considered proper to accommodate to the place:—"Thus speak the servants of the king, whose name is the sun and the rock of Prussia, Lepsius the writer, Erbkam the architect, the brothers Weidenbach, painters, Frank the moulder, &c., &c. Hail to the eagle, the defender of the Cross, to the king, the sun, and the rock of Prussia, to the son of the sun who delivered his country, Frederick William the Fourth, the favourite of wisdom and history, the guardian of the river Rhine, the *Dispenser of Life*," &c.

As the modern inhabitants of the country are not acquainted with the ancient hieroglyphic, the inscription could not have been intended for their edification, and if for that of European travellers, some other tongue would surely have answered the purpose better. The expedition afforded sufficient variety of choice, as it included within itself a perfect Babel of tongues—English was spoken by Messrs. Wild and Bonomi; French and Italian served for intercourse with the authorities and the natives of the Levant; the travellers gave their orders and journeyed with Arabic, and planned their proceedings, gossiped and lived with German. The only conclusion we can come to, therefore, is, that the inscription was intended for the sole behoof of the ghost of King Cheops, and its style, to convey to him the consolatory assurance that there are points on which the world is not much wiser than it was in his day.

"Dialogues with Spirits," by Bettina

"Gespräche mit Dämonen." Des Königs-

Arnim, bears on its title-page the same loyal appropriation as that formerly published by the same lady under the striking appellation of "This Book belongs to the King," but it is dedicated, nevertheless, (whether "with permission" we are not informed,) to the Spirit of Llam, represented by the magnanimous Abdul Meschid Khan, Emperor of the Osmons. The dialogues are of a political character, and, as far as we can venture to give any opinion of their scope and purpose, it appears to be that of affording salutary counsel to an "illustrious personage" in Prussia. With the exception of the introductory portion, they are carried on between the "Demon and a *Sleeping King*," on the principle that the truth reaches the ear of a monarch more clearly in his slumbers than in his waking moments; but the truth as here presented is involved in so many whimsical wrappages and quaint conceits, that few readers will have patience to search for it. Politics belong to the practical business of life, and should be seen by clear daylight, and not in this kind of pseudo-poetical moonshine. The name of the authoress will be remembered by the reader in connexion with Goethe, for whom, in her youthful days, she entertained a most vehement sort of histrionic passion, and took care to make the world acquainted with the fact.

"Goethe in Letters and Conversations"<sup>12</sup>—if it be a sin to write books, certainly Goethe was the "most offending man alive" in his day; for, besides those which owe their origin directly to his literary activity, the number of which he has been indirectly the cause amount to a library in themselves. The compiler of the present selection of aphorisms enumerates above twenty separate works—"Correspondence with," "Recollections of," "Communications concerning," &c.,—from which he has made up a tempting table of contents. The thoughts of Goethe on "literature and poetry, nature and society, politics, religion, and philosophy," who would not gladly know? But the selection might have been better made from the works of Goethe himself, than from the reports even of the most zealous observers. Wilhelm Meister alone, indeed, might almost furnish a volume of such. On all matters connected with the plastic arts, and on physical nature, Goethe is a first-rate critic; on society and life his remarks are the perfection of common sense, for the perfect equilibrium of his great powers

buch. Von Bettina Arnim. Berlin. Arnims Verlag. 1852.

<sup>12</sup> "Goethe in Briefe und Gesprächen. Sammlung der brieflichen und mündlichen Bemerkungen und Betrachtungen Goethe's über Welt, Wissenschaft, Literatur und Kunst." Berlin. Vereins Buchhandlung. 1852.

enabled him to manifest, in its highest form, what may be regarded as the net result of all the intellectual faculties in their equal development.

"Austrian Military Life,"<sup>14</sup> (From the "Austrian Soldier World,") is a collection of amusing, off-hand sketches of a kind of life which, more than any other, is attractive to the mere looker-on, from the nursery-maid who runs after the soldiers in the park, to the "highest personages in the realm." It is here described with less of the obvious exaggeration and making up for effect than is usually met with in productions of the class; and though the sorrows of the "White Coat" are peculiar to the Austrian, the adventures of young soldiers out on leave, the life of the camp and the garrison, the incidents that sometimes vary the sentinel's lonely watch, and so forth, may stand for those of military life in general.

The collectors of classical German literature will care to learn the republication, by Cotta, of Herder's works.<sup>15</sup> Although Herder labours under the disadvantage, that many of the subjects he wrote upon have received new light since the period of his labours, whilst others have lost their importance altogether, his spirit is so genial, his place in the history of German literature is so prominent, and he is so complete a representative of that universalism which is the great characteristic of his nation, that he will always command a certain amount of popularity among the more earnest class of readers. The series, which is not expensive, will be completed in forty small square volumes.

That the zeal for classical antiquity is not extinct in Germany, is proved by the appearance of a bulky life of Cicero,<sup>16</sup> by C. A. F. Brückner, who undertakes to set Drumann right as to the character of the great Roman orator. Only the first volume has as yet appeared.

To the lovers of a *little* science, the German press presents some popular geological papers, neatly ornamented with wood-cuts, by Bernhard Cotta.<sup>17</sup> They were originally published in the "Illustrirte Zeitung"—the "Illustrated News" of Germany—and pleased so much, that the author was requested to republish them in a collected form. M. Cotta amiably consented, and the present good-looking volume is the result.

<sup>14</sup> "Aus der Oesterreichischen Soldatenwelt. Von einem müssigen Kriegsknecht. Stuttgart. Mezler. 1852.

<sup>15</sup> J. G. von Herder's "Sämmtliche Werke." Stuttgart und Tübingen. 1852.

<sup>16</sup> "Leben des M. Tullius Cicero." Von C. A. F. Brückner. Göttingen. 1852.

<sup>17</sup> "Geologische Bilder." Von Bernhard Cotta. Leipzig. 1852.

"The House Chronicle,"<sup>18</sup> of which we have here six numbers, scarcely falls within the limits of our jurisdiction, being a periodical of miscellaneous contents. Opening a number at random, we find "The Mysterious Treasure," "The Goldsmith of Westcheap," "Knightly Deeds and Adventures," "Hamlet the Dane," &c. The style is homely, but not unpleasant; and, like most specimens of the popular literature of Germany that reach us, it is of a more healthy character than the majority of the productions that form the chief mental aliment of the corresponding classes in England or France.

#### Fiction.

The "Hochwald"<sup>19</sup> of Adalbert Stifter, will add nothing to the reputation of its author. The extreme inspidity of the *dramatis personæ* is unrelieved by any of the variety of incident or ingenuity of plot which, though a merit of an inferior order, will sometimes make partial amends for the absence of the character, passion, or sentiment that we look for in a novel. A pair of young ladies, warranted first-rate in point of beauty, but otherwise nothing in particular, a venerable papa, a faithful old servant, a young gentleman in love to the required depth—such are the materials of this silly little story; but, from its outward form, it may perhaps be intended to take its place among the literature of the *boudoir*, or the toy-shop.

The two best novels that have reached us this quarter are translations from the Swedish of Emilie Carlen, "The Guardian," and "The Report."<sup>20</sup> The latter especially possesses in an eminent degree that power of charming the attention which is so much prized by novel-readers; and in fertility of invention, in range of character, in humour and pathos, stands greatly in advance of any previous work of the authoress. Our sympathies are powerfully moved by the domestic tragedy in the earlier portion, by the situation of the young poet husband, on whom nature and fortune seem equally to have lavished their gifts, yet who is in reality only mocked by a Tantalus-show of happiness. His young and lovely bride, in deliberate villany, is the equal of Becky

<sup>18</sup> "Haus Chronik." Herausgegeben von Kaspar Braun und Friedrich Schneider. Munich: Braun und Schneider. 1852.

<sup>19</sup> "Der Hochwald." Von Adalbert Stifter. Pesth: Heckenath. 1852.

<sup>20</sup> "Der Vormund." Roman von Emilie Flygare Carlen. "Ein Gerucht." Roman von Flygare Carlen. Aus dem Schwedischen, von G. Finck. Stuttgart: Franckschen Buchhandlung. 1852.

Sharp, but lacks something of the cool and logical consistency of that admirable young woman. Astonishing as Becky's proceedings are, we never for a moment doubt that, granting the premises, such they would have been. Such a nature and such an education must have produced such results. But the wickedness of Lilia cannot well be accounted for, without the supposition of a nature originally delighting in evil, and even then it is not always consistent with itself.

Some of the humorous personages—the poet's pupil, Dick, the formidable Frau Walbog—a visitor of the Mrs. Falcon genus, but of an honester species—her daughter, Mamsell Jolly, whose *mission* it is to be permanently twelve years old, as that age is considered most suitable to the various accomplishments and feats to which she has been trained, with a view of affording amusement in the houses where it is her mother's pleasure and profit to quarter herself—all these are amusing and effective sketches. As a whole, however, both these romances would be improved by being simplified in their plot and reduced in their dimensions. There are so many plantings and transplantings of affections, so many loving pairs tending by devious tracks to the common goal of matrimony, that we get somewhat bewildered. In one instance, where the lover is a doctor, there is a rather nauseous mixture of love and medicine; the marriage arises out of the malady, and the tender passion and the tumour are simultaneously brought to a head. We should add perhaps, though it is with regret, that neither of these productions could be unhesitatingly admitted as "*family reading*."

No such objection can be raised against the next novel on our list, a novel in four volumes, entitled "Herder."<sup>21</sup> It is as innocent as butter-biscuit, and not much more piquant. The author seems to have set to work, in an unusually methodical and deliberate manner, to construct a series of novels, of which persons of high literary reputation, with whom he desires his countrymen to be better acquainted, should figure as the heroes. Having *done* Lessing and Humboldt, he proceeds, in the regular course of business, to Herder—the object he has in view being to make the German nation acquainted with the literary history of the past generation, and to unite "Homeric fidelity with dramatic action and representation of character;" and thus to awaken an interest for distinguished individuals even in the mere entertainment-

seeking public. But the lives of literary men in general are extremely undramatic, and none was ever more so than that of Herder. The author has certainly succeeded in reproducing the literary aspect of the time with astonishing exactness and industry; but a mere repetition of actual life in all its prosaic tediousness is not desirable in fiction, which should stir our imaginations by something more attractive, more vivid, than reality—by brighter joys, stronger emotions, grander sorrows—"des *Hasses Kraft, die Macht der Liebe*." A false entry in a tradesman's ledger could not well be classed as a work of imagination. We hope therefore that Dr. Klencke will reconsider his resolution of continuing these performances; and employ the large amount of information he possesses, rather in the production of authentic biographies, than of dull and uninteresting novels, without either the authority of truth or the charm of fiction.

---

#### ART. XIII.—CONTEMPORARY LITERATURE OF FRANCE.\*

ALTHOUGH Literature cannot be said to flourish under the Dictator, owing to the restraints placed upon the expression of opinion, the list of this quarter shows, among its few publications, some two or three of marked importance. Auguste Comte has sent forth the second volume of his "*Système de Politique Positive*." It is devoted to Social Statics, or the abstract statement of the principles of Order. The positive study of Humanity is divided into two essential portions: first, that which concerns the fundamental nature of the organism, the *structure* of society, or Social Statics; secondly, that which concerns the evolution of society, or Social Dynamics. It is of course as difficult, if not more so, to separate the statical from the dynamical point of view in treating of society as in treating of the human organism; but logical convenience suggests that we should subjectively separate considerations of structure from those of life, and begin our study with anatomy before approaching physiology. In seven chapters Comte discusses the statical conditions. First in order stands Religion, or the "positive theory of human unity;" secondly, the sociological appreciation of the human problem or "positive

<sup>21</sup> "Herder." Roman von Klencke. Leipzig: Kollman. 1862.

\* The works named in the course of this article have been furnished us by Mr. Jeffs, of the Burlington Arcade.

theory of material property ;" thirdly, the positive theory of the human family; fourthly, the positive theory of language; fifthly, the positive theory of the social organism; sixthly, the positive theory of social existence systematized by the sacerdotal institution; seventhly, the positive theory of the general limits of variations incident to order.

Throughout these abstract considerations we observe the presence of one peculiarity observable in no other treatise of the kind—viz., that the theory of social order is rigorously deduced from, and limited by, the theory of individual organism. In the first volume Comte propounds a cerebral theory which may be accepted as the positive theory of human nature; and, guided by this theory, he analyzes the social organism, showing how it employs the three fundamental principles of human life,—activity, affection, and intelligence—to construct therewith a higher organism, Humanity. In other words, Comte makes Biology the basis of Sociology. All systems pretend to take human nature as their basis; none but his rigorously fulfils the condition; they either introduce some extraneous elements—or they present a truncated system of human nature in which one or the other essential is wanting.

Comte begins with religion as the keystone of the social arch: the bond which binds the divergent tendencies of human beings into unity, and which binds together (*religare*) the diverse individualities into society. Religion, which at first was spontaneous, then inspired, then revealed, now finally becomes *demonstrated*: following thus the laws of evolution which have presided over Science. Religion, as defined by Comte, is not this or that form of creed, but the harmony proper to human existence, individual and collective, constituting for the soul a normal *consensus* similar to that of health for the body. It gathers into its bosom all the tendencies of our nature, active, affectionate, and intelligent. It presides over politics, art and philosophy.

Every stage of religion demands the continuous concurrence of two spontaneous influences: the one objective and essentially intellectual, the other subjective and purely moral. On the one hand our intelligence must conceive an external Power to which our existence must be subordinated. On the other, it is equally indispensable that we should be animated by an internal affection capable of binding together all the other affections. Submission to the external power naturally seconds this internal discipline. Men in our day almost univer-

sally consider Unity as resulting only from our moral condition; but, in truth, no unity would be possible without this objective dependence. When the belief in an external power is incomplete or vacillating, the purest moral sentiments are incapable of preventing "*d'immenses divagations et de profondes dissidences.*" (However orthodox this may appear to the casual reader, he is warned not to understand by this external Power the orthodox theological formula. Having made this caveat, we continue.)

To fulfil its true function (*pour nous ré- gler et nous rallier*) Religion must, therefore, first subordinate our existence to an external and irresistible Power. This social dogma is, properly speaking, no more than the development of the biological notion of the necessary subordination of an organism to a medium. Religion rests on the permanent combination of two conditions: love and faith; and its "*véritable unité consiste à lier le dedans et le relia au dehors.*" Since then it concerns at once both the heart and the mind, it naturally divides itself into two parts, one intellectual, the other moral: the first constitutes the *credo*, properly so called, and consists in determining the *ensemble* of that external order to which we are necessarily subordinate. And here it is that the capital distinction must be sought between the Positive Religion and all other Religions. It is, as before stated, a Religion of demonstration. Its *credo* comes from the demonstrated truths of Positive Science, and the striving of science has resulted in furnishing precise and coherent views of the *ensemble* of physical phenomena, and thus furnishing a basis to Religion.

Hitherto, in spite of their decrepitude, intellectually speaking, the earlier Religions have maintained their supremacy by reason of moral considerations. To Science has been handed over all consideration of physical laws; but moral laws have been reserved for other teachers. Comte claims to have made the two one, by his foundation of social science. The gradual appreciation of the fundamental order reveals to us a final class of natural laws more hidden and more complicated than the former, but also more nearly concerning us. Although the course of our existence is directly subordinated to the cosmical and biological laws, it is not wholly represented by them. Our principal functions demand another explanation. We all feel ourselves ruled over by astronomical, chemical, and vital laws. But on a closer inspection we find there is another yoke, not less irresistible though more

modifiable, resulting from the *ensemble* of the statical and dynamical laws proper to the social order. Like all the others, this fatality makes itself sensible, first by its physical results, next by its intellectual influence, and finally by its moral supremacy. Since the dawn of civilization, every one has felt that his destiny was materially bound to that of his contemporaries, and even his predecessors. Later on, the involuntary comparison of various social conditions manifests the intellectual dependence of each upon the rest. The proudest dreamer cannot misconceive the great influence exercised over individual opinions by time and place. And, finally, as regards the most spontaneous phenomena, examination detects the dependence of our own moral condition on that of the general character of the corresponding sociability. Thus, under all aspects, man feels himself subject to Humanity.

We cannot, in our brief space, follow Comte, be it never so rapidly, into the various sections of this chapter on Religion—a chapter only appreciable by those who have previously familiarized themselves with his Positive Philosophy. Let us rather glance at the other chapters—and first, at that wherein the theory of property is treated. This *question brûlante* of property is one which Socialist writers in general have treated very inconsiderately, not to say absurdly. “*La Propriété c’est le vol*” was, it may be, only a pistol fired in the air; but the experience of revolutions teaches us the terrible consequences of a pistol fired in the air. As far as the social argument was concerned, the question of Property was purely one of *Distribution*, not of *Origin*. It was thought that another mode of distribution would be more effective, more equitable, more economical. By perplexing this question with one of “Rights,” of “possession,” the egotistic fears and prejudices of all professors were aroused, and instead of discussion there was combat, instead of argument, invective on *both* sides.

Comte, as a philosophic Socialist who founds his theories upon actualities, who leaves to others the pleasant fields of Utopia, and is content to take human nature as he finds it, not only vindicates Property, but undertakes to show its essential position in Social Order. He includes in it the whole material and industrial activity of man, and shows how the institution of Capital becomes the necessary basis of that division of labour which Aristotle declared to be the principal practical characteristic of social harmony; and by thus permitting the division of labour, Capital impels every active citizen to work not only for himself, *but for others*.

As before noted, the peculiarity of this

treatise is its deduction of social principles from biological principles; and in this great question of property it does not discuss alone the economical side, but shows how here, as elsewhere, the selfish instincts of man lead in their satisfaction to the development of unselfish instincts, how *egotism* is the impulse to *altruism* (to use a felicitous phrase coined by Comte): thus the egotistic instinct of material preservation, which impels to industry, is the foundation of Society, rendering it possible in a higher sense than that of mere aggregation of families.

The same luminous method of deducing the social from the individual is seen in the next chapter, which treats of “The Family” both as a moral and as a political basis, where we see clearly the origin of public social virtues arising out of private personal feelings. Comte is very energetic in his denouncement of what he considers the anarchical theories of “female emancipation.” Considering “woman’s mission” to be strictly and simply the office of Sentiment in tempering, refining, and rendering more social the essential practical Activity of Man—viewing woman as the symbol of Affection, as man is of Force, he holds that, so far from women performing the same work as men, they ought not to work at all, except in their domestic sphere. The man is bound to work for the woman’s support; and she, in return, is bound to obey him implicitly. He quotes, with immense approbation, the saying of Aristotle, that “woman’s force is best shown in surmounting the difficulty of obedience.”

The fifth chapter is on Language, which he rightly conceives as analogous to Capital. It is intellectual capital; the stored-up labour of generations of minds. Its social function has never before been so closely indicated. But to bring forward the views here maintained would require considerable space; indeed, the same may be said of the whole volume, the novelty of which prevents rapid analysis, every point requiring to be placed in a light acceptable to the general reader. We may say, however, in conclusion, that agree with the opinions, or differ from them, no man can attentively study these two volumes, so eminently suggestive and so novel, without a very considerable benefit.

Although they are reprints, Guizot’s volumes on *Cornelle* and *Shakspeare* are certainly to Englishmen equivalent to new works, except in the tone, which occasionally speaks of the period when they were written. Old or new, two such admirable volumes rarely call upon our notice; and not the least curious point in them is the eminently academic *literary* spirit of the

professor, who, when he wrote these volumes, never dreamed of one day being minister. The reader will find them anything but the leisures of an ex-minister; they betray the steady labour of ambitious youth, digging the foundations deep, in order that the pedestal may be secure. An erudition, copious and exact, is set forth in a certain tempered gravity of style, which, if not eloquence, is the next best thing to eloquence; and the criticisms have an union of good sense with catholicity very rare in French writers. We do not say that, on all points, we believe Guizot to be a trustworthy guide; but, on all points, his opinion is well worth weighing. To Englishmen, there will always be that fundamental objection of his being a Frenchman, with the French attitude of mind regarding Poetry as "versified good sense," consequently, preferring "a wise moderation" to the eagle flight—

"Soaring with supreme dominion,  
Through the azure fields of air."

But although his attitude is that of a Frenchman, it is not that of a Parisian; by which we mean that he is seldom guilty of the error of turning off a sentiment with a *mot*. He is guilty of it in the following passage, which we quote as a warning, "to let well alone:"—Geoffroy Rudel, the Troubadour, had embarked for Holy Land, that he might see his lady-love. *En route*, he fell ill, and arriving at Tripolis, in a dying state, he sent to the Countess, who came to his bed-side, and "le trouvant presque mort, l'embrasse, ce baiser lui rend ce qu'il lui faut de vie pour le sentir; il ouvre les yeux et meurt en remerciant la Providence de son bonheur." Only a Frenchman could spoil such a beautiful little poem as this by an epigram. The dying Troubadour, wakened for a moment to new life by the kiss of his mistress, thanks Providence for his kindness; and the comment suggested is—*Geoffroy n'était pas difficile!* It is a natural characteristic, as he confesses a few pages onwards;—"Le Français né observateur et par conséquent malin," is the reading he gives to Boileau's famous line; and this tendency to observation is shown in placing the ridiculous everywhere—epigrams by death-beds, *esprit* in solemnities!

The volume on "Corneille et son Temps" is divided into three essays: On the state of French Poetry previous to Corneille; a rapid, yet satisfactory sketch, erudite and entertaining; On the Life and Works of Corneille; a meagre biography, but containing an admirable indication of the rise and progress of dramatic art, and excellent criticisms on Corneille's genius; and finally,

an account of Corneille's three contemporaries, Chapelain, Rotrou, and Scarron.

Poetic criticism, as it is understood in Germany and England, must not be expected in these essays; but that philosophic criticism which is always welcome—the psychological insight of the intellect rather than the appreciative delicacy of taste—will be found here in abundance.

"Shakspeare et son Temps," is less valuable, but has its value too, and deserves a place on the shelves between Gervinus and Schlegel. We have naturally more deductions to make on the score of national characteristics than in the volume on Corneille; but when all deductions are made, there remains a solid amount of excellent criticism and suggestive remark. It mingles with unostentatious success the philosophical and historical points of view; and although the biography is at once meagre and fanciful—repeating long-exploded traditions, and giving no notice of the recent discoveries, such as they are, in this obscure region—yet even cultivated Englishmen will not peruse without profit the Essay on Shakspeare and his times. The criticisms on the separate plays we cannot greatly commend, but in the *general* considerations we recognise the philosopher.

