THE STUDENT"S FLORA<br>OF THE

BRITISH ISLANDS.

## THE STUDENT'S FLORA

OF THE

## Grititisly ifglamos.

## BY

J. D. HOOKER, C.B.,<br>M.D., D.C.L. OXON., LL.D. CANTAB., F.R.S., F.L.S., F.G.S. DIRECTOR OF THE ROYAL GARDENS, KEW,

fonvon: MACMILLAN AND CO. 1870.

## RONDOK

R. CLAY, SONS, AND TAYLOR, PRINTER8,

BREAD STRKET HILL.

## PREFACE.

THE object of this work is to supply students and field-botanists with a fuller account of the Plants of the British Islands than the manuals litherto in use aim at giving.

For the number and kinds of plants introduced as composing the British Flora proper, I have been guided by the "London Catalogue of British Plants," 6th ed., 1867 ; being fully satisfied that I should thus best serve the interests of British Botany. The difficult task of determining which of the many doubtfully indigenous or naturalized plants should be regarded as British by adoption or otherwise, or the reverse, has in the successive editions of this Catalogue been settled by the two Botanists most competent to form an opinion, not only by many years of research and thorough knowledge, but also by matured judgment in such matters; Messrs. H. C. Watson and J. Boswell Syme. It is true that I may think some of the species they have introduced have less claims than some they have rejected, but this applies to very few cases indeed. I have included but one species that is not in the Catalogue, Claytunia perfoliata, very lately but certainly now established as a colonist.

The Ordinal, Generic, and Specific characters have been rewritten, and are to a great extent original, and drawn from living or dried specimens or both. After working them out, I have also consulted the usual British and Continental Floras, and collated the descriptions throughout with Mr. Syme's Edition of English Botany (to the end of Cyperacea), of the

## $2090<40$

## PREFACE.

descriptions in which work I cannot speak in terms of too high praise. By this method of re-description, whilst I believe I have avoided some errors of my predecessors, I have no doubt made others of my own : such creep into all endeavours to describe most or all of the organs of many species: and if I have made many such blunders, a part may be attributable to the fact that various Genera were described amidst constant interruptions, and all under pressure of official duties.

The adoption of sub-species will, I hope, prove generally acceptable, though open to abundant criticism in details; indeed, in a good many cases this subdivision is almost purely arbitrary. In defining the subspecies I have been much guided by the views held by British Botanists, and especially as expressed in the London Catalogue.
The terminology employed is intended to be as simple as I think is attainable with a due regard to precision of language. As a rule, I have been guided in the choice of terms by Oliver's "Lessons in Elementary Botany;" and I have especially avoided terms applied to single Orders, or of special signification in single Orders or Genera. It is not easy to be consistent in this matter, in a work extending over so many different Orders, and occupying so many months in its preparation; and I fear that I may have at times forgotten my own principles. For modifications of the fruit the choice of terms presents great difficulty; and I have therefore very much confined myself to such as are required to avoid periphrasis, as capsule, drupe, berry, utricle, follicle, pod, \&c. (about which there is no ambiguity), and to achene for the dry indehiscent carpels of an apocarpous fruit. For Grasses, Composite, \&c. the term fruit is itself sufficiently explicit, its nature being always explained in the Ordinal description. The term nutlet for the parts of the fruit of Borraginee and Labiata I have borrowed from Asa Gray.

The Keys to the Genera are naturally arranged, but in Umbellifere I have added an artificial key, as essential for the determination of a Genus before the whole Order has been studied. I have added no keys to the Species, preferring curt diagnoses which embrace the more
important characters of the plant; finding, moreover, from experience, that such keys promote very superficial habits amongst students.

For the areas and elevations inhabited by the Species in the British Isles I am wholly indebted to Mr. Watson's accurate works, and especially to his (unfortunately unpublished) "Compendium of the Cybele Britannica," 1868-9. The limits of the more or less local Species are here defined by the counties, and the addition of northwards or southwards indicates that they extend to Caithness and Sutherland, and to Cornwall and Kent, respectively. When a plant is remarkable for its absence in Ireland, this is stated; and when rare or local in Ireland, its limits are taken from the "Cybele Hibernica" of More and Moore, a standard work. Of the altitudes, I have chosen the highest the Species attains, and indicated the region where this is the case; where no elevation is given, the Species is not known to ascend to 1,000 feet, and may be assumed to be a "low-ground" plant. To the doubtfully indigenous Species I have added Watson's opinion as to whether they are "colonists" or "denizens," \&c. The extra-British distributions I had worked out myself for most of the British plants before the appearance of Mr. Watson's "Compendium;" I have, however, revised them by means of the latter work with great advantage.

The estimates of the numbers of Genera in the Orders, and of Species in the Genera, are compiled from the Kew Herbarium, and from many other sources, and are unavoidably very vague; they serve to indicate to the student the relative extent of these groups. The notices of their affinities and properties are necessarily extremely brief indications. The etymologies I have endeavoured to reduce to really useful limits. Only such English names as are pretty well known are given, and for these I have in many cases been guided by Dr. Alexander-Prior's "Popular Names of British Plants," a very good book.

I am greatly obliged to Mr. J. G. Baker for an account of the Genera Rubus, Rosa, and Hieracium, and wish that I had enlisted his services for the aquatic Ranunculi, of which I have admitted too many Sub-species.

I am also indebted to him and to Professor Oliver for the careful revision of the proof-sheets, and for many valuable facts, opinions, and suggestions during the progress of the work.

When I commenced this Flora, it was my intention to have made it a record of those physiologioal and morphological observations on British plants which have of late given so great an impulse and zest to botanical pursuits; and towards which I was offered much assistance from my friends Mr. Darwin, Professor Oliver, and Professor Diokson of Glasgow; and this intention was my chief inducement to undertake the work. I had, however, made but little progress before I discovered that the number of such observations was so great, and that the value, accuracy, and interpretation of many were so much disputed, that to make even a small selection from them would be a very difficult task, and would have filled a volume far exceeding the dimensions required for students. I do not, however, abandon the hope of being able at some future time to undertake such a task, in the form of a Companion to the Student's Flora.

Ruyal Gardens, Kew, May 1, 1870.

## SYNOPSIS OF THE NATURAL ORDERS

## (ADAPTED TO THE BRITISH GENERA).

Trie arrangement here adopted adheres very closely to the Jussieuan as modified by De Candolle, which, notwithstanding its many defects (inseparable from a linear arrangement), is, I think, as good as any of those subsequently proposed,* and has the great advantage of being that most generally adopted in the Universities and Schools of Great Britain and Ameriea, and in systematic works everywhere. Its great defect is the necessity of an Apetalous division, embracing a heterogeneous mass of Orders, which have rarely any mutual affinities, and are incapable of being naturally grouped. Some of these are obviously allied to Polypetalous or Monopetalous Orders, but cannot be placed in contiguity with these without interfering with other and closer alliances; some again present cross affinities with two or more often distant Orders; and the greater proportion have no ascertained affinities. Under these circumstances, and seeing how much the retention of the Apetalous division facilitates the often difficult task of finding the Natural Order of a plant, it appears to me to be premature to depart from the Jussieuan system.

## Cleags I. dicotyle'dons.

Stem when perennial, with pith, one or more concentric layers of woody tissue and a separable bark. Leaves usually net-veined. Whorls of the prrianth in 4's or 5's. Einbryo with 2 cotyledons; the radicle itself usually elongating in germination.

## Division I. Polypet'alæ.

Flovers with both calyx and corolla (dichlamydeous). Petals free. (See also the exceptional Monopetaloe.)
Exceptions: Flowers wanting either calyx or corolla occur in: 1, Ranunculacese; 6, Cructfere ( 5 Cardamine, 16 Senebiera, and 17 Lepidium); 9, Violacee (apetalous forms of Viola) ; 12, Caryophyllees (8 Arenaria §Cherleria, 9 Sagina) ; 14, Paronychiee (2 Herniaria, 4 scleranthus); 27, Rosacee (8 Alchemilla, 10 Poterium); 28, Saxifrageee (2 Chrysosplenium) ; 31, Haloragee; 32, Onagrariex (2 Luduigia); 33, Lythracee (2 Peplis).

[^0]Petals more or less adherent or coherent occur in : 5, Fumartaces ; 10, Poly. galee; 13, Portulacef; 14*, Tamariscinee; 17, Maliacee; 21, Ilicinee; 29, Crassulacee (2 Cotyledon); 30, Cucurbitacee.
SUb-division 1. Thalamifo'ræ. Stamens inserted on the receptacle (hypogynous) free from the calyx, or on a disk that terminates the pedicel. Ovary superior.
Exceptions. Stamens apparently perigynous or epigynous in 3 Nymphaacear ( 1 Nymphaza) and 14 Paronycliear. See also 30 Lroseracea; ; Parnassia in 23 Saxifragere; and 44 Ericucea.

* Pistil apocarpous, carpels 1 or more; oviles sutural or basal. (See also 17 Malvaceæ and 20 Geraniaceæ.)

1. Ranunculacee. Flowers regular or irregular. Stamens indefinite ; anthers basifixed, opening by slits. Seeds albuminous.-Herbs with alternate leaves (except Clematis). (p. 1.)
2. Briberides. Flowers regular, 3 -merous. Stamens definite, opposite the petals; anthers basifixed, opening by recurved valves. Seeds albumi-nons.-Shrubs; leaves alternate ; flowers often showy. (p. 12.)

> ** Pistil syncarpous, 1-celled (except 3 Nymphæaceæ), or 2 -celled by a membranous septum; ooves parietul, rarely busal.
3. Nympheaces. Flowers regular. Stamens indefinite; anthers basifixed. Ovary many-celled; ovules scattered over the walls of the cells; stigmas sessile. Sceds albuminous.-Water-herbs; flowers showy. (p. 13.)
4. Papaveracee. Flowers regular, 2 -merous. Stamens indefinite; anthers basifixed. Ovules parietal or on the surfaces of partial dissepiments ; style 1 or stigmas sessile. Secds albuminous.-Herbs; juice milky; leaves alternate, exstipulate ; flowers usually showy. (p. 14.)
5. Fumariacee. Flowers irregular. Sepels 2. Petals 4. Stamens 6 in 2 bundles. Ovary 1 -celled ; ovules many parietal, or 1 (by suppression) basal ; style 1 or 0 . Secds albuminous. - Weak herbs with exstipulate alternate leaves; flowers usually small. (p. 17.)
6. Checifera. Flowers usually regular. Sepals 4. Petals 4. Stamens usually 6,4 longer than the others. Oeary $1-2$-celled, of 2 carpels; ovules parietal ; style 1 or 0 . Seeds exalbuminous.-Herbs; leaves exstipulate, alteruate ; flowers usually small and ebracteate. (p. 19.)
7. Resedacee. F'lowers irregular. Sepals and petals 4-7 each. Stamens indefinite. Ovary 1 -celled, of 2-6 carpels, at length open at the top; ovules prarietal ; stigmas sessile. Seeds exalbuminous.-Herbs; leaves alternate, stipules glandular or 0 ; flowers small, greenish. (p. 41.)
8. Cistines. F'lowers regular. Sepals 3-5. P'etals 5. Stemens iudefinite. Ovary 1 -celled, of 3 carpels; ovules parietal ; styles 3. Secels albuminous.-Shrubs; leaves usually stipulate; flowers yellow or red, showy ; petals fugacious, (p. 42.)
9. Vimlaces. Flowers irregular. Sepals, petals, and stamens 5 each. Ovary 1-celled; ovules parietal; style 1. Capstble 3 -valved, loculieidal. Seeds albuminous.-Herbs; leaves alternate, stipulate; flowers often sbowy. (p. 43.)
11. Frankeniacee. Flowers regular. Sepals, petals, and stamens 4-6 each. Ovary 1-celled, of $2-5$ carpels ; ovules parietal ; style 1.-A littoral herb; leaves opposite, exstipulate ; flowers şmall. (p. 47.)

> *** Pistil syncarpous, 1-celled ; placenta free-central or basal.
12. Caryophyllee. Flowers regular. Sepals and petals 4 or 5 each. Stamens 8 or 10. Ovules many; styles 2-5. Seeds albuminous; embryo curved.-Herbs ; leaves opposite, stipulate or not; flowers usually small and pink or white. (p. 48.)
13. Portclacee. Flowers regular. Sepals 2. Petals 4 or more. Stamens 3 or more. Ovules 2 or more; style 1, 2-3-fid. Seeds albuminous; embryo curved.-Herbs; leaves opposite or alternate, quite entire ; flowers small. (p. 63.)
14. Paronychiee. Flowers regular. Sepals 4-5. Petals 4-5 or 0. Stamens 1-5. Ovule 1; style 1, 2-3-fid. Seeds albuminous ; embryo usually curved.-Herbs; leaves opposite or alternate, stipulate or not, quite entire or serrulate; flowers small or minute. (p. 64.)

14*. Tamariscinee. Flowers regular. Sepals and petals 4-5 each. Stamens 4 or more. Ovules 2 or more; styles 3-4.-Shrubs; leaves minute, exstipulate ; flowers small. (p. 66.)
**** Pistil syncarpous, 2 - or more-celled; placentas axile.
10. Polygalee. Flowers irregular. Inner sepals petaloid. Petals adnate to the staminal sheath. Stamens 8 ; anthers 1 -celled. Ovary 2-celled, 2 -ovuled; style 1.-Herbs; leaves alternate or subopposite, exstipulate ; flowers small, usually blue. (p. 46.)
15. Elatinee. Flowers regular. Sepals and petals 3-4 each. Stamens $3-4$ or twice as many, free. Ovamy $2-5$-celled; styles $2-5$. Seeds minute; albumen scanty or 0 .-Water-herbs; leaves opposite, stipulate; flowers minute. (p. 67.)
16. Hypericines. Flowers regular. Sepals and petals 5 each. Stamens many, united in bundles. Ovary more or less completely 3-5-celled, cells many-ovuled ; styles 3-5. Seeds exalbuminous.-Herbs or shrubs; leaves opposite, often gland-dotted, exstipulate; flowers often showy, yellow. (p. 68.)
17. Malvacee. Flowers regular. Sepals 5, valvate. Petals 5, convolute in bud, adnate to the staminal tube. Stamens monadelphous; anthers 1-celled. Ovary many-celled, cells 1-ovuled (in British genera). Albumen scanty or 0 ; embryo crumpled.-Herbs or shrubs ; leaves alternate, stipulate ; flowers often showy. (p. 70.)
18. Tiliacee. Flowers regular. Sepals 5, valvate. Petals 5. Stamens indefinite; anthers 2 -celled. Ovary $2-10$-celled; cells 2 -ovuled ; style 1. Seeds albuminous.-Trees ; leaves alternate, stipulate ; flowers not showy. (p. 72.)
19. Linee. Flowers regular. Sepals 4-5. Petals 4-5, convolute in bud. Stamens usually $4-5$. Ovary $3-5-(-10-)$ celled, cells $1-2$-ovuled; styles 3-5. Seeds albuminous.-Herbs; leaves opposite or alternate, narrow, quite entire, exstipulate ; flowers usually showy. (p. 73.)
20. Geraniacee. Flowers regular or not. Sepals 3-5. Petals 3-5,
imbricate in bud. Stamens definite. Ovary $3-5$-lobed and -celled ; cells 1-many-ovuled; styles 1 or more. Albumen scanty or 0 ; cotyledons plaited or convolute.-Herbs ; leaves opposite or alternate, usually stipulate ; flowers often showy. (p.75.)
21. Ilicines. Flowers regular. Sepals 4-5. Petals 4-5; often connate, imbricate in bud. Stamens 4-5. Gvary 3-5-celled, cells 1-2ovuled. Seeds albuminous.-Shrubs; leaves evergreen, alternate, exstipulate ; flowers small. (p. 80.)
22. Empetracee. Flowers regular, diœecions. Sepals 3. Petals 3, imbricate in bud. Stamens 3. Ovary 3-9-celled, cells 1-ovuled. Siceds alhuminous.-Small shrubs; leaves evergreen, alternate, exstipulate; flowers inconspicuous. (p. 81.)

Sub-division 2. Calyciflo'rge. Stamens inserted on the calyx or disk (perigynous or epigynous).-See also the exceptional Thalamiflore.
Exoptions. Stamens hypogynous in 28 Saxifragees (3 Parnussia), and in 30 Drosiracee; epipetalous in some 29 Crassulacees; obscurely perigynous in 26 Leguminos.s.

* Ocary superior (except some Rosaceæ and Saxifrageæ). Stamens periyynous.

23. Celastrineas. Flowers regular. Calyx 4-5-lobed, and petuls 4 b, both imbricate in bud. Stamens 4-5, inserted on the disk. Uxary 3-5celled, cells with 2 ereet ovules. Seeds arillate; cotyledons foliaceous. -Trees or shrubs ; lenves various; flowers small. (p.81.)
24. Rhamnee. Flowers regular. Calyx 4-5-lobed, valvate in bud. Petals 4-5, minute. Stamens 1 opposite each petal, inserted on the calyxtube at the edge of the disk. Ovary 3 -celled; ovule 1 erect in each cell. -Shrubs ; leaves alternate or opposite, stipules small ; flowers inconspicuous. (p. 82.)
25. Sapindacese, Tribe Acerinees. Flouers regular. Calyx 4-9-hobed, and petals 4-9, both imbricate in bud. Stamens 8-12, inserted on the disk. Ocery 2-loled and -celled; cells 2-ovuled. Fruit a samara; cotyledons plaited.-Trees or shrubs; leaves opposite ; flowers rather small, green. (p. 83.)
26. Leguminose. Flowers irregular, papilionaceous. Stamens 10, subhypogynous or inserted on the calyx-tube, all or 9 of them combined. Ocary of 1 carpel. Fruit a legume. Albumen 0 .-Herbs or shrubs ; leaves usually alternate compound and stipulate. (p. 84.)
27. Rosaces. Flouvers regular. Calyx 4-5- (rarely 8-9-) lobed, imbricate or valvate in bud. Petels 4-5 (rarely 8-9 or 0), imbricate in bud. Stamens usually indefinite, inserted on the calyx-tube or disk, incurved in bud. Unary of 1 or more free or connate 1- or more-ovuled carpels. Fruit varions. Albumen 0.-Herbs or shrubs; leaves usually alternate, stipulate; flowers often showy. (1. 105.)
28. Saxifrage.e. Flowers regular. Calyp 4-5-lobed. Petals 4-5, rarely 0 , imbricate in bud. Stamens definite. Curpels fewer than the petals, usually 2 comnate; placentas axile, rarely parietal. Fruit various. Seeds albuminous.-Herbs or shruhs; leaves opposite or alteruate, stipulate or not ; flowers small. (p. 128.)
29. Crassclacee. Flowers regular. Calyx 4-12-lobed. Petals 4-12. Stamens twice as many as the petals (except 1 Tillcea). Fruit follicular. -Herbs; leaves succulent, exstipulate ; flowers small. (p. 135.)
30. Droseracee. Flouers regular. Sepals and petals 5, imbricate in bud. Stamens as many, hypogynous or perigynous. Ovary 1-celled; ovules many, parietal. Fruit capsular. Seeds albuminous.-Glandular herbs; leaves radical ; flowers small, white or pink. ( p .139. )
31. Lythracee. Flowers regular. Calyx-lobes 3-6, valvate in bud. Petals 3-6, crumpled in bud. Stamens definite. Ovary 2-6-celled, cells many-ovuled. Capsule many-seeded. Seeds exalbuminous. Herbs; leaves opposite or whorled, quite entire, exstipulate ; flowers often showy. (p. 146.)

## ** Ovary inferior. Stamens epigynous.

31. Haloragee. Flowers usually apetalous and 1 -sexual. Calyp-lobes 2-4, valvate in bud, or 0 . Stamens 1 or more, definite. Ocary 1-4-celled, cells 1-ovuled. Seeds albuminous. - Herbs, often marsh or aquatic; leaves opposite alternate or whorled, exstipulate ; flowers very inconspicuous. (p. 140.)
32. Onagraries. FFlowers usually regular. Calyx-lobes 2 or 4, valvate in bud. Petals 2 or 4, twisted in bud. Stamens definite. Ovary 1-4celled, cells 1-many-seeded. Seeds exalbuminous.-Herbs; leaves opposite or alternate, exstipulate ; flowers often showy. (p. 142.)
33. Cuctrbitacee. Flowers regular, 1 -sexual. Calyx 5-toothed. Corolla 5 -lobed. Stamens 3. Ovary 3-celled, many-ovuled. Fruit a berry. Seeds exalbuminous.-Herbs with tendrils; leaves alternate, exstipulate; flowers showy or not. (p. 148.)
34. Umbelliferas. Flowers usually regular. Calyx-lobes 5 or 0. Petals 5. Stamens 5, incurved in bud. Ovary 2-celled; styles 2; ovules solitary. Fruit of 2 separable indehiscent dry carpels. Seeds albuminous.-Herbs; leaves alternate ; flowers usually umbelled, small. (p. 149.)
35. Araliacee. Flowers of Umbelliferce, but shrubs or trees; ovary of often more than 2 carpels, and fruit a berry.-Leaves alternate; flowers usually green. (p. 171.)
36. Cornacea. F'lowers regular. Calyx-lobes 5 or 0. Petals 4-5. Stamens 4-5. Ovary 2 -celled, cells 1 -ovuled; style simple. Drupe 1-2-celled. Seeds albuminous.-Herbs, shrubs, or trees; leaves opposite ; flowers usually small. (p. 172.)

## Division II. Monopet'alæ or Gamopet'alre.

Flowers with both calyx and corolla (dichlamydeous); petals more or less connate into a 2 - or more-lobed corolla.-See also various monopetalous genera under the exceptional Polypetales.
Exceptions : Petals free in 44 Ericacee ( 11 Pyrola and 12 Monotropa) and 59 Plumbiginee. Corolla absent in 45 Olfinese (2 Fraxinus), and 58 Primelace.e ( 4 Gikur).

1. Ovary inferior.-(See also 58 Primulacese (8 Samolus) in 2.)

* Stamens epipetalous; see also 43 Campanulacees ( 1 Lobelia).

38. Caprifoliacee. Flowers regular or not. Corolla-lobes valvate or imbricate in bud. Ovary 1-5-celled, cells 1-or more-ovuled. Secds albuminous.-Shrubs, rarely herbs; leaves opposite, exstipulate ; flowers usually showy. (p. 173.)
39. Rubiacee, T'ribe Stellate. Flowers regular. Corolla-lobes valvate in bud. Ovary 2 -celled ; cells 1 -ovuled. Seeds albuminous.-Herbs; leaves whorled or opposite, exstipulate ; flowers small or minute. (p. 176.)
40. Valerianee. Flowers irregular. Corolla-lobes imbricate. Stamens $1-3$ or 5, free. Ovary 1-3-celled, one cell 1-ovuled; ovule pendulous. Seeds exalbuminous.-Herbs ; leaves opposite ; flowers small. (p. 181.)
41. Dipsacee. Flowers regular or not, in involucrate heads. Corollalobes imbricate. Stamens 4. Ovary 1-celled; ovule 1, pendulous. Seeds albuminous.-Herbs ; leaves opposite, exstipulate ; flowers small. (p. 183.)
42. Composite. Flowers in involucrate heads. Corolla-lobes valvate. Stamens 4-5 ; anthers usually connate. Ovary 1-celled ; ovule 1, erect. Seeds exalbuminous.-Herbs, rarely shrubs; leaves various, exstipulate ; flowers small or minute. (p. 184.)

> ** Stamens inserted on the top of the ovary.
43. Campanulacee. Flowers regular or irregular. Stamens 5, free or connate. Ovury 2-8-celled, cells many-ovuled.-Herbs; juice milky; leaves alternate, exstipulate ; flowers usually showy. (p. 224.)
44. Ericacee, Suborder Vaceiniee. Flowers regular. Stamens 8 or 10. Ovary 4-5-celled.-Slender shrubs; leaves alternate and exstipulate. (p. 229.)
2. Ovary superior. Stamens epipetalous (hypogynous in some Ericaces, in 52 Plantaginee (2 Littorella), and in 59 Plembagine.e).

* Corolla regular, except sometimes in 50 Borragineæ and 51 Solaneæ; placentas axile or parietal.

44. Ericacee, Suborder Emices. Stamens usually twice as many as the corolla-lobes; anthers opening usually by pores or transversely.Shrubs or trees, rarely herbs ; leaves various, exstipulate ; flowers small. (p. 229.)
45. Oleinete. Calyx 4 -fid or 0. Corolla 4 -lobed or 0 . Stamens 2. Ovary 2 -celled, cells $2-3$-ovuled. Fruit a drupe or samara. -Trees or slirubs ; leaves opposite, exstipulate ; flowers small. (p. 237.)
46. Apocynea. Calyx 4 - 5 -fid. Corolla 4 - 5 -lobred, contorted in bud. Stamens 4-5 ; anthers basifixed. Carpels 2, free below. Fruit of 2 fol-licles.-Shrubs; leaves opposite, quite entire; flowers often showy. (p. 238.)
47. Geatiane... Calyx 4-8-fid. Corolla 4-8-lobed, contorted in bud. Stamens 48 ; anthers versatile. Ovary 1-celled; ovules many, parietal. Fruit usually capsular.-Herbs ; leaves opposite, quite entire (alternate, 3 -foliolate in Menymuthes) ; flowers often showy. (p. 239.)
48. Polemoniacee. Calyx 5 -lobed. Corolla 5 -lobed, contorted in bud.

Stamens 5. Ovary 3-celled ; stigma 3-fid. Fruit capsular.-Herbs; leaves pinnate, exstipulate ; flowers showy. (p. 243.)
49. Convolvulacee. Sepals 5. Corolla 5 -lobed, plaited and contorted in bud. Stamens 5. Ovary 2 -celled, cells 2 -ovuled; stigmas 2-tid or styles 2.-Herbs; leaves alternate, simple ( 0 in Cuscuta); flowers often showy. (p. 245.)
50. Borraginew. Calyx 5 -lobed, valvate in bud. Corolla 5 -lobed, imbricate in hud. Stamens 5. Ovary of 2 2-lobed 2 -celled 2 -ovuled carpels. Fruit of 4 nutlets.-Hispid or scabrid herbs; leaves alternate, quite entire, exstipulate ; flowers often showy. (p. 247.)
51. Solanee. Calyx 5-fid. Corolla 5-lobed, imbricate plaited or valvate in bud. Stamens 5, often cohering. Ovary 2 -celled; ovules many, axile. Fruit a capsule or berry.-Herbs; leaves alternate or in pairs, exstipulate ; flowers small or large. (p. 255.)
52. Plantaginea. Sepals 4. Corolla scarious, 4 -lobed, imbricate in bid. Stamens 4; anthers pendulous. Ovary 2-4-celled; style and stigma filiform. Capsule 1-4-celled.-Herbs; leaves alternate or radical; flowers inconspicuous. (Littorella is altogether anomalous.) (p. 257.)

## ** Corolla irregular, ravely subregular. Placentas axile or parietal. (See also 50 Borraginc $æ$ and 51 Solaneæ.)

53. Scrophularinee. Calyx 4-5-merous. Corolla often 2-labiate, 4-5-lobed. Stamens 4, didynamous, rarely 2 or 5 . Ovary 2 -celled; orules many, axile.-Herbs; leaves various; flowers often showy. (p. 259.)
54. Orobanchee. Sepals 4 or 5, free or connate. Corolla gaping. Stamens 4, didynamous. Ovary 1-celled ; ovules many, parietal.-Herbs, with alternate scales instead of leaves; flowers rather large, brown or coloured. (p. 275.)
55. Labiates. Calyx 5 -eleft or 2 -lipped. Corolla usually 2 -lipped. Stamens usually 4, didynamous. Ovary of 2 2-lobed 2 -celled 2 -ovuled carpels. Fruit of 1-4 1-seeded nutlets.-Herbs or shiubs : stems square ; leaves opposite, exstipulate; flowers in opposite cymes forming false whorls, rather small. (p. 277.)
56. Verbenacee. Calyx cleft or toothed. Corolla tubular, often 2 -lipped. Stamens 4. Ovary not lobed, 2-4-celled; cells 1-ovuled. Fruit a drupe, berry, or of 1-4 nutlets.-Herbs or shrubs; leaves opposite or whorled, exstipulate ; flowers small or showy. (p. 295.)
*** Corolla regular or irregular. Ovary 1-celled with a free basal 1-or manyovaled placenta.
57. Lentibularinee. Corolla 2-labiate. Stamens 2. Capsule 2 -valved, many-seeded. - Marsh or water plants; flowers rather large for the plant. (p. 297.)
58. Primulacee. Corolla regular. Stamens usually 5 (4-9) opposite the corolla-lobes. Capsule usually $5-10$-valved at the top, or circumsciss, many-seeded.-Herbs; leaves various ; flowers usually showy. (p. 298.)
59. Plumbagine.e. Petals 5, equal, free or cohering. Stamens 5, opposite the petals. Utricle 1 -seeded.-Maritime (rarely alpine) scapigerous herbs ; leaves broad or narrow ; flowers small. (p. 304.)

## Division III. Apet'alse or Incomple'tæ.

Corolla and often culyx absent. (For other apetalous genera see the exceptions to the Polypetalar and Monopetala.

1. Corolla alone absent (Monochlam'ydea). Flowers 1-2-sexual, not in cones or catkins, except in the female of 71 Cannabinex. - See also 74 Cupllifere.

* Ovary superior, 1-celled (2-celled in Ulmus), usually 1-ovuled; stigmas 2-3.

60. Polygones. Flowers usually 2 -sexual. Sepals 3-6, green or coloured, imbricate in bud. Stumens 5-8, perigynous or hypogynous. Fruit usually enclosed in 2 or 3 enlarged sepals. Allumen floury; embryo curved.-Herbs ; leaves alternate; stipules sheathing ; flowers small. (p. 307.)
61. Amaranthacee. Flowers 1 -sexual. Sepals 3-5, subsearious, imbricate in bud. Stamens 1 opposite each sepal. Utricle 1 -seeded, indehiscent. Albumen floury ; embryo curved.-Herbs; leaves usually alternate exstipulate; flowers inconspicuous, green. (p. 314.)
62. Chenopodiacee. Flowers 1-2-sexual. Culyx 3-5-lobed, herbaceous, imbricate in bud, persistent round the fruit. Stamens 1-5, opposite the sepals. Utricle 1 -seeded, indehiseent. Albumen floury; embryo curved.-Herbs ; leaves opposite or alternate, exstipulate, or stems leafless and jointed ; flowers green, inconspicuous. (p. 314.)
63. Urticee. Flowers 1 -sexual.-Male: Calyp 4-5-partite. Stamens as many as and opposite the sepals. - Female: Calyje tubular or 3-5-cleft. Style simple or 0 ; ovule erect. Albumen fleshy ; embryo straight.-Herbs or shrubs; bark tenacious ; leaves stipulate or not. (p. 331.)
64. Cannabinex. Flowers 1 -sexual. - Male panicled, with 5 sepals and 5 stamens aduate to their bases. - Female fl. in cones. Sepal 1, bractlike. Styles 2, subulate. Albumen 0; embryo curved.-Bitter herbs ; leaves stipulate. (p. 333.)
65. Ulmacees. Flovers 2 -sexual, fascicled. Calyo 4-8-fid, imbricate in bud. Stamens as many. Ovary 2-celled; styles 2, sululate ; ovule pendulous. Fruit a samara.-Trees; leaves distichous, oblique, stipules caducous. (p. 333.)
** Ovary superior, 1-celled, 1-oveled; style short or slender, stigma entire.
66. Thymele.e. Calyx tubular ; lobes 4-5, imbricate in bud. Stamens definite, inserted in the tube. Ooule pendulous. Albumen 0 or seanty; embryo straight. - Shrubs; leaves quite entire, exstipulate; bark tenacious; flowers conspicuous, sweet-scented. (p. 322.)
67. Eleagnees. Calyr, in male il. 3 - 4 -sepalous; in female or 2 -sexual fl. tubular. Stamens 48 at the base of the seprals in the male fl. Orule erect. Albumen 0 or seanty; embryo straight.-Shruhs with lepidote scales; leaves quite entire, exstipulate ; flowers inconspicuous. (p. 323.) *** Ovary inferior, 1 - or more-celled.
68. Lorantifacea. Calya: 4-cleft, valvate in bud. Stamens one adnate to each calyx-lohe. Ocrery 1 -velled; ovule 1, erect. - Parasitic shrubs ; leaves quite entire, exstipulate ; flowers inconspicuous. (p. 323.)
69. Santalacee. Calyx 3-5-lobed, valvate in bud. Stamens one adnate to each calyx-lobe. Ocary 1-celled ; ovules several, pendulous from a free central placenta. -Shrubs or herbs, often root-parasites; leaves usually alternate, quite entire, exstipulate ; flowers inconspicuous. (p. 324.)
70. Artstolochies. Celyx 3-lobed, or 1-2-lipped, valvate in bud. Stamens 6-12, epigynous or gynandrous. Ovary 4-6-celled ; ovules many.Herbs or shrubs; leaves alternate, exstipulate. (p. 325.)
71. Calyx and corolla both absent (except in Buxus and Mercurialis). (Achlamydece.) Flowers 1-sexual, often in a calyx-like involucre.
72. Euphonbiacem. Male fl. : Calyge 0 or sepals 2 or more. Stamens 1 .or more; anthers dilymous.-Female fl.: Ovary 2-3-lobed and -celled; ovules 1-2 in each cell, pendulous ; styles 2-3. Albumen copious, fleshy.Herbs or shrubs; leaves various; inflorescence often of many stamens and 1 pistil collected in a small calyx-like involucre. (p. 326.)
73. Cehatuphyllee. Flowers 1 -sexual, in an $8-12$-partite involucre with subulate segments.-Male, of many anthers.-Femele, a 1 -celled ovary, with subulate persistent style and 1 pendulous ovule.-A submerged herb, with whorled multifid leaves; flowers very inconspicuous. (p. 331).
74. Flowers 1 -sexual ; males and females or males only in catkins, spikes, or cones, with or without a perianth.-See 71 Cannabinem.
75. Salicinee. Flowers diœecious, without perianth, both sexes in catkins.-Mule: stamens 1 or more to each seale.-Femule: Ovary solitary, 1 -celled ; stigmas 2 ; ovules many, parietal. Capsule 2 -valved.-Trees; leaves alteriate, stipulate ; catkins conspicuous. (p..334.)
76. Cuplliferw.-Flowers mon-dinecious. Males in catkins. Sepats 0 or 5 or more. Stamens 5-20.-Females, sessile in an involucre of free or connate bracts. Calyx superior, 5-6-toothed. Ovary 2-3-celled; styles 2-3; cells 1-2-ovuled. Fruit 1-celled, 1-seeded, dry, indehiscent, seated in the enlarged involucre.-Trees or shrubs; leaves alternate, stipulate; flowers small, green. (p. 343.)
77. Betulacee. Flowers monœcious, in catkins.-Male: Sepals or scales 1 or more. Stamens one opposite each sepal.-Female: Perianth 0. Ovary 2-celled; stigmas 2, filiform ; ovule 1 pendulous in each cell. Fruit dry, small, indehiscent.-Trees or shrubs ; leaves alternate, stipulate ; flowers inconspicnous. (p.345.)
78. Myricacee. Flowers of both sexes in catkins; perianth 0.-Male of $4-8$ stamens ; anthers basifixed, bursting outwards.-Female: Ovary 1-celled; styles 2, filiform ; ovule 1, basal. Fruit a drupe.-A glandular shrub; leaves alternate, exstipulate ; flowers very inconspicuous. (p. 347.)
79. Conifers. Perianth 0.-Male flowers of 2-8-celled anthers, usually forming a deciduous catkin. - Female fl. of one or more naked ovules (ovaries of some) on the scales of a cone or head, or of a solitary ovule (Taxus). Albumen fleshy; embryo straight.-Trees or shrubs; leaves alternate opposite or fascicled ; flowers very inconspicuous. (p. 347.)

## Class II. MONOCOTYLE'DONS.

Stem with isolated vascular bundles seattered through the cellular tissue. Leares usually parallel-veined. Whorls of the porianth in 3's. Embryo with 1 cotyledon; the radicle usually remaining undeveloped, but throwing out roots from its crown.
Exatptions. Leaves net-veined in 5 Dioscorees, 8 Liliacese ( 1 Puris), and 10 Aboidee ( 1 Arum). Flowers 4 -merous in 7 Naladex, and $2-3$-merous in 15 Gramines.

## Division 1. Petaloid'ere.

Perianth usually petaloid, more or less brightly coloured, rarely green.
Exceptions are very numerons, but chiefly in Orders 7 Naiadew, 9 Juncee, 10 Aroidea, 11 Leтиасеа, 12 Typhacee, and 13 Eriосаиloneж.

## 1. Perianth superior.

1. Hydrocharides. Flowers regular, 1-sexual. Perianthe 6-partite, outer segments herbaceous, inner petaloil (except in Anachuris). Stumens 3 or more. Occery 1- or 3-6-celled. Fruit a berry.-Water-plants ; leaves erect or floating, flowers usually conspicuous. (p. 349.)
2. Orcuine.e. Flowers irregular, 2 -sexual. Stemens 1 or 2, adnate to the style. Ovary 1 -celled. Fruit capsular.-Herbs of various habit. (p. 351.)
3. Iridex. Flowers 2 -sexnal. Perienth 6-partite, petaloid. Stamen. 3, free; anthers bursting outwards. Ocary 3 -celled. C'upsule 3 -valved. -Herbs ; roots tuberous, or rootstock creeping ; leaves narrow ; flowers usually handsome. (p. 362.)
4. Amaryllidea. Flowers 2 -sexual. Perianth 6-partite, petaloid. Stamens 6, free; anthers bursting inwards. Ocerry 3-celled. Capsule 3 -valved.-Herhs; leaves narrow; flowers usually handsome. (p. 364.)
5. Dioscores. Flowers 1 -sexual. Perienth small, 6 -partite, herbaceous. Stamens 6 ; anthers bursting inwards. Ocary 3 -celled. Berry few-seeded,-Climbing herbs; leaves broad, with netted veins; flowers inconspicnous. (p. 366.)
6. Perianth inferior, or often wanting.

* Carpels many, free, or slightly connate (solitary in carious Naiadeæ).

6. Alismaces. Flouers usually 2 -sexual. Perianth 6 -partite, outer segments often herbaceous and inner petaloid. Stamens 6. Carpels many. Fruit of many achenes ; albumen 0 ; radicle very large.-Marsh or water herbs ; leaves radical ; flowers usually conspicuous. (p. 367.)
7. Naladef. Flowers 1-2-sexual. Periunth of 4 valvate sepals, or imperfect or 0 . Stamens as many as the sepals, or fewer. Carpels 1-4, 1 -ovuled. Albumen 0 ; radicle very large-Marsh or water plants; leaves radical or cauline ; flowers inconspricuous, green. (p. 369.)
** Carpels solitary or connate into a 1-3-celled ovary (see 7 Naiadeæ).
8. Lilhacee. Flozers usually 2 -sexual. Peruenth usually 6 -partite or of 6 pieces, and pretaloid. Stamens one opposite each perianth-segment. Ovary 3 -celled. Fruit various.-Herbs (except Rusous) of various habit ; flowers usually showy. (p. 377.)
9. Juncee. Flowers 2-sexual. Perianth of 6 brown, scarious segments. Stamens usually 6. Ovary $1-3$-celled with 3 basilar, or many parietal or axile ovules. Capsulc 3 -valved-Rushy herbs; leaves very narrow ; flowers brown, small. (p. 387.)
10. Aroidee. Flowers sessile on a spadix, enclosed in a spathe when young, 1-2-sexual. Perianth 0, or of seale-like sepals. Stamens few or many. Ovary 1- or more-celled. Berry few- or many-seeded. Albumen mealy.-Herbs; leaves various, often broad, net-veined; flowers with often conspicuous spathes or spadixes. (p. 393.)
11. Leminaeee. Minute floating cellular green fronds. Flowers imbedded in slits or cavities of the frond, most minute, $1-3$ in a spathe. Stamens 1-2. Ovary 1-celled, 1-7-ovuled.-Fronds covering pouds ; flowers very rare and inconspicuous. (p. 395.)
12. Typhaceze. Flowers moncecious, in catkins or heads. Perianth 0 , or of scales or hairs. Stemens many ; anthers basifixed. Orary 1-2-celled; style persistent; ovule 1, pendulous. Fruit a drupe or utricie. - Erect marsh or water plants ; leaves linear ; flowers small or minute, in couspicuous spikes or heads. (p. 396.)
13. Eriocaulonee. Flowers monœecious, in involucrate heads. Perianth membranous or scarious; outer of 2-3 sepals; inner 3 -lobed or of 3 scales. Stamens $2-3$ on the inner perianth-segments. Ovary 2-3-celled; ovule 1, pendulous in each cell. Cupsule 2-3-valved.-Usually scapigerous, cellular, marsh or water herbs; flowers small, dull-coloured. (p. 397.)

## Division II. Gluma'ceæ.

Flowers in the axils of the scales (glumes) of spikelets. Perianth 0 , or of a few minute scales or bristles (ovary and fruit enclosed in a perigynium in Carex).
14. Cyperacee. Flowers 1-2-sexual. Perianth 0 or of bristles, rarely of scales. Stamens 1-3; anthers basifixed. Ovary 1 -celled ; style 1, stigmas 2-3 papillose ; ovule 1, erect. Fruit compressed or 3-gonous. Embryo at the base of the albumen.-Stems usually solid, 3-gonous; leaves very slender with entire sheaths. (p. 398.)
15. Graminee. Flowers usually 2 -sexual. Perianth usually of 2 very minute seales. Stamens usually 3 ; anthers versatile. Ovary 1 -celled; stigmas 1-2 hairy or feathery. Fruit terete, or grooved on one side. Embryo on one side of the base of the albumen.-Stem usually hollow, septate, terete ; sheaths split to the base. (p. 422.)

## Class III. ACOTYLE'DONS or CRYP'TOGAMS.

Plants with or without vascular bundles, destitute of proper flowers (i.e. having no stamens, pistils, or floral whorls). Reproduction by minute bodies (spores), which contain no embryo.

## Diviston I. Vasculares.

Stoms with copious bundles of vascular tissue. Reproduction by spores destitute of an embryo, but developing a prothallus in germination.

1. Filices. Capsules usually very minute, situated on the eige or under side of the leaf (frond) ; rarely larger, in separate spikes or panicles. Spores of one kind only, developing a prothallus. - Fronds usually circinate in vernation. (p. 457.)
2. Lycoponacee. Capsules not very minute, situated in the axils of the leaves, or of the scales of a cone. spores of 1 or 2 kinds; large whon present developing a prothallus; small containing antherozoids.-Fromels usually circinate in vernation. (p. 469.)
3. Mabsileaces. Capsules (membranous sacs) very minute, enclosed in the cells of a glohose receptacle near the base of the fromd. Spores of 2 kinls ; large developing a prothallus; small containing antherozoids. Marsh or water plants, rarer on dry soils. (p. 471.)
4. Equisetacee. Capsules 2 -valved, on the under side of peltate seales that are arranged in terminal cones. Spores of one kind only, with 4 filifurm cluhbed appendages rolled round them, devaloping a pro-thallus.-Strms erect from a ereeping rootstock, terete, hollow, grooved, septate, simple or with whorled branches and toothed sheaths at the joints. (p. 472.)

## 

## Class I. DICOTYLEDONS.

## Division I. POLYPET'ALA.

## Order I. ranuncula'cefe.

Annual or perennial herbs, rarely shrubs. Leaves radical or alternate, opposite in Clematis; stipules 0 , or adnate to the petiole. Flowers regular or irregular, $1-2$-sexual. Disk 0 . Sepals 5 or more, rarely 2-4, deciduous, often petaloid, usually imbricate in bud. Petals 0 , or 5 or more, rarely 3 , imbricate in bud, often minute or deformed. Stamens many, hypogynous; anthers adnate, dehiscing laterally. Carpels many, rarely 1, usually free, 1 -celled; stigma simple; ovules 1 or more on the ventral suture, anatropous, erect with a ventral or pendulous with a dorsal raphe. Fruit of 1 -seeded achenes, or many-seeded follicles. Seed small, albumen copious; embryo minute.-Distrib. Abundant in temp. and cold regions; genera 30 ; species 500.-Afrinities. With Berberidea and Papaveracee; analogies with Alismaceae and Rosacea.-Properties. Usually acrid.-Exceptional Forms (British). Stem woody in Clematis; flowers polygamous in Thalictrum; pedicels bracteolate in Aconitum; sepals persistent in Helleborus; stamens few in Myosurus; carpels connate in Helleborus; follicle solitary in some Delphinia; berry solitary, and stigma dilated in Actoea.
Tribe I. CLemati'dest. Sepals valvate. Shrubs with opposite leaves.

1. Clematis.

Tribe II. Anemo'neft. Sepals imbricate. Achenes with 1 pendulous seed.
Involucre 0. Sepals 4-5, petaloid. Petals 0
2. Thalictrum.

Involucre of 3 leaves. Sepals 4-20, petaloid. Petals 0...........3. Anemone.
Involucre 0. Sepals 5-8, petaloid. Petals 5-16, conspicuous.....3*. Adonis.
Involucre 0. Sepals 5, spurred. Petals small, tubular ..........4. Myosurus.
Tribe III. Ranun'CuLeex. Sepals imbricate. Achenes with one ascending seed 5. Ranunculus.

Tribe IV. helleb'orexe. Sepals imbricate. Follicles many-seeded, except in Actaca.

* Flowers regular. Follicles many-seeded.
Sepals petaloid. Petals 0 6. Caltha.
Sepals petaloid, deciduous. Petals small, entire 7. Trollius.
Sepals herbaceous, persistent. Petals small, 2-lipped ..... 8. Helleborns.
Sepals petaloid, deciduous. Petals small, 2-lipped. 8*. Erantlis.
Sepals 5-6, petaloid. Petals large, spurred. 9. Aquilegia.
** Flowers irregular. Follicles many-seeded.
Sepals many, the dorsal spurred.9*. Delphinium.
Sepals many, the dorsal arched and hooded 9**. Aconitum.
*     * Floveers nearly regular. Fruit a l-seeded berry ..... 10. Actæa.

## 1. Clem'atis, $L$. Traveller's Joy.

Woody, usually climbing under-shrubs. Leaves opposite, usually com. pound, exstipulate; petioles often twining. Inforescence axillary or terminal. Sepals usually 4, petaloid, valvate. Petals 0 . Stamens many. Carpels many, each with 1 pendulous ovule. Fruit a head of sessile or stalked achenes, with long bearded styles.-Distirib. All temp. climates, rarer in the tropics; species 100.-Etym. кл $\eta \mu a \tau i s$, the Greek name for this or a plant of similar habit.

1. C. Vital'ba, L. ; leaflets 3-5 remote. Old Man's Beard.

Hedges and thickets, most common on chalky soil; not a native of Scotland
or Ireland (?) ; fl. July-Aug.-A climbing under-shrub. Leaflets 2-s in.
ovate-cordate, entire toothed or lobed; petioles persistent when twining.
Flowers 1 in . diam., odorous, greenish-white. Sepals 4, pubescent. Achenes
hairy ; awns 1 in. feathery.-Distrib. Europe, from Holland southwards, N. Africa, W. Asia.

## 2. thalic'trum, $L$. Meadow-rue.

Erect perennial herbs. Leaves compound, stipulate. Floners panicled or racemed, often polygamous. Sepals $4-5$, petaloid, imbricate. Petals 0. Stamens many. Carpels with 1 pendulous ovule. Fruit a small head of sessile or stalked achenes; style persistent or deciduous.-Distrib. Temp, and colder regions of the N . hemisphere; species 50 .- Еtym. Probably the Thatictrim of Pliny.

1. T. alpínum, $L$.; raceme simple, flowers few drooping, anthers linear apiculate.
Alpine and subalpine bogs ; rare in Ireland; ascends to $4,000 \mathrm{ft}$; f. July-Aug. -Stem $4-10 \mathrm{in}$. wiry, simple, often stoloniferous. Leaves 2 -ternate; leaflets. $\frac{1}{8}$ to $\frac{1}{2} \mathrm{in}$., suborbicular, glaucous beneath, obtusely lobulate. Raceme drooping, then erect; pedicels recurved in fruit. Sepals 4, purplish. Stamens 8-20, pendulous. Achenes 2-3, stipitate, curved, ribbed.-DisTrib. N. and Arctic Europe, N. and W. Asia to Himalaya, N. America.
2. T. mi'nus, $L$.; stem more or less striate, panicle lax, flowers drooping, anthers apiculate, fruit erect.
Dry places; ascends to $1,800 \mathrm{ft}$. in the Lake District; fl. July-Aug.-Stem $\frac{1}{2}-4 \mathrm{in}$. stout, rigid, often -igzag, striate throughont or towards the nodes only, usually furrowed when dry. Leaves triangular, $3-1$-pinnate ; leaflets variable, $\frac{1-1}{} \mathrm{in}$. ; lobes 3-6, acute or obtuse ; stipules formed by the sheathing leaf-bases. Sepuls 4, yellow-green. Achenes 3-6 ovoid, ascending,
sessile. - Distrib. Europe (Arctic), N. Africa, N. and W. Asia to the Himalaya, Greenland. Various forms have sometimes stipellæ to the leaflets.
Sub-sp. Mi'NUS proper ; often glaucous and glandular, stem 6-18 in., leafless at the base, auricles of stipules spreading, achenes gibbous 8 -ribbed.VAR. 1, marit imum; branches of broad panicle spreading. Sandy sea-coasts.-VAR. 2, monta'num, Wallroth (sp.); branches of deltoid panicle erecto-patent. T. calca'reum, Jord.
Sub-sp. MA'JUs, Jacq.; stem 3 ft . leafy at the base, leaflets large, auricles of stipules reflexed, achenes compressed gibbous 10 -ribbed. T. minus, L. Herb., T. Alexuo'sum, Bernh.-More common in Scotland.
Sub-sp. Koch'II, Fries (sp.) ; stem 3-4 ft. leafy at the base; leaflets very small, auricles of stipules horizontal, achenes hardly compressed not gibbous. -Lake District, rare.
Sub-sp. saxat'ile, Schleich. (sp.) ; stem 1-3 ft., leafy at the base, auricles of stipules reflexed, flowers suberect, achenes not gibbous.-Hills of Cambridge and Somerset.
3. T. fia'vum, $L$.; stem furrowed, panicle compound, flowers erect crowded at ends of branches, anthers not apiculate.
Wet places, from Fife and Argyle southwards, rare in Scotland; local in Ireland; fl. July-Aug.-Rootstock yellow, creeping, stoloniferous. Stem 2-4 ft., stout. Leares 3 -nately 2 - 3 -pinnate ; leaflets $1-1 \frac{1}{2}$ in., 3 -lobed. Panicle subcorymbose or pyramidal ; flowers pale yellow, often umbelled. Sepals small, 6-10. Anthers bright yellow. Achenes' small, dark, $\delta$-ribbed.-DIsTrib. Europe (Arctic), N. Africa, N. Asia.
Var. 1, sphaerocar pum, Syme ; panicle usually contracted, achenes broadly oblong.-Var. 2, ripa'rium, Jordan (sp.); panicle usually lax, achenes oblong.-Var. 3, Moriso'nia, Gmel. (sp.) ; pavicle usually interrupted, fascicles of flowers small, achenes narrow oblong.

## 3. ANEMO'NE; $L$.

Perennial herbs. Leaves radical, lobed or divided, Flowers on 1- or more-flowered scapes, rarely yellow; involucre 3-partite. Sepals 4-20, petaloid, imbricate. Petals 0. Stamens many, outer sometimes deformed or petaloid. Carpels many ; ovvle 1, pendulous. Fruit a head of sessile achenes, with naked or bearded styles.-Distrib. Cold and temp. regions; species 70.-Etym. ăvemos, the wind-of obscure application.-All parts very acrid.

1. A. Pulsatil'1a, $L$.; calyx campanulate, sepals 6 silky, outer stamens reduced to glands, awns long feathery. Pasque-flower.
Chalk downs and limestone pastures; Yorkshire to Berks, and Oxfordshire to Suffolk ; fl. May-June:-Silky, 4-10 in. Rootstock stout, woody. Leaves maturing after flowering, 3 -pinnatifid; segments linear; involucre sessile, divided to the base into long linear segments. Flower $1 \frac{1}{2}$ in., solitary, inclined in bud, dull purple; peduncle lengthening after flowering. Styles of silky achenes $1_{\frac{1}{2}}$ in.-Distrib. Europe, N. Asia to Dahuria.
2. A. nemoro'sa, $L$.; sepals 6 (rarely $5-9$ ) oblong glabrous spreading, stamens all perfect, achenes with a straight style. Wood Anemone.
Woods and copses ; ascends to $2,800 \mathrm{ft}$. in the Highlands ; fl. April-May.-
Nearly glabrous, slender. Rootstock horizontal, woody. Scape 4-8 in.
Leaves few, usially remote from the scape, petioled, 3 -foliolate; leaflets
narrow, subsessile, cut lobed or pinnatifid, involucral like the radical, petioled. Flower solitary, 1-1 $\frac{1}{2} \mathrm{in}$. diam. Sepals oblong, white, rarely purple. Achenes downy, as long as the style.-Distrib. Europe (Arctic), W. Siberia, N. America.
A. apennína, $L$.; leaves 2 -nately pinnate, sepals $10-14$ narrow pale blue, achenes pointed.
Naturalized in plantations, \&ce, in England, Scotland and Ireland; fl. April.-
Glabrous. Rootstock stout, black. Scape 4-8 in. Leaves few, from the base of the scape ; leaflets pinnatifid, subacute, involucral similar. Flover $1 \frac{1}{2}$ in. diam. Sepals spreading. Head of ovoid achenes globose.-Distrib. Italy to Turkey.

$$
3^{*} . ~ A D O^{\prime} N I S, L . \quad \text { Pheasant's-EYE. }
$$

Herbs, annual or perennial. Leaves much divided. Sepals 5-8, petaloid, imbricate. Petals 5-16, yellow or red, eglandular. Carpels many; ovule 1, pendulous. Pruit, a spike or head of many achenes. Styles short, persistent. - Distrib. Temp. Europe and Asia; species 3-4. - Etym. classical.
A. autumna'lis, L.; annual, flowers globose, petals broad concave.

Naturalized in Suffolk, and S. counties, sporadic elsewhere, and in Scotland and Ireland ; an alien or colonist, Watson; fl. May-July.-Stem 8-10 in., erect, branched, very leafy. Leaves decompound, segments small, linear. Sepals greenish. Petals scarlet, with a dark basal spot, suberect, rather longer than the sepals. Head of reticulated achenes, sometimes elongate.Distrib. Europe, W. Asia, N. Africa ; introd, in America.

## 4. MYOSU'RUS, L. Mouse-tail.

Smail annual herbs. Leaves narrow, all radical. Scapes 1-flowered, leafless. Sepals 5, rarely 6-7, with a small basal spur behind, imbricate in bud. Petuls 5, rarely 6-7, small, narrow, tubular, or 0. Stamens few. Carpels many ; ovule 1, pendulous. Fruit a long spike of densely packed achenes; style short, persistent.-Distrib. Europe, S. America ; species 2.-Еtym. $\mu \hat{\text { ves and oùpá, mouse-tail. }}$

1. m. min'imus, $L$.; spike slender, style very short. Cornfields, \&ce from Northumberland southwards ; fl. April-June.-Glabrons, $2-6 \mathrm{in}$. Leaves erect, many, linear, rather fleshy. Scapes many, slender. Flowers minute, yellow-green. Sepals 5, narrow-oblong; spur appressed to the scape. Petals 5 ; limb short, ligulate. Spike of achenes dense, lengthening to $1-3 \mathrm{in} . ;$ receptacle filiform ; achenes attached by the ventral surface, minute, keeled, mueronate at the back.-Distrib. Europe, W. Asia, N. Africa ; introd. in America, \&c.

## 5. ranun'culus, L. Buttercup, Crowfoot.

Annual or perennial herbs. Lemves entire, lohed or compound ; stipules membranous or 0. Flowers usually panieled, white or yellow. Sepals 3-5, caducous, imbricate in bud. Petals usually 5, rarely 0, glandular at the hase. Stamens many. Carpels many ; style short; ovule 1, ascending. Fruit a head or spike of apiculate or beaked achenes.-Distrib. All temp. regions ; species about 160.-ЕТчм, rana, a frog.

