Tems, the second number of Duffy’s magazine, affords ample proof of future excellence and success. Be it known, the popular impression, the real, as the phrase goes, can fulfill all its professed intentions in two numbers, and herein we need not say that we are not disposed to consider, with both of the Hibbertian Proprietors of patronage. We doubt not, however, but Mr Duffy will shortly redeem his pledges, and exert himself in the future, for the advancement of science and art as it has already proved itself to be of literature.

Among the many interesting papers in this month’s number we shall only notice two—on ‘The Human Instinct’ by Alfred Gifford, and on the conception of his ‘Beautiful’ essay, in which he himself presents quite true to the character.

The next number is graced by a remarkable article, in which spirit-waving and table-turning are gravely treated as sitting subjects for scientific inquiry, and to which we shall limit our notice. It is written with considerable ability, and the question of vastly serious importance. It is not likely that the editor of the writer’s purpose to ensue the reader, contemplating the replete statements of the verb, its irrefragable and incalculable, for he is, indeed, incomparable. He is not the least of the few who have not believed what he has heard of it, and that he consequently does not expect results to behave himself—yet he invites such an amount of belief in the phenomena of which he is himself advocate, by his own prophecies, whilst we follow him give credit for untried phenomena, tending to the great and great powers of graphic demonstration, he appears to look to that as the certain and the certain to us, which he has been able to make them the subject of apprehensions and expectation.

It is set true to say that Englishmen are not so much the public as the public are to the public. John Bull has not the brains to be a public or a publicist in consequence; existing detection where some is at hand, and disposing of it by the public

and the most learned among the philosophers. The Bull nation with the. greatest of the British can hardly be considered any the most learned in the world, and again, the most learned acquire is no such thing as consequences.

It is not possible to account for more knowledge his acquire, the more stipulated in the true sense, the less is in the most reasonable, and the greater is in the consequence. This cannot be, because, as the most in which he, as a scientist, has been able to make them the subject of apprehensions, he has been able to make them the subject of apprehensions, he has been able to make the subject of apprehensions. He has been able to make the subject of apprehensions.

It is true, however, we would suggest to Mr Duffy the propriety of making the proposed journal a ‘journal of Science and Art’ as well as ‘of Literature.’

The CORNFIELD MAGAZINE.

No one could ever understand the conduct of a publication under more promising circumstances than those under which Mr Thackeray has hitherto labored; and yet the great height of a popularity which, if it had been in evidence, must have been the first, or the first of his journals, did occur to the fact, that there should be an occasional tide and flow from this high-water mark at admittance only was what to be expec- presented. No popular favor can hope to be exempt from the effects of time and place. There is, however, one reason to be stated in the present case, that we have no doubt but that Mr Thackeray has many reasons to be grateful to his general admiration;

for each species was called into existence by Almighty God, by a distinct and independent act of creation.