Roman history has of late been the arena of iconoclastic combats. Every one has something to knock down or to "rehabilitate." The agrarian laws have naturally formed a "very pretty quarrel," and now M. Macé, in his "Histoire des Lois Agraires chez les Romains," has undertaken, with erudition and ingenuity, to show the injustice of traditional opinions on that subject. He is not by any means the first who has written in this sense; but he is the last and not the least. He builds his conclusion on the nature of the land affected by these laws, in limiting the quantity each citizen was permitted to hold, and in distributing the surplus to the poor. These "slices of the rich fat soil" were obtained by conquest: originally they formed portions of the public domain, and could only become private property by usurpation. In her wars with her neighbours, Rome always sold peace for land. This land was let out at rent. By degrees the rich and powerful forgot, or declined to pay, the rent; while the poor sold their portions to pay their debts. Thus formed, the property became consolidated by passing through the various forms of sale, exchange, marriage-contract, inheritance, until nothing remained to raise a claim upon save the *original* sin of defective right—of usurpation. It was this the tribunes thundered against. They reclaimed from the few what belonged rightfully to the

many. The lands were the property of the republic, and not of individual citizens; and to restore them to their lawful owners was the object of the agrarian laws. An object totally different, according to our author, from that of modern imitators of this measure; since the Roman reformers left private property untouched, and only called upon usurpation to give back what it had unlawfully got possession of—whereas our reformers attack directly the sacredness of private property! Whatever may be thought of M. Macé's historical views, his logic will not find much favour.

Lamartine's sixth volume of the "Histoire de la Restauration" brings the narrative down to the death of Napoleon. It is a very interesting volume, with fewer of those ambitious absurdities of style which fatigue us in the earlier volumes. There are too many, however. What can a plain man make of such descriptions as this of Ney on his trial?—"Son front élevé roulait des remords et des pressentiments." Burleigh's shake of the head is nothing to it.

The story of the trial and execution of Marshal Ney is admirably told in these pages; and there is one incident to which we direct especial attention, illustrating the theatrical nature of the French, even in their most serious moments. At a certain stage of the trial, Dupin, Ney's advocate, whispered to him, "All hope is over! Nothing now remains but to fall with *éclat*, and save your name in men's memories by falling nobly and patriotically in the eyes of France!" Whereupon the Marshal, feigning want of a breath of fresh air, left the court with his two advocates, "to concert with them his attitude and language." *Concierter son attitude*: what a thought to preoccupy a man about to die! Guilty of contemptible treachery, he feels that, now all hope of evading punishment is lost, there still remains the compensation of *la mise en scène!* Die he must, but he will die with got-up *éclat*; he will attitudinize before "the universe," (a Frenchman seldom takes a mirror of less modest compass than "the universe!") His advocates convinced him of the hopelessness of his cause. "But we have reserved for you," said M. Dupin, "the means of playing a part in the *denouement* of your trial and your life, by some *supreme and noble words*. We will re-enter the court. I will demand the right of defending you, and will begin by pleading your quality as a foreigner which withdraws you from the judgment of a French government, you having been born at *Sarrelouis*, now no longer a portion of the French territory. No sooner have the words which

claim protection for you as a stranger issued from my mouth, than you spring to your feet and interrupt me with an *éclat* of indignation, and a patriotic movement, which you will not need to feign, and you will imperiously forbid my attempt to save your life at the price of the abdication of your glorious nationality!" And this mock-heroic scene was acted! They wrote on a piece of paper the few words they had arranged for him; he learnt them by heart; at the premeditated moment he played out the scene, and not only "electrified" theatrical France, but even the historian who applauds it from behind the scenes! What an odour of foot-lights this anecdote makes us scent in other heroisms played on the stage of France! That Dupin should arrange such a scene is natural enough; an advocate is always seeking effect, not truth. That Ney should gladly have fallen in with such a plan is intelligible enough, being a Frenchman. But that the historian calmly relating the whole story should not be aware of its painful falsehood and trumpery tinsel, that, we confess, is less intelligible and very disagreeable.

Among the interesting pages of this volume let us note the hitherto inedited little pamphlet wherein Louis XVIII. himself, with his own royal hand, becomes the historian of one episode of his reign; and let us also note the story of Louvel and his murder of the Duc de Berri as among Lamartine's most successful efforts. There are also some elaborate "portraits" in the Lamartine fashion. That of the fascinating Madame du Cayla being, perhaps, the most successful.

Of the books produced by the *coup d'état*, there are three not to be overlooked, and these are the works by Proudhon, Victor Hugo, and Schœlcher. With a blindness scarcely explicable, Proudhon's "*Révolution Sociale démontrée par le coup d'état*," has been allowed to appear in France, and four editions have been sold in two months. Because it professes to accept the *coup d'état* as a progress towards the final triumph of socialism, it has been permitted, although, in truth, it is one of the most destructive books ever written, and, to all thinking readers, exposes the nullity of Louis Napoleon. Amidst much that is paradoxical, and not a little that is absurd, there is matter for reflection in this book. Proudhon sees in Louis Napoleon the natural consequences of three years of imbecile reaction, always preaching against socialism, and the necessity for a restoration of authority, the absorption of individual liberty in the state. You, Men of Order, wanted Authority;

you have got it. You wanted Socialism knocked on the head; it is silenced. You wanted "order;" you have it.

The 24th February, 1848, he bids us remark, a revolution overturned constitutional monarchy and placed a democracy in its stead; the 2nd December, 1851, another revolution substituted a decennial presidency for that democracy; in six months, perhaps, another revolution will drive away the president, and re-establish a legitimate monarchy on the ruins. What is the secret of these changes? That which Louis Philippe could neither foresee nor avoid, overthrew him, and brought a republic; that which the republicans were afraid to undertake overthrew the republic and decided the success of Napoleon; that which Napoleon dare not attempt will, in turn, be his ruin; and so on with all his successors, provided the country is willing to bear the expense of all these failures. And what is this but the problem of the proletariat, *l'idée sociale*? In vain do men exclaim that socialism is vanquished. It can only be vanquished by a solution of their problem it presents. At present it is silenced, not solved. It has been answered with diatribes and bayonets. And the 2nd December was only possible because Napoleon declared himself as the representative of the social idea. The people believed he was to solve the problem for them.

Couple with this Proudhon's notorious theory of non-government, or *anarchy*, which he says this *coup d'état* illustrates anew, and you have the *résumé* of his new book. There are incidental passages of singular interest; among them a sort of philosophic history of the causes which led to the failure of the Republic, and an energetic vindication of the morality of the Provisional Government. It was that morality which hastened the fall; because, in face of a clergy opposed to them at heart, and a mass of interests necessarily affected by their measures, the Republicans vainly endeavoured to conciliate where they should have vanquished, not seeing that, as Proudhon says, every change in the state *must* damage many interests. "Les hommes du Gouvernement provisoire firent de la République le synonyme de *Moralité*. Ils furent pieux, modestes, pleins d'honneur et de scrupule, prompts au dévouement, esclaves de la légalité, gardiens incorruptibles de la pudeur démocratique, vrais surtout." The reader is requested to note these epithets coming from Proudhon, the great iconoclast; epithets the truth of which his own pages demonstrate; and then let us ask where was the censor's sagacity that could

allow such a passage to appear? Every epithet ennobles the Republican party, and brands as with a red-hot iron the character of the Decembrizers; every word is an irony in contrast. *This* is what one must say of the Provisional Government; can one word of it be said of the Decembrizers?

Proudhon is at no pains to conceal his contempt for Louis Napoleon. But repeat as often as you will, he says, that the 2nd December was an act of brigandage, that the army was ferocious, the people cowardly, and the Government wicked; all that only perplexes the question. It is true that the Louis Napoleon of Boulogne and Strasbourg was needed for such an act, but it still remains to be explained how the Napoleon who failed so miserably in Boulogne and Strasbourg succeeded in Paris. And he attempts an explanation which amounts to this: the People sympathized with the *coup d'état*. There is no doubt of it:—

One trait of the people is worth pausing to consider. Proudhon, relating the ineffectual efforts of the Republicans to rouse the people to resistance, says they were met with ignoble railleries on the loss of their twenty-five francs a day. "The Montagnards had become unpopular. Do you know why? Because they were paid. The people who quietly suffer a civil list of twelve millions regard payment of its representatives as a robbery. Twenty-five francs a day! From democrats! . . . *Democracy is envy!*" The same feeling actuates our working classes; they cannot believe in the honesty of a man who is paid for any labour not obviously physical.

If Louis Napoleon sees no danger in Proudhon's book, he is not so blind respecting Victor Hugo's "Napoleon le Petit," the sale of which must be reckoned by thousands. It is a vehement diatribe, and eloquent as vehement, against the usurper, which however becomes rather fatiguing at last; the more so as the indignation is too exclusively directed against Napoleon, and not sufficiently against the nation which submits to him. All that is said against his villany is acceptable enough; but it will not explain the success of the *coup d'état*. We are no admirers of Louis Napoleon; we think even his "ability," so much lauded, is more attributable to his utter want of conscience than to any intellectual superiority,—as Victor Hugo, in a sparkling epigram, says, "*Fausse clef bien faite. Tout est là,*"—nevertheless the question still returns, in the words of Proudhon, How is it that this adventurer succeeded? Heap accusation upon accusation, call him all the names an energetic language has among its re-

sources, prove him to be utterly contemptible (he is so), and you have only made it more difficult to explain his success.

Of explanation we have little in this volume. The poet revels in images; the orator in apostrophes and epigrams; the philosopher is nowhere to be found. Page after page of splendid writing; not a page of careful thinking. It is a cry, a protest, an appeal.

Victor Schœlcher's "Histoire des Crimes des Deux Decembre" is a book that will better satisfy the English reader. It wants the splendid rhetoric and sarcasm of "Napoleon le Petit;" but it compensates the deficiency by presenting a circumstantial, animated, detailed history of the *coup d'état*. It is warmed with the generous indignation of a republican who played a prominent part in that Revolution, glorious among Revolutions for its purity, its generosity, its integrity, and its clemency—a Revolution which abolished capital punishment, exiled no one, imprisoned no one, wronged no one, and is now persecuted in the person of all its active men by the very parties it spared. M. Schœlcher, in rapid traits, depicts the conduct of the reactionists, who first in the fatal days of June excited against the Provisional Government the terror and the anger of the *bourgeoisie* by the sudden suppression of the Ateliers Nationaux, thus throwing a mass of working men upon the streets, armed with the despair of want. Next, having suppressed the revolt, the "party of order" organised a coalition in the rue de Poitiers, whence it issued its incessant pamphlets and journals, vilifying the Republicans in every way, raising up against them the "Spectre Rouge" which finally took shape as the phantom of *La Jacquerie*. Here, indeed, lies the secret of Napoleon's success. The *bourgeoisie* were frightened by the "Spectre Rouge;" the people were made to distrust and despise the assembly. One long unvarying crusade against socialism as a doctrine of spoliation hoisting a red flag, made the "Spectre Rouge" a conviction. In vain did the socialists themselves protest at the tribune and through the press against these insulting charges; in vain did they demonstrate the absurdity, and appeal to their acts when in power: the cry of "anarchy" and "robbery" was kept up, and gained credence. Louis Napoleon availed himself of the bugbear. He "saved society."

M. Schœlcher in narrating this sad episode of the Nation's history, confessed that he had never thought the *état major* of the French army could have been so devoid of honour and loyalty, could have been so demoralized as to submit to such men as

Bonaparte and Persigny. But he must permit us to say that here his patriotism blinded him. A very little examination would have shown the *quality* of that French army so monstrously belauded by all French publicists. Of their gallantry and power on the battle-field no two opinions are admissible. Of their deplorable morality, we grieve to say the same. A more corrupt body does not exist. It is not the common soldier, the subaltern, or the junior officers alone, but the very highest people, the generals, the marshals, the "glories" of that army, who have always shown themselves the willing tools of power. How they fell away from their Emperor when at odds with fortune! How basely they deserted the Bourbons when Napoleon returned! Ney, who left Louis XVIII. vowing to "bring back Napoleon in a cage," passed over to the side of Napoleon without even offering battle. When Waterloo had finished the career of Napoleon, how these generals crowded round the Bourbons once again! So far from being astonished at the officers of the French army being seduced by the gold and promises of Louis Napoleon, our astonishment would have been at their resistance. There are honourable exceptions to this general censure; but the facts of history are damnable. It is of no use to shut our eyes to these facts. Flattery of a people will not make them virtuous; and although it is the fashion for all parties in France to laud the integrity of the French army, we, who love France dearly, with all her faults, cannot stand by and not perceive that to count upon the morality of the *état-major* for the triumph of Right, is to build on sand. M. Schœlcher does not disguise the fact that the conspiracy of December was truly a "military conspiracy." "Presque tous les officiers supérieurs de la garnison parisienne étaient complices."

The soldiers, indeed, forming as they do a living section of the People, have repeatedly shown themselves willing enough to espouse the cause of the People. But they, too, were worked upon by adroit calumnies, one of which—a most effective though audacious lie—M. Schœlcher has noticed, viz. the soldiers were told that Lamennais had proposed the suppression of their daily *sou* of pocket-money! It was a lie; but as the soldiers were not allowed to read the papers wherein such lies were contradicted, they believed it!

M. Schœlcher admits, and explains why, the Bourgeoisie and the People remained passive during the struggle. He draws this lesson: *In future let the Bourgeoisie and the People be united! As friends they can resist*

every oppression ; divided they fall beneath the sabre of Pretorians and the inquisition of the Jesuits. Well, if France and Europe have learnt but this lesson from the *coup d'état*, there will yet be hope. But what a change must have penetrated the Republican ranks when one of their chiefs can look to the union of the Bourgeoisie and the People as a source of safety ! A welcome change, a hopeful change. From it may possibly spring that other evolution which M. Schœlcher justly remarks is necessary to France, namely, the sentiment of Duty. "Nous n'avons que le sentiment de l'Autorité" he says, "il faut y substituer celui du Droit." Therein, as he judiciously recognises, lies the political stability of England. The facility with which any Authority finds obedience in France draws from him these reflections :—

"We have a thousand times shuddered with rage and indignation, a thousand times been wounded to the soul, since we have been mixed up with political life, in seeing with what excessive disdain Authority, in France, disposed of the liberty of citizens. Our sorrow was the greater because it seemed to us an abuse of force against the weak. We never suspected that those who gave way to such violence against others would themselves just as easily succumb to the effects of violence ; we could not fancy the most considerable men of the nation, representatives of the people, ministers, and ambassadors, could be illegally arrested in the presence of all the world without rousing the entire population ; we could not suppose that generals who had commanded large armies, generals notoriously innocent, would be placed between two gendarmes, and led to the frontier like malefactors, without the gendarmes, who were only the day before under their orders, hesitating to conduct them, without emotion on the part of the public, without resistance on their own part. One feels more hatred and contempt for arbitrary rule when one sees how easy it is ; when one considers that in a state of society where *order* reigns, the meanest authority finds submissive agents for the most revolting enormities."

We quoted but now a passage from Proudhon, wherein the miserable jealousy of the working classes regarding the payment of its representatives was energetically reproved. M. Schœlcher gives us an anecdote wherein we read a still finer reproof :—

"The representative of the people, Baudin, will be inscribed on the glorious and too long list of martyrs of liberty, by the side of the brothers Bandiera, of Robert Blum, and of Bathiany. His death was not without bitterness. 'We will not sacrifice ourselves for the *twenty-five francs*,' a workman said to him. 'The salaried servants of universal suffrage ! the *twenty-five francs* !' We were called so in jest even by some of our own friends. 'You shall see,' replied Baudin, 'how a man dies for *twenty-five francs* !' And he offered up his life at the foot of the Constitution, leaving to posterity his name and a noble speech !"

No one will read without absorbing interest and indignation the animated history M. Schœlcher has written of the arrest of the various generals and representatives, and the subsequent ineffectual attempts to arouse the faubourgs to resistance. Comparing these attempts with the success in 1848, one sees clearly enough how thoroughly the people were duped by Louis Napoleon's artful restoration of universal suffrage and promises of amelioration. They looked upon him as the armed solution of their difficulties. What Barbès promised, Bonaparte would give them. They even admired, without disguise, the adroitness with which he had vanquished his enemies. M. Schœlcher conceals nothing. He has written with impartiality, in spite of his indignation.

There are, of course, many striking traits of courage and devotion in these pages. At one barricade, at which the historian was present, the following scene was visible. A detachment of troops is approaching the barricade :—

"The three companies were silently advancing with funeral slowness. We made signs to them to stop ; the captain (M. Petit), who was at their head, replied by signs in the negative ; seven then got down and advanced towards him. At the sight of these few men advancing in the majesty of civic duty, the soldiers halted almost in spite of themselves. We appealed to their patriotism and honour. 'We are representatives of the people,' said we. 'You are deceived ; you are attacking the Constitution, whereas you ought, on the contrary, to save it. We entreat your assistance in maintaining respect for the law of the land. Come with us ; it will be to your glory.' 'Silence !' said the captain ; 'I will not hear you. I obey my superiors. Retire ; I have orders to execute. Retire, or I give orders to fire.' 'You may kill us,' replied the Montagnards, with one voice, 'but you will not make us give way ; our bodies must serve as a rampart to the people !' 'Soldiers, make ready—forwards !'

"This order was executed.

"We were all seven in a line ; some of us, thinking the last hour had come, stood hat in hand, as if to salute death. Officers and soldiers were, no doubt, touched by our attitude.

"It is certain that they could have killed us, as, the next day, others killed the heroic Dus-soubs, who, his scarf over his shoulder, and unarmed before the soldiery, as we were, did what we were then doing. They would not do so ; they passed between us. Nine lines of soldiers, as they rushed to the barricade, met us face to face ; not one fired. We were at the points of their bayonets and swords ; they glanced off as they touched our breasts. A young officer of the second platoon, in front of whom the *mêlée* brought us, and whom we entreated to join us, reproaching him with his fault, said despairingly, 'Our position is frightful. What can we do ? We have orders !' . . . Sword in hand, he looked miserable. Ah ! if the generals had not been

sold! He who writes these pages alone received two blows from a bayonet, which did not even pierce his clothes; they had been given rather to separate him from the captain, whom he was thought to be too near, than to hurt him.

"An episode will show still better the character of the French soldier, when left to his natural generosity. A soldier took aim *à bout portant* at our friend Bruckner. He perceived it, and said quietly, 'Fire! I dare you to do it.' The soldier smiled, raised his gun over the bold man's shoulder, and firing into the air, pressed the representative's hand as he sprung aside."

### *Belles Lettres.*

In the department of *Belles Lettres*, usually so rich, the quarter has been very poor. Dumas continues his "*Mémoires*," the twelfth volume only coming down to his first success as a dramatic author. Here the biography becomes very amusing; and we can imagine the surprise of the reader, when he learns that so strong was the feeling of the classicists against the dangerous innovation of the romanticists, that a petition was actually written, signed by seven grave personages, and sent to the king, begging him to interdict the performance of "Henri III."—not on the ground of immorality, but on that of its offence against "*le bon goût!*" There are some piquant revelations of the Orleans meanness in this volume, and many a readable page. Besides the "*Mémoires*," we have only to note the continuation of "*La Comtesse de Charny*."

Théophile Gautier has reprinted his *feuilletons* in two amusing and eccentric volumes. The first, "*Italia*," gives a picturesque account of his residence in Venice. The reader, familiar with Gautier's charmingly impertinent and highly-coloured style, will expect to hear more about art and women than anything else in "*Italia*." In fact, Gautier ought to have called his book "*A Search after the Effects of Colour in Venice*." Colour, colour everywhere. In one of his raptures, he can find no other epithet for the Creator than that of "*grande coloriste*;" which (as a "so French!" phrase) may be placed beside his other definition; "*Dieu—ce dernier amour des femmes!*" Life to him seems only acceptable, in as far as it affords subjects for pictures and epigrams. Death itself ought, he thinks, to preserve its plastic terrors, under pain of becoming contemptible; and thus it is that he despises the guillotine as a poor mechanical instrument, totally wanting in poetry: death by the guillotine he calls "*un supplice doucereusement bourgeois, privé par la mécanique et la philanthropie de sa poésie affreuse*."

Having thus indicated "*Italia*" to those who are not turned away by infinite coxcombrery, an infusion of blasphemy, and a certain *quartier latin* gaiety, let us also mention "*Caprices et Zigzags*," a more interesting volume to English readers, because mainly devoted to "impressions of England and Belgium." Gautier was much pleased with London, and has written wittily, kindly, pleasantly of what he saw, heard, and ate. Accuracy is not the quality one seeks in a Frenchman; but Gautier does not blunder so ludicrously as his predecessors.

Another book, also a reprint, "*Les Illuminés*," by Gérard de Nerval, is worth half a dozen Novels. It is a collection of biographical studies—*more Gallico*—of eccentric persons. The first "*Le Roi de Bicêtre*," is an anecdotal and dramatic narrative of poor Raoul Spifame: the second is "*L'Histoire de l'Abbé de Bacquoy*"—a striking picture of the gentilhomme forced into holy orders, and scandalizing, by his adventures, the church which imprisoned him. But amusing as these are, they are nothing compared with the story of "*Restif la Bretonne*," the once popular romancist, of whom Gérard de Nerval has written a biography more interesting than a novel. There are also admirable articles on "*Ca-zotte, Cagliostro and the Mystics*." Altogether a more curious and readable book we cannot easily name.

Louis Reybaud, author of the well-known "*Jérôme Paturot*," has also collected a volume of "*Nouvelles*," which, in the present dearth of fiction, must be gladly welcomed. The story of "*Le Dernier des Commis-Voyageurs*" is one of the best he has ever written. George Sand has written no new novel, and her last play, "*Le Démon du Foyer*," intrinsically a weak, uninteresting work, has made a "sensation" among the critics, by the disdainful epithet of penny-a-liners (*gazétiens*) it applies to them.

The only work of permanent merit among the Belletristic publications is the fifth volume of Sainte-Beuve's charming "*Causeries du Lundi*." We have already expressed our opinion on these "*Causeries*;" and, as Gray exclaimed "Be it mine to lie on the sofa and read endless new novels," so we would call for endless new volumes of "*Causeries*." This fifth volume is as various as its predecessors: Jules Janin, de Retz, Raynouard, Rivarol, the Duchesse d'Angoulême, La Harpe, Le Brun, Madame de Motteville, Sièyes, Fiévée, Perrault, Patru, Fouquet, Louis XV., Saint-Just, Pascal, Portalis, &c., pass before our eyes in this collection of subtle, anecdotal, witty, historical, *causeries*.

THE  
WESTMINSTER REVIEW,

No. CXV.

FOR JANUARY, 1853.

ART. I.—MARY TUDOR.

*England under the Reigns of Edward VI. and Mary, with the contemporary History of Europe; illustrated in a series of Original Letters, never before printed.* By Patrick Fraser Tytler. London: 1839.