Section 1. Batra'chium. ${ }^{1}$ Water-plants. Leaves often submerged and multifid ; stipules membranous. Peduncles usually leaf-opposed, 1-flowered. Petals white ; gland naked, yellow, basal. Achenes transversely wrinkled.

1. R. aquat'ilis, L.; floating leaves 0 or 3 -lobed or -partite, submerged $2-3$-chotomously multifid, segments capillary or linear, stipules broad, auricles free or 0 , receptacle and sometimes the achenes more or less hispid, stigma oblong.
Ponds and ditches, ascends to $1,500 \mathrm{ft}$. ; fl. May-Aug.-A very variable plant.
-Distrib. All temp. regions, except New Zealand and the Pacific.
Sub-sp. Heterophyl'lus, Auct. (sp.); floating leaves rarely 0 , submerged suborbicular, segments not in one plane, stipules broad adnate usually auricled, petals large mostly 7-9-nerved, stamens many. Also N. America and Arctic Europe.

* Segments of submerged leaves rather rigid, spreading vohen removed from the water.-Var. 1, pelta'tus, Fries (sp.) ; floating leaves reniform 3-lobed to the middle, peduncles long, receptacle spherical.-Var. 2, tloribun'dus, Bab. (sp.) ; floating leaves reniform 3 -lobed to below the middle, peduncles about as long as the leaves, receptacle spherical. - Var. 3, confu'sus, Godron (sp.); floating leaves 3 -foliolate, peduncles slender longer than the leaves, receptacle ovoid.-VAr. 4, Buudótii, Godron (sp.) ; floating leaves 3-partite, segments cuneate, peduncles stout more slender upwards, receptacle ovoid. R. aquatilis, var. Symei, Hook. and Arn.
*     * Seyments of submerged leaves collapsing, and forming a pencil when removed from the, vouter.-VAR. 5, heterophyl'lus proper, Fries (sp.); floating leaves rarely 0 , orbicular 3 -lobed to or below the middle, segments cuneate approximate, peduncles rather slender about as long as the leaves, receptacle conical.-VAR. 6, pseudo-ftu'itans, Syme (sp.); floating leaves 0 , or 3 -lobed to or below the middle, segments of submerged very long, peduncles much longer than the leaves, receptacle spherical.
Sub-sp. panto'thrix, Broteri (sp. in part); stem very slender, floating leaves 0, rarely 3 -partite or -foliolate, submerged 2 - 3 -chotomously multifid, segments not in one plane, stipules $\frac{1}{2}$-adnate, auricles large, peduncles not tapering about as long as the leaves, petals $5-7$-veined, stameus few, receptacle globose or oblong. Ponds and ditches; less common than heterophyllus.$\mathrm{V}_{\text {ar. }}$ 1, Drouétii, Schultz (sp.) ; segments of submerged leaves collapsing when removed from the water, buds oblong or obovoid.-VAR. 2, trichophyl'lus, Chaix (sp.) ; segments of submerged leaves spreading when removed from the water, buds globose.
Sub-sp. circi'natus, Sibthorp (sp.) ; floating leaves 0, submerged orbicular subsessile, segments rigid in one plane, stipules narrow altogether adnate not auricled, petals much larger than the calyx $7-9$-veined, stamens many, receptacle oblong, style cylindric. R. diva'ricatus, Schrank.-A small and very distinct form, also N. American.
Sub-sp. flu'itans, Lamk. (sp.) ; tloating leaves 0 or 3 -foliolate; submerged cuneate, segments very long ( $6-10 \mathrm{in}$.) sub-parallel linear rigid, stipules
1 The species of this section are considered by some authors as forms of one or two, by others as 20 to 30 . The comparative length of the stamens and carpels varies with age; and the shape of the achenes and styles varies with age and the position of the achenes on the receptacle; these characters are not valueless, but are aluost undefinable. For the subspecies, \&c., I have followed Syme ; who has, however, in the 1869 Report of the Botanical Exchange Club, so far modified his views, as to reduce the first four to two.
$\frac{1}{2}$-adnate, auricles large rounded, petals much larger than the calyx sometimes 2 -seriate, veins many, stamens many short, receptacle conical at length glabrous, style cylindric.-Common, a very large and distinct form.-VAR. Bach'ii, Wirtg. (sp.); leaves shorter almost sessile narrower.-Rare.
Sub-sp. Triparti'tus, $D C$. (sp.); floating leaves or all 8 -lobed nearly' to the base or 3 -partite, segments cuneate, submerged 0 or with collapsing segments, peduncles slender shorter than the leaves, stipules free, receptacle pubescent, style slender deciduous.-Surrey, Pembroke, Cornwall, Ireiand.

2. R. Lenorman'di, Schultz; leaves uniform floating or submerged alternate long-petioled orbicular-reniform, lobes or crenatures broat shallow narrowest at the base, stipules large broad $\frac{1}{8}$-adnate, petals 5 -veined twice as long as the calyx, receptacle glabrous, style usually terminal. $R$. coeno'sus, Gren. and Godr., not of Gussone.
Shallow ponds and ditches from Mid-Scotland south ; south half of Ireland; ascends to $1,600 \mathrm{ft}$. in Yorkshire ; fl. June-Aug.-Stem branched. Leuves very variable in size, rounded and more crenate than in $R$. hederaceus. Flower $\frac{1}{2}$ in. diam.-Distrib. W. Europe.
3. R. hedera'ceus, $L$. ; leaves uniform usually opposite broadly reniform 5 -angled or -lobed, lobes usually entire broadest at the base, stipules adnate longer than broad, petals narrow 3 -veined scarcely longer than the calyx, stamens few, receptacle glabrous, style lateral. R. coenosus, Gussone, not of Hook. and Arn. Ivy-leaved Ranunculus.
Shallow ponds and ditches; ascends to $2,200 \mathrm{ft}$. in Wales ; fl. May-Aug.-
Habit of R. Lenormandi. Leaves more or less angled as in the ivy, often with a semi-lunar black patch, lobes rarely notched. F'lorers very small.-
Distrib. Temp. and sub-Arctic Europe, S. Africa, Greenland.
Section 2. Hecatónia. Perennial, rarely annual. Leaves mostly radical, stipules inconspicuous or 0. Stems 2 - or more-flowered. Sepals 5. Petals 5, yellow. Achenes not tubercled (except in R. ophioglossifolius).

Leaves undivided; gland of petals with a small scale.
4. R. Lin'gua, L.; perennial, erect, leaves lanceolate sessile $\frac{1}{2}$-amplexicaul entire or toothed, achenes pitted, style broad. Spear-wort.
Marshes and ditches, from Moray south, local in Ireland ; fl. July-Sept. -Glabrous. Roots densely fibrous. Stem 2-3 ft., hollow; lower nodes rooting. Leaves $6-10 \mathrm{in} . \frac{3}{4}-1 \mathrm{in}$. broad, veins parallel and reticulated. Flowers 2 in. diam., handsome, sub-panicled.-Distrib. Temp. Europe, N. and W. Asia to the Himalaya.
5. R. Flam'mula, L. ; perennial, procumbent or ascending, leaves petioled linear- or ovate-lanceolate nearly entire, achenes minutely pitted, style minute subulate. Lesser Spear-wort.
Wet places ; ascends to $2,700 \mathrm{ft}$. in the Highlands ; fl. June-Aug.-Very variable, glabrous or slightly hairy, 4-12 in. Lowest leuzes petioled, ovate, upper more lanceolate and sessile. Flower yellow, rarely fin. diam. Hend of achenes small.-Distrib. Europe (Arctic), N. Asia, Africa, and America.
Sub-sp. Flam'mula proper; stem prostrate or erect, internodes straight, style of achenes short obtuse. A small form of this passing into the following is found (according to A. Gray) in the N. United States.
Sub-sp. REP'TANs, $L$. (sp.) ; stem creeping very slender, internodes
arching, style of minute achenes subcylindric, tip recurved. Sandy shores of Windermere and Loch Leven.
6. R. ophioglos'sifolius, Villars; annual, erect, many-flowered, lower leaves long-petioled broadly ovate or cordate, petals scarcely longer than the sepals, achenes minutely granulate small hairy, style minute.
St. Peter's Marsh, Jersey ; fl. June-Aug.-Glabrous or slightly hairy upwards
Root fibrous. Stem 6-10 in. or more, slender, decumbent at the base, branched, hollow, furrowed. Peduncles furrowed. Flowers $\frac{1}{4} \mathrm{in}$, diam.Distrib. W. and S. Eurupe.

## ** Leaves divided, gland of petals without a scale.

7. R. auri'comus, L. ; perennial, leaves orbicular 3-lobed or -partite, segments of lower obtuse cuneate cut, of upper linear spreading subentire, sepals spreading pubescent, head of downy achenes globose. Goldielocks.
Woods and copses, from Lanark and Moray southwards ; ascends to $1,600 \mathrm{ft}$. in the Highlands ; rare in the S. and W. of Ireland ; fl. April-May.-Erect, 6-10 in., branched, slender, glabrous or slightly hairy upwards. Radical leaves long-petioled. Peduncles not furrowed, pubescent. Flourrs $\frac{3}{4} \mathrm{in}$. diam. Petals larger than the downy sepals, bright yellow, often imperfect (var. depaupervitus). Achenes on tubercles of the receptacle, compressed; style slender, subulate, curved.-Distrib. Europe (Arctic), N. and W. Asia to the Himalaya.-Not acrid.
8. R. scelera'tus, $L$. ; annual, erect, stem hollow, leaves glabrous 3lohed or -partite, segments of lower lobed obtuse, of upper linear subentire, sepals reflexed hairy, head of small glabrous achenes oblong.
Ditches, \&ce., rarer in the N.; fl. May-Sept.-Roat fibrous. Stem 8-24 in., subcorymbose above. Leaves variable in lobing, upper a little hairy. Flozers $\ddagger$ in. diam. Achenes many, small, a little wrinkled on the faces, furrowed on the dorsal edge; style minute.-Distrib. Europe (Arctic), N. Asia, N. India to Bengal; introd. in America, \&c.-Very acrid.
*** Leaves divided, gland of petals with a small scale.
9. R. a'cris, L. ; perennial, hairy, erect, without runners, leaves 3-7partite, segments of lower cuneate deeply cut and lobed, of upper linear entire, peduncles not furrowed, sepals spreading pubescent, receptacle glabrous, achenes glabrous compressed margined, style recurved.
Meadows, \&c. ; ascends to nearly $4,000 \mathrm{ft}$. in the Highlands ; fl. April-Sept.Rootstock straight. Stem $8 \mathrm{in} .-\mathbf{3} \mathrm{ft}$. Leaves usually all petioled, orbicular or 5 -angled in outline, uppermost sessile. Flower 1 in . diam. Petals spreading.-Distrib. Europe (Arctic), N. Asia; introd. in America.
Mr. Syme has pointed out (Report of Bot. Exchange Club for 1869, p. 8), that the varieties Steve'ni, Reich. (sp.), vulgu'tus, Jord. (sp.), and rec'tus? Boreau (sp.), all enumerated in his English Botany (p. 38), are not the continental plants so called, but forms of Borra'nus, Jord. (sp.), and tomophyl'lus, Jord. (sp.).
10. R. re'pens, L. ; perennial, hairy, stem decumbent below with long runners, leaves 3 -foliolate or 3 -nately pinnatisect, segments cuneate lobed and toothed, those of the upper leaves more entire narrower, peduncles
furrowed, sepals spreading hairy, receptacle slightly hairy, achenes compressed glabrous margined, style hooked.
Waste ground ; ascends to $2,700 \mathrm{ft}$. in the Highlands ; fl. May-Aug.-Rootstock stout, short. Stem $8 \mathrm{in} .-2 \mathrm{ft}$. Leaves petioled, triangular or ovate; segments variable, middle usually longest. Flowers 1 in . diam. Petels generally sub-erect.-Distrib. Europe (Arctic), N. and W. Asia, N. Africa ; introd. in America.
11. R. bulbo'sus, L. ; perennial, hairy, erect, stem swollen at the base without runners, leaves 3 -foliolate or ternatisect, segments lobed, peduncles furrowed, sepals reflexed and receptacle hairy, achenes compressed glabrous margined, style short hooked.
Meadows, \&c.; ascends to $1,500 \mathrm{ft}$. in the Highlands ; fl. May-June.-Stem 6-12
in., base often as big as a walnut, sometimes corymbose above. Leuves
variable in form and lobing. Flowers $\frac{1}{2}-1 \mathrm{in}$. diam.-Distkib. Europe,
Asia, N. Africa; introd. in America.
Seotion 3. Echinelíla. Annual, rarely biennial. Roots fibrous. Leaves radical and cauline, divided ; stipules inconspicuous. Sepals 5. Petals 5, yellow. Achenes tubercled or spinose, compressed, margin thickened.
12. R. hirsu'tus, Curtis; erect, leaves 3 -lobed or -partite, segments obtuse cut, peduncles furrowed, sepals reflexed hairy, petals with a scale over the gland, receptacle hairy, achenes tubereled towards the margin, style straight. R. Philono'tis, Ehrhart.
Waste damp ground from Argyle and Forfar southwards ; rare in Scotland; absent in Ireland; fl. June-Oct.-Hairy. Stems many, 6-18 in. Learex variable in lobing. Flowers about 1 in . diam., peduncles with spreading or reflexed hairs. Achenes broad, much flattened.-Distrib. Europe, W. Asia, N. Africa.
13. R. arven'sis, L. ; erect, lowest leaves obovate or cuneate toothed, upper 3 -partite or -foliolate, segments narrow cut, peduncles not furrowed, sepals spreading, petals with a scale over the gland, receptacle hairy, achenes usually covered with hooked spines, style stout hooked.
Cornfields, from the Forth and Clyde southwards, in Ireland near Dublin only ; a colonist, Wutson; fl. May-July.-Nearly glabrous. Stem 6-24 in., solitary. Leaves variable. Flouers $\frac{1}{2} \mathrm{in}$. diam., pale. Petuls suberect. Achenes few, large.-Distrib. Europe, temp. Asia to India, N. Africa.
14. R. parvifio'rus, L. ; stems slender decumbent, leaves orbicular or reniform 3 -lobed, segments toothed, peduncles leaf-opposed or in the forks, furrowed, sepals reflexed, petals 3-5 small oblong, gland with an obscure scale, receptacle glabrous, achenes faced with hooked tubercles, style short nearly straight.
Dry banks, \&c. from Durham southwards; S. and E. of Ireland, rare ; fl. May-Aug.-Hairy. Stems and branches spreading, 6-18 in. Leaves divided to the middle or less, lowest often entire, uppermost more deeply cut into linear lobes. Flowers $\frac{1}{-\frac{1}{2}} \mathrm{in}$ diam. Achenes small.-Distrib. Europe from Denmark southwards, W. Asia, N. Africa ; introd. in America.
Section 4. Fica'ria, Dillen. (gen.). Perennial. Leaves chiefly radical,
entire, not beaked. Sepals 3-5. Petals 8-12, yellow ; gland with a scale, Achenes small.
15. R. Fica'ria, L.; leaves cordate obtusely angled or crenate, Pilewort or Lesser Celandine.
Pastures and waste places ; ascends to $2,400 \mathrm{ft}$. in Wales ; A. March-May.Glabrous. Root of stout cylindric tubers. Stem short, decumbent, branched at the base. Leteves variable, on stout petioles with dilated stipular bases. Pedrucles stout, axillary, 1-flowered. Flozers about 1 in . diam., bright yellow. Head of large subglobose smooth achenes globular ; style minute. Distrib. Europe (Arctic), W. Asia, and N. Africa.
Var. 1, diver'gens, F. Schultz; lobes of lowest leaves not overlapping at the base, lowest sheaths narrow.-Var. 2, incum'bens, F. Schultz; lobes of lowest leaves overlapping at the base, lowest sheaths amplexicaul.

## 6. Cal'tha, L. Marsir Marigold.

Herbs with stout creeping rootstocks. Leaves chiefly radical, cordate. Flowers terminal, few, white or yellow. Sepals 5 or more, petaloid, deciduous, imbricate. Petals 0. Carpels several, sessile; ovules numerous, in two series. Follicles numerous, many-seeded. Seeds with a prominent raphe and thickened funicle. - Distrib. N. and S. temp. and cold regions ; species 5-6.-Etym. кd́入äos, a cup.

1. C. palus'tris, L.; leaves orbicular reniform or deltoid toothed.

Marshes and ditch-banks ; ascends to $3,400 \mathrm{ft}$. in the Highlands ; fl. March-
May.-A coarse, glabrous, dark green, showy, very variable plant.-Rootstock short, horizontal. Stem $8 \mathrm{in} .-3 \mathrm{ft}$., suberect, prostrate, or procumbent and rooting from all the nodes. Stipules very large, membranous glairy, quite entire in bud and enclosing the young leaf, as in Magnoliacece (Dickson). Flowers 1-2 in. diam., bright golden yellow. Sepais unequal, obovate or oblong. Follicles $\frac{1}{3} \frac{-3}{4}$ in.-Distrib. Europe (Arctic), N. and W. Asia to the Himalaya, N. America.
Sub-sp. palus'tris proper; nodes not rooting, radical leaves orbicular-reniform deeply 2 -lobed at the base crenate-toothed, sinus narrow.-VAR. 1, mulga'ris, Schott (sp.) ; stem ascending many-flowered, flowers $1 \frac{1}{2}-2 \mathrm{in}$. diam., sepals contiguous, follicles spreading, beak short.-VAR. 2, Guevangérii, Boreau (sp.) ; stem ascending, flowers many smaller, sepals remote when expanded, follicles spreading, beak longer. Probably C. ripa'ria, Don, and the origin of the double-flowered Calihu of the garden.-Var. 3, mi'nor, Syme; stem procumbent, flower solitary $\frac{3}{4}-1 \mathrm{in}$. diam., sepals remote, follicles erect, beak short. Mountainous places.
Sub-sp. Rad'icans, Forster (sp.); rooting at the nodes, radical leaves deltoid obscurely 5 -angled truncate or reniform at the base, toothed, teeth triangular. Forfarshire, Don (known now in cultivation only).

## 7. TROL'LiUS, $L$. Globe-flower.

Erect perennial herbs. Leaves alternate, palmately lobed or cut. Flowers terminal, large, yellow or lilac. Sepals 5-15, petaloid, imbricate. Petals 5-15, small, narrow, claw very short, blade with a glandular pit at the base. Stamens very many. Carpels 5 or more, sessile; ovules many, 2 -seriate. Follicles, 5 or more. Seeds angled, testa coriaceous.-

Distrib. N. temp. and arctic regions; species 9.-Etym. Trol, a globe, in old German.

1. T. europre'us, $L$.; flower globose, petals equalling the stamens. Moist subalpine pastures and copses, from Worcester and S. Wales northwards, ascending to $3,300 \mathrm{ft} . ; \mathrm{N}$. of Ireland only, and very rare ; fl. June-Aug. -Glabrous. Rivotstock short, crowned with rigid fibres. Stem 6-24 in., simple, leafy. Ruclical leuves petioled, suborbicular, 5 -partite, segments cuneate lobed and cleft; cauline smaller, sessile. Flozers $1-1 \frac{1}{2} \mathrm{in}$. diam., pale yellow. Sepals orbicular, concave. Petals oblong. Stumens short. Follicles transversely wrinkled, keeled, beaked. Seeds many, testa black dotted. -Distrib. Europe (Arctic) to the Caucasus.
2. helleb'orus, l. Hellebore, Bear's-foot.

Coarse perennial herhs. Leaves palmately pedately or digitately lobel, upper bract-like. Flowers corymbose. Sepals 5, large, petaloid or herbaceous, imbricate, persistent. Petals small, tubular, 2-lipped. Stamens many. Carpels free, or united below; ovules many, 2 -seriate. Follicles few or many, dehiscing at the top. Seeds many, oblong, funicle thickened, testa crustaceous, shining.-Distrib. Europe, N. and W. Asia; species 10.Etym. èneìr to injure, and Bopa food.

1. H. vi'ridis, $L$.; stem few-flowered annual, radical leaves digitate, cauline sessile, sepals spreading.
Woods, hedges, \&c. chiefly on chalk in the S. and E. of England, often naturalized ; a denizen, Watson ; fl. March-April.-Glabrous, dark-green, 1-1 $\frac{1}{2} \mathrm{ft}$. Radical leaves fully developed after flowering; leaflets 5-7, narrow, serrate, lateral cleft. Flowers inclined, $1 \frac{1}{2} \mathbf{2} \mathrm{in}$. diam. Sepals green, oblong. Petals 9-12, minute, shorter than the stamens, curved. Follicles 3; style straight, subulate. - Distrib. Europe, from Holland southwards, exclusive of Russia ; introd. in U. States. Occasionally used as a substitute for $H$. officinalis.
2. H. foe'tidus, $L$. ; stem many-flowered perennial, leaves pedate, sepals erect. Stinking Hellebore.
Chalk-pastures and thickets S. and E. of England, rare, naturalized elsewhere, but indigenous in Suffolk ; a denizen, Watson ; fl. Feb.-March.-
Glabrous below, glandular-pubescent above. Stem 1-2 ft. leafless, searred below. Lover leaves petioled, leaflets 5-7, nearly as in H. viridis, but the outer segments recurved, upper with large sheaths. F'lowers drooping, 1 in . diam. Sepuls green, bordered with dull-purple, truacate. Petuls shorter than the stamens. Follicles 3, wrinkled, glandular, style subulate-Distrib. W. Europe, from Belgium southwards.-Plant foetid and cathartic.

## 8*. ERAN'THIS, Salisbury. Winter Aconite.

Low herbs. Rootstock stout, creeping. Radical leaves palmate ; cauline whorled and involucriform. Flower solitary, yellow. Sepals 5-8, narrow, petaloid, deciduous, imbricate. Petals small, clawed, 2 -lipped. Stamens many. Carpels 5-6 stipitate. Follicles many-seeded. Seeds ovoid or globose, testa smooth crustaceons. - Distrib. Europe and N. Asia; species 2. -Etym. Épos spring, and antos flower.
E. hyema'lis, Salisb.; sepals 6-8 oblong.

In plantations, parks, \&c., naturalized; fl. Jnn.-March.-Stem 4-6 in. Radical
leaves orbicular, 3-5-partite, segments obtusely lobed; petiole long. Involucre of 2 sessile lobed bracts. Flower cup-shaped, $1-1 \frac{1}{2} \mathrm{in}$. diam. Sepals pale yellow. Petals shorter than the stamens. Follicles as in Helleliorus, but free and stipitate.-DIstrib. W. Europe, from Belgium southwards.

## 9. AQuile'gia, L. Columbine.

Erect herbs. Rootstock perennial. Leaves 3 -nately divided. Plowers panicled or solitary, handsome. Sepals 5, regular, petaloid. Petals 5, concave, spurred behind. Stamens many, inner imperfect. Carpels 5, manyovuled. Follicles 5. Seeds many, testa crustaceous smooth or granulated. -Distrib. N. temp. zone ; species 5-6.-Etym. aquila, from the form of the petals.

1. A. vulga'ris, L.; spur hooked, follicles cylindric hairy.

Woods and thickets, but often naturalized, ascending to $1,000 \mathrm{ft}$. in Yorkshire;
N., E., and W. Ireland ; fl. May-July.-Rootstock stout, blackish. Stem 1-2 ft., slender. Radical leaves fascicled, petioles long, 2-3-ternately divided, segments stalked, lobed, glaucous, glabrous, or pilose beneath. Florers $1 \frac{1}{2}-2 \mathrm{in}$. diam., loosely corymbose, drooping, blue or dull purple, (white or red in garden varieties). Sepals ovate-lanceolate. Petals oblong, spur curved, involute at the tip. Inner stumens reduced to broad wrinkled white filaments. - Distrib. Europe, Canaries, Siberia, Asia to the W. Himalaya.

$$
\mathbf{9}^{*} . \text { DELPHIN'IUM, L. Larkspur. }
$$

Erect, annual or perennial herbs. Leaves alternate, lobed or cut. Flowers racemed or panicled. Sepals 5, cohering below, dorsal spurred behind. Petals 2-4, small, spurs of the 2 dorsal developed within that of the sepal, 2 lateral spurless or 0. Stamens many. Follicles 1-5. Seeds many, testa coriaceous wrinkled or plaited.-Distrib. N. temp. zone; species about 40 . -Етум. $\delta \in \lambda \phi(\nu$, from the form of the flower.

1. D. AJa'cis, Reich. (not L.) ; racemes long, lower bracts lobed, follicles solitary pubescent. D. Consol'ida, Brit. Fl. (not L.).
Cornfields, naturalized in Cambridgeshire, sporadic elsewhere; alien or colonist,
Watson; fl. June-July.-Annual, pubescent. Stem 10-18 in., slender, sparingly branched. Leaves cut into many narrow linear lobes, lower petioled, upper sessile. Flower 1 in . diam., blue, white or pink. Sepals spatbulateoblong, spur $\frac{1}{2} \mathrm{in}$. Petals 2. Follicle $\frac{3}{4} \mathrm{in}$., cylindric ; style short. Seeds continuously plaited all round.-Distrib. Central and S. Europe, N. Africa ; introd. in U. States.-Syme observes that D. Aja'cis, Reich. (and continental authors), is not the plant of Linnæus (which is orienta'le of Gay); hence the present plant should have a new name: but as the names Censol'ida, orienta'ls, and Aja'cis are now fixed, it is unwise to disturb the present arrangement. D. Consol'ida, L., has been once found in cornfields in Jersey; it has glabrous follicles shorter than those of D. Aja'cis, short racemes and seeds with interrupted ridges.

$$
\mathbf{9}^{* *} \text {. ACONI'TUM, L. Monkshood, Wolfsbane. }
$$

Erect perennial herbs. Leaves alternate, palmately-lobed or cut. Flowers panicled or racemed. Sepals 5, dorsal large, arched, hooded; anterior narrowest. Petals 2-5, small; 2 upper with long claws, hooded at the tip, covered by the sepaline hood; 3 lower small or 0 . Carpels 3-5,
many-ovuled. Follicles 3-5. Secds many, testa spongy rugose.-Distrib. Mountains of the N. hemisphere.-Etym. classical.
A. Napel'lus, $L$.; leaf-lobes pinnatifid, raceme simple dense-flowered.

Shady places near streams, native (?) in Wales, Hereford and Somerset, naturalized elsewhere; a denizen? Watson; fl. July-Sept.-Rootstock fusiform, black. Stem 1-2 ft., ereet, slightly pubescent. Leaves palmately 5-7-partite ; petiole dilated at the base ; upper often sessile. Florers bracteate and bracteolate, 1-1. $\frac{1}{2} \mathrm{in}$. diam. dark blue, horizontal ; pedicels erect, pubescent. Upper sepal at first concealing the others, then thrown back. Spurs of upper petals conical, deflexed. Filaments dilated below. Anthers greenish-black. Follicles 3-5, sub-cylindric, beaked.-Distrib. Europe, Siberia, W. Asia to the Himalaya.-A deadly acrid poison.

## 10. Actere'A, L. Bane-berry, Herb Christopher.

Erect perennial herbs. Leaves alternate, 3-nately compound ; stipules aduate. Flowers small, in short crowded racemes. Sepals 3-5, rather unequal, petaloid. Petals 4-10, small, spathulate, or 0. Carpel 1, manyovuled; stigma sessile, dilated. Berry many-seeded. Seeds depressed, testa crustaceous smooth.-Distrib. Colder regions of the N. hemisphere ; species 1 or 3.-Етум. $\alpha_{\kappa \tau}$ и, the Elder, from a fancied resemblance.

1. A. spica'ta, $L$. ; raceme simple, fruiting pedicels slender.

Copses on limestone, Yorkshire, Lake District, ascending to $1,000 \mathrm{ft}$; native?
Wutson ; fl. May.-Rootstock stout, black. Stem 1-2 ft., perennial, simple or sparingly branched. Radical leaves on long petioles, 2-3-ternately-pinnate; leatlets 1-3 in., ovate, acuminate, lobed and serrate, dark green, glabrous; stipules adnate, auricles short rounded. Racemes 1-2 in., solitary or few, oblong ; peduncle pubescent. Flowers $\frac{1}{4} \mathrm{in}$. diam., white ; pedicels pubescent, spreading in fruit. Sepals obtuse, caducous. P'etals minute or 0 . Filuments dilated above. Bervy $\frac{1}{\frac{1}{2}} \mathrm{in}$. long, ovoid, nearly black.-Distrib. Temp. and Arctic Europe, Asia, and N. America (a red-berried var.).-Nauseous, poisonous.

## Order II, BERBERID'EA.

Herbs or shrubs, ereet or climbing; buds scaly. Leaves alternate, simple or compound, usually exstipulate. Inflorescence various ; flowers often globose. Sepals petaloid. Petals hypogynous, numerous, distinct, multiples of 2,3 or 4 , never of 5 , imbricate or the outer valvate. Stamens one opposite each petal; anthers opening by 2 aseending lids or valves. Carpel 1, 1-celled; stigma usually peltate ; ovules 2 or more, basal or on the ventral suture, anatropous, raphe ventral. Fruit a berry or capsule. Seeds albuminous; embryo various.-Distrib. Most cool regions, except Australia and S. Africa; genera 20, species 100.-Afrinities. See Ramunculacere; allied to Menispermacees; analogy in anther with Laurinee and in the 3 -nary floral whorls with Monocotyledons. - Properties. Astringent, and yield a yellow dye. Berries of Berberis acid and eatable.

## 1. Ber'beris, $L$. Barberry.

Spiny shrubs, wood yellow. Leaves spinous-toothed, jointed on the very short petiole, often reduced to 3 -7-fid spines. Flowers racemed,
solitary or fascicled, yellow, globose. Sepals 8-9, outer minute, imbricate. Petals 6, in 2 series, 2-glandular at the base, imbricate. Stamens 6, free. Ovules few, hasal, erect. Berry 1-2-seeded. Seed oblong, testa crustaceous, albumen fleshy ; embryo straight.-Distrib. N. temp. regions, sub-trop. Asia, temp. S. America; species 50.-Etym. Arabic.

## 1. B. vulga'ris, L.; leaves obovate spinous-serrate.

Copses and hedges, not uncommon in England, naturalized in Scotland and Ireland; fl. May-June.-An acid shrub, 4-6 ft. Leaves on the woody shoots reduced to 3 -7-forked (rarely simple) spines jointed on to a very short sheath, and bearing fascicles of leaves (reduced branches) in their axils; leaves on the annual shoots $1-1 \frac{1}{2}$ in., alternate, shortly petioled. Flowers $\frac{1}{4}-\frac{1}{3} \mathrm{in}$. diam., in terminal pendulous racemes, pale yellow ; bracts short, triangular. Stigma broad, sessile, black. Berry $\frac{1}{2} \frac{\mathrm{in}}{} \mathrm{i}$. long, oblong, compressed, slightly curved, orange-red,-Distrib. Eunope, temp. Asia, N. Africa ; introd. in U. States.

## Order III. NYMPH feA'CEAE.

Aquatic perennial herbs. Leaves usually floating often peltate, involute in vernation. Scapes 1-flowered, naked. Floral whorls all free and hypogynous, or adnate to a fleshy disk that envelops the carpels. Sepals 3-5. Petals 3-5 or many. Stamens many. Carpels 3 or more in one whorl, free, or adnate with the disk into a many-celled ovary ; styles as many as carpels, stigma peltate or decurrent; ovules few or many, scattered over the walls of the cells, anatropous or orthotropous. Fruit a berry, its carpels consolidated, or separate and indehiscent. Seeds naked or arillate, albumen floury or 0 ; embryo enclosed in the enlarged amniotic sac.-Distrib. Temp. and trop.; genera 8 ; species $30-40$.-Affinities. With Papaveracew, but not close; presents analogies with Hydrocharidece and Villarsia. -Properties unimportant.

1. Nu'phar, Smith. Yellow Water-lily, Brandy-bottle.

Flowers yellow, globose. Sepals 5-6, concave. Petals many, small, hypogynous. Stamens many, inserted beneath the disk; filaments short flattened. Carpels many, together forming a many-celled ovary ; stigma peltate, rayed; ovules many. Berry ovoid, of separable carpels. Seeds small.-Distrib. N. temp. hemisphere; species 3-4. -Etym. Arabic naufar.

1. N. 1u'teum, $L_{0}$; leaves rotundate, base deeply 2 -lobed, lobes usually contiguous, anthers linear, margin of stigma entire or waved 10-20-rayed.
Still waters from the Caledonian Canal south; ascends to near 1,000 ft. in
Yorkshire ; fl. June-Aug.-Rootstock creeping in mud ; bud terminal. Sulmerged leaves membranous, waved; floating coriaceous; petioles obtusely 3 -gonous at the top. Flower yellow, fragrant, odour alcoholic. Sepals concave. Petals 18-20, obovate-cuneate, thickly coriaceous, with a subterminal glandular pore. Berry ovoid, rostrate.-Distrib. Europe (Arctic), temp. Asia, N. America-Rootstock abounds in tannic acid.

Var. 1, május, Syme; flower 2-3 in. diam., stigma generally entire 15-20 rayed.-Var. 2, mi'nus, Syme; flower $1 \frac{1}{2} \mathrm{in}$. diam., stigma waved at the margin 10-14-rayed.-Chartner's Lough, Northumb.
2. N. pu'milum, Smith; leaves oblong deeply' 2 -lobed at the base, lobes at length spreading, anthers oblong, stigma lobed at the margin, rays $8-10$ reaching the margin.
Small lakes in Scotland, and Ellesmere in England, rare ; fl. June-Aug.-
Very similar to $\boldsymbol{N}$. luteum, var. minus, differing in the smaller more orbicular petals, shorter anthers, and in the stigma. Petiole 2-edged. -
Distrib. N. and Central Europe, N. Asia.

## 2. NYMPHAE'A, $L$. White Water-lily.

Habit of Nuphar, lut flowers expanded, white blue or red, and fruit ripening under water. Sepals 4, adnate to the base of the disk. Petals in many series, inuer successively transformed into stamens, both adnate to the disk. Carpels many, in 1 series, sunk in the fleshy disk, and with it forming a many-celled ovary, crowned by the connate radiating styles; ovules many, anatropous. Fruit a spongy berry. Seeds buried in pulp, all but enclosed in a sac-like fleshy aril.-Distrib. Most temp. and trop. regions, except N. Zealand and the Pacific Isles ; species 20.-Etym. dedicated by the Greeks to the nymphs.

1. N. al'ba, $L$. ; leaves orbicular base cordate quite entire horizontal. Lakes and ponds, ascending to $1,000 \mathrm{ft}$. in the Lake District; fl. June-Aug.Rootstock stout, fleshy; buds terminal. Leaves $5-10 \mathrm{in}$. diam. floating, deeply 2 -lobed at the base; lobes contiguous; petioles very long. Flowers concave. Sepals linear-oblong, white, green at the back. Petuls oblong, obtuse, white, with no glandular pore. Outer stemens with petaloid filaments. Fruit globose ; stigmatic rays 15-20.-Distrib. Europe (Arctic), N. Africa, N. and W. Asia to the Himalaya, N.W. America.

## Order IV. papavera'cefe.

Annual or perennial herbs; juice milky or coloured. Leaves radical or alternate, exstipulate. F'lowers usually nodding in bud, envelopes and stamens very caducous. Sepals 2, concave. Petals 4, crumpled. Stumens very many, hypogynous, filaments slender ; anthers erect, insertion basal, bursting laterally. Ovary 1 -celled, or $2-4$-celled by prolonged placentas; style short or 0 , stigmas radiating connate opposite the placentas, or separate and alternating with these; ovules in many rows on parietal placentas, anatropous, mieropyle below, raphe lateral. Capsule dehiseing by pores or valves. Seeds many, small, albumen oily and fleshy ; embryo minute, 2 -fid.-Distrib. N. temp, zone chiefly ; genera 17 ; species 65. -Affinities. With Fumariacee, Berberidea, Ranuneulacee, and Cruci-feree.-Properties. Narcotic, emetic, purgative or acridly poisonous.

> * Capsule dehixcing by pores or very small valves.

Stigmas 4 or more sulsessile, forming a radiating disk.............1. Papaver.
Stigmas 4-5, deflexed on a conical clavate style .................2. Meconopsis. ** C'ipsule dehiscing to, or reurly to, the base by valves.
Ovary 1-celled. Seeds crested. Flower yellow ..............3. Chelidonium.

Ovary more or less completely 2 -celled. Flower yellow ..........4. Glaucium.
Ovary 1-celled. Seeds not crested. Flower violet..................5. Romeria.

## 1. PAPA'VER, L. Poppy.

Annual herbs; juice milky. Leaves lobed or cut. Flowers on long peduncles. Ovary 1-celled ; style short or 0, stigma discoid or pyramidal with radiating lobes opposite the placentas which project into the cell. Capsule short, opening by very small valves under the lobes of the persistent stigma. Seeds small, pitted.-Distrib. Europe, N. Africa and N. Asia, with one S. African and one Australian ; species 12. Flowers sometimes 3 -merous, and the placentas hardly projecting.-Etym. obscure.

1. P. hyb'ridum, L.; leaves $2-3$-pinnatifid sparingly hispid, filaments dilated upwards, capsule globose sessile bristly, stigma convex, rays 4-8.
Dry fields and waste places from Durham and Carnarvon southwards; rare in Ireland ; a colonist, Watson; fl. May-July.-Stem 10-18 in., sparingly branched. Leaves with acute or awned lobes. Flower 1-2 in. diam. searlet, with a black disk. Capsule $\frac{1}{2} \mathrm{in}$. Stigmatic rays reaching or exceeding the edge of the disk.-Distrib. Europe, N. Africa, W. Asia to the Himalaya.
2. P. Argemo'ne, $L$.; leaves 2 -pinnatifid, filaments dilated upwards, capsule clavate usually hispid, stigma convex, rays 4-6.
Waste dry places ; rare in Ireland ; a colonist, Watson; fl. May-July.Habit. \&cc. of P. hybridum, but weaker, flowers smaller and paler, petals narrower, and capsule very different. The smallest British species.Distrib. Europe, N. Africa, W. Asia, introd, in America.
3. P. du'bium, L.; leaves 1-2-pinnatifid, filaments filiform, capsule sessile obovoid glabrous, stigma 6-12-rayed.
Waste places ; a colonist, Watson ; fl. May-July.-Habit of succeeding species.
Hairs of peduncle appressed. Pairs of petals unequal.-Distrib. Europe, N. Asia, N.W. India; introd. in America.

Sub-sp. Lamot'ter, Boreau (sp.) ; leaf-lobes shorter, capsule narrowing from just below the stigma to the base, lobes of stigmatic disk spreading. A bundant. Sub-sp. Lecoq'il, Lamotte (sp.) ; leaf-lobes longer, capsule broadest at $\frac{1}{3}$ below the stigma, lobes of stigmatic disk deflexed. England and Ireland, rare.
4. P. Rhœ'as, L. ; leaves $1-2$-pinnatifid, filaments filiform, capsule subglobose glabrous, stigma convex with overlapping lobes, rays 8-12.
Cornields and waste places ; rare N. of the Tay ; a colonist, Watson; fl. JuneAug. Stem branched, hispid. Leaf lobes ascending, with a bristle at the tip. Peduncles with spreading or appressed hairs. Flowers 3-4 in. diam. scarlet; pairs of petals unequal. C'apsule stipitate.-Distrib. Europe, N. Africa, W. Asia to India.
P. somníferdm, $L$.; glancous, glabrous or setigerous, leaves amplexicaul sinuate-lobed or toothed, flowers large white or blue-purple, filaments slightly dilated upwards, eapsule ovoid or globose stipitate. Opium Poppy. Cornfields and waste places, sporadic. Established in Kent, Syme ; fl. July-

Aug. - This has no claim to be called English. It varies in the shape of the capsule, colour of the flower, and has black or white seeds.-Distrib. Europe,
W. Africa, all Asia ; introd. in N. America.

## 2. MECONOP'sis, Viguier. Welsh Poppy.

Perennial herbs; juice yellow. Leaves entire pinnate or pinnatifidly lobed. Flowers solitary or racemed. Ovary 1-celled; style distinct, stigma dilated or club-shaped radiating; placentas 4 or more projecting parietal. Capsule ovoid or elongate, with short valves below the persistent style. Seeds small, testa rugose.-Distrib. Mountainous regions of the N. hemi-

1. M. cam'brica, Vig.; leaves pinnate, lobes pinnatifid.

Moist glens in Devon, Somerset, York, Westmoreland, and Wales, ascending about $2,000 \mathrm{ft}$., and Ireland ; naturalized in Scotland ; fl. June.-Nearly glabrous. Rootstock stout, branched, tufted; roots thick. Stem $1-2 \mathrm{ft}$., woolly at the base. Leaves petioled, pale green, segments distinct or decurrent, ovate-lanceolate, lobed and toothed. Flovers $2-3 \mathrm{in}$. diam., pale yellow ; peduncles long. Sepals hairy. Petals orbicular. Style short ; stigma capitate, 4-6-rayed. C'apsule 4-6-valved, ribbed.-Distrib. W. Europe, from Ireland to the Pyrenees.

## 3. Chelido'nium, $L$. Celandine.

Erect, branched perennial herbs ; juice yellow. Leaves much divided. Flowers yellow. Ovary 1-celled ; style dilated at the top, stigmas 2 adnate reflexed; placentas 2, slender, parietal. Capsule linear; valves thin, separating upwards from the persistent placentas and style. Seeds with a shining testa and crested raphe.-Distrib. Europe and Japan ; species 2. -Etym. doubtful.

1. C. ma'jus, $L$. ; leaves 1-2-pinnate, flowers small.

Waste places, hedgerows, in the S. of England, elsewhere an obvious escape,
probably naturalized only ; a denizen, Watson; fl. May-Aug.-Stem 1-2 ft.,
brittle, sparingly hairy, leafy. Leaves membranous, glabrous beneath; segments 1-2 in., ovate, toothed and lobed ; petiole dilated at the base.
Flozers ${ }^{3}-1$ in. diam., in loose few-flowered umbels, yellow ; pedicels slender; bracts whorled. Capsule $1 \frac{1}{2}$ in., readily dehiscing, valves torulose.-A variety occurs in cultivation with laciniate petals. - Distrib. Europe (Aretic), Siberia, W. Asia to Persia ; introd. in N. America.

## 4. Glau'crum, Juss. Horned Poppy.

Glancous herbs ; juice yellow. Leaves lobed or cut. Flowers large, yellow or purple ; peduncles long. Ovary 2-celled; style short or 0 ; stigmatic lobes 2, deflexed, opposite the placentas. Ovules very many; placentas 2, narrow, meeting in the axis of the ovary. Capsule long, narrow, 2 -valved almost to the base. Sceds many, sunk in the spongy septum, testa pitted.-Distrib. Chiefly Mediterranean ; species 5-6. The false dissepiment of the ovary (formed by the placentas as in Cruciforoc) is sometimes incomplete, and 3 placentas occasionally occur.-Етум. $\boldsymbol{\gamma}^{\lambda a v i c i o v, ~ b l u e, ~ f r o m ~ t h e ~ h u e ~ o f ~ t h e ~ p l a n t s . ~}$

1. G. lu'teum, L.; leaves $\frac{1}{2}$-amplexicaul, capsule tubercled. Sandy sea-shores from the Forth and Clyde southwards, and all round Ireland; fl. June-Oct.-Glaucous, sub-hispid, annual, sometimes perennial. Stem ]-2 ft., branched, erect or ascending. Radical leceves 2 -pinnatifid, rough with stout hairs ; lobes pointing various ways. Flowers $2-4 \mathrm{in}$. diam., golden yellow ; peduncles short, glabrous. Petals in opposite dissimilar
pairs. Pod curved, a foot long, glabrous; stigmatic lobes spreading. -Distrib. Europe, N. Africa, W. Asia; introd. in U. States.

## 5. RCEME'RIA, $D C^{\prime}$.

Annual herbs; juice yellow. Leaves much cut. Flowers long-peduncled, violet. Sepals 2. Petals 4. Ovary 1-celled; stigma sessile, lobes 2-4, deflexed, opposite as many slender placentas; ovules many. Capsule linear, 2-4-valved nearly to the base. Seeds many, testa rough. Distrib. Cornfield plants of Europe and W. Asia; species 2.-Etym. J. F. Romer, a German botanist.

1. R. hyb'rida, $D C$.; leaves 3 -pinnatifid, capsule 3 -valved. Glau'cium viola'ceum, Juss.
Dry soil, Swaffham Prior, Cambs and Norfolk ; a colonist, Watson ; fl. MayJune. - Habit of Papaver Argemone, glabrous or slightly hairy. Stem erect. Leaves 1-or 2-pinnatifid, segments tipped by a bristle. Flower 2-3 in. diam., violet-purple with a black disk. Sepals hairy. Capsule 2-3in., cylindric., hispid above.-Distrib. Central and S. Europe.

## Order V. fumaria'cere.

Annual or perennial herbs; juice watery. Leaves usually divided. Flowers racemose. Sepals 2, small, scale-like, deciduous. Petals 4, in 2 usually very dissimilar pairs; 2 outer larger, one or both gibbous or spurred; two inner smaller, erect, often coherent at the tips. Stamens (in the British species) 6 , in 2 bundles opposite the 2 outer petals; anther of central stamen in each bundle 2 -celled, of lateral 1 -celled. Ovary 1 -celled; style long or short, stigma obtuse or lobed; ovules two or more, amphitropous ; placentas parietal. Fruit a 2 -valved many-seeded capsule, or an indehiscent 1 -seeded nut. Seeds albuminous, raphe sometimes appendaged ; embryo minute.-Distrib. Natives of the temp. and warm N. hemisphere, and S. Africa; genera 7 ; species 100 . -Affinities. Close with Papaveraceo, near Cruciferce in the structure of the fruit of several.-Properties. Astringent, acrid, and reputed diaphoretic.

## 1. FUMA'RIA, L. Fumitory.

Annual, rarely pereunial herbs; usually branched, often clinibing. Leaves mnch divided; segments very narrow. Flowers small, in terminal or leaf-opposed racemes. Petals 4, erect, conniving; 2 outer dissimilar, one gibbous or spurred at the base, the other flat; 2 inner narrow, cohering by their tips, winged or keeled at the back. Stamens 6, in 2 bundles opposite the outer petals : one filament usually spured. Ovary 1-celled; style filiform, stigma entire or shortly lobed; ovules 2 , on 2 placentas. Fruit 1-seeded, indehiscent, globose.-Distrib. Europe, Asia, following cultivation ; species 6.-Etym. doubtful.-The following species are by many considered as varieties of one.

1. F. capreola'ta, L.; climbing by the twisting petioles, leaf-segments flat, sepals ovate toothed below at least as broad and $\frac{1}{3}-\frac{2}{3}$ as long as the corolla-tube, lower petal gradually dilated at the tip, pedicels longer than the bracts, fruit globose contracted into a neek at the base not retuse.

Fields and waste places ; a colonist, Watson ; fl. May-Sept.-Stems 1-2 ft. or more, branched. Leuves 2 -pinnate; segments broad. Florer $\frac{3-1}{3}$ in. Rucemes lax-flowered, not much elongated in fruit.-Distrib. Europe, N. Africa, W. Asia.

Sub-sp. Pallidiflo'ra, Jordan (sp.) ; sepals denticulate $\frac{1}{2}-\frac{2}{3}$ as long as the corolla-tube, petals cream-coloured tipped with purple, fruit longer than broad, neek narrower than the dilated top of the recurved pedicel, with 2 deep pits at the top. -S.W. England.
Sub-sp. Borét, Jordan (sp.) ; sepals $\frac{1}{3}$ as long as and broader than the corollatube, petals pale purple tipped with darker, fruit broader than long, neck narrower than the dilated top of the spreading pedicel, with two deep pits at the top.-Common.
Sub-sp. Confu'sa, Jordan (sp.) ; sepals $\frac{1}{3}$ as long and nearly as broad as the corolla-tube, petals pink tipped with purple, fruit subrugose when dry, a little longer than broad, neek broader than the dilated top of the erectopatent pedicel, with two broad shallow pits at the top. $F$. agra'ria, Mitten.
Sub-sp. mura'lis, Sonder; flowers smaller and laxer, sepals as in con 'u'su, corolla rosy tipped with purple, fruit finely rugose when dry, neck narrower than the dilated top of the erecto-patent pedicel, with 2 inconspicuous pits at the top.-England only, rare.
2. F. officina'lis, $L$.; diffuse, leaf-segments flat, sepals ovate-lanceolate $\frac{1}{3}$ as long and half as broad as the corolla-tube, lower petal abruptly dilated at the tip, pedicel ascending longer than the bracts, fruit depressed-spherical, rugose when dry, with a large shallow pit at the top.
Waste places, ascending to near 1,000 feet in N. of England ; a colonist, Watson ; fl. May-Sept.-Smaller than F. caprenlata, leaves more divided, flowers smaller and raceme much elongated after flowering. Flower dark or pale rose-purple. -Distrib. Europe, N. Africa, W. Asia ; introd. in U. States.
3. F. densifio'ra, $D C$.; diffuse, leaf-segments flat or slightly channelled, sepals broadly ovate toothed half as long as and broader than the corollatube, lower petal abruptly dilated at the tip, pedicels erecto-patent about as long as the bracts, fruit globose rugose when dry, with 2 shallow pits at the top. F. calycina, Bab.; micran'tha, Tagasca.
Waste places, from Forfar and Elgin southwards; a colonist. Watson; fl. May-Sept.-Habit of $F$. officinulis, but weaker, leaf-segments smaller and narrower, flowers smaller, racemes short, much elongated after flowering, flower $\frac{1-\frac{1}{3}}{} \mathrm{in}$. pale, bracts coloured.-Distrib. Europe, N. Africa, W. Asia to India.
4. F. parvifo'ra, Lamk.; diffuse, leaf-segments flat or slightly channelled, sepals ovate- or linear-lanceolate toothed $\frac{1}{1}^{10}-\frac{1}{6}$ as long and not half as broad as the corolla-tube, lower petal abruptly enlarged at the tip, pedicels erecto-patent equal to or exceeding the bracts, fruit globose rugose when dry, with 2 pits at the top. $F$. tenuisectu, Syme.
Waste places, \&cc. from Mid. Scotland southwards ; a colonist, Watson ; fl. June-Sept.-Best distinguished by habit, by the narrow leaf-segments, small pale flowers and minute sepals.-Distrib. Europe, N. Africa, N. and W. Asia to India.
Sub-sp. Parviflóra proper; leaf-segments channelled, racemes denseflowered, sepals triangular-ovate $\frac{1}{8}$ as long and $\frac{1}{\frac{1}{2}}$ as broad as the corolla-
tube, pedicels as long as the bracts, fruit pointed at the top. England, rare.
Sub-sp. Vaillan'tiI, Loisel. (sp.); leaf-segments flat, racemes lax-flowered, sepals lanceolate is as long and $\frac{1}{3}$ as broad as the corolla-tube, pedicels longer than the bracts, fruit rounded at the top.- Yorkshire and S.E. England.

## 2. CORYD'ALIS, $D C$.

Erect herbs, with a tuberous rootstock, or weak and diffuse, or slender and climbing by tendrils. Leaves much divided, alternate or subopposite. Racemes terminal or leaf-opposed. Sepals 2, seale-like. Floral characters of Fumaria, but the ovules more numerous, and fruit an inflated 2 -valved capsule. Seeds small, raphe often crested.-Distrib. Chiefly Mediterranean and Himalayan, a few American and African ; species 70.-Етym. Greek for a Fumaria.

1. C. clavic'ulata, $D C$.; annual, branched, climbing by branched tendrils terminating the petioles.
Copses, banks, and thatched roofs ; ascending to near $1,000 \mathrm{ft}$; N.E. of Ireland only ; fl. June-Aug. - Stems $1-3 \mathrm{ft} .$, brittle, slender. Leaves glaucous, pinnate, 3 - or digitately 5 -foliolate ; segments small, ovate or oblong. Puccemes opposed to the leaves ; pedicels very short; bracts cuspidate. Flower's $\frac{1}{4}$ in., straw-coloured; spur very short. Pods $\frac{1}{4} \mathrm{in}$. linearoblong. Testa shining, granulate.-Distrib. W. Europe, from Denmark and Germany to Spain.
C. lu'tea, $D C$. ; perennial, root fibrous, stems many diffuse, leaves 2-3ternately pinnate, raceme leaf-opposed, flowers yellow.
Old walls; an escape from cultivation; fl. May-Aug.-Rootstock branched. Stem 6-12 in., angular. Leaves on long petioles, leaflets oblong ovate or obovate, entire or lobed. Peduncles long ; bracts lanceolate, erose. Flovers $\frac{1}{2}-\frac{3}{4}$ in., subsecund ; spur short, thick, incurved. Pod oblong, compressed acuminate ; style decidnous.-Distrib. W. Europe from Belgium southwards.
C. sol'ida, Hook. ; perennial, rootstock tuberous, stem simple, leaves 2-3-ternately pinnate, raceme terminal, flowers purple. C. bulbo'sa, DC.
Banks and cultivated ground, naturalized in England ; fl. April-May.-Very glaucous. Rootstock 1 in . diam. and upwards. Stem 6-10 in., stout, with one or two oblong scales below, and a few leaves about the middle. Leaves on stout petioles; leaflets broad. Flovers 1 in . subsecund, bracts lobed, leafy; spur longer than the rest of the corolla. Pod narrow, lanceolate ; style persistent. Cotyledons connate.-Distrib. Europe, from Denmark southwards.

## Order VI. crucif'zrfe.

Herbs. Radical leaves in a rosette, cauline alternate, exstipulate. Flowers racemed. Sepals 4, free; 2 lateral (opposite the placentas) often larger and saccate at the base, imbricate in bud. Petals 4, free, hypogynous, placed crosswise, imbricate in bud. Stamens 6 (rarely 1, 2, or 4), in 2 series; 2 outer opposite the lateral sepals; 4 inner longer, in opposite pairs. Disk with usually 4 glands opposite the sepals. Ovary 2 -celled, by a vertical prolongation of the placentas, or 1 -celled,
or with superimposed cells; style short or 0 , stigma simple or 2 -lohed, lobes opposite the placentas; ovules usually many, 2 -seriate on 2 parietal placentas, rarely solitary and erect, amphitropous or campylotropous, raphe ventral, micropyle superior. Fruit usually a long or short 2 -celled and 2 -valved capsule ( $p o d$ ) ; valves deciduous, leaving the seeds on the persistent placentas (replum), rarely indehiscent, or transversely jointed with 1 -seeded joints. Seeds small, albumen 0 ; cotyledons large, planoconvex or longitudinally folded, foliaceous in germination, radicle turned up on the back of one cotyledon (incumbent) or facing their edges (accumbent ).-Distrib. All temp. regions, but chiefly of the Old World ; genera 172; species 1,200.-Affinities. Between Fumariacece and Capparidece.-Properties. All parts are nitrogenous and contain sulphur, are pungent, stimulant, and anti-scorbutic, often acrid. Seeds oily. Testa of cress and others mucilaginous when moistened, owing to the swelling and bursting of superficial cells.
A. Pod elongute (much longer than broad), dehiscing throughout its length,
fut or turgid, not compressed at right angles to the septum. (Pod sometimes
short in Nusturtium, its tip sometimes indehiscent in Brassica. See Draba
in B.)

Tribe I. ARABID'EFE. Seeds 1 -seriate (rarely 2 -seriate in Aralis and N(asturtium), cotyledons accumbent. (Flowers white, yellow or lilac.)

* Stigmas erect or decurrent on the style ................................1. Matthiola. ** Stigma small, simple terminal
Lateral sepals saccate. Hairs forked
1*. Cheiranthus.
Pod terete, valves turgid. Seeds minute, 2 -seriate...............2. Nasturtium.
Pod 4-angled. Seeds oblong .............................................3. Barbarea.
Pod flat, valves not elastic 1-nerved.........................................4. Arabis
Porl flat, valves elastic. Funicle filiform ..........................5. Cardamine.
Pod flat, valves elastic. Funicle dilated ..............................6. Dentaria.
Thibe II. SISYM'BRIEe. Seeds usually 1 -seriate, cotyledons incumbent, straight, plano-convex. (Flowers white, yellow or lilae.)
Glabrous or hairs spreading, stigma obtuse.

7. Sisymhrium.

Hairs apppressed 2-3-fureate, stigma obtuse ..........................8. Erysimum.
Hairs spreading, stigmas decurrent on the style ..................8*. Hexperis.
Tribe III. BRAS'SICEAE. Seeds $1-2$-seriate, cotyledons incumbent, longitudinally folded or very concave. (Flowers yellow.)
Pord terete or angled. Seeds 1 -seriate
9. Brassica.

Pod compressed. Seeds 2 -seriate, compressed
10. Diplotaxis.
B. Pod shont (not or not much longer than broaul), deliscing therongh its whole length, broad, flat or turgul, not compressed at right angles to the septum. (Flowers white or yellow.) (Pod sometimes long in Draba; see Nasturtium in A.)
Tribe IV. ALYSSI'NERE. Seeds 2-seriate, cotyledons accumbent.
Petals entire. Pod oblong, flat, many-seeded..........................11. Draba.
Petals 2 -cleft. Pod oblong, flat or turgid ..........................12. Erophila.
Petals entire. Pod circular, few-seeded .............................12*. A $l_{\text {ysszm }}$.
Petals entire. Pod inflated, many-seeded .........................13. Cochlearia.
Tribe V. Cameli'nef. Seeds 2-seriate, cotyledons incumbent.
Tall herb, cauline leaves sessile auricled..............................13*. C'amelina.
Small scapigerous water-herb. Leaves subulate.................14. Subularia.
C. Pod short, dehiscing throughout its length, much compressed at right angles to the septum, which is hence very nasrow. (Pod indehiscent in Senebiera.)
Tribe VI. Lepidi'nese. Cotyledons incumbent, straight incurved or longitudinally folded. (Flowers white.)
Pod dehiscent, many-seeded
15. Capsella.

Pod didymous, indehiscent, 2 -seeded
16. Senebiera.

Pod dehiscent, 2-4-seeded.
17. Lepidium.

Tribe VII. THLASPID'ese. Cotyledons accumbent, straight. Pods on horizontal pedicels. (Flowers white.)
Pod notched. Petals equal. Filaments without scales.. .........18. Thlaspi. Pod ovate. Petals very unequal. Filaments without scales ......19. Iberis. Pod oblong. Petals unequal. Filaments with basal scales...20. Teesdalia. Pod oblong. Petals equal. Filaments without scales.. ..... 21. Hutchinsia.
D. Pod indehiscent or with very short valves which cover a few of the seeds only.

Tribe VIII. ISATI'des. Pod indehiscent, 1 -celled, 1 -seeded ...21*. Isatis. Tribe IX. CAkili'NEers. Pod transversely 2-jointed, lower joint seedless or 2-celled, 2 -valved, 2- or more-seeded, upper joint 1-2-celled. (Affinity with Brassicece.)
Lower joint slender, seedless ; upper globose, 1 -seeded ............22. Crambe. Lower joint 2-edged, 1-celled; upper ensiform, 1-seeded ............23. Cakile.
Tribe X. RAPHA'Ne.t. Pod elongate, 1 -celled, many-seeded; or transversely jointed, the joints $1-2$-celled, cells 1 -seeded...............24. Raphanus.

## 1. MATthi'OLA, Br. Stock.

Herbs, sometimes shrubby, downy with stellate hairs. Leaves entire or sinuate, Flowers large. Sepals erect, lateral saccate at the base. Petals with long claws. Pod elongate, terete or compressed ; septum thick, often 2-3-nerved; stigmatic lobes erect, conniving, often thickened or horned at the back. Seeds 1 -seriate, compressed, winged or margined; cotyledons accumbent.-Distrib. Europe, N. Africa, W. Asia, one is S. African ; species 30.-Етум. After Matthiolus, an Italian physician.

1. M. inca'na, $B r$.; shrubby, erect, hoary, leaves oblong-lanceolate entire, pod eglandular.
Sea-cliffs eastward of Hastings (now extinct), Ventnor and Freshwater, Isle
of Wight; a denizen, Watson; fl. May-June.-Stem 1-2 ft., branched.
Leawes rarely obscurely toothed. Raceme 1-2 in. Flowers 1-2 in. diam., purple to violet. Pod 2-4 in., $\frac{1}{8}$ in. broad. Seed orbicular, winged.-Distrib. W Europe, Canaries, Levant. The "Queen Stock" of gardens, where it is treated as an annual or biennial.
2. M. sinua'ta, Br.; herbaceous, diffuse, woolly or downy, leaves linearobovate or -oblong, lower sinuate-toothed, pod muricate and glandular.
Shores of Wales, Cornwall, Devon, S.E. and S.W. Ireland, Channel Isles;
fl. May-Aug. - Stem 1-2 ft., branched above. Root-leaves petioled.
Raceme 1-3 in. Flowers 1 in . diam., pale lilac, fragrant at night. l'orl
$3-4 \mathrm{in} ., \cdot \frac{1}{8} \mathrm{in}$. broad ; seeds winged.- Distrib. W. Europe, N. Africa, Levant.
-Taste alkaline.

$$
\mathbf{1}^{* *} \text { CHEIRAN }{ }^{\prime} \text { THUS, L. Wallflewer. }
$$

Herbs or under-shrubs, pubescent with appressed 2 -partite hairs. Learrs entire or toothed. Flowers large, racemed, yellow or purple. Sepals erect,
lateral saccate at the base. Petals with long claws. Pord elongate, compressed or 4-angled; valves 1-nerved, flat or convex ; stigma capitate or with 2 spreading lobes. Seeds 1 -seriate, compressed, cotyledons accumbent. -Distrib. N. temp. and cold regions; species 12.-Etym. doubtful.
C. Cheíri, $L$. ; leaves lanceolate acute entire.

Old walls ; naturalized ; an alien, Watson ; fl. May-June.-Perennial. Ntem shrubby below, branched, angled. Leaves 2-3 in. Ruceme usually short. Flowers about 1 in . diam. fragrant, orange-yellow (in cultivation red, purple or brown). Pod $1-2 \frac{1}{2}$ in., 4 -angled ; stigma almost sessile ; seed shortly winged above,-Distrib. Central and N. Europe.

## 2. NASTUR'TIUM, $B r$.

Branched, terrestrial or aquatic glabrous herbs ; hairs if present usually simple. Leares entire lobed or cut. Flowers small, usually vellow, sometimes bracteate. Sepals short, equal, spreading. Petals slightly clawed, or 0. Stamens 1-6. Pod short or long, often curved, terete, pedicels patent and curved, valves not rigid, convex, obscurely 1 -nerved; style short or long, stigma simple or 2 -lobed. Seeds 2 -seriate, small, turgid; cotyledons accumbent.-Disrrib. N. temp. and warmer regions; species about 20.-Etym. doubtful.-United with Cochlearia by C. Armoraciu (Horse-radish) and others.

1. N. officina'le, $B r$.; aquatic, leaves pinnate, leaflets suhcordate si-nuate-toothed, petals white twice as long as the sepals, pod linear. Wutcrcress.
Watercourses, ascending above 1,000 feet in the N. of England ; fl. May-Oct. -Perennial, glabrous, green or olive-brown. Stem 2-4 ft., rooting, of ten floating, fistular. Lecellets 3-6 pair. Flowers $\frac{1}{6}-\frac{1}{+1}$. diam. Rucemes short. Hypoyynous glands 4. Porls i-1 in., deflexed or horizontal, longer than their pedicels; valves beaded; seeds suborbicular, compressed.Distrib. Europe. W. Asia, N. Africa; introd. in N. America and the colonies, and choking some rivers of N. Zealand, where the stem grows as thick as the wrist.
Var. 1, officina'le proper; decumbent, terminal leaflet broadest and largest.Var. 2, siffo'lium, Reich. (sp.) ; erect, tall, terminal leaflet oblong, all nearly equal.
2. N. sylves'tre, $B r$. ; rootstock creeping, leaves deeply pimatifid, leaflets many, lanceolate more or less cut nearly equal, petals yellow twice as long as the sepals, pod linear, seeds hardly 2 -seniate.
Moist waste places from the Forth and Dumfries southwards, rare in the north; S. of Ireland, rare ; fl. June-August.-Stem angular, flexuous. Leaves very variable. Rucemes short; flowers $\frac{f}{} \mathrm{in}$. diam. Hypogynous glands 6 . Porl $\frac{1}{2}-\frac{3}{4}$ in., curved, pedicel very slender longer or shorter than the pod; seeds minute.-Distrib. Europe, N. Africa, temp. and subtrop. Asia; introd. in America.
3. $\mathbf{N}$. palus'tre, $D C$.; leaves lyrate pinnatifid, segments few broad unequally ent, terminal of the lower leaves very large, petals yellow equalling the sepals or shorter, pol oblong turgid. N. terrestre, Sm.
Damp places from Argyle and Forfar southwards ; fl. June-Oct.-Rioot fibrous. Stem 1-2 ft., erect or inclined. Leuces pinuate or pinnatifid, terminal leaflet
sometimes 6 in. Flower $\frac{1}{8}$ in. diam. Pod about as long as its pedicel ; style very short. Seeds angular.-Distrib, Europe (Aretic), N. Africa, temp. and cold Asia and America.
4. N. amphib'ium, $B r$.; rootstock short stoloniferous, leaves entire toothed or pinnatifid, petals yellow twice as long as the sepals, pod oblong shorter than its pedicel. Armora'cia, Koch.
Wet places in England and Ireland ; doubtfully native in Scotland; fl. June-Sept.-Stem 2-4 ft., erect. Leaves pinnatifid chiefly when submerged, base often $\frac{1}{2}$-amplexicaul. Flowers $\frac{1}{4} \mathrm{in}$. diam. Pod $\frac{1}{4} \mathrm{in}$., pedicels spreading or deflexed; style slender ; stigma large, capitate; seeds small, oblong.-Distrib, Europe, N. Africa, temp. Asia.

## 3. barbare' $\mathbf{A}, B r$. Winter-cress.

Erect, branched, glabrous, biennial herbs. Stem angular. Leaves entire lobed or piunatifid. Flowers yellow, sometimes bracteate. Sepals suberect, equal. Petals clawed. Pod linear-elongate, compressed, 4 -angled, acuminate; valves keeled or ribbed; style short, stigma capitate or 2-lobed. Seods 1 -seriate, oblong, not margined; cotyledons accumbent.-Distrib. All temp. regions; species about 6. -Etym. Dedicated to St. Barbara.-The usually straight and stiff pods, with keeled valves, 1 -seriate seeds, and hahit, chiefly separate this from Nasturtium.

1. B. vulga'ris, $B r$.; leaves toothed or pinnatifid at the base, pod short 4-gonous acuminate broader than its slender pedicel, style straight distinct. Hedgebanks, water-sides, from the Clyde and Elgin southwards ; fl. MayAug. -Stem rigid, erect, angled, glabrous, simple or sparingly branched. Lower leaves pinnate, rarely pinnatifid, terminal leaflet usually largest; upper subentire or pinnatifid with amplexicaul auricled bases. Flowers small, bright yellow. Pods $\frac{3}{4}-1 \mathrm{in}$.; style $\frac{1}{8} \mathrm{in}$.-Distrib. Europe, temp. Asia, S. Africa, Australia, and N. America ; ascends to $17,060 \mathrm{ft}$. in the Himalaya.
Sub-sp. vulga'ris proper ; raceme about as long as broad, petals twice as long as the sepals, pods in a dense raceme 3-6 times as long as their pedicels erect rarely spreading, seed $1 \frac{1}{2}$ times as long as broad.-Common.
Sub-sp. arcua'ta, Reich. (sp.) ; raceme elongate, petals rather more than twice the length of the sepals, pods in a lax raceme arched and spreading when young $\overline{5}-8$ times as long as their pedicels, seed more than twice as long as broad.-Rare, Loughgall, Armagh.
Sub-sp. stric'ta, $A^{\prime}$ ndrz. (sp.) ; terminal segment very large, pods in a dense narrow raceme erect 4-6 times as long as their pedicels, seed nearly twice as long as broad.-Rare, Yorkshire, Northampton, Essex. Attains Arctic Europe.
Sub-sp. intermédia, Boreau (sp.) ; leaf-segments many, petals twice as long as the sepals, pods in a dense raceme erect 4-6 times as long as their pedicels, seeds nearly as long as broad.-Cultivated fields, probably intro-duced.-Intermediate between B. vulgaris and precox.
B. PRE'COX, Br.; leaves pinnatifid, segments narrow, petals 3 times as long as the sepals, pods long and distant scarcely thicker than their very stout short pedicels, style very short. American Cress.
Roadsides, \&ce., a garden escape ; an alien, Watson; fl. April-Oct.-Very similar to the preceding, of which I suspect it is a cultivated form. Secds
$\frac{1}{2}$ longer than broad, twice as large and more orbicular than in B. vulgaris. -Disirib. All Europe ; introd. in U. States.-An excellent salad.

## 4. AR'ABIS, $L$. Rock-cress.

Annual or perennial herbs, glabrous or with forked or stellate hairs. Radical leaves spathulate; cauline sessile. Flowers usually white. Sepals short, equal, or the lateral saccate at base. Petals entire, usually clawer. Pod linear, compressed; valves flat, keeled, veined or ribbed; stigma simple or 2 -lobed. Seeds 1-rarely sub-2-seriate, compressed, often margined or winged ; cotyledons accumbent. - Distrib. N. temp. zone; species 60.-Etym. From Arabia, the native country of various species. -Differs from Cardamine chiefly in the more strongly keeled non-elastic pod.

1. A. petre'e, Lamk.; leaves petioled radical lyrate-pinnatifid, cauline subentire, petals spreading broad clawed, pods spreading. $A$. his'pida, L. ; Curdamine hastula'ta, Sm.
Alps of N. Wales, Shetland, Skye, Cairngorm Mts. and Braemar, ascending above $4,000 \mathrm{ft}$., Glenade Mt. Leitrim ; fl. June-Aug. - Glabrous or hairy, perennial. Stem 3-6 in., branched below. Lenf-segments si.ort. Flozers corymbose, white or purplish. Pods $\frac{1}{2}-1 \mathrm{in}$.; valves 3 -nerved. Seeds hardly winged.-Distrib. Alpine and Arctic Europe, N. Asia and N. America.
2. A. stric'ta, Huds.; hispid, radical leaves subpetiolate small obtuse sinuate-lobed, cauline few $\frac{1}{2}$-amplexicaul, petals narrow cuneate suberect, pods suberect.
Rocks, Bristol and Cheddar, very rare; fl. March-May.-Perennial. Stems $5-10 \mathrm{in}$., ascending or erect. Ractical leaces ciliate, hairs forked and simple ; lobes oblong or triangular, pointing upwards. Flowers rather large, cream-coloured. Pods 1 in., 3-6 times as long as their pedicels ; valves 1 -nerved; style short; seeds oblong, slightly winged above.Distrib. Central Europe, from Spain to Hungary.-Habit of Nisymb. Thalia'na.
3. A. cllia'ta, Br.; ciliate or hairy, stem leafy, radical leaves entire subsessile ohovate-oblong obtuse slightly toothed, cauline sessile, petals suberect white, pods erect.
Sandy and rocky shores, Galway and S. Wales ; fl. July-Aug.-Rootstock short, stout, perennial. Ntem 4-6 in., strict, rigid, quite erect. Leuves ${ }_{3}-1 \mathrm{in}$. , cauline sessile. Flowers $\frac{1}{\frac{1}{2}} \mathrm{in}$. diam. I'ods few, $1-1 \frac{1}{2} \mathrm{in}$., $\frac{1}{2} \frac{\mathrm{in}}{} \mathrm{in}$. hroad, strict, beaded ; pedicels short; valves 1 -nerved; seeds contiguous, narrowly winged all round.-Distrib. Central Europe.-Perhaps a sub-species of A. hirsuta, as considered by Syme.
Var. 1, cilia'ta proper; leaves ciliate.-Seashore, Connemara, Kerry, and Cork.-Var. 2, his'pida, Syme ; leaves hispid, hairs forked.-Tenby in 8. Wales.
4. A. hirsu'ta, Br .; hispid, stem leafy, radical leaves subpetiolate toothed, cauline sessile or $\frac{1}{2}$-amplexicaul, petals spreading white, pods many slender erect. A. sagitta'ta, DC.; T'urrit' is hirsu'ta, L.
Dry places, ascending to 2,700 ft. in Scotland, local in Ireland; fl. June-Aug.
-Ruotstock biennial or perennial. Stems $1-2 \mathrm{ft}$., many, slender. Leaves $1 \frac{1}{2}$

3 in., obtuse or acute. Flowers small. Pods $1 \frac{1}{2}-2$ in., very many, much narrower than in A. ciliata; style short ; seeds distant, very narrowly winged all round.-Distrib. Europe, temp. Asia to the Himalaya, N. America.
Var. 1, hirsu'ta proper; stem and leaves covered with simple or forked hairs. -Var. 2, glabra'ta, Syme; stem and leaves glabrous or ciliated.-Great Arran Is., W. of Ireland ; (this I have not seen.)
5. A. perfolia'ta, Lamk.; nearly glabrous, glaucous, radical leaves obovate sinuate or lobed, cauline amplexicaul entire auricled, petals erect pale yellow, pods many crowded slender erect, seeds sub-2-seriate. Turrit' is gla'bra, L.
Dry rocky places, local, from Perthshire southwards; Ireland, Antrim only ;
fl. May-July.-Annual or biennial. Stem 2-3 ft., erect, with few spreading hairs about the early withering root-leaves, \&c. Pods 1-2 in., pedicels slender; style very short; seeds minute, oblong, angled, not winged.Distrib. Europe (Arctic), temp. Asia to the Himalaya, N. America
A. Turrita, L.; stellately pubescent, leaves remotely toothed, radical petioled entire, cauline narrow oblong amplexicaul, flowers bracteate, petals obovate-lanceolate spreading, pods large long secund decurved.
Naturalized on old castle walls, as at Cleish, Kinross-shire, Oxford, \&c.;
fl. May-July. Perennial. Stem 1-2 ft., rather robust, leafy. Radicul leaves on barren branches of the rootstock, Flowers pale yellow. Pods 3-6 in.; valves thick, veined; seeds oblong, winged.-Distrib. Central and S. Europe.

## 5. CARDAMI'NE, $L$. Bitter-cress.

Annual or perennial herbs, usually glabrous. Leaves usually pinnate. Flowers white cream-coloured or purple. Sepals equal at the base. Petals clawed, rarely 0. Pod elongate, linear, compressed ; valves flat, indistinetly nerved, elastic ; septum hyaline; stigma small. Seeds compressed, not margined, funicle filiform; cotyledons accumbent.Distrib. Temp. and cold regions, rarely tropical ; species 50.-Etym. A Greek word.

1. C. hirsu'ta, L.; radical leaves pinnate, leaflets broad petioled auricles 0 , cauline narrower, petals small erect oblong-lanceolate, anthers yellow, pods erect.
Moist places, ascending to $3,000 \mathrm{ft}$. in Scotland ; fl. April-Sept.-Very variable, glabrous or hairy, 6 in. -2 ft ., erect or diffuse. Leaftets 3-6 pairs, angled or sublobate. Flowers $\frac{1}{8}$ in. diam., white. Pods about 1 in., slender, torulose. - Distrib. All temp. and cold climates; in S. temp. regions the perennial varieties are excessively numerous and very puzzling.
Sub-sp. hirsu'ta proper; annual, radical leaves rosulate, stamens usually 4, style short stout. - Open ground.
Sub-sp. Flexuo'sa, Withering (sp.); perennial or biennial, radical leaves few, leaflets lobed, stamens usually 6 , style slender elongate. C. sylvat ica, Link.-Shaded places.
2. C. praten'sis, $L$. ; leaves all pinnate, leaflets of radical petioled suborbicular, of cauline narrow subsessile, petals large spreading obovate, anthers yellow, pods erect on slender pedicels, style short stout. Lady's Smock, Cuckoo Flower.

Moist meadows, ascending to $3,200 \mathrm{ft}$. in Scotland ; fl. April-June. - Reotstock short, stout, sometimes stoloniferous. Stem 1-2 ft. Leaftets of radical leaves $\frac{-3}{4} \mathrm{in}$; of cauline usually much longer, almost entire. Flozer $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam., lilae or almost white. Pods $1-1 \frac{1}{2} \mathrm{in}$.; pedicels $\frac{1}{2}-1 \mathrm{in}$. - Distrib. N. temp., Aretic and sub-Arctic regions. - A similar plant occurs in Tasmania.
3. C. ama'ra, L.; leaves pinnate, radical leaflets suborbicular, cauline narrow or deeply toothed, petals large obovate spreading, anthers purple, poils erect on slender pedicels, style slender.
River-sides, \&c. scarce ; from Mid. Scotland southwards, ascending to near $1,000 \mathrm{ft}$. in Yorkshire ; N.E. Ireland ; fl. April-June.-Rootstock slender. stoloniferous. Stem 1-2 ft., ascending, glabrous or hairy. Leures all alternate. Flovers $\frac{1}{2} \mathrm{in}$. diam., racemed or panicled. Petuls white, creamy. Porls $1-1 \frac{1}{2}$ in.. pedicels $\frac{1}{2}-\frac{3}{3}$ in.; style slender, stigma minute. Distrib. N. Europe and Asia to the Himalaya.
4. C. Impa'tiens, $L$.; leaves pinnate, petioles with stipuliform fringed auricles, leatlets all narrow deeply cut, petals linear-obovate or 0 , anthers yellow, pods erect on short slender pedicels, style slender.
Shady eopses, \&c. local; from York (ascending to near $1,000 \mathrm{ft}$.) and Denbigh southwards ; absent in Scotland and Ireland ; f. May-Aug.-Rootstork spindle-shaped. Stem 1-2 ft., stout, erect, very leafy, glabrons. Lentlets
 slender ; pedicels $\frac{1}{\mathrm{i}} \mathrm{in}$.-Distrib. Europe, temp. Asia to the Himalaya.The stipuliform auricles, reflexed on the stem, are anomalous structures.

## 6. DENTA'RIA, L. CORAL-ROOT.

Herbs with creeping, scaly rootstocks. Radical leaves few or 0 ; cauline often opposite or 3 -nately whorled. F'lowers large, purple. Sepuls erect, equal at the base. Petals clawed. Pod narrow-lanceolate; valves flat, nearly nerveless, elastic; septum membrauous. Secds 1 -seriate, compressed, not margined, funicle dilated ; cotyledons accumbent, stalked.-Distris. N. temp. regions; species about 20. - ETYM. dens, from the scaly rootstock. -Differs from Cardumine chiefly in habit, and the funicles.

1. D. bulbif'era, L.; lower leaves pinnate, upper simple entire.

Whods and copses, rare, Sussex, Middlesex, Kent, Surrey, Bucks ; doubtfully a native of Perth, Ayr, and Lanark; absent from Ireland; fl. April-June. -Rootxtock annual or biennial, white. Stem 1-2 ft., simple, leafless below. Leuces with few pairs of oblong, entire or serrate ciliate leaflets 1-2 in.; the uppermost lenflets confluent at the base ; upper leaves with bulbs in their axils. Flowers $\frac{1}{2}-\frac{3}{3} \mathrm{in}$. diam., white or lilac ; pedicels slender. P'ods erect, rarely ripening.-Distrib. Throughout Europe, rare in W. Asia.

## 7. Sisym'brium, L. Hedge-mu'stard.

- Annual or biennial herbs; hairs always simple. Radical leaves spreading; cauline alternate, often auricled. Flowers loosely racemed, usually yellow, often bracteate. Sepals short or long. Petals often narrow and long-clawed. Pod narrow-linear, terete or 4-6-angled or compressed ; valves concave or convex, often 3 -nerved; septum membranous, nerveless or 2-nerved; stigma simple 2-lobed or cun-shaped. Needs many, 1 -seriate, not margined; cotyledons incumbent.-Distrib.

Temp. and cold N. hemisphere ; rare in the Southern ; species 80.-Etym. doubtful.-Differs from Brassica only in the flat cotyledons, and is united to Arabis by S. Thaliana. The British species present 4 types of pod, represented by 1. S. Thaliana, Irio, and Sophia; 2. S. officinale; 3. S. polyceratium ; 4. S. Alliaria.

1. S. Thalia'na, Hook. ; leaves toothed pubescent, flowers white, pods spreading or ascending obscurely 4 -angled. Thate-cress.
Dry soils, ascending to $1,500 \mathrm{ft}$. in Yorkshire ; fl. May-Sept.-Annual. Stem
6-10 in., slender, nearly leafless. Radical leaves rosulate, oblong, petioled; cauline narrow, sessile, all entire or toothed. Flowers $\frac{1}{8} \mathrm{in}$. diam. ; pedicels slender. Pods $\frac{1}{2}-\frac{3}{4}$ in., slender, curved; seeds minute; cotyledons usually incumbent.-Distrib. Europe (Arctic), Asia to the Himalaya, N. Africa; introd. in N. America.
2. S. $\mathbf{I r}$ 'io, L. ; leaves runcinate-toothed or pinnatifid glabrous, flowers yellow, pods terete slender suberect. London Rocket.
Old walls, \&e., Berwick-on-Tweed and Dublin; sporadic in other places; a denizen, Watson; fl. July-Aug.-Annual or biennial. Stem 1-2 ft., branched.
Radical leaves petioled; lobes irregularly toothed, terminal large often
hastate. Flozers $\frac{1}{8} \mathrm{in}$. diam. Pods $1 \frac{1}{2}$ in., very many, glabrous, erect, strict, very slender; valves beaded, 3 -nerved; style 0 ; seeds oblong.Distrib. Central and S. Europe, N. Africa, W. Asia to the Himalaya. -Called "London Rocket" because it sprang up abundantly after the Great Fire of 1666.
3. S. Sophi'a, L. ; leaves 2-3-pinnatifid glabrous or downy, segments narrowly linear, flowers yellow, pods slender terete ascending curved, pedicels very slender. Flixweed.
Waste places, rarer in Scotland and Ireland; fl. June-Aug.-Annual. Stem $1-3 \mathrm{ft}$. , branched above ; branches spreading and ascending, leafy. Leaves $2-4 \mathrm{in}$., finely divided ; lobes spreading. Floxers $\frac{1}{8} \mathrm{in}$. diam. Pods 1 in ., in long racemes ; valves beaded, 3 -ribbed; style very short.-Distrib. Europe (Arotic), N. Africa, West Asia to the Himalaya, N. and S. America.
4. S. officina'le, L.; leaves runcinate-toothed or -lobed hairy, flowers yellow, pods in a leafless raceme subulate terete appressed to the stem. Hedge-mustard.
Hedgebanks and waste places ; fl. June-July.-Stem 1-2 ft., terete, erect, with spreading or retlexed hairs; branches horizontal. Leuves variously cut or lobed, with a tendency to a large terminal lobe. Flowers $\frac{1}{1 / 5}$ in. diam. I'ods $\frac{1}{2} \mathrm{in}$., tapered from the base into the almost pungent style; pedicels short, thick. - Distrib. Europe, W. Asia to the Himalaya, N. Africa ; introd. in the U. States.
5. S. Allia'ria, Scopoli; leaves all petioled deltoid or reniformcordate coarsely toothed or crenate pilose beneath, pods stout long 4-angled, pedicels short stout. Erysimum, L.; Alliaria, Andrz. Garlicmustard, Sauce alone, Jack by the hedge.
Hedgebanks, \&ce., ascending to near 1,000 ft. in England ; rarer in N. Scotland and Ireland ; fl. May-June.-Annual or rarely biennial, glabrous or with a few scattered simple hairs, rank scented. stem 2-3 ft., decumbent at the base, then flexuous, erect, simple or sparingly branched. Rudical leavrs often 3 in . diam., on long slender petioles, smaller and more reniform than
the cauline, which are cuneate at the base. Flovers $\frac{1}{2} \mathrm{in}$. diam. Pods $2 \frac{1}{2} \mathrm{in}$., linear, slightly curved, rigid, subacute; valves keeled, style very short, stigma truncate. Seeds oblong; funicle dilated.-Distrib. Europe, N. Africa, temp. and W. Asia to the Himalaya.
S. polycera'ticm, L.; prostrate, leaves runcinate-pinnatifid glabrous, flowers yellow, pods 1-3 in the axils of leafy bracts cylindric curved spreading.
Roadside paths near Bury St. Edmunds, where introduced by Dr. Goodenough ; fl. July-Aug.-Annual, glabrous, very leafy. Leaves often reduced to the large triangular coarsely toothed terminal lobe. Flowers small, yellow. Pods 3 in., in short leafy racemes, broad at the base, on very short thick pedicels; valves 3 -nerved, very convex, beaded, obtuse; style evident, short, thick, stigma obtuse.-Distrib, S. of France and Mediterranean to the Caucasus.

## 8. ERYS'IMUM, L. Treacle-mustard.

Annual biennial or perennial hoary herbs, hairs appressed forked. Lcaves narrow, entire. Flowers yellow, often fragrant. Sepouls erect, equal or the lateral gibbous at the base. Petals clawed. Pod narrow, compressed, 4 -angled or terete; valves linear, often keeled; replum usually prominent ; septum membranous or corky; stigma 2 -lobed or entire. Sceds many, 1 -seriate, oblong, not winged or winged at the tip; cotyledons incumbent.-Distrib. Temp. and cold N. hemisphere ; species about 70.-Etym. Épúa, to draw blisters.-Near Sisymbrium, but cauline leaves never auricled, and hairs 2-3-partite; differs from Cheiranthus in the cotyledons, and generally in the stigma.

1. E. cheiranthoi'des, L.; leaves lanceolate, pods short suberect.

Waste places in the S. of England ; rarer in the N. and in Ireland ; a colonist,
Wutson ; fl. June-Aug.-Annual. Stem 1-2 ft., erect, leafy, rigid, terete.
Leuves 3-4 in., subsessile, lanceolate or oblong-lanceolate, acute, narrowed at the base, obscurely toothed. Florers $\ddagger \mathrm{in}$. diam. Pods 1 in ., straight; pedicels spreading; valves strongly keeled, acute ; style very short, stout, stigma truncate; seeds oblong, smooth, very strong-tasted.-Distris.
Europe (Arctic), N. Africa, N. Asia, N. America.

## $\boldsymbol{8}^{*}$. HES'PERIS, L. Dame's Violet.

Erect, biennial or peremnial herbs. Leaves alternate, entire. Flowers large, handsome. Sepals erect, lateral gibbous at the base. Petals elawed. Pod elongate, terete or 4 -angled; valves flattish, keeled, 3-nerved; septum membranous; stigmatic lohes suberect. Sceds many, margined or not; cotyledons incumbent.-Distrib. Europe and temp. Asia; speecies 20.Etym. $\begin{gathered} \\ \sigma \\ \epsilon\end{gathered}$ pos, from some species being odorous in the evening.-Very near Matthioln and Cheiranthus, differing chiefly in the stigmas and cotyledons.
H. matrona'lis, $L$.; leaves oblong-lanceolate acuminate.

Meadows, plantations, \&c., an escape, not even naturalized ; fl. May-July.Pubescent with simple or branched hairs. Rout perenvial. Nitems 2-3 ft. few or solitary, erect, stout. leafy. Leaves $2-5$ in., shortly petioled or sessile, finely irregularly toothed or serrate. Flowers $\frac{3}{3} \mathrm{in}$. diam.. white or lilae, odorous in the evening ; pedicels $\frac{1}{2} \mathrm{in}$., spreading. Pouls $2-4 \mathrm{in}$., slender, cylindric, contracted here and there between the remote seeds; pericels
ascending; valves much narrowed at the tip; style stout; seeds linear-oblong.-Distrib. Europe, temp. Asia

## 9. BRAS'SICA, L. CAbBAGE, \&c.

Herbs of various habit. Leaves entire or pinnatifid, often large. Flowers in long racemes, white or yellow, rather large. Sepals erect or spreading, equal or the lateral saccate at the base. Pod elongate, nearly terete, with sometimes an indehiscent 1 -seeded beak; valves convex, often 3 -nerved, the lateral nerves flexuous; septum membranous or spongy; stigma truncate or 2 -lobed. Seeds 1 -seriate, oblong or subglobose ; cotyledons incumbent, concave or conduplicate.-Distrib. Temp. Europe, Asia, and N. Africa; species 100.-Еtym. The Latin name.

Section 1. Brassica proper. Sepals erect.

1. B. olera'cea, $L$. ; rootstock stont branched leafy at the top, leaves obovate lobed or sinuate below glaucous glabrous, upper sessile oblong dilated at the base, flowering racemes elongate, beak of pod seedless, valves keeled and nerved. Wild Cabbage.
Sea-cliffs, S.W. of England, Wales, and Ireland ; naturalized here and there elsewhere and in Scotland; a denizen? Wutson; fl. May-Aug.-Stems 1-2 ft., biennial or perennial, as thick as the finger or thicker, tortuous, usually decumbent, scarred. Lower leuves often $1-1 \frac{1}{2} \mathrm{ft}$. Flowers 1 in . diam., pale yellow. Pods 2-3 in., spreading, slightly compressed; beak short, subulate ; seeds globose.-Distrib. W. and S. coasts of Europe. The chief cultivated forms are forma aceph'ala (Scotch kail. cow cabbage, borecole) ; $f$. bulleci'ta and gemmif'era (Brussels sprouts and Savoys); f. capita'ta (red and white cabbage) ; $f$. caulora'pa (Cole rabi or Kohl-Rebe); $f$. Botry/tis (cauliflower and broccoli).
2. B. campes'tris, $L$.; erect, lower leaves lyrate-pinnate, upper oblong or lanceolate amplexicaul and auricled at the base, flowering racemes corymbiform, beak of pod seedless, valves 1-nerved. B. polymor'pha, Syme. Weeds of cultivated ground ; a colonist? Watson ; fl. June-Sept.
The following is Mr. Syme's arrangement of the forms of Brassica campes'tris, which he includes under the aggregate name of polymor'pha, a good one, but which should not supersede the Linnean. All are annual or biennial. Probably none are wild in this or any other country; B. campestris proper may be a starved form of one of the others, though it appears more reasonable to regard it as their parent.-Distrib. All Europe, temp. and sub-trop. Asia, where the turnip is cultivated up to $15,000 \mathrm{ft}$. in the Himalaya.
Sub-sp. CAMPES'TRIS proper ; root tuberous, leaves glancous, radical hispid, upper glabrous, petals persistent till the corymb lengthens. Swedish turnip. -Extends into Arctic Europe.
Sub-sp. Na'PUs, L. (sp.); root fusiform, leaves all glabrous and glaucous, petals deciduous before the corymb lengthens. Rupe, Cole-seed-yields Colza and Carcel oils.
Sub-sp. Ra'PA, L. (sp.) ; root tuberous, lower leaves not glaucous hispid, upper glaucous and glabrous, petals deciduous. Turnip.
3. B. monen'sis, Huds.; leaves petioled deeply pinnatifid, segments tootherl, upper linear, beak of pod $1-3$-seeded, valves 3 -nerved.
Sea-shores on the west coasts from Skye to S. Wales, Channel Is. ; fl. May-June.-Rootstock usually stout, woody and perennial. Stem 6-24 in., erect or
decumbent. Radical leaves with short brond toothed segments. Florers $\frac{1}{3} \frac{1}{2} \mathrm{in}$. diam., pale yellow. I'ods $1 \frac{1}{2}-2 \frac{1}{2}$ in., spreading ; beak thick; seeds globose dark, punctate.-Distrib. Shores of W. and S. Europe and N. Africa.
Sub-sp. MONEN'sis proper, glabrous, stem nearly simple, leaves chiefly radical. S. Wales to Skye ; inland at Merthyr Tydfil, S. Wales.

Sub-sp. Cheiran'thos, Villars (sp.); hispid, stem branched leafy. - St. Aubyn's Bay, Jersey, Alderney.
Section 2. Sina'pis, L. (Gen.) Sepals spreading.

* Pods erect, appressed to the stem; valves 1-nerved; cells fero-seeded.

4. B. nígra, Boiss.; stem-leaves petioled linear-lanceolate entire or toothed glabrous, pods subulate 4 -angled glabrous, beak short seedless. Black Mustard.
Hedges and waste places, common as an escape, wild on sea-cliffs (Syme); rare in Scotland; a doubtful native in S. of Ireland ; a native? Witson ; fl. June-Sept.-Annual. Stem 2-3 ft., rigid, branched, more or less hispid. Leaves 4-8 in., lower lyrate, terminal lobe much the longest. Flowers $\frac{1}{3}-\frac{1}{2}$ in. diam., bright yellow. Pod $\frac{1}{4}-\frac{1}{2}$ in., subulate, beak slender, valves keeled, torulose; pedicels short, stout, erect; cells $3-5$-seeded; seeds oblong.-Distrir. Europe, N. Africa, W. Asia to the Himalaya ; introd. in U. States.
5. B. adpres'sa, Boiss.; uppermost stem-leaves linear or lanceolate quite entire hispid, pods subeylindric, beak clavate ribbed $\frac{1}{2}$ as long as the valves often 1 -seeded. Sina'pis inca'na, L.
Sandy fields, Jersey and Alderney; fl. July-Aug.-Habit of B. nigra, but more branched ; pod very short ( $\frac{1}{2} \mathrm{in}$.) ; valves linear ; beak 8 -ribbed ; seeds fewer, flattened.-Distrib. Europe, from Belgium southwards.
** Pod spreading; valves 3 -nerved; cells few or many-seeded.
6. B. Sinapis'trum, Boiss.; hispid, upper leaves toothed or lyrate, pods linear angular longer than the elongate compressed rarely 1 -seeded beak. Sina'pis arven'sis, L. Charlock.
Cornfields, ascending to $1,200 \mathrm{ft}$; a colonist or likely a native, Watson; fl. May-Aug. - Annual. Stem 1-2 ft ., usually hranched. Letres lyrate-pinnatifid, toothed. F'lowers $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam., subcorymbose, bright yellow. l'ools $1 \frac{1}{2}-2 \mathrm{in}$.; pedicels slender, spreading; valves torulose ; beak deciduous, straight, almost rigid, as broad as the hispid valves ; seeds subcompressed, dark brown.-Distrib. Europe, N. Africa, N. and W. Asia to the Himalaya ; introd. in America.
7. B. al'ba, Boiss. ; hispid with reflexed hairs, upper leaves pimnatifid, pods short beaded few-seeded, valves equalling the broad sometimes 1 -seeded beak. Sinapis, L. White Mustard.
Cultivated ground, \&ce. from Mid. Scotland southwards; Mid. Ireland rare; a colonist, Wutson; fl. June-July.-Annual. Stem 1-3 ft., erect, furrowed, branches ascending. Leares all lyrate-pinnatifid or pinnate; segments cut and lobed. Flowers $\frac{1}{2}$ in diam., yellow. Pods 2 in ., hispid ; valves strongly ribhed, concave; beak ensiform, persistent, ribbed, often curved; cells $1-3$-seeded ; seeds suhglobose, pale.-Distrib. Europe, N. Africa, N. and W. Asia to the Himalaya ; introd. in the U. States.-Cultivated as a salad.

## 10. DIPLOTAXIS, DC. Rocket.

Annual or perennial herbs. Leaves pinnatifid. Flowers yellow. Sepals spreading, equal. Pod narrow, elongate, compressed; valves 1-nerved; suptum membranous ; style usually slender ; stigma simple. Seeds many, sub-2-seriate, compressed ; cotyledons as in Brassica.-Distrib. Temp.
 the 2 -seriate seeds. -Differs from Brassica in the flat pods, membranous valves, minute compressed 2 -seriate seeds, and the flowers varying to pink or purplish, which is never the case in Brassica.

1. D. mura'is, $D C$.; stem hispid leafy at the base, leaves sinuate or pinnatifid, seapes slender ascending, pods suberect linear. Sisym'brium, L. Bras'sica brevi'pes, Syme.

Roadsides and waste places, from Wales and Suffolk southwards; rare in Scotland and Ireland; a denizen, Watson; fl. Aug.-Sept.-A small plant.
Leaves usually long-petioled. Scapes 6-8 in., slender, ascending. Flowers
$\frac{1}{3} \mathrm{in}$. diam., yellow. Pods 1-2 in., slender, compressed, narrowed above and
below ; valves flat, almost nerveless ; style stout, straight, cylindric ; seeds
many, small, compressed.-DIsTRIB. W. Europe, from Belgium southwards,
N. Africa.

Sub-sp. MURA'Lis proper ; scapes few-leaved, pedicels as long as the expanded tlowers, petals 2-3 times as long as the sepals abruptly obovate, style not narrowed below.-VAR. 1, muralis proper ; annual, stem-leaves few or 0.Var. 2, Babingto'nii, Syme ; biennial or perennial, stem-leaves several. S. of England, common, rarer in Scotland ; E. of Ireland, very rare ; a denizen, Watson.
Sub-sp. vimn'EA, $D C$. (sp.); scapes leafless, pedicels shorter than the expanded flowers, petals not twice the length of the sepals obovate gradually narrowed into the claw, style narrowed towards the base.-St. Peter Port, Guernsey.
2. D. tenuifo'lia, $D C$.; stem branched leafy, leaves pinnatifid, lobes long narrow, pods suberect linear on very long slender pedicels. Sisymbrium, L.; Sinapis, Sm.; Brassica, Boiss.
Roadsides, old walls, \&ce from Fife southwards; a denizen, Watson; fl. June-Sept. - Bushy, glabrous or hispid, glaucous. Rootstock woody; branches $1-3 \mathrm{ft}$. Leaves $3-5 \mathrm{in}$., lobes distant, very unequal. Flowers $\frac{3}{4} \mathrm{in}$. diam., yellow. Pods $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. distant, linear, narrowed at both ends; valves flat; style stout, straight, oylindric ; seeds many, small, compressed. Distrib. Europe, N. Africa, W. Asia.

## 11. $\mathbf{D R A}^{\prime} \mathbf{B A}, L$. Whitlow-grass.

Herbs, usually small, perennial rarely annual, hoary with stellate down. Leaves entire ; radical rosulate, cauline sessile or 0. Flowers small, racemose or corymbose, white or yellow. Sepals short, equal at the base. Petals shortly clawed, entire. Pod oblong, rarely linear, compressed; valves flattish, rarely ribbed; septum membranous; stigma simple. Seeds 2 -seriate, compressed ; funicles filiform; cotyledons accumbent.-Distrib. Temp. Arctic and mountain regions, chiefly of N. hemisphere, and Andes of S. America; a prominent feature in N. Polar regions ; species 80, all very variable.-Етум. $\delta \rho \alpha \beta^{\beta} \eta$, acrid, in allusion to the taste.

1. D. aizoi'des, $L$. ; leaves rigid ciliate, scape leafless, petals yellow. Walls and rocks, Pennard Castle and Worm's Head, Glamorgan ; a native? Watson ; fl. March-May.-Perennial, densely tufted. Leaves $\frac{1}{3}$ in., rosulate, glabrous, shining, keeled, with white cartilaginous ciliate margins and tip. Scape 1-5 in., rigid. Raceme short, slightly lengthened after flowering. Floovers $\frac{1}{3}$ in. diam. Petals hardly notched. Pod oblong, acute, glabrous; style half its length; cells 10-12-seeded.-Distrib. Sub-Alpine, Central and S. Europe, W. Asia.
2. D. rupes'tris, $B r$. ; erect, small, leaves oblong-lanceolate hairy, scape-leaf 1 or 0 , petals white, pod small straight oblong hairy, pedicel straight erecto-patent.
Alpine rocks, alt. $3-4,000 \mathrm{ft}$. , rare and local ; Ben Lawers, Cairngorm, Benhope ; fl. July-Aug. - Rootstock slender. Leaves $\frac{1-1}{3}$ in., ciliate, rarely toothed. Scapes one or more, 1-2 in., slender, flexuous; their leaf sessile, stellately pubescent. Flowers $\frac{1}{6} \mathrm{in}$. diam., few, white. Pod $\frac{1}{4} \mathrm{in}$., oblong, obtuse; stigma subsessile. - Distinib. Aretic Europe, Siberia, Arctic America. - The Ingleborough plant, gathered by Sir Wm. Hooker, and referred to by Syme (Engl. Bot. 1. 103), is a small state of D. incana.
3. D. inca'na, $L$. ; erect, stellately hispid, often branched, leaves oblong cauline amplexicaul, petals white, pod linear or oblong-lanceolate usually twisted, pedicel erecto-patent. D. confiu'sa, Ehrh.
Alpine rocks, England, Wales, Scotland, ascending above 3,000 ft., mountains and maritime sandhills of S.W. Ireland; fl. June-July.-Rootstock often woody and long. Stem 6-14 in. Rudical leaves short, $\frac{3}{4}-1 \mathrm{in}$., densely rosulate, usually much toothed ; cauline many, suberect. Rucemes much elongated after flowering, many-flowered. Flowers as in D. rupestris. Pods $\frac{1}{4}-\frac{1}{2}$ in., variable in length breadth and twisting, glabrous or hairy, obtuse or subacute ; stigma subsessile ; pedicels short; sceds many.-DIstrib. N. Eurnpe (Arctic), Alps, N. Asia to the Himalaya; Alpine and Arctic America. -Very variable ; small, unbranched specimens with few stem-leaves resemble $D$. rupestris.
4. D. mura'lis, L.; suherect or prostrate, stellate-hispid, slender, hranched, stem-leaves broadly ovate or cordate obtuse coarsely toothed, petals minute white, pods linear-oblong horizontal, pedicels spreading.
Limestone rocks and walls in W. England from Westmoreland (ascending to $1,200 \mathrm{ft}$. in Yorkshire) to Somerset, introd. in Scotland and N. W. Ireland ; fl. A pril-May.-Ruststack annual or biennial, slender. Stem 1-2 ft., flexuous. Radical leuves small, $\frac{1}{2}-1 \mathrm{in}$., obovate ; cauline few, distant, broader. Flowers $\frac{1}{8} \mathrm{in}$. diam. Raceme short, fruiting long. Pucts $\frac{1}{3}$ in., flat, obtuse, on pedicels longer than themselves; style 0 ; seeds 10-12, minute.-Distrib. Europe, temp. Asia to the Himalaya, N. Africa.

## 12. Eroph'tha, $D C$. Vernal Whitlow-grass.

Small annual or biennial herbs. Radical leaves entire, spreading. Scapes slender, leafless. Flowers few, small, white. Sepals spreading, equal at the hase. Petals obovate, 2 -lohed or 2-partite. Pod oblong, compressed; valves 1 -nerved, membranous, flat or convex ; septum membranous. Seeds 2 -seriate, very many and minute ; funicle capillary ; cotyledons accumbent.-

Distrib. Europe, W. Asia, and N. India; species 2-3.-Etym. $\neq \rho o s$ and $\phi i \lambda \omega$ from flowering in spring.-Usually combined with Draba, but as distinct as any genus in the Order.

1. E. ver'na, $L$.; leaves oblong-lanceolate coarsely toothed.

Abundant in its common form on walls, paths, \&ce. ; fl. March-June.-Subglabrous or delicately pubescent herb, 1-6 in. Leaves $\frac{1}{2}-1 \mathrm{in}$., all radical, rosulate. Wcapes slender, flexuous. Flowers $\frac{1}{8} \frac{1}{4} \mathrm{in}$. diam. Pods $\frac{1}{6} \frac{1}{3} \mathrm{in}$., on spreading pedicels. - Distrib. Europe, temp. Asia to the Himalaya, N.Africa, N. America (perhaps introd.).-Seventy forms have been separated by M. Jordan as specific, and cultivated with more or less constancy of character.
Sub-sp. VER'NA proper ; pod compressed, obovate-oblong twice or more as long as broad, cells $20-40$-seeded.-Ascends to $1,200 \mathrm{ft}$. in Yorkshire.
Sub-sp. brachycar'pa, Jordan (sp.) ; pod compressed, orbicular-oblong 1-1 $\frac{1}{2}$ as long as broad, cells 12-20-seeded.-Walls in Yorkshire, \&e.
Sub-sp. infla'ta, Watson; pod turgid, ovoid-oblong twice as long as broad, cells $20-40$-seeded.-Alpine rocks, Ben Lawers, alt. $2,500-3,000 \mathrm{ft}$. ; fl. June-July. D. verna $\beta$. Hook.

## 12*. ALYS'SUM, L.

Herbs or small shrubs, often covered with stellate down. Leaves scattered or crowded, entire. Flowers small, white or yellow. Sepals short, equal. Petals short, entire or 2 -fid. Filaments sometimes toothed or appeudiculate. Pod short, very various in form; valves flat, concave or convex ; septum entire or perforate; stigma simple. Seeds 2-10; cotyledons accumbent.-Distrib. N. and W. Asia and N. Africa; species $80-90$. - Etym. obscure. - A very polymorphous genus, almost every organ varying from the normal in one or other of the species; hence 10 genera have been made out of it.
A. Calycínum, $L$.; pubescent with appressed stellate hairs, leaves linear-spathulate, flowers yellow, pods suborbicular, sepals persistent.
Cultivated fields, rare and sporadic in England and Scotland, not indigenous ; fl. June-Aug.-Annual, hoary. Stem woody and branched at the base; branches 3-8 in., rigid, ascending. Leaves $\frac{1}{4}-\frac{3}{4} \mathrm{in}$. long, few, scattered, obovate or oblong, obtuse. Flowers small ; filaments with 2 teeth at the base. Fruiting racemes elongate. Pods in in. diam. very numerous, on short stiff spreading pedicels, nearly orbicular, turgid with broad thin flat margins, notched at the tip; style very short. Seeds $1-2$ in each cell, narrowly winged.-Distrib. Central and S. Europe, W. Asia.
A. marit'imum, $L$.; pubescent with appressed 2 -partite hairs, leaves linear, petals obovate white, pod obovoid-orbicular, sepals deciduous. Kön'iga, Br.; Lobula'ria, Desv. ; Gly'ce, Lindl.
Waste places near the sea; a garden escape; fl. June-Sept.-Annual or perennial.-Rootstock prostrate. Stem 4-10 in., ascending, leafy. Leaves $1-1 \frac{1}{2}$ in., to $\overline{\frac{T}{2}}$. broad, linear subacute. Flowers small, odorous; filaments all simple. Pod $\frac{1}{1} \mathrm{in}$., without a border ; pedicels slender, spreading ; valves convex, 1 -nerved; cells 1 -seeded; style slender.--Distrib. Maritime S . Europe and W. Asia.

## 13. Cochlea'ria, $L$. Scurvy-grass.

Perennial herbs. Leaves entire or pinnate. Flowers small, white. Sepals short, equal, spreading. Petals shortly clawed. Pod sessile or shortly stalked, oblong or globose ; valves turgid, reticulate; septum often imperfeet ; stigma simple or capitate. Sceds few or many, 2 -seriate, not margined, tubercled. Cotyledons accumbent.-Distrib. Temp. and Aretic regions, chiefly littoral or Alpine ; species 25.-Etym. cochlea, from the form of the leaves.-The native British species form a very well defined group of variable littoral plants, confined to N.W. Europe and the Arctic regions; but there are exotic species with the habit of Nusturtium.

> * Valves with a dorsal nerve.

1. C. officina'lis, L.; radical leaves cordate at the base, pod subglobose, valves reticulate, style very short. C. polymor'pha, Syme.
Sea-shores and high mountains ; fl. May-Aug.-Stems 4-10 in. glabrous, fleshy, many, ascending from the annual biennial or perennial rootstock. Flocers $\frac{1-\frac{1}{3}}{}$ in. diam. Pod $\frac{1}{8}-\frac{1}{4}$ in. diam., cells $4-6$-seeded.-Distrib. Arctic and sub-Arctic shores and Alps of W. Europe, N. Asia and N. America.-A valuable antiscorbutic.
Sub-sp. officina'Lis proper ; radical leaves deeply cordate orbicular or remiform, cauline amplexicaul angled toothed or lobed, pod nearly globose.Muddy sea-shores.
Suh-sp. alpi'Na, Watson; radical and cauline leaves as in officinalis, pod rhomboid-oblong narrowed at both ends. C'. groenlen'dica, Sm.-Mountains, ascending to near $4,000 \mathrm{ft}$.
Sub-sp. DAN'ICA, L. (sp.); radical leaves deltoid lohed cordate at the base, lower cauline similar petioled, upper amplexicaul also lobed, pod as in alpina.-Sandy and muddy shores, common in England, rarer in Scotland and Ireland.
2. C. ang'itea, $L$. ; radical leaves oblong-rhomboid or ovate not cordate entire lobed or angled, cauline $\frac{1}{2}$-amplexicaul, pod oblong or ohovoid inflated much constricted at the suture, valves reticulate, style slender.
Muddy shores, in England, Wigton in Scotland, rare in Ireland ; fl. May-July. -Much larger than any form of C. othcinalis, with branches 10-18 in. Leaves more fleshy, narrower, and pod very different, almost $\frac{1}{2}$ in., style longer.-Distrib. N. and W. Europe, Arctic and sub-Arctic Asia and America.
** Valves with no dorsal nerve. Armora'cia, Rupp. (gen.).
C. Armora'cia, L.; leaves linear-oblong ohtuse deeply regularly crenate, radical long-petioled, cauline narrower sessile, racemes panicled, pods (immature) obovoid on long slender pedicels. Horse-rudish.
Ditches, corners of fields, \&c. ; an alien or denizen (?) Wulson ; fl. May-June. -Rootstork stout, long, cylindric. Leavex 8-12 in., radical 3-5 in. broad, on petioles 1 ft ., waved with many spreading reticulate nerves, cordate cuneate or unequal at the base ; cauline many, $4-8 \mathrm{in}$., $\frac{1}{-1} \mathrm{in}$. broad, more serrate than toothed. Flowers $\frac{1}{3} \mathrm{in}$. diam. Pod never ripening in this country; style slender; stigma large, capitate; seeds described as 8-12 in a cell, smooth. - Distrib. Origin unknown. I have not seen ripe pods; it is possibly a cultivated form of C. macrocarpa, W. and K., a native of Hungary.

## 13*. CAMELI'NA, Crantz. Gold of Pleasure.

Annual, erect herbs. Leaves almost entire, cauline auricled. Flowers small, yellow. Sepals short, equal at the base. Petals obovate. Pod obovoid; valves turgid, keeled at the base, produced upwards along the base of the style; margins flattish ; septum membranous; stigma simple. Seeds many, 2 -seriate, not margined ; funicle slender, adnate at the base to the septum ; cotyledons incumbent.-Distrib. Europe and temp. Asia ; species $5-10$ (all vars. of one ?).-Etym. $\chi \alpha \mu a i$ and $\lambda$ inov, dwarf flax.
C. satíva, L. ; radical leaves petioled, cauline oblong-lanceolate.

Flax-fields, sporadic, not even naturalized ; fl. June-July.-Stems 2-3 ft., branched above, slender. Radical leaves soon withering ; cauline 1-3 in., obtuse; auricles pointed, entire or lobulate. Flowers $\frac{\frac{1}{8}}{\frac{1}{3}} \mathrm{in}$. diam. Petals erect, spathulate. Pods $\frac{1}{4} \frac{1}{3}$ in., on slender spreading peduncles, obovoid, margins flat, thin ; seeds few, oblong, punctulate.-Distrib. Central and S. Europe, and temp. Asia.-Seeds used for soap-makers' oil, for feeding poultry, and making oil-cake.

## 14. SUBULA'RIA, L. AWl-wort.

A small submerged perennial scapigerous herb. Rudical leaves all subulate. Flowers small, white. Sepals spreading, equal. Petals small. Pod shortly stalked, oblong or nearly globose ; valves convex, ribbed; septum membranous; stigma sessile, entire. Seeds few, 2 -seriate; cotyledons incumbent, incurvel, narrowed into the radicle; the lengthened bases of the cotyledons being turned up, a transverse section of the embryo shows a radicle with apparently 4 cotyledons.-Distrib. Arctic, N. and Central Europe, N. Asia, Iceland, N.E. U. States.-Etym. subula, from the form of the leaves.