If persecution was necessary to give stability to the reformed Church of England, it was no more than retributive justice that the instrument of it should have been the daughter of Catherine of Arragon. The wrongs of that lady were so widely felt, and the Reformation, ill able as it was to afford so far to compromise itself, was so deeply implicated in the history of them, that nothing less than the long list of the Marian victims was sufficient for their expiation; and we may congratulate ourselves that the education and early life of Queen Mary had left her with no other qualities than what were necessary for the part thus assigned to her, or Cranmer's prayer-book and Articles might have perished with himself; the Church of England, like the Church of France, might have risen out of the confusion of the sixteenth century, a moderate Catholicism; and the course of all European history have been different. According to the loose notions generally prevalent, the fluctuations of belief under the Tudors are to be explained by the variation of opinion in the successive princes, whose dominion is supposed to have been absolute over the souls if not the bodies of their subjects. But no prince of the Tudor, or any other dynasty in England, has been able to do more than incline the scale between parties equally balanced; and so large a majority of the English people went along with the return to Catholicism, the will of the country was so repeatedly and distinctly pronounced for it, that we must

look elsewhere for the explanation of a revolution so remarkable. Incomprehensible as it may seem, it would have been far more easy for Mary to have recovered for the old faith the ground which it had lost, and renewed—at any rate for a period—the lease of its endurance, than it afterwards proved for Elizabeth conclusively to establish the Reformation.

The whole story is so curious, and illustrates, in so remarkable a degree, the danger to which the English may expose themselves by their distaste for speculative change, that it is worth while to examine the nature of the influences which were then at work among them, as closely as the limits of our present essay will permit us.

English Protestantism, in the form of resistance to papal and ecclesiastical encroachment, is as old as the Norman kings; in the Mortmain Act, and the apparently extravagant provisions of the *Præmunire* Statute, we perceive the same spirit growing in the fourteenth and fifteenth centuries; and although the splendid victories of Henry the Fifth in France gave temporary success to the more papal policy of the Lancasters, and enabled the Church partially to recover its position, yet the body of the nation went along willingly with Henry the Eighth in following out the traditionary English policy to its national issue, and wiping utterly out the last traces of the authority of the Pope throughout the country. It was a measure as welcome to the clergy as to the laity; for the former were delivered from the intolerable burden of first-fruits, and had no reason to foresee any other consequences; and the latter had always resented the pretensions of an Italian priest to nominate to English offices of so much political importance as the great abbasies and the bishoprics. The suppression

of the monasteries, though less popular at the moment, yet was also felt by most serious persons, of whatever creed, to be imperatively called for. The grosser moral disorders have been probably over-estimated by Protestant controversialists, and the rare exceptions too lightly assumed to be the rule. But the evidence which came out on the visitation of them in 1532, singularly resembling, as it does, that lately given in reply to the circulars of the Oxford Commissioners, revealed a systematic breach of vows, non-observance of statutes, and misapplication of funds which, after exposure, could be neither defended nor tolerated; while the large discovery of sham miracles, sham relics, winking Virgins, and bowing roods, by which the pockets of believers were relieved of their superfluous contents, very properly and naturally aggravated the general irritation. The Establishments themselves, under the best interpretation of the mode in which they were conducted, had long been of doubtful value. Wolsey, assuredly no enemy of the Catholic Church, had set the example of appropriating their revenues to more useful purposes; and it was supposed and expected, when Henry finally broke them up, that he would go on with Wolsey's schemes, and endow large national foundations for education and charity.

The sole duty of the monks for some time past had been confined to chanting poor souls out of Purgatory; and the monastic theory of Purgatory had become suspicious when it was represented as a place from which there was a legal deliverance through private masses, at per dozen. The deliverance was considered too problematical to be worth the cost; and although the king himself, on the chance that there might possibly be something in it, provided in his last will that six hundred such masses should be said for himself, yet he did not hesitate to deprive his subjects of an advantage which they had no reluctance to lose, if they might exchange it for others of a kind more definite and palpable. Nevertheless, all this implied very little advance in the direction of a reformation of doctrine, as the Protestants understood it. The poor Lollards went to the stake as usual; and Cromwell, when he ventured upon leniency toward them, went to the scaffold. The movement on the continent was ruined in the eyes of the sober English by the Anabaptist exiles, who had, many of them, belonged to John of Leyden's congregation at Munster; and the language in which they and the foreign Reformation were spoken of, might seem, with the change of a few words, to express the feelings with which sober-minded people now regard the liberals of Germany and France. The exceedingly profligate doctrines attribut-

ed to the Anabaptists existed (as in the modern parallel) rather in the errors of the orthodox than in the poor misbelievers themselves; but there is no doubt that they were a questionable set of fanatics, whose theories were impracticable, if not worthless, and they unhappily conceived themselves to be at liberty to propagate them with the sword of the flesh as well as of the spirit. Thus the dislike in England to speculative change became almost more decided in proportion to the natural expectation that such a change was likely to take place. *Masses* might be suspected as patent instruments of making money; but it did not follow that the Sacrifice of the Mass should be called in question. Transubstantiation remained an article of faith with all educated persons; and Cranmer, and even Latimer, only ceased to believe it when the death of Henry opened their minds to conviction. Though the *scholastic* doctrine of Purgatory was overthrown, yet men were still unable to face the appalling alternative, that all who leave their bodies unfit for heaven must remain in hell for ever. Other doctrines of Purgatory might continue to be believed, though the scholastic passed away; and if the monks' masses were no longer thought of any value, yet the saint, whose glorified figure lived in light in the chapel window, still remained to make prevailing intercession. For the marriage of the clergy, the distaste which was long felt for it may be seen in the ecclesiastical titles which survive to the present day as the surnames of families, and which were cast opprobriously on those first "monks," "clerks," "abbots," "priors," "deacons," "archdeacons," and "bishops," who broke their vows, and begot children; and the statute of the Six Articles, cruel as it may seem to be, was no more than the deliberate expression of the English feeling on all these subjects. The executions which took place under it were regarded by the body of the nation as the legitimate penalties of damnable and soul-destroying herodoxy.

The intention of Henry the Eighth was to sever the English branch of the Catholic Church from the Roman stem, and to graft it on the life of the nation; perhaps accepting the literal analogy of this metaphor, at any rate, expecting it to teach the same doctrine, and enforce the same discipline, unaltered either of them in any essential point, as it had taught and enforced before. The supreme authority in it, which had belonged to the Pope, was to be transferred to the king, and that was all the change. The infallibility, he expected, went along with the position, and the very idea never probably occurred to him, that a heretic might succeed him on the

throne. Whether the branch thus severed—severed after it had been attached for a thousand years to its parent tree—would continue to live and thrive was a problem which only experiment could resolve. He himself, however, never had a misgiving about it; and his security, shared in, as it was, by the nation generally, had at least the countenance of one man of high ability, Bishop Gardiner. This remarkable minister was, for twenty years, his ablest assistant in the Reformation; and in nominating him at his death among the guardians of his son, Henry expected that, as a matter of course, he would fill the same position, and exercise the same authority, as he had done under himself.

Henry, however, lived long enough to discredit both himself and his work. The spoils of the monasteries, instead of going to found colleges and hospitals, had been squandered in extravagances, or divided among a good-for-nothing aristocracy. It was hard to believe in the infallibility of a man who succeeded so ill in his domestic relations, and who mixed brass with the current silver, when he wanted money. His Church theory had begun to shake, even while he lived. He was no sooner dead than it fell to ruins. Gardiner himself would have been perplexed to discover where the supreme headship resided, with a council composed of such elements as that of Edward the Sixth. The fear which had previously compelled the various members of it to pretend uniformity, was no sooner gone than it was found to be composed of factions in which his voice, at least, would have little chance of being heard. Cranmer had been long married, and hastened to throw off a concealment which had become intolerable. The majority in the council were the noblemen who had already shared largely in the Church plunder, who being anxious for a further slice of spoil so tempting, were disposed to favour whatever doctrine would most readily gratify them; and the majority, with the *Præmunire* Statute in their hands, could silence any opposition from the bishops and clergy. Before the king had been a week dead, Gardiner found himself without power; within a year he was in the Tower, and the Catholic ritual was gone.

The Lords of the Council, to secure the Church lands and to get more, and the reforming bishops, from real conviction, flung themselves into the track of the Germans; the more the body of the people complained, the more it became necessary to secure the attachment of the extreme Protestants; and the reign of Edward the Sixth presents the unedifying spectacle of a spiritual anarchy deepening day by day; the supreme authority in the hands of a clique of profligate no-

bles, quarrelling over their plunder, and destroying one another; and each faction, as it rose to power, buying adherents by fresh and fresh spoliation. First, the lands went, and when there were no more lands the tithes went, to be impropriated by some noble lord or noble lord's dependent. Cranmer's liturgy, too, venerable and beautiful as it may now seem at the end of three hundred years, was but a bald exchange for the old ceremonial. Composed in the warmth of his own conversion, it contained expressions which outraged the belief of far the greater number of the people (the obnoxious passages were afterwards struck out by Elizabeth,) and yet the use of it was made everywhere obligatory. The priests who objected were turned out of their benefices; and because there were no educated men to be found who would, or who could, take their place, the income was seized upon by some hungry squire, and the parish was either left unsupplied, or some poor tradesman or mechanic was thrust upon the place at the lowest conceivable salary.

We can well understand that measures such as these should have been considered too serious to have been undertaken in a minority, and should have caused sufficient dissatisfaction. After changes, too, of so grave a kind, there was naturally with many people a certain earnest looking for of judgment, an expectation that, in some way or other, God would show whether He was pleased with them; and several years of unusual suffering were construed into an expression of His anger. Short harvests brought more than their usual consequences: for the currency had been still further debased; and wages remaining at their old level, with the necessaries of life at famine price, there was no longer distress, but positive starvation. We can fancy with what feelings, therefore, at such a time, the poor hungry peasants must have gazed at the walls of the desolated abbeys, all the sins of them forgotten, and only the open table and the warm hearth remembered. Hard landlords at least the monks had never been; and if charity had grown cool with them, cool charity was better than none at all. The silent eloquence of the ruins found a voice too in the unhappy remnants of their old possessors, who wandered, like wretched ghosts about their wasted homes; ten thousand of them, friars and nuns, turned adrift to beg or die, only by a refinement of cruelty with their vows of chastity continued upon them under penalty of death. Cromwell had assigned them pensions, which Henry had guaranteed; but the world is a hard place for those who have no means to force their claims. While Henry lived, they were perhaps paid; but in the

after reigns, "through the greediness of the officers of the exchequer," their poor pittances never found a way to them; and it was left for Elizabeth to do tardy justice to such few as were alive when she became queen. She indeed had them all sought out, and paid to the last farthing, but years too miserable to be thought of must have intervened; and the sight of them, shivering along the roads and villages, in raggedness and hunger, must have been a bitter and telling protest against the iniquity of the times.

To leave conjecture for fact, we have Lord Paget's evidence that the new Prayer Book was distasteful to eleven-twelfths of the population. The number is perhaps exaggerated, and in these eleven-twelfths there was a considerable fraction for whom it was not too little popish, but too much so. It was determined, at all hazards, to conciliate the latter, and perhaps it was necessary to do so; but it was at the cost of alienating the middle party more hopelessly than ever. The victories of Charles the Fifth naturally were regarded as a signal declaration from Heaven against the doctrinal reformers; and a worse effect of them was to increase the multitudes of Dutch and German fanatics, with whom England was already overrun. The presence of such men at all was sufficiently offensive; and when their leaders were placed in authority at the universities, when Martin Bucer and Peter Martyr were consulted on the services and the Articles, the majority of the English felt much as they would now feel if Louis Blanc were invited to a council of State, or a modern project of church reform submitted to Feuerbach or Ronge. The Reformation was so rapidly discrediting itself, that if Edward had not died, and the policy of the government had remained unchanged, the same rebellions, supported by the same coalition from abroad, which were so formidable to Elizabeth, would in all probability have broken out irresistibly against him, and swept away the very name of Protestant out of the country. But it became evident that there would be no need of any such violent measures. In the spring of 1553, the health of the young king rapidly declined: in the middle of the summer he was on his death-bed. It is the misfortune of all great movements, political and spiritual, that if men of the very highest character are to be found on their side, they have attractions not to be resisted for the most worthless. A man of this latter sort was unhappily supreme in the council, and was able to inflict one more stain on the Reformation by implicating it in treason. John Knox had long before seen through the Duke of Northumberland; but possessing, as he did, the absolute confidence of Edward, this

bad nobleman was able without difficulty to work on the fanaticism of the dying boy, and induce him to tamper with the succession. As a party measure, nothing could have been more infatuated. Extraordinary powers had been granted to Henry the Eighth by parliament on purpose that the succession should be decisively settled; the wars of the Roses had been too severe a lesson of the consequences of a dispute to require repeating; and since, in consequence of his proceedings with his wives, it was difficult to define which among his children were or were not legitimate, he was empowered to determine by will the order in which they were to succeed him. It was not likely that a measure so gravely considered could be set aside by a private nobleman, of questionable character, for his own personal advantage. The few really good men who were in the council, foreseeing the inevitable consequences, implored the king, at the risk of their lives, to abstain from committing both himself and them so fearfully; and although their entreaties were ineffectual, and they themselves, at Edward's order, subscribed the instrument which nominated Lady Jane Grey as queen, yet Northumberland knew well that even by such an act as this, neither Sir William Cecil, nor Sir William Petre, nor Lord Arundel, nor Lord Pembroke, nor Lord Paget, was committed to an approval of the proceeding. They had agreed among themselves, as it appears, to sign their names, but only as witnesses; and Northumberland's after conduct proves that it was no secret even from him.

All was over in nine days. London—the stronghold of Protestantism—declared enthusiastically for Mary. The fleet went over; the troops which Northumberland attempted to gather in the eastern counties deserted in a body. The conspiracy was crushed without a blow, and the duke himself was arrested at Cambridge by Lord Arundel, whom he had left in London. The following conversation is said to have passed between them:—

"For the love of God consider," the duke said, "I have done nothing but with the consent of you, and all the whole council."

"My lord," quoth the Earl of Arundel, "I am sent hither by the Queen's Majesty, and in her name, I do arrest you."

"And I obey it," quoth he; "but I beseech you, my lord Arundel, use mercy towards me, knowing the case as it is."

"My lord," quoth the earl, "ye should have sought for mercy sooner; I must do according to my commandment."

If these are the very words which were spoken, they are still but an imperfect evidence of what past; for words bear many meanings, and we do not know the tone in

which they were pronounced, but, at any rate, it is impossible to agree with Mr. Tytler, in regarding the scene as one of revolting perfidy. He would have us believe that the council had affected an enthusiastic unanimity, and that, when the failure of the attempt had become evident, it was a race of treachery which should first betray the other. Difficult as it would be, under any circumstances, to believe that four or five statesmen of unblemished character could have stooped to conduct so degrading, it becomes impossible when we remember that Arundel, Petre, Pembroke and Paget were continued upon the council, and that Cecil was only excluded by his own refusal to serve. If they might have earned a contemptuous pardon by perfidy, they could not have earned confidence; and historians overshoot their mark, when they attempt to explain the obscure actions of men who for any length of time fill important offices of trust and responsibility, by motives to which, in their own basest moments, they could not conceive themselves as yielding. It is certain that the entire council did sign the instrument: it is equally certain that these five members of it signed only at the express command of the dying king,—a command which it might not only have been exceedingly dangerous, but, on quite other grounds, exceedingly difficult to disobey; but the compliance ended with the formal act, and was never believed, by any party concerned, to have extended beyond it.

The conduct of the leading bishops was far more exceptionable. Cranmer was among those who were at first unwilling to subscribe; but he acknowledged that he had yielded at last, not to the king's command, but to the persuasion of the law officers of the Crown. Ridley preached against Mary at Paul's Cross, denounced her as an inveterate papist, and appealed to the fanaticism of the people; and although Hooper and Bradford were actively loyal, yet the dominant Anglicanism was identified in public feeling with the Archbishop of Canterbury and the Bishop of London, and the party were forced to share in the odium and the guilt of its two great leaders.

And, as we said, as a question of policy, to say nothing of duty, a more wretched blunder has never been made. Mary's entry into London was a triumphant procession; her devotion to catholicism was notorious, but, even with the Protestant Londoners, loyalty was too sincere a passion to be interfered with by theological intolerance, and it was not till she had forfeited their attachment by her own infatuation that they ceased to feel it for her. She sailed in on the full stream of popularity, surrounded with all the prestige,

and invested with all the real power, which a triumph over an unpopular conspiracy is certain to confer; and scarcely any English king or queen was ever more warmly welcomed to the throne than this poor princess, who has left such a name behind her. She herself was only known as a harmless, persecuted devotee, the child of a lady whose cruel injuries had enshrined her in the affection of the people, and their only wish was to offer to the daughter such poor compensation as loyalty and obedience could bestow.

Her first actions as queen, though inevitably displeasing to a part of her subjects, were, on the whole, well calculated to sustain her in the advantage which she had gained. Gardiner, whom she found in the Tower, was made chancellor, the council being composed of the national party in the council of the late king, and the leading Catholic nobility. The only symptom which she showed of a disposition to act independently of them or their advice, was in a letter which she wrote to the emperor for instructions as to how she should best proceed; but the emperor's advice coincided with that of her own ministers in prescribing the utmost circumspection. The immediate and pressing question was the late conspiracy, and if she showed any want of judgment at all, it was in the leniency with which she dealt with it. Charles had been taught in the preceding year by Maurice of Saxony that Providence had not irrevocably decided for the Catholics; that Protestantism was still dangerous enough to require to be proceeded with cautiously; and, by his recommendation, the whole affair was treated as a private treason of Northumberland, for which only he and two others, one of them a man of abandoned character, should suffer. Cranmer, Ridley, and the Duke of Suffolk, had undoubtedly forfeited their lives; and no reasonable person could have complained, if she had determined to send them to execution. But Cranmer and Suffolk were set at liberty without fine or even reproach, and against Ridley, though he was kept in prison, there was no apparent intention of proceeding. Nor is there anything to object to the steps which she took about the religions. Being a Catholic, she will not be found fault with for permitting the open exercise of a form of belief which was not only her own, but that of at least half her subjects: but nothing further was to be attempted till she had taken the advice of Parliament.

The conduct of the Protestants in the two months which elapsed before it assembled, is a most curious evidence of the temper of the time, and of itself is sufficient to explain many things. They had as yet no reason to complain of persecution, but Popery with

them was in real truth a doctrine of devils, and it was little to them to be allowed their own religion, if they were to be prevented from trampling out the other. The fierce annals of the Israelites provided them with ample precedents of what was lawful for saints in dealing with idolaters—and the arms of the Reformed Church militant were by no means those of peaceful and mild persuasion. The reverend the vice-chancellor of Cambridge, afterwards bishop and archbishop, preached a seditious sermon, and when called in question for it, drew his dagger in the senate house, and was only held back by two grave doctors of divinity from doing prompt execution with it. Strange scenes took place in the churches, priests and parsons scuffling for the pulpits, and the conqueror taking possession of the conquered citadel with a flourish of rapier and pistol. One priest of Baal was stabbed at the altar, his blood running over the chalice and mixing with the wine; a dagger was hurled at a second, and a musket fired at a third. Elsewhere, the consecrated wafer was seized by a desperate iconoclast and trampled under foot, as he cried, between his teeth, "If thou be the Son of God, save thyself;" and even the mild Archbishop Cranmer, within a few weeks after the remission of his first treason, composed a declaration, which, although it was in fact made public by accident, he acknowledged that he had intended to have fastened against the door of St. Paul's; wherein, after setting out the virtues of Henry and his son in promoting the Reformation, he ascribed the re-appearance of the idol of the Mass to the devil, of course in the form of Queen Mary. He excused himself on the plea that the many rumors current about him, made some public declaration from him necessary. But it would have been more prudent, and perhaps more proper, if he could have waited for the opportunity which would so soon have been afforded him, of declaring himself from his place in Parliament. Mary had nothing to do but to sit still and wait; no amount of political sagacity could have invented a course which it was more desirable for her that her adversaries should follow, than that upon which they were now thrusting themselves. Partially conservative (as the English always are) when in power, they were no sooner in opposition, than no ultra extravagance was too wild for them; and the queen, by the incessant homilies against rashness which poured in upon her from the emperor, the Pope, and her own ministers, was persuaded (irritated as she might naturally be) to continue to submit to provocation, and venture on nothing by her own authority. Only one thing she did, and that was really forced upon

her. The pulpits had become political tribunes, or high places from which the opposite clerisies cursed each other; and the scandal becoming intolerable, she wisely required her subjects of both beliefs to content themselves for a while with prayer; and abstain, till more quiet times, from such a dangerous amusement.

Having done this, she quietly waited the approach of autumn, when Parliament was to meet. Neither she nor her ministers could foresee the result of the elections; but, in spite of all which Protestant writers have stated, of the means which were used to secure a majority, it does not appear, on examination, that they used any means at all: their policy was, to appear, as far as possible, to submit to the will of the country, and the absence of any evidence of attempts at bribing and intimidating, such as does exist for the elections of the following year, makes it far more than probable, that at first they desired to feel their way, and really to learn the actual temper of the people; on the present occasion a matter of unusual difficulty. On most subjects which divide a nation, it is possible, at least roughly, to conjecture the comparative strength of parties; but on the present, it was impossible, for the singular reason that three-fifths of the nation are described as of no religion at all: that is, neither Catholic nor Protestant, but ready to attach themselves to whichever party promised to be least extravagant.

On the 5th of October, the legislature assembled. We are told that it was violently purged of its anti-Catholic members, but the records of its proceedings entirely disprove this random charge; and it is no more than an exaggeration of the expulsion of two of the bishops, who, on occasion of the high mass at its opening, were ostentatiously disrespectful, and were ejected in consequence out of the Abbey. Proceeding to business, the House of Commons was desired at once to consider the state of religion, and determine whether there should be any change in the existing Establishment—whether they would leave things as they were, or tolerate both religions; or, if not both, then which, and on what conditions. The discussion lasted eight days. There was no violence, and certainly no precipitancy; and, at the close, a commanding majority of two-thirds of the House agreed to repeal every act which had been passed under Edward, to abolish and forbid the use of Cranmer's prayer-book, and to restore the ritual unaltered, which had been in use in the last year of Henry the Eighth. Nothing could be more decisive. It was a grave and calm declaration that the country had tried doctrinal Protestantism,

and did not like it. The protest against Rome was retained and re-affirmed; but, in all other respects, England was declared to be again a Catholic country, on the terms on which Henry and Gardiner had desired to establish it. And so distinctly this appears to us to have been the general desire at the time through England, that if Mary could only have brought herself to be contented with what she had achieved, if she could have felt that she was a queen of a great nation, as well as the restorer of the belief in Transubstantiation, and bridled in her eagerness with ever so little human understanding, the game was fairly in her hands. The crisis was of that rare kind when the after history of centuries may be seen to depend on the conduct of a single person; and it rested with her, to change the entire current of the fortunes of Europe.