1. S. aquat'ica, $L$.; leaves cellular, scape naked few-flowered.

Gravelly bottoms of subalpine lakes in Scotland, ascending to 2,200 ft.; Wales, and Ireland; fl. June-Aug.-Roots of densely tufted glabrous matted white fibres from a small stock. Leaves 1-3 in., fascicled, terote, gradually taporing upwards. Scapes 1-3 in. Flowers $\frac{1}{n} \mathrm{in}$. diam., submerged. Pods small, $\frac{1}{8}$ in. ; pedicel short, ascending ; seeds pale brown, punctulate.

## 15. CApselíla, Moench. Shepherd's Purse.

Annual herbs. Radical leaves entire or lobed. Flowers small, white, pedicels slender. Sepals spreading, equal. Pod much laterally compressed, oblong or obcuneate or obcordate; valves boat-shaped, keeled; septum membranous; stigma sessile. Seeds many, minute; cotyledons incumbent. -Distrib. N. temp. regions; species 6.-Etym. Diminutive of Capsula. -Petals tend to be transformed into stamens.

1. C. Bur'sa-Pastor'is, $D C$.; pod triangular or obcordate.

A weed in all situations, ascending to $1,200 \mathrm{ft}$; f f. March-Nov.-Gilabrous or hairy, hairs branched. Roots long, tapering. Stems 6-16 in., branched. Leaves rosulate, pinnatifid, rarely entire, upper lobe triangular, cauline auricled. Flowers in in. diam. Pods $\frac{1-\frac{1}{3} \mathrm{in} \text {. ; pedicels slender; style }}{\text { s }}$ short; valves smooth; seeds many, oblong, punctate.-Distrib. Temp and Arctic Europe, N. Africa and Asia to the Himalaya; introd. in all temp. climates.

D 2

## 16. SENEBIE'RA, $D C$. Wart-cress.

Annual or biennial, branched, prostrate herbs. Leaves entire or cut. Flowers minute, white, in short leaf-opposed racemes. Sepals short, spreading. Stamens 2, 4, or 6 . Pod small, indehiscent, didymous, laterally compressed ; valves subglobose, rugose or crested ; stigma sessile. S'eeds 1 in each cell ; cotyledons incumbent or induplicate, gradually narrowed into the radicle.-Distrib. Temp. and warm regions; species 6.-Etym. J. Senebier, a Genevese vegetable physiologist.-Rapidly spreading weeds in the colonies, \&ce. The shorter stamens are sometimes absent. Embryo in some species cyclical.

1. S. Corono'pus, Poiret; lobes of fruit not separating deeply wrinkled, the wrinkles forming a crest, style subulate. Corono'pus Ruel'lii, Gaertner. Waste ground, from Fife southward, rare in Scotland, local in Ireland; fl. June-
Sept.-Habit, \&c. of S. didyma, but glabrous, less branched ; foliage larger,
less divided; petals and stamens usually perfect ; pods twice the size, abruptly narrowed into the subulate style, lobes conuate; pedicels very short, thick ; and seeds twice as large. Surface of pod variable as to sculpturing.-Dysfrib. Europa, N. Africa, W. Asia; introd. in the U. States.
S. DID'yMA, Persoon; lobes of fruit separating wrinkled, style minute. Corono'pus, Sm.
Waste ground near the sea from Hampshire westward, S. and W. Wales, S. and W. Ireland ; sporadic elsewhere ; a denizen, Wutson; H1. July-Sept.Annual or biennfal, slightly hairy, diffuse, creeping, branched and leafy. Leuves finely cut, 1-2-pinnatitid; lobes small, obovate, spreading. Flowers in short racemes, very minute, white, usually apetalous and diandrous. $l^{\prime}$ 'od $\frac{1}{2} \mathrm{in}$. broad, pedicels spreading; separating into 2 indehiscent hard lobes; seed reniform, punctate-striate.-Distrib. Believed to he a native of the S. States of S. America ; now introd. in many countries.

## 17. LePrid'ium. Cress.

Herbs sometimes shrubby at the base, varions in habit. Leaves entire or much divided. Flowers small, white, often apetalous and oligandrous. Sepals short, equal. Petals short or 0. Stamens 2, 4, or 6. P'od oblong ovate obovate or obeordate, much laterally eompressed; valves keelerl, winged or not ; septum narrow ; stigma notched. Seeds 1 in each cell, rarely 2 , pendulous from the septum; cotyledons incumbent, rarely aeenimbent.-Distrib. Temp. and warmer regions of the globe; species $601-80$. - Etym. $\lambda \in \pi i \delta t o v$, from the scale-like form of the pools. - Stamens sometimes deformed. Cotyledons 3 -prartite in the common 'ress.

Sicution 1. Nasturtias'trum, Gren. and (rodir. Pod much compressed, entire or notched, valves keeled, not winged ; style minute.

1. L. Iatifo'lium, L. ; perennial, erect, radical leaves long-petioled oblong serrate, pod ovoid entire. Dithender.
Sait marshes, indigenous in S. Wales, Somerset, Kent, Hampshire, Essex, and
Norfolk; introd. ih Fife and Berwick ; S. of Ireland; A. July-Aug.-
Glahrous, rather glaucous. Rootstock elongate, stoloniferous. Stem 2-4 ft., much branched, leafy. Radicul leaves often 1 ft ; ; cauline narrower, upper sessile. Florers minute, in short densely panicled bracteate corymbs. Pord is in.; pedicels short; valves not winged.-DisTrib. Mid. and 8.
Europe, W. Asia.
2. L. rudera'le, $L$.; annual, erect or prostrate, lower leaves 2 -pinnatifid, pod orbicular-oblong notehed.
Waste places near the sea, E. and S. of England, rarer and probably not indigenous elsewhere; a denizen? Wutson; fl. May-June.-Glabrous or slightly pubescent. Radical leaves much divided, segments narrow; upper cauline linear, entire. Flocers minute, usually apetalous and diandrous, in terminal and lateral corymbs. Pods $\frac{14}{1}-1 / 2$ in., flat ; pedicels slender, diverging ; valves keeled, almost winged at the top ; seeds compressed.-Diswrib. Europe, N.W. Asia to the Himalaya; introd. in U. States.
Section 2. Le'pia, DC. Pod ovoid or oblong, much compressed, notched ; valves broadly winged; style short.
3. L. campes'tre, Br. ; cauline leaves auricled toothed, anthers yellow, pods concave papillose, style not longer than the notch. Pepperwort.
Fields and roadsides, from Lanark and Elgin southwards, rare in Scotland and
Ireland ; fl. May-Aug.-Glabrous or pubescent, annual or biennial. Stem 6-18 in., erect, simple or branched. Radicul leares pinnatifid or entire, cauline oblong-lanceolate. Flowers $\frac{1}{n} \mathrm{in}$. diam. Pods $\frac{1}{4} \mathrm{in}$., in horizontal racemes, broadly ovate, shorter than the spreading pedicels ; papillæ scale-like when dry ; seeds oblong, curved.-Distrib. Europe, N. Africa, N. and W. Asia to India ; introd. in U. States.
4. L. Smith'ii, Hook. ; cauline leaves auricled toothed, anthers violet, pods concave slightly papillose, style longer than the notch. L. hirtum, Sm. in part.
Fields and roadsides, from Moray southwards, rare in Scotland, ascending to $1,000 \mathrm{ft}$., and in Ireland ; fl. April-Aug.-Habit of L. campestre but perennial, more downy, with a large style and less papillose pod, probably a form of L. hirtum, L.-Distrib. W. Europe.

Section 3. Cardária, DC. Pod deltoid-cordate, constricted between the valves; valves hardly keeled, not winged ; style distinct.
L. Dra'ba, L.; stem flexuous leafy, leaves oblong amplexicaul toothed.

Fields, hedgebanks, and railway cuttings, rare and sporadic in Mid. and
S. England, but hardly naturalized ; an alien, Wutson; fl. May-June.-

Perennial, hoary or downy. Stem 1-3 ft., branched above. Leuves 1-3 in.,
auricles converging, lower petioled. Racemes in branched panicles. Floxers
$\frac{1}{4} \mathrm{in}$. diam., white. Porl $\frac{1}{6} \mathrm{in}$. broad, deltoid with rounded angles, on slender
spreading pedicels, disposed in short racemes; valves slightly papillose, one
often smaller or imperfeet, enclosing the seed when dehiscing.-Distrib.
Central and S. Europe, W. Asia; introd. in U. States.

## 18. thlas'pi, L. Penny C'ress.

Annual or yerennial, glabrous, often glancous herbs. Leaves quite entire or toothed, radical rosulate, cauline hastate. Flowers white or rosecoloured. Sepals erect, equal at the base. Petals obovate. Pod short, laterally compressed, broader upwards, emarginate; valves keeled or winged. Seeds few, not margined; cotyledons accumbent.-Distrib. Temp., Alpine, and Arctic N. hemisphere, rare in South ; species 30.Etym. The old Greek name of the genus.

1. T. arven'se, L.; annual, cauline leaves sagittate sinuate-toothed, pod large orbicular deeply notehed, valves broadly winged all round, cells 5-8 seeded. Mitleridate Mustard.

Fields, \&c. rather common ; rarer in Scotland ; east of Ireland ; a colonist, Watson; fl. May-July.-Stem 1-2 ft., usually simple, slender, erect. Radical leaves petioled, cauline with prominent auricles. F'lorers $\frac{1}{4} \mathrm{in}$. diam., white. $P$ ods $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam., flat, on slender spreading pedicels, disposed in long racemes. IVinys with a delicate marginal nerve, lobes sometimes overlapping at the tip; style very short ; seeds dark, oblong, ridged and punctate. -Distrib. Europe to N. Africa, N. and W. Asia to N. W. India ; introd. in U. States.
2. T. perfolia'tum, $L$.; annual, cauline leaves cordate with converging auricles, pod small obcordate, valves winged above, cells 4-6 seeded.
Limestone pastures, rare ; Oxford and Gloucestershire ; fl. April-May.-Much branched from the base ; branches 4-6 in., ascending, flexuous. Leuves $\frac{t}{2}-1 \mathrm{in}$. broad; radical spathulate, petioled. F'lourers in in. diam., white. Porls $\frac{1}{6} \mathrm{in}$., and pedicels horizontal; valves turgid, wings short with a stout marginal nerve ; style very short ; seeds pale.-Distrib. Mid. and S. Europe, N. Africa, N. and W. Asia.
3. T. alpes'tre, L. ; pereunial or biennial, cauline leaves sagittate, pods obcordate retuse, valves winged above, cells 4-8-seeded.
Mountain distriets, England and Scotland, ascending to 2,500 ft. in Forfarshire ; fl. June-Aug.-Stem 6-10 in. Radical leates long-petioled, obovate, entire ; cauline $\frac{1}{2} \mathrm{in}$. Flower $\frac{1}{8} \mathrm{in}$. diam. Racemes of pods variable. Pod $\$$ in., curved upwards, on spreading pedicels, longer than in the preceding species, and more narrowed at the base ; wing with an obscure marginal nerve; seeds red-brown.-Distrib. Europe, Himalaya. -I do not find that authentically named specimens of the following sub-species altogether tally with the characters assigned to them.
Sub-sp. sylves'tre, Jord. (sp.) ; notch of pod shallow, style as long as its lobes.-Teesdale, Allen river, Northumberland; Glen Isla, Scotland.
Sub-sp. occita'num, Jord. (sp.); notch of pod shallow, style slender longer than its lobes, radicle at times incumbent (Syme).-Limestone rocks, Settle, Yorkshire and Llanrwst, N. Wales.
Sub-sp. vírens, Jord. (sp.); notch of pod minute, style slender much exceeding it.-Limestone rocks, Matlock.

## 19. MBE'RIS, L. CANDY-TUFT.

Low, glabrous, branched, leafy herbs, often shrubby below. Leaves entire or pinnatifid, often fleshy. Flowers corymbose, all or the outer only with the 2 outer petals radiating. Sepals equal at the base. Petals white or lilac, the two outer much the longest. Filaments without appendages. Pod broad, much compressed, orbicular or ovate, tip entire or notched; valves keeled or winged; septum very narrow, of two lamellæ; stigma notched. Seeds 1 in each cell, not margined; cotyledons aceumbent; radicle horizontal or ascending.-Distrib. Mid. and S. Europe, Asia Minor ; species about 20.-Etym. Iberia (Spain), where many species grow.

1. I. ama'ra, $L$.; leaves oblong-lanceolate, pods suborbicular.

Cornfields and cultivated ground on a dry soil, chiefly in the centre and E. of England, rare in Scotland ; a colonist, Wotson: fl. July-Aug.-Annual. Ntem 6-9 in., erect, corymhosely branched, ribhed, the ribs minutely downy. Leawes 1-3 in., sessile, scattered, sparingly toothed or pinnatifid, often minutely ciliate. Flovers $\frac{1}{1}-\frac{1}{2} \mathrm{in}$. diam., white or purplish. P'ods $\frac{1}{8} \mathrm{in}$. broad, tlat, on
short horizontal pedicels, in short racemes ; notch triangular ; valves narrowly winged, wings acute above; style exceeding the wings.-Distrib. W. Europe, from Belgium southwards.-Very bitter.

## 20. TEESDA'LIA, Br.

Small, annual, glabrous, seapigerous herbs. Leaves rosulate, pinnatifid. Flovers minute, white. Sepals spreading, equal at the base. Petals equal, or 2 outer larger. Stamens 4 or 6 , with a scale at the base of each filament. Pod broadly obovate or orbicular, emarginate or 2 -lobed; valves boat-shaped, slightly winged; cells 2 -seeded; stigma simple. Cotyledons accumbent. -Distrib. S. and W. Europe and W. Asia ; species 2.-Etym. Robert Teesdale, a Yorkshire botanist.

1. T. nudicau'lis, $B r$.; two outer petals twice as long as the others.

Sandy and gravelly places, not rare in England, ascending to near 1,000 ft. in
Yorkshire, very local in Scotland, Moray, Aberdeen, Glasgow ; absent from
Ireland ; fl. A pril-June.-Stems 4-18 in., usually many, slender, ascending.
Radical leares 1-2 in., numerous, lobes broad, spreading. Flowers 1, in. diam. Pods $\frac{1}{6}$ in., in racemes 2-9 in., pedicels short slender spreading; style very short.-Distrib. Europe, N. Africa, W. Asia.

## 21. HUTCHIN'SIA, $B r$.

A small annual herb. Leaves rosulate, pinnatifid. Flowers minute, corymbose. Sepals short, equal at the base. Petals small, equal. Filaments without scales at the base. Pod broadly oblong, obtuse, much compressed; valves keeled; septum narrow; stigma sessile. Seeds 2 in each cell, compressed, not margined; funicle slender; cotyledons accum-bent.-Distrib. Europe, N. Africa, W. Asia to N. W. India.-Еtym. Miss Hutchins, a zealous Irish botanist.

1. H. petræ'a, $B r$.; sepals about equalling the petals.

Limestone rocks W. of England and Wales, from Yorkshire (ascending to to $1,500 \mathrm{ft}$.) to Somerset ; naturalized on the walls of Eltham churchyard, (where it was planted by Dillenius?) and of the Mathew cemetery, Cork ; fl. March-May.-Glabrous or sparingly hairy, slender, much branched from the base, $2-5 \mathrm{in}$. Radical leaves $\frac{1}{2}-1 \mathrm{in}$., lobes spreading, obovate, almost petioled ; cauline shorter, pinnatifid. Pods f-1 in., on horizontal pedicels, in a short raceme ; style distinct ; seeds pale.

## 21*. ISA'TIS, L. Woad.

Tall, erect, annual or biennial branched herbs. Cauline leaves sagittate. Flowers yellow, on slender pedicels deflexed in fruit. Sepals equal at the base. Petals equal. Pod indehiscent, 1 -celled, oblong ovate or orbicular, thickened in the middle; wing or margin very broad; stigma sessile. Seed pendulous from the top of the cell ; cotyledons incumbent. - Distrib. Temp. Europe, Asia, and N. Africa ; species 25-30.-Etym. The Greek name of the genus.

1. I. tinctória, $L$.; pod obovate-oblong, wing broad and thick.

Sporadic ; cultivated fields and chalk-pits; naturalized near Guildford; an alien, Wutson ; fl. July-Aug.-Glaucous, glabrous or nearly so. Stem 1-3 ft., stout, erect, branched above. Radical leaves oblong-obovate or lanceolate;
petioles long ; cauline 3-5 in., sessile. Floners $\frac{1}{6}$ in. diam., in crowded panicled corymbs. Pods $\frac{1}{2} \mathrm{in}$., in short racemes, pendulous, glabrous, brown when ripe, rounded at the tip; wing hard; stigma sessile in a minute notch ; seed linear-oblong.-Distrib. Europe, N. Asia. - The Ancient Britons stained themselves with this plant ; later, the Saxons imported it ; it is still cultivated in Lincolnshire.

## 22. CRAM'Be, L. Sea-kale.

Perennial herbs with stout branched stems. Leaves usually broad. Flowers white, in long panicled racemes. Sepals spreading, equal. Lomger filaments often with a tooth on the outside. Pod indehiscent, 2 -jointed, lower joint slender, seedless, forming a pedicel to the upper, which is globose 1-celled and 1 -seeded; stigma sessile. Seed globose, pendulons from a basal funicle; cotyledons incumbent, conduplicate.-Distrib. Europe and W. Asia; species 16.-Еtym. The Greek name of the plant.

## 1. C. marit'ima, $L$. ; leaves broad waved toothed or pinnatifid.

Sandy and shingly sea-coasts, rare, from Fife and Isla southwards ; very rare in Ireland ; fl. June-Aug.-Rootstock as thick as the thumb, fleshy, burrowing; branches 1-2 ft., spreading. Leaves 6-10 in., fleshy, petiolate, broadly ovate-cordate oblong or orbicular, glabrous and glaucous; upper few and small. Corymbs in large much-branched panicles. Flowers $\frac{1}{2}$ in. diam., white; shorter filaments toothed near the tip externally. Pods $\frac{3}{4} \mathrm{in}$., on slender ascending pedicels 1 in .-Distrib. Coasts of Europe, from Finland to the Bay of Biscay and the Black Sea.-Formerly eaten wild, cultivated for about 200 years in England, whence it was introduced to the Continent.

## 23. Caki'le, Gaertn. Sea Rocket.

Annual, large, fleshy, branched herbs. Leuves entire or pinnatifid. Flowers white or purplish. Lateral sepals gibbous at the base. Pod indehiscent, of 2 angular 1 -celled joints; upper joint deciduous, compressed, with 1 basal seed ; lower cuneate, 2 -edged, with 1 penduluos seed; stigma sessile. Cotyledons accumbent, sometimes oblique.-Distrib. Seashores of Europe and N. America ; species 2.-Etym. An Arabic word.

1. C. marit'ima, $L$.; suberect or decumbent, leaves entire or lobed.

Sandy and shingly shores, abundant ; fl. June-July.-Annual ; rather suceulent ; branches 1-2 ft., zigzag, ascending. Leares 2-3 in., fleshy. Florers $\frac{1}{2}$ in. diam., corymbose, lilac or white ; pedicels stout. Pods on short thick pedicels in lax racemes, ribbed when dry; lower joint $\frac{1}{2} \mathrm{in}$., broadish upwards; upper $\frac{3}{4}$ in., base truncate.-Distrib. Europe, N. Africa, Iceland. - (: americana, which appears to me identical with this, is found on the shre ; of the Canadian Lakes, as well as on the American sea-coasts, south to the W. Indies.
24. RAPH'ANUS, $L$. Radish.

Annual or biennial herbs. Ratical leaves lyrate. Flowers in long racemes, white or yellow, purple-veined. Scpals ereet, lateral saccate at the base. Pod elongate, indehiscent, or separating into 1 -seeded joints, terete or moniliform, coriaceous or corky, with several superimposed 1 -seeded cellules; style or beak of the porl slender; stigma notched Seeds pendulous, globose; cotyledons conduplicate or much folded.-.

Distrib. Europe and temp. Asia; species 6.-Еtym. 今\& and фаiva, in allusion to its rapid growth.

1. R. Raphanis'trum, $L$.; leaf-segments usually few and remote, pod subulate not much constricted at the 4-8 joints faintly ribbed, heak as long as the 2 or 3 last joints. Wild Radish or White Charlock.
Cornfields; ascends to 1,000 feet; a colonist, Watson ; fl. May-Sept.Annual, stout, $1-2 \mathrm{ft}$., erect or spreading, hairy or hispid. Leaves $4-10 \mathrm{in}$., coarsely toothed or serrate, terminal lobe largest. Florers $\frac{3}{4} \mathrm{in}$. diam., white or straw-coloured. Pods 1-3in., dehiscing at the base above the first seedless segment, which is very small; beak $\frac{1}{2}-\frac{3}{4} \mathrm{in}$., subulate, flattened. -Distrib. Europe (Arctic), N. Africa, N. and W. Asia to India ; introd. in America. - This, the origin of the garden radish, is probably a form of the next species.
2. R. marit'imus, L.; leaf-segments many approximate horizontal or reversed, alternate often stialler, pod of $2-4$ joints separated by a very deep constriction strongly ribbed when dry, beak slender subulate.
Sandy and roeky shores from the Clyde southwards, and in Ireland ; fl. July-Aug.-Very near R. Raphanistrum and perhaps the wild form of that plant, but biennial, more hispid ; leaves with more numerous and closer set lobes; flowers smaller, darker yellow, rarely white ; pod with fewer joints, deeper intervals between them, stronger ribs and a beak as long as the upper joint. -Distrib. W. Europe, from Holland to Spain.

## Order VII. Reseda'cers.

Annual or perennial herbs, rarely shrubs. Leaves alternate, simple or pinnatisect; stipules 0, or minute and glandular. Flowers racemed or spiked, bracteate. Calyx persistent, 4-7 partite, often irregular, imbricate in bud. Petals 4-7, hypogynous, entire or lobed, equal or the posticous larger, open in bud. Disk hypogynous, conspicuous. Stamens usually many, inserted on the disk, equal or unequal, free or connate. Ovary of 2-6 connate carpels, lobed at the top, open between the stigmatiferous lobes; ovules usually many, on 2-6 parietal placentas, amphitropous or campylotropous. Fruit usually a coriaceous capsule, open at the top. Seeds many, reniform, exalbuminous ; embryo curved or folded ; cotyledons incumbent. -Distrib. Europe, W. Asia, N. and S. Africa; genera 6 ; species 20. -Affinities. Too closely allied to Capparidea.-Properties. Reseda Luteola yields "Weld," a yellow dye ; others are considered acrid.

## 1. Res'edA, L. Mignonette.

Herbs. Leaves entire lobed or pinnatifid ; stipules glandular. Flowers racemed. Calyx irregular. Petals unequal, 2 -multifid, the posticous with a membranous appendage on its face. Disk broad dilated behind. Stamens 10-40. Ovary sessile or stalked. - Distrib. Europe and W. Asia ; species 26.-Etym. resedo, in allusion to supposed sedative properties.

1. R. Lute'ola, L.; leaves linear-lanceolate oundivided, sepals 4, stigmas 3. Dyer's weed, Weld.

Waste places, especially on clay or chalk soils ; doubtfully native in Scotland; common in Ireland ; fl. June-Aug.-Glabrous, $2-3 \mathrm{ft}$., amnual or brenmal, branched. Rucemes long, spike-hke. F'locers yellow. P'etuls 3-5, if 5 upper 3-4-cleft, two lateral 3-cleft, two lower entire. Disk large, crenate. Sthmens 20-24. C'upsule depressed, 3-lobed. Needs subglobose, black. - Distrib. Europe, N. Africa, W. Asia ; introd. in U. States.
2. R. Iu'tea, L. ; leaves $2-3$-fid or pimate or bipinnatifid, lobes few distant linear obtuse, sepals and petals 6 very unequal, stigmas usually 3 .
Waste places, from Dumfries and Haddington southwards, very rare in Ireland, and perhaps introduced ; H. June-Aug. - Biemmal. Stem $1-2 \mathrm{ft}$., tranched, ribtued, papillose. Leaces very various in lobing. Rawemes denseHowered, conical ; Howers pale yellow. Depuls hmear, upper smaller. Clpper petuls with a 2 -lobed claw and 3 -fid limb, lateral 2 -fid, lower entire. Stumens 16-20, deflexed. C'apsule $\frac{1}{2}-\frac{3}{4}$ in., oblong, 3 -toothed. Seeds obovoid, black. -Distrib. Europe, N. Africa, W. Asia.
R. AL'ba, $L$.; leaves pinnate undulate glaucous, sepals $5-6$, petals $5-6$ all 3 -fid, stigmas usually 4. R. suffiruticulo'se, L., and $R$. fruticulo'sa, L.
Waste places, chiefly near the sea, an outcast, naturalized only ; fl. June-Aug.-1 follow. Bentham in taking the name of ulbe for this, whieh most authors agree in considering the same with fruticulosa and suffraticulusa. F'lowers white. Stamens 12-14. Deeds reniform, rough.-Distrib. S. Europe and N. Africa. - The tive $R$. alba is more often 6 -merous than is fruticulosa.

## Order VIII. Cisti'nere.

Herbs or shrubs. Leaves opposite, eutire ; stipules foliaceous, small. or 0. Flowers terminal and solitary, or in racemes (scorpioid cymes). Sepals 3-5, imbricate, 2 outer (bracts of some) small or $0 ; 3$ inner often convolute in bud. Petals 5, rarely 3 or 0 , fugacious, convolute in bud. Stamens many, rarely tew, hypogynous, free. Uvary 1-celled, or divided by parietal septa ; style simple, stigmas 3 ; ovules 2 or more, on parietal placentas, orthotropous, funicles slender. C'apsule 3 - 5 -valved; valves placentiferous. Seeds with mealy or firm albumen, testa crustaceous often mucilaginous; embryo usually curved and excentric.-Distrib. Furope, N. Africa and W. Asia; rare in N. America; genera 4; species 60.Affisities. With Bisinew and Cupparidee. - Yhoperties. A resinous balsam (Ladanum) is yielded by C'isti.

## 1. HELIAN'THEMUM, Tourn. Rock-ROSE.

Herbs or under shrubs. Petuls 5. Stemens many, rarely few. Ovary many-ovuled, style jointed at the base, stigma capitate or 3 -lobed. Embryo hooked, folded or circumflex.-Distrib. Europe, W. Asia and N. America;
 are dimorphic, some flowers having no petals and few stamens.

Section 1. Hellan'themum proper. Style elongate, bent upwards. Funicle thickened. Embryo with the radicle bent upwards parallel to the cotyledons.

1. H. vulga're, Gertu.; shrubby, leaves opposite stipulate, margins
flat hairy above downy below, pedicels bracteate. H. surreja'num, Eng. Bot. (a garden variety) ; C'is'tus tomento'sus, Sm.
Dry soils, abundant, except in the W. of Scotland and Cornwall, ascending to $2,000 \mathrm{ft}$., absent from Ireland ; fl. July-Sept.-Brunches 3-10.in., pro cumbent. Leaves oblong, variable. Flowers $\frac{3}{3}-1 \frac{1}{4} \mathrm{in}$. diam., yellow; bracts narrow. Sepals subglabrous, inner apiculate.-1Istrib. Europe (Arctic), N. Africa, W. Asia.
2. H. polifo'lium, Pers. ; shrubby, leaves opposite hoary and downy on both surfaces stipulate, margins recurved, pedicels bracteate.
Stony places, very rare, Brean Downs Somerset, Babbicombe and Torquay; fl. July-Aug.-Habit of H. vulgare, kut more shrubby, leaves with recurved and even revolute margins, and flowers white. Sepuls tomentose, inner obtuse. -Distrib. Mid. and S. Europe, N. Africa.
Sfetion 2. Tubera'ria. Style straight or 0 . Funicle thickened. Embryo annular.
3. H. gutta'tum, Miller ; annual, hoary and hairy, erect, lower leaves opposite exstipulate, upper alternate stipulate.
Dry hilly downs in Wales, S. Ireland, and the Channel Is.; fl. June-Aug. -Stem 6-12 in., 2-3-chotomously branched. Leaces 1-2 in., linear- or obovate- or oblong-lanceolate. Flowers $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. diam., in unilateral cymes, yellow with a red spot at the base of the cuneate petals. Capsule smooth.Distrib. Europe, N. Africa, W. Asia.
Sub-sp. GUTTA'TUM proper ; pedicels ebracteate. -Cork, Jersey, Alderney.
Sub-sp. Brewe'ri, Planchon (sp.); pedicels bracteate. - Holyhead and Anglesea.
Section 3. Pseudo-cis'tus. Style sigmoid. Funicle not thickened. Einbryo sigmoid.
4. H. ca'num, Dunal; shrubby, hoary, leaves opposite exstipulate, pedicels usually bracteate. Cis'tus mar'ifolius, and C. ang'licus, $L$.
Dry banks, rocks, \&c. in W. England, from Westmoreland to Glamorgan, and in Teesdale, ascending to $1,800 \mathrm{ft}$.; W. Ireland, Arran Is.; fl. May-July. -Woody, procumbent, much branched, 6-8 in. Leaves $\frac{3}{4}-\frac{3}{4} \mathrm{in}$., ovate or oblong. Flowers $\frac{1}{4} \frac{3}{4}$ in. diam., few, yellow.-Distrib. Europe, N. Africa and W. Asia.
Vir. 1, са'жиm proper ; leaves hoary on both surfaces, and hairy above, sepals pubescent and having spreading hairs.-Var. 2, vinea'le, Pers. (sp.); leaves hoary beneath, nearly glabrous above, sepals hoary and shortly hairy on the edges ribs and margins.

## Order IX. VIOLA'CEIE.

Herbs or shrubs. Leaves alternate, entire or pinnatisect, margins involute in vernation ; stipules generally persistent. Flowers axillary, regular or irregular, solitary or cymose, 2 -bracteolate. Sepals 5 , persistent, equal or unequal, imbricate in bud. Petals 5, equal or unequal, hypogynous, imbricate or contorted in bud. Stamens 5, filaments short, broad; anthers free or connate by the broad connective, which is produced beyond the cells. (vcury sessile, 1-celled ; style simple, stigma entire cup-shaped or lobed;
ovules many on 3 parietal placentas, anatropous. Fruit a 3-valved capsule rarely a berry, many-seeded. Seeds small, funicle short, allumen fleshy; embryo straight, cotyledons flat.-Distrib. Temp. and trop. regions; genera 21, species 240.-Affinities with Bixinecx, Pussiflorex, and Franke-nincere.-Properties. Emetic and laxative.

## 1. Vi'ola, $L$. Violet, Pansy, Heartsease.

Low herbs, rarely shrubs. Leaves radical or alteruate. Flowers on 1rarely 2 -flowered peduncles. Sepals sub-equal, produced at the hase. Petals erect or spreading; lower largest, spurred or saceate at the base. Anthers connate, connectives of the 2 lower stamens often spurred at the base. Style swollen above, straight or oblique at the tip, stigma obtuse or cup-shaped. Capsule 3-valved; valves elastic. Seeds ovoid or globose. - Distrib. All temp. regions; species 100 .-Etym. The old Latin name. -Flowers often dimorphic, the large-petalled flowering early and often yielding no seed; the small-petalled or apetalous flower late, and are very prolific.

Sketion 1. Nomim'ium. Upper petals directed forwards. Stigma obliquely beaked.-Apetalous autumnal flowers chiefly fertile. Stipules not leafy.

## * Stem very short. Leaces enlarging"after flowering. Sepals obtuse.

1. V. palus'tris, L.; glabrous, routstock sulterranean (reeping, leaves reniform-cordate, style straight, stigma obliquely truncate, fruiting peduncles erect.
Swamps and bogs, ascending to $4,000 \mathrm{ft}$. in the Highlands, rarer in the south of
England ; fl. April-July.-Rootstork white, sealy ; rumners short, leafless.
Lewess slightly crenate; stipules glandular. Flowers $\frac{1}{2}$ in. diam., white or
lilac, scentless ; spur short, obtuse. Lateral petuls almost glabrous. Auther
spurs short.-Distrib. Temp. Arctic and sub-Arctic Europe, Asia, and
America
2. V. odora'ta, L.; slightly hairy or downy, runners very long, leaves broadly cordate, spur nearly straight, style hooked, stigina oblique. Sweet Violet.
Hedrebanks and copses, wild in E. and S.E. England, naturalized elsewhere, perhaps native of E. Ireland ; fl. March-May. - Romtstork short, searred. Leuers deeply cordate at the base, sinus closed; stipules glandular. Brects at or about the middle of the peduncle. Flowers fragrant, hlue, white, or red-purple ; lateral petals with or without a tuft of hairs ; spur short, obtuse. Anther spars linear-oblong. Crapsule pubescent, pedicels decurved.--Distrib. Europe, N. Africa, N. and W. Asia to the Himalaya.
3. V. hir'ta, L.; pubescent, rootstock very short, runners short or 0 , leaves subtriangular-eordate, spur hooked, style hooked, stigma ohlique.
Dry soils, local, chiefly in the E. counties from Forfar southwards, ascending to near $1,000 \mathrm{ft}$. in Yorkshire ; fl. April-June.- Very near F. oderute, and perhaps a variety of it, but more tufted and hairy, leaves narrower and more triangular, with deeper crenatures and a shallower sinus ; bracts lower on the peduncle ; spur long and hooked ; flowers inodorous or faintly scented.
-Distrib. Europe, N. and W. Asia to N.W. India.
Var. 1, culca'rea, Bab.; petals narrow. Gogmagog Hills.-Var. 2, sepin'colu,

Jord. (sp.); more hairy, with longer runners (possibly a hybrid of hivla with odorata). Yorkshire.
** Stem evident. Leaves not enlarging after flowering. Sepals acute or acuminate. 4. V. cani'na, $L$.; perennial, leaves long-petioled ovate-cordate or oblong-lanceolate, stipules small narrow, toothed and ciliate, style hooked, stigma acute, fruiting peduncles erect. Dog-violet.
Woods, pastures, and banks ; fl. April-Aug.-Very variable in size, habit, and colour of flower, glabrous or nearly so. Leaves crenate-serrate, varying in the sub-species from broadly ovate and deeply cordate $\frac{3}{4} \mathrm{in}$., to oblong-lanceolate and 3 in . ; stipules subulate linear or lanceolate. Bracts at or above the middle of the peduncle, subulate or lanceolate, toothed or serrate. Flower$\frac{1}{2} 1 \frac{1}{4} \mathrm{in}$. diam., blue, lilac, grey or white. Sepals narrow, acuminate. Capsule oblong, 3 -gonous.-Distrib. Europe (Arctic), N. and W. Asia to the Himalaya, N. Africa.
The following is Mr.J. G. Eaker's disposition of the sub-species of this var:able plant:-

## 1. Main stem elongated, branching and flowering.

Sub-sp. CANI'NA proper ; rootstock short, stolons 0 , leaves narrow ovate-cordate, spur obtuse, anther spurs 5 times as long as broad. V. flavicornis, Sm.; pu'mila, Hook. and Arn.-Extends into Arctic Europe, Siberia, and Greenland.
Sub-sp. Lac'tea, $\operatorname{Sm}$. (sp.) ; rootstock short, stolons 0 , leaves ovate-lanceolate, base rounded or cuneate, petals narrow grey, spur very short, capsule sub-globose.-Heaths, E. England ; confined to W. Europe.
Sub-sp. stagnína, Kitaib. (sp.); rootstock elongated stoloniferous, leaves oblong-lanceolate base truncate, upper narrower, petals pale lilac or white, spur very short, capsule 3-gonous.-Bogs, E. of England, Galway; extends into Siberia.
2. Muin stem with a rosette of radical leaves; "flowering-stem axillary.

Sub-sp. sybvat'ica, Fries (sp.); rootstock 0, leaves broadly ovate-cordate subacute, anther spurs very long, capsule glabrous.-Var. 1. Rivinia'na, Reich. (sp.); spur compressed furrowed, fruiting sepals with prominent notched auricles.-Var. 2. Reichenbachia'na, Boleau (sp.); spar narrower not furrowed, fruiting sepals with minute auricles. Copses and hedgebanks, ascending to $3,000 \mathrm{ft}$. in Wales and Scotland ; also Arctic and N. American.
Sub-sp. arena'ria, DC. (sp.) ; pubescent, rootstock short or 0, stolons 0, leaves broadly cordate obtuse, stipules small, spur short, capsule oblong pubescent.-Upper Teesdale, alt. 2,000 ft., very rare.-Extends into Arctic Europe.
Section 2. Mela'nium. L'pper petals erect. Stigma capitate, hollow, with a pencil of hairs on each side.-No apetalous flower. Stipules leafy.
5. V. tri'color, L.; leaves long-petioled ovate;oblong or lanceolate crenate, stipules leafy pinnatifid, sepals with large auricles, style short straight, stigma capitate, excavated. Heartsease or Pansy.'
Pastures, banks and waste places, \&cc. ; fl. May-Sept.-Very variable. Stem +18 in., branched, erect or ascending, angular, flexuous. Leaves $1-1 \frac{1}{2}$ in., Tyrate, coarsely and remotely crenate-serrate ; stipules $\frac{1-\frac{1}{2}}{} \mathrm{in}$. across, very large, spreađing like a fan, lobes deep linear or oblongobtuse, lateral smaller, middle sometimes leafy. Bracts minute, high up on the peduncle. Flowers
$\ddagger 1 \neq \mathrm{in}$. diam., purple whitish or golden yellow, sometimes parti-coloured. Distrib. Europe (Arctic), N. Africa, N. and W. Asia to Siberia and N.W. India.-Sub-sp. Iu'tea and Curtis'ii are confined to W. Europe from Belgium southwards to Naples. Sub-sp. tricolor and arven'sis proper are naturalized in America.
Sub-sp. Tri'color proper ; rootstock 0 , stem elongate branched, petals spreading pale yellow or lilac longer than the sepals, capsule ovoid.-Cultivated ground ; ascends to near 2,000 ft. in the Highlands.
Sub-sp. arven'sis, Murray (sp.); rootstock 0, stem elongate branched, petals erect white or yellowish not longer than the sepals, capsule globose.-Cultivated ground ; ascends to near $1,000 \mathrm{ft}$. in Scotland and York.
Sub-sp. Curtis'in, Forster (sp.); rootstock branched stoloniferous tufted, petals spreading blue purple or yellow rather longer than the sepals, capsule 3 -gonous. V. sabulo'sa, Boreau.-Sandy shores, rare, Cheshire to Devon; S. and W. of Ireland.

Sub-sp. LU'TEA, Muds. (sp.) ; rootstock branched, branches slender with short stems and underground runners, petals blue purple or yellow spreading longer than the sepals, capsule oblong 3-gonous.-Hilly districts from Wales and Notts northwards; ascends to $2,800 \mathrm{ft}$. in the Highlands and Yorkshire.

## Order X. polygathere.

Herbs or shrubs, erect or climbing. Leaves alternate or subopposite, simple, exstipulate. Flowers irregular. Sepals imbricate in bud; 2 inner larger, petaloid, winglike. Petals 3-5, hypogynous, 2 outer (lateral) free or united with the hooded lower into a tube split at the base behind; 2 inner equal to the outer, or smaller or 0 . Stamens 8, filaments connate in 1 cleft sheath which is usually adnate to the petals; anthers 1-rarely 2 -celled, opening by pores, rarely by valves. Disk small. Ovary free, 2 -celled; style simple, curved, stigma various; ovules 1 in each cell, pendulons, anatropous, raphe ventral. Seeds pendulous, testa often hairy, hilum strophiolate, albumen fleshy or 0 ; embryo straight. - Distrib. Temp. and trop. regions; genera 15 ; species 400 .-Affinities, distant with Sapindacea, Violacear, and Pittosporece. - Properties. Bitter, emetic, purgative, and diuretic.

## 1. POLYG'ALA, L. Milkwort.

Herbs or shrubs. Leaves alternate, rarely subopposite or whorled. Flowers in terminal or lateral racemes or spikes. Petals combined below with the staminal sheath. Stamens 8 ; anthers 1-2-celled, opening by transverse pores. Capsule compressed, loculicidally splitting along the edges. Seeds usually downy, with a crested raphe.-Distmib. Trop. and temp. regions; species 200 .-Etym. $\pi \delta \delta \lambda u$ and $\gamma d \lambda a$, being supposed to increase the milk in cows.

1. P. vulgaris, $L$.; stems many leafy, leaves alternate lower oblong upper lanceolate, veins of inner sepals anastomosing copiously, capsule oblong-obovate notched, lohes of aril unequal.
Heaths and meadows ; ascends to near $3,000 \mathrm{ft}$. in the Highlands ; fl. June-
Aug.-A small wiry perennial, 2-10 in., glabrous or very rarely pubescent.
Rootstock short. Lewves $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$., rather coriaceous, quite entire. Flowers
$\frac{1}{6}-\frac{1}{3} \mathrm{in}$., white, pink, blue, lilac, or purple. Sepals purplish in flower, green in fruit.-Distrib. Europe (Arctic), N. Africa, Siberia, and W. Asia.
Sub-sp. vulga'ris proper, stems ascending, leaves all linear or lanceolate, racemes many-flowered, central bract as long as the flowering pedicel, pedicels sepals petals and capsules not ciliate.-VAR. 1, branches straight, large sepals oblong-obovate broader than the capsule. Common; ascends to near $3,000 \mathrm{ft}$. in the Highlands.-Var. 2, graud' itlora, Syme ; upper leaves large, inner sepals oblong acute, flowers large dark blue. Beubulben, Sligo.
Sub-sp. oxyp'tera, Reich. (sp.); branches flexuous, leaves linear, inner sepals cuneate below shorter and narrower than the capsule, pedicels, \&cc. glabrons. -Sandy shores, limestones and chalky soils, local.-VAR. cil'iata; branches prostrate tortuous, inner sepals broader than the capsule, pedicels bracts sepals and capsule ciliate. Gogmagog Hills.
Sub-sp. DEPRES'SA, Wenderoth (sp.); stems flexuous, leaves somewhat opposite and distichous, lower oblong spathulate, racemes fewer-flowered, central bract shorter than the flowering pedicel.-Common on heaths.
2. P. calca'rea, F. Schultz; stems many, flowering shoots axillary from the rosulate obovate radical leaves, cauline leaves oblong, inner sepals obovate broader and longer than the capsules, central nerve branched beyond the middle, capsule obcordate, lobes of aril unequal. P. ama'ra, Don, not L.
Dry soil and rocks, S. and S.E. England ; Wiltshire to Kent, and Gloucester to Berks ; fl. June-July.-Rootstock branched. Stem 2-6 in. ; leaves more rosulate; flowers various in colour. The flowering shoots being always axillary from the lower leaves is its best character, giving the plant an umbellate appearance: sub-sp. depressa of $P$. vulgaris is intermediate in this respect.-Distrib. Central and S. Europe.-Perhaps only a sub-species of $P$. vulgaris.
3. P. uligino'sa, Fries; leaves rosulate spathulate, from the axils of which the flowering branches spring, inner sepals oblong or obovate obtuse narrower than the capsule, veins simple or slightly branched free, capsule obcuneate notched, lobes of aril nearly equal. P. austri'aca, Crantz.
Very rare, margins of rills, High Force and Cronkley Fell, Teesdale, alt. $1,800 \mathrm{ft}$.; fl. June-July.-Much smaller than either of the above, $2-4 \mathrm{in}$. Rootstock short. Leaves more fleshy. Flowers deep pink or blue in the British form, which Syme distinguishes as a variety from the German, which is white (Reichenbach's figure is blue), and has the capsule rounded at the base.-Distrib. W. Europe (Arctic) from Sweden to Italy.

## Order XI. FRANKENIA'CERE.

Perennial rarely annual herbs or small shrubs, with jointed internodes. Leaves small, opposite, exstipulate. Flowers small, regular, solitary, in the forks of the branches. Calyx tubular, persistent ; lobes 4-6, induplicate in bud. Petals 4-6, hypogynous, free, imbricate in bud, claws with an adherent scale. Stamens 4 or more, free or connate at the base ; anthers versatile, 2 -celled. Ovary free, sessile, 1 -celled; style slender, stigma 2-5 lobed; ovules many, in 2 series, on 2-5 parietal placentas, amphitropous with the micropyle below; funicle slender. Capsule
enclosed in the persistent calyx, 3-5-valved. Secds oblong, raphe linear, testa crustaceous, albumen mealy; embryo axile, straight. - Distrib. Temp. and warm regions, chiefly littoral ; genera 1 ; species about 12.Affinity with Carophyllece and Tamariscinca.-Properties none.

## 1. franke'nia. Sea-Heath.

Characters of the order.

1. F. læ'vis, $L$.; stem pubescent, leaves with revolute margins.

Salt marshes on S. E. coasts of England, Yarmouth to Kent ; fl. July-Aug.-
Perennial, procumbent. Stems wiry. Leuves $\frac{1}{8}-\frac{1}{4}$ in., fascicled or whorled, oblong but linear from the reflexed margins, glabrous, ciliate at the base. F'locers small, rose-coloured. Capsule 3-gonous.-Distrib. Central and S. Europe, N. Africa, W. Asia to India.

## Order XII. CARYophyl'Lex.

Herbs sometimes woody at the base, with thickened nodes. Leaves opposite, usually connate at the base, entire; stipules 0 , or small and scarious. Inflorescence definite, centrifugal. Sepals 4-5, free or counate, imbricate in bud. Petals 4-5 (rarely 0), hypogynous, rarely perigynous, imbricate or contorted in bud. Stamens 8-10, rarely fewer, inserted with the petals, filaments filiform. Disk annular hypogynous or perigynous, or elongated, or broken up into glands. Ovary free, 1-celled, or 3-5celled at the base ; styles 2-5, free or connate below, stigmatose on the inuer surface ; ovules 2 or more, on slender basal funicles, which are often connate into a short column, amphitropal, micropyle inferior or transverse. Capsule dehiscing by valves. Seeds many, small, often reniform, albumen floury rarely fleshy ; embryo eylindric, curved, radicle incumbent. - Distrib. Cosmopolitan, but chiefly Arctic, Alpine, Eurojean, and W. Asiatic ; genera 35, species 800.-Affinities with Paronychica, Portulucsa, and Chenopodiacea.-Properties unimportant.
Tribe I. Sile' Nefe. Calyx 4-5-lobed. Disk elongated, bearing the petals and stamens. Styles free. Stipules 0 .

* Hilum on the face of the peltate seed.
\#ntryo straight...............1. Dianthus.
Hilum lateral.

Styles 2. Capsule 4-valved ............................................1*. Saponaria.
Styles 3. Capsule 3-6-valved ...............................................2. Silene.
styles 4-5. Capsule 4-5-8-10-valved.
Petals appendiculate.
3. Lychnis.

Petals exappendiculate
4. Githago.

Thibe II. ALSI'NEIs. Sepals free. Disk small. Styles free. - Stipules 0.

Capsule eylindric, 6-valved. Petals jagged. Styles 3. .......5. Holosteum.
Capsule cylindric, $8-10$-valved. Petals notehed (rarely entire)..6. Cerastium.
Capsule globose, 6-10-valved; styles 3-5. Petals 2 -fid. ........7. Stellaria.
Capsule 3, 4, 6, or 10-valved. Styles 3-4. Petals entire........8. Arenaria.
Capsule 4-5-valved. Styles 4-5. Petals entire or 0 .................9. Sagina.
** Stipules scarions.
Styles and valves of capsule 5
..10. Spergula.
Styles and valves of capsule 3
11. Spergularia.

Tribe III. POLYCAR'PEAE. Sepals free. Disk small. Petals small. Stamens 5 or fewer. Styles combined at base ...............11*. Polycarpon.

## 1. dianthes. Pink and Carnation.

Tufted herbs, often shrubby at the base. Leaves narrow, grass-like. Flowers solitary, panicled, or fascicled. Calyx tubular, 5-toothed, striate, with imbricating bracteoles at the base. Petals 5, entire or cut, claw long. Stamens 10. Disk elongated. Ovary 1-celled; styles 2. Capsule 4 -valved at the top. Seeds discoid, imbricate upon the columnar placenta ; embryo straight.-Distrib. Europe, temp. Asia, N.W. America, N. and S. Africa; species about 70.-ЕTYM. $\Delta$ iós and ăpos, flower of. Jupiter.

## * Flowers in dense fascicles.

1. D. Arme'ria, L.; bracts lanceolate downy as long as the calyx, tips, subulate. Deptford Pink.
Fields and dry banks from Cumberland to Devon and Kent ; a doubtful native, Watson; fl. July-Aug.-Annual. Stems 1-2 ft., few, striet, erect. Leaves 1-2 in., linear, lower obtuse, upper acute. Fascicles of flowers dichotomous. Calyc-tube 2-3 in. cylindric, many-nerved. Flowers $\frac{1}{2} \mathrm{in}$. diam. Petals distant, narrow, red with dark dots, toothed.-Distrib. Europe, W. Asia; introd. in the U. States.
2. D. pro'lifer, $L$.; fascicles of flowers capitate, bracts ovate membranous as long as the calyx-tube, inner obtuse.
Gravelly pastures S. and E. of England, rare, Windsor, Norwich, formerly near Ryde, Jersey ; a doubtful native, Watson; fl. June-Oct.-Annual. Stems few, 6-18 in., sometimes branched above. Leaves short, linear-lanceolate, margins seabrid. Heads $\frac{3}{4} \mathrm{in}$., many-flowered, ericlosed in dry brown bracts. Flowers $\frac{1}{4}-\frac{1}{2} \mathrm{in}$. diam., opening one by one. Calyx faintly ribbed. Petals contiguous, purplish-red, obovate, emarginate. Capsule ovoid, rupturing the calyx.-DIsTRIB. Europe, W. Asia; introd. in the U. States.

## ** Flovers solitary or loosely cymose.

3. D. deltoides, $L$.; leaves narrow-lanceolate downy and subscabrous, lower obtuse, flower solitary, bracts ovate acuminate half as long as the calyx-tube, petals toothed. Maiden Pink.
Fields and banks, dry soil, from Moray and Argyle southwards ; absent from Ireland ; fl. June-Sept.-Perennial, much branched ; branches slender, 1 ft . Leares of barren shoots ligulate. Floarers $\frac{3}{4} \mathrm{in}$. diam., rarely 2 together, inodorous. Calyx glabrous, strongly ribbed. Petals distant, obovate, rosy, spotted with white. Capsule cylindric.-Distrib. Europe.
Var. 1, deltoi'des proper; faintly glaucous, bracts generally 2, flowers rosy. -Var. 2, glau'cus, L. (sp.) ; very glaucous, bracts usually 4, flowers white.
-King's Park, Edinburgh.
4. D. cæ'sius, $S m$. ; leaves scabrous at the margin, flowers usually solitary, bracts orbicular mucronate 4 times shorter than the calyx-tube, petals jagged and bearded. Cheddar Pink.
Limestone rocks, Cheddar ; f. June-July.-Perennial, glaucous. Rootstock woody, branched. Stems 4-10 in., many. Leaves of barren shoots linear, obtuse, upper ones of the flowering stems acute. Bracts membranous.

F'lower 1 in. diam., fragrant. Petals obovate, rosy, contiguous, teeth $\frac{1}{8}-\frac{1}{8}$ the length of the blade. Calyx-tube faintly ribbed.-Distrib. Belgium southwards to Lombardy and Hungary.
D. Caryophyl'lus, $L$.; leaves grooved above, margin smooth, cymes loosely panicled, bracts obovate mucronate 3-4 times shorter than the calyx-tube, petals toothed and crenate. Wild Camation, Clove Pink.
Old castle walls, \&c., naturalized ; fl. July-Aug.-Perennial, glabrous, glaucous, stout, much branched and leafy below, 18-24 in. Leaves 4-6 in., recurved. Bracts membranous, tips herbaceous. Flover $1 \frac{1}{2} \mathrm{in}$. diam., fragrant. Calyx cylindric, faintly ribbed. Petuls obovate, rosy, teeth $\frac{1}{8}-\frac{+}{}$ the length of the blade. Capsule ovoid.-Distrib. Belgium and France to Italy, Hungary and Greece.-Flowers dimorphic on the same individual ; stamens in one form much longer than in the other. The origin of the garden Carnation.
D. pluma'rius, $L$.; leaves all acute 1 -nerved, margin scabrous, cymes loosely panicled, bracts 4 rhomboid cuspidate equalling $\frac{4}{}$ of the calyxtube, petals fimbriate. Wild Pink.
Naturalized in Shalford, Surrey ; East Ham, Essex ; Haughmond Abbey, Ludlow and Conway Castles ; fl. June-Aug.-Perennial, cesspitose, branched,
1 ft . Flower as in D. Caryophyllus, but smaller, rose-purple, segments of petals $\frac{1}{3}-\frac{1}{2}$ as long as the blade.-Distrib. Mid. Europe from Austria to Lombardy and Mid. Russia. - The origin of the Garden Pinks.

## 1*. SAPONA'riA, L. Soapwort, Fuller's Herb.

Annual or perennial herbs. Radical leaves spathulate, cauline narrower. Flowers in panicled or fascicled cymes, white, lilac, red or yellow. Calyx tubular, 5 -toothed, obscurely nerved, ebracteate. Petals 5, clawed, entire or notched. Stamens 10. Disk small. Styles 2. Capsule oblong, 2 -celled at the base, 4 -valved at the top. Seeds reniform, tubercled; embryo annular.-Distrib. Europe and temp. Asia; species 30.-Etym. Sapo, the plant having been used as a soap.

1. S. officina'lis, $L$. ; glabrous, glaucous, leaves oblong-lanceolate.

Hedges, roadsides, and fields, apparently naturalized in S. W. England and
N. Wales ; a denizen, Wutson ; fl. Aug.-Sept.-Rootstock white, ereeping, fleshy, stoloniferous. Stem 1-3 ft., straight, ascending. Letees 2-4 in., 3 -ribbed. C'ymes in panicled corymbs. Flowers 1 in . diam. I'etuls obcordate, lilac or white. C(c)ssule ovoid, 2 -celled at the base, on a stout pedicel, enclosed in the fusiform calyx-tube.-Distrib. Europe, W. Asia; introd. in U. States.-A decoction is very saponaceous. Flower often double. $\mathbb{S}$. hylnichu, L. is a variety with connate upper leaves and monopetalous corolla.

## 2. SILE'NE, L. Catchfly.

Habit of Saponaria and Dianthus. Calys inflated, 5 -toothed, 10 -nerved. Petals 5 ; claw narrow ; blade entire or divided, with usually 2 scales at its base. Stamens 10 , the 5 -petaline sometimes adherent to the claw. Disk columnar. Ovary 1-3-celled below the middle ; styles 3, rarely 2-5, opposite the sepals; ovules many. Capsule 6 -valved at the top. Seeds with a marginal hilum ; embryo annular or $\frac{1}{4}$ annular.-Distrib. N. temp. hemisphere; species 200.-Etym. $\sigma a \lambda o v$, saliva, from the viscidity of some species.