Happily for all of us, Mary was without the faculty to understand her opportunity. There was no reason which could be expressed in words why Henry's Anglo-Catholicism should be a delusion. It is not easy to say (to keep to the usual illustration) why an aged branch cut from a tree should be unable to live independently; but so it is with the branch, and so it was with the State Church. Henry had affirmed *one* doctrine as supreme head: Edward had affirmed the opposite by the same authority; and now Mary, the third to whom it descended, declared in virtue of it, that it was usurped altogether, and desired to give it back to its proper owner. So decisive a *reductio ad absurdum* was enough even for Gardiner. When he found himself unable to prevail upon the queen, he gave up his project conclusively, and left her to carry out her own schemes undisturbed any further, although knowing too well what a price she would have to pay for them.

These schemes, however, she was wise enough to keep from the knowledge of the Parliament. She accepted what they gave, and would not frighten them by touching on dangerous questions, as long as she had further work for them.

The religious revolution being completed, they proceeded next to repeal the act by which Mary was declared illegitimate, with some unfairness, laying the blame of the separation of Henry from her mother on Archbishop Cranmer.

The illegitimacy of Elizabeth was thus in a manner re-enacted; and if, instead of waiting till the following year, the queen had then pressed to have her cut off from the succession, there is little doubt that the two Houses would have readily consented. Elizabeth herself was little known, and only rose in popular favour as Mary's scale went down;

and, if she was set aside, the next heir would have been Mary of Scotland, a princess whose succession to the throne of England would, for many political and other reasons, have been extremely convenient. The country was weary of spiritual anarchy, and could not afford these constant revolutions of ritual, and the peaceful union of the two crowns of England and Scotland was equally desired by all thinking persons on both sides of the Tweed.

Such appear to have been the feelings of the English Parliament in October, 1553. But in periods of revolution the air is electric, and the wind shifts sharply and suddenly. In November all was changed. They had expressed a polite desire that their queen would marry. She took them at their word, and allowed it to transpire that she proposed to give her hand to the most powerful prince in Europe, the heir of the emperor. In an instant, the entire English heart began to palpitate; England was already, in imagination, become a second Netherlands, a province of Spain; the old liberties were seen vanishing one by one, Spanish noblemen dividing the great offices of State, Spanish bishops over the dioceses, Spanish priests in the pulpits, behind the Spanish prince the Pope, and behind the Pope, revolution, anarchy, civil war, and the devil.

Dr. Maitland, in his anxiety to prove every statement which has ever been made by any Protestant writer to be a lie, denies that the Spanish marriage was unpopular, and sets aside, without scruple, the entire testimony of cotemporary history, on the single ground that the rebellions which it provoked were all unsuccessful. We will not quarrel with Dr. Maitland for the word "unpopular;" it is enough that Mary's wisest advisers, including two Roman cardinals, assured her that it would not only lose her the affection of her subjects, but ruin the cause which she had most at heart; and that the Parliament, at the first hint of the matter, petitioned against it without a dissentient voice.

Mary, however, had ceased to listen to advice which went against her own opinion-ateness. The Parliament were sent about their business on the instant, for their impertinent interference; and, on the evening of the day on which the resolution was passed in the House, she called the emperor's ambassador into her closet, and, before the image of the Virgin, swore her troth, somewhat theatrically, to Philip of Spain. She had never seen him. He was only twenty-six years old, while she was thirty-eight, and she had been betrothed to his father before the latter had married his mother. It is said that she fell in love through a portrait, which, if

it was lovely, must have been unlike the original. It is more likely that she saw in him a prince like herself, devoted to the Catholic faith, who would go hand-in-hand with her in her crusade against the Protestants; the difference of years would hardly be so perceptible to her as it was to him, who had vainly implored the emperor to spare him so unwelcome a connexion; and, poor lonely creature, after her joyless existence, it was likely enough that she might long for a companion who might love her and be loved by her. But, whatever it was, it was a miserable dream, from which a bitter awakening was in store for her. Neither the disapprobation of her people, nor the entreaties of her ministers, nor the indifference of the bridegroom, which was evident to every one, could turn her from her purpose, and she went through with it to the natural consequences, which the emperor and herself were, perhaps, the only two persons in Europe unable to foresee.

Whatever Dr. Maitland may suppose, rebellion with the long-enduring English is not the immediate consequence of disapproval,—it is the last and most desperate remedy, to which they can only be compelled when all else has failed; but, in the partial revolts which broke out in the winter of 1553-4, in Kent, and Devonshire, and Suffolk, there were warnings enough, if the queen could have understood them, of the changing feelings with which she was now regarded. Though the two last were insignificant, the first, under Wyatt, was dangerous; and though London, on the whole remained obedient, there were threatening symptoms visible which it would have been prudent to have treated with less disdain. But the Catholic princes had yet to learn the lesson which it required a century to teach them, that human beings could not any more be governed by the corollaries of Roman theology; and she went on her way, believing, like a religious woman, that it was God's way, and that he would carry her through.

The secret history of the five months which followed, has been recently laid open to us by the industry of the late Mr. Tytler, who has published, from originals at Brussels, the despatches of Renaud, the Spanish ambassador, then in England negotiating the marriage. The execution of Wyatt was just and even necessary. Fox has classed him among the Protestant martyrs (as, indeed, he classed a noted highwayman who was put to death for serious murders and robberies, but who expiated his offences, and earned an apotheosis by cursing the Pope under the gallows), but we cannot think that he has any business among them. His crime was treason, not heresy:

he rebelled and failed, and had no right to complain of the consequences. But Mary disgraced her previous clemency by another execution, which was neither necessary nor just, and was no more than a useless piece of cruelty. Lady Jane Grey was not implicated in Wyatt's rebellion; she was not to have profited by it if it had succeeded, and other motives are supposed to have influenced the queen beyond what appeared upon the surface. It is said that she never forgave a speech which Lady Jane had made a year or two before, when on a visit to her at New Hall. One of the ladies in waiting was showing her over the house, and took her, among other places, into the chapel. In passing the altar, the lady curtsied. Lady Jane inquired what she meant by that. Her God was present there, the lady answered, and she curtsied to him. Lady Jane, with a half smile, said she believed the baker had made him.

Such a piece of profanity, doubtless, lost nothing on the way through the lady in question, to Mary; and, on the mind of so thoroughly devout and real a believer, may well have made an impression which could never be effaced. It would of course be foolish to suppose that this, or any other *single* feeling, determined her upon acting as she did, but the sense that she was punishing an obstinate heretic, as well as her rival for the throne, may have softened the reluctance which we will hope that she experienced. This warrant was signed the day after the battle in the streets, in the midst of that excitement of feeling which follows the escape from serious danger. And, familiarized as Mary had been from her childhood with the shedding of blood, accustomed to see the friend and counsellor, even the queen of one day going the next, as a matter of course, to the scaffold, and having herself, for many a year, lived in steady expectation of the same end to her own life, she could not be expected to look upon it as the dreadful thing which it appears to us. If her conduct still remains unaccountable to us, we must leave what is obscure to our charity, and think the best which we can. From her treatment of Lady Jane Grey, we turn to her treatment of another rival, whose position towards her was infinitely more questionable and painful.

The person in whose behalf Carew and Wyatt had professed to rise was the Princess Elizabeth. At the time of the outbreak she was ill at Ashridge. Letters written by Wyatt to her had been intercepted, in which he warned her to keep away from London. It appears to have been forgotten, both by those who were most anxious to destroy her, and by those who, in later times, most wish that she had been destroyed, that the fact of

these letters having been intercepted is a proof that, at least, she never received *them*. Wyatt, on the scaffold, entirely exculpated her; she herself declared, on her honour, that no word from him had ever reached her. The only other evidence against her was a letter in cypher, supposed to have been written by her to the French king, which was found among the despatches of the French ambassador. But this, too, broke down when it was examined; and at the end of three months, after the most active efforts of hatred, the law officers of the Crown were obliged to declare that there was no matter on which to proceed against her whatever. It will, therefore, surprise persons who are unacquainted with the way in which history is written, to hear that modern historians speak of her concern in the rebellion as a certain and indisputable fact, and do not hesitate to say, that she owed her life solely to the clemency of her sister.

So many lies have been told about this business (Lingard is among the worst of the offenders), that it is worth while to follow the detail of it with some minuteness. We make no pretence to the character of the "unprejudiced historian"—a pretence hardly compatible with much self-knowledge; indeed, we are far from satisfied that, for beings like men, to be without prejudice is a virtue at all. But we undertake that we will not willingly and consciously tell any fresh lies, there being already so vast a superabundance of them.

That any love could have existed either at that or any other moment between the daughters of Anne Boleyn and Catherine of Arragon, it is not necessary to believe. There had been too many jars and jealousies in their early lives, arising out of their father's caprice, to have permitted them at any time to regard each other as sisters; and their several duties to their mothers compelled them to regard each other as illegitimate. Mary had, indeed, as we have seen, in the past autumn, declared her own legitimacy by a formal act, and although we may excuse and even admire her doing so as an act of natural piety, it was a violation of her father's will, who had undoubtedly desired to place both his daughters on the same footing; while to Elizabeth it must have appeared a serious injury. But it is equally certain that no resentment ever provoked her to forget her duty as a subject, and only the most spotless integrity could have saved her from the efforts which were now made to destroy her.

One of the parties concerned in these efforts we are at no loss to identify, for the Spanish ambassador makes no secret of his own share in them. His letters in this critical year are almost a diary for the months of

March, April, and May, and he exposes, without hesitation, his own aims and motives, and those of every one about him, as far as he was able to enter into them. His own most single-minded wish appears to have been, since his master's son was to commit himself to a residence among the English savages, to make his coming as little dangerous as possible. He freely expresses his terrors at the ferocity of their nature, and describes them as uncertain tempered wild beasts, alternately fawning and rabid, whose claws must be pared, and whose teeth must be drawn before they can be safe company for persons whose lives are valuable. Elizabeth was to him the rallying point of disaffection, and as long as she was alive there could be no safety for his precious Philip.

We said that she was at Ashridge at the time of the rebellion. A few days before the outbreak, Mary had written to desire her to come up to Whitehall, but she replied that she was ill, and was unable to leave her house. Lingard believes that it was pretence, that she was guilty, and conscious, and shrunk from showing herself. As he has no evidence to offer, except what he considers internal probability, as all the evidence which there is lies the other way, and as other people have other notions of internal probability, we need not trouble ourselves any further with this opinion of Dr. Lingard. At the end of a fortnight a second dispatch came down of a more peremptory kind. The queen's own litter was sent to fetch her, with a company of the royal guard, and the escort was accompanied by the court physicians, who were allowed discretionary power, and were to take care that she was not injured by the journey. She was brought up by slow stages, four or five miles a day; the diary of each day remains to us exact, and it is evident that her own account of herself was literally true, and that she was seriously ill. Renaud's description of her entry into London is not a little striking:—

"The Lady Elizabeth arrived here yesterday (the twenty-third of February), clad completely in white, surrounded by a great assemblage of the servants of the queen, besides her own attendants. She caused her litter to be uncovered, that she might show herself to the people. Her countenance was pale, her look proud, lofty, and superbly disdainful—an expression which she assumed to disguise the mortification which she felt. The queen refused to see her, and caused her to be accommodated in a quarter of her palace, from which neither she nor her servants could go out without passing through the guard. Of her suite only two gentlemen, six ladies, and four servants are permitted to wait on her."

From the palace she was in a few days

sent to the Tower, and with her the foolish profligate Lord Courtenay, who it appears Wyatt had intended should marry her, and in whose own head some notion of the kind had nursed itself. No sooner were they securely engaged, than Renaud assured the emperor that he never ceased to admonish her majesty of the necessity of a "prompt punishment;" the preliminary of a trial being, in the Spanish view of such matters, a very unnecessary formality. The safety of a prince of Spain was at issue, whose little finger was of greater value than the lives of a thousand English princesses. The council met day after day, and soon Gardiner followed Renaud in the same strain. He saw in Elizabeth a heretic, who, if Mary's frail body failed, would be a more dangerous enemy to the Church than her brother had been, and we cannot wonder at Gardiner any more than at Renaud. Most glad we should be, if we could believe that in the queen there was any reluctance to listen to them; but it is certain, that Elizabeth had no friend except her own innocence, and those unfortunate laws of England, which necessitated an arraignment and a conviction as the antecedents of the scaffold.

Mary did not hate her: we could almost wish she had. The most vindictive personal malignity would be a feeling more intelligible and more respectable than that which was now influencing her. We acknowledge, as we said before, that written accounts of spoken words, however correct, are necessarily an inadequate account of them, and often an absolutely false one. The intonation is everything, and the intonation evaporates in the passage from the lip to the pen. But after the most cautious employment of such means of judging as we possess, we really conclude that Mary at the time was capable of no feeling whatsoever, except an impotent eagerness for the arrival of her husband, and a readiness to sacrifice everything which lay in its way. At a meeting of the council, in the first week of April, Renaud declared—

"That it was of the utmost importance that the trials and execution of Courtenay and the Lady Elizabeth should be concluded before the arrival of his highness.

"The queen answered, that she had neither rest nor sleep for the anxiety she took for the security of his highness at his coming.

"Gardiner then remarked, that as long as Elizabeth was alive, there was no hope that the kingdom could be tranquillized, and that if every one went on soundly to work as he did in providing the necessary remedies, things would go on better."

The difficulty, Renaud acknowledges, was not from any unwillingness in any quarter to

proceed to extremities, "but that they had not been as yet able to fall on matters sufficiently penal according to the law of England. Nevertheless," he adds, "her majesty tells me that every day they are finding new proofs against her."

These little sentences, if they are given correctly, appear to us to admit of only one interpretation. It is but fair to say, however, that a very chivalrous defence has been made for Mary, by Miss Strickland; and thoroughly creditable as it is to this lady, that she has been the first Protestant historian who has dared to speak a word for her, we should be disposed, if the defence were entirely single-minded, to leave it unchallenged. There is no danger of an over lenient judgment of Mary Tudor in the minds of the English, and Miss Strickland's conception of her is at any rate, infinitely more like the truth than the popular one. In this particular case, however, she is unable to confine herself to the subject before her; and in vindicating one sister takes the opportunity of a side-blow at the other.

There is a foolish story to be found in Foxe, Heywood, and other Protestant writers, which has been copied from one to the other without comment or inquiry, to the effect that when Elizabeth was in the Tower,

"A warrant came down for her execution, Gardiner being the inventor of that instrument. Master Bridges, the lieutenant, no sooner received it, but mistrusting false play, he presently made haste to the queen, who was no sooner informed but she denied the least knowledge of it. She called Gardiner, and others whom she suspected, before her, blamed them for their inhuman usage of her sister, and took measures for her better security."

It is scarcely credible that a person of Miss Strickland's experience should have transferred to her pages such an extravagant piece of folly. No warrant could have been issued for Elizabeth's execution before she had been tried; and if any warrant was issued it must have been signed by Mary. The Lord Chancellor of England is not likely to have set an example of such preposterous illegality; and if he really did venture on it, it is more disgraceful to Mary than anything which we know of her, that she passed it over with a reprimand for inhumanity. But nothing of all this occurs to Miss Strickland; and it is an opportunity for her too good to be passed over to make a point on a favourite subject. As Gardiner was to Elizabeth, so was Burleigh to the Queen of Scots. Though the latter was tried by a high commission and formally condemned; though the Houses of Lords and Commons petitioned that sen-

tence might be executed, and the warrant had been duly signed before Burleigh despatched it; yet she can see no difference of circumstance in the two cases; Burleigh only succeeded where Gardiner attempted; and Mary is an angel of mercy and Elizabeth an inhuman murderess. It remained to be seen what she would make of Renaud's despatches; from her frequent allusions to them, there was no doubt that she had studied them carefully, and we were really anxious to learn whether any other meaning than that which we had gathered ourselves, could with any plausibility be forced upon them. Giving her the benefit of every doubt, the manner in which she proceeds is little to her credit.

"He" (the Spanish ambassador), she writes, "observes, angrily, that it was evident the queen wished to save Courtenay, and of course Elizabeth, since she does not allow that her guilt was as manifest as his."\*

This passage she includes between inverted commas, as a direct quotation from Renaud; and if any such passage were to be found in his letters, it would of course be conclusive: we felt certain however that they contained nothing of the kind, and her reference being wrong, we could only conjecture, on going again carefully through with them, that what she intended to quote was this,—

"Quant au dit Courtenay, je la vois inclinée et persuadée pour luy donner liberté.

"Quant au dit Elizabeth les gens de loix ne trouvent maitère pour la condamner."

The queen's desire to save is pointedly limited to Courtenay, while the difficulty with Elizabeth is ascribed not to any feeling of hers, but to the impracticable honesty of the *gens de loix*; and this is the perpetual burden of Renaud's lamentation; but it is a very different thing indeed from what Miss Strickland represents him as saying.

We suppose that she intended to quote only the first paragraph; that she paraphrased the second according to her own interpretation; and that the remaining errors are due to the carelessness of the printer and to her own want of attention in revising the press. But that she should have forced such an interpretation from such words at all, is a grave evidence of her untrustworthiness when her prejudices bear upon her judgment.

And now to leave this somewhat tedious story, and to follow Mary along the rapid process by which she disembarrassed herself of her brief popularity. The executions for

the Wyatt rebellion had neither conciliated the Londoners, nor frightened them. Parliament was to meet in April to settle the preliminaries of the marriage; and as the time drew on, the English wild beast began to show its displeasure by antics which not a little terrified Renaud. One morning the city urchins turned out three hundred on a side to play at English and Spanish, the prince of Spain himself figuring in all the splendour of rags and tinsel; after a brief fight, in which Spain was contumeliously routed, the said prince was clutched up by friends and foes, and vicariously suspended from a branch; and so eager were his executioners, that the mock death was very near a real one. The queen lost her temper, and declared that she would have her parliament meet at York or at Oxford, where the people were good Christians and not a nest of heretics; but this was only an impotent threat: and, considering the way in which the Londoners had behaved a few months previously, it was neither wise nor graceful. At any rate, matters did not mend; a few mornings later, when the sun rose upon the cross at Cheapside, a cat was found swinging from it, apparelled like a priest with a shaven crown, her fore-feet tied over her head with a paper like a wafer-cake between them; and when Easter came there was "a great scandal" at St. Paul's, which was considered the best practical joke of the time.

"The custom was to lay the sacrament into the sepulchre the even-song of Good Friday, and to take it out at break of day on Easter morning. At the time of taking it out, the quire sung, Surrexit, non est hic. But then the priest, looking for the host, found it was not there indeed, for one had stolen it out, which put them all into no small disorder; but another was presently brought in its stead. Upon this a ballad followed, that their God was stolen and lost, but a new one was made in his room."

It would have been well if this had been the worst; but attached to both religions there was a refuse of population, in which, both under Mary and Elizabeth, foul scandals against the character of the princesses readily generated themselves, and these were printed and scattered about the streets. It is to the credit of the Protestant historians that the most foolish of them have not polluted their pages with these abominations, while no cess-pool has been too foul for priests, bishops, cardinals, and even great ladies, to dive into, for materials with which to defile Elizabeth. But although the stories against Mary were left to rot where they were thrown, yet they were offensive enough when first they were uttered, and wounded her cruelly.

\* "Life of Queen Mary." By Agnes Strickland.

At last, however, Parliament was sitting; and for these and all other disorders a remedy would be devised. If the towns were heretical, the country was orthodox, and the loyal knights of the shires would outnumber and overawe the insolent burgesses. It may be asked with what good hope the queen, who had been obliged to dismiss her first Parliament with such precipitation, could look without alarm to the assembling of a second. The secret comes out in the despatches of Renaud. The hope of her life, in case she ever had the power, had been to make reparation for her father's injustice, and restore the property of the Church. The distribution of it had been in direct violation of the principle on which the confiscation had been justified. But Cranmer and Latimer had protested in vain; and the latter, unable to rescue a single acre for education or for charity, was obliged to content himself with anathematizing in his strong way the hypocritical lords and squires, who only pretended to be "gospellers" for the chance of the scramble. The gospel part of the affair was now laid aside; but the convenience of the broad lands remained unaffected. Almost all the peers, and a large body of the commons, had shared more or less in the plunder; and as the queen's wish was no secret, and many right-minded men in the country were disposed to sympathize in feeling the enormity of the wrong, however they might differ as to the manner in which it should be remedied, there was no little anxiety among them. They were determined not to part with the lands, cost what it might to defend them; but they were not desirous that things should be pushed to extremities, and were open to reason if the queen would come to terms. And so it was arranged that they were to make no more difficulty about the marriage, and she was formally to relinquish her design upon their property. So far, all went easy. It was a downright bargain; so much was paid on one side, and so much was given for it on the other, and both parties affected to be mutually satisfied. But the queen attempted to close her eyes to its nature; to flatter herself that they had been persuaded not to a single act, but to approbation of a policy, and proceeded to make fresh demands upon them. The Catholic faith was re-established, but the country still swarmed with heretics, and she desired fresh powers to repress them. It was still in schism, if not in heresy; and she desired a reconciliation with Rome. Considering that at least the upper house was composed of the same men who had gone with Henry's anti-papalism, and who, under Edward, had forbidden the very exercise of the mass under any pretext whatsoever; the demand which

she was pressing upon their consciences was extravagant, and without further "consideration," she was made to feel that it was impossible that they could concede. The reconciliation with Rome was for the present again postponed; but the chancellor, in the beginning of the session, brought forward a bill for the restoration of the penalties against the Lollards; and now it appeared that a second transaction was necessary. The difficulty had been foreseen as a possible one; and Renaud was empowered to meet it with promises of Spanish gold; but the peers were so well aware of the baseness of their doings, that without the money down they would not give way. Renaud's letters of agony are not a little amusing. First the peers sent the bill to the commons, refusing to pass it while the penalties were made death. Oh! the pensions—the pensions! where were they? Then they threw it out altogether; and still no money. At last there was\* an understanding that it should be passed in the following session, with another understanding that the Prince was to bring the money when he came over. After this disgraceful revelation, we can understand Queen Elizabeth's motives in creating a new aristocracy.

Among other misfortunes which befel England through the gold of Spain, too clearly is due to it that dark and dreadful persecution which has made Mary's name execrable through all generations. The Parliament was dismissed, the proceedings in it having scandalized the country, and "a great revolt," in Renaud's opinion, "being imminent," which it would be better "should be over before the arrival of his Highness." When this arrival was to take place was now the important question. The articles were drawn, and Mary was impatient; but Renaud was anxious about the revolt, and wished first to see the steam let off in an explosion. He regarded political effervescences as periodical necessities of the English, and recommended autumn as the safest to make a first acquaintance with them, "pour ce que ordinairement les humeurs des Anglois bouillissent plus en l'esté qu'en autre temps." The danger might, however, be less than he feared. The queen assured him that there was not the slightest occasion for alarm, and that "gaignant et s'assurant des principaux par pensions et liberalitez l'on n'aura occasion de craindre le peuple." At last, although he could not close his eyes to the determinedly cold attitude of the country, and though no preparations were made anywhere to celebrate the arrival except at the

\* This must have been what really took place. Renaud says the bill was actually carried; but this is a mistake. It was not passed till the following December.