## * Calyx bladdery, nerves reticulate. Capsule incompletely septate.

1. S. infla'ta, Sm.; stem erect, panicle many-flowered, bracts scarious, petals deeply cloven, scales obscure. Cucubalus Behen, L.
Roadsides and waste places; ascending to near 1,000 ft. in Yorkshire; fl. JuneAug. - Perennial, branched, 2-3 ft., glaucous, glabrous or downy. Leaves 1-3 in., variable, ovate obovate or oblong. Flowers $\frac{3}{4} \mathrm{in}$. diam., drooping, white. Capsule globose, top conical.-DisTrib. Europe (Arctic), N. Africa, Siberia, W. Asia to N. W. India ; introd. in the U. States.
Var. puber'ula, leaves downy. Rarer.
2. S. maritima, L. ; stems diffuse, flowers 1-4, bracts herbaceous, petals shortly cleft, segments broad with two scales at the base.
Sea-shores, abundant, more rare by Alpine streams ; ascending to $3,000 \mathrm{ft}$. in the Highlands; fl. June-Aug.-Very nearly allied to S. inflata, easily recognized by the above characters.-Distrib. Shores of Europe (Aretic), from Italy westward to the Canaries, and northward to Norway and Finland.
** Calyx cylindric, strongly many-ribbed, closing tightly over the capsule at the top. Capsule incompletely septate.
3. s. con'ica, L.; hairy and glandular, erect, dichotomously branched, flowers many erect.
Pastures and sandy heaths, local ; Kent, Norfolk, Suffolk, Haddington and Forfar ; fl. May-July.-Annual, 6-12 in. Leaves linear, upper acute and ribbed. Calyx $\frac{1}{2}$ in., ampulliform, 30 -ribbed, intruse at the base; teeth subulate. Petals small, rosy or purple, cleft, with 2 scales at the base of the blade ; gynophore very short.-Distrib. Europe, N. Africa, Siberia, W. Asia to India.

$$
\text { *** Calyx with } 10 \text { broad nerves. Capsule incompletely septate. }
$$

4. S. an'glica, L.; everywhere hairy and viscid, lower leaves spathulate, flowers in leafy racemose cymes, calyx-teeth setaceous, petals and scales small entire or slightly 2 -fid.
Gravelly places from Moray southwards, not rare, probably often an escape;
fl. June-Oct.-Annual, 1-2 ft., erect or diffusely branched. Leaves variable.
Calyx $\frac{1}{2}$ in., membranous with green pubescent ribs. Capsules ovoid, on usually deflexed peduncles.-Distrib. Europe, N. Africa, Siberia, N. Asia to N.W. India.
Var. 1, gal'lica, Koch (sp.) ; flowers white or pink, petals 2-fid.-Var. 2, quinquevul'nera, L. (sp.); petals entire white with a red spot.
5. S. acau'lis, $L$. ; densely tufted, sub-diœcious, leaves small linearsubulate close set, flowers shortly peduncled solitary erect, calyx tubular teeth obtuse, petals notched and with a notched scale. Moss Campion. Wet Alpine rocks, ascending to $4,300 \mathrm{ft}$. ; fl. June-Aug.-Perennial, forming bright green, moss-like cushions. Leaves $\frac{1}{-\frac{1}{2}}$ in., channelled above, keeled below, ciliate. Flowers pink, $\frac{1}{2}$ in. diam., peduncles lengthening after flowering. Calyx faintly nerved; teeth with scarious margins. C'apsule exserted, subcylindric, 5-toothed.-Distrib. Alps of Europe, N. Asia, N. America; all Arctic regions.
6. S. Oti'tes, L.; flowering stems erect viscid simple few-leaved, radical leaves narrow-spathulate, cymes panicled, flowers small subdiwecious erect whorled, calyx-teeth obtuse, petals linear, scales 0 .

Sandy fields and roadsides of the E. counties, local ; fl. June-Aug.-Rootstock woody, branched. Stem 1-3 ft. Radical leazes $\frac{1}{2}-3 \mathrm{in} .$, many, slender, puberulous. Panicle narrow, interrupted. Flowers $\frac{1}{6}$ in. diam., many, suberect, pale yellow-green; bracts memliranous. Culyx obovoid, membranous. Petals entire. Stamens and styles much exserted. C'apsule ovoid, rupturing the calyx.-Distrib. Europe, Siberia, W. Asia to Persia.
7. S. nu'tans, L.; pubescent, stem above and calyx viscid, radical leaves oblong-lanceolate, cauline linear, flowers in panicled or subracemed cymes drooping, calyx-teeth acute, petals 2 -partite, scales lanceolate. S. paradoxa, Sm. Nottingham Catchfly.
Dry places and walls, Nottingham and other castles, rare ; S. Kent, Dovedale, Orme's Head, Conway, Fife, Forfar, Kincardine, Jersey ; fl. May-July.Rootstock woody, branched. Ralical leures 2-5 in., tufted, petioled; cauline small, narrow, sessile. Flozer-stems 2-3 ft. Calyx $\frac{1}{2}$ in.,' tulular, swollen in the middle, membranous, nerves purple. Petals white or pink, segments diverging, narrow, incurved. Capsule erect, exceeding and rupturing the calyx.-Distrib. Europe (Arctic), Siberia, Dahuria, Canaries.
-Flowers dimorphic, fragrant at night.

## **** Calyx cylindric or ovoid, 10-nerved. Capsule aithout uny septa.

8. S. noctifóra, L.; softly pubescent, viscid above, leaves all oblonglanceolate acute the lower petioled, flowers 1 or few all 2 -sexual, calyx-tube long, teeth slender, petals 2 -fid, scales truncate.
Sandy fields, on the E. coasts only ; Forfar to Sussex ; fl. July-Aug.Annual, 1-2 ft., erect, simple or dichotomous. Leazes $3-4 \mathrm{in}$., $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$. broad. Flozers erect. Culyp 1 in ., narrow in flower; nerves green. I'etals rosy within, yellow outside, segments incurved by day. Capsule as long as, and often rupturing, the calyx.-Distrib. Europe, Siberia, W. Asia to India ; introd. in U. States.-Flowers open at night and very fragrant.

## 3. LYCH'NIS, L. CAMPION.

Characters of Silene, but styles 5. Sepals not foliaceous. Petals with an appendage at the base of the blade. Styles and carpels opposite the sepals. - Distmib. N. temp. hemisphere; species 30.-Etym. 入ú $\chi$ дos, from the flame-like flowers of some species, - Styles sometimes, but rarely, 3-4, when the species may be referred with equal justice to Silene.

## * Petals 4-cleft. Capsule 5-toothed, rithout septa.

1. L. Plos-cu'culi, L. ; flowers in loose dichotomous cymes, petals 4 -cleft. Ragged Robin.
Moist meadows, copses, \&c. ; ascends to near 2,000 ft. in the Highlands; A. May-June.-Glabrous. Rootstork slender. Stem $1-2 \mathrm{ft}$., roughish ahove.

Radical leaves petioled, oblong-lanceolate, acuminate; cauline narrow.
Flowers drooping, pedicels slender. Caly $y \frac{1}{\frac{1}{3}}$ in., veins purple; teeth acuminate. Petuls rosy, rarely white, segments linear ; seales long, 2 -fid. Capsule broadly ovoid, very shortly pedicelled.-Distrib. Europe (Arctic), Siberia.
** Petals notched or 2-fid. Capsule 5-toothed, rith incomplete septa.
2. L. Visca'ria, L. ; stem viscid at the nodes, petals notched.

Limestone rocks in N. Wales, and trap rocks local, in Mid. and S. Scotland; fl. June-Aug.-Glabrous, stout, 6-10 in. Rootstock perennial, woody. Radical
leaves 3-5 in., very narrow-lanceolate, petioles downy at the margins. Cymes very contracted, panicled, few-flowered. Flowers almost sessile. C'ulyx $\frac{1}{2}$ in., membranous, purple, dilated upwards; teeth short, acute. Petuls obovate, red-purple ; scales short. Capsule broadly ovoid; pedicel slender, $\frac{1}{2}$ as long as the capsule.-Distrib. Europe (excl. Spain and Greece) to the Caucasus, Siberia.
3. L. alpi'na, $L$.; tufted, not viscid, cymes compact, petals 2 -lobed.

Alpine moors and ravines ; Hobeartin Fell, Cumberland ; Little Kilrannock, Perthshire ; Clova Mts., aseending to $3,000 \mathrm{ft}$. ; fl. June-July.-Glabrous, $4-8 \mathrm{in}$. Rootstock short, much branched. Leaves 1-2 in., crowded, narrow, linear-lanceolate. Flowers nearly $\frac{1}{2}$ in. diam., shortly peduncled, bracts red. Calys nerves faint, teeth rounded. Petals rosy. Capsule ovoid, pedicel half its length.-Distrib. Arctic and high alps of Europe (excl. Greece and Turkey), Siberia to Dahuria, Arctic America.
*** Petals 2 -partite. Capsule 10 -toothed, without any septa. Flowers sub-dicecious.
4. L. diur'na, Sibth. ; calyx reddish, teeth triangular acute, petals red, capsule subglobose teeth recurved. L. dioica a, L. Red Campion.
Damp copses and hedgebanks ; fl. June-July.-Softly hairy, rarely quite glabrous, viscid above. Rootstock slender, branched. Radical leaves 3-6 in., obovate, petioled ; cauline narrower. Flowering stem 1-3 ft., erect. Flowers in loose dichotomous cymes. C'alyx $\frac{1}{2}$ in., subcylindric, reddish, rarely green. Petals red, rarely white, lobes oblong; seales lanceolate. Capsule mouth wide ; gynophore very short.-Distrib. Europe (Arctic) to the Caucasus, Siberia to Baikal, Greenland.
5. L. vesperti'na, Sibth. ; calyx greenish, teeth elongate, petals white, capsule conical, teeth short linear-lanceolate erect. White Campion. L. divica $\beta, L$.

Fields, hedgerows, \&ce. ; f. June-Sept.-Very similar to the last, and probably only a sub-species. Flowers rarely reddish, fragrant in the evening.Distrib. Europe, N. Africa, Siberia, W. Asia ; introd. in the U. States.

## 4. Githa'go, Desfontaines. Corn-cockle.

Characters of Lychnis, but calyx coriaceous with foliaceous teeth. Petals without scales at the base of the blade, entire. Styles and carpels opposite the sepals.-Distrib. Europe, Siberia, W. Asia to Persia; introd. in U. States ; species 1. -Еtym. obscure.

1. G. se'getum, Desf.; flowers solitary, calyx woolly segments much longer than the petals. Agrostem'ma Githago, L.
Cornfields ; a colonist, Watson ; fl. June-Aug.-Annual ; clothed with dense white hairs. Stem 1-2 ft. Leaves $2-5 \mathrm{in}$., linear-lanceolate. Flowers $1 \frac{1}{2}-2 \mathrm{in}$. diam. ; peduncles long. Calyx $1-1 \frac{1}{2}$ in., cylindric-ovoid, ribs strong. Petals pale purple, limb obovate. Capsule ovoid.

## 5. HOLOS'TEUM, $L$.

Annual herbs, viscid and glandular. Leaves narrow. Flowers in terminal umbel-like cymes. Sepals 5. Petals 5, toothed or notched. Stamens $3-5$, ravely 10 . Ovary 1 -celled ; styles 3 , rarely 4 or 5 ; ovules many. Capsule subcylindric, with twice as many short terminal valves as there are styles. Seeds concavo-convex, rough; embryo horseshoe-shaped.Distrib. Europe, W. Asia; species 3.-Etym. unknown.

1. H. umbella'tum, $L$. ; lower leaves petioled elliptic-oblong.

Old walls and thatched roofs, very rare, Norwich, Eye, and Bury St. Edmunds; a denizen or native? Watson; f. April-May.-Stem 4-8 in., very slender, branched at the base. Radical leanes, $\frac{1}{2}-1$ in. ; cauline very few, sessile, ovate or linear. Flozers few, erect ; pedicels $\frac{1}{2}$ in., deflexed after flowering, erect in fruit; bracts small, membranous. Sepals white, edges scarious, obtuse. Petals $\ddagger$ in., a little longer than the sepals, white or pale pink. Stamens and styles often 3 each. Capsule twice as long as the sepals. Seeds black.-Distrib. Europe, N. Africa, W. Asia to N.W. India.
6. Ceras'tium, $L$. Mouse-ear Chickweed.

Pubescent rarely glabrous herbs, the hairs articulate, some glandular, others not. Leaves small. Flowers white, in terminal dichotomous cymes. Sepals 5, rarely 4. Petals as many, rarely 0 , notched or 2 -fid, rarely quite entire or much cut. Stamens 10, sometimes 5 or fewer. Ovary 1 -eelled; styles usually 3 or 5, ovules many. Capsules cylindric, often incurved, with twice as many short terminal valves as styles. Seeds compressel, often tubercled ; embryo annular.-Distrib. All temp. and cold regions; species 40.-Етум. ќ́pas, from the horn-like capsule.

Section 1. Moench'ia, Ehr. (gen.). Sepals acuminate, longer than the entire petals.

1. C. quaternel'Ium, Fenzl; glabrous, glaucous, stamens 4. Moenchia erecta, Ehr.
Gravelly pastures, \&c. from Northumberland (rare) southwards ; ascends to $1,200 \mathrm{ft}$. in Wales ; fl. May-June.-Annual. Stems 2-6 in., dichotomously branched from the base; branches slender, stiff. Leaves 1 in ., linear, radical sublanceolate ; cauline few, shorter, broader. Flovers few; pedicels long, erect, stiff. Sepals $4, \frac{1}{4} \mathrm{in} . ;$ margins broad, membranous, white. P'etals 4, shorter than the sepals, oblong. Styles 4, short. Capsule subcylindric, as long as the sepals, 8 -toothed.-Distrib. W. Europe from Holland southwards and west to Hungary, N. Africa ; introd. in the U. States.

## Section 2. Ceras'tium proper. Petals notched, 2-fid, or erose.

## * Annual ravely perennial, hairy and viscid except C. triviale. Sepals 4-5, a long as the petals. (Perhaps all subspecies of one.)

2. C. tetran'drum, Curtis; cyme leafy, pedicel usually erect when fruiting 2-3 times as long as the capsule, bracts herbaceous, sepals 4 rarely 5 acuminate glandular margins narrowly membranous, capsule straight. C. atrovirens and pedunculatum, Bab.
Sandy and waste places near the sea ; fl. April-Oct.-Stem 4-12 in., dichotomously branched from the base. Radical leaves obovate-lanceolate ; cauline usually broader upwards. Flowers $\ddagger \mathrm{in}$. diam. Petals notched, veins branched. Capsule scarcely longer than the sepals.-Distrib. W. Europe from Sweden to Spain and westwards to Hungary.
3. C. semidecan'drum, $L$.; cyme few- or many-flowered, pedicels a little exceeding the calyx deflexed between flowering and fruiting, bracts half-membranous, sepals usually 5 glandular acute margins broadly membranous, capsule slightly curved.

Walls and banks; ascending to near 1,000 ft. in Yorkshire; fl. March-May. -Stem 1-10 in., erect or decumbent, sometimes nearly glabrous, branched from the base. Leaves as in C. tetrandrum. Petals erose, with simple veins, shorter than the sepals. Stamens 4-5, or 10. Capsule exserted.-Distrib. Europe, N. Africa.--Flowers long before C. viscosum.
Var. ? pu'milum, Curtis (sp.); upper bracts with narrow membranous edges, petals notched, veins branched, fruiting pedicel short curved, capsule curved. C. glutino'sum, Fries.-Dry banks, rare, I. of Wight, Bristol, Surrey. -Intermediate in many points between C. tetrandrum gnd semidecandrum.
4. C. glomera'tum, Thuillier; cymes at first subcapitate, fruiting pedicels suberect shorter than the sepals, bracts all herbaceous, sepals acute with few glands and narrow membranous borders, petals as long as the sepals 2 -fid rarely 0 , capsule twice as long as the sepals curved. C. vulga'tum, L., and visco'sum, L. in part.
Dry places, ascending to $1,000 \mathrm{ft}$. in Westmoreland and Scotland ; fl. April-Sept.-Habit of the preceding, but usually larger, less glandular and cymes more fascicled.-Distrib. Europe (Arctic), N. Africa, W. Asia to the Himalaya, Iceland, Greenland, \&cc. ; introd. in U. States.
5. C. trivia'le, Link; cymes lax, pedicels longer than the sepals reflexed between flowering and fruiting, primary bracts wholly herbaceous, margins of secondary sometimes membranous, sepals obtuse margins broad membranous, petals 2 -fid, capsule twice as long as the sepals curved. C. viscosum L. of Hook. and Arn.
Waste places; ascending to $3,600 \mathrm{ft}$. in Scotland; fl. April-Aug.-Similar to C. glomeratum, but usually perennial, often with leafy barren shoots. Syme alludes to an exotic alpine form that has petals twice as long as the sepals. -All Europe from the Arctic circle southwards, N. and W. Asia to Spitzbergen and the Himalaya, N. Africa; introd. in U. States.
$\mathrm{V}_{\mathrm{AR} .} 1$, trivia'le proper; perennial, decandrous, hairs not glandular, sepals pubescent.-Var. 2, holosteoi'des, Fries (sp.) ; perennial, stem with only 2 lines of pubescence, sepals glabrous. Neweastle and Perth.-Var. 3, pentandrum ; annual, pentandrous, capsule shorter, sepals as in Var. 1. Seashores.
** Perennial, downy or woolly. Petals 5, twice as long as the sepals, 2-fid.
6. C. arven'se, L.; stems hairy all round, leaves linear-lanceolate, bracts and sepals subacute, margins and tip membranous, seeds sharply tubercled. Sandy fields and waste places, not uncommon in England, rarer in Scotland; local in Ireland ; fl. April-Aug. - Branches 6-10 in., tufted, ascending. Leaves crowded on the basal shoots. Cymes many-flowered. Sepals oblonglanceolate, glandular. Capsule a little longer than the sepals.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to the Himalaya, N. America, Fuegia, Chili.
Var. 1, pubes'cens, Syme; leaves soft and pubescent, cymes 3-10-flowered.Var. 2, Andren'sic, Syme ; leaves rigid glabrescent, midrib strong below, flowers subsolitary.
7. C. alpi'num, L.; stems hairy all round, leaves ovate or oblongovate obtuse pubescent, cymes dichotomous often 1 -flowered, bracts herbaceous obtuse, sepals with often a faint membranous margin, seeds sharply tubercled.

Alpine and subalpine rocks, England, Wales, and Scotland; ascending to near $4,000 \mathrm{ft}$.; absent from ireland; fl. June-Aug.-Habit of C. wremest, but leaves much broader and flowers fewer and much larger, $\frac{3}{4}-1 \mathrm{in}$. diam., with scarcely any glands ; and capsule almost twice as long as the sepals.... Distrib. Mountains of Europe, N. America, and all Aretic regions.
Var. 1, lunu'tum, Lamk. (sp.); covered with long woolly hairs.-Vir. 2, pubes'cens, covered with short hairs.
8. C. latifo'lium, Sm.; stems hairy all round, leaves ovate or oblong obtuse pubescent, flowers usually solitary, lower bracts herbaceous, sepals obtuse margins broadly membranous, seeds obtusely tubercled.
Alpine rocks in Wales and Scotland, ascending to $3,600 \mathrm{ft}$., rare; fl. May-Aug. - Very like C . cllpinum, perhaps a sub-species of that plant; it does not precisely accord with the Continental (:. Lutitolium (itself too near alpinum), and is altogether a very doubtful species.-Distrib. (of the European form), Alps and Arctic regions, from Lapland to Italy, and from France to Austria; Greenland and Arctic America.
Var. 1, Smith'ii; yellow-green, loosely tufted, glandular and hairy, sepals almost eglandular. C. latifolium, Sm. N. Wales and Scotch Alps.-VAr. 2, compeci'tem, Syme; light green, densely tufted, glandular and hairy, sepals glandular. Braemar.-Vir. 3. Edmondstome'i, Watson (var. nigrescens, Syme) ; deep green, wanting the articulated hairs, stem-leaves broader, sepals broader and glandular. Unst in Shetland.
9. C. trigy'num, Villars; stem with alternating hairy lines, leaves small narrow oblong-lanceolate glabrous, cymes 1-3-flowered, bracts herbaceons margins broadly membranous glandular or glabrous. Stella'riu cerastoides, L. Alpine and subalpine rills and springs in Scotland, ascending to $3,700 \mathrm{ft}$., rare ; fi. July-Aug.-A smaller and more delicate species than the two preceding alpine ones, nearly glabrous. Lettes $\frac{\ddagger}{-\frac{1}{2}}$ in., distant, obtuse, often recurver. Flowers $\frac{1}{2} \mathrm{in}$. diam., on very slender pedicels. dipuls linear-oblong, spreading, 1 -nerved. P'etuls deeply 2 -fid. Styles $3-5$, usually 3. Capsule longer than the sepals.-Distrib. Alps of Europe (Aretic), Siberia, W. Asia to the Himalaya, all Arctic regions.-Altogether intermediate between Ceras. tien and Stellaria.

## 7. Stella'ria, $L$. Stitchwort.

Slender usually glabrous herbs, Leaves grassy or broad. Flowers in dichotomous cymes, white, small. Sepals 5, raiely 4. Petals 5, rarely 4, 2 -fid or 2 -partite. Stamens 10 , rarely 8, more or less perigynous. Disk: annular, sometimes dividel into glands. Ovary 1 -celled ; styles 3 ; ovules many. Capsule short, splitting below the middle into as many simple or 2 -fid valves as there are styles. Seeds compressed, granulate; embryo annular.-Distrib. All temp. and cold regions; species 70. - Etym. Stella, in allusion to the star-like flowers.

Section 1, Mala'chium, Fries (gen.). Sepals free to the base. Styles 5 , rarely 3 . Capsule with 52 -fid valves.

1. S. aquat'ica, Scopoli; slightly glandular above, stems diffuse decumbent angular, leaves ovate-cordate. Cerastium aquaticum, L. Borders of ditches, streams, \&c. from Cheshire southwards ; fl. July-Aug.--
Perennial. Strm $1-3 \mathrm{ft}$., brittle, branched, trailing over bushes. Letces
1-1/itin., membranous, lower shortly petioled, acute, sometimes ciliate.

Floxers $\frac{1}{2}$ in. diam., axillary. Sepals lanceolate, enlarged in fruit. Petals white, lobes diverging. Capsule 1 m ., ovoid, a little longer than the sepals, peduncle deflexed, curved at the tip.-Distrib. Europe, N. Africa, Siberia, W. Asia.
Section 2, Stella'ria proper. Sepals free to the base. Stamens subperigynous. Styles 3. Cupsule with 6 entire valves.
2. S. nem'orum, $L$.; stem glabrous or hairy all round, leaves ovate acuminate, lower subcordate long-petioled, upper cauline sessile, cyme lax, petals longer than the sepals.
Shady places, from Dumbarton and Moray southwards to S. Wales; ascends to $1, z \omega 0 \mathrm{ft}$. in Yorkshire ; absent from Ireland; A. May-Aug.-Glabrous or pilose with jointed hairs and slightly glandular. stem $1-2 \mathrm{ft}$., stout, terete, brittle, shining. Leaves 1-3 in., membranous, ciliate. Flowers $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam.; pedicels very slender. Sepals lanceolate, obtuse, edges scarious. C'apsule uvoid, as long as the sepals; pedicels spreading or reflexed.-Distrib. Europe (Arctic), excl. Greece and Turkey.
3. S. me'dia, $L$.; stem procumbent with a line of hairs, leaves ovate acuminate, lower petioled, upper sessile, cymes many-flowered, petals shorter than the glandular sepals sometimes 0 , stamens 3-10. Chickweed. Cultivated and waste ground, ascending to $2,700 \mathrm{ft}$. in Scotland ; fl. March-Oct.-One of the commonest and most variable of plants, 6-18 in., easily recognised by the line of hairs on the stem and branches.-DIsTrib. All Arctic and N. temp. regions ; naturalized elsewhere.
Var. 1, média proper ; pedicels pubescent, sepals hairy, petals present, stamens 5, seeds punctate and obtusely tubercled. - Var. 2, Borcéana, Jordan (sp.) ; pedicels pubescent, sepals hairy, petals 0 , stamens 3 , seeds smaller obscurely punctate and tubercled. - Var. 3. neglec'ta, Weihe (sp.); stem suberect, pedicels pubescent, sepals hairy as long as the petals, stamens 10 , seeds as in Var. 1.-Var. 4, umbro'su, Opitz (sp.); stem erect or ascending, pedicels almost glabrous elongate, sepals glabrous with raised points, seeds fuscous acutely tubercled. Sussex, Dorset, Somerset, York.
4. S. Holo'stea, $L$.; stem suberect 4 -angled, angles rough, leaves sessile connate lanceolate acuminate ciliate, petals twice as long as the almost nerveless sepals.
Copses and hedgerows, \&c.; ascending to 1,900 ft. in the Highlands; fl. April-June.-Perennial. Stem 1-2 ft., decumbent at the base, brittle at the nodes, hairy above. Leaves 1-4 in., rigid. Flowers $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam., white, pedicels slender. Capsule globose.-Distrib. Europe, W. Asia.-Flowers sometimes double ; petals occasionally laciniate.
Section 3, Larbræ'a, St. Hilaire (gen.). Sepals united at the base into a conical tube. Stamens very perigynous. Styles 3. Capsule 6-valved.
5. S. glau'ca, Withering; glaucous, glabrous, stem suberect 4 -angled, leaves very narrow sessile margins even, pedicels very long axillary, petals longer than the 3 -nerved sepals.
Marshy places, not uncommon from the Clyde and Forth southwards, rare in Ireland ; fl. May-July. - Perennial. Stems 1-2 ft., very slender. Leaves 1-2 in., oblong-lanceolate, or linear-oblong. Flowers $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam., few, distant. Bracts membranous. Sepals lanceolate, acute, margins broad, scarious.

Capsile ovoid, as long as the sepals, pedicel spreading.-Distrib. Europe, Siberia, W. Asia to the Himalaya, Greenland.
6. S. gramin'ea, L.; glabrous, stem suberect 4 -angled, leaves very narrow sessile ciliate, cymes branched, petals about as long as the 3 -nerved sepals.
Meadows, hedgebanks, \&c. on a dry soil ; ascends to $1,500 \mathrm{ft}$. in Yorkshire ; f. May-Aug. - Perennial, not glaucous. Stem 1-3 ft. Leaves as in S. glaucu, but ciliate. Flowers $\frac{1}{2}-\frac{1}{4}$ in. diam., many. Bructs scarious, ciliate. Pedicels reflexed after flowering, then spreading. Sepals acute. Cupsule ovoid, nodding, a little longer than the sepals.-Distrib. Europe (Aretic), Siberia, W. Asia to the Himalaya -S. scanigera, Willd., found by Don in Perth and Inverness-shire, is a cultivated abnormal form of this, with short stems, imbricate leaves, long ereet solitary peduncles, and small flowers.
7. s. uligino'sa, $L$.; glaucous, nearly glabrous, stem 4-anglel, leaves ovate-lanceolate, cymes few-flowered, sepals lanceolate acute, petals mimite. Wet places ; ascending to $3,300 \mathrm{ft}$. in the Highlands ; fl. May-July.-Amual,
$3-18 \mathrm{in}$., erect or diffuse, variable in size, habit, and breadth of leaves,
1- or more-flowered, glabrous, or with a few hairs at the bases of the leaves, which are narrowed at both ends, and callous at the tip. Bracts scarious. Flarers $\frac{1}{4}$ in. diam. Tube of caly $x$ funnel-shaped. Capsule ovoid. Seeds minute. - Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to the Himalaya, E. and W. N. America.

## 8. arena'ria. Sandwort.

Annual or perennial herbs, often tufted. Leaves broad or narrow. Flowers white, in dichotomous cymes. Sepals 5. Petals 5, entire or slightly notched, rarely 0 . Stamens 10 , rarely 5 , inserted on the disk. Disk anuular, or rising into inter-staminal glands. Ovary 1-celled; styles 3-4; ovules many, rarely few. Capsule short, with as many entire or 2 -fid valves as there are styles. Seeds compressed, smooth or tubercled; embryo annular.-Distrib. all temp. and cold regions; species 130.Etym. Arena, from many growing in sand.

Section 1, Alsi'ne, Wahl. (gen.). Flowers hermaphrodite. Disk annular. Capsule with 3-4 entire valves. Secds many, funicle not swollen or appendaged. (Leaves linear-setaceous in all the British species.)

1. A. ver'na, $L$.; densely tufted, leaves crowded subulate, flowering branches slender few-flowered, oblong petals, and capsule longer than the lanceolate sepals.
Dry rocks, pastures and banks, local ; ascending to 2,500 ft. in the Highlands ; fl. May-July. - Perennial, bright green, sparingly hairy and glandular. Rootstock woody; branches 2-4 in., very many, matted, forming a green cushion. Leaves $\frac{1}{-1} \frac{1}{3}$ in., 3 -nerved. Bracts acute, margin scarious. Flowering branches $1-4 \mathrm{in}$., strict. Flozers $\frac{1}{3} \mathrm{in}$. diam., white; pedicels slender, glandular. Petals oblong, hardly longer than the sepals, white.-Distrib. Mid. and S. Europe, N. Africa, N. America.
Var. 1, ee'na proper; leaves apiculate, lower not appressed. - Var. 2, Gerardi, Willd. (sp.?); leaves not apiculate, lower appressed.
2. A. rubel'la, Hook.; densely tufted, leaves crowded subulate obtuse,
peduncles pubescent 1 -flowered, petals lanceolate and capsule shorter than the acute 3 -nerved sepals.
Rocky tops of Breadalbane Mts. and Ben Hope, alt. 2,500 to $4,000 \mathrm{ft}$., very rare ; fl. July-Aug.-General character of $A$. verna, but yellow-green and purplish, of laxer habit, smaller in all its parts; leaves more flaccid and obtuse ; flowers usually solitary ; petals shorter; styles commonly 4 ; seeds smaller and more orbicular.--Distrib. Aretic Europe, Asia, and America.
3. A. uligino'sa, Schleich.; loosely tufted, stems ascending 1-3-flowered, peduncles slender, leaves subulate semiterete obtuse nerveless, petals obovate-oblong as long as the ovate acute 3 -nerved sepals. Spergula stricta, Swartz ; Alsine stricta, Wahl.
Banks of a rill, Widdy-bank Fell, Teesdale, alt. 1,800 ft. ; fl. June July.Perennial, glabrous, 2-3 in., very slender, habit of Sagina. Leaves $\frac{1-\frac{1}{3} \text { in., }}{\text { in }}$ curved, upper pairs few and distant. Peduncles 1-2 in., filiform. Flouers $\frac{1}{3} \mathrm{in}$ diam., small, white. Capsule ovoid. Seeds reniform, rugose on the disk.-Distrib. W. Europe (Aretic), Lapland to Italy, Greenland.
4. A. tenuifo'lia, $L$. ; erect, very slender, simple or branched, leaves linear-subulate acute $3-5$-nerved, cymes many-flowered, petals oblong not half as long as the lanceolate 3 -nerved sepals, capsule 3 -valved as long as. the sepals.
Sandy fields and waste places from York southwards, chiefly in the Eastern counties; f. June-Aug.-Annual, 2-8 in. Leaves crowded below, upper pairs remote. Flowers $\frac{1}{2} \mathrm{in}$. diam., white. Petals obovate-lanceolate.Distrib. Europe, N. Africa, Siberia, W. Asia to India.
Var. 1, tenuifo'lia proper; glabrous, stamens 10 , capsule equalling the sepals. -Var. 2, lax'a, Jordan (sp.) ; calyx glandular, stamens 5 , capsules longer than the sepals. Great Wilbraham.-Var. 3, hybrid'a; peduncles and sepals glandular, stamens $8-10$, capsule hardly longer than the sepals broader at the base. $\beta$, visco'sa, Bab. Thetford.
Section 2. Arenária proper. Flowers hermaphrodite. Disk annular. Capsule with 3.2 -fid valves. Seeds many. (Leaves broad in all the British species.)
5. A. triner'vis, $L$.; diffuse, leaves petioled ovate acute 3-5-nerved ciliate, flowers solitary, sepals obscurely 3 -ribbed, seeds smooth, funicle appendaged. Moehringia, Clairv.
Moist copses, hedgebanks, \&c.; fl. May-July-Annual, branched, flaceid, decumbent, pubescent; branches $4-18 \mathrm{in}$. Leaves $\frac{1}{2}-1 \mathrm{in}$. Flowers $\frac{1}{4} \mathrm{in}$. diam., rarely 5 -androus; pedicels long, slender. Sepals lanceolate, longer than the obovate-lanceolate petals, middle nerve hairy. Capsule subglobose, shorter than the sepals.-Distrib. Europe (Arctic), Canaries, Siberia, W. Asia, Greenland.
6. A. serpyllifo'lia, L. ; decumbent or suberect, leaves subsessile ovate acuminate rather rigid $1-3$-nerved ciliate, cymes many-flowered, lracts foliaceous, sepals with 3-5 hairy ribs, funicle without an appendage. Wall-tops, \&c. abundant, ascends to near 2,000 ft. ; fl. June-Aug.-Annual, very variable in habit, grey-green, branched, pubescent, hairs recurved on the stem and peduncles. Leaves $\frac{1}{4}-\frac{1}{3}$ in., very shortly petioled. Flowers
$\frac{1}{6} \mathrm{in}$. diam. Sepals with narrow margins, longer than the petals. Steeds rough, shining.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to the Himalaya; introd. in the U. States.
Var. 1, spheerocer'pa, Tenore (sp.) ; rigid, sepals ovate-lanceolate, capsule ovoid its pedicel ascending. - VAR. 2, Lloyd'ii, Jord. ; shorter, stouter, more glandular, capsule more swollen below. Isle of Wight.-VAR. 3, leptoclu'dos, Gussone (sp.); weak, sepals lanceolate, capsule narrower its pedicel spreading.
7. A. cilia'ta, L.; pubescent, procumbent or ascending, leaves oblongspathulate obtuse 1 -nerved ciliate, flowers subsolitary, bracts foliaceous, sepals oblong-lanceolate with 3 hairy ribs much shorter than the petals.
Mountains of Sligo, alt. 1,000-1,700 ft. ; fl. June-July.-Perennial, dark green, pubescent with reflexed hairs. Stems 3-6 in., numerous, matted, tips ascending. Leaces $\frac{1}{\frac{1}{4}} \frac{3}{4} \mathrm{in}$., petioled. Flocers nearly $\frac{1}{2} \mathrm{in}$. diam. Sepals subacute, margins membranous. Petals spathulate. Cupsule ovoid, as long as the sepals. Fimicle without an appendage.-Distrib. Arctic Europe to the Mediterranean and eastwards to Crete.
8. A. norve'gica, Gunner ; procumbent, almost glabrous, leaves fleshy short broadly oblong-spathulate 1 -nerved, flowers $1-2$, bracts herbaceous, sepals oblong acute with 3 glabrous ribs much shorter than the petals.
Balta Sound, Shetland, and N. Ronaldshay, Orkney ; fl. July-Aug.-Habit, \&c. of A. ciliuta, of which it may be an Arctic variety, but succulent, with shorter, eloser-set leaves, short peduncles, and broader sepals. Fineicle without an appendage.-Distrib. Norway, Lapland, Finmark, Iceland.
Section 3. Ammode'nia, Gmel. (gen.). Flowers polygamous. Disk glandular, 10 -lobed. Capsule fleshy, usually 3 -valved. Seeds 1-2, large. Honcken'ya, Ehr.
9. A. peploi'des, $L$.; creeping, fleshy, leaves ovate acute recurved, flowers 1-3 together axillary subsessile, sepals obtuse. Sea Purslane. Sandy and pebbly shores; fl. May-Aug.-Perennial, dark green and glabrous.

Rootstock creeping; branches 4-8 in., ascending. Leuves $\frac{1-\frac{1}{2}}{2} \mathrm{in}$., decussate, margins cartilaginous. Flowers $\frac{1}{4} \mathrm{in}$. diam., pedicels compressed. Sepals with membranous margins. Petuls of male fl. as long as the sepals, of female shorter. Stumens 10, the alternate shorter. Styles 3-5. C'upsale globose. Seeds obovoid, concavo-convex.-DIstRIB. Shores of W. Europe from the Aretic regions to Spain, Arctic America.-Used as a pickle in Yorkshire.
Section 4. Cheriéria, L. (gen.). Flowers polygamous. Sepals united at the base. Petals 0 or minute. Disk with 5 glands. Seeds few, minute.
10. A. Cherle'ria, Fenzl (sub. Alsine) ; densely tufted, leaves closely imbricate linear-subulate 3 -gonous, flowers solitary, sepals obtuse. Cyphel. Lofty Scotch mountains, alt. 2,500-5,000 ft. ; fl. June-Aug.-Perennial, forming mossy, yellow-green cushions, $6-12 \mathrm{in}$. diam., with a very long tap root. Leuves $+\frac{-3}{4}$ in., obtuse, ciliate, grooved above. Flozers sessile. Sipals 3 -nerved, margins membranous. Petals 0 , or in the male fl. subulate. rilunds large. Capsule ovoid, shorter than the sepals. Seeds smooth. Distrib. Alps of Central and S. Europe, Pyrenees.

## 9. SAGi'na, L. Pearl-wort.

Very small, tufted, annual or perennial herbs. Leaves subulate, connate at the base. Flowers small, pedicelled. Sepals 4-5. Petals 4-5, entire, sometimes minute or 0 . Stwinens 4, 5, 8, or 10. Ovary 1-celled ; styles 4-5, opposite the sepals; ovules many. Capsule 4-5-valved to the base.Distrib. Temp. and cold N. and S. hemispheres; species 8.-Etym. doubtful.

## * Flovers 4- rarely 5-merous. Petals minute.

1. S. apet'ala, L.; annual, primary and lateral branches all flowering, the latter ascending, radical leaves sub-rosulate, petals minute or 0 .
Dry banks, wall tops, \&c. ; fl. May-Aug.-A slender, almost filiform, wiry herb, $4-10 \mathrm{in}$. Leaves $\frac{1}{16}-\frac{1}{4} \mathrm{in}$., spreading. Flowers $\frac{1}{2} \mathrm{in}$. diam., green, pedicels capillary.-Distrib. Europe, N. Africa, W. Asia; doubtfully indigenous in the U. States.
Sub-sp. APET'ALA proper; branches ascending sparingly glandular-pubescent, leaves ciliate at the base mucronate, pedicels erect, sepals at length spreading obtuse exceeding the capsule.-From Perth and Forfar southwards, rare in Scotland.
Sub-sp. cilia'ta, Fries (sp.) ; decumbent, glandular-pubescent, leaves ciliate mucronate, sepals always appressed to the capsule 2 outer mucronate. -Rather rare.
Sub-sp. Marit'ima, Don (sp.) ; decumbent or ascending, glabrous, leaves obtuse or apiculate, sepals suberect in fruit broad obtuse.-VAR. 1, marit ima proper; ascending, slender, internodes long, capsule about equal to the sepals. Sandy sea-shores.-Var. 2, deb'ilis, Jord. (sp.) ; decumbent, slender, internodes long, capsule a little shorter than the sepals.-Var. 3, den'sa, Jord. (sp.) ; ascending, slender, internodes short, capsule as in var. 2. Cheshunt and Wisbech.-Var. 4, alpi"na, Syme ; ascending, stoutish, internodes short, capsule shorter than the sepals. Top of Ben Nevis, Don.
2. S. procum'bens, $L$. ; perennial, stems many, primary shoot flowerless, lateral slender with fascicled branchlets usually procumbent and rooting, sepals spreading in fruit, petals very small.
Waste places, paths, banks, \&c. ; ascends to $3,800 \mathrm{ft}$. in the Highlands ; fl. May-Sept.-Branches 1-8 in. Leaves glabrous or ciliate, obtuse, mucronate, longer than in S. apetala. Flowers usually solitary, sometimes 5-merous. Styles recurved during flowering. Capsule a little longer than the sepals, pedicels erect or curved at the tip.-Distrib. Europe (Aretic), N. Africa, Siberia, W. Asia to the Himalaya, Greenland, N. America, Fuegia.
** Flowers 5, rarely 4-merous. Petals half as long as the sepals or longer. (Perennial, with a leafy floverless central stem, many lateral flovering branches, minute subulate leaves, and slender erect 1 -flowered pedicels. SPERgella, Reich.)
3. S. saxat'ilis, Wimmer; stems numerous prostrate and rooting, leaves mucronate, petals longer than the glabrous obtuse sepals, pedicels curved erect in fruit, capsule 5 -valved almost twice as long as the usually appressed sepals. S. Linnæi, Presl ; Spergula saginoides, Sm.
Scotch alps north of the Forth and Clyde ; ascending to $2,700 \mathrm{ft}$. ; fl. JuneAug. - Distinguishable from the 5 -merous forms of S. procumbens only by the longer white petals, erect styles and usually longer capsules with
appressed sepals. - Distrib. Arctic and Alpine Europe, Siberia, N. America.
4. S. niva'lis, Fries; densely tufted, glabrous, leaves acuminate, petals rather longer than the broad glabrous obtuse sepals, pedicel always erect, capsule much longer than the appressed sepals.
Ben Lawers, Skye, and Clova Mts. ; fl. June-Aug.-Very much more densely tufted than S. saxatilis, of which it may be a subspecies with shorter petals, and shorter always erect pedicels.-Distrib. Norway, Spitzbergen, Greenland.
5. S. subula'ta, Wimmer ; tufted, more or less glandular and hairy, leaves narrowed to the aristate tip, petals as long as the lanceolate obtuse subglandular sepals, pedicels long slender curved after flowering then erect, capsule rather longer than the appressed sepals. Spergula, Swartz.
Heaths, dry pastures, \&cc. ; ascending to $2,700 \mathrm{ft}$. in the Highlands ; N. and W. of Ireland ; fl. June-Aug.-This again might be combined with the two preceding.-Distrib. Mid. and W. Europe, N. America (doubtfully indigenous, Gray).
6. S. nodo'sa, L.; glabrous or glandular, stems with many leaf-buds in the axils of the rather remote pairs of subulate acute leaves, peduncles short always erect $1-2$-flowered, petals and capsules much longer than the oblong obtuse sepals. Spergula, L. Knotted Spurrey.
Moist heaths, and sandy places ; ascending to 1,800 ft. in Yorkshire ; fl. JulyAug. - Much the largest and largest-flowered species of the genus. Branches 4-10 in., decumbent, curved, wiry. Radical leares $\frac{1}{2}$ in., cauline usually $\frac{1}{8}-\frac{1}{-1} \mathrm{in}$. Flowers $\ddagger \mathrm{in}$ diam.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to the Himalaya, N. America.

## 10. SPER'Gula, L. Spurrey.

Annual herbs, with forked or fascicled branches. Leaves opposite, with abbreviated leaf-buds in their axils, whence the foliage appears whorled; stipules small, scarious. Flowers white, in stalked panicled cymes. Scpals 5. Petuls 5, entire. Stamens 5 or 10. Ovary 1-celled; styles 5 ; ovules many. Cupsule with 5 entire valves. Seeds compressed, margined or winged ; embryo annular.-Distrib. Weeds of cultivation in temp. regions ; species 2-3.-Etym. spargo, from scattering its seeds.

1. S. arven'sis, $L$.; leaves linear-subulate $\frac{1}{2}$-terete rather fleshy.

Cornfields, \&e. ; ascending to $1,000 \mathrm{ft}$. ; fl. June-Aug.-More or less pubescent and glandular. Stems 5-18 in., branched from the root, geniculate. Lectes $\frac{1}{2}-1 \frac{1}{2}$ in., in distant pairs, grooved beneath. Flozers $\frac{1}{f-\frac{1}{t}} \mathrm{in}$. diam., subumbellate in racemose terminal cymes; peduncles slender, spreading or reflexed. Sepals ovate, obtuse, rather shorter than the white petals. Capsule subglohose. Seeds lentieular, tubercled, keeled, naked or papillose. - Distrib. Europe (Aretic), N. Africa, W. Asia to N.W. India; introd. in N. America.

## 11. spergulária, Persoom. Sandwort-Spurrey.

Diffuse herbs, with the foliage, inflorescence, and stipules of Spergula. Sepals 5. Petals 5, entire, rarely 0, white or red. Stamens 10 or fewer.

Ovary 1-celled; styles 3. Capsule 3 -valved. Seeds coinpressed, often winged ; embryo annular or hooked. Lepigonum, Fries.-Distrib. Temp. and warm regions ; often littoral ; species 3-4.-Etym. the diminutive of Spergula.

1. S. ru'bra, St. Hilaire ; leaves linear flat, stipules lanceolate cleft, capsule as long as the sepals, seeds plano-convex angular tubercled.
Gravelly and sandy soils; rare in Ireland; fl. June-Sept.-Pubescent and glandular, annual or biennial. Stem much branched from the base ; branches 4-12 in., spreading, prostrate. Leaves $\frac{1-\frac{1}{2}}{}{ }^{\frac{1}{2}}$. Stipmles connate, silvery, torn. Flocerss $\frac{1}{4}$ in. diam., solitary or in subracemose cymes; peduncles short, spreading or reflexed, erect in fruit. Petals rosy, shorter than the obtuse lanceolate sepals. Stamens 5 or 10.-Distrib. Europe, N. Africa, Siberia, W. Asia to India, N. America.
2. s. marína, Cambessedes; leaves linear $\frac{1}{8}$-terete, stipules deltoidovate, capsule longer than the sepals, seeds plano-convex smooth or papillose with or without a membranous wing.
Sandy, muddy and rocky sea-coasts ; fl. June-Aug.-A more fleshy species than S. mubra, of which it may be ranked as a sub-species, with a generally more woody rootstock and compressed branches. Flowers $\frac{1}{4}-\frac{1}{2}$ in. diam.Distrib. Europe, N. Africa, W. Asia to India, N. and S. America.
Sub-sp. Mari'Na proper; perennial, glabrous, pedicels shorter than the bracts, flowers large, petals lilac or white as long as the sepals, stamens 10, capsules longer than the sepals, seeds pale-brown papillose, all broadly winged. L. marinum, Wahlb. Arenaria media, L.
Sub-sp. neglec'ta, Syme ; annual, pedicels as long as or exceeding the bracts, petals rosy shorter than the sepals white at the base, stamens few, capsule exceeding the sepals, seeds pale-brown almost smooth rarely winged. - Var. 1, neglec'ta proper; glandular-pubescent, pedicels longer than the searious bracts, seeds papillose.-Var. 2, sali'na, Presl (sp.); pedicels equalling the foliaceous bracts, seeds not papillose.-Var. 3, média, Fries (sp.) ; pedicels shorter than the foliaceous bracts, seeds not papillose.
Sub-sp. RUpes'tris, Lebel (not of Cambessedes); perennial, glandular-pubescent, pedicels longer than the bracts, petals as long as the sepals rose-purple, stamens 10, capsule equalling the sepals, seeds obovate dark-brown not winged.-Maritime rocks, rare ; Isle of Wight, Cornwall, Carnarvonshire.

## 12. POLYCAR'PON, $L$.

Annual herbs. Leaves flat, apparently whorled ; stipules scarious. Flowers small, in crowded bracteate cymes. Sepals 5, keeled, entire. Petals 5, small. Stamens 3-5. Style short, 3-fid ; ovules many. Capsule 3 -valved.-Distrib. Various warm and temp. regions ; species 6.-Etym. $\pi \delta \lambda u s$ and картб́s, from the abundant cupsules.

1. P. tetraphyl'lum, L. ; lower leaves in whorls of 4, flowers 3-androus. Channel Islands, Devon and Dorset, in sandy and waste places; fl. June-July -Stems 3-6 in., prostrate. Leaves $\frac{1}{2}$ in. obovate, upper opposite. Flower $\frac{1}{8}$ in. diam.--Distrib. Europe, Asia, Africa, \&c.

## Order XIII. portulácere.

Herbs, rarely small shrubs. Leaves opposite or alternate, quite entire ; stipules scarious. Inflorescence various. Sepals 2, imbricate in bud. Petals 4
or more, free or united at the hase, imbricate in bud. Stamens 4 or more, free or adnate to the petals, filaments filiform. Disk small or 0. Orary free, 1-celled : style simple or 3 -fid, branches stigmatose all over; ovules 2 or more, on long free or connate basal fumicles, amphitropal, ascending, micropyle inferior or transverse. Capsule dehiscing transversely or 2-3valved. Seeds 1 or more, compressed, hilum marginal ; embryo terete, hooked or annular and coiled round the mealy albumen.-Distrib. Cosmopolitan, but chiefly American ; genera 15 ; species 125.-Affinities. Close to Caryophyllea, Ficoidea, and Molluginece.-Properties. Purslane is a good salad and a potherb.

Petals united at the base. Stamens 3

1. Montia.

Petals free. Stamens 5.
1*. Claytonia.

## 1. MON'tiA, L. Blinks.

A small, annual, glabrous herb. Leaves usually opposite. Flowers minute, solitary or few and shortly cymose, white. Petals 5, hypogynous, united at the base. Disk small, hypogynous. Stamens hypogynous, usually 3 , opposite and attached to the base of the petals. Ovary free; styles short, 3 -fid ; ovules 3. Capsute globose, 3 -valved. Seeds 1-3, compressed; embryo annular.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to the Himalaya, N. America, Arctic and Antarctic regions.-Etym. J. de Monti, an Italian botanist.

1. M. fonta'na, L. ; leaves spathulate, flowers drooping then erect.

Brooks and marshy grounds ; ascends to nearly $3,200 \mathrm{ft}$. in the Highlands; fl. May-Ang.-Pale-green, 1-5 in., usually flaccid, branched, tufted. Lerees $\frac{1}{1} \frac{3}{4}$ in., opposite or nearly so. Cymes 1- or few-flowered ; flowers in in. diam. Bracts scarious. Petals white, a little longer than the obtuse sepals. Capsule obovoid. Seeds shining.
Var. 1, mínor Gmelin (sp.) ; stem short, cymes terminal and axillary, tubercles of seed conical.-VAr. 2, ricula'ris, Gmelin (sp.) ; stems elongate flaccid, cymes all axillary, tubercles of seeds flattened.
1*. CLAYTO'NIA, LL

Glahrous succulent herbs. Radical leaves petioled, cauline alternate and opposite, exstipulate. Flmers in terminal cymes. Petals 5. Stamens 5, opposite and adnate to the bases of the petals. Ovary free; style entire or 3 -fid at the tip; ovules few. Capsule membranous, 3 -valved.-Distrib. - Ameriea, N.W. Asia, Australia ; species 20.-Etym. Dr. J. J. Clayton, an American botanist.

1. C. perfolia'ta, Dom; radical leaves rhomboid, cauline 2 connate. A carden outcast, rapidly becoming naturalized in many parts of England; fl. May-July.-Annual, tufted, fleshy, 6-12 in. Canline leaves connate into a suborhicular blade. Floners small, white.-Not in the Lond. Cat., but too frequent to be omitted.-Distrib. N.W. America.

## Order XIV. PARONY'ChiEfe.

Annual or perennial generally small, often tufted herbs. Leaves opposite or alternate, quite entire (serrulate and exstipulate in Scleranthus) ; stipules scarious. Flowers very small, cymose, regular, 2 -sexual. Sepals 4-5, free or connate, persistent, closing over the fruit. Petals
small or 0 . Stamens hypogynous or perigynous, filaments short free or connate ; anthers small. Disk 0 or annular. Ovary free, sessile, ovoid, 1 -celled; style terminal, 2 - rarely 3 -fid, stigmas decurrent ; ovule 1 , erect or pendulous from a basal funicle. Utricle or achene enclosed in the perianth, 1 -seeded. Seed globose reniform or lenticular, testa smooth, hilum frontal or lateral, albumen copious or scanty, floury; embryo straight curved or annular.-Distrib. All latitudes, but chiefly warm and dry ; genera 17 ; species 60.-Affinities. Very close to Caryophyllece and Amaranthacece.-Properties unimportant.

Leaves alternate. Petals 5. Stigmas 3..............................1. Corrigiola.
Leaves when opposite not connate. Sepals green, obtuse .....2. Herniaria.
Leaves opposite. Sepals white, concave with long points ......3. Illecebrum.
Leaves opposite connate at the base
4. Scleranthus.

## 1. CORRIGI'OLA, L. Strapwort.

Annual or perennial prostrate glabrous herbs. Leaves alternate, linear or oblong ; stipules scarious. Flowers minute. Sepals 5, connate at the base, obtuse ; margins membranous. Petals 5, small, white. Stamens 5, perigynous. Ovary ovoid, style short, 3 -partite ; ovule suspended from a basal funicle. Achene crustaceous, 3 -gonous, dotted or rugose. Testa nembranous; embryo annular.-Distrib. Europe, Africa, temp. S. America; species 3-4.-Етym. The classical name for Polygonum, trausferred.

1. C. littora'lis, L.; leaves linear-lanceolate, stipules $\frac{1}{2}$-sagittate.

Sandy places, Helstone, Cornwall ; Slapton sands near Start Point ; fl. July-
Sept.-Annual. Stems many from the root, 4-8 in., slender, prostrate or ascending. Leaves $\frac{1}{3}-\frac{1}{2}$ in., narrowed into an obscure petiole ; stipules small. Florers in crowded terminal cymes. Petals as long as the sepals.-Distrib. Europe from Denmark southwards.

## 2. herniária, $L$. Rupturewort.

Annual or perennial prostrate herbs. Leaves opposite and alternate, narrow. Flowers minute, green, crowded, axil large, 1-2-sexual. Sepals 4-5, connate at the base, obtuse, equal or unequal. Petals 4-5, setaceous, minute or 0 . Stamens 3-5, inserted on an amular disk. Ovary ovoid; style 2 -fid or -partite ; ovule erect. Utricle indehiscent. Seed subglobose or reuiform, testa crustaceous shining; embryo annular.-Distrib. Europe, N. and S. Africa, W. Asia.-Etym. the classical name.

1. H. gla'bra, $L$.; leaves oblong glabrous or ciliate.

Sandy soils, rare, Lincoln, Norfolk, Suffolk, Cambridge ; f. July-Aug.-Root woody, often perennial. Stems 4-6 in., many, prostrate, tufted, glabrous or slightly pubescent. Leaves $\frac{1}{6} \frac{1}{4} \mathrm{in}$.-Distrib. Europe, Siberia, W. Asia.Probably a var. of II. hirsuta, L., a more southern and eastern plant.
Var. ciliu'tu, Bab. (sp.); perennial, stouter, forming larger tufts, leaves broader, stipules larger whiter. Lizard Point, Guernsey. Syme remarks that this var. keeps its green colour during the winter of Middlesex, which H. glabra proper does not.

## 3. ILLECE'BRUM, $L$.

A small diffuse glabrous annual herb. Leaves opposite. Flowers minute,

pressed laterally, keeled, ending in a subulate process. Peta's 5, setaceous, very minute. Stamens 5 , hypogynous. Ocary ovoid; style very short, stigmas 2 capitate ; ovule erect. Utricle 5 - 10 -fissured at the base, included in the hardened calyx. Seed oblong; embryo curved, lateral. - Distrib.

* Europe from Denmark southwards, N. Africa.-Etym. doubtful.

## 1. I. verticilla'tum, $L$.; leaves ovate-oblong or spathulate.

Sandy bogs, Devon and Cornwall ; fl. July-Aug.-Branched from the root, very slender, prostrate; branches 4-8 in., ascending, covered throughout with leaves and tufts of white flowers. Leaves $\frac{1}{6}-\frac{1}{4} \mathrm{in}$. Flowers subsessile, shorter than the leaves. Sepuls opaque.

## 4. scleran'thus, $L$. Knawel.

Small, low, tufted, annual or perennial herbs. Leaves opposite, connate, subulate, pungent, often serrulate; stipules 0 . Flowers minute, green, in axillary and terminal cymes or fascicles. Calyx-tube funnel-shaped or urceolate, hardening over the fruit; lobes 4-5, short, erect. Petals 0. Stamens 1, 2, 5, or 10, inserted on the calyx-mouth. Ovary ovoid; styles 2, filiform stigmas capitate ; ovule pendulous from a filiform basal funicle. Utricle indehiscent. Seed lenticular, testa smooth; embryo annular.-Distrib. Europe, E. Asia, Africa, Australia, New Zealand.Etym. $\sigma \kappa \lambda \eta \rho \sigma$ s, from the indurated perianth.

1. S. an'nuus, L. ; calyx-lobes suberect in fruit acute with narrow membranous margin.
Fields and waste places, ascends above 1,000 ft. in Highlands; fl. June-Sept.
-Stem 2-8 in., slender, green, sometimes puberulous. Leaves $\frac{1-\frac{1}{2}}{2} \mathrm{in}$., recurved, often ciliate towards the base. Flowers solitary in the lower axils, and fascicled in dichotomous cymes at the ends of the branches. Calyx-tube 10 -grooved in fruit.-DIstrib. Europe to the Caucasus, N. Africa, Siberia, W. Asia ; introd. in U. States.

Var. 1, annuus proper ; annual, diffusely branched, internodes long, calyxlobes as long as the tube or longer, furrows of fruiting tube deep. - Var. 2, biennis, Reuter (sp.); biennial, stem shorter 2-3 in. subereet, internodes short, leaves and flowers smaller, calyx-lobes shorter, furrows on tube shallower.
2. S. peren'nis, L.; calyx-lobes incurved obtuse with broad scarious margins.
Sandy fields, Radnor, and on the borders of Norfolk and Suffolk; fl. June-Aug.-Very similar to S. annuus, and perhaps only a sub-species, but more glaucous, with shorter bracts and pubescent calyx-tube.-Distrib. Europe to the Caucasus, Siberia.