Court, he made up his mind that it might be ventured in July (Midsummer though it was), and reported to that effect to the emperor. So in July it was to be; and, like the tragedy writers who scatter sunshine over the scenes which precede the catastrophe, as if they would linger in the light to the latest moment before they plunge into the darkness, we cannot refuse ourselves the pleasure of loitering over the tragi-comedy of the meeting of the bridegroom and the bride.

On came the summer, like no summer in all the world except in England—raining, thundering and blowing. The English fleet went down to the coast of Spain to join the Spanish, and form a squadron of escort with them. But the Spaniards would have been better pleased to have been left to themselves, for complaints were forwarded to the Court that Lord Clinton, the admiral, did nothing but laugh at their ships, and call them "mussel-shells;" and as the prince was long in coming, and the sailors grew weary and wanted amusement, they "did so cruelly push and torment" the crews of the said mussel-shells when they went on shore for water together, that it became necessary to fix separate hours for their landing, to keep them apart. And this was not the worst; for when the prince came at last, and a stiff south-wester had blown them into the channel, where the English considered themselves sovereign, the Spanish admiral, though the heir of half the world was in his ship, was made to strike his top-sails, and do homage to English supremacy. What poor Philip thought of this there is no saying; probably all minor evils were drowned in the one terrible evil which was before him, and probably too he knew nothing about the matter; for to add to his miseries, he was wretchedly, pitifully sick. The voyage, however, if a detestable, was at least a brief one, and after no more than seven days of suffering, he was set on shore at Southampton, on Saturday, the 20th of July—a memorable day in the history of this country, for the prospects of the queen may now be said to have been finally closed up, and the love, interest, sympathy, affection of her subjects gone from her forever: thenceforward there was no more inclination for Catholicism; thenceforward, in the terror of being absorbed into the dominions of a foreign country, England sought only to intensify and defend her nationality, and isolate herself within her own white walls from all foreign princes, priests, and potentates. It was not the husband of her sovereign that she could recognise in Philip of Spain, but the deadly enemy of herself, her laws, and her children.

Fortunately for us mortals, however, necessary as any future may be, and inevitable as

by our own actions we may have made it, it is kindly kept from us wrapt up in clouds, and we are not made wretched about it by anticipation. No visions of wrecked armadas or plundered caracques haunted Philip's dreams, as he rested his wearied body at the Southampton mayoralty. And if Mary's sleep was troubled when she heard that he had landed, it was certainly from no thought of impending disasters. On the Monday evening they were to meet at Winchester; and the long summer's day would only be long enough for the slow magnificence of the procession, in which the bridegroom was to march thither from Southampton. He had brought with him a glorious retinue, decked out in all the splendours in which they had been wont to glitter up and down under the blue sky of Castile. The choicest chivalry of Europe were there in choicest holiday costume, with gold, and pearls, and silks, and velvets, and plumes of gorgeous birds of Paradise, from the forests of the new world. Southampton had never seen such a troop of cavaliers as on that July morning wound along their streets; and well might Southampton stand and gaze, and wonder at them, for never before or since were so many men worth marking seen together there. Alva was among them, and Count Egmont, and, greater than either, William Prince of Orange, and Count Horn, four men whose equals were not perhaps alive in Europe, or in the world. Poor England, and still more the English climate, which showed such weak perception of the honour done to it! The sun, at least, did not care to look at them, however the people did. Swithin lying there in his shrine at Winchester would not sacrifice one hour of his moist rites. Down fell the rain, as if the whole torrent of the forty days were streaming into one; down it fell, hopeless, cheerless, incorrigible. The gay feathers dangled in the bonnets; the drenched horses drooped their heads, trailing their gaudy caparisons as they waded through the chalk slush of the roads; but no horse might quicken its pace, and no outward composure be disturbed: on they paced, slow, solemn, and most miserable. We can fancy how the Hampshire peasants stood grinning under the dripping eaves of the cottage porches, and bare-legged urchins darted out with disrespectful capers, as the last horse went by. We can fancy the oaths which were muttered between Philip's yellow lips at all England, weather, marriage, queen, and the whole accursed connexion. And the rain was not the worst. To propitiate the gods of his new subjects, he had drained in their honour, before starting, a huge tankard of "the wine of the country"—Hampshire ale—the flavour and the properties of which

alike displeased his inexperienced stomach; and, within and without, he was drenched in wretchedness.

Two hours had brought them two miles from Southampton, when suddenly a messenger dashed up from Winchester full gallop in a shower of rain and mud, and delivered, breathless, a mysterious message, that the prince was to come no further, and was instantly to return: What was to be done? What was the meaning of it? Renaud's warnings, what he had said of English inconstancy, the mysterious *boullissement* of their evil humours periodically recurrent at the dog days, all rushed into his mind; the cavalcade was halted, and Alva, Egmont, and he, drew up at the edge of the road to consult. Tradition has not preserved what passed between them; but what strange thoughts the associations of those three names call up in us when we think of them on that wet day, standing talking at the ditch side, on the Southampton road. After such a ride together, and such a scene, it is hard to understand why they were not sworn friends for ever. But we must cut short our sentimentalism, as an English nobleman, who was present, cut short their agitation. "Sire," he said, laughing, "the queen only begs you will not think of coming to her in such dreadful weather." If ever Philip blushed, he blushed then. He gathered himself together, dismissing the hope which perhaps, for a moment, had shot across him, of a reprieve from the purgatory into which he was to be precipitated. The foot march recommenced; and after eight more mortal hours of slush and shower-bath, the draggled cavaliers waded into the town of Winchester, and found dry clothes and supper waiting for them at the Deanery. Where let us leave him to digest his watery welcome as best he could.

In another day or two, the precipitation was completed. How long a time elapsed before the queen's eyes opened to the light in which she was regarded by him we cannot tell. There was much to blind her; and perhaps, during the few succeeding months, she was as nearly happy as with her unhappy nature she could be. At the close of August, they made their entry together into London; where, though they were received with a show of pageantry, there were threatening indications visible also, which showed that the temper of the citizens had not become more submissive. At one end of London Bridge stood a large painted figure of King Henry, holding a book as if to present to her as she passed, on which was written, "Verbum Dei." Without taste, and without tact, she halted till a painter had been summoned, and had dashed out the words.

The objects, however, most notable on this occasion were the twenty cart-loads of bullion which followed in the train, and in which, as behind the triumphal car of the prince and queen, the honour of the English nobles was drawn along in shameful captivity. The price of blood was come, and Parliament was now to meet once more, when they were to fulfil their promise. Means of another sort, though equally sure, had been taken to secure a pliant House of Commons, and now the queen was to inaugurate her final victory, and place the last stone on the reconstructed edifice of Catholicism. Her first Parliament had given her the mass, but protested against Pope and husband. Her second had granted the husband, but there ceased their compliance. The third was to do submission, in the name of the country, to a Roman legate. England was to be received again, as a returned prodigal, in the bosom of her mother, and, as a token of her repentance, was to offer up her misleaders with fire and faggot at the altars of the offended gods.

Unanimity would be certain; for no dissentient voice was to be permitted. The Church had been diligently weeded; the heretical bishops were in prison or in exile; three thousand clergy had been turned adrift to find some other employment or to starve. Convocations were already, therefore, secured, and the elections to the House of Commons could be controlled. A letter of Mary's is preserved to us, obviously a circular to the lieutenants of the counties, directing them how to proceed. It is addressed to the Earl of Sussex, and runs as follows;—

"Mary the Queen.

"Right-trusty and well-beloved Cousin, we greet you well: And whereas for divers causes, tending principally to the advancement of God's glory and the government of this realm, we have thought convenient to call our High Court of Parliament for the twelfth of next month, as by our writ of summons sent unto you you may at better length perceive; like as for your own part we doubt not but ye will be ready to assist us with your best advice and counsel for the furtherance of our good purpose in such matters as are to be treated of in our said Parliament, so, to the end the same may be more gravely debated and circumspectly handled to the honour of Almighty God and general commodity of our loving subjects, we have thought convenient specially to require and pray you to admonish on our behalf such of our good and loving subjects as by order of our writs have the election of knights, citizens, or burghesses within our realm to choose of their inhabitants such as, being eligible by order of our laws, may be of the wise, grave, and Catholic sort; such as indeed mean the true honour of God with the prosperity of the commonwealth, the advancement whereof we and our dear husband the King do chiefly profess and intend, without alteration of

any man's possession, as, amongst other false rumours, the hinderers of our good purpose and favourers of heresy do report.

"Given under our signet at our palace of Westminster, the 6th of October, this second year of our reign."\*

The specific form of admonition which Sussex was to administer to the good and loving subjects may be left to conjecture. It is enough that it answered its purpose; persons who attempt a game of this kind usually taking precautions which shall secure them against immediate failure. All was at last ready therefore. The commons were nominated, the peers were bribed, the convocation weeded; and, with a hand of packed cards, the game would not be difficult. Considering what the work was, it had been dexterously done. The island of heretics was prostrate, and nothing remained but that Cardinal Pole, the legate, should now make his appearance and complete the farce. It was the culmination of Mary's star,

"and from that full meridian of her glory She hasted to her setting."

On the 28th of November, the Parliament and the cardinal came face to face; on the 29th, the motion for the reunion with Rome was carried with acclamation; on the 30th was the great scene with legislature, king, queen, and legate, at the close of which, after mutual weepings, prayings, and admonishings, the latter rose in his place, and declared that "all those present, and the whole nation and the dominions thereof, he absolved from heresy, schism, and all judgments, censures, and penalties for that cause incurred, and restored them to the communion of

\* If this letter was the only evidence remaining to us, it would not be sufficient to prove that the means employed by the court were decidedly unconstitutional, as the constitution was then understood. It is important, however, as a comment on the universal complaints of the Protestants that the elections were unfairly controlled, and the following language of *Michèle*, the Venetian ambassador at the court of Mary, inapplicable as we know that was to her first two parliaments, describes the impression which he gathered from the proceedings of her third. He is mistaken in deducing a practice from a single instance, but his evidence is no less valuable as to what he himself witnessed:—

"The kings use in more than one way to keep out (of parliament) or bring in, whomsoever they please; choosing for the latter purpose such only on whose good disposition towards them they can firmly rely. They are at this time become so formidable and powerful that they may do even as they please; nor can any body, whether in Parliament or out of it, impunely, or indeed without utter ruin to himself, venture to stand up in opposition, or even to make the least show of resistance to their pleasure generally. In short, servants they enter Parliament, and servile are their proceedings therein."

the holy church, in the name of the Father, Son, and Holy Ghost." Amen, amen, amen, rang out round the hall, the members rose from their knees, and they and the court and the legate adjourned to the chapel and sang *Te Deums*; with what emotions we feel no temptation to pause and to consider. Next followed a similar scene with the convocation, and the Sunday after Gardiner did penance at Paul's Cross, and preached a sermon of self-abomination for his schism. On the 18th of December, the persecuting bill passed, and, with the new year, the heretic burning was to begin. It was a great victory, or it looked like one; and to add to it, in the middle of all the joy, the queen was declared to be *enceinte*. Up went *Te Deums* again from every cathedral in Europe. Bells rung and bonfires blazed. There was no doubt any more; Heaven had spoken; Heaven had blessed the queen for her glorious work, and doubly blessed the Church through her. The news was sent flying to the emperor. "I never doubted of the matter," he said; "I never doubted but that God, who had wrought so many miracles, would make the same perfect by assisting nature to His good and most desired work." It was only natural that Catholics should think so. It was natural, too, perhaps, when it all turned out a dream, that they should not have seen, in the failure of their hopes, the same evidence of the disfavour of God as they supposed themselves to see of His favour, while they thought it a reality. The weight of the evidence was the same, into whichever scale it was cast. But so it is with the sons of men. The most trifling coincidence, the idlest straw driven before the wind, will be claimed as a providence when it flatters their prejudices; the most startling catastrophe will be explained away, ascribed to luck, to fortune, or the malice of the devil, sooner than they will acknowledge it to be a judgment on their sins.

That Mary's pregnancy was a pitiable delusion, politically we cannot but rejoice. With her ultra-montane extravagance she had sacrificed for ever the hope of reconciling the English to any form of Catholicism, however moderate; and the events of the next three years would have inevitably precipitated a revolution if her breaking health had not enabled them to expect an early remedy in natural causes. There is no doubt how the struggle would have ended, but while it lasted it would have been inconceivably dreadful; and instead of the long glorious peace of Elizabeth, when the population doubled their numbers, and trebled their wealth, the best blood of England would have flowed away on new fields of Towton or of Barnet, and the

Protestants might only have found themselves conquerors, to bleed to death on the scene of their victory. But for the poor queen herself it was a disappointment which may well command our commiseration. From her childhood she had been the plaything of a fortune which had bound her heart in ice; and her woman's feelings, as she brooded over her own and her mother's wrongs, had curdled into bitterness. With a more powerful nature, injuries such as hers would have brought about some tragical catastrophe; but such a result was prevented by the poverty of her disposition, and she was transformed instead into a wretched being who could neither love nor be loved.

If her husband had treated her even with ordinary kindness—inexperienced as she, who had never known kindness at all, must have been in distinguishing between the degrees of it—it might have satisfied her self-flattery; and if those other hopes had not deceived her, and if in becoming a mother fresh springs of affection had been allowed to open for her, it is not impossible that the hard frost-bound soil might have thawed, and the latent humanity shot up again.

It might have been so; and those dark blots which will now lie upon her name for ever, might either never have been, or have been washed away by repentance. There is no saying. History is not of what might have been, but of what was; which, indeed, perhaps is all which could have been. But Queen Mary, cruelly as she was wronged in her own young days, is not one of those persons whom it is possible to hate, and we pity her, even for her crimes.

To return to the Parliament. Although Pole had received a commission from the Pope to confirm the existing tenures of the spoliated Church lands, there was, nevertheless, a hope, that by persuasion, if not by violence, the holders of them might be induced to disgorge. The Mortmain Act was suspended for twenty years to give the priests the opportunity of working upon them on their death-beds, and perhaps of terrifying them by a refusal of the viaticum. The queen set an example by giving back what remained to the Crown; and Pole, in the very speech in which he consented to the Acts of Parliament which established things as they were, yet reminded those whom he allowed to retain what they had got of the punishment which God sent upon Belshazzar for his sacrilegious usage of the vessels of the temple. Here and there a few straggling monks began to nestle among the ruins of the abbeys, like the remnants of a wasp's nest about the blackened hole which has been their home; and natural repentance, and

natural uneasiness, when the dying point was near, would soon, it was hoped, lead many a man to sacrifice for his children what he could not resolve to sacrifice for himself.

The gangrene of heresy was now to be cauterized. The queen had got her bill, and might now burn when she pleased. We can believe that the legislature, in granting her the power, had little notion of the manner in which she would use it. The Statute of the Six Articles, except on a few occasions, had been a dead letter in the hands of her father; and they may easily have been unable to conceive that a woman, who had been merciful to traitors, would be harder upon heretics than so ostentatious a champion of orthodoxy as Henry the Eighth. But they had underrated the power of Catholicism over a heart in which no natural feeling operated to soften or to counteract it.

We have no intention of pursuing the horrible history of the years which followed; but many attempts have been made to remove the responsibility from the queen; and it is necessary to say, that the closer we examine, the more certain we feel that it is wholly and exclusively hers. It has appeared so horrible a thing that a woman should have done it all, that the blame has been desperately hurled upon Philip, Gardiner, Bonner, Pole, any one whose name is prominent. And yet, the Sunday after the first execution, Philip's confessor preached openly in severe condemnation of it; Gardiner and Bonner recoiled from their loathsome duty, and we have letters extant of Mary's own, in which she rebuked them for their slowness, and goaded them into proceeding. And Pole was so notoriously opposed to the persecution, that complaints were entered against him at Rome, his legative office was suspended, and only his death prevented his being called to account as a favourer of heresy. It was the queen, and the queen only; and the explanation of her conduct, if we will only reflect, is not so exceedingly difficult.

A Catholic, if he is really sincere, cannot but approve of persecution. If he believes, as he professes to believe, that teachers of what he calls heresy are indeed leading away the souls of all miserable men who listen to them, into the eternal fires of hell, no crime can equal theirs in atrocity, as the consequences of none approach it in horror. Catholics who pretend to deplore the spirit of persecution, can by no possibility be sincere in denying salvation to all who are beyond the pale of their church; and when they prate of toleration, they make their profession an imposture and a lie. We naturally shrink from pressing one another with the logical consequences of our creed, whether political or

religious, and it seems a hard thing to charge upon the faith of so large a section of educated, well-disposed people, so dreadful a necessity. But the question is too serious to be trifled with; and whether we like it or not, we must look it in the face. Let us consider what damnation means in the creed of a Catholic; consider what the *crime* must be which involves a penalty so appalling. And if a simple heretical belief is sufficient to involve it, what can we say of those who teach heresy? It is only because the gates of hell lie beyond the grave, and he does not with his bodily eyes see the poor souls hurled through them, that the Catholic of weak faith talks of toleration. If he have the power to crush a heretic teacher, and spare him, he must stand self-condemned—condemned of a crime as infinitely greater than that of him who lets loose a murderer from his prison, as the torture of unending years exceeds the moment's pain of a single death.

And thus Catholicism, wherever it is dominant, and wherever it is sincerely professed, would always carry out persecution to its extreme and cruel issue, were it not that in the generality, if not the whole, of mankind, there is an element of humanity which no creed can extinguish, making them *men* as well as orthodox believers, and compelling them to refuse the conclusion, even while they continue to accept the premises. Gardiner would have punished the *leaders* of Protestantism, as he would have punished the leaders of a rebellion; but four or five, instead of as many hundreds, would have closed the lists, if he had had the keeping of them. Bonner, a good-natured, choleric man, would have whipped a few for the example, and let the rest go free. But in Queen Mary, early ill usage had trampled out the natural woman, and delivered her up to Catholicism, to be moulded by it exclusively and completely. With a resolute wish to do the will of God, without one bad passion, careless of herself, and only caring for what she believed to be her duty, she had no idea of what duty meant, except what she gathered from her creed; and all her loves, and all her hatreds, submitted to the literal control of the propositions of it, uncounteracted and uninfluenced by a single human emotion. The character is a fearful but an intelligible one; and we shall not easily exhaust the instructiveness of it. We may look through history in vain to find a second specimen; one such was enough, and that one was raised up on high on the English throne, for all mankind to gaze upon as an example of what Catholicism was able to do with a nature wholly given over to it, in which no other influence,

either of head or heart, assisted or interfered with its operations.

The most painful feature in the English persecution is the rank of the victims. Five bishops, and a very few leading clergymen alone appear, of men whose names were known to the world. There was neither peer among them, nor knight, nor gentleman—only poor mechanics, weavers, tailors, carpenters, common day-labourers, and poor blind boys. We are unwilling to think that the queen only struck where she dared, and would not risk a collision which might put an end to her proceedings; we know, as a fact, that it was among the poor that Protestantism had the strongest hold, and that the preachers of it were as unlettered as the first apostles; and yet as we turn over the catalogue of sufferers, the painful impression will cling to us that cowardice was added to inhumanity.

The rest of Mary's life is soon told: she was shot down from the show of her prosperity as swiftly as she was raised to it; her life on earth was one long mistake, and but for the brief delusive interval, which only served to make her cup more bitter, it was one long misery. The symptoms which she had mistaken for pregnancy were the approaches of a hideous disease. Her husband, for whom she had sacrificed the hearts of her people, detested her, and, brute as he was, took no pains to conceal his aversion. He insulted her by infamous solicitations of the ladies of her court; when they turned with disdain from him, he consoled himself with vulgar debauchery; and making no secret of the motives which had induced him to accept her hand, when the policy burst like an air-bubble, he hastened to leave a country which was always execrable to him, and a wife whose presence was a reproach.

Thus bitterly Mary's heart was again flung back upon itself; and with scared feelings and breaking health, she threw herself with undivided heart upon her religion to fulfil the mission on which she believed that she had been sent by God. The most severe edict which was issued for the persecution went out after her husband had left her, proving, if proof were wanted, that she, and not he, was the author of it. Heretics, like the Hydra's heads, seemed to multiply by their destruction, and every victim offered, kindled fresh and fresh enthusiasm for martyrdom. Dragged in troops before the bishops, the labour of the latter was to thrust upon them opportunities of escape: and, fairly read, the history of the Marian trials is that of wretched judges compelled to administer a law which they abhorred, and whose one effort was to escape the duties which it forced upon them. The queen's

determination, however, only grew with failure. She saw the hatred of her people, but it did not move her. She felt her life was ebbing from her: it was the more reason she should make haste. Her sister's accession, which now she could not hinder, would be the signal for the downfall of all for which she had laboured, if she could not first destroy the poison. In the portraits which remain of her, we can read the history of it all; that high projecting forehead, falling in and narrowing above the eyes—weak, and yet inflexible; foolish, yet with the conceit of wisdom. As she sank and sank, the more fiercely she drove on the persecution: fresh and fresh powers were given to the ecclesiastics, and fresh and fresh injunctions; what had begun in conviction of duty, had settled into a monomania. But the endurance of the people, like the queen's life, was drawing to its limits; and it was a race between them which would first give in. Near as the close of the latter evidently was, Cecil had to fear some dreadful outbreak would anticipate it. Her death was openly prayed in the churches, and it was idle to declare it treason. The exiled clergy in Germany poured pamphlets across the Channel, in which it was declared lawful, and even meritorious, to make away with her *ferro veneno quocunque modo*, and though she justly made the possession of such papers punishable with death, yet when the nation shared the treason, the impossibility of executing it made the threat contemptible.

Thus wretchedly, the last sovereign in England who reigned on to her natural end—a Catholic, sank towards the grave. She ascended the throne when the people whom she was called to govern were inclining to return to their old bondage, and her reign, though but of little more than five years' duration, was long enough to make such a return impossible for ever. Fearful as it was, we cannot regret it, for those poor men whom she destroyed, secured in their death a perpetual freedom to England; and, if to die nobly in a noble cause, be really for a mortal man the happiest service of life; if, in the midst of the profitless existence of so many millions of millions, those few are to be accounted blessed who have not lived in vain, the five hundred poor working men who sank to ashes at the stake by the order of Mary Tudor, are not among those whose fate we most deplore, or who would themselves ask us to deplore it. Surely happier far was the meanest of them all, than that poor forlorn princess who was piteously divorced from life by years of agony; who, although she passed away a queen amidst the splendour of a palace, yet knew too well in dying that no man or woman left on earth would waste one re-

gret, or shed one tear upon her memory; and who, in the miserable consciousness of the vanity of her existence, prayed that she might be buried in the habit of a poor *religieuse*, in which alone it would have been well for her if she had lived.

#### ART. II.—CONDITION AND PROSPECTS OF IRELAND.

7. *Sketch of the Origin and Operations of the Society for Irish Church Missions.* By the Rev. W. Marrable, A.M. Fourth Edition. 1852.
8. *Tracts issued by the Society for Irish Church Missions to the Roman Catholics.* London. 1852.

THE world is weary of the subject of Ireland; and, above all the rest, the English reading world is weary of it. The mere name brings up images of men in long coats and women in long cloaks; of mud cabins and potatoes; the conacre, the middleman, and the priest; the faction fight, the funeral howl. The sadness of the subject has of late years increased the weariness. People who could read with enjoyment Abdallatif's descriptions of famine, and Defoe's of plague, turn away from narratives of similar woes in Ireland, because they are too real and practical to be an intellectual exercise or pastime—to serve as knowledge or excitement. Something ought to be done for Ireland; and, to readers by the fireside, it is too bewildering to say what. So the subject is left to Parliament; while members of Parliament feel in this case, as in every other where great questions are involved, that they can do nothing, except in as far as they are sustained by public interest.

Our own attention has been of late so attracted to Ireland, and so much novelty of incident and of aspect has presented itself in the course of our study, that we cannot but believe that an hour's interest and entertainment may be furnished to the reader out of the experience of many weeks, and the teachings of some new and valuable books.

Without going back into the sad old history of Ireland, we can give some idea of what was the state of things there before the calamity of 1846, and during the famine years—and of the present state and prospects of the country. About the last of these aspects, at least, there should be nothing wearisome, for, of all new things, this is the newest. The new French emperor is a stale conception compared with it: and so is the junction of the Atlantic and Pacific; and so are the gold-fields. Take what subject of contemporary excitement you will,—the opening prospects of Ireland do, in novelty and interest, surpass them all.

Ten years ago, the persuasion that lay deep in the Irish heart was that the height of human felicity was in having a stretch of green earth for one's own, with nothing to do. There is nothing wonderful in this being the general persuasion, in that particular island. A gentle rain, distributed over most days of the year, falls in a moderate total amount, but so as to prevent the pastures being either flooded or burnt up. A glance at a geological map of Ireland will show a vast extent of limestone, large tracts of which thinly covered with soil, produce grass on which cattle thrive wonderfully. From end to end of the island, the quality of the stock is such as to strike a stranger more than many sights of which we hear more. If we do hear of it, it is in the form of lamentation that human beings should pine while four-footed creatures fatten like favourites of nature. But, why should not the cattle be fat? There is the vast limestone basin; there is the shallow soil; and there is the sweet, fine, thick herbage. The soil and the stock are evidently fitted to each other; so, let them be. The Irish have been, till now, willing enough to let them be. The landlord, whose interest was for life only, and who had no capital to lay out in farming, found grazing a good thing for the little money and trouble it cost: and so did his tenant, who, without a lease or other security, could not venture to look beyond the year; and so did the middleman, who, living where there was no middle class, could be genteel only by imitating the idleness of the landlords. Up to a recent time, Ireland has strongly resembled a slave-holding country in the one particular, of the disgracefulness of industry. Why it was so, it is easy enough

to see. William III., addressing the House of Commons on the 2nd of July, 1698, made a promise which reads rather strangely now. "I shall," said he, "do all that lies in me to discourage the woollen manufactures of Ireland." Other potentates made the same promise, and kept it faithfully; so, between that policy and the operation of the penal laws about religious matters, there was created a great gap in Irish society where there should have been a middle class. The laws against the importation of corn discouraged trade in food, and drove the people to patches of land for subsistence. Butter was exported from Cork and Waterford, and bacon from Dublin; but so small was the number of importers and retailers of food throughout Ireland, that the master difficulty at the time of the famine was how to put the food, as it arrived in abundance, within the reach of the people. Even now, it is a curious spectacle to the English traveller,—the attempts of the Irish to sell food to each other. Women carry about apples; and here and there, two or three members of a family may be seen escorting a kid, or a fowl, or a basket of eggs, to some region where traffic goes on,—reminding one of Arthur Young's description of how the French peasants wasted their time in seeking a market—before the great Revolution. The fisheries never came to anything for want of a market; and, in fact, the important class of food-sellers was almost entirely wanting in Ireland, except in the great towns. And in the great towns, the manufacturing element was smaller than has almost ever been known, in modern times, in a country where the people were numbered by millions. We have had a glimpse of the treatment of wool, in a country so rich in pasturage. One manufacture after another died out under restriction, or was destroyed by combinations of workmen. Flannel, coarse linen, silk, woollen, lace, gloves, and several more went down. The best workmen came over to England. The employers withdrew from business, in terror at the brutality attending trade-combinations; and those combinations were made as brutal as they were by the absence of a poor-law, which left no alternative to the depressed operative but violence or despair. There are few manufacturers capable of exercising the heroic pertinacity of Messrs. Hutton, of Dublin, who have preserved to their country their splendid coach-manufacture, after half a century of firm and fine-tempered occasional conflict with men who battered their carriages, cut their silks and laces, beat their foremen, and compelled the partners themselves to ride home armed, and walk about in protracted peril of their lives. And so it has been with fisheries and

curing establishments. The Catholics were depressed by penal visitations and restrictions; and the Protestant men of business were jealously watched by their injured neighbours, and so thwarted and held in check by their own work-people, that they gave up the game; and down went the pursuits of industry and the strength of the middle class, and up went the value of the land and the dignity of having nothing to do.

There was not even the farming element of the middle class. Arthur Young gave a good account of the requisites for profitable tillage on the spot in his time. Speaking of Limerick and Tipperary, he says, "It is the richest soil I ever saw, and, as such, is applicable to every purpose you can wish. It will fatten the largest bullock, and at the same time do equally well for sheep, for tillage, for turnips, for wheat, for beans, and, in a word, for every crop and circumstance of profitable husbandry." In Ireland, the produce of wheat exceeds that of France by ten bushels per acre; and the superiority over all other countries in the produce of green crops is even more remarkable, where due pains are taken. But due pains were not taken in Arthur Young's time, and afterwards. There was no substantial farming class, any more than there was a manufacturing or commercial.

If we show what there was on either side of this great chasm, it does not follow that we must say what the reader is weary of hearing. We have all good reason to be tired of the popular representation of the Irish landlord and the Irish peasant. But, perhaps, there may be another aspect of each, disclosed by the searching power of recent misfortune.

It is rather a bold venture to say a word in favour of the Irish landlord,—in favour, not only of the Irish landlord who, in our day, impoverished by visitations of natural calamity, engages the respectful compassion of all humane men; but of him who was a by-word to the last generation. We shall be called perverse, and paradoxical, and so forth; but not the less must we say that, to us, at least, the case of the whole landlord class of Ireland is considerably altered by the recent exhibition of what that case really is—an exhibition made, not by the landlords, but by some who can tell their story better than they can themselves.

The laws have allowed the Irish landlord no fair chance. They have been cruelly oppressive to his fortunes.—But who made those laws relating to Irish land? Did not the landlords make them? They did. But it was very long ago, when the law-makers were all land-owners; when, in the natural endeavour to legislate for the honour and profit of their

own class, they did what such self-seekers always must do,—pass laws which must in time become so oppressive to all classes as to bring about, after a world of misery, their own extinction. A glance at the condition of an Irish landlord ten years ago, will show what his law-making ancestors subjected him to.

It appears that a mistake has been prevalent about the uncertainty of titles to land in Ireland. On the spot, it is said, and appears to be proved, that English conveyancers have been mistaken about this. The ascertainment of title has been difficult, in the case of incumbered estates; but the title once got at, seems to be as clear there as anywhere else. But not for this was the owner the more able to sell any of his land—and not for this had he any more enjoyment of it while it was called his own. He came into it under a settlement which settled all his affairs, with a vengeance, while it arranged the descent of the land.

"Can you," ask the Select Committee of the House of Commons, of Dr. Longfield,—“can you describe, briefly, the mode in which this practice of family settlements interferes with the freedom of land and its transfer?—A common settlement is in this form: to the husband for life, and then terms are created to secure a jointure to the wife, and then charges for younger children, and then to the first son of the marriage in tail; and, till the first son comes to the age of 21 years, the land cannot by possibility be sold; and even when he comes of age, it is subject to incumbrances for the younger children; and sometimes a second settlement is made when the son comes of age, and there is a new set of incumbrances for younger children. I have known three generations of incumbrances on one estate.

“What is the practical effect of such a state of things with regard to that property?—The practical effect is that very frequently a country gentleman finds himself quite disabled from managing the property, where a great portion of the income of his property goes to other people who have no interest in the good management of the property; and he is a poor man, and is not able to act with the liberality with which he would otherwise be disposed to act.

“And he is injured by being placed in a position which he is not able to maintain?—Yes. He has the rank and territorial influence attached to the estate, though he has not the income from it. In improving times, he has an advantage, because he gets the benefit of any rise; but when a reverse takes place, he is unable to overcome it, because he bears the whole weight of the reverse, none of which falls on the incumbrancers.”—*Tenth Report*, p. 9.

Thus, the landlord had to bear all pressure of every sort. The poor-rate on the whole property had to be paid by him, while no allowance had been made for it in the arrange-

ment of jointures and mortgages. He thinks this hard; but is told that it would be unjust to jointresses to tax their settled incomes; and that if there was any attempt to charge mortgages with poor-rate, they would foreclose at once. If his farms are left empty, he is chargeable with the rates on them; and if the tenant has gone away in debt, the landlord not only loses his rent, but has to pay the arrears of rate. What can a man do who, with a nominal income of 1500*l.*, has only 400*l.*, and is subject to the charges upon the whole 1500*l.*!

The first thing he would desire would be the improvement of his tenantry,—for his own sake, and for everybody's. But, he has no power to give the security of a good lease to a promising tenant; that is, the law does not allow, as in Scotland, a priority of claim to lessees, over other incumbences, in case of the landlord's death. He cannot bind his successor, and the lease expires with his life. Again, he cannot charge his estate with the cost of improvements, be they ever so desirable. He cannot, out of his restricted income, build houses and barns for his tenants, or drain their land, while it is out of his power to make a secure lease of sufficient length, or to engage to compensate them for their expenditure in improvements. Without such a lease, it is not to be expected that the tenant should incur such an outlay; so, down goes each party:—the land degenerates, the buildings fall to pieces, the tenant cannot pay his rent, the landlord loses his rent, and has to pay the rates and all other charges, while his property is sinking to waste. Again, while his fertile land is thus sinking to waste, he has no power to let waste land to be made fertile. In ancient times, when there were no surveys of land, it was a serious matter to alter the description of land—as by turning a moor into corn-fields; and the law forbade such transformation. If land now descends under the description of waste, it is against the law to cultivate it; and its legal description still is "waste." Again, the decay of woods in Ireland—a serious misfortune—is not the fault of the landlords, but a misfortune sustained by them. It is not the landlords who utter the foolish saying, that trees will not grow in Ireland. Those of them who are of ancient descent can tell of the extent of ancient forests. They can tell of outlawed chiefs who lived in the woods. They can tell that Westminster Hall was built of oak from Ulster. They can tell of the income once derived from the sale of timber and staves. They can point to their bogs, where miles of forest lie sunk; and some few can look up with complacency to the sheltering growth of trees about the family mansion. But they will

know that, in the present state of the law, they might as well expect to see palms and banyan trees on their tenants' farms, as oak, elm, ash, or pine. Tenants for a shorter term than fourteen years,—that is, almost the whole tenantry of Ireland—have no claim whatever for the trees they plant, any more than for those they found growing; and the landlord cannot fell them, because the tenant has a right to their "fruit and shade." If the tenant obtains a renewal of his lease, he must cut down his trees within a year, or forfeit all claim to them; and the landlord cannot relieve him, because he may not charge the estate with improvements. It is only by a troublesome act of registration of his trees, that the tenant can have any benefit of them at all; and the short-lived and precarious benefit obtainable is not such as will clothe Ireland with woods in the place of those that are gone.

"I remember," says Professor Hancock, "hearing of a case in a northern county, where the tenant attributed the landlord's unwillingness to purchase, or secure him the value of the trees, entirely to the landlord. The negotiations about renewing the lease were prolonged till the time within which the tenant could cut the trees had almost expired; but on the last day the tenant assembled the whole country-side, and cut down and removed every tree from the place, being compelled to destroy the greater part of the value of the trees, in order to secure to himself the small compensation for his labour and capital which the law allowed in the right of cutting. The country people, seeing an improving tenant resort to such a step, never thought of the law respecting trees, but were loud in their indignation against the landlord, very unjustly ascribing to him a set of circumstances over which he had no control."—*Impediments to the Prosperity of Ireland*, p. 126.

Up to a late date, the land owner was controlled by law in the leasing of mines and coal-pits, the rent he was to charge being settled for him, and at such a point that he could get no lessees, while Cornwall was open to them. And here is a case of bondage about leasing for the erection of mills. Professor Hancock, in giving evidence that the owner is forbidden, in an ordinary case of settled property, to let more than three acres for a mill, and more than fifteen for a cotton-mill, is asked—

"Have you known cases in which a mill, or mills, have not been built on certain properties, in consequence of that restriction?—Yes; there is a very remarkable case that came to my knowledge; and I had the consent of the surviving parties who were connected with the matter to publish it. The substance of it is simply this: that about fifteen years ago (that is, before 1849)

a gentleman, intending to erect a flax-mill, applied to a landlord in the north of Ireland, to give him fifty acres of land, and fifty acres of bog, to build a mill, and to put up a mill village in a very poor part of his estate. The landlord was delighted with the proposal: he offered to get up the fifty acres of land from the tenants, to buy out the tenants, to give him the fifty acres of land rent free, and to give him the fifty acres of bog also rent free, and to give him the longest lease that the settlement would allow. When the settlement was examined, it was found that the landlord could not carry out this good intention: that he must set at the best rent, consequently he could not grant the thing at a nominal rent; it was also found that he could not renew the lease as long as he lived, because the moment the mill was put up, he was then bound to set at the best rent again, and include the rent of the mill. The only lease that he could grant was for three lives, or thirty-one years; and the flax-spinner said, that he could not lay out his capital upon that lease, because he would have to lodge his lease the next day with a banker in Belfast, as security. In consequence of that, the mill was not built; the capitalist went to Belfast, where he could get a better interest; he built his mill, and he has laid out 15,000*l.* a year ever since in wages. He has prospered; and that district where that mill was not erected, was one of the poorest parts of that landlord's estate during the famine. It suffered very seriously; and the people are still in a state of distress."—*Tenth Report*, p. 50.

Thus we see the landlord unable to sell, except under difficulties which amount to a prohibition. He cannot let his land, or not to advantage. He cannot improve, but by giving up his own income, and the fortunes of younger children, to throw the increased value into the lap of his eldest son. He cannot borrow money, for the improvement of his land, on the ordinary commercial terms. Being a tenant for life, he has to pay not only the interest of the money borrowed, but the insurance on the entire amount for his own life, being unable to charge his successor for improvements on the estate. He was brought up, perhaps, to consider himself a sort of prince—the descendant of old nobles—the proprietor of mountains, lakes, and rivers; able to boast to the sovereign, in the Long Walk at Windsor, that to his castle there was an avenue of thirty miles. When he came into possession, he finds himself, perhaps, with an income of a few hundreds a year; with a tenantry for whose losses he is blamed; with land, for whose deterioration he is made answerable. He cannot stand there in the midst, tied hand and foot, to be denounced by the priest, insulted by the newspapers, (especially by the *London Times*,) heart-wrung by the sight of suffering that he cannot relieve, perplexed by calls he cannot meet, and subject to the assassin's shot from

behind the wall. He goes abroad, to live in peace on his little income, or to increase it by entering into political or other official life; and immediately he is branded as an absentee. Hear Professor Hancock on this:—

"I do not think that the want of improvements arises so much from their being absentees as from their being heavily incumbered. I find that, with respect to those absentees who live in England for the purposes of ambition or pleasure, some of their estates are the most improved in Ireland; but whenever an absentee is an absentee because he cannot reside on account of incumbrances, the mismanagement of his estate arises from its being incumbered, and not from his being an absentee. . . . I doubt very much whether parties under entails would lay out much money in improvements; certainly not without the adoption of the Scotch law, of enabling them to charge the inheritance for doing so. But I think that a great deal of what is attributed to absenteeism arises from the landlord not being allowed to sell. They are compelled to hold on their estates, and cannot reside on them; and therefore, by law, they are made absentees. If they were allowed to sell their estates, the parties who bought would reside.

"Are there any proprietors whatsoever in Ireland who do erect farm buildings, and carry on their business with their tenants upon the same principle that is generally adopted in England?—I believe there are some who do so; and I believe some of those who do it most are absentees."—*Tenth Report*, p. 65.

Such was the state of a large proportion of the landlord class just before the famine. In many districts, the priests of the two churches were almost the only resident gentry: the priests of the one church with an income, but no influence outside of it: the priests of the other church with much power, but very little money. Of farmers, and shopkeepers, and artisans, there were very few. The middlemen were almost the only specimen of middle-class. On the further side of the chasm, there was a mournful spectacle. We will not describe it; for everybody knows what was the cabin-life of the Irish poor. We will merely set down the numbers. Out of a population of eight millions, nearly three-and-a-half millions lived in mud cabins—in the lowest order of human habitations. Because of the fault in the ownership and occupation of land, there was no improvement. Because there was no improvement, there was no middle-class, or work, or wages. Because there was no middle-class, or work, or wages, the multitude betook themselves to such land as they could obtain. Because the most abundant crop from that land was potatoes, the people lived on potatoes: and, finally, because, when potatoes failed, they could go no lower for food, they were doomed victims of famine.

And all this time, landlords were abroad, or hiding from their creditors behind their own iron gates, and maintaining the population as paupers in the workhouses which were rising over all the land—while many millions of acres of good land were lying waste, and the seas were alive with fish, which nobody caught—no less than 20,000 Irish capitalists had invested nearly 40,000,000*l.* in the English funds, at 3 1-4 per cent. interest. There lay the money, while the world talked of the impoverishment of Ireland, and cried aloud for an influx of capital. We may be very thankful for this curious fact of the investment of so large an amount of Irish capital in the imperial funds. It shows that Ireland is not without capital. It shows that the material for a middle-class exists; for this money cannot belong to the incumbered land-owner; nor to the very few unincumbered, who could possess but a very small share of it, and would not invest that share so unprofitably; nor can it belong to the farm-tenants, hampered as they are for want of capital to improve their business; and, of course, it does not belong to the labourers. It must belong to those who constitute the trafficking and speculative middle-class in England, and who are ready to become such a class in Ireland, as soon as there is the same freedom and security for speculation as there is in England. It is a comfortable fact in another way—as a testimony to Irish caution and thriftiness in money matters. There cannot be a greater mistake than to speak of “Irish idleness” and “Irish improvidence,” because the younger sons of the aristocracy have been wont to gallop about the country, and game, and drink, and get into debt. What the real character of the bulk of the Irish is, as to industry and providence, we have abundance of testimony. Professor Hancock says:—

“These migrations of labourers afford the strongest proof of the energy, industry, and foresight of the Irish labourers. They are willing to undergo every toil for good pay. One-half of these harvest labourers every year traverse and retrace Ireland, from Connaught to the eastern ports, for the sake of the high wages for harvest work. The self-denial which they practise while in England, in order to save all they can of their wages to provide support for their families during the winter, is the strongest proof of their providence. But the extent to which they understand the economic principle of buying in the cheapest market, is illustrated by some observations of the Census Commissioners:—‘The singular thrift and foresight which has so frequently been remarked as characterizing these people (the harvest labourers) is curiously illustrated by this table, in which it will be seen that no less than 12,256 Connaught labourers embarked at Drogheda, and only 8,308 at Dublin. This unusual circumstance is attri-

buted to a small reduction in the fare from Drogheda a few weeks before the season commenced; which reduction was industriously made known in all the towns through which the stream of labourers was likely to pass in its progress from the west.’”—HANCOCK, *On the Condition of the Irish Labourer*, p. 8.

So reported the Census Commissioners of 1841. The testimony is confirmed by those who have since known the Irish labourers face to face. “You may tell my friends,” said a benevolent and wise settler in a remote part of Connaught, to a traveller,—“you may tell my friends in England, that I am not in any one respect disappointed, and in some agreeably surprised. I find, perhaps, somewhat less truthfulness than among the same order of neighbours in England; and I have met with an instance, here and there, of dishonesty; but not more than I should expect anywhere. And I find, to my surprise, that my neighbours are not only very industrious, but very provident.” And he went on to tell how hard they worked, and how rapidly they saved. Where they put their money, he did not know. They did not put it into his hands, nor, he believed, any other man’s. It requires the lapse of generations to do away with the suspicions engendered by tyranny; and the gentry are not yet the bankers of the labourers; but the money was somewhere—whether in the thatch, or in an old stocking, or under a stone—and there was plenty of it—enough to carry many men to England once a year, and a good many more to America.

When everything was brought to depend on the potato—when that dependence was screwed up to the last degree of tightness—the potato failed. It was the potato that yielded the landlords their high rents, real or nominal. The farmers paid wages in potato-ground. It was for potato-growing that middlemen sublet the land as the only way of making it profitable. On the potato, the labourer staked his all. As the Central Relief Committee declare,

“The labourer thus became a commercial speculator in potatoes. He sunk his capital in manuring the ground, and in seed. He mortgaged his labour for a part of the ensuing year, for the rent of his field. If his speculation proved successful, he was able to replace his capital, to fatten his pig, and to support himself and his family, while he cleared off his debt to the farmer. If it failed, his former savings were gone; his heap of manure had been expended to no purpose in preparing his field, and he had lost the means of rendering his pig fit for market. But his debt to the farmer still remained, and the scanty wages which he could earn at some periods of the year were reduced, not only by the increased number of persons looking for work, but

also by the diminished ability of the farmers to employ them."—*Transactions*, p. 9.