## Order XIV*. TAMARISCI'NE.E.

Shrubs or small trees. Leaves very small, often seale-like, imbricate, amplexicaul, exstipulate. Inflorescence of solitary or panicled axillary spikes. Sepals 5, rarely 4, imbricate in bud. Petals 5, rarely 4, free or connate below, imbricate in bud. Stamens 4,5,8 or 10 inserted on the disk, free or connate below; anthers versatile. Disk hypogynous or slightly perigynous, 10 -glandular. Ovary free, 1- or imperfectly 2-5-celled; styles

3-5, free or connate, or 3-5 sessile stigmas ; ovules 2 or more, on basal placentas, erect, anatropous, raphe ventral, micropyle superior. Capsule 3-5-valved. Seeds erect, usually more or less comose or winged, albumen fleshy farinaceous or 0 ; embryo straight, cotyledons flat.-Distrib. Cold, temp. and hot regions, often in sandy or saline places ; genera 5 ; species 40.-Affinities. With Caryophyllea, Portulacere, and Frankeniaceee.Properties. Tamarix yields manna and galls, and its ashes soda.

## TAM'ARIX, L. Tamarisk.

Sepals 4-5, free. Petals 4-5, free or united at the base. Stamens 4, 5, 8, or 10 . Ovary narrowed upwards; styles $3-4$, short, thick; ovules many. Capsule 3 -valved. Seeds many, with a lateral and terminal pencil of hairs, albumen 0 ; embryo ovoid.-Distrib. Of the Order; species 20.-Etym. The Tamaris, a river of Spain where Tamarisk abounds.
T. gall'ica, L. ; glabrous, disk acutely 5 -angled. T. anglica, Webb.
S. and E. coasts of England, where planted only ; an alien, Watson; fl. July-Sept.-An evergreen shrub or small tree, $5-10 \mathrm{ft}$. Branchlets excessively slender and feathery. Leaves on the branchlets extremely minute, closely imbricate, triangular, auricled, keeled ; on the older wood much larger, $\frac{1}{8}$ in., subulate. Flowers $\frac{1}{8} \mathrm{in}$. diam., white or pink, in catkin-like obtuse spikes, 1 in . Sepals lanceolate. Petals persistent. Anthers apiculate. Capsule 3-gonous.-Distrib. Shores of Atlantic and Mediterranean, W. Asia to N.W. India.

## Order XV. elat'inef.

Herbs, often minute, or under-shrubs. Leaves opposite or whorled, entire or serrate, stipulate. Flowers small, axillary, solitary or cymose. Sepals and petals each 2-5, free, imbricate in bud. Stamens 2-5, or twice as many, hypogynous, free; anthers versatile. Ovary free, cells and styles $2-5$; stigmas capitate; ovules many, on the inner angles of the cells, anatropous, raphe lateral or ventral. Capsule septicidal; valves flat concave or inflexed, separating from the axis and septa. Seeds straight or curved ; raphe on the concave side, testa often rugose, albumen seanty or 0 ; embryo cylindric, straight or curved, cotyledons small. Distrib. Scattered over the globe ; genera 2 ; species 20.-Affinities. With Caryophylleze and Hypericinea.-Properties. Supposed to be acrid.

## 1. ELAT'INE, $L$. Waterwort.

Very small, aquatic, creeping, glabrous herbs. Leaves spathulate. Flowers minute, axillary. Sepals 2-4, membranous. Petals 2-4. Ovary globose. Capsule membranous ; septa evanescent after bursting, or adhering to the axis. Seed cylindric, straight or curved, ridged and pitted. -Distrib. Temp. and sub-trop. regions; species 6.-Еtym. obscure.

1. E. hexan'dra, $D C$.; flowers pedicelled 3 -merous, capsule turbinate, seeds 8-12 in each cell straight ascending. E. tripetalu, Sm.
Margins of ponds and lakes, rare, from Perth southwards; N. and W.
Ireland ; fl. July-Sept.-Stems 1-3 in., matted, flaccid, rooting at the nodes.
Leaves $\frac{1}{8}-\frac{1}{3}$ in., spathulate. Flowers $\frac{1}{1} \frac{\mathrm{in}}{} \mathrm{i}$. diam., alternate, axillary. Sepals
unequal. Petals pink, longer than the sepals.-Distrib. Europe, from Holland southwards to Lombardy and Hungary (excl. Spain), Azores.
2. E. Hydropi'per, L.; flowers sessile 4 -merous, capsule subglobose, seeds 4 in each cell hooked pendulous.
Muddy ponds, very rare, Trencham pond, Farnham; Llyn-Cwm, Anglesea ; Lough Neagh, and Lagan Canal, Ireland; fl. July-Aug.-Extremely similar in general appearance to $\boldsymbol{E}$. hexandra.-Distrib. Europe to S. Russia (exel. Spain, Greece, Turkey, and Denmark).

## Order XVI. hyperici'nems.

Herbs, shrubs, or trees. Leaves opposite, often covered with pellucid glands, entire or glandular-toothed, exstipulate. Flowers terminal, cymose, rarely axillary. Sepals 5, rarely 4, imbricate in bud. Petuls as many, hypogynous, usually twisted in bud. Stamens many, rarely few, united in bundles; anthers versatile. Disk obscure or of interstaminal glands. Ovary of 3-5 carpels, 1- or 3-5-celled ; styles as many, filiform, stigmas terminal ; ovules few or many, on parietal or axile placentas, anatropons, raphe lateral or superior. Fruit a septicidal capsule, rarely a berry. Sowlds exalbuninous; embryo straight or curved.-Distrib. Temp. and mountains of warm regions; genera 8; species 210. -Affisities. Close with fiuttifme: and Ternstremince, less close with Elatinea.-Properties. Drastic purgatives, astringents, and tonics.

## 1. HYPER'ICUM, L. St. Johx's Wort.

Herbs, shrubs, or small trees. Loaves sessile, often gland-dotted. Flouers cymose, yellow. Sepals 5. Petals 5, generally very oblique. Tewry 1 -celled with 3 or 5 parietal, or 3-5-celled with axile placentas; styles distinet or combined; ovules many in the cells, rarely fow. Corpsente septicidal, placentass adhering to the elges of the valves or to the axis. Sicely oblong ; embryo straight or ineurved.-Distrib. All temp. regions ; species 160 .-EtYM. obscure.

Section 1. Sepals 5, unequal. Petals deciduous. Stamens cohering in 5 bumbles at the very base only, without intervening glands. Uewry incompletly 3 - or 5 -celled.

1. H. Androsse'mum, $L$.; shrubhy, leaves ovate subcordate, cymes corymbose few-flowered, petals very oblique, styles 3 recurved. Tulsan.
Hedres and thickets, from Ross sonthwards ; fl. June-Aug.-Glabrous. Stem
1-2 ft., compressed, 4 -angled. Leaws $1-3$ in., obtuse or acute, glands very minute, close. Flouress $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam. Sepuls ohtuse, glandular, but not on the margins, about as long as the petals and stamens. Berwy globose, black, incompletely 3 -celled.-Disitrib. Mid. and S. Europe, N. Africa, W. Asia.
H. calyct'sum, L.; shrubby, leaves sessile oblong obtuse, flowers subsolitary, styles 5 straight.
Herlges and thickets, in various places, undoubtedly naturalized: f. July-Sept.-Glabrous, extensively creeping. Stom $10-16 \mathrm{in}$., subsimple, compressed, 4 -angled. Leares 2-4 in., coriaceous, glands rather large, seattered. Flowers 3-4 in. broad, shortly peduncled. Outer sepuls orbicular,
half as long as the petals. Capsule ovoid, 5 -celled towards the base.Distrib. S.E. Europe.
Section 2. Sepals 5, connate at the base. Petals persistent. Stamens cohering in 3 bundles at the very base only, without intervening glands. Ovary completely 3 -celled. Capsule septicidal.

## * Margins of sepals entire or toothed, eglandular.

2. H. perfora'tum, $L$.; stem erect with 2 ridges, leaves oblong obtuse with pellucid glands, secondary nerves opaque, sepals erect lanceolate. Woods, copses, and hedgehanks ; ascends to near $1,000 \mathrm{ft}$. in Yorkshire ; fl. July-Sept.-Glabrous. Stems 1-3 ft., branched above, slender, strict, light brown. Leaves $\frac{3}{4}-1 \mathrm{in}$., obtuse; glands black. Cymes corymbose, manyflowered. Flowers 1 in . diam. Sepals acute, entire or slightly serrate. Petals much longer. Capsule transversely wrinkled; valves with 2 glandular lines on the back.--Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to the Himalaya ; introd. in U. States.
3. H. quadrang'ulum, $L$.; stem erect with 4 lines or ridges above, leaves ovate-oblong, cauline suhamplexicaul with pellucid glands, primary and secondary nerves transparent.
Copses and moist places ; fl. July-Sept.-Very variable, habit of $H$. perfora-tum.-Distrib. Europe (Arctic) to the Caucasus (excl. Turkey), N. Africa, Siberia, W. Asia.
Sub-sp. Du'bium, Leers (sp.) ; leaves with few pellucid glands, sepals patent and recurved with black glands on the back, petals oblong obtuse quite entire, style as long as the capsule.-VAR. macula'tum, Bab.; sepals oblonglanceolate acute slightly toothed.
Sub-sp. 2. tetrap'terum, Fries (sp.) ; leaves with many pellucid glands, sepals erect lanceolate acuminate quite entire, styles half as long as the capsule.-Ascends to 1,200 ft. in Yorkshire.
Sub-sp. 3. nndula'tum, $S_{\text {chousb. (sp.) ; leaves with many pellucid glands and }}$ black glands beneath, sepals ovate-lanceolate acuminate often crenate, styles not half as long as the capsule. H. boticum, Boiss.-Bogs, Plymouth and Cornwall.
4. H. humifu'sum, $L$.; stems many procumbent with 2 raised lines, leaves oblong without pellucid glands, margins often revolute with black glands, cymes forked, sepals unequal.
Roadsides, commons, \&c.; ascends to near $1,000 \mathrm{ft}$. in Yorkshire ; fl. July-Aug.-Perennial, glahrous. Branches 4-10 in., very many, compressed, curving upwards, leafy. Leaves $\frac{1-1}{3} \mathrm{in}$. Flower $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. diam.-Distrib.
Europe from Denmark southwards (excl. Turkey), Canaries, and Azores.
** Margins of sepals with glandular teeth.
5. H. linarifo'lium, Vahl; stems ascending terete, leaves linear obtuse, margins revolute, sepals lanceolate acute. H. linearifolium, DC., \&e. Rocky banks, Cape Cornwall, and on the Teign, Tamar and Tavey, Devon ;

Channel Is.; f. June-July. - Stems 6-15 in., many from the roots, leafy.
Leaves $\frac{1}{3}-1 \mathrm{in}$. Cymes few-flowered. Flowers $\frac{1}{2} \mathrm{in}$. diam. Petals twice as long as the sepals, with black marginal glands. Stamens few. Styles short. Distrib. S.W. and S. Europe, Canaries.-Syme finds in Jersey the H. decumbens (Petermann) growing with this, intermediate between it and H. humifusum.
6. H. pul'chrum, L. ; glabrous, stems erect slender terete branched above, leaves cordate very obtuse, upper oblong, all with pellucid glands, sepals small oblong.
Dry copses, heaths, and commons ; ascending to $2,200 \mathrm{ft}$. in the Highlands ; H. June July.-Very elegant. Stems 1-2 ft., flexuous. Cymes panicled, many-flowered. Leaves $\frac{1}{2} \mathrm{in}$. Flower $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam. Petals twice as long as the sepals, yellow, tinged with red, margins with black glands. Authers red. Styles short.-Distrib. Europe (Aretic), eastwards to Lithuania and Turkey.
7. H. hirsu'tum, $L$.; finely pubescent, stem erect terete subsimple, leaves very shortly petioled ovate or oblong obtuse with pellucid glands, sepals linear-oblong subacute.
Copses, \&.c. ; ascends to $1,300 \mathrm{ft}$. in Yorkshire; very rare in Ireland ; fl. JulyAug. - Rather stout, $1-3 \mathrm{ft}$., leafy ; pubescence curly. Leares 1-2 in., without marginal glands. Cymes panicled. Florers $\frac{3}{4}$ in diam., pale yellow. Petals twice as long as the sepals.-Distrib. Europe, Siberia, W. Asia.
8. H. monta'num, $L$. ; almost glabrous, stem ascending terete, leaves sessile oblong obtuse, upper cordate-ovate or linear-oblong puberulous beneath, margin with black glands, sepals lanceolate acute.
Copses in gravelly or chalky soil, England and N.E. of Ireland; not ascending above 600 ft ; fl. July-Aug.-Stem 1-2 ft. rigid, very slender, often leafless above. Leures 1-2 in., membranous. Cymes few and dense-flowered; bracts glandular, toothed. Flowers $\frac{1}{2}-\frac{2}{3} \mathrm{in}$. diam., pale yellow. Petuls eglandular or nearly so, twice as long as the sepals.-Distrib. Europe to the Caucasus, N. Africa.
Section 3. Sepals nearly equal. Petals not oblique, persistent. Stamens 15 , cohering $\frac{2}{8}$ way up in 3 stalked bundles which alternate with 2 -fid hypogynous scales. Orary incompletely 3 -celled.

## 9. H. elo'des, L.; villous, leaves orbicular or oblong-cordate.

Bogs, ditches, and wet moors, S. of England, W. of Scotland, all Ireland; f. July-Aug.-Stems 3-18 in., many, creeping, terete. Leaves $\frac{1}{2}-1 \mathrm{in} ., \frac{1}{2}$-amplexicaul, pellucid glands small. Cymes irregular, often spuriously axillary, 3 -chotomous ; bracts small, deltoid, gland-serrated. Floxers $\frac{1}{2} \mathrm{in}$. diam., pale-yellow. Sepuls glabrous, oblong, obtuse, with red glandular serratures. -Distrib. W. Europe, from Holland to Spain and Austra; Azores.

## Order XVII. malva'cem.

Herbs, shrubs, or trees, hairs often stellate. Leaves alternate, 3- or morenerved at the base ; stipules deciluons. Inflorescence various; bracteoles $3-9$, rarely 0 , free, or connate and forming an involucel. Caly $x 5$-lobed, valvate in bud. Petals 5, adnate at the base to the staminal column, twisted in bud, often oblique. Stumens many, filaments combined into a tule variously split at the top into antheriferous lobes; anthers reniform annular linear or twisted, 1 -celled, bursting outwards. Dhisk small, often proluced upwards between the carpels. Carpels many, whorled, free or connate ; styles free or united, stigmatose on the inner face, or top; ovules

1 or more on the inner angles of the carpels, usually horizontal or ascending, raphe ventral or superior. Fruit usually of many dry indehiscent or 2 -valved loculicidal crustaceous or coriaceous 1 - or moreseeded carpels. Seed often woolly, albumen little or 0 ; embryo straight or curved, cotyledons usually thin folded or plaited.-Distrib. All regions but very cold ones; genera 60 ; species 700.-Affinities. With Sterculiacece and Tiliacece, also with Euphorbiacea.-Properties. Mucilaginous; the bark yields textiles, and cotton is the covering of the seeds of Gossypium.

> Bracteoles 6-9, connate at the base. 1. Althæa.
> Bracteoles 3, free, inserted on the calyx.....................................2. Malva.
> Bracteoles 3, connate at the base.
> 3. Lavatera.

## 1. Althéa, L. Marsh-mallow.

Herbs, hairy or tomentose. Leaves lobed or divided. Flowers axillary or racemose. Calyx 5-fid; involucel 6-9-fid. Staminal column long, filaments free at the top only. Ovary many-celled; styles filiform, inner surface stigmatose ; ovules 1 in each cell. Fruit a whorl of indehiscent 1 -seeded carpels. Seed ascending.-Distrib. Temp. and warm regions; species 12.--Еtym. ä $\lambda \theta \omega$, from its healing properties.

1. A. officina'lis, $L$.; softly pubescent, cymes axillary shorter than the leaves. Marsh-mallow, Guimauve.
Marshes near the sea, local ; from Lincoln and S. Wales southwards, and in Ireland ; Scotland, introduced only ; fl. Aug.-Sept.-Perennial. Stem 2-3 ft., subsimple. Leaves 2-3 in. broad, shortly petioled, ovate-cordate or suborbicular, thick, entire or 3-5-lobed, toothed. Flowers 1-2 in. diam., rosy. Sepals ovate.-Distrib. Europe from Denmark southwards, N. Africa, Siberia, W. Asia ; introd. in N. America.
A. hirsu'ta, $L$. ; hispid, peduncles 1 -flowered longer than the leaves. Naturalized in fields N . of Cuxton Church, Kent ; fl. July-Aug.-Annual or biennial. Stems 6-18 in., many, ascending, slender. Leaves long-petioled, reniform, acutely 5 -lobed, crenate, upper 3 -partite. Flowers 1 in. diam., rose-purple. Sepals lanceolate.-Distrib. Europe from Belgium southwards.

## 2. MAL'VA, L. Mallow.

Hirsute or glabrous herbs. Leaves angled, lobed or cut. Flowers axillary. Calyx 5 -fid, 3 -bracteolate. Staminal column long, filaments free at its top only ; anthers reniform, 2 -celled in bud, 2 -valved dehiscing along the convex side; Tallen globose, hispid. Ovary many-celled; styles stigmatose on the inner surface. Fruit a whorl of indehiscent 1 -seeded carpels separating from a short conical axis. Seed ascending, albumen scanty mucilaginous. - Distrib. Europe, temp. Asia and N. Africa, and as weeds of cultivation in other regions; species 16.-ETYM. $\mu a \lambda a ́ \chi \eta$, in allusion to its emollient properties.

1. M. sylves'tris, $L$. ; hairy, stems many ascending, leaves 3 - 7 -lobed crenate-serrate, peduncles spreading, carpels glabrous reticulate.
Waste places from Isla southwards, rare, if native (Watson), in Scotland;
fl. June-Sept.-Perennial or biennial, 2-3 ft. Leaves 2-3 in. diam., lobes
shallow acute. Flozers 1-1 $1 \frac{1}{3} \mathrm{in}$. diam., irregularly fascicled, pale purple or blue, pedicels slender.-Distrib. Europe, N. Africa, Siberia, W. Asia; introd. in U. States.
2. M. rotundifo'lia, L. ; pubescent, stems many decumbent, leaves reniform obscurely lobed crenate, peduncles decurved, carpels pubescent smooth edges rounded.
Waste places from Aberdeen southwards; rarer in Scotland and Ireland; fl. June-Sept.-Perennial. Stems $6 \mathrm{in} .-2 \mathrm{ft}$. Leaves $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$. broad, often serrate. Flowers $3^{3}-1 \mathrm{in}$. diam., irregularly fascieled, pale lilae or whitish. -Distrib. Europe, N. Africa, Siberia, W. Asia to India; introd. in U. States.
3. M. moscha'ta, L. ; hairy, stem erect, leaves $5-7$-partite lobes pinnatifid, peduncles erect in fruit, carpels smooth hispid on the rounded back. Meadows, \&c. in a dry soil ; from an alien? in Mid. Scotland, Watson; rare ini Ireland ; fl. July-Aug.-Perennial.-Stem 2-3 ft., often purple-spotted. Lenves 1-3 in. diam., long-petioled. Florems 1-2 in. diam., rosy, rarely white.-Distrib. Europe, eastward to Lithuania; introd. in the U. States.

## 3. Lavate'ra, L. Tree-Mallow.-

Tall, hirsute or tomentose herbs or shrubs. Leaves angled or lohed. Flowers axillary. Caly, 5 -fid; involucel 3 -fid. Stuminal column long, filaments free at its top only. Ovary many-celled ; styles filiform, as many as the cells, inner surface stigmatose; ovules 1 in each cell. Fruit a depressed whorl of indehiscent 1 -seeded carpels, separating from the axis. Seed aseending.-Distrib. Europe, W. Asia, N. Africa, and 1 Australian : species 18. - Etym. The brothers Lavater, Swiss physicians.

1. L. arbo'rea, $L$. ; leaves suborbicular $5-9$-lobed plaited crenate.

Maritime rocks, England, and Scotland south of Firth of Clyde ; rare in Ireland ; fl. July-Sept.-Biennial, softly puboscent. Stem 3-6 ft., very stout, erect. Leaves long-petioled; lohes broad, short, upper more entire. Peduncles crowded, axillary, 1-flowered, shorter than the petioles. F/omers $1 \frac{1}{2} \mathrm{in}$. diam., purple, glossy. Incolucel with 3 very large ovate lobes. Sipuls deltoid. Carpels wrinkled.-Distrib. Coasts of France, and eastwards to Greece.

## Order XVIII. tilia'cese.

Trees or shrubs, rarely herbs. Leaves alternate, entire or toothed, stipulate. Flowers cymose ; cymes usually corymbose or panicled. Siyuls 5 , free or connate below, valvate in bud. Petals 5 or fewer or 0, æstivation various. Stamens many, inserted on the disk, filaments filiform free or united in bundles; anthers 2 -celled, opening by pores or valves.-Disk tumid. Ovary free, 2-10-celled; styles entire or divided, or stigma sessile; ovules 1 or more, in the inner angle of the cells, anatropous, usually pendulous with the raphe ventral. Fruit 1-12-celled, dry or baceate, indehiscent or loculicidal. Seeds various, albumen fleshy ; embryo straight with foliaceous cotyledons.-Distrib. Chiefly tropical ; genera 40 ; species 330.-Affinities with Sterculincee and Malvacee.-Properties usually mucilaginous, liber of many species yields fibre.

## 1. tilíiA, L. Lime-tree or Linden.

Trees with simple or stellate hairs. Leaves obliqne, cordate, serrate. Cymes axillary or terminal ; bract leafy, adnate to the peduncle. Sepals 5. Petals 5, with often a scale at the base. Stamens many, filaments free or united into bundles at the base. Ovary 5 -celled ; style simple, stigma 5 -toothed. Fruit globose, indehiscent, 1-2-seeded. Seeds ascending; cotyledons broad, crumpled, with involute margins.-Distrib. Europe, N. Asia, N. America ; species 8.-Еtym. The old Latin name.

1. T. parvifo'lia, L.; glabrous, leaves pubescent in the axils of the nerves beneath, fruit crustaceous pubescent.
Woods from Yorkshire southwards ; a doubtful native, Watson; indigenous,
Borrer ; fl. July-Aug.-A small tree. Leures $1 \frac{1}{2}-2 \frac{1}{2} \mathrm{in}$. diam., ovate-cordate, acuminate, finely serrate, glaucous and glabrous beneath, upper obscurely lobed. Flowers $\frac{1}{3}$ in. diam. Fruit about $\frac{1}{4} \mathrm{in}$. diam., faintly ribbed.Distrib. Europe (excl. Greece and Turkey) and Siberia.-This is probably the English wild form of the continental T. europaa.
T. intermédia, $D C$.; glabrous, leaves pubescent in the axils of the nerves beneath, fruit woody pubescent not ribbed when ripe. Common Lime. Woods and hedges, not indigenous ; fl. June-July.-This is probably a subspecies of $T$. europea, L., which should include all the rest.
T. grandifólia, Ehrhart; twigs pilose, leaves downy beneath, fruit obovate-globose with 3-5 prominent ribs when ripe. Large-leaved Lime.
Woods and hedges; a denizen? Watson; fl. June-July.-A tree 70-90 ft. high,
differing very little in foliage and floral characters from T. parrifolia.-
Distrib. Europe from Denmark southwards.
VAR. corallina, bark of young branches reddish brown.

## Order XIX. Line'te.

Herbs, shrubs, or trees. Leaves alternate, rarely opposite, simple, entire, sometimes stipulate. Inflorescence cymose. Sepals 4-5, free or connate, imbricate in bud. Petals 4-5, hypogynons, imbricate or twisted in bud. Stamens 4-5, with alternating staminodes or 10 with the filaments inserted on a hypogynous ring; anthers versatile. Disk 0 or glandular. Ovary free, $3-5$-celled ; styles $3-5$, stigmas terminal ; ovules 1-2 in each cell, pendulous, raphe ventral, micropyle superior. Capsule septicidally splitting into 2 -valved cocei. Seeds compressed, albumen fleshy; embryo nearly as long as the seed, cotyledons plano-convex.-Distrib. All regions; genera 14; species 135.-AFfinities, slightly with Malracee and Geraniacee; more close with Malpighiacece and Ternstremiacea.Properties. Mueilaginous, oily, diuretic ; seeds oceasionally purgative; bark fibrous (as in flax).
Sepals 5, quite entire

1. Linum.

Sepals 4, 2-4-toothed
2. Radiola.

## 1. LI'NUM, L. Flax.

Herbs or small shrubs. Leaves alternate, rarely opposite, narrow, quite entire ; stipules 0 or glandular. Flowers in dichotomous, panicled, race-
mose or fascicled cymes. Sepals 5, entire. Petals 5, fugacious. Stamens 5 , hypogynous, united at the base, alternating with 5 minute staminoles. Disk of 5 glands opposite the petals. Ovary 5 -celled, cells sometimes divided into 2 ; styles 5 ; ovules 2 in each principal cell. Cocci 5 , 1- or partially 2 -celled, 2 -seeded. Albumen seanty; embryo straight.-Distrib. Temp. and warm regions; species 80.-Etym. The classical name.

1. L. cathar'ticum, $L$.; annual, small, leaves opposite, upper alternate, buds nodding, petals free. Purging Flax.
Heaths and pastures ; ascends to $2,400 \mathrm{ft}$. in the Highlands ; fl. June-Sept.Glabrous, glaucous, 2-10 in., very slender. Leaces linear-oblong. Flozers $\frac{1}{8}-\frac{1}{t} \mathrm{in}$. diam., white. Petals oblong, acute or obtuse.-Distrib. Europe (Arctic), Canaries, W. Asia to Persia.
2. L. peren'ne, L.; perennial, leaves alternate narrow linear-lanceolate acute, sepals obovate obtuse glabrous 3-5-nerved, petals free.
Chalky soils, rather rare, from Durham to Essex ; fl. June-July.-Glabrous. Stems many, 1-2 ft., wiry, very slender. Leaves $\frac{1}{2}-\frac{3}{4}$ in. C'ymes fewflowered, racemose. Flowers 1 in . broad, bright blue. Sepals obovate, 3 inner broader, quite entire.-Distrib. Mid. and S. Europe, W. Asia to India.
3. L. angustifo'lium, L. ; annual or perennial, leaves alternate narrow linear-lanceolate, outer sepals ovate acuminate, inner ciliate 3 -nerved.
From Lancashire southwards ; Ireland rare ; fl. May_Sept.-Glabrous, glaucous. Stems 1-2 ft.; branches few, divaricate. Leaves as in L. porenne, but fewer and smaller. Cymes few-flowered. Flovers $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam., pale lilac-blue.-Distrib. W. and S. Europe, from France to Greece, N. Africa, W. Asia.
L. usitatis'simum, $L$.; annual, leaves alternate linear-lanceolate, sepals ovate acuminate ciliate 3 -nerved, petals crenulate. Common Flax.
An escape of flax fields ; fl. June-July.-Larger than any of the preceding.
Stem solitary, corymbosely branched above. Cymes broad, many-flowered.-
Distrib. Wherever flax is cultivated for oil or fibre.

## 2. RAdi'ola, Gmelin. All-seed.

A minute, annual herb, with filiform many times forked branches. Leaves opposite, exstipulate. Flowers in corymbose cymes. Sepals 4, 2-4-toothed. Petals 4, fugacious. Stamens 4, nearly free, with minute staminodes or 0 . Disk glands inconspicuous. Ovary 4 -celled; cells divided into 2; styles 4 ; ovules 2 in each cell. Capsule of 4 nearly 2 -celled 2 -seeded divisible cocei. Seeds exalbuminous.-Distrib. Europe, N. Africa, W. Asia.Etym. radius, from the rayed ramification.

1. R. Millegra'na, $S m$.; leaves ovate acute 3 - 5 -nerved.

Gravelly and sandy damp places, uncommon, but widely diffused from the Orkneys to Cornwall, and in Ireland; fl. July-Aug.-Stem 1-4 in. Leaces $\frac{1}{6}-\frac{1}{8}$ in., sessile, rather succulent. Floxers axillary and in the forks, most minute ; peduncles short, erect. Sepals united below, as long as the oblong petals.

## Order XX. GERANiA'cese (including oxal'ideze and BALSAMI'NEEE).

Herbs, rarely shrubby. Leaves opposite or alternate, usually stipulate. Inflorescence various; flowers regular or irregular. Sepals 5 or fewer, imbricate or valvate in bud. Petals $3-5$, imbricate in bud. Stamens usually 5 in irregular flowers, and 10 in the regular, some often deformed. Disk inconspicuous or glandular. Ovary 3-5-lobed, 3-5-celled, produced upwards into a styliferous beak, or with one or more terminal styles ; ovules 1-2 or many in each cell, anatropous, pendulous, raphe ventral. Fruit septicidal or loculicidal, or separating into cocci. Seeds small, albumen scanty or 0 ; embryo various.-Distrib. Temp. and trop., rarely arctic regions ; genera 16 ; species 750.-Affinities. With Rutaceee and Linew.-Properties. Tribe Geranice are often astringent, aromatic, and abound in volatile oil. Oxalidex abound in oxalic acid, and some have eatable tubers.
Tribe I. Gera'nieme. Flozer's regular. Sepals imbricate. Stamens alternating with glands. Capsule beaked, of several 1 -seeded awned cocci, that separate elastically from the beak.
Stamens 10 , all antheriferous

1. Geranium.

Stamens 5, staminodes 5.......................................................................2. Erodium.
Tribe II. oxali'dere. Flowers regular. Sepals imbricate. Glands 0. Capsule loculicidal ; cells 2- or more-seeded .............................3. Oxalis.
Tribe III. balsami'neze. Flozeers irregular. Sepals coloured, posticous spurred. Stumens 5. Glands 0. Capsule loculicidal ; eells 2- or more-seeded
4. Impatiens.

## 1. Gera'nium, $L$. Crane's-bill.

Herbs, rarely shrubs, with swollen nodes. Leaves opposite or alternate, usually cut or lobed, stipulate. Flowers regular, on 1-2-flowered axillary peduncles. Sepals and Petals 5, imbricate in bud. Stamens 10, free or connate at the base, hypogynous. Disk of 5 glands opposite the sepals. Ovary 5 -lobed, 5 -celled, with a long beak terminated by 5 stigmas ; ovules 2 in each cell, superposed. Fruit of 5 dehiscent carpels, terminating upwards in long slender tails, which separate elastically from the styliferous and placentiferous axis. Seeds solitary in the carpels, albumen seauty or 0 ; cotyledons plicate or convolute ; radicle incumbent.-Distrib. Ail temp. especially littoral and sandy regions; species 100.-- Etym. үépavos, a crane, from the form of the fruit.-The so-called garden Geraniums are Pelargonia, having irregular flowers, a spurred sepal, perigynous petals, no glands, and few declinate stamens.

## * Perennial. Peduncles 1-flowered. Sepals spreading.

1. G. sanguin'eum, L.; pilose, leaves orbicular 5-7-partite, lobes narrow $3-5$-fid to the middle, carpels hairy, seeds wrinkled and dotted.
Dry rocky places and on sandy shores ; ascends above $1,000 \mathrm{ft}$. in the Highlands; local in Ireland; fl. July-Aug.-Rootstock stout, truncate. Stems 1-2 ft., geniculate ; hairs spreading. Leaves 1-2 in. diam., segments linearoblong or lanceolate, obtuse or subacute; stipules ovate, acute. Flowers 1-1 $1 \frac{1}{2} \mathrm{in}$. diam., crimson or pink; peduncles very long, 2 -bracteate in the middle. Sepals oblong, obtuse, awned.-Distrib. Europe, W. Asia.

Var. 1, sanquin'eum proper; suberect, hairs seattered.-VAR. 2, prostru'tum, Cav. (sp.) ; stems decumbent shorter, hairs more copious, flowers pinkish. G. lancastriense, With.
** Perennial. Stem erect. Peduncles 2-flovered. Sepals spreading.
2. G. sylvat'icum, L.; erect, pilose and glandular above, leaves orbicular deeply 7 -lobed, lobes cut and serrate, sepals awned, petals notched, capsules smooth hairy, pedicels erect, seeds minutely reticulate.
Copses and moist meadows from Worcester and Warwick northwards, ascending to $2,700 \mathrm{ft}$. in the Highlands ; very rare in Ireland; fl. June-July.Rentstock truncate, creeping. Stem 1-3 ft., branched above. Leazes $3-5 \mathrm{in}$. diam., radical long-petioled, cauline sessile ; stipules ovate. Florers $\frac{1}{2}-\frac{3}{-3} \mathrm{in}$. diam., blue-purple or rose-coloured, cymose at the ends of the branches. Filuments filiform, ciliate.-Distrib. Europe (Arctic), Siberia, W. Asia.
3. G. praten'se, L.; erect, pubescent, hairs reflexed, leaves orbicular 7-9-partite, lobes laciniate coarsely serrate, sepals awned, petals notched, capsule smooth glandular-hairy, pedicels deflexed, seeds minutely reticulate.
Moist meadows, \&e. from Banff and Isla southwards, ascending to $1,810 \mathrm{ft}$. in the Highlands; N.E. of Ireland only, very rare; fl. June-Sept.-Routstork truncate. Stem 3-4 ft., branched above. Leaves 3-6 in. diam.. all petioled; petioles of radical very long; stipules subulate-lanceolate. Flumers many, $1 \frac{1}{4} \mathrm{in}$. diam. Sepals with very longawns. Filaments glabrous, cuneate at the base.-Distrib. Europe (Aretic), Siberia.
4. G. pyrena'icum, L.; erect or ascending, pilose, leaves reniform 7-9. lobed to the middle, lobes cuneate 3 -fid crenate, sepals mucronate, petals 2-lobed, capsules keeled pubescent, pedicels deflexed, seeds smooth.
Meadows, rarely, if ever, indigenous, from York and Denbigh southwards, Ireland ; a denizen, Wutson; fl. June-Aug.-Rootstock fusiform. Nems $1-2 \mathrm{ft}$., many, deeumbent below. Leures 3 in . broad, radical very longpetioled ; lobes contiguous ; stipules ovate-lanceolate. $F /$ mecers $\frac{1}{2} \mathrm{in}$. diam., bright red-purple. N'puls small, oblong. Claw of petals densely bearded. Distrib. Europe, N. Africa, W. Asia to India.
G. phe'vm, $L$.; erect, laxly hairy and glandular above, leaves orbicular or reniform 5-7-lobed lobes cut and serrate, sepals mucronate, petals waved, capsules hairy wrinkled above, pedicels deffexed, seeds smooth.
Woods near parks and gardens, naturalized; fl. May-June. - Rootstork truncate. Nems 1-2 ft., many. Lecees 3-5 in. broad, radical very longpetioled; stipules lanceolate. Flocers $\frac{3}{4} \mathrm{in}$. diam., dusky purple. Ňpu/s oblong, shortly-awned. Distrib. Central and W. Europe.

## *** Annual or biennial. Stems assending or decumbent. Peduncles 2-flovered. Sopals spreading.

5. G. mol'te, L.; softly pilose, leaves orbicular 7-9-lobed, segments contiguous, sepals mucronate generally shorter than the notehed petals, claw of petals bearded, capsules wrinkled keeled glabrous, seeds smooth.
Pastures and waste places, ascending to $1,500 \mathrm{ft}$. in Yorkshire ; H1. May-Sept.

- Branches $8-12 \mathrm{in}$. Leuzes 1-2 in. diam., lobes broadly irregularly lohed or crenate at the tip, radical very long petioled; stipules lanceolate. Peduncles axillary. Florers $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. diam., rose-purple or pink.-Distrib.
Europe, N. Africa, W. Asia.

6. G. rotundifo'lium, L.; laxly pilose, leaves as in $G$. molle, sepals mucronate generally shorter than the entire petals, claw of petals naked, capsules keeled not wrinkled hairy, seeds pitted.
Hedges and waste places, rare, from Gloucester and Suffolk southwards; local in Ireland; ff. June to July.-Branches 6-12 in., slender, geniculate. Leazes $\frac{3}{4}-1 \mathrm{in}$. broad ; stipules short. F'lowers $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. diam., pale pink. Petals narrow.-Distrib. Europe, N. Africa, Siberia, W. Asia to India.
7. G. pusil'lum, $L_{.}$; softly pubescent, leaves as in $G$. molle but deeper lobed, sepals acute equalling the notched petals, claw of petals faintly ciliate, capsule keeled not wrinkled pubescent, seeds smooth.
Hedgebanks and waste places; rare in Scotland and Ireland; fl. June-Sept.-Branches 6-18 in.; stipules ovate-lanceolate. Peduncles axillary.
Flowers $\frac{1}{-\frac{1}{3}}$ in. diam., many, pale rose-colour. Perfect stamens often only 5.
-Distrib. Europe, N. Africa, W. Asia ; introd. in America.
8. G. columbínum, $L$.; nearly glabrous, leaves 5-7-partite, lobes distant pinnatifid, segments narrow, sepals large acuminate long-awned equalling the entire petals, claw ciliate, capsule not wrinkled keeled glabrous, seeds pitted.
Dry copses and pastures, from Forfar and Dumbarton southwards ; rare in Seotland and Ireland; fl. June-July. - Brunches 8-24 in., slender, hairs reflexed. Leaces $\frac{3}{4}-1 \frac{1}{4} \mathrm{in}$. broad, long-petioled; stipules ovate-lanceolate. Florers $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. broad, few, rose-purple ; peduncles and pedicels very long and slender. Calyx angular.-Distrib. Europe, N. Africa, Siberia.
9. G. dissec'tum, $L$.; pilose and suhglandular, leaves as in $G$. columbinum, peduncles very short, sepals long-awned, petals short obovate notched, capsules not wrinkled or keeled hairy, seeds pitted.
Hodges and waste places, ascends to near $1,000 \mathrm{ft}$. in Yorkshire ; fl. May-Aug.
-Similar to $G$. columbinum, but petioles and peduncles very much shorter, and calyx and capsules quite different. Stipules ovate, long-acuminate. Flowers $\frac{1}{4} \frac{1}{2}$ in. diam., axillary, bright red.-Distrib. Europe, N. Africa, W. Asia, N. America.
**** Annual or biennial. Stems ascending or decumbent. Pedunclex 2-flowered. Sepals erect in flower, conniving in fruit.
10. G. Robertia'num, $L$.; glabrous or slightly hairy, leaves 5 -foliolate, leatlets 1-2-pinnatifid, sepals long-awned, petals entire narrow, capsule wrinkled keeled, seeds smooth. Herb-Robert.
Waste places and hedgebanks, ascends to near 2,000 ft. in Yorkshire ; fl. May-Sept.-Plant fœetid, reddish. Brouches 6-18 in., brittle, leafy. Leaces 1-3 in. hroad ; petioles $\frac{1}{2}-1$ in.; stipules ovate. Flocers $\frac{1}{2} \mathrm{in}$. diam., streaked with dark and light red, sometimes white. "Cultsx angular. Cluw of petuls glabrous. Curpels attached by silky hairs to the axis.-DIsthib. Europe (Aretic), N. Africa, Siberia, W. Asia to N.W. India.
Var. 1, Rowertiunum proper; glandular-hairy, blade of petal about as long as the claw, carpels with deciduous hairs. - Var. 2, Raii, Lindl. (sp.); almost glabrous, sepals and pedicels glandular-pubescent, blade of petal shorter than the claw, carpels glabrous. G. modes'tum, Jord. Guernsey and Torquay.-Var. 3, purpu'icum, Jord. (sp).; as in Var. 2, but leaves more finely divided Shingly beaches, S. of England.
11. G. Iu'cidum, L.; glabrous, shining, bright red, branches above with 2 lines of hairs, leaves orbicular 5 -lobed, sepals long-awned longer than the petals, capsules wrinkled keeled glabrous or nearly so, seeds smooth.
Hedgerows, old walls, \&c. from Ross southwards, local ; fl. May-Aug.Branches 6-18 in., succulent, brittle. Leaves $\frac{3}{3}-1 \frac{1}{2} \mathrm{in}$. broad, lohes short obtusely lobulate at the top; petioles $1-2 \frac{1}{2} \mathrm{in} . ;$ stipules ovate, acute. Peduncles longer than the petioles. Flovers $\frac{1-\frac{1}{3}}{3} \mathrm{in}$. diam., rose coloured. Calyx pyramidal, tuberculate. Claz of petuls glabrous. Carpels separating wholly from the axis.-Distrib. Europe, N. Africa, Siberia, W. Asia to N.W. Himalaya.

## 2. ERO'diUM, L'Héritier. Stork's-Bill.

Herbs with swollen nodes. Leaves alternate, or, if opposite unequal, stipulate. Flowers regular, solitary or umbellate, on axillary peduncles. Sepals 5, imbricate. Petals 5, hypogynous, imbricate, 2 upper sometimes deficient. Stamens 5, alternating with scale-like staminodes. Drisk of 5 glands opposite the sepals. Ovary, fruit and seed as in Geranium, but tails of carpels spirally twisted and usually silky on the inner surface.Distrib. Europe, N. Africa, temp. Asia ; rare in S. Africa and Australia ; species 50. -Етум. 'épósios, a heron, from the form of the fruit.

1. E. cicuta rium, L.; leaves 1-2-pinnate, leaflets pinnatifid, segments narrow cut, peduncles few or many-flowered, filaments entire.
Waste places, most frequent by the sea, ascends to $1,200 \mathrm{ft}$. in N . Wales; fl. June-Sept.-Annual or biennial ; laxly pilose and glandular. Stems at first short, then elongating to $6-24 \mathrm{in}$., prostrate or decumbent. Leaves 6-18 in., oblong; stipules lanceolate. Peduncles longer than the leaves, strict. Flozers $\frac{1}{3}-\frac{1}{2}$ in. broad, umbelled, rosy or white. Petuls rather unequal, two often spotted at the base, entire. Carpels hairy with an eglandular subapical pit and usually a shallow curved furrow below the pit ; pedicels reflexed.-DIsTRIB. Europe, N. Africa, Siberia, W. Asia to N.W. India.
Var. 1, commix'tum, Jord. (sp.); two upper petals with a spot at the base, carpels distinctly furrowed.-VAR. 2, trivia'le, Jord. (sp.) ; two upper petals not spotted, carpels faintly furrowed.-Var. 3, pilo'sum, Bor. (sp.), petals not spotted, leaflets with more divided segments, carpels not furrowed.
2. E. marit'imum, $L$.; leaves entire oblong or ovate-cordate, margin lobulate, segments crenate, peduncles 1-2-flowered, filaments entire.
Sandy and gravelly W. shores, from Cornwall to Wigtonshire ; Farnham, Surrey ; and all round Ireland ; fl. May-Sept.-Small, pilose, annual or biennial. Stems 6-16 in., decumbent. Leaves $\frac{1-\frac{1}{3} \mathrm{in} \text {., petioles longer ; }}{2}$ stipules ovate. Flovers $\frac{1}{8} \frac{\mathrm{in}}{}$. diam., pale pink. Petuls sometimes 0 . Cherpels hairy with a deep subapical eglandular pit subtended by a straight deep furrow.-Distrib. W. Europe, from France to Italy.
3. E. moscha'tum, $L$.; leaves pinnate, leaflets deeply sharply irregularly serrate, antheriferous filaments toothed at the base.
Waste places, \&c. from Yorkshire to Anglesea southwards, not indigenous inland ; local in Ireland; fl. June-July.-Larger than E. cicutarium, covered with spreading hairs, smelling strongly of musk. Stem 2 ft ., stout ; stipules broadly ovate, obtuse. Flowers pale rose-purple. Carpels hairy with a glandular subapical pit subtended by a deep curved furrow.-Distrib. Europe, N. Africa, W. Asia,

## 3. OXA'LIS, $L$. WOOD-sORREL.

Acid herbs. Leaves radical or alternate, stipulate or exstipulate, compound, usually 3 -foliolate. Flowers on axillary 1- or more-flowered jeduncles, regular. Sepals 5 , imbricate in bud. Petals 5 , twisted in bud. Stamens 10 , free or comnate at the base. Disk 0 . Ovary 5 -lobed, 5 -celled; styles 5, stigmas terminal ; ovules 1 or more in each cell. Capsule loculicidal, valves adhering by the septa to the axis. Seeds with an elastic dehiscent fleshy coat, testa crustaceous, albumen fleshy ; embryo straight. -Distrib. 3 or 4 species widely dispersed, the rest S. African and S. American ; species 220.-Етym. ögus, acid. - Leaflets pendulous at night, often sensitive to light.-Tetramorphic flowers occur ; petaliferous large, others minute apetalous and very fertile.

1. O. Acetosel'ıa, L.; pilose, stemless, leaves all radical 3 -foliolate, stipules broad membranous, scape 1 -flowered. Wood-sorrel.
Moist shady places, ascending to near $4,000 \mathrm{ft}$. in the Highlands ; fl. April-Aug.-Glabrous or pilose. Rootstock creeping, scaly. Petioles 3-6 in. ; leaflets obcordate, $\frac{1}{3} \frac{2}{3}$ in., often purple beneath. Scape axillary, slender, 2 -bracteate about the middle. Flover $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam. Sepals oblong. Petals obovate, white veined with purple, erose, cohering above the claw. Capsule erect, 5-gonal ; cells 2-3-seeded.-Distrib. Europe (Arctic), N. Africa, Siberia and W. Asia to the Himalaya, E. and W. N. America.
O. cornicula'ta, L.; pubescent, stems branched procumbent without runners, leaves all cauline 3 -foliolate, stipules adnate, peduncles axillary 2-3-flowered, fruiting pedicels deflexed, capsules downy.
Waste shady places, local, possibly indigenous in S.W. England, not north of it ; fl. June-Sept.-Very variable in size and habit ; annual or biennial. Stems 6-16 in. Leaves as in O. Acetosella. Flovers $\frac{3}{4} \mathrm{in}$. diam., subumbellate, very long-peduncled, yellow. Seeds transversely ribbed.-Distrib. Ubiquitous, except in very cold regions.
O. stric'ra, L. ; subglabrous, stem erect with copious runners at the base, leaves as in 0 . corniculata but often whorled and stipules minute, peduncles $2-8$-flowered, capsule glabrous, pedicel spreading.
A weed in Cheshire and south of it, local ; not indigenous; fl. June-Sept.Similar to and distribution of O. corniculata, of which it is perhaps a subspecies.

## 4. IMPA'TIENS, L. BALSAM.

Herbs, rarely shrubby. Leaves opposite or alternate, stipules 0 or glandular. Flowers irregular, resupinate, on 1- or more-flowered axillary peduncles. Sepals 3 , rarely 5 , petaloid, imbricate; 2 anterior (if present) minute; 2 lateral small, flat ; posterior large, produced into a hollow spur. Petuls 3; anterior external in bud, large ; lateral 2-lobed. Stamens 5, filaments short broad ; anthers cohering. Disk 0. Ovary oblong, 5 -celled; stigma sessile, 5 -toothed; ovules many in each cell, 1 -seriate. C'apsule loculicidal, valves 5 , elastic, springing away from the placentas. Seeds smooth or villous, albumen 0 ; embryo straight.-Distrib. Mountains of trop. Asia and Africa; rare in temp. Europe, N. America, N. Asia and S. Africa; species 135.-Etym. The Latin name, from the ripe capsules burst-
ing when touched. -The anterior lateral sepals occur in a few Indian species. Minute flowers, fertilized when still in bud, occur in some.

1. I. Noli-me-tan'gere, $L$. ; glabrous, leaves oblong obtuse crenateserrate, pecluncles $1-3$-flowered, posterior sepal funnel-shaped gradually contracted into a slender spur with an entire tip. Yellow Bulsam.
Moist mountainous situations, probably wild in N. Wales, Lancashire, and
Westmoreland; introd. elsewhere; a native? Wutson; fl. July-Sept.-
Annual, succulent, 1-2 ft., nodes thickened. Leaces 2-4 in., alternate, membranous ; petioles half as long, slender. Flowers $1 \frac{1}{4}$ in., drooping, pale-
yellow dotted with red.-Distrib. Europe, Siberia, W. Asia.
2. Fel'va, Nuttull; habit and characters of I. Noli-me-tangere, but leaves acute, serratures more shallow, flowers orange, posterior sepal saceate suddenly contracted into an upeurved spur with a notched tip.
Naturalized on river-banks in Surrey, the Clyde, and various other places; fl.
June-Aug.-A N. American plant, naturalized within the last 40 years, and spreading rapidly.

## Order XXI. ihicin'ere or AQuifolia'cere.

Shrubs or trees. Leaves alternate, simple, exstipulate, often coriaceous and evergreen. Flowers small, in axillary cymes, often polygamous. Culyz: 3-6-parted, imbricate in bud, persistent. Petuls 4-5, free or commate at the hase, deciduous, imbricate in bud. Stumens 4 or 5 , hypogynons, free or adhering to the petals; filaments subulate; anthers oblong. Disk 0 . Trariy free, 3-5-celled, style 0 or short, stigma terminal ; ovales 1 , or 2 and collateral, pendulous, raphe dorsal, micropyle superior ; funicle often rupular. Irupe with 3 or more 1 -seeded free or connate stones. Seed with a memhranous testa, fleshy albumen, and minute straight embryo.-D) fatris. Temp, and trop. regions, absent from N. W. Ameriea; genera 3; speries 150 . -Affisitisas. Very close with Olacinee, differing only in the several-welled ovary- Phopertis.s. Antiseptic and astringent. Holly herries are purgative anl emetic ; bark yields bird-lime. "Mati" or "Paragnay tea" is the leaf of Ilex Paraguayensis.

## 1. I'LEX, L. Holly.

('iflux 4-5-parted, persistent. Corolla rotate ; petals connate at the hase or free. Stamens 4, adhering to the base of the corolla. Uoury 4-6-celled; stigmas free or confluent. Irupe glohose, with 4 stones or a 45 -welleni stone--Distmp. Trop. and temp. regions, abundant in S. America, rare in Afriva and Australia ; species 145.-Etym. doubthul.

1. I. Aquifo'lium, L.; glabrous, shining, leaves ovate spinescent.

Copses and woods, often planted ; ascends to $1,000 \mathrm{ft}$. in the Highlands ; f.
May-Aug. - A shrub or small tree, $10-40 \mathrm{ft}$., young shoots puherulous :
hark ashy, smooth. Leures glossy, 2-3 in., acute or acuminate, with waved spinous cartilaginous margins, those on the upper branches often entire.
Cymes umbellate, shortly peduncled, many-flowered. F'lorers $\frac{1}{4}$ in. diann.,
white, often suhdiwecious. Sepuls ovate, pubierulous. Petals ohovate, concave.
Stumrus 4, erect. Stignues 4, sessile. Frouit scarlet, rarely yellow ; stones 4,
hony, furrowed.--Distimb. Europe from S. Norway to Turkey and the
Caucasus ; W. Asia.

## Order XXII, EmPETRA'CERI,

Heath-like evergreen shruhs. Leaucs alternate, exstipmlate. Flowers small, solitary or clustered, axillary or terminal, usually dicecious, regular, hrarteolate or not. Sepals 2-3, free, coriaceous or thin, imbricate in bud. Petuls 2-3, hypogynous, free, persistent.-Male fl. Stumens 3-4, alternate with the petals, hypogynous; filaments long, filiform, free, persistent; anthers deciduous, 2 -celled, bursting inwards, pollen compound. Ovary rudimentary.-Female fl. Staminades minute. Ocary globose, 3-9-celled ; styles short, stigmas subulate or dilated: ovule 1, ascending from the inner angle of each cell, anatropous. Drupe depressed-globose, with 2-9 bony 1 -seeded connate or free stones. Seed erect, 3 -gonous, testa thin, alhumen fleshy; embryo straight, slender, axile, cotyleduns short, radice. stperior.-Distrib. Temp. and Aretic N. hemisphere, Chili and Fuegia; genema 3 ; species 4.-Affinities. Very close to Ilicinece (Decaisne and Maout) ; reduced form of Ericaceer (A. Gray) ; with Buxcce and Euphorbiacee (A. DC., \&c.).-Properties unimportant.

## 1. EmPE'TRUM, L. Crowberry.

Flowers bracteolate. Sepals and petals 3 each, quite entire. Ovary 6-9-celled ; stigmas 6-9, dilated. Drupe fleshy ; stones free.-Distrib. of the Order ; species 1.- Еtym. è $\boldsymbol{\pi} \pi \tau \rho o \nu$, from growing in stony places.

1. E. ni'grum, L.; leaves linear-oblong margins so recurved as to meet over the midrib.
Heaths and rocks, in Scotland, Ireland, and mountainous parts of England; ascending to $4,000 \mathrm{ft}$. in the Highlands ; fl. April-June.-Glabrous, tufted; branches 6-18 in., slender, wiry, spreading and trailing, leafy. Letrecs $\frac{1}{4}-\frac{1}{3}$ in., crowded, obtuse, reddish in age, sides minutely scabrid, the recurved portion concealing the pubescent under-surface of the leaf, which forms a hollow cylinder closed at both ends. Floxers minute, sessile. Sepals rounded, concave. Petals scarious, subspathulate, pink, reflexed. Fila-
 America, red in S. America). Berries eatable.-The structure of the leaf is very curious.

## Order XXIII. celastri'nere.

Trees or shrubs, sometimes spinous or climbing. Leaves opposite and alternate, simple, stipulate or not. Flowers small, cymose. Calyx small, 4-5 lobed, imbricate in bud, persistent. Petals 4-5, short, imbricate in bud. Stamens 4-5, inserted on the disk, filaments subulate; anthers small. Disk flat, tumid, or lobed. Ovary sessile, 3-5-celled ; style entire or 3-5-fid, stigmas terminal ; ovules 2 , erect from the base of the cells, anatropous, raphe ventral. Fruit various, dehiscent or not. Seeds erect, usually arillate (the arillus, being produced from the exostome, an arillode), albumen fleshy or 0 ; cotyledons large, foliaceous.-Distrib. Temp. and trop. plants, genera 40 ; species 400 .-Affinities. With Ampelidece and Sapindacece; less strong with Ilicinees and Rhamncee.-Properties. Purgative and emetic.

## 1. EUON'YMUS, L. Spindle-tree.

Shrubs or trees. Leaves opposite, persistent ; stipules caducous. Flowers small, in axillary cymes. Caly>: 4-6-fid. Petals 4-6, and stamens as many, both inserted on a broad, fleshy, 4-6-lobed disk. Ovary confluent with the disk, 3-5-celled; style short, stigma 3-5-lobed. Cnpsule 3-5-lohed and celled, angled or winged, loculicidal, cells 1-2 seeded. Seeds with a complete arillode, albumen fleshy; embryo straight.-Distbib. Temp. Europe, Asia, and N. America; species 40.-Etym. Euonyme, mother of the Furies, the berries being poisonous.

1. E. europre'ns, L. ; leaves ovate- or oblong-lanceolate serrulate.

Copses and hedges, \&ce. from Lanarkshire southwards ; rare in Scotland, local in Ireland ; fl. May-June.-A glabrous fetid shrub or tree, $5-20 \mathrm{ft}$. ; bark grey, smooth, twigs 4 -angled green. Lertes 1-4 in., acute or acuminate: petioles short. Cymes dichotomous, $5-10$ flowered ; peduncles 1-2 in. Fluecrs $\frac{1}{3} \mathrm{in}$. diam., greenish white. C'upsule $\frac{1}{3}$ in., deeply 4 -lobed, pale crimson ; arillode orange.-Distrib. Europe to the Caucasus, N. Africa, W. Sileria. -Wood hard and tough, used for the finer sorts of gunpowder, spindles, ¿c.

## Order XXIV. rham'nefe.

Trees or shrubs, often spiny, erect or climbing. Lcaves simple, alternate or opposite, often $3-5$-nerved ; stipules small. Flowers small, sometimes unisexual, green or yellow. Calyx-tube coriaceous; lohes 4-5, triangular, valvate in bud. Petcels 4, 5, or 0, inserted on the throat of the calyx, small, usually clawed, hooded. Stamens 4-5, inserted with and opposite the petals which often enclose them, filaments sulmuate; anthers small, versatile. Disk large, annular, cupular or coating the calyx-tube. Ovary 3 -celled, sessile or sunk in the disk, free or adnate to the calyx-tube ; styles short, simple or 3-lobed, stigmas terminal; ovules 1 in each cell, basal, erect, anatropous, raphe usually ventral. Fruit various, free or girt with the calyx-tube. Seeds compressed, sometimes arillate, albumen fleshy or 0 ; embryo large, often green, cotyledons plano-convex.-Distrib. Chiefly in warm and temp. regions; genem 37 ; species 430.-Affinities. With Celastrince, and certain Euphorbiacea.-Properties. Purgative. Rhamnus yields a green dye.

## 1. RHAM'NUS, L. Buckthorn.

Leaves alternate, deciduous. Flowers in small axillary cymes, often unisexual. Calyx-tube urceolate. Petals 4-5 or 0 . Stamens 4 or 5 , very short. Disk coating the calyx-tube. Ovary free, base sunk in the bottom of the calyx-tube, 3-4-celled; style 3-4-fid, stigmas ohtuse. Irupe girt with the ealyx-tube ; stones 2-4, 1 -seeded. Seeds oboveid, albumen fleshy ; cotyledons flat or with recurved margins ; radicle short.-Temp. and trop. regions, none Australian ; species 60.-Position of raphe variable, dorsal lateral or ventral.

1. R. cathar'ticus, $\boldsymbol{L}$. ; branchlets spinous, leaves ovate actely serrate, nerves divergent, flowers 4 -merous dicecious.
Woods and thickets from Ayrshire southwards, chiefly on chalk, perhaps not
wild S. of Durham, rare in Ireland ; fl. May-July.-A rigid shrub, 5-10 ft.,
much branched; bark blackish. Leaves 1-2 in., fascicled at the ends of the shoots, subopposite lower down, shortly petioled, young downy beneath; stipules subulate, deciduous. Flowers $\frac{1}{6} \mathrm{in}$. diam., solitary or fascicled in the axils of the fascicles of leaves on the previous year's wood, yellow-green; pedicels very short. Caly $x$ of the male campanulate, female cupular, lobes acute. Style 4 - rarely 2 - or 5 -cleft. Drupe $\frac{1}{2}$ in. diam., globose, black; stones 4, obovoid, grooved at the back. Albumen longitudinally curved and like a horseshoe ; embryo obcordate, similarly curved.-Distrib. Europe, N. Africa, Siberia ; cult. for hedges in the U. States.
2. R. Fran'gula, L.; unarmed, leaves obovate quite entire, nerves parallel, flowers 5-merous bisexual. Berry-bearing Alder.
Woods and thickets, common in England, Ayr and Moray in Scotland, very rare in Ireland ; fl. May-June.-Shrub $5-10 \mathrm{ft}$. ; branches slender. Leaves alternate; stipules subulate. Floxers $\frac{1}{5} \mathrm{in}$. diam., few, axillary, greenishwhite, pedicels $\frac{1}{2} \mathrm{in}$. Culyx campanulate. Style entire. Drupe $\frac{1}{3}$ in. diam., globose, black when ripe; stones compressed, broadly obovoid. Seed of the same form.-Distrib. Europe, N. Africa, Siberia.-Drupes cathartic, when unripe used to dye green; wood used by gunpowder-makers and called Dogwood.

## Order XXV́. Sapinda'cerf.

## Tribe Aceri'nees.

Trees; juice often sugary, sometimes milky. Leaves opposite, simple or pinnate, deciduous. Flowers racemed or corymbose, often polygamous, regular ; the lower or earlier in the raceme generally male, the terminal 2 -sexual. Calyx 5- rarely 4-12-parted, deciduous, imbricate in bud. Petuls as many or 0 , imbricate in bud. Stamens 8, rarely indefinite, inserted on the disk. Disk annular, thick, lobed or 0. Ovary laterally compressed, 2- rarely 3-4-lobed and celled ; styles 2, filiform, stigmatose on the inner surface; ovules 2 in each cell, attached by a broad base, superposed or collateral. Fruit of 2, rarely 3 or 4 spreading samaras. Seed ascending, compressed, testa membranous, inner coat fleshy; cotyledons plaited, radicle long.-Distrib. Europe, N. Asia, N. America, Java, most abundant in the Himalaya and Japan; genera 3 ; species 50.Affinities. Allied to Celastrineo. The tribe Acerinea differs from the other plants of the great tropical order of Sapindacece chiefly in the opposite leaves, and stamens inserted on (not within) the disk.-Properties. Sugar is made from the juice of American species.

## 1. a'cer, L. Maple.

Leares simple, entire or lobed. Disk annular.-Distrib. of the Tribe.

- Etym. The Latin name.

1. A. campes'tre, $L$.; leaves reniform obtusely 5 -lobed entire lobulate or crenate, corymbs erect, wings of fruit horizontal. Common or Smallleaved Maple.
Thickets and hedgerows, from Durham southwards; naturalized in Scotland; rare in Ireland; fl. May-June. -Small tree $10-20 \mathrm{ft}$., with spreading branches ; bark rough, fissured; wood beautiful, fine-grained. Leaves 2-4 in.
diam., puhescent when young: petiole 1-1 $\frac{1}{2}$ in., slender. C'rimble 1-2 in. Flowers $\frac{f}{f} \mathrm{in}$. diam., green, shortly pedicelled. S'rpuls linear. ohloner. I'tuls similar, but narrower: wings of fruit linear chlong, slishtly ourved, each $\frac{1}{2}$ in. long. -Distrib. Europe, from Demmark sonthwards. WV. Asia.
2. Pserdoplat'ants, L.; leaves 5-angleyl 5 -lobed, lohes cremate-sertate, racemes elongate pemdulons, wings of fruit divergent. Girat Mann', Sycamore, Plane of Scotland.
Thickets and woods ; naturalized onlv; fl. Mav-June.-A tall umbrageous tree, $41-$-fil ft . Bar $\%$ smonth, outer layer deciunoms. Lawors $4->\mathrm{in}$. diam., glaucous heneath, lobes acute or acuminate. Flouress as in A. ceurmsta, but pedicels shorter, and stamens longer. Ocary villous. Sumurias $1 \frac{1}{\mathrm{~b}} \mathrm{in.}$, scimitar-shaped.-Distrib. Mid. Europe and W. Asia.-Sap sugary. Wood much used for turnery, \&c.

## Order XXVI. Legumino'sce.

Suborder Papiliona'cee.
Herbs, rarely shrubs. Leavrs alternate, 3- or more-foliolate, rarely simple; stipules usually present; leaflets often stipellate. In flomeseence varimus. Flowers irregnlar. Calyg of 5 connate sepals, often 2 -lipped. Pctuls 5. very unequal, free or 2 or more adherent by their claws to the staminal tube, imbricate in bud ; upper (stumard) broad, often reflexed. exterior in bud; 2 lateral (wings) parallel, enclosing and sometimes adhering to the 2 lower (kee), which are interior in bud, and free, or connate by their lower edges. Stremens 10 , perigynous, filaments united into a sheath, or the upper one free, their free tips equal or altermate longer ; anthers usually versatile. Disk lining the base of the calyx-tuthe. Orary of one 1 -celled carpel, included in the staminal sheath; style incurved, stigma simple oblique or terminal ; ovules 2 or more, $1-2$-seriate on the ventral suture, ampylotropons or anatropous, horizontal erect or pendulous. Frmit a dry pod (legume) dehiseent along one or both sutures or not at all, contimuous or septate internally. Seeds with a coriaceous testa, and simple or dilated funicle, alhumen 0 ; cotyledons plano-convex, radicle incurven, incum-bent.-Distrib, Chiefly N. temp. but found all over the globe; few in New Zealand; genera 295 ; species 4,700 .-Affisities. Principally with $R$ sacece.-Propfities too numerous to mention here.

The tribal characters here given apply to British Genera to the exclusion of many exotic members.

SFrifs 1. Leares 1- to 3 -foliolate, without tendrils.
Tribe I. GENIS'TEAE. Shrubs. Leaces 0 or 1 foliolate or digitately compound; leaflets quite entire, Stamens all united. Pod 2 -valved.
Calyx shortly 2 -lipped, lips deeply toothed .............................1. Genista.
Calyx deeply 2 -lipped, yellow :..................................................2. Vlex.
Calyx shortly 2 -lipped, lips minutely toothed
3. Cytisus.

Tribe II. TRIFO'LiEfe. Herbs, rarely shrubs. Leaves pinnately rarely digitately 3 -foliolate; veins generally ending in teeth. Upper stumen. usually free.
Filaments all united
4. Ononis.
Upper filament free.
Racemes short. Pod longer than calyx, curved dehiscent...5. Trigonella.Racemes short. Pod usually spiral6. Medicago.
Racemes long. Pod short, indehiscent. Keel free 7. Melilotus.Plowers capitate. Pod short, 1-4-seeded. Keel adnate.......8. Trifolium.
Series 2. Leures 57 or multi-foliolate, with a terminal leaflet.
Tribe III. LO'tere. Herbs or shrubs. Leeces pinnately 5 -many-foliolate ;leaflets quite entire. Upper stamens free or not; alternate filaments oftendilated. P'od 2 -valved, without a longitudinal septum.
Calyx inflated, including the pod 9. Anthyllis.
Calyx not inflated, pod exserted dehiscent. ..... 10. Lotus.
Tribe IV. Galege'廆 (sub-tribe Astragale' e). Herbs or shrubs. Leacespinnately 5 -multi-foliolate; leatlets quite entire. Upper stamen free.$1^{\prime}$ od 2 -valved, turgid or flat with a longitudinal septum.
11. Astragalus.
Keel beaked or with an incurved tip ..... 12. Oxytropis.
Tribe V. Hedysar'exe. Herbs or shrubs. Leaves pinnately 3-multi-foliolate. Upper filament free. Pod indehiscent, of 1 or many 1 -seededjoints.
Pod cylindric, many-jointed 13. Ornithopus.
Pod flat, of many curved 1 -seeded joints 14. Hippocrepis.
Pod flat, hard, 1-seeded ..... 15. Onobrychis.
Series 3. Leaves abruptly pinncte (or leaflets 0 ) ; petiole endiny in a tenaril or point.
Tribe VI. Vic'iefe. Herbs. Leates pinnate ; petiole ending in a tendrilor point. Leaftets often toothed. Cuper stamen free. Pod 2 -valved.
Style filiform, hairy below or all round ..... 16. Vicia.
Style flattened, hairy on the upper side only 17. Lathyrus.

1. GENIS'TA, $L$.

Shrubs, sometimes spinous. Leaves 1 -foliolate in British species; stipules minute or 0 . F'lowers racemed, yellow, rarely white, bracteate. Calys shortly 2 -lipped; upper lip deeply 2 -fid, lower shorter 3 -toothed. Winys oblong, gibbous at the base, adnate to the staminal tube, deflexed after Howering. Filaments all united, tube entire ; anthers alternately short and versatile, and long and basifixed. Style incurved, stigma oblique ; ovules 2 or more. Pod 2 -valved or indehiscent, 1-celled. Distrib. Europe, W. Asia, N. Africa ; species 70.-Etym. obscure.

1. G. tincto'ria, $L$.; unarmed, leaflet oblong or lanceolate nearly glabrous, racemes slender, keel and pod glabrous. Dyers' Greenweed.
Meadows and fields, from Wigton and Edinburgh southwards ; rare in Scotland; Co. Dublin only in lreland ; fl. July-sept.-Stems 1-2 ft., branched, rigid, striate. Leuptets $\frac{1}{2}-1 \mathrm{in}$., appressed, ciliate ; stipules minute, subulate. Flouters $\frac{1}{2}$ in., yellow. C'alyx deciduous above the base ; teeth acuminate. Pod 1-1 $\frac{1}{4} \mathrm{in}$., compressed, 5-10-seeded.-Distrib. Europe, from Gothland southwards, N. Asia ; introd. in N. America.-Yields a yellow dye.
Var. 1, glu'lra, Syme; glabrous, branches erect or ascending.-Var. 2, humifit'su, Syme; branches decumbent hairy as are the pedicels calyx and pod. Kynance Cove.
2. G. pilo'sa, L.; unarmed, leaflet obovate-lanceolate obtuse complicate recurved silky beneath, racemes short leafy, keel and pod pubescent.
Gravelly heaths, rare and local, from Suffolk to S. Wales, and Kent to Cornwall ; fl. May-Sept.-Stem much branched, curved, prostrate, tortuous, woody. Leaflets $\ddagger$ in., very shortly petioled ; stipules ovate, obtuse. Flowers $\frac{1}{2}$ in., yellow. Culyx with 2 upper lobes lanceolate, and 3 lower subulate. Porl $\frac{2}{3}$ in., deciduous, flat, valves bulging over the seeds.-Distrib. Europe, from Gothland southwards.
3. G. ang'ica, $L$.; glabrous, spinous, leaflet ovate oblong or lanceolate, racemes short leafy, keel and pod glabrous. Needle Furze.
Heaths and moist moors, from Ross southwards, ascends to $2,200 \mathrm{ft}$. in the Highlands; absent in Ireland ; fl. May-June.-Branches 1-2 ft., slender, spreading, curved ; spines $\frac{1}{2}-1$ in., slender, recurved, simple, rarely branched. Leutlets $\frac{1}{1}-\frac{1}{3}$ in.; stipules obsolete. Flovers $\frac{1}{2}$ in., yellow, shortly perlicelled. Culyx persistent; teeth short, triangular. Pod $\frac{3}{4}$ in., deciduous, inflated, acuminate at both ends.-Distrib. W. Europe, from Denmark to France and Germany.

## 2. U'lex, L. Furze, Whin, Gorse.

Densely thorny shrubs. Leaves 3 -foliolate in seedling plants, in mature spinescent or reduced to small scales, exstipulate. Flowers yellow, axillary ; bracts small. Calyx membranous, coloured, 2 -partite, upper lobe 2- lower minutely 3 -toothed. Petals shortly clawed; keel and wings obtuse. Stumens as in Genista. Style smooth, stigma capitate; ovules many. Pod 2-valved, 1-celled.-Distrib. W. Europe to Italy, N. W. Africa; species 12.-Етум. doubtful.

1. U. europæ'us, $L$.; bracts large ovate lax, calyx hairs spreading, teeth minute, wings longer than the keel.
Heaths, \&c., rarer in the North ; ascends to 2,100 ft. in Wales ; fl. Feb-March, and Aug.-Sept.-Bush 2-5 ft., rounded, spinous ; spines 1-2 in., straight. Leaves small; leaflets hairy; spines sometimes furnished with minute 1 -foliolate leaves. Flovers $\frac{3}{4} \mathrm{in}$., irregularly racemose, bright yellow, odorous, borne on the spines. Culy $y$ hairs black. P'ed $\frac{3}{4}$ in., black, covered with brown hairs, dotted.-Distrib. Denmark to Italy and Greece, Canaries and Azores.
Var. I, européus proper ; branches spreading, spines furrowed rigid.-V Ar. 2, stric'tus, Mackay (sp.); branches erect compact, spines soft 4-gonous. Irish Furze. Lord Londonderry's park, Down.
2. U. na'nus, Forster ; bracts minute, calyx with appressed pubescence, teeth lanceolate, wings about equalling the keel.
Heath and commons, from Ayr and Northumberland southwards; common in Ireland; fl. July-Nov. - Much smaller than $U$. europeess. Stem 1-3 ft. Spines $\frac{1}{1}-1 \frac{1}{2} \mathrm{in}$. F$/$ louers $\frac{1}{2} \mathrm{in}$., more spiked, more orange.-Distirib. Belglum, W. France, Spain.
Sub-sp. Na'vus proper; branches procumbent drooping, primary spines weak short, wings straight shorter than the keel.-S. of Eugland.
Sub-sp. Gat.'Lit, Pleuchon (sp.); branches ascending, primary spines rigid, wings curved rather longer than the keel.-Heaths and downs in the West, from Wigton to Somerset.

## 3. CYTIS'US, L. BRoom.

Shrubs, rarely spinous. Leaves $1-3$-foliolate or 0 . Stipules minute. Flowers yellow, purple, or white. Calyx 2-lipped ; upper lip minutely 2lower 3 -toothed. Wings oblong, and keel obtuse, deflexed after flowering, their claws free. Stamens as in Genista. Style incurved or coiled, smooth, stigma terminal; ovules many. Pod flat, elongate, 2 -valved, manyseeded, somewhat septate. Seeds with a tumid funicle.-Distrib. Europe, N. Africa, W. Asia.-Etym. obscure.

1. C. scopa'rius, Link; branchlets and obovate leaflets silky. Spar tium, L. Sarothamnus, Koch.
Heaths, commons, \&ce. from Sutherland southwards ; ascends to $2,000 \mathrm{ft}$. in the Highlands ; fl. May-June.-Shrubby, 2-6 ft., hairy; branches green, angular, furrowed. Leaves shortly petioled; leaflets $1-3, \frac{1}{-\frac{1}{2}} \mathrm{in}$. Flovers 1 in., bright yellow, pedicels short. Style spiral. Pod 1-2 in., black; valves twisted after dehiscence.-Distrib. Europe, N. Ásia, Canaries and Azores.-Twigs diuretic, and used for tanning. Seeds a substitute for coffee.

## 4. onónis, L. Rest-harrow.

Herbs or small shrubs, with often viscid hairs. Leaves pinnately 3 foliolate, nerves ending in teeth ; stipules adnate to the petiole. Flowers pink or yellow ; bracts minute or 0, upper leaves bractaform ; peduncles sonretimes spinescent. Standard broad; wings oblong; keel incurved, pointed, not adnate to the staminal tube. Filaments all united, 5 or all dilated above; anthers uniform, or the alternate smaller. Style incurved, smooth, stigma terminal; ovules 2 or many. Pod turgid or terete, 1 -celled, 2 -valved.-Distrib. Europe, W. Asia, N. Africa; species 60.-Етум. The Greek name for the genus.

1. O. arven'sis, L.; perennial, procumbent, viscid and hairy, leaflets oblong, pods ovate erect shorter than the calyx. Wild Liquorice.
Dry pastures, sandy shores, \&ce. from Sutherland southwards ; not common in
Ireland; fl. June-Sept.-Rootstock elongate, stoloniferous. Stems 1-2 ft.,
shrubby, rooting at the base, prostrate or ascending, rarely spinous. Lower
leaces 3 - upper 1 -foliolate ; leaflets $\frac{1}{4}-\frac{3}{4}$ in., oblong-obovate, toothed. Flowers ${ }_{4}^{3}$ in., axillary, subracemose, rosy; peduncles 1 -flowered, not articulate.
Pod 1-3-seeded. Seeds granulate.-Distrib. Europe, Azores.
2. O. spino'sa, L.; perennial, suberect, stem with a line of pubescence, pod ovate erect longer than the calyx. O. campestris, Koch.
Waste places, moors, \&c. from Forfar and Dumbarton southwards; rare in Scotland; absent in Ireland; fl. June-Aug.-Similar in many respects to O. areensis, but has no runners, is less viscid and hairy, less strongly scented, and is smaller leaved.-Distrib. Europe, W. Asia.-Possibly only a subspecies of 0 . arvensis.
3. O. reclina'ta, L.; annual, spreading, viscid and hairy, pod cylindric oblong reflexed.
Alderney ; naturalized on sea-cliffs, Mull of Galloway ; fl. June-July.-Stem $2-3 \mathrm{in}$. Leatlets $\frac{2}{4}-\frac{1}{2} \mathrm{in}$., acutely toothed; stipules large, $\frac{1}{2}$-ovate. Pelicels slender, articulate beneath the flower. F/ower $\frac{1}{3}$ in., rosy. Pod $\frac{1}{2}$ in., glandular and hairy, as long as the calyx or longer.-Distrib. W. of
France, Spain, Italy, Greece.

## 5. trigonelíla, $L$. Fenvgreek.

Herbs, often strongly scented. Lauves pinnately 3 -foliolate; nerves terminating in teeth; stipules adnate to the pretiole. Flowers solitary, capitate, or in dense racemes, white, yellow, or blue. Calys tubular, teeth suberual. Prtuls very persistent; wings longer than the keel, the claws of both free from the staminal tube. Filtments not dilated, upper free or nearly so ; anthers uniform. Style glabrous, stigma terminal ; ovules many. Pod variuns in form, dehiscent in the British species, longer than the calyx.-Distrib. Europe, temp. Asia, N. and S. Afriea, Australia; species 50.-Etym. The old Greek name.

1. T. ormithopodioi'des, DC.; glabrous, prostrate, very slender, leaflets obrordate, keel nearly as long as the wings. Trifulium, L. Aporan'theus Trifulius'trem, Bromfield.
Sandy heaths and gravelly places, rare, from the Forth and Clyde southwards;
East of Ireland very rare ; fl. June-Aug.-Annual or biemial, branching
from the base; branches $2-8 \mathrm{in}$., slender. Lectilets $\frac{1}{2}-\frac{2}{3} \mathrm{in}$., toothed,
strongly nerved ; petiole $\frac{1}{2}-1 \mathrm{in} . ;$ stipules large, ovate, long-acuminate.
Peducles solitary, shorter than the petioles, axillary, 1-3-flowered. Flumess
$\frac{1}{3}$ in., very shortly pedicelled, white and pink. Poi $\frac{1}{4}$ fin., lmear-oblong,
slightly curved, obtuse, partially dehiscent, 6-8-sealed.-Distrib. Den-
mark, France, Portugal, Italy, and Turkey-An anomalous species, on
account of the length of the keel ; habit of Trifolinm sebterneneem.

## 6. MEDICA'GO, L. Medick.

Herbs. Leaves pinnately 3 -fuliolate, nerves ending in teeth; stipules adnate to the petiole. Flowers small, yellow or violet; stipules small or 0. Culys-teeth 5, nearly equal. Kicel obtuse, shorter than the oblong wings, not adnate to the stamens. Filaments not dilated, upper free; anthers uniform. Style subulate, glabrous, stigma subeapitate; orules few or many: Pod spirally curved or coiled, very rarely falcate, often spiny, rarely dehiseent.-Distimb. Europe, W. Asia, N. Africa; speceies 40. -Еtym. The Greek name.

* P'erennial. I'od deliscent, fulcate, annular, or coiled into an open helix, smonth,
many-seeded; marginal nerve 0 .

1. M. falca'ta, L.; decumbent, flowers subcorymbose, pods linear compressed curved or annular downy.
Gravel banks and waste sandy places in the E. counties ; an alien or denizen,
 linear, or obovate-oblong, toothed, notched and mucronate at the tip; stipules large, subulate. F'lowers $\frac{1}{3}$ in., shortly pedicelled. P'ond $\frac{1}{2}$ in.Distrib. Europe, N. Asia.
Sub-sp. Filca' fa proper; flowers yellow, pod falcate.
Suh-sp. Siflisis'This, Fries (sp.); flowers yellow then dark green, pod semicircular or annular.
M. sativa, $L$. ; erect, flowers racemose, pod with 2-3 coils downy. Purple Merlick.
Hellges and fields, not indigenous; fl. May-July.-Stom 1-2 ft., fistular, branched. Leujlets narrowly obovate-oblong, toothed, tip notched and
apiculate. Floicers $\frac{1}{3}-\frac{1}{2} \mathrm{in}$., in a short dense raceme, usually blue or purple; peduncles longer than the leaves, pedicels very short. Pod $\frac{1}{4} \mathrm{in}$. diam.-Distrib. Europe, in cultivation only, naturalized in the U. States. -Perhaps only a form of $M$. fulcata.
** Annual or biennial. Pod indehiscent, reniform, tip coiled, smooth, 1-seeded; marginal nerve 0 .
2. M. lupuli'na, L.; procumbent, flowers in ovoid heads, pods reticulate. Black Medick.
Waste places and fields ; ascends in the Lake district to $1,000 \mathrm{ft}$; fl. May-Aug.-Pubescent or glaibrous. Stems $6-24 \mathrm{in}$., much branched. Leaflets $\frac{1}{4}-\frac{\pi}{3}$ in., obovate, toothed, apiculate ; petioles very short ; stipules $\frac{1}{2}$-cordate. Flumer' $\frac{1}{8} \mathrm{in}$., peduncles longer than the petioles ; pedicels very short. I'ods $\frac{1}{8}-\frac{1}{6} \mathrm{in}$., black.-Distrib. Europe, N. Africa, siberia, W. Asia to India; introd. in N. America.
*** Annal. Pod indehiscent, coiled into a closed helix, many-seeded; bordered with spines or tubercles; with a strong maryinal neroe. (Stems prostrate. Leaplets obooute or obcordate, twothed. Pecturcles fect-rlowered. Flonerrs yellow; calyx-teeth subulate, incurved.)
3. M. denticula'ta, Willd.; nearly glabrous, stipules laciniate, pod Hat deeply reticulate with 2 or 3 coils and a double row of spines.
E. and S . counties from York and Norfolk to Devon, naturalized elsewhere ; a denizen ? Wutson; A. May-Aug. - Stem 6-24 in., furrowed. Leatlets $\frac{1}{4}-1 \mathrm{in}$. Flurers $\frac{1}{6}$ in., umbellate, yellow; pedicels very short. Pod $\frac{1}{4}$ in. dam.Distrib. Mid. and S. Europe, N. Africa, W. Asia to India ; introd. in N. America.

Var. 1, denticula'ta proper; spines subulate, half the diameter of the pod.Var. 2, apicula'ta, Willd. (sp.); spines of pod very short.
4. M. macula'ta, Silthorp; nearly glabrous, stipules $\frac{1}{2}$-cordate toothed, pod subglobose faintly reticulate with $3-5$ coils and a double row of long curved spines.
Pastures and hedgebanks, from York and Durham southwards ; S. of Ireland, doubtfully natıve ; fl. May-Aug.-Stems 1-2 ft., numerous. Leuflets $\frac{1}{6}-1 \mathrm{in}$., obovate obcordate or cuneate, with often a black central spot; stipules herbaceous; petiole pilose. Flowers $\frac{1}{6} \mathrm{in}$., yellow. Pod $\frac{1}{4} \mathrm{in}$. broad; margin with 4 ridges. -Distrib. Europe, N. Africa; introd. in N. America.
5. M. min'ima, L.; downy, stipules $\frac{1}{2}$-cordate faintly toothed, pod subglobose faintly reticulate, with 4 or 5 coils and a double row of closeset hooked spines.
Saudy fields, rare ; E. counties, from Norfolk and Cambridge to Surrey, and in Glamorgan ; H. May-July.-stems 6-10 in., very many, rigid, prostrate. Leculdets $\frac{1}{4} \frac{-1}{3}$ in., from narrowly to very broadly obovate. Flowers $\frac{1}{8} \mathrm{in}$. Pod $\frac{1}{4}$ in. diain., margin keeled.-Distrib. Europe, N. Africa, W. Asia.

## 7. Melilo'tus, Tournefort. Melilot.

Annual or biennial, fragrant herbs. Leaves pinnately 3 -foliolate, nerves ending in teeth; stipules adnate to the petiole. Flowers in axillary racemes, small, drooping, yellow or white ; bracts minute or 0. Culys-teeth 5, nearly equal. Petuls very deciduous; standard oblong; keel shorter than the wings, obtuse, not adnate to the stamens. Filcements not dilated
upwards, the upper free, or only so above the middle ; anthers uniform. Style filiform, stigma terminal ; ovules few. Pod short, straight, thick, hardly dehiscent. Seeds 1 or few.-Warm and temp. regions of the Old World ; species 10.-Etym. mol and lotus, from the honeyed smell.

1. M. officina'lis, $L$.; erect, petals nearly equal, pod ovoid compressed acuminate reticulate hairy.
Fields, \&.e. from Durham southwards; very rare in Ireland; a denizen,
Wutson; fl. June-Aug.-Annual or perennial. Stem 2-3 ft., much branched.
Leutlets $\frac{1}{2}-1 \frac{1}{1}$ in., obovate- or linear-oblong toothed; stipules subulate, very slender. Racemes 3-4 in. F'loiers $\neq$ in., secund, deep yellow, perlicels short. Corolla more than twice as long as the calyx. Pool black when ripe, 1-2-seeded.-Distrib. Europe, Siberia, W. Asia to India; introd. in N. America.
2. M. al'ba, Lamk.; standard longer than the wings or keel, pod owoid acute reticulate glabrous. M. vulgaris, Willd.; leucantha, Koch. White Melilot.
Waste places, not rare, from Norfolk and S. Wales southwards ; Ireland natu. ralized ; an alien or colonist? Watson; fl. July-Aug. - Very similar to M. otticinalis, but more slender; flowers smaller, white, in long racemes: pods more ovoid and glabrous, also black when ripe.-Distrib. Europe, Siberia, W. Asia to India ; introd. in N. America.
M. arven'sis, Wallroth; standard longer than the keel as long as the wings, pod ovoid obtuse mucronate transversely ribbed rugose glabrous.
Waste places, chiefly in the E. counties, also in Ireland, not indigenous in either; fl. June-Aug.-Habit, \&c. of the preceding. Flowers pale-yellow or white. Poll olive-brown when ripe.-Distrib. Europe, N. Africa, W. Asia to N.W. India.

## 8. trifóhium, $L$. Trefoil, Clover.

Herbs, usually low. Leares digitately, rarely pinnately 3 -foliolate; stipules adnate to the petiole. Flowers capitate or spiked, rarely solitary, red, purple or white, rarely yellow ; bracts small or 0 , sometimes forming a toothed involucre. Calyx-teeth 5, suberqual. Petals persistent; wings longer than the keel, the claws of both adnate to the staminal tuhe. Lipper stamens free; all the filaments or 5 of them dilated at the tip; anthers uniform. Style filiform, stigma oblique or dorsal; ovules few. Pod small, indehiscent, $1-4$-seeded, nearly enclosed in the calyx.-1) istins. North temp. and warm regions, rare in Southern ; species 150 . - Etyms. in allusion to the 3 leaflets.

Section 1. Heals axillary. Fertile fomers few. Calyx enclosing the 1 -seeded pod, which at length splits; its throat naked. Petuls caducous. Porls burrowing in the earth when ripening, then covered by the reflexed deformed calyces of the other flowers.

1. T. subterra'neum, $L$.; very hairy, stipules broadly ovate acute, calyx-teeth setaceous as long as the tube, deformed calyces slender with 5 rigid palmate lobes.
Gravelly and sandy pastures, from Anglesea and Nottingham southwards; fl. May-June. - Annual ; covered with spreading soft hairs. Stems $\frac{1}{2}-2 \mathrm{ft}$.,
very many, prostrate. Leaflets $\frac{1}{3}$ in., broadly obcordate. Heads of flowers $\ddagger$ in. diam., lengthening after flowering. Flowers cream-coloured. Pod orbicular, compressed. Seeds shining.-Distrib. Europe from Holland southwards, N. Africa, W. Asia to N.W. India.

Section 2. Heads many-flowered, rarely axillary, globose or oblong, pedicels ebracteate. Calyx not inflated; throat with a ring of hairs or callous constriction (obscure in T. Bocconi) ; teeth ciliate, equal or the lower longest. Pctals usually persistent. Pod sessile, 1 -seeded.

## * Heads cylindric or oblong during or after flowering.

2. T. arven'se, $L$. ; softly hairy, leaflets narrow obovate-oblong longer than the petioles, stipules with very long setaceous points, heads terminal perduncled soft cylindric, calyx-teeth persistent longer than the petals plumose. Hare's-foot Trefoil.
Dry pastures and fieids, from Isla and Ross southwards; rare and local in Ireland; fl. July-Sept.-Annual. Stems many, ascending or suberect. Leatets $\frac{1}{2} \frac{3}{4}$ in. Heads $\frac{1}{2}-1$ in., dense. Flowers minute, white or pale pink.Distrib. Europe, N. Africa, Siberia, W. Asia ; introd. in America.
3. T. Bocco'ni, Savi; pubescent, leaflets obovate, stipules ovate with setaceous points, heads axillary and terminal cylindric sessile, calyx glabrous teeth straight erect spinescent rather shorter than the petals.
Dry places, Lizard and Ruan-Minor in Cornwall, very rare ; a native? Watson; fl. July.-Annual. Stems $2-4 \mathrm{in}$. (10-12 in. in cultivation). Leaves shortly petioled; leaflets $\frac{1}{4}-\frac{3}{4} \mathrm{in}$., glabrous above, variable in breadth. Heads $\frac{1}{4}-\frac{1}{2} \mathrm{in}$. Flowers white. Calyx with a very obscure ring in the throat. Pod enclosed in the (not ventricose) calyx.-Distrib. France, Spain, Italy, to Turkey; Canaries.
4. T. incarna'tum, L.; softly pubescent or villous, leaflets broadly obovate or obcordate, stipules obtuse, heads peduncled terminal ovoid or cylindric, calyx hairy teeth shorter than the corolla spreading in fruit. Crimson Clover.
Fields and roadsides; not in Ireland ; fl. June July.-Annual. Very variable in size and pubescence. Stems rather slender. Leaves shortly petioled; leaflets $\frac{3}{4}-1 \frac{1}{2} \mathrm{in}$. Heads $1-2 \mathrm{in}$. Flowers $\frac{1}{2} \mathrm{in}$. Calyx-ribs strong.-Distrib. S. and W. Europe.
Sub-sp. incarna'tum proper; hairs of stem spreading, calyx-teeth hairy to the tips, flowers bright scarlet.-An escape from cultivation. A common fodder crop.
Sub-sp. Moline'rir, Balbis (sp.); hairs of stem appressed, heads shorter, calyx-teeth glabrous at the tips, flowers pale white or rose.-Lizard Point and Kynance Cove, amongst short grass; native? Watson. Probably the original form, of which incarnatum is the cultivated state.

## ** Heads ovoid or globose.

5. T. ochroleu'cum, L.; softly pubescent, leaflets obovate or oblong, heads terminal globose at leugth ovoid, peduncles short subtended by opposite leaves, calyx-teeth spinescent spreading and recurved in fruit, lowest much longest.
Dry pastures, local, E. counties, from Norfolk and Bedford to Hants; H. June-Aug.-Perennial. Stems ascending 6-18 in. Leaflets $\frac{1}{2}-1 \mathrm{in}$., tip
entire or notehed ; stipules lanceolate, adnate to the middle. Heads $3-1 \mathrm{in}$. hroad. Floners pale yellow, hrown when old. Calyc ribibed, half as long as the petals. forl striate, opening by the conical top falling away:Distilb. Europe, from Belgium southwards, W. Asia.
6. T. praten'se, $L$. ; more or less pubescent, leaflets oblong, stipules membranous free portion appressed to the petiole, heads terminal sessile globose, at length ovoid, subtended by opmesite leaves with much-dilated stipules, calyx-teeth slender setaceous, erect or spreading in fruit, the lowest longest. lied Clocer.
Pastures, roalsides, \&c., both wild and cultivated ; ascending to $1,900 \mathrm{ft}$. in the Highlands ; H. May-Sept.-Anmual or peremial. Steme 6-2t in., solid or fistular, robust or slender. Leenflets $\frac{1}{2}-\frac{2}{2} \mathrm{in}$., often marked with a white spot or lunate band, finely toothed; stipules often $1-1 \frac{1}{2}$ in., with long setaceous points. Heceds $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$. diam., pink purple or dirty white. Culy, t tulur with a 2 -lipped contraction in the throat, strongiy nerved; teeth not exceeding the petals, very slender, unequal. Pod opening liy the top falling off.- Dismib, Europe (Arctic), N. Africa, Siberia, W. Asia to India ; introd. in N. America.-Extensively cultivated for fodder.
7. T. me'dium, L.; slightly hairy, leatlets oblong obtuse or acute, stipules herbaceons free portion spreading, heards sulglobose terminal shortly peeduncled subtended by opposite leaves, calyx-teeth setaceous spreading in fruit, lowest a little longest. Muadou C'locer.
Pastures, meadows, \&c. ; ascending to $1,310 \mathrm{ft}$. in the Highlands ; fl. June-Sept.--Perennial. Ntoms straggling, flexuous. Leuthets $1-2$ in., rather rigid, alhost quite entire, ciliate. Meads $1-1 \frac{1}{2} \mathrm{in}$. diam. Flocers $\frac{3}{4}$ in., rose purple. Citlys--flaout with a ring of hairs, tube 10 -nerved, glabrous; teeth reaching half-way up the petals. Pod dehiscing longitudinally.-Distrab. Europe (Arctic), Siberia, W. Asia ; introd. in N. America.
8. T. marit'imum, Hucison; pubescent, leaflets narrowly obovateoblong obtuse or acute, stipules herhaceous free portion linear-sululate spreating, heads terminal ovoid very shortly peduncled subtended by opposite leaves, valyx-teeth short triangular-subulate spreading and herbaceous in fruit, 4 upper shorter than the tube.
Nalt marshes and meatows, from Gloucestershire and Norfolk southwards ; f1. June-Aug. -Anmual. Stems 6-18 in., rigid, decumbent or ascending. Lenffets $\frac{1}{3} \frac{1}{3}$ in., alnost quite entire. Heuls $\frac{1}{2} \mathrm{in}$, terminal, elongating in fruit. Culyr with a 2 -lipped contraction in the throat; tube ribhed; teeth reaching half-way up the petals. D'od 2 -valved.-Distrib. W. and S. Europe from Holland to Spain, and thence eastwards to Dalmatia, N. Africa.
9. T. stria'tum, $L$.; softly hairy, leaflets obovate, stipules membranous free portion broadly triangular tip reeurved, heads sessile terminal and axillary ovoid, calyx ventricose, teeth short spinescent triangular-subulate 1 -nerved spreading in fruit.
Dry pastures in England; rarer in Scotland from Forfar southwards; very
rare in Ireland; th. June-July. Amnual. Stems \& 12 in., spreading, prostrate or ascending. Leatlets $\frac{1-3}{4}$ in., almost quite entire, petioles 2 in. ; stipules of the leaves under the heads very mich dilated. Heads $\frac{1}{-\frac{1}{2}}$ in., dense, broadest at the base. Flocers $\frac{1}{4} \mathrm{in}$. rosy. C'ulyc-tube ovoid, n̄bbed,
mouth contracted; teeth shorter than the petals.-Distrib. Europe from Gothland southwards, N. Africa.
10. T. sca'brum, L. ; puhescent, leaflets narrowly or broally ohovate, stipules rather rigid, free portion short triangular-subulate, heads terminal and axillary sessile ovoid, calyx-tube ribleed, teeth triangular spinestent 1-nerved erect in flower lengthening spreading rigid and recurved in fruit. Sandy and stony pastures, \&e., in England ; E. coast of Scotland, from Forfar southwards ; E. of Ireland, very rare; H. May-July.-Annual. stome 4-10 in., rigid, stout, prostrate, zigzag. Luters very shortly petioled, leaflets $\frac{1}{4} \frac{1}{2}$ in., rí iil. strongly-nerved, toothed. Iteads $\frac{1}{3}-\frac{4}{4}$ in. long, broadest in the iniddle.
Flourers minute, white. Cidyex-tule purpish; teeth equalling the potals.
Pord minute.-Distrib. Europe from Belgium southwards, N. Africa.
Sectin: 3. Heads many-flowered, usually axillary, rarely axillary and terminal ; pedicels distinct, short or long, lracteate. Calype not inflated; throat naked ; teeth equal or the upper longest. Pod 2-4-seeded (1-seeded in T. strictum and through imperfection in others).
11. T. glomera'tum, $L$. ; glabrous, leaflets obovate acute or obcordate, stipules ovate with long points, heads axillary and terminal sessile globose, palyx-teeth short ovate 1-nerved spinescent reticulated spreading in fruit.
Gravelly and sandy pastures, \&c., rare, from Norfolk and Denbigh southwards ; fl. June.-Annual. Stems 6-12 in., prostrate, spreading, slender. Leatlets $\frac{1}{6} \frac{1}{3}$ in.; nerves fine but strong-toothed. Heuds $\frac{1}{4} \mathrm{in}$. diam., distant.
Flowers blue-purple, subsessile. Cidlyx-teeth nearly equal, shorter than the corolla, contracted at the base. Stumelurd persistent, scarious, striate.Distrib. Europe, W. of France, and from Spain to Turkey, N. Africa.
12. T. suffoca'tum, $L$.; glabrous, petioles very long, leaflets obcordate, stipules ovate acuminate, heads sessile ovoid, calyx campanulate, teeth not spinescent recurved in fruit exceeding the corolla.
Sandy and gravelly pastures, especially near the sea, rare, from Anglesea and
Suffolk to Cornwall and Kent ; fl. June-July.-Annual. Stems 2-6 in., prostrate, spreading, slender. Leatlets $\frac{1-3}{4}-\frac{3}{4}$ in., toothed, nerves faint ; petioles $1-3 \mathrm{in}$. Heculs $\frac{1}{4} \mathrm{in}$. diam., often confluent, axillary and terminal. Flovers minute, whitish. Standard persistent, scarious. Culys membranous; teeth herbaceous, lanceolate, as long as the tube.-Distrib. S. of France, Portugal, Italy to Greece, Hungary, N. Africa.
13. T. stric'tum, Waldst. and Kit. ; glabrous, petioles very short, leaflets linear-lanceolate, stipules hroadly ovate acute toothed, heads peduncled globose, calyx-tube campanulate, teeth subulate spinescent nearly equal spreading in fruit.
Rocky banks near the sea, very rare ; Lizard rocks, Anglesea (once seen), Jersey; native? Watson; fl. June-July.-Amual. Stems 2-6 in., few, ascending. Leaflets $\frac{1}{2}-1 \mathrm{in}$., toothed ; nerves slender. Heads $\frac{1}{4}-\frac{1}{3} \mathrm{in}$. broad, terminal and axillary ; peduncles $\frac{1}{2}-1 \mathrm{in}$., strict. Florers $\frac{1}{8} \mathrm{in}$., rose-purple. Corolle longer than the calyx. Pool obliquely orbicular, compressed, beaked, dorsal suture much thickened, 1 -seeded.-Distrib. S. of France, Bohemia, Italy and Turkey ; N. Africa.
T. hy'bridum, $L$. ; almost glahrous, leaflets obovate or oblong, stipules oblong tips triangular, heads axillary peduncled glwbose, pedicels elongate
at length reflexed, flowers drooping, calyx-tube campanulate gibbous, teeth subulate nearly equal unaltered in fruit. Alsike c'lozer.
Fields, \&c., introduced with clover, and now often replacing it ; fl. June-Aug. -Perennial. Stems 2-10 in., flexuous. Petioles long; leaflets $\frac{1}{2}-1 \frac{1}{2}$ in., toothed. Stipules herbaceous, nerves green. Heauls $\frac{3}{4}-1 \mathrm{in}$. diam., depressed (from the drooping flowers) ; peduncles 2-4 in. Flowers $\frac{1}{3}$ in., white or rosy. Calyz white, teeth green. Standurd twice as long as the calyx, striate, folded over the 2 -seeded pod.-Distrib. Europe, N. Africa, W. Asia.
Var. 1, hylnrid'un proper; stem stout fistular stipules few-nerved. Naturalized at Saffron Walden.-Var. 2, el'eguns, Savi (sp.) ; stem weak decumbent solid, leaves more sharply toothed, stipules with several nerves, heads small.
14. T. re'pens, L.; glabrous, leaflets obovate or obcordate, stipules lanceolate acuminate, heads all axillary very long-peduncled glohose, pedicels at length reflexed, calyx-tube campanulate gibbous, teeth triangular unaltered in fruit. White or Dutch Clover.
Meadows and pastures, abundant ; ascends to $2,700 \mathrm{ft}$. in the Highlands; f. May-October. -Perennial. Stems 1-18 in., creeping. Leetlets $\frac{1}{4}-1 \mathrm{in}$, toothed, with often a white semilunar band towards the hase; nerves slender; petioles 2-4 in. Heads $\frac{2}{3}-1 \frac{1}{2} \mathrm{in}$. diam.; peduncles 3-6 in. Florrers nearly $\frac{1}{2}$ in., white or rosy. Standurd persistent, brown, covering the pod, much longer than the calyx. Pod elongate, 4-6-seeded.-Distrib. Europe (Arctic), N. Africa, N. and W. Asia to India; N. America (indigenous, A. Gray).

Section 4. Heads many-flowered, all axillary ; pedicels short, bracteate. Calyx 2-lipped, becoming inflated above, membranous, reticulated; throat naked; teeth equal, the upper pair lengthening. Corolla withering, standard deciduous. Pod sessile, 1-2-seeded.
15. T. fragif'erum, L.; glabrous, leaflets obovate or obcordate, stipules oblung-triangular with a long point, heads globose dense-flowered longpedmeled, outer bracts lanceolate as long as the calyx, calyx-tube downy above striate vesicular, 2 upper teeth enlarged and deflexed in fruit.
Meadows and ditches, from Westmoreland southwards; rare and local in Scotland and Ireland; f.July-Aug.-Perennial. Stems 6-12 in., creoping.
Heuds $\frac{1}{2} \mathrm{in}$ in. diam. Florers $\frac{1}{4} \mathrm{in}$., rose-purple. Pod ovoid compressed, reticulate, $1-2$-seeded.-Distrib. Europe, N. Africa, W. Asia to N.W. India.-Habit and appearance when flowering of T. repens, from which the large bracts distinguish it; in fruit widely different.
Section 5. Heads many-flowered, axillary, globose, long-peduncled ; pedicels short or 0, hracteate. Flowers at length pendulous. Calyj not inflated; throat naked; teeth equal, or upper shorter. Corolla yellow; standard persistent, enlarged and bent down over the fruit. Pod stalked, 1 - rarely 2 -seeded.-Leares pinnately or palmately 3 -rarely 5 -foliolate.
16. T. procum'bens, $L$.; stems pubescent, leaves more or less pinnately 3 -foliolate, leaflets obovate or obcordate, heads many and dense-flowered, stanlard broad slightly convex arching but not folded over the pods. $T$. agra'rium, Huds. Hop Trefoil.

Pastures, roadsides, \&c.., ascends to near $1,000 \mathrm{ft}$. in Yorkshire ; fl. June-Aug. -Annual. Stems 6-18 in., central erect, lateral decumbent. Leaflets $\frac{1}{4} \frac{3}{4}$ in., toothed ; petioles $\frac{1}{4} \frac{-3}{4}$ in., slender; stipules $\frac{1}{2}$-ovate, tip triangular, acute. Heuls $\frac{1}{3} \frac{-2}{3} \mathrm{in}$. diam. Flozers pale yellow, upper pedicelled. Calyx campanulate, upper teeth triangular, very short; lower longer, lanceolate. stundurd $\frac{1}{4}$ in., brown, shining. Pord obovoid; style hooked. - Distrib. Europe, N. Africa, Siberia, W. Asia; introd. in N. America. - Syme shows this to be T. procumbens of Linn. Herb.; it may or may not be the T. agrarium of Linn. Sp. Plant.
17. T. mi'nus, Sm.; nearly glabrous, leaves pinnately 3 -foliolate, leaflets narrow-obovate or obcordate, heads dense-flowered, pedicels very short, standard narrow keeled folded over the pod. T. procumbens, Huds.
Pastures and roadsides, \&c. from Isla and Banff southwards; ascends to $1,000 \mathrm{ft}$. in the Lake district; fl. June-Aug. - Annual. Stems 10-20 in., straggling, slender. Leaflets truncate or notched, finely toothed; petioles very short, slender; upper part of stipules ovate, acuminate. Heads 4-20-flowered, much smaller than in T. procumbens; peduncles long, very slender. Flowers yellow, small, turning dark brown. Calyx and pod much as in T. procumbens.-Distrib. Europe and Canaries; introd. in N. America.-This is the T. filiforme of foreign authors ; and there is much confusion in its nomenclature and that of the preceding and following.
18. T. filifor'me, $L$. ; sparsely hairy, leaflets obcordate or obovate, heads axillary, peduncles slender, flowers few subracemose, pedicels as long as the calyx-tube spreading or reflexed, standard keeled folded over the pod.
Dry pastures often near the sea, rare, from Oxford and Cardigan southwards; also in Fife and Clackmannan in Scotland; rarer in Ireland ; fl. June-July. -Annual. Stems 4-8 in., very slender, prostrate. Leaves pinnately or digitately 3 -foliolate; upper part of stipules ovate, acute. Leaflets $\frac{1}{8}-\frac{1}{1}$ in., toothed at the tip. Heads very small, 2 -6-flowered; peduncles capillary. Florer's yellow. Calyx and pod much as in the two last species.-Distrib. Europe to the Caucasus.

## 9. ANthyl'lis, $L$. Kidney-Vetch.

Herbs or shrubs. Leaves pinnate, with a terminal leaflet; stipules small or 0. Flowers in capitate cymes, sometimes involucrate, yellowwhite or red-purple ; bracts various or 0. Calyx inflated, mouth oblique, 5 -toothed. Petals with long claws, those of the 4 lower adnate to the staminal tube; standard auricled at the base; keel incurved, gibbous on each side. Filaments all united, or the upper free; anthers uniform. Style smooth, stigma terminal ; ovules two or more. Pod enclosed in the calyx, obliquely ovoid, dehiscent or not, 1-3-seeded.-Distrib. Europe, Asia, N. Africa ; species 20.-Etym. The old Greek name.

1. A. Vulnera'ria, $L$. ; silky, stems herbaceous, leaflets $2-6$ pairs.

Dry rocky banks, rather local; ascends to 2,400 ft. in the Highlands; fl. June-Aug.-Rootstock woody, short, branched. Stems 6-16 in., many, leafy, herbaceous, suberect. Radical leaves 2-4 in., pinnate, unequal ; leaflets $\frac{1}{2}-1 \frac{1}{2}$ in., narrow-oblong. Heads $\frac{1}{2}-1 \frac{1}{2}$ in. diam., in pairs, rarely solitary, or with small accessory ones, the pairs peduncled, but each sessile ; involucre of subsessile linear appressed or spreading leaflets. F'lowers $\frac{1}{2} \frac{2}{3} \mathrm{in}$. C'alyx membranous, longer than the petals ; teeth minute, ovate, acute ; mouth
contracted. Pod very small, acute, glahrous, roticulated, partially dehiscent, 1 -sceded.-Distrib. Europe (Aretic), N. Africa, W. Asia.
Var. 1. Fulmeríria proper ; involucral leaves short, flowers yellow.-Vak. $\stackrel{\text { - }}{ }$, Dille'nii, Schultz (sp.); involucral leaves nearly as long as the red flowers.

## 10. Lo'tus, $L$. Bird's-Foot Thefoil.

Iferhs or under-shrubs. Leares pimnately or palmately 4-5-foliolate: stipules minute or 0 . Flowers in capitate or umbellate axillary pedunderl cymes, yellow red or white; bracts 3 -foliolate. Calyp: 2-lipped, or with 5 -subequal teeth. Petals free from the staminal tube ; keel incurven or inflexed, beaked, gibhous on each side. Altornate filaments dilated upwards, upper free; anthers uniform. Oerry sessile; style inflexed, glabrous, stigma terminal or lateral ; ovules many. Ped elongate, cylindric, 2 -valved, septate between the seeds.-Distrib. Europe, N and S. Africa, temp. Asia, America, Australia; species 50.-Etym. unknown.

1. L. cornicula'tus, L.; decumbent, heads 5 - 10 -flowered, peduncles very long, calyx-teeth erect in bud, 2 upper triangular converging with an obtuse sinus.
Pastures and waste places, ascending to $2,800 \mathrm{ft}$. in the Highlands; f. June-Sept.-Variable in halit and stature. Rootstock short, woody, brancherl, not or scarcely stoloniferous. Stems 4-16 in., tufted at the base. Laters very shortly petioled; leaflets $\frac{1}{1}-\frac{1}{2}$ in.; stipules ovate or lanceolate. Meurls $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$. diam., depressed. Flowers $\frac{1}{2}-\frac{3}{4}$ in., very shortly pedicelled. Petels twice as long as the calyx, bright yellow, often streaked with crimson; often greenish or purple-hrown when dry. l'od $\frac{3}{4}-1 \frac{1}{4}$ in.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to India.
Sub-sp. CORNICULA'TUS proper; stem short, leaflets obovate obtuse or suh-acute.-Var. 1, culgáris ; almost glabrous, leaflets membranous.-Vir. 2, crassifo'lius; almost glabrous, leaflets fleshy. Chiefly maritime.-VAr. 3, villo'sus; covered with spreading hairs. Higham in Kent, Budleigh Salterton and Sandgate.
Suh-sp. TEs'C1S, Kitaibel (sp.) ; stem filiform, leaflets generally linear-lanceolate acuminate, stipules narrower, flowers fewer and smaller. L. temifo'lius, Reich.; L. decum'bens, Forst. - Damp soils, not common, from the Lowlands southwards; very rare in Ireland.
2. L. ma'jor, Scop.; erect or ascending, heads 5-12-flowered, peduncles very long, calyx-teeth spreading in bud, 2 upper triangular diverging with an acute sinus.
Moist meadows, \&ce from Isla and Banff southwards, ascending to $1,200 \mathrm{ft}$. in Yorkshire ; fl. July-Aug.-Perennial, glabrous or hairy. Rontstork elongate, stoloniferous, branched at intervals. Stems 6-24 in. Lectets $\frac{1}{2}-1 \mathrm{in}$., obliquely obovate. Floners and pods much as in L. comiculatus, except in the calyx.-Distrib. Europe, N. Africa.
3. L. angustis'simus, L. ; prostrate or ascending, heads 1-4-flowerel, peduncles $2-3$ times as long as the leaves, calyx-teeth erect in bud all subulate.
Dry grassy banks, very rare; Castle Rock, Hastings; Stokes Bay, and marshes on the S. coast ; Channel Is.: fl. June-Aug.-Annual ; much smaller than either of the preceding, with shorter peduncles, fewer flowers; calyx-
teeth slender, longer than the tube, reaching $\frac{3}{4}$ way up the petals.Distrib. Europe, N. Africa, Siberia, W. Asia.
Var. 1, diffiu'sus, Smith (sp.); flowers 1-2, standard broader than long fading green, pod $1-14 \mathrm{in}$. -VAR. 2. his'pidus, Desf. (sp.); more silky, flowers 2-4, standard longer than broad not fading green, pod $\frac{1}{2} \frac{3}{4} \mathrm{in}$. Lizard, Land's End, Dartmouth, \&c.

## 11. astrag'alus, $L$. Milk-vetch.

Herbs or shrubs. Leaves pinnate with a terminal leaflet, rarely 3 -foliolate; leaflets entire; stipules free connate or adnate to the petiole. Flowers in axillary racemes or spikes ; bracts small. Calyx tubular; teeth 5 , subequal. Petals usually narrow with long claws; keel obtuse. Upper filument free ; anthers uniform. Ovary sessile or stalked; style filiform, beardless, stigma terminal ; ovules many. Pod 2-valved, often longitudinally 2 -celled by the inflexion of the suture next to the keel.Distrib. Temp. and cold regions; most abundant in Asia; absent in S. Africa and Australia; species 500.-Etym. doubtful.

1. A. glycyphil'los, $L$.; glabrous, stipules free, flowers racemed, peduncles much sherter than the leaves, pods suberect exserted elongate many-seeded.
Fields and copses ; chiefly on the E. coasts, from Ross and Banff southwards; absent from Ireland; fl. June-Sept.-Rootstock short, stout. Stems 2-3 ft., prostrate, stout, zig-zag. Leaves $4-6 \mathrm{in}$.; leaflets $\frac{3}{4}-1 \frac{1}{4} \mathrm{in}$., broadly oblong, obtuse, glabrous above, slightly hairy below ; stipules 1 in ., ovate-lanceolate, acute, lower auricled. Racemes 1-2 in., compact, ovoid; bracts subulate, longer than the short pedicels. Flowers $\frac{1}{2}$ in., creamy white. Calyx campanulate, half as long as the petals. Pod $1-1 \frac{1}{2}$ in., linear, terete, curved, acuminate, 2 -celled, pale. Seeds many, pale, compressed. - Distrib. Europe, N. Asia.
2. A. hypoglot'tis, L.; hairy, stipules connate, flowers spiked, peduncles usually much longer than the leaves, pods very short ovoid suberect included 2 -seeded.
Gravelly and chalky soil in the E. counties, from Ross to Essex; Isle of Arran only in Ireland; fl. June-July. - Clothed with soft white hairs mixed with black above. Rootstock very slender, straggling, branching. Stems 2-6 in., slender, ascending. Leaves $2-4 \mathrm{in}$.; leaflets $\frac{1}{6} \frac{-1}{2} \mathrm{in}$., many, oblong or linear-oblong, obtuse. Spikes 1 in ., ovoid; peduncles stout. Flozers $\frac{1}{2}-\frac{3}{4}$ in., blue-purple. Calyx with black hairs, longer than the bracts. Pod shortly stipitate.-Distrib. Arctic and Alpine Europe, N. Asia, E. and W. N. Âmerica.
3. A. alpi'nus, $L$. ; decumbent, pilose, stipules free, flowers shortly racemose or subcapitate, peduncles rather shorter than the leaves, pods oblong pendulous exserted few-seeded. Phaca Astragali'na, DC.
Aberdeen and Forfar, very rare; Craig-an-dal near Braemar, and head of Glendole ; alt. 2,400-2,600 ft.; fl. July.-Perennial, more slender than $A$. hypoylottis; leaves very similar ; peduncles shorter; flowers horizontal or drooping, pale blue tipped with purple ; calyx shorter. Pod $\frac{1}{3}$ in., 1 -celled, stalk longer than the calyx, hence wholly exserted, covered with black
hairs.-Distrib. Aretic and Alpine Europe, N. Asia, E. and W. N. America.