We hope that reason enough has been shown for the sad state of the Irish labourer, without throwing blame on the potato. The condition of the land and labour market exhibits but too much reason for the people eating the food they could most readily lay hands on—and that food was the potato. Their becoming addicted to it was the effect, not the cause, of their poverty. They became as fond of it as people always are of the staple of their food; but there is abundant evidence that their tastes enlarge with experience, and that there is no natural obstacle to the Irishman becoming as good a beef-eater as his English neighbour. When the Indian meal first came over, it was not so good as it is now. Its transmission and management were not so well understood. In at least one workhouse orders were given to wet it, as a precaution against its being sold; and this made it as hard as mortar, and sour. It was a trial to the weakened digestion of the hungerers to deal with any new food at all; and many who were dying before, were believed by their friends to have died of the new food. But all that was got over long ago; and Indian meal may now be regarded as an established article of popular food in Ireland. "O, ma'am," exclaimed a Connaught girl to a friend of ours, "I hope it will please the Lord to take me to Himself, before I have to eat turnips." Soon after, she was glad enough to get turnip-tops; and now, when authorized to return to potatoes, she and her neighbours, while very glad, find they like to have meal too.

It would be mere cruelty to afflict our readers with details of the famine. If it should, unhappily, be ever necessary to recur to that dreadful history, for warning or guidance, it may be found, told in the most noble manner, in the volume of "*Transactions*" before us. "Noble" is the word for this remarkable volume. It is noble in its uprightness, in its simplicity, in its wisdom, in its benevolence—at once earnest and calm. We wish that the sentimentalist and the misanthrope, the sceptic and the enthusiast, the self-seeker and the agitator, would read this book and take a lesson. Its earnest conscientiousness may be a lesson to us all; and we are sure that its unconscious revelation of the goodness that is dwelling in the midst of us, ought to be a comfort to us all. Rich and rare fruits came out of the famine itself; and here is a feast of the richest and rarest. But the pain must be taken with the good; and here may be found details of misery to which we may refer, but which we shall not quote.

Nothing like this distress was anticipated when the Poor-law was framed. There was no adequate machinery for dealing with a whole starving population. The houses were many miles apart. There were, as we have said, no food-shops in districts where the people had not been accustomed to buy their food.

The priest of either church found himself alone, in the midst of the famine-stricken—left to deal single-handed with the calamity. And now (of all times!) was felt its full bitterness, the misery created by the protective system, just then expiring. Under that system, a factitious encouragement had been given to the growth of wheat, for exportation to England; and not only had the growth of green crops, flax, oats, and barley, been discouraged, but the importation of various kinds of food, and their distribution through the country, had been artificially hindered. When the hour of need came, nothing was ready. Food had to be hunted up on foreign shores; vessels could not be had for less than double or treble the ordinary rate of freight. "We are unable," wrote an American, "to send you all the food you require, for want of vessels. It is heart-rending to think that, while our granaries are bursting with food, your people are starving." And when it arrived, who was to distribute it? If the Government did, this was ruin to the trading interest, to the small specimen of a middle class which could not be injured without accelerating the ruin of all. If the merchants and shopkeepers went down, all was over. The Government interfered as little as it could, without letting the people die unassisted. They sent their supplies to the west, where scarcely any trade in food existed at all; and from their commissariat dépôts, food went forth in the least objectionable manner then possible. But, as the Committee declare,

"It had doubtless some effect in retarding the growth of a new trade in those very districts where it was most required. Any administrative interference with the natural course of commerce produces an apparent necessity for its continuance. The original restrictions on the importation of corn led to the interference in 1845; and the interference in 1845 rendered some repetition in 1846 almost unavoidable."—*Transactions*, p. 22.

We have not forgotten, it is to be hoped, the vast munificence of the Americans, during the whole of that awful time; nor the generosity shown wherever the story of a nation's hunger was known. "Our difficulty," says one of the benevolent agents, "was not that there was not food enough for the people, but that we could not get it to them

in time to save their lives." It appears, indeed, from what the traveller in Ireland now hears as he goes, as if there was nothing for it but visiting every house with gifts of food. As this could not be done, the people died in their cabins, and lay there till the roofs tumbled down upon their bones, because there were none to bury them. A gaunt man, trembling from exhaustion, made his way to the commissariat window, through the groaning crowd of hungerers, with a basket on his shoulders, and another on his breast, and a dead child in each. A lady, crossing through the long grass of a field, found a dying child half-hidden there, alone. A stranger, travelling for benevolent purposes, with a guide, proposed to ask a question at a house by the road side. There was no answer to the knock. They went in, and found the corpses of the man and his wife on one bed, and of the two daughters on the other. The parents had been some time dead. Of the two pretty young girls, who lay close together, one was yet warm. What a last hour must hers have been! But no more of this! Suffice it, that these were the scenes common over all Ireland, and justifying the saying that, owing to the effects of the then expiring Corn-laws, no adequate relief could possibly be given, otherwise than by ministering from house to house—for which no machinery existed. Something like this was the adversity which Peel foresaw when he delivered to Parliament the evidence collected by the agents sent by Government to Ireland. It should be remembered now, how the Disraelis, and other protectionists, then scoffed at the evidence of impending famine in Ireland. They called it a *ruse* of Peel's—a threat—a fabrication. They resisted an amount of evidence which should have sealed their lips, and softened their hearts, and humbled their pride. Men who could use the woes of Ireland as they did, to wring the great statesman's heart, and insult his name and maintain their selfish policy for another term, can never again be worthy of a nation's confidence. Whether they were destined to be converts to Free-trade or not, the men who showed themselves so devoid of integrity, reasonableness, and heart, as the Protectionist leaders, during Peel's exposition of the case of Ireland in 1846, can never be fit to rule a nation that has a conscience and a heart. It is not quitting our subject to say this: for there is a very close connection between the advocacy of Protectionist principles and the state of Ireland in 1846—a connexion which it is, as yet, much too soon for us to forget.

The money-value of the lost potatoes and oats of 1846 was reckoned by the Government at sixteen millions sterling. The first step

towards relief was taken at Calcutta, where, on the earliest hint of probable distress, 14,000*l.* were raised. Nearly a million and a half was contributed by associations at home, central and local. Government advanced nearly ten millions. Irish emigrants sent home, from America and elsewhere, in the course of 1847, 200,000*l.* Year by year, we may remark, that species of remittance has increased, till it reached, last year, the amount of 1,000,000*l.* The Americans sent food to the value of 133,847*l.*, besides tens of thousands of pounds in money. "The supplies sent from America to Ireland," say the Committee, "were on a scale unparalleled in history." This also is a fact which it will ever be too soon for us to forget. Then came the unfortunate mistake of the Public Works test—the roads, yet unfinished, where haggard men were sent to faint away, in proof of the reality of their need—roads which are now shut up and grass-grown; unfinished, and sadly premature if they were finished. Then came the dropping dead at the gate of the workhouse, or within the doors; and the opening of auxiliary workhouses, where fever patients lay three or four in a bed; and the coffins could not be put together fast enough; and death made a repeated clearance, only to have the space filled again. Then were landlords compelled to lock themselves within their gates, because they could not pay their rates,—some of them even being glad to have a bag of meal dropped in the night at their own backdoors. Then was seen the strange spectacle of the representative of an ancient family, lately a justice of the peace, presiding in his own mansion—not as host—but as master of the workhouse, with his own children there as paupers. Then did every kind of animal disappear from the road, even the donkeys: and a horrible stillness reigned when every living thing had been eaten. Then did the jobbers come forth, and make their profit out of the misery. A man here and there committed the bull of riding on his own handsome horse to fetch away the meal he meant to beg and then sell; but the owner of fifteen cows drove them up among the hills before he put on his pauper character. Then did the good Quakers, and other friends of the suffering, spread their network of communication over the land, and "lift up the hands that hung-down, and strengthen the feeble knees." Then did those excellent men toil and strive,—not only to feed the hungering for the day, but to prepare a better lot for their future years. Here, they set the people to fish, there to grow root crops; here to spin or embroider,—and there to preserve, if possible, the quarter acre which precluded their claim to legal relief. After

appeasing the immediate hunger, their aim was to foster industry, and guard trade, and multiply resources, and discourage selfishness, as much as despair. It was not to be expected that their farms and their fisheries should flourish at such a time, or at any time,—seeing how fatal corporate management is to industrial enterprises; but nobody will question their funds being well spent, in supporting life and hope, whether the result in money was profit or loss. Now was the time when another change of incalculable importance was begun. In some wild parts of Connaught, a Quaker must have been a new sight. “I believe,” said one, the other day, “they think us very queer people.” Something of an angelic light must have beamed into dim eyes, from under the broad brim—some heavenly tone must have sounded through the plain speech—when the strangers entered the desolate places, to see whom they could aid, and to speak of better cheer. Some—many—of the people’s own priests did likewise. Some had no longer a horse, and could not, therefore, go far. Some were hungry and poorly clad, and all the good were overworked; but there were many who did all they could. Many there were who did not. After all due allowance is made for unreasonable expectation, on the part of the people, and for the fretfulness of anguish—after all due allowance for the sufferings of the priestly class itself, it is impossible to avoid the persuasion that very many showed themselves hard, selfish, and insincere in their ministration. They had brought up the people in the belief that salvation depended on the performance of the last offices; and their neglect and refusal to perform those offices is, in the minds of the people, an established fact. Whether they are right or wrong, so they believe. They had always paid the priest before everybody else,—paid him for his blessing on every article of their furniture or dress,—paid him at the chapel,—paid him in their homes,—paid him by the road side,—paid him while they had anything left; and now they say that calling him to dismiss in peace the soul of the famishing, he refused to come, or neglected to come, because they, this time, could not pay. They say now that “the priest is no good where there is no pay.” Whether this judgment is just or unjust, such is the popular judgment in a multitude of cabins in the west; and the fact is of vast importance, as will be seen hereafter. Meantime, the apostles of that season did their work without a word of claim on either hand. Here is their notice, pathetic in its calmness, of their martyrs:—

“At an early period of the distress, fever and

dysentery, the usual attendants of famine, had appeared, and continued very prevalent throughout the year. The fever was peculiarly fatal among the upper classes. Those who had exerted themselves in the relief of suffering were most exposed to contagion; and thus the best and most tried were lost at the time when their services appeared to be increasingly required. Others sank beneath their own unceasing, though fruitless, efforts to relieve the suffering which they daily witnessed. This mortality greatly increased the difficulty of procuring suitable administrators of relief, and we had to deplore the loss of many of our most valued correspondents.”—*Transactions*, p. 65.

Under the Temporary Relief Act, which began to operate in June, 1847, the daily issue of food amounted, before the harvest, to rations for above three millions of persons. Then came the harvest; and then followed the amended Poor-law, by which great relaxations in the ordinary principles of the law were permitted, in accommodation to the needs of the time. Out-door relief was allowed even to the able-bodied poor, till a natural state of society should be restored. Then the charity funds, rapidly becoming exhausted, were no longer applied in the distribution of food, but in clothing, in seeds and implements, in raw material for industrial employments, and in aiding the holders of small lots of land to hold them on till the crisis should be past.

It was over at last. The visitation left the condition and prospects of Ireland entirely changed. The oracular personages who had held forth all their lives about over-population, suddenly found themselves compelled to silence, and to observe what was to be seen before venturing to preach again. Perhaps they see now that what they called over-population was simply under-production; and that if there had been manufacturers and a middle class in Ireland, with a free trade in food, the famine could not have happened. The same, or a greater number of people might then have been fed, under any failure of a particular crop. All that set of considerations was now over. It is believed that about a third of the population has been carried off by the calamities of the last few years, and emigration removes more than a quarter of a million a year. But the reduction of capital was found to have kept pace with the reduction of labour, and most forlorn was the aspect of the land. The lowest order of dwellings had disappeared, or nearly; and of the next, the bare gables stood up, dreary monuments of the calamity gone by. Wide tracts of land were falling back into waste, and for miles together scarcely a human habitation was to be seen. Where men were at work, it was for sixpence a day, or perhaps

digging a stony soil for 7s. an Irish acre; at which rate a good digger might earn 4d. a day—a rate of pay for which no man can dig well for want of sufficient food. The women were earning more than the men, at embroidery, knitting, crochet work, &c. We know of one family of ladies who pay away at this time £80,000 a year to women who do crochet work in their own cabins, the work having now attained the beauty of point lace. The burden of the family maintenance was found to have devolved upon the women, in many parts of Ireland—a strange and fearful spectacle in itself. Another was the overproportion of children. In Cavan workhouse there were 800 young girls at the close of the famine. The priests went afoot now, and their coats were rusty, and their demeanour subdued. The landlords' gates were closed, and their drives grass-grown; and the receiver came and went, instead of the family residing. The removal of the millions who were gone left a clear space on which the real questions of the country and the time stood forth conspicuously. These questions were at once seen to be, what they are now,—the land, and the churches.

The first thing to be done was to establish a free trade in land, that land and other capital might find their way to each other, and labour obtain due scope and reward. The first step towards this was to let out the land into the market; to make it purchasable at all. How well this has been done by the Incumbered Estates Act, the world knows. The burdens have been transferred from the inheritance to its price; the costs of sale have been reduced to a comparative trifle; the title has been made accessible and indisputable, and overgrown estates have been divided into manageable portions. The benefit is vast. The old landlords, humbled by long and too severe reproach, and then by calamity, had not the pride of a former generation; and their mortifications cannot but be largely compensated for by their relief and present freedom. If they have lost some ancient honours, they have slipped their bonds. At a recent date, the amount of sales effected through this court was nearly seven millions and a half; and the process is in full activity. One remarkable fact in connexion with these sales is the very small number of other than Irish purchasers. Desirable as it is that there should be a greater fusion between the inhabitants of our different islands, and that Scotch and English farming should be well planted down in Ireland, we cannot but rejoice that the Irish have ability to buy their own fields, and that some of the capital so unnaturally locked up in the imperial funds should now sow the Irish soil, and yield its

harvests where it ought. One circumstance we are sorry for; that the Friends, who have done so much for Ireland, cannot be purchasers in this court. The Tithe commutation is an insuperable obstacle. They would make such admirable settlers and employers, that it is a matter of regret that they are excluded from this class of purchasers. Of the buyers, many are, no doubt, the mortgagees, and some are the owners, who take this method of shaking off their burdens, and beginning with a small but clear property. But, whoever they may be, the purchasers must mean to do something with their land; and this is the grand point—the land being brought into a useable state.

If the Incumbered Estates Act stood alone, it would render great immediate service, but leave the country subject to the return of the old mischiefs. It has been followed up, therefore, by other Acts, and will be by yet more. Irish judgments now attach only to the lands to which they relate, instead of extending over so many claims as to embarrass the ascertainment of title. They are now of the nature of a mortgage. Indexes of land, based upon the Ordnance Survey, are now provided; and original deeds are to be deposited instead of memorials; and the process of investigation into title is simplified and made secure. The power of leasing is greatly expanded, and its expenses are reduced. Moreover, the suffrage of the tenant is now made independent of the tenure of his land. This not only severs a bad political connexion, unfavourable to the granting of leases, but much more than doubles the constituency, which had sunk very low. Still, other improvements are needed to facilitate dealings in land; and all Ireland, and we hope a good deal of England, is looking with eagerness to the further reforms promised by the Irish Attorney-General for the present session of Parliament.

What, then, is doing on Irish land?—so much of which is thus set free. To look at the worst symptoms first: certain landlords, and not a few,—landlords of the kind that have brought down so much reproach on their whole order—are indubitably trying to bring back the old state of things, for the sake of their own pride and profit. Such men are sneering at manufactures, and crying out for a restoration of the Corn-laws. They disbelieved to the last moment, this year, in the failure of the potato; and, when compelled to believe it, they used their utmost endeavours to conceal the fact. They discourage emigration, lest wages should rise. They favour, to their utmost, small holdings, and sub-letting, and potato planting,—knowing that they can never again enjoy their old rents but by this method. They refuse leases

to skilful farmers, and are pleased to see the finest pastures, even in the shallow limestone bottoms, broken up for potato patches. Another set of landlords are those who, well nigh impoverished, are giving up all thoughts of tillage, except such as is required for the winter feed of stock. Their tenants are gone, without having paid rent or rates: the farm-buildings, always wretched, are crumbling into ruins; nobody applies for their farms, or only on terms which they cannot grant. The wages of labour are rising, continuously, if not rapidly. The men who had 6*d.* a-day are not content with 9*d.*, and ask 1*s.*, and they talk of having another 6*d.* next year. The men are right; but the employer cannot take them on,—at least till he has augmented his capital. He lays out what he has in stock, throws his farms together into a great grazing ground, and finds two or three herdsmen enough on land which, under tillage, would occupy a score of labourers. These landlords are unpopular; but what can they do? The people vilify the fat cattle that flourish where men have pined and died; and they claim to be employed. But some of them will go away; and the others can, as the case shows, get work at rising wages. Another class are the purchasers of the old estates; some of whom are managing, by skill, care, and benevolence, to support the whole population on their lands, without a threat of ejection, and with substantial help towards emigrating, if it is desired. These, though in the districts where the people shoot landlords, seem to be as secure as the English merchant in his counting-house. And so are the new settlers, Scotch and English, who take farms, or break up new ground, or set up peat-works or salt-works. Not being involved in old or political feuds, and setting out on the supposition that wages will rise as rates fall and the people depart, they begin, with a good grace, to pay well. They say, that they meet with no difficulty while they make a point of good work, stick to their own business, ask no man what his religion is, and pay wages regularly in cash. When these settlers, or any other cultivators who understand their business, have fairly introduced the practice of good tillage into the soil of Ireland and the mind of its inhabitants, we, or the next generation, may hope to see a great extension of the proprietary class of landholders. At present, it is much too soon for a peasant proprietary; and the extension ought to be, and must be, very gradual. Before the famine, the number of landowners was smaller, in proportion to the land, than in any part of Europe except Spain. The number for all Ireland, was supposed not to exceed eight thousand—eight thousand pro-

prietors of land in a population of more than eight millions! Through the division of overgrown estates, now going on,—through the intermediate process of leasing,—through the establishment of tenant-right, of some kind and degree,—through the natural demand for agricultural products which must arise from the spread of manufactures,—and through the increasing tendency to regard the tillage of the ground as a food manufacture,—men will become qualified to deal properly with land, and therefore to possess it as their own; and, by that time, land will be no more difficult to buy than other raw material. That time is a long way off; and much has to be done in training the people to the practice of good tillage: for nothing can well be worse than the spectacle of Irish fields and pastures as they stand now. The time may come when they will be like the Scotch, where, within a walk of Edinburgh, may be seen the highest perfection to which the food manufacture has yet been brought. There lies the land, rich and various; there are the people, no longer too many; there are the new possessors, bringing in new methods; there are the government and lawyers, throwing open the sale of land by facilitating its transfer; and there is the absentee capital, flowing back steadily, though not very fast, and bringing plenty more after it. Every pound of such capital, flowing back into Ireland, represents a particle of a middle class which, thus deposited, will become fruitful,—filling up the wide space between the barren heights of landlordism and the engulfing floods of pauperism.

So much for the one grand feature in the condition of Ireland. Now for the other—the churches.

This used to be considered a very old subject. People were tired of it before Catholic Emancipation. But it has suddenly become a very new one. There is a fresher interest about it now than there was when King James was galloping away from the Boyne. The complaint against the Protestant Church in Ireland has always been that it was not a missionary church, and that it was therefore a mere imposition upon the Catholic nation. It was quite true that, at first, there was no attempt to convert the Catholics, but only to subdue them; and that afterwards, it was found impossible—as was natural enough—to make any impression upon those whom we had handled so roughly at the outset. It is no longer so. A fever of zeal has taken possession of a portion of the Church, and conversions, of various quality, are going on with a rapidity suspicious enough to leave no excuse for disappointment in the probable case of reaction. The impression of dispas-

sionate observers on the spot seems to be little more favourable to the Protestant Church than before, since events appear to show that that Church either does nothing or breaks the peace.

Here and there may be seen a Protestant clergyman, rich, and living in a good house, with his pretty church within sight. He is beloved by his neighbours, who cut his hay to the neglect of their own, and look glad when they meet him in the road. He is a farmer and good neighbour all the week. On Sunday, he preaches to his own household, and perhaps half-a-dozen more. It is as a neighbour that he is beloved,—his clerical character being forgotten; or, if the people are told of his fine income as priest of heresy, they forgive it in their thankfulness for his letting them alone. Here and there may be seen a Protestant clergyman, once filled full of the true spirit of a missionary, but now, disappointed and forlorn, baulked of sympathy, and wounded by exclusion, finding nothing to do, and only too much to feel, sunk into bad habits—even suspended for intemperance. Painful as this fact is, it is fact. The answer in Ireland is, when one asks whether the thing is so,—“it is just the same with the priests.” Again, here and there—in many places now—may be seen the Protestant clergyman in the missionary character, the busiest of men. There are not only prayer meetings, and school meetings, and missionary meetings, but every transaction in life is to go forward “on true Protestant principles.” Crochet and embroidery are no longer to be taught but in connexion with true Protestant principles: bibles and tracts are, on the same principles, to be laid on every table in inns and public buildings: the clergyman, in asking a blessing in public on his boiled egg and bread and butter, intercedes for the downfall of Popery. If a passionate priest works himself into a rage, at the altar or on the highway, and a fit of apoplexy is the consequence, the clergyman hastens to point out how Heaven acts on true Protestant principles in dispensing its judgments: and little children have their mouths stuffed full of texts, to spit in the face of the priest—all on true Protestant principles. In the strength of the same principles, the missionary gets up again, when knocked down in the street, sees himself burned in effigy, and affixes to the priests all the terms descriptive of Antichrist that he can cull from the Bible; and on the same principles, he “deals plainly with the people in search of a blessing,” saying, “If you listen to the priest, you will be damned.” He is not always aware that the priest follows him, saying, with the same “plainness,” “If you listen to that

man, you will be damned.” And, perhaps, neither is aware that the natural effect upon the people is, first, perplexity and terror, and then a sly defiance of both zealots. Threatened with perdition on both hands, they think that there must be some mistake, and doubt whether there is any such gulf at all. Or, the same superstition which made them slaves to the priests before, makes them anything but disinterested disciples now. They “love Jesus” warmly enough for a time. His name relieves them from the horror of their relations having died unannealed in the famine. He will preserve their potatoes,—and they saw that the priest could not,—for the priest’s sprinkling the potatoes with holy water did not do any good (even though salt was prudently used also); and, in truth, their new faith gives them, if not a good potato crop, plenty of work and Indian meal. We do not suppose that the charge of open and shameless bribery—of intentional bribery at all—brought against the missionaries, is true. The standing rule of the body is to apply its resources only to the spiritual wants of the people. They say, however, that they do not presume to interfere with private charity; and private charity cannot, and need not, resist the appeal of converts who show that the Catholic employers of the neighbourhood will not give them work, and that the priest is bent upon their ruin. Work and food must be found for such, and ought to be; but, then it throws a suspicion on the spiritual character of the movement, that the converts rise in the world by it. Priests denounce from the altar the Jumpers (as the Connaught converts are nicknamed), who, in the actual words of a priest at Achill, “are justified by stir-about and redeemed by porridge.” A short extract or two will give an idea of the state of things, according to the view of the Mission Society itself.

“In the district of West Galway there are now between 5000 and 6000 converts in connexion with this Society, where in 1840, not 500 Protestants were to be found. . . . In this district of the country upwards of 3500 children are daily attending the mission schools, and are instructed in the Scriptures which they delight to read. These often prove a blessing to their parents, in conveying from their schools the information they receive, whereby many of the aged and infirm have learned the way of salvation; thus, out of the mouths of these babes has God perfected his praise! They are each of them, more or less, ‘able to give him that asketh a reason of the hope that is in them.’ On asking a girl in the Streamstown school-house, ‘What is it to believe in Christ?’ the reply she made would put to shame many more advanced, and under greater advantages from their youth. She said—“It is the Spirit of God moving the soul to lean

upon Jesus, and trust Him for salvation? Would to God this explanation of what faith in Christ is were apprehended by our young and old! In visiting these stations in the far west, one cannot but observe the decrepid and famine-stricken appearance of many; yet the eye brightens up, and the whole countenance changes when Jesus and His salvation is the subject of conversation. The eagerness and facility which they exhibit in finding out passages of Scripture is remarkable, and nothing they delight in more than holding a controversy with their priests and neighbours, concerning the way in which a sinner can be saved."—*Sketches, &c.*, p. 23.

They are "ready;" they do delight in these conflicts, these shrewd and excitable Irish children. And it is true that they do perplex and confound the priests. The traveller asks himself which is the most disgusting and mournful sight,—a controversial child provoking the priest, or the priest, the people's guide, who can be foiled and exasperated by a voluble child? The controversy too often ends in the priest's laying his horsewhip over the little creature, or knocking it down with a box on the ear, followed up by his shouting aloud words of this sort: "The curse of a mother's broken heart be upon you! May God Almighty scald your heart in your dying bed, and command your soul to the lowest pit of hell!" We shall not be supposed to have drawn on our imagination for these words. They were actually used by a bishop to a convert, the utterance of the curse being preceded by an exhibition of the apostolic ring.

"The influence and power of the popish bishop and his emissaries," says the Sketch, "is, however, daily on the decline in districts where the Reformation has gained ground. In the town of Clifden—where Mr. Dallas was burned in effigy—Mr. D'Arcy, the magistrate, struck in a mob consisting of at least a thousand persons—the Rev. Mr. Kilbridge knocked down, and nearly murdered—and about 400 or 500 children cruelly beaten with sticks and stones—all which happened in or near Clifden in June, 1850—so great a change has taken place within the short period of a year, that when Mac Hale, their 'archbishop,' was actually in town, in June, 1851, with a body-guard of 'Italian Police,' not an insult was offered towards the Protestant Bishop Plunket, Mr. Dallas, or his party, in Clifden at the time."—*Sketch*, p. 26.

Dr. Mac Hale was somewhere else this last summer, where matters did not go off so quietly. He was visiting Achill; and there, as soon as the great brawler was gone, the little brawlers began to do like him. The reports of the petty sessions have since shown the consequences. There was, besides all manner of private railing between the Mission and the Papists, a riot at Keel, when two Scripture

readers were mobbed, and a priest incurred a trial and a penalty of 5*l.* Such is the condition of the religion of peace and love in Ireland just now. Our short extracts show something of the offensive temper and manners of the missionaries; and we have nothing to say for the priests. The natural tendency, in regarding such a case as that of the Irish Catholics, is to side with the weaker party—to disbelieve the bad, and think the best to the last moment. That last moment, however, is that of setting foot on the Irish coast. On the spot it is utterly impossible to think well of the priests and their influence. After traversing the whole island, the observer has seen, perhaps, scarcely any one who looks even human. Their very preparation for office consists in extinguishing human affections, while the passions seem to be exasperated by the process. It is painful enough to see in Italy the priests who go about in couples—the fat and thin, the jolly and ascetic; but it is worse to mark the two Irish classes—the brutes and the devils. These are strong words, but they convey our impressions; and, in considering the ecclesiastical condition of Ireland, it would hardly be right to disguise those impressions. There is plenty of material for forming a judgment for those who wish to do so. Let them look back to the part the priests took in the elections of last summer; let them read, not only the writings of John of Tuam—who may be considered an exceptional personage—but the *Tablet*, the understood organ of the body, for the last year alone. Let them go to South Inniskea, the island which is almost in view from the missionary field of Connemara, and ask for the stone pillar which the inhabitants worship. There, within the diocese (we believe) of John of Tuam, is the stone pillar which is annually dressed in new woollen by the old woman who acts as priestess, and to which the people pray for weeks. This, and the locks of hair hung on trees for offerings in various holy places, and plenty more such horrors, will show to any body who wishes to know what care the Romish Church takes of her children, and how far she has saved them from what she calls the 'perdition of heathenism.'

What are the prospects of the two churches?—and of Ireland in connexion with them? There is no question about the weakening of the power of the Romish Church—not only among the few thousands of recent converts, but over a wider area. In inquiring, for instance, into the responsibility of the priests in regard to Ribbonism—in inquiring whether they must not necessarily know, through confession, of every Ribbon conspiracy, one is told—"By no means. There is no doubt that they might, if they chose, put a stop to

secret societies; but as to knowing of special plans, they know little more than any body else, as men now very seldom confess. Women do; but the mortal sin of neglect of confession is very lightly and generally incurred by Irishmen now." Will Catholicism long sustain itself, in the presence of such a fact as this?

We have a strong impression that Catholicism will profit by this conversion movement. If it is to die out, it will die out less fast for this. The movement is not a healthy one, and it is manifestly of a temporary character. It is quite certain that the hearts of many "converts" are still with their priests and their old ways; and many will do what Gavan Duffy proposes—but with more sincerity—"go back to the old holy well." Of the many who will not do this, we do not think the greater part will belong to the Protestant Church under any form. Our expectation rather is that, in an age when the Protestant Church cannot hold her ground elsewhere against awakened inquiry, she will not do so in Ireland; and that the cry in the next generation will be about "the great spread of infidelity." This is the common and natural result of such mutual hatred and denunciation as exists between the earnest members of both churches in Ireland. Any one who reads the *Tablet* on the one hand, and the Tracts issued by the Protestant Mission Society on the other, may judge for himself whether the conclusion of a rational generation must not be that all who so vituperate must be wrong—the one party as much as the other. What will be done with church property in such a state of things, each thinker may debate for himself. If we set to work to wish, we should probably wish for a revival of the Appropriation enterprise;—for the application of all church property left over and above the reasonable needs of actual worshippers, to educational and other moral and intellectual purposes. Meantime, we cannot but see how partial must be the improvement of Ireland while this conflict of the churches is going on. In the great Dublin shops, where the shopmen are Ulster Protestants—as violent as Mac Hale, and as ignorant as his priests—there is talk behind the counter and in the evening club, of "wading knee-deep in Catholic blood." In Sligo, the priest obtains the name of the Clerical Skull-cracker, from instigating a street-row, for which he goes to jail. In Mayo, Scripture readers, who are not clergymen, and are sometimes ne'er-do-wells, mob young women who listen to the priest rather than become "Jumpers;" and in Clare, three priests lead on the mob to stone soldiers in a narrow lane. In the rivalry of oratory, there is no saying which

excels,—the Orangeman who utters his opinion of the Catholic clergy, or the priest who, from the altar, denounces the landlord, threatens the electors, and hints to the peasantry what to do to the neighbour who refuses "to vote for God." And there seems no hope of a subsidence of this hatred through lapse of time. The Catholic priesthood is certainly more offensive than it was,—stirred up from Rome (which some of the wisest of them lament to safe hearers), and exasperated by new opposition and by poverty. Very poor they are; for the people who died in the famine and fever were their most lucrative disciples; and they are growing daily poorer from the emigration of their flocks. And the Protestants, even some of the best educated and the most liberal in politics, are saying that there is nothing for it now but a tooth-and-nail fight with the Romish Church. They believe that the people can never prosper till Romanism is cast out, and they point to the contrast which exists between certain continental peoples, and which they ascribe to their respective Protestantism and Catholicism. Those who have seen how industrious and prosperous Catholics are in the United States and in the plains of Lombardy, and in the Vale of the Arno, and, we may now add, in districts of Ireland, settled by just and peace-loving gentry, will insist that it is not the Catholicism, but something else which makes the misery of Spain, Sicily, and Mexico. But the Irish Protestant gentry do not think so; and they are for theological war: We confess that, looking at the kind and degree of disqualification and disgrace on both sides,—at the bad quality of the Catholic priesthood on the one hand, and the unjust exaltation of the Church of the minority on the other,—we regard the religious quarrel as the most melancholy and the most thoroughly discouraging of the woes of Ireland.

It is cheering, to a certain extent, to rest on the hope held out by the National School system,—the brightest symptom of Irish life at present. The Dublin schools are a glorious spectacle; and there it is found possible and easy for Catholics and Protestants, at the very age of the theological passion, to live together on good terms. The teachers who are in training there, from the age of seventeen to five-and-twenty, have no quarrels about religion, though the Catholics and Protestants are in about the same proportion there as throughout Ireland. If this could last, while half a million of children are going forth from the National Schools, to spread themselves over the land, we should have great hope of the subsidence of the theological mischief. But this would imply such a decline or local extinction of the Catholic Church as

we have little reason to expect. It would imply this because, as we all know, the National School system is abhorred, as are the Queen's Colleges, by the Catholic authorities and their ignorant ministers; and there are tokens at present of renewed vigilance and aggravated hatred which make us dread a break-up, after all. It is a satisfaction to see that Lord Derby's government does not mean to meddle with the school-system. We earnestly hope that the Protestant supporters of the schools, who have shown their benevolent zeal by great devotedness, will incessantly remember how much more important it is to preserve the school-system in its strength and integrity than to make Protestants of any score or two of the pupils,—giving opportunity to the priests to complain of encroachment on their domain.

We have enlarged upon the two great causes of Irish misery,—the condition of the land question, and that of the ecclesiastical controversy. The worst mischiefs of the land question are over, or are doomed. The worst mischiefs of the ecclesiastical question are in full force. What is there to be seen besides? The Repeal agitation is over; and, except at election times, other political agitation, though the priests are ever ready to revive it. Tillage is improving, wages are rising, the work-houses are becoming disburdened, with a fair prospect of further and sufficient relief when the weight of infirmity and orphanage left by the famine is naturally disposed of. Education is raising the next generation to a fitness for a better fortune. The institution of Schools of Design in Dublin and Belfast points to an improvement in manufactures. There is something better even than all this. The education of children seems to be reacting on the mind of adults. The tone of society, in town and country, is so changed, that the Edgeworths and their contemporaries would hardly know their own country. It is a great thing to observe that literary societies are on the increase, and that reading and discussion are taking the place of shooting and drinking. But more striking still is the condition of two new societies, whose success shows how earnestly some of the best minds are engaged in searching into the causes of Ireland's misfortunes. The Dublin Statistical Society has been established only five years. It is so flourishing as to be able to send lecturers,—gentlemen of high qualifications,—to deliver lectures in a circuit of provincial towns. Out of it has sprung another,—an Association for Promoting Scientific Inquiry into Social Questions. Out of these has come some of the reform in regard to the laws of land already attained, and out of them will come much more. To them we owe, directly, Professor

Hancock's small but highly important volume, whose title stands at the head of our article; and Dr. Longfield's Report on the Land Question, and Dr. Lawson's on the Patent Laws. Mr. Pim, who was considered by Sir R. Peel the highest authority on Irish subjects, and whose work ought to be on every statesman's shelves, is one of the fraternity; and so is Professor Hearn, who wrote the Cassel Prize Essay on the Condition of Ireland, while teaching Greek in the Queen's College at Galway. If we were asked what practical measure we should suggest, and most earnestly desire for the benefit of Ireland, it would be to send as many as possible of these gentlemen to Parliament. If we could see Professor Hancock and Mr. Pim in the House of Commons, in the place of any two ranters who may be found there, and Drs. Longfield and Lawson instead of the bores, we should consider the regeneration of Ireland the most probable event in the world. Any large constituency which should send them to the National Council would virtually declare their country saved, by choosing for their representatives men who can so well instruct the Imperial Government how to save her.

ART. III.—CHARITIES, NOXIOUS AND BENEFICENT.

*The Charities of London.* By Sampson Low. London. 1850.

THERE is much in the aspect and the tendencies of our age and country that is encouraging and gratifying. We are receding fast from the barbarism of former times, both in practice and in legislation. As a community, we are awakening to a far stronger and more general sense of the claims and dues of all classes. We are beginning to estimate our objects and possessions more according to rational principles and less according to conventional formulas. We are learning to look rather to the essentials of actions and enjoyments, than to the adventitious and unreal qualities with which imagination and prejudice have hitherto invested them. We judge more by substance and less by shadow. We lead on the whole a more individual life than formerly, and are less the slaves and puppets of each other's breath. Fame is less to us, and achievement and acquisition more. We are a little reverting towards nature and reality. Fewer are willing to ruin themselves, in order to seem rich. Fewer are disposed to wear chains, in order that they may

seem to wield sceptres. Fewer are ready to pull down their house, in order to build their monument.

On the other hand, with our progress in civilization and intelligence, we have encountered many of its perils, and are lapsing into some of its disadvantages and drawbacks. We are getting soft; we are getting material; we are getting utilitarian and calculating. We are in danger of reducing everything to an arithmetical standard, and discarding everything that cannot show a pounds-shillings-and-pence balance in favour of its retention. We are too apt—at least a pushing, active, and increasing school among us is—to forget that there are things too high, too sacred, too great for calculation—things which the multiplication-table and the two-foot rule can neither estimate nor measure. We are in danger of being more swayed by material realities than by grand ideas; yet ideas are realities too. Interest is taking the helm which principle ought to hold. Where we formerly worshipped power, fame, and empire, we now bow down before the more solid idols of peace, safety, comfort, and wealth. But we are also in peril from another tendency, with which we are more immediately concerned in the following pages: we are becoming foolishly soft, weakly tender, irrationally maudlin, unwisely and mischievously charitable. Under the specious mask of mercy to the criminal and benevolence to the wretched, we spare our own feelings at the cost of the most obvious principles of morality, the plainest dictates of prudence, the dearest interests of our country. We are kind to every one except society. We find it easier and more agreeable to be generous than to be just. We shrink from painful subjects, painful scenes, painful necessities.

Under the old system of parochial administration, for example, mistaken kindness, a misty sense of duty, and bad political economy, had gone hand-in-hand in augmenting destitution, and demoralizing our peasantry, till the result of their joint efforts threatened absolute ruin to society, when the new Poor-law stepped in to arrest the evil. It did much; it would have done much more, had not blind charity—debased this time by an admixture of the worst political passions—interfered to prevent the free and full action of those thoroughly sound, though stern principles of right and justice, on which it was founded. It was perceived by the authors of that admirable measure, that the only way of discouraging pauperism, and promoting energy and self-reliance, was by rendering the position of the pauper less comfortable and less desirable than that of the independent labourer. It was shown—what it was

a reproach to our national good sense to think required a proof—that this was demanded by every consideration of policy and justice. But since it was necessary that the poor-house should be a substantial and weather-proof building; since it was essential to health and propriety that it should be warm and clean; and since it was impossible to feed the inmates so wretchedly, or to cook their food so ill, as in the case of the honest and self-supporting peasant, it became indispensable to the object in view to compensate these advantages to the pauper with some counterbalancing *désagrémens*, in the shape of confinement, labour, classification, privation of tobacco and other luxuries, &c. &c. It was at once seen, moreover, that paupers supported by the contributions of the industrious part of the community should not be allowed to propagate paupers at their leisure and discretion. It was admitted to be indecent to have married couples sleeping together in the public dormitory, and it was found simply impossible to provide them with separate rooms: man and wife were therefore separated in the workhouse. Then, it was obviously wise and right that the young and the old, the curable and the corrupt, should not herd together. It was necessary that children should be instructed and trained, so that they, at least, if not their parents, might cease to be willing paupers: the young were, therefore, classified together, and placed under proper control and tuition; and there began to dawn a hope of better days and worthier feelings. Forthwith, however, our benevolence took umbrage; it was cruel to separate parent and child; it was wrong to separate man and wife—"whom God hath joined together, let no man put asunder;" so the right of indefinite multiplication at the expense of others was broadly maintained. It was barbarous to force the aged and unfortunate into the workhouse (as most unquestionably it often was), so the law must be relaxed; out-door relief must be conceded; and the few hardships and restraints which still remained to make pauperism unattractive, must be modified or removed, till the very purpose of the original scheme was all but neutralized.

We are now just beginning to awaken to some of the mischiefs wrought by this ill-regulated tenderness. Alas for poor human nature!—our very amiabilities seem to lead us astray. The crimes of the virtuous, the blasphemies of the pious, and the follies of the wise, would scarcely fill a larger volume than the cruelties of the humane. In this world a large part of the occupation of the wise has been to neutralize the efforts of the good. Selfishness and benevolence have

been fellow-labourers in doing harm. It has seemed scarcely possible to attempt to do good without incurring the danger of doing a preponderating amount of evil.

There must, it is evident enough, be something intrinsically and fundamentally wrong in our system and principles of action, when such excellent feelings can lead to such deplorable results. It is well worth while once more to call attention to the point in which the error lies. In doing this, we are well aware that we are but treading over old ground that has been travelled by far abler expositors before us. But, alas! a path needs to be trodden very smooth, and made very plain indeed, before public opinion will practically and habitually walk therein.

To relieve distress, whether arising from accident or want, is not only the impulse of benevolent and cultured feelings, but a healthy natural instinct—an instinct which, in a rude and simple state of society, might probably be indulged with safety. But as we recede from this condition, as social arrangements become more complicated, and men grow more and more sophisticated, it soon begins to appear that our charitable impulses cannot always be followed without injury or danger; that to relieve misery is not always to mitigate or diminish it; and that to attack symptoms and effects only is a costly and clumsy mode of action. Then arises the second stage of awakened kindness—the desire to search out causes, origins and hidden springs, to cut off poverty and privation by drying up their source; in a word, to prevent misery instead of relieving it. At this stage many of us, theoretically at least, have now arrived. But our search is groping, unsystematic, and incomplete; our tenderness is too impatient to wait for the slow, but certain harvest of *radical* applications, and of wholesome principles. We not only shrink from administering the unpalatable medicine, but when administered, we interfere with its operations by anodynes and palliatives; in a word, we are still in a measure thoughtlessly obedient to the more instinctive promptings of our nature. Finally and slowly, and only after we have exhausted every form of benevolent error, do we reach the last form which ripened and chastened charity assumes, and learn and recognise—painfully, it may be, and reluctantly—that success in our object is only attainable when we shall have taught suffering and destitution to prevent themselves—when the cure shall have been found in the natural operation of the malady itself.

The charities of England, in extent, variety, and amount, are something perfectly stupendous. They have long been so. There is scarcely a conceivable form of human want

or wretchedness for which a special and appropriate provision has not been made. There is scarcely a malady to which the human frame is subject, scarcely a casualty to which it is liable, which has not a peculiar hospital or dispensary allotted to its victims. If people are destitute, they are lodged, clothed, and fed at the cost of the public, by a compulsory Poor-law. If they meet with accidents, hospitals and infirmaries without number are open to receive them. If they are afflicted with disease, the medical charities are endless and diversified, and easily accessible. Thousands of surgeons are willing and anxious to attend them *gratis*, for the mere sake of practice. If maternity comes and finds them unprovided, lying-in-hospitals and cognate institutions swarm around them. If a long course of vice has punished them with a loathsome malady, Lock hospitals welcome them and cure them. If they wish to emigrate, there are societies to help them. From the cradle to the grave, they are surrounded with importunate benevolence.

The following graphic sketch of the all-embracing charities of one of the most pauperized districts of the metropolis is full of instruction. It was given to the Commissioners of Inquiry in 1833, by the Rev. Wm. Stone, of Christchurch, Spitalfields, who describes himself as a clergyman concerned in the distribution of £8000 a year of charitable funds:—

“A young weaver of twenty-two, marries a girl of nineteen: the consequence is, the prospect of a family. We should presume that, under ordinary circumstances, they would regard such a prospect with some anxiety; that they would calculate upon the expenses of an accouchement, and prepare for them in the interval by strict economy and unremitting industry. No such thing. It is the good fortune of our couple to live in the district of Spitalfields; and it is impossible to live there without witnessing the exertions of many charitable associations. To these, therefore, they naturally look for assistance on every occasion.

“They are visited periodically by a member of the *District Visiting Society*. It is the object of this society to inquire into the condition of the poor, to give them religious advice and occasional temporal relief, and to put them in the way of obtaining the aid of other charitable institutions. To the visitor of this society the wife makes known her situation, and states her inability to meet the expense of an accoucheur. The consequence is, that she obtains from him, or under his directions, a ticket either for the *Lying-in-Hospital*, or for the *Royal Maternity Society*. By the former of the charities she is provided with gratuitous board, lodging, medical attendance, churching, registry of her child's baptism, &c.; by the latter she is accommodated with the gratuitous services of a midwife to deliver her at her own home.

1853.

"Delivered of her child at the cost of the *Royal Maternity Society*, she is left by the midwife; but then she requires a nurse, and for a nurse she is, of course, unable to pay herself. A little exertion, however, gets over this difficulty: she sends to the *district visitor*, to the minister, or to some charitable parishioner, and, by their interest with the parish officers, she has at last a nurse sent to her from the workhouse. But still she has many wants—and these, too, she is unable to supply at her own expense. She requires blankets, bed and body-linen for herself, and baby-linen for her infant. With these she is furnished by another charitable institution. Soon after her marriage she has heard one of her neighbours say, that she had been favored in no less than *five* successive confinements with the loan of a 'box of linen' from the *Benevolent Society*. She had accordingly taken care to secure the 'box of linen' for herself; and during her confinement she receives occasional visits and pecuniary relief from a female visitor of the charity. By her she is kindly attended to, and through her, or the 'district visitor,' she is provided, in case of fever or other illness, with the gratuitous services of the parish apothecary, or some other charitable medical practitioner of the district.

"At the end of the month she goes, *pro forma*, to be church'd; and, though perhaps the best dressed female of the party, she claims exemption from any pecuniary offering, by virtue of a *printed ticket* to that effect put into her hands by the midwife of the *Royal Maternity Society*.

"The child thus introduced into the world is not worse provided for than his parents. Of course he requires vaccination, or, in case of neglect he takes the small-pox. In either case, he is sent to the *Hospital for Casual Small-pox and for Vaccination*, and by this means costs his parents nothing.

"He has the measles, the whooping-cough, and other morbid affections peculiar to childhood. In all these instances he has the benefit of the *City Institution for Diseases of Children*.