## 12. OXY'TROPIS, $D C$.

Herbs or shrubs. Leares pinnate with a terminal leaflet; leaflets quite entire; stipules free or alnate to the petiole. Flovers in axillary spikes or racemes, purple white or pale yellow; bracts membranous. Curlyse tubular, teeth subequal. Petals with long claws; keel erect, with a straight or recurved tooth at the tip. Lpper filcement free; anthers uniform. Ovary sessile or stalked; style beardless, stigma minute ; ovules many. Pod longitudinally more or less 2-celled, by the inflexion of the suture next the standard.-Distrib. Europe, temp. and cold Asia, and N. America; species 100 . - Etym. $\quad$ bgús and $\tau \rho \sigma \pi i s$, from the sharp keel. -Halit, \&c. of Astragalus; distinguished only by the mueronate keel, and septum of the pod never being produced from the dorsal suture.

1. O. Uralen'sis, $D C$.; silky, leaflets ovate-lanceolate, peduncles longer than the leaves, flowers pale purple. O. Hulleri, Bunge.
Dry rocky pastures in Scotland, from Wigton to Caithness; ascending to perhaps 2,000 ft.; fl. June-July.-Rootstock stout, woody ; branches very short. Leaves 2-4 in., stipules lanceolate, membranous; leaflets $\frac{1}{4} \mathrm{in}$., many, close-set. Heads 6-10-flowered; peduncles stout, erect; bracts leafy, shorter than the calyx. F'lowers $\frac{3}{3}$ in., pale; keel tipped with dark purple. Culyr-tube oblong, hairy and slightly glandular, cylindric; teeth short, suhulate. Pod about 1 in., ereet, ovoid, heak curved, sessile, tumid, bursting the calyx, hairy ( 1 - or 2-celled, Brit. Fl.), many-seeded.-Distrib. Arctic and sub-Alpine Europe, N. Asia, E. and W. N. America.
2. O. campes'tris, $D C$.; softly hairy, leaflets linear-oblong or oblonglanceolate, flowering peduncles shorter than the leaves, flowers pale yellow. Alpine rocks, Bradoony in the Clova Mts. ; alt. 2,000 ft. ; fl. June-July.Habit of $O$. Uralensis, but larger; leaves 4-6 in. ; leaflets usually longer, sometimes 1 in ., narrower, more obtuse; peduncles lengthening after flowering to 8 in . Florers $\frac{3}{3} \mathrm{in}$., yellow tinged with purple. Pod $\frac{1}{2}-\frac{2}{3} \mathrm{in}$., sessile, oyoid-lanceolate, hairy, half 2 -celled, beak curved.-Distrib. Arctic and Alpine Europe, Siberia, E. and W. N. America.

## 13. ORNITHO'PUS, $L$. BIRD'S-FOOT.

Slender, hairy herbs. Leaves pinnate with a terminal leaflet; leaflets small ; stipules membranous. Flowers minute, in long peduncled heads or umbels, pink white or yellow. Caly,r-lobes equal, or 2 upper connate. Keel obtuse, sometimes very short. Alternute filaments dilated upwards, the upper free ; anthers uniform. Style inflexed, stigma capitate; ovules many. Pod curved, slender, indehiscent, breaking up into many short 1 -seeded joints.-Distrib. Europe, N. Africa, W. Asia.-Etym. öpyıs and тou's, from the fruits resembling bird's claves.

1. O. perpusil'lus, $L$.; bracts pinnate, flowers white, pod much constricted between the seeds.
Sandy and gravelly places from Moray and Dumbarton southwards; east of - Ireland, very rare ; ft. May-July.-Annual, grey-green, hairy above. Stems 6-18 in., many, prostrate, filiform, leafy, sparingly branched. Leaves 1-2 in., upper sessile ; leaflets $\frac{1}{8}-\frac{1}{4} \mathrm{in}$., close-set, 6-14 pair, oblong or linear-oblong, the lowest pair recurved when at the base of the petiole ; stipules minute.

Peduncles axillary, slender, strict, longer or shorter than the leaves. Heads 3-6-flowered. Flowers $\frac{2}{6}$ in., veined with red; pedicels very short. Calyxtube subcampanulate ; teeth short. $\operatorname{Pod} \frac{1}{2} 1 \mathrm{in}$., 7-9-jointed, beaked, glabrous or pubescent, reticulated.-Distrib. Europe, N. Africa.
2. O. ebractea'tus, Brotero; bracts 0, flower yellow, pod slightly constricted between the seeds. Arthrolo'bium ebracteatum, DC.
Sandy places, Scilly and Channel Is.; fl. June-Aug.-Annual, glaucous, nearly glabrous. Stems 6-18 in., filiform, ascending. Leaves 1-4 in., all petioled; leaflets $\frac{1}{4}-\frac{1}{2}$ in., oblong, distant. Heads 2 -5-flowered; peduncles as long as the leaves. Flowers $\frac{3}{4} \mathrm{in}$., bright yellow with red veins. Pod $\frac{3}{4}-1$ in., very slender, beaked, $10-14$-jointed, granulate.-Distrib. W. and S. Europe from France to Italy and Turkey, Canaries, Azores.

## 14. hippocre'pis, $L$. Horseshoe-vetch.

Diffuse, glabrons herbs. Leaves pinnate with a terminal leaflet; leaflets many, quite entire, stipules small or 0 . Flowers yellow, nodding. Calyx with 2 upper teeth connate. Petals long-clawed; keel incurved, beaked. Style inflexed, subulate, stigma minute ; ovules many. Alternate filaments slightly dilated, upper free; anthers uniform. Pod flat, curved, upper margin deeply notched opposite each seed, breaking up into 3-6 horseshoelike joints. Seeds curved.-Distrib. Europe, N. Africa, W. Asia; species 12.-Еtym. $/ \pi \pi \pi o s$ and $\kappa \rho \eta \pi i s$, from the shape of the joints of the pod.

## 1. H. como'sa, $L$.; leaflets $4-8$ pair oblong-obovate.

Rocky and stony pastures in the S. of England ; ascends to 1,800 ft. in Yorkshire; rare in the North, Ayr and Kincardine; fl. May-Aug.-Nearly glabrous. Rootstock branched. Stems 6-18 in., very many, branched, ascending. Leaves $2-6 \mathrm{in}$.; leaflets $\frac{1}{4} \frac{1}{2} \mathrm{in}$. Heads $6-10$-flowered; peduncles curved, slender, longer than the leaves. Flowers $\frac{1}{3} \frac{1}{2}$ in., shortly pedicelled, yellow. Calyx-tube short, broad. Petals at length reflexed. Pod $1-1 \frac{1}{2}$ in., faleate, granulate.-Distrib. W. and S. Europe, N. Africa.

## 15. ONO'BRYCHIS, Tournefort. SAIN-FOIN.

Herbs or shrubs. Leaves pinnate with a terminal leaflet; leaflets quite entire; stipules scarious. Flowers purple red or white, in axillary spikes or racemes. Calyx-lobes subulate. Wings short ; keel obliquely truncate, as long as or longer than the standard. Upper filament free at the base; anthers uniform. Style inflexed, stigma minute. Pod compressed, indehiscent, not jointed, often spiny winged or crested, 1-2-seeded.-Distrib. Europe, temp. Asia and Africa; species 50.-Etym. obscure.

1. O. sati'va, Lamk.; pod tubercled on the lower margin.

Dry fields and pastures in the S.E. of England, perhaps indigenous, elsewhere usually a relic of cultivation ; a native? Watson; fl. June-Aug.-A perennial herb, 1-2 ft., pubescent with appressed hairs. Rootstock woody, branched. Stems ascending, stout, tough, leafy. Leaves 3-6 in.; leaflets $\frac{\frac{1}{2}}{4} \frac{3}{4} \mathrm{in}$., obovate or linear-oblong, apiculate, very shortly petioled ; stipules ovate-lanceolate, membranous. Racemes ovoid, compact; peduncles slender, erect ; bracts subulate. Flovers $\frac{1}{2}$ in., bright rosy-red, veins darker; wings very short. Calyx short, woolly, teeth subulate. Pods $\frac{1}{4} \frac{3}{4}$ in., obliquely semicircular in outline, strongly reticulate, pubescent, 1 -seeded.-Distrib. W. and S.

Europe, N. Asia.-Much cultivated as fodder crop on dry soils, because of the depth its roots penetrate.

## 16. Vic'ia, L. Vetch, Tare.

Climbing or diffuse herbs. Stems with prominent ridges. Leaves abruptly pinnate ; petioles ending in a simple or branched tendril (except $V$. Orobus); leaflets many, entire or toothed at the tip; stipules $\frac{1}{2}$-sagittate. Flowers blue, purple or yellow, axillary, racemed. Calyx-tecth subequal or the lower longer. Wings adnate to the keel. Staminul tubr abruptly truncate; filaments filiform, upper more or less free; anthers uniform. Style inflexed, cylindric or flattened, glabrous or downy all round, or with a tuft of hairs below the terminal stigma externally; ovules usually many. Pod compressed, 2 -valved. Sceds globose, with a small arillus.-Distrib. Temp. N. hemisphere, and S. America; spee ies 100.-Etym. The old Latin name.

Section 1. Er'vum, L. (gen.). Annuals. Leaflets few. Flowers few. Calyx equal at the base. Style equally pubescent all round.

1. V. tetrasper'ma, Moench; leaflets 3-6 pair, peduncles 1 -2-flowered, pol shortly stipitate glabrous 3 -8-seeded.
Hedges, cornfields, \&c. from Lanark and Forfar southwards; rare and hardly indigenous in Scotland; S. and E. of Ireland, very rare; fl. May-Aug.Almost glabrous. Stems $1-2 \mathrm{ft}$., filiform. Learlets variable, -1 in. , usually truncate, narrow ; tendrils once or twice forked; lower stipules 2 -fid, upper entire, toothed on the base at one side. Peduncles $\frac{3}{4}-1 \frac{1}{2}$ in., produced beyond the flowers; pedicels slender, curved. Flowers $\frac{1}{2}$ in., pale blue. Calys-tube short, upper teeth shortest. Pod $\frac{1}{2} \frac{3}{4} \mathrm{in}$., linear-oblong.-DIstrib. Europe, N. Africa, W. Asia to India; introd. in N. America.
Sub-sp. TETRASPER'MA proper ; leaflets $4-6$ obtuse mucronate, peduncles as long as the leaves 1-2-flowered, pod 3-4-seeded.
Sub-sp. GRac'inis, Loiseleur (sp.); leaflets 3-4 pair acuminate, peduncles longer than the leaves 1-4-flowered, pod longer 5-8-seeded. -From Warwick and Cambridge southwards; a native or colonist, Watson.
2. V. hirsu'ta, Koch; leaflets 6-8 pair obtuse mucronate, peduncles 1-6-flowered, pod sessile hairy 2 -seeded. Common Tare.
Hedges and waste places ; fl. May-Aug.-Habit of I. tetrusperma, but hairy ; leaflets smaller, more numerous; stipules often t-lobed ; pedicels straighter; flowers smaller, and pods much shorter, sessile, hairy and 2 -seeded.Distrib. Europe (Arctic), N. Africa, N. and W. Asia to N.W. India ; introd. in N. America.
Section 2. Crac'ca. Perennial. Leafets many. Flowers very many. Cialy,r-tube gibbous at the base, teeth very unequal. Style equally pubescent all round. Pod rather short, stipitate, 3 -many-seeded.
3. V. Crac'ca, $L$.; tendrils branched, stipules $\frac{1}{8}$-sagittate nearly entire, flowers bright blue.
Hedges, fields, and waste places; ascending to $2,400 \mathrm{ft}$. in the Highlands ; fl. June-Aug. - Pubescent or slightly silky. Rootstock creeping. Stems ${ }_{2}^{2-6} \mathrm{ft}$., angled, scandent or diffuse. Letces $1-4 \mathrm{in}$. , sessile ; leaflets $\frac{1}{-1} \mathrm{in}$., linear-oblong, acute or mucronate. Ruceme dense, 10-30-Hlowered, unilateral;
peduncles longer than the leaves, pedicels short. Flowers $\frac{1}{2}$ in., drooping. Culyx-tube short. Pod $\frac{3}{4}-1 \mathrm{in}$., obliquely truncate, beaked, many-seeded.Distrib. Europe (Arctic), N. Africa, N. and W. Asia to the Himalaya, Greenland, N. America.
4. V. Or'obus, $D C$.; tendrils 0 , stipules $\frac{1}{2}$-sagittate slightly toothed, flowers white tinged with purple. Or'obus sylvat'icus, L. Bitter Vetch. Western wooded and rocky districts, from Skye to Somerset; W. and Mid. Ireland, very rare ; fl. June-Sept.-Sparingly pubescent. Stem 1-2 ft., erect, stout, leafless or with reduced leaves below. Leaves 2-3 in., sessile ; leaflets $\frac{3}{4}-1 \frac{1}{2}$ in., linear-oblong or oblong-lanceolate, acute, or obtuse and mucronate ; petiole produced beyond the leaflets. Racemes loose, 6-20flowered, unilateral; peduncles as long as or longer than the leaves; pedicels much shorter than the calyx-tube. Flowers $\frac{1}{3}$ in. Pods oblonglanceolate, 1 in ., acute at both ends, glabrous, 3-5-seeded.-Distrib. Norway, Denmark, France, Germany.
5. V. sylvat'ica, $L$.; tendrils branched, lower stipules lunate toothed, flowers white with blue veins. Wood Vetch.
Rocky woods, not common, from Ross and Elgin southwards ; ascending to near $1,700 \mathrm{ft}$. in the Highlands ; not uncommon in Ireland; fl. June-July. --Glabrous. Rootstock creeping. Stems 2-4 ft., usually trailing. Leaves $2-4 \mathrm{in}$., sessile ; tendrils usually much branched ; leaflets $\frac{1}{2}-1 \mathrm{in}$., oblong, obtuse, mucronate, membranous; stipules with spreading teeth. Racemes laxly 6-18-flowered, unilateral ; peduncles as long as or longer than the leaves; pedicels nearly as long as the calyx-tube. Flowers $\frac{s}{s i n} \mathrm{in}$. Pods oblong-lanceolate, acuminate at the ends, slightly curved, 3 -4-seeded.Distrib. Europe (Arctic), N. Asia.
Shetion 3. Vic'ía proper. Annual, rarely perennial. Leafets many. Flower's few, sessile, or on very short pedicels. Style villous below the stigma on the outer side.

## * Leaflets many. Calyx gibbous at the base.

6. V. se'pium, $L$.; perennial, flowers racemose, calyx-teeth unequal shorter than the tube, pod stipitate linear glabrous.
Hedges, copses, \&c., ascending to near 2,000 ft. in Yorkshire ; fl. May-July. -slightly hairy. Rootstock creeping, stoloniferous. Stem 2-3 ft., climbing or trailing. Leaves 2-5 in.; leaflets in 6-8 pairs smaller upwards, lowest ${ }_{3}^{2}-1$ in., ovate, acute obtuse or truncate, mucronate, membranous; stipules $\frac{3}{2}$-sagittate. Racemes $\frac{1}{4}-\frac{1}{2}$ in., 2-6-flowered, subsessile ; pedicels shorter than the calyx-tube. Flowers $\frac{1}{2}-\frac{\pi}{3}$ in., dull pale purple. Pod linear, 1 in ., beaked, black, 6-10-seeded. S'eel with a linear hilum.-Distrib. Europe (Arctic), Siberia, W. Asia.
7. V. Iu'tea, L. ; annual, flowers solitary sessile, upper calyx-teeth shorter lower longer than the tube, pod shortly stipitate hairy.
Rocky and pebbly places, especially on the E. coast, from Ayr and Kincardine southwards; absent from Ireland; fl. June-Aug.-Sparingly hairy. Ruotstock short. Stems 6-18 in., tufted, prostrate. Lences $1-2 \mathrm{in}$. ; leaflets $\frac{1-\frac{1}{2}}{} \mathrm{in}$., 5-7 pairs, linear-oblong, obtuse, mucronate; stipules small, ovate, acute, lower $\frac{1}{-h a s t a t e . ~} F^{\prime}$ lowers rarely in pairs, suberect, pedicels shorter than the calyx-tube. Flovers $\frac{3}{4}-1$ in., narrow, pale yellow. Pod $1-1 \frac{1}{2}$ in., hairy,
narrow, oblong, acuminate at both ends, beaked, 4-8-seeded. Seeds with a short hilum.-Distrib. Europe from Holland southwards, N. Afriea, W. Asia.
Sub-sp. Leviga'ta, $S m$. (sp.), which differs from the type by its glabrous standard and pod, once found on the beach at Weymouth, is now extinct.
8. V. sati'va, $L$. ; annual, flowers 1-2 axillary subsessile, calyx-teeth nearly equal as long as the tube, pod sessile silky.
Hedges and roadsides, but usually the remains of cultivation; ascends to upwards of $1,000 \mathrm{ft}$. in the Highlands ; fl. April-June.-Annual, sparsely hairy. Stems many, trailing or climbing, stout in the cultivated form, slender in the wild. Leuflets variable, in $5-6$ pairs, $\frac{1}{8} \frac{-3}{4}$ in., $\frac{1}{1}-\frac{1}{2}$ in. broad. Stipules $\frac{1}{2}$-hastate, toothed or entire, often with a dark blotch. 1'ouls 1-3 in., linear, 4-10-seeded, slightly hairy, broadest in the cultivated forms. Seeds variable in size and colour, small in the wild state, smooth ; hilum linear.Distrib. Europe, N. Africa, W. Asia to India, N. America.-The typical form is only known as a cultivated plant.
Sub-sp. sati'vu proper ; stout, leaflets linear-obovate obtuse truncate or excised at the tip, nerve long-awned, flowers $\frac{3}{4} \mathrm{in}$. pale purple, pods $2-3 \mathrm{in}$. ascending imperfectly septate, seeds $\frac{1}{5} \mathrm{in}$. diam.-Occurs as a relic of cultivation.
Sub-sp. Angustifo'Lia, Roth (sp.); leaflets acute or obtuse, flowers $\frac{1}{2}-\frac{2}{3} \mathrm{in}$. red or dark purple, pods $1-2 \mathrm{in}$. spreading, seeds $\frac{1}{8} \mathrm{in}$. diam.-Var. 1, seyetu'lis, Koch (sp.) ; stout, leaflets of upper leaves oblong, flowers usually in pairs, pods $1 \frac{1}{2}-2$ in. bursting the calyx.-Var. 2, Bobu'tii, Forst. (sp.) ; slender, leaflets of upper leaves narrow, flowers usually solitary, pod $1-1 \frac{1}{2}$ in. not bursting the calyx. V. angustifólia, Sm.--Distrib. Europe, N. Africa, N.W. India.

## ** Leaflets fev. Calys not gibbous at the base.

9. V. lathyroi'des, $L$. ; annual, flowers solitary sessile, calyx-teeth equal nearly as long as the tube, pod sessile glabrous.
Dry pastures and roadsides, local from Moray and Ross southwards; S. and E. of Ireland, very rare ; tl. May-June.-Hairy. Stems 6-8 in., spreading, slender. Leaves $\frac{1}{2} 1 \mathrm{in}$. ; leaflets $\frac{1}{6}-\frac{1}{3}$ in., 2-3 pair, linear-oblong or obovate, acute obtuse or notched ; stipules $\frac{1}{2}$-sagittate ; tendrils simple or 0 . Flurers $\frac{1}{4} \frac{1}{3} \mathrm{in}$., lilac. C'alyx funnel-shaped ; teeth subulate. P'ouls $\frac{1}{2}-1 \mathrm{in}$., linear, tapering at both ends, beaked, 8-12-seeded. Seeds obtusely angled, granulate; hlum very short.-Distrib. Europe, N. Africa, W. Asia.
10. V. bithyn'ica, L. ; perennial, peduncles 1- rarely 2 - 3 -flowered, pedicels as long as the calyx, calyx-teeth unequal subulate, pod shortly stipitate reticulate hairy.
Bushy sea-cliffs, rare and local, from Flint and York, southwards ; fl. MayJune. -Stens l-2 ft., many from the root, glabrous, except at the tips, trailing or climbing, flexuous. Lewees $1 \frac{1}{2}-2$ in., exclusive of the tendril ; leaflets variable, $\frac{2}{2}-2 \frac{1}{2} \mathrm{in}$., $\frac{1}{8} \frac{-1}{3} \mathrm{in}$. broad, obtuse and mucronate or acute or acuminate; stipules large, $\frac{1}{2}$-sagittate; tendrils elongate, branched. L'eldencles $\frac{1}{4}-3 \mathrm{in}$., and pedicels hairy. F'lorers $\frac{1}{4}$ in., pale purple, wings paler. Calyx hairy, longer than the tube, very slender. Pod the largest of the British species, $1 \frac{1}{2} \mathrm{in}$. hy $\frac{1}{3} \mathrm{in}$. broad, abruptly beaked, 4-6-seeded. Séeds large, $\frac{1}{6}$ in. diam., dark-brown.-Distrib. W. and S. Europe, N. Africa.
Var. 1, lutifóliu, syme; leaflets ovate or oblong, stipules all toothed.-VAB. 2, angustifólia, Syme; leaflets linear acuminate, upper stipules sparingly toothed.

## 17. Lath'Yrus, $L$. Everlasting Pea, Bitter-vetch.

Herbs with the habit of Vicia, but fewer leaflets, petals broader, staminal tube obliquely truncate, and the style flattened and longitudinally bearded on its inner face.-Distrib. of Vicia; species 100.-Еtym. An old Greek name.

Section 1. Aph'aca, annual. Stipules leaf-like. Leaves reduced to tendrils. Calyx-tube equal at the base, shorter than the teeth.

1. L. Aph'aca, $L$. ; stipules ovate-hastate acute or obtuse, peduncles elongate 1 -flowered, flowers erect.
Cornfields, \&c. from Warwick, Lincoln, and Cambridge southwards; a colonist, Watson; f. June-July.--Glabrous. Stems 1-3 ft., trailing. Leaflets chiefly seen on seedlings, then oblong, when developed on older plants linear $\frac{1}{2}-\frac{3}{4}$ in. ; stipules $\frac{1}{2}-1$ in. broad, quite entire, striated with nerves. Peduncles slender, stout and $2-3 \mathrm{in}$. in fruit ; pedicel $\frac{1}{4} \mathrm{in}$., with a minute bract at its base. Flowers $\frac{1}{2}$ in.', pale yellow. C'alyx-lobes green, linear, nearly as long as the corolla. Pod $1-1 \frac{1}{2} \frac{1}{2}$., $\frac{1}{4} \mathrm{in}$. broad, ascending, slightly falcate, beaked, reticulate, $6-8$-seeded.-DisTrib. Europe from Denmark southwards, N. Africa, W. Asia to India.
Section 2. Nisso'lia. Annual. Stipules minute, setaceous; tendrils 0 . Petioles leaf-like (phyllodes). Calyx rather gibbous at the base.
2. L. Nisso'lia, L.; phyllodes grass-like, peduncles very slender 1-flowered, flowers erect.
Grassy bushy places from Derbyshire southwards, and as an escape north of it ; fl. May-June.-Glabrous. Stems 1-3 ft., ascending, very slender. Phyllodes 3-6 in., quite entire ; nerves many, parallel. Peduncles 1-4 in., pedicel as long as the calyx; bracts obsolete. Flowers $\frac{1}{2}$ in., crimson. C'alyx-teeth lanceolate, lower teeth longest. Pod 1-2 in., very slender, slightly compressed, glabrous. Seeds granulate.-Distrib. W. and S. Europe from Holland southwards, N. Africa.
Section 3. Lath'yrus proper. Petioles all with leaflets and tendrils. Calyx gibbous at the base.

> * Leaflets one pair. Flowering peduncles longer than the leaves.
3. L. hirsu'tus, L. ; stem winged, leaflets linear-lanceolate, stipules small $\frac{1}{2}$-sagittate, peduncles $1-3$-llowered, calyx-teeth ovate-lanceolate longer than the tube, pods tubercled densely silky, seeds papillose.
Fields in Surrey and Essex, very rare ; a colonist, Watson; fl. June-July.Annual, almost glabrous except the pod. Stems $2-4 \mathrm{ft}$., angled and 2 -winged, wings herbaceous, $\frac{10}{} \mathrm{in}$. broad. Leaves scattered; petioles $\frac{1}{4} \frac{1}{2} \mathrm{in} . ;$ tendrils stout, branched ; leaflets $1-2 \frac{1}{2}$ in., nerves parallel ; stipules with long subulate auricles. Peduncles 2-3 in.; flowers 2, distant, pedicels as long as the calyx, hairy ; bracts minute, subulate. Flowers $\frac{1}{2}$ in. ; standard crimson, keel and wings paler. Calyx-tube short, obconic. Pod $1 \frac{1}{2} 2 \mathrm{in} ., \frac{1}{3} \mathrm{in}$. broad, stipitate, dilated upwards, $8-10$-seeded.-Distrib. W. and S. Europe from Belgium southwards, N. Africa.
4. L. praten'sis, L. ; stem acutely angled, leaflets lanceolate, stipules very large lanceolate, sagittate, peduncles 3 -12-flowered, calyx-teeth subulate as long as the tube, pod glabrous or hairy, seeds smooth.

Hedges, copses, and meadows ; ascending to near $1,600 \mathrm{ft}$. in the Highlands ; fl. June-Sept.-Glabrous or slightly hairy. Rootstock creeping. Stemss 1-2 ft., trailing or climbing. Leatlets $\frac{1}{2} 1 \mathrm{in}$., nerves indistinct ; stipules with spreading subulate auricles, petioles $\frac{1}{2} \frac{3}{4} \mathrm{in}$.; tendrils short. Peduncles longer than the leaves ; pedicels as long as the calyx-tube, hairy ; bracts setaceous. Flowers $\frac{1}{2} \frac{3}{4}$ in., racemose, bright yellow. Pods $1-1 \frac{1}{2}$ in., sessile, linear, acuminate, many-seeded.-Distrib. Europe (Arctic), Siberia, W. Asia to the Himalaya ; introd. in N. America.
L. tubero'sus, $L$.; stem angled, leaflets obovate, stipules large $\frac{1}{2}$-sagittate, peduncles $2-5$-flowered, calyx-teeth triangular as long as the tube, pod glabrous.
Cornfields, Chipping Ongar ; a denizen, Watson; fl. June-Aug.-Glabrous. Rorotstock creeping, rootlets with small tubers. Stem $2-4 \mathrm{ft}$., climbing and trailing. Leaflets $1-1 \frac{1}{2}$ in., nerves diverging ; petioles and tendrils stout. Peluncles very long; pedicels longer than the calyx; bracts subulate. Floners $\frac{3}{4}$ in., racemose, crimson. Calyx-tube broad.-Distrib. Europe, N. Africa.-Root tubers edible.
5. L. sylves'tris, $L$. ; stem winged, leaflets large ensiform, stipules falcate $\frac{1}{2}$-sagittate, peduncles 3 -10-flowered, calyx-teeth triangular, upper shorter than the tube, pod glabrous, seeds faintly remotely tubercled.
Rocky thickets and hedges, local, often an escape, from Mull and Forfar southwards ; absent from Ireland ; fl. June-Aug.-Glaucous, glabrous. Rootstock creeping. Stem 3-6 ft., wings herbaceous. Leaflets $1-6 \mathrm{in}$., $\frac{1}{2} \mathrm{in}$. broad; nerves parallel ; stipules large, falcate, with long lanceolate auricles ; petioles winged or not; tendrils slender, branched. Pecluucles 4-6 in., pedicels longer than the calyx ; bracts filiform. Flovers $\frac{2}{3}-\frac{3}{4} \mathrm{in}$., racemed; standard rosy; wings purplish. Culyx-tube broad, short. Pod 2-3 in., sessile, narrowly winged above, $10-14$ seeded.-Distrib. Europe (Arctic), N. Africa.-Very near the garden Everlasting Pea, which occurs here and there as an escape.
** Leaflets 2 or more pairs. Flowering peduncles longer or shorter than the leaves.
6. L. palus'tris, L.; stem winged, leaflets 2-3 pair sword-shaped, stipules lanceolate $\frac{1}{2}$-sagittate, peduncles usually longer than the leaves 2-6-flowered, pod compressed glabrous.
Boygy meadows and copses, from York and Carnarvon to Somerset and Suffolk, local ; N. and Mid. Ireland, very rare ; fl. June-Aug.-Gilaucous, glabrous. Rootstock creeping. Ntems 2-4 ft., climbing or trailing, wings herbaceous. Leutlets 2-3 pair, 2-3 in., nerves parallel ; tendril rather short, brauched ; stipules $\frac{3}{3} \mathrm{in}$. Pedunclos $1-4 \mathrm{in}$.; pedicels shorter than the calyxtube ; bracts minute. Flowers $\frac{1}{3}-\frac{3}{4} \mathrm{in}$., pale blue-purple. Culyx-tule short. Pod $1 \frac{1}{2}-2 \mathrm{in}$., stipitate, reticulate, $6-8$-seeded. Seeds smooth.-Distrib. Europe (Arctic), N. Asia, E. and W. N. America.
7. L. marit'imus, Bigelow; stem angled, leaflets $3-5$ pair oblong, stipules ovate $\frac{1}{2}$-hastate, peduncles usually shorter than the leaves $5-10$ flowered, pod turgid glabrous. Pisum maritimum, L.
Pebbly heaches, very rare and local ; Orkney, Shetland, Lincoln, Suffolk,
Kent, Sussex, and Dorset ; Kerry only in Ireland ; f. June-Aug.-Glaucous,
glabrous. Reotstock long, stout, black. Stems $1-3 \mathrm{ft}$., ereeping at the base,
prostrate. Leaflets 1-2 in., alternate or subopposite, nerved, upper gradually
smaller; petioles 2-4 in.; tendrils short ; stipules nearly $1 \mathrm{in}$. stout ; pedicel shorter than the calyx ; bracts minute. $F^{\prime}$ lowerss $\frac{2}{3}-\frac{3}{3}$ in., purple, fading to blue. Pods $1 \frac{1}{3}-2$ in., reflexed, straight, $6-8$-seeded. Seeds smooth. Distrib. Arctic and Northern Europe, Asia, and America.
Var. 1, marit imus proper; leaflets broadly oblong obtuse. Pebbly beaches, S. and E. coast, local, at intervals from Lincolnshire to Cornwall ; Kerry.VAR. 2, acutifo'tius, Bab.; slender, straggling, leaves elliptic-lanceolate acute. Shetlands and Orkneys.
Section 4. Or'obus, L. (gen.). Perennial. Petioles ending in a short point without tendrils. Calyx gibbous at the base.
8. L. macrorrhi'zus, Wimmer; stem simple winged, leaflets $2-4$ pairs, stipules $\frac{1}{2}$-sagittate usually toothed below. Or'obus, L.
Copses and thickets, \&cc., ascending to 2,100 ft. in the Highlands ; fl. June-Aug.-Glabrous or very slightly hairy. Rootstock creeping and forming tubers. Leaflets $1-2 \mathrm{in}$., $\frac{3}{4}-1 \frac{1}{2} \mathrm{in}$. broad, nerves parallel in the narrow forms, diverging in the broad; petioles $\frac{1}{2} 1 \frac{1}{2} \mathrm{in}$.; stipules $\frac{1}{4} \mathrm{in}$., rarely quite entire, very variable. Peduncles slender, as long as or longer than the leaves, 2-6flowered; pedicels shorter than the calyx; bracts minute. Flovers $\frac{1}{2} \frac{3}{4}$ in., lurid crimson, fading to green or blue. Calyx-teeth triangular, shorter than the tube, upper very short. Pod subcylindric. Seeds globose.-Distrib. Europe.
Var. 1, macrorrhi'zus proper ; leaflets elliptic oblong, acute or obtuse. On'obus tubero'sus, L.-VAR. 2, tenuifo'lius, Roth. (sp.); leaflets sword-shaped or narrow-linear.
9. L. ni'ger, Wimmer; stem angled, leaflets 3-6 pairs, stipules linearlanceolate acute. Orobus, L.
Rocky subalpine Scotch valleys; Den of Airly, Pass of Killiecrankie, Craiganain near Moy House ; ascending probably to $1,200 \mathrm{ft}$. ; fl. June-Aug.Glabrous, brown, black when dry. Rootstock short. Stems 1-2 ft., ereet, branched, stout or slender. Leaflets $\frac{3}{4}-1 \frac{3}{4} \mathrm{in}$. , oblong-lanceolate, acute or mucronate, nerves diverging; petioles $1-2 \mathrm{in}$.; stipules $\frac{1}{6} \frac{1}{4} \mathrm{in}$., very narrow. Peduncles shorter or longer than the leaves, $2-8$-flowered, pedicels about as long as the calyx ; bracts filiform or obsolete. Floners $\frac{1}{2}$ in., lividpurple fading to blue. Calyx-teeth very short, triangular. Pods 2 in ., narrow, turgid, rugose, acuminate at both ends, $6-8$-seeded, almost septate. Needs compressed, obtusely angled.-DIstrib. Europe.

## Order XXVII. ROSA'cerz.

Herbs, shrubs, or trees. Leaves alternate, rarely opposite, simple or compound, stipulate. Inflorescence various. Flowers regular. C'ulyic superior or inferior; lobes 5, the 5th next the axis, imbricate in bud. Petals 5, rarely 0 , inserted under the margin of the disk, often orbicular and concave, claws very short or 0, deciduous, imbricate. Stamens many, rarely 1 or few, inserted with the petals or on the disk, 1-many-seriate, incurved in bud; anthers small, usually didymous. Disk lining the calyx-tube. Carpels 1 or more, free or connate or ailnate to the calyx-tube ; styles as many, free or connate, terminal ventral or hasal, stigma simple rarely feathery or decurrent; ovules 1 or 2 collateral in each carpel, rarely more, anatropous, pendulous with a ventral raphe, or ascending with a dorsal one. Fruit various, a pome, or of oue
or many drupes, achenes or follicles, rarely a berry or capsule. Seeds ascending or pendulous, testa coriaceous or membranous, albunen scanty or 0 ; cotyledons plano-convex, radicle short.-Distrib. L'biquitous ; genera 71 ; splecies 1,000. - Affinities with Leguminoser and Susifrayea. -Properties astringent in Potentillece and Rosece. Hydrocyanic and malic acids are secreted in Prunces and Pomea.

## Series 1. Ripe carpels not enclosed within the calyx-tube.

Tribe I. PRUNE'届. C'alyx deciduous. Carpel 1 ; ovules 2, pendulous. Fruit a drupe

1. Prunus.

Tribe II. SPire'es. Calyx persistent, ebracteolate. Carpels 5 or more; ovules 2 or more in each carpel, pendulous. Fruit a follicle......2. Spiriea. Tribe III. RUBE'压. Calyx persistent, ebracteolate. C'arpels many; ovules 2 in each carpel, pendulous. Fruit of many small drupes.........3. Rubus. Tribe IV. potentilílefz. Calyx persistent, bracteolate. Carpels 4 or more ; ovule 1 in each carpel, ascending. Fruit of 4 or more achenes.

> - Style elongating after flovering.

Leaves simple. Scape 1 -flowered. Styles of achenes feathery......4. Dryas.
Leaves pinnate.
Scape several-flowered.............................5. Geum.
Leaves pinnate. Scape several-flowered
5. Geum.
** Style not elongating after flowering.
Leaves 3 -foliolate. Achenes on a fleshy receptacle. 6. Fragaria.

Leaves 3-many-foliolate. Achenes on a dry receptacle .........7. Potentilla.

> SERIES 2. Ripe carpels enclosed within the calyx-tube.

Tribe V. poterie'fs. Petals 4, 5, or 0. Carpels 1-3; ovules 1 in each carpel, erect or pendulous. Fruit of 1-3 achenes enclosed in the small dry calyx-tube.
Calyx 4-5-lobed, with 4-5 adnate bracts. Petals 0...............8. Alchemilla.
Calyx 5 -lobed. Petals 5. Stamens 12-20 .............................9. Agrimonia.
Calyx of 4 petaloid lobes. Petals 0 . Stamens 4-30...............10. Poterium.
Tribe VI. Rose'fe. Petals 4-5. Carpels many ; ovules 1 in each carpel, pendulous. Fruit of many achenes enclosed in the fleshy calyx-tube.
11. Rosa.

Tribe VII. POME'Es. Petals 5. Carpels 1-5; ovules 2 collateral in each carpel, pendulous. Fruit fleshy, 1-2- or 5-celled.
Fruit 2-5-celled, cells with cartilaginous walls.
12. Pyrus.

Fruit a drupe with 1-5 included stones
13. Crateegns.

Fruit a drupe with $3-5$ bony $\frac{1}{2}$ exserted stones
14. Cotoneaster.

## 1. Pru'nus, $L$. Plum and Cherry.

Shrubs or trees. Leaves alternate, simple, glandular-serrulate; petiole 2 glandular. Flowers white or red, solitary corymbose or racemed. Calyx deciduous; lobes 5, imbricate. Petals 5. Stamens 15-20, perigynous, filaments free. Curpel 1; style terminal ; ovules 2, collateral, pendulous. Drupe with an indehiscent or 2 -valved, 1 -seeded, smooth, or rugged stone. Seed pendulous, testa membranous, albumen scanty or 0 .-Distrib. N. temp. regions, rare in the tropics; species 80.Etym. The old Latin name.

Section 1. Pránus proper. Leaves convolute in bud. Flovers solitary or fascicled, appearing with the leaves or before them. Drupe glaucous.

1. P. commu'nis, Huds.; leaves ovate or oblong-lanceolate pubescent
beneath when young, petals obovate-oblong, flesh of drupe adhering to the stone.
Copses, hedges, \&c., ascending to $1,300 \mathrm{ft}$. in Yorkshire ; fl. March-April.--A small, rigid, much-branched shrub, $3-8 \mathrm{ft}$.; branches usually spinescent; wood very hard and tough. Leaves petioled, $\frac{3}{4}-2 \mathrm{in}$., variable in breadth, acuteness, and length of petiole. Flowers white, shortly pedicelled. Petals variable in breadth. Drupe globose.-Distrib. Europe, W. Asia.-The Sloe is confined to Europe, the Bullace extends to N. Africa and eastwards to the Himalaya.
Sub-sp. spino'sa, L. (sp.); bark black, branches divaricate all spinescent, leaves finely serrulate at length glabrous beneath, flowers $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam. preceding the leaves, pedicels solitary or in pairs glabrous, petals obovate, drupe $\frac{1}{2} \mathrm{in}$. diam. black erect very austere. Sloe, Blackthorn.
Sub-sp. INSITI'TIA, L. (sp.); bark brown, branches straight a few spinescent, leaves larger broader more obtusely serrate pubescent beneath, peduncles downy, petals broader, drupe $\frac{3}{4}-1 \mathrm{in}$. diam. globose drooping black or yellow.--Doubtfully wild in Scotland, where it does not extend N. of Dumfries.-Bullace.
Sub-sp. domestica, L. (sp.) ; bark brown, branches straight unarmed, leaves pubescent on the ribs beneath, peduncles glabrous, drupe 1-1 $\frac{1}{2} \mathrm{in}$. diam. black.-Not indigenous. Wild Plum.
Section 2. Cer'asus. Leaves conduplicate in bud. Flowers solitary or fascicled, appearing with the leaves or after them.
2. P. Cer'asus, L.; leaves elliptic or obovate-oblong abruptly acuminate irregularly crenate-serrate, flowers in subsessile umbels, calyx-tube turbinate, lobes entire or serrate, petals orbicular. Dhoarf Cherry.
Hedges, thickets, and copses, from Cumberland southwards; rare in Ireland ; a doubtful native ; fl. May.
Sub-sp. Cer'asus proper ; shrubby, leaves firm erect, peduncles strict, calyxtube not contracted at the mouth, lobes obtuse serrated, petals spreading horizontally.-A denizen? Watson.
Sub-sp. 2, A'vium, L. (sp.); a tree, leaves flaccid drooping, peduncles drooping, calyx-tube contracted at the top, lobes subacute serrate, petals suberect. -A native? Watson.-Gean.
I follow Bentham and the "London Catalogue' in combining these species, which are kept apart by Babington, Syme, and Hewett Watson, and with a doubt in the "British Flora." The Dwarf Cherry forms a bush with copious suckers, redder bark, shorter petioled less acuminate and more coarsely unequally serrated leaves, and with the umbels developed at the tops of the flower-buds, and it bears a juicy, red, acid cherry. The Gean is a small tree, with few or no suckers, the umbels produced laterally on the leaf-buds, and the drupe is more often black and bitter. The Dwarf Cherry is the supposed origin of the Garden Cherry, and the Gean of the Morella. Distrib. of both : Europe, W. Asia to the Himalaya.-The Gean is found farthest north, and also in N. Africa.
Section 3. Laurocer'asus. Leaves conduplicate in bud. Flowers in axillary or terminal racemes, appearing after the leaves.
3. P. Pa'dus, L.; leaves elliptic or obovate acutely doubly serrate. Bird Cherry.

Copses and woods, from Sutherland southwards ; ascending to $1,500 \mathrm{ft}$. in Yorkshire ; fl. May.-A tree, $10-20 \mathrm{ft}$. Leaves 2-4 in., unequally cordate at the base, axils of the nerves pubescent; stipules linear-subulate, glandularserrate. Racemes 3-5 in., from short lateral buds, lax-flowered. Flowers $\frac{1}{2} \frac{3}{2} \mathrm{in}$. diam., white, erect, then pendulous; pedicels $\frac{1}{4}$ in., erect in fruit; bracts deciduous, linear. Calyx-lobes obtuse, glandular-serrate. Petuls erose. Drupe $\frac{1}{3}$ in., ovoid, black, bitter; stone globose, rugose.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to the Himalaya.

## 2. SPIRAE'A, $L$.

Perennial herbs or shrubs. Leaves alternate, simple or compound ; stipules free or adnate to the petiole, rarely 0 . Flowers in axillary or terminal cymes, white or red. Calyx persistent, lobes 4-5, imbricate or valvate in bud. Petals 4-5. Stamens 20-60, filaments free or connate below. Disk fleshy, often hairy. Carpels 5 or more, free or commate below; styles subterminal ; ovules 2 or more, pendulous. Follicles 5 or more, few-seeded.-Distrib. Temp. and cold regions of the N. hemisphere ; species 50.-Etym. doubtful.

1. S. Ulma'ria, $L$.; herbaceous, leafy, leaves interruptedly pinnate serrate white and downy beneath, terminal segments large acutely lobed, cymes corymbose very compound, carpels glabrous twisted 2 -ovuled. Meadow-sweet, Queen of the Meadons.
Meadows and water-sides ; ascending to 2,700 ft. in the Highlands ; fl. JuneAug. - Rootstock short. Stems 24 ft ., erect, furrowed. Radical letees 1-2 ft.; terminal leaflets $1-3 \mathrm{in}$.; lateral entire, alternate very small; stipules leafy, $\frac{1}{2}$-ovate, toothed. Cymes 2-6 in. diam., pubescent. Fluwer's $t \frac{1}{3}$ in. diam., white. Calyx-lobes reflexed. Carpels 5-9, twisted together into an almost horizontal plane. - Distris. Europe (Arctic), Siberia, Dahuria, Iceland.
2. S. Filipen'dula, $L$. ; herbaceous, leaves interruptedly pinnate glabrous, leaflets sessile deeply cut serrate, cymes panided, carpels pubescent straight 2 -ovuled. Dropwort.
Dry pastures, from Fife and Forfar southwards; ascending to $1,200 \mathrm{ft}$. in Yorkshire ; W. of Ireland, very local : fl. June-July.-Rootstock short ; rootfibres interruptedly tuberous. Stem $2-3 \mathrm{ft}$., erect, grooved, with few small leaves. Leures 4-10 in., chiefly radical ; leaflets $\frac{1}{8}-\frac{1}{2}$ in., very many, almost pinuatifid, sessile by a broad base, alternate very small, terminal 3 -lohed; stipules of cauline leaves toothed. C'ymes loose ; perduncles slender. Flourers $+\frac{1}{3} \mathrm{in}$. diam., white or rosy outside. Calyc-lobes obtuse. Carpels 6-12, erect.-Distrib. Europe, N. Africa, N. Asia.
S. s.alicifo'lia, L.; shrubby, leaves oblong-lanceolate serrate glabrous, stipules 0 , eymes terminal racemose, carpels glabrons many-ovuled.
Moist plantations, not indigenous ; fl. July-Aug.-Stems 3-5 ft., stoloniferous.
Lreces 2-3 in., equally or unequally serrate. Cymes dense, subeylindric.
Flouers rosy or pink. Carpels 5.-Distrib. Europe (Arctic), N. Asia, N. America.
3. RU'bus, $L$. Bramble, Raspberry, \&c.

Creeping herbs or sarmentose shruls, almost always prickly. Lruves alternate, simple or compound; stipules aduate to the petiole. Flowers in
terminal and axillary corymbose panicles, rarely solitary, white or red. Calyc-tube broad; lobes 5, persistent. Petals 5. Stamens many. Disk coating the calyx-tube. Carpels many, on a convex receptacle; style subterminal ; ovules 2, collateral, pendulous. Drupes many, 1-seeded, crowded upon a dry or spongy conical receptacle. Seed pendulous.Distrib. Abundant in the N. hemisphere, rare in the Southern ; species 100.-Etym. The old Latin name.

## * Stem herbaceous or almost so.

1. R. Chamæmo'rus, $L$. ; stem erect unarmed 1 -flowered, leaves few suborbicular-cordate obtusely 5 -7-lobed, flowers diœecious. Cloudberry.
Peaty alpine and subalpine moors from Derby and Wales northwards; ascending 'to $3,200 \mathrm{ft}$. in the Highlands ; N. of Ireland, very rare; fl. June-July. - Pubescent. Rootstock creeping, branched. Stem 4-8 in., simple, sheathed below by obtuse leafless stipules. Leaves few, 1-3 in. diam., petioled, crenate, plaited, rugose; stipules ovate, obtuse. Floxers 1 in. diam., white. Sepals oblong, obtuse, unequal, villous. Petals oblong. Frit $\frac{1}{2}$ in., orange-yellow ; drupes few, large, persistent, stone smooth. -Distrib. N. Europe (Arctic), Siberia, E. and W. N. America.-Berry very grateful, fresh or preserved.
2. R. saxat'ilis, L. ; barren-stems procumbent unarmed or with scattered bristles, flowering shorter erect, leaves 3 -foliolate, petals very small. Stony banks of subalpine rivulets, copses, \&c. from S. Wales and Gloucester northward ; ascending to 2,700 ft. in the Highlands ; common in Ireland; fl. June-July.-Softly pubescent. Rootstock creeping, stoloniferous. Stems simple, with leafless obtuse stipules below; leafing 2-3 ft., flowering 6-18 in. Leeves few ; leaflets 1-3 in., green, membranous, lateral shortly petioled, rhomboid-ovate, obscurely lobed, sharply doubly toothed; stipules linear. Flowers $\frac{1}{3}$ in. broad, few, white ; peduncles terminal, very short. Calyx-lobes ovate. Petals linear-obovate. Drupes 2-3, globose, scarlet, persistent, stone reticulate.-Distrib. Europe, Siberia, Dahuria, W. Asia to the Himalaya.

> ** Stem shrubby, with many suckers. Leaves pinnately 3-5-foliolate.
3. R. Idæ'us, L.; prickles of the stem straight slender, of the flowering shoots curved, leaflets ovate or elliptic acuminate white and hoary beneath, flowers drooping, petals short, drupes deciduous. Raspberry.
Woods, most frequent in mountain districts ; ascending to near $2,000 \mathrm{ft}$. in the Highlands ; fl. June-Aug.-Rootstock short. Stems 3-5 ft., erect, biennial, terete, pruinose. Leaves variable; leaflets $3-5$ in., acutely irregularly serrate ; stipules adnate half-way, subulate. Cymes $\frac{1}{3} \mathrm{in}$. diam., few-flowered, axillary and terminal, white. Calyx-lobes ovate-lanceolate, tips long. Petals linear-obovate. Lrupes many, red or yellow, hoary, stone pitted.-DISTrib. Europe (Arctic), N. Africa ?'Siberia to Kamtschatka, W. Asia.-R. Leesii, Bab. (sp.), is a state with crowded shorter leaflets (Bab. Brit. Rubi, p. 47), found in Devon and Somerset.
*** Stem shrubliy, without suckers. Leaves 3-5-foliolate, rarely pinnate.
4. R. fruticosus, $L$.; stem prickly, flowers in panicled or racemed corymbs or fascicles. Blackberry, Bramble.
A bundant everywhere, copses, hedges, \&c.., ascending to near $1,000 \mathrm{ft}$ in Yorkshire ; fl. July-Sept. - stem glabrous or with bristles and gland-tipped hairs in various proportions, best marked on the flowerless shoots, which are sub-
erect, or arched and rooting from a callus at the tip, thus giving rise to innumerable individuals. Leaves usually pinnately $3-5$-foliolate, subpersistent, glabrous or pubescent ; leaflets on long or short petioles, overlapping or not, obovate or rhomboid-ovate, coarsely irregularly serrate or toothed, convex, dark green above, paler often glaucous below. Flowers white or pink, in terminal racemes, the lateral branches corymbose or elongate. Drupes black or red-purple.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Assia to Upper India.

For the following arrangement of the British forms of $R$. fruticosus I am indebted to Mr. J. G. Baker.

* Stems with scattered uniform prickles, quite glabrous, i.e. without bristles or gland-tipped hairs.
Sub-sp. suberec'tus, Anderson (sp.); barren shoots suberect not rooting at the tip, leaflets large membranous bright green glabrous or slightly hairy beneath, sepals green with distinctly marked white edges, drupes numerous claret-coloured or black. R. umbrosus, Lees.-Copses, especially in the north. One of the best-marked forms.-VAR. plica'tus, W. and N. (sp.), has larger and more hooked prickles than the type.-Var. fis'sus, Lindl., has copious small prickles, leaflets more hairy beneath, sepals sometimes appressed to the fruit.-VAR. affin'is, W. and N. (sp.), (lentigino'sus, Lees, a form), is a connecting link with sub-sp. rhamnifo'tius.
Sub-sp. RHAMNIFo'liUs, $W$. and $N$. (sp.) ; barren stem arched angular rooting at the tip not glaucous, leaflets often large cordate and reflexed, more finely toothed than in the two following sometimes white and tomentose beneath, sepals not distinctly bordered with white, fruit large black juicy.-From Mid. Scotland southwards.-Var. Lindleia'nus, Lees; prickles more copious and straight, leaflets narrower, panicle more open.-VARS. incurra'tus, Bab. (sp.), and imbrica'tus, Hort., have no decided characters; R. Grubocr'shiii, Weihe, of which one plant alone is known, and $R$. Coleman'ni, Bloxam, are intermediate between this sub-sp. and infes'tus; $R$. macrophyl'lus, var. glaIra'tus, Bab., belongs here.
Sub-sp. CORYLIFO'lius, Smith (sp.) ; barren stem between arched and prostrate rooting at the tip not glaucous, leaflets 5 membranous hazel-like imbricate, sepals densely tomentose all over the back, drupes few large.-From S. of Scotland southwards. R. sublustris, Lees ; $R$. conjungens, and $R$. purpureur, Bab. -The type has terete stems and many small slender prickles.-Var. Balfimeria'mus, Blox. (sp.), and altherifo'lius, Bab. not Host., have sepals appressed to the fruit; the former approaches cassius by its corymbose inflorescence.-VAR. latifo'lius, Bab. is a rare form intermediate between this sub-sp. and the last.
Sub-sp. C ©'siUs, $L$. (sp.); stem prostrate glaucous, prickles more unequal setaceous, leaflets usually 3 green on both surfaces, sepals densely tomentose all over the back appressed, drupes few large glaucous. - Hedges and thickets from Perth southwards ; ascends to near $1,000 \mathrm{ft}$. in Yorkshire. -Derherry.-Often a well-marked form from its glaucous character. R. ten'uis, Bell Salter, ulmifo'lius, interme'dius, and his'puidus are indistinguishable forms ; R. pseudo-ida'us, Lejeune, is probably a hybrid with $R$. Ideus.
** Stem with equal scattered prickles, pubescent or hairy, but vith feno or no glandtipped hairs or bristles, arching and rooting at the tip. Calyx densely tomentose, achite, eglandular.
Sub-sp. Dis'color, $\boldsymbol{W}$. and $\boldsymbol{N}$.; stem with appressed stellate pubescence, prickles strong, leaflets small more persistent than in any other, bright
green above densely tomentose and white bencath, flowers pink, sepals always reflexed, drupes small with little flesh.-Abundant everywhere. -Var, therrsoi'deus, Wimmer; stem stronger and more arching, flowers white, leaflets larger less white beneath, pubescence of stem and leaves looser.--The stellate appressed or very short hairs of the stem distinguish this from all the following.
Sub sp. leucosta'chys, Smith (sp.) ; stem angular between arching and prostrate with copious spreading hairs and sometimes a few glandular hairs, rachis of panicle densely villous, leaflets finely toothed densely pubescent often white below, terminal one roundish with a point, panicle thyrsoid compound, sepals reflexed, petals often deep red. $R$. vesti'tus, Weihe; $R$. Leightonia'wus, Bab.-Common.
Sub-sp. villicaúlis, Weihe (sp.); stem angular with copious spreading hairs but no glandular ones, rachis of panicle densely villous, leaflets finely toothed densely pubescent often white beneath, terminal roundish with a point, panicle thyrsoid compound, sepals reflexed, petals pale. $R$. carpinifo'lizes, Bab. not Blox.; R. pampino'sus, Lees.
Sub-sp. RUBE'olUs, Weihe (sp.) ; stem angular arching with no glandular hairs, spreading hairs few and deciduous, leaflets coarsely and irregularly toothed shortly grey-pubescent or finally subglabrous beneath, terminal one roundish with a point often cordate, panicle thyrsoid compound, rachis finely pubescent with copious strong red prickles, sepals reflexed, petals pale. R. Salte'ri, Bab. ; R. calva'tus, Blox.-Connects this group with rhamnifolius.
Sub-sp. immbro'sus, Arrh. (sp.) ; stem angular, hairs few and deciduous none glandular, leaflets sometimes 7 finely toothed finely grey-pubescent beneath, terminal roundish or obovate with a point, panicle thyrsoid compound, rachis finely pubescent, sepals reflexed, petals pale. $R$. macrophyllus, var. umbrosus, Bab. ; R. carpinifo'lius, of many English writers, not Weihe.Common.
Sub-sp. MACROPHYL'LUS, Weihe (sp.) ; stem angular, with a few spreading hairs and no glandular ones, leaflets coarsely and irregularly toothed finely grey-pubescent beneath, the terminal obovate or obovate-oblong with a point, panicle thyrsoid compound, rachis tinely pubescent, sepals reflexed, petals pale. $R$. Schlechtendahl'ï, Weihe ; R. amplifica'tus, Lees.
Sub-sp. mucrondula'tus, Boreur (sp.) ; stem between arching and prostrate with a few spreading hairs and often a few glandular hairs, leaflets shortly grey-pubescent below, terminal roundish abruptly pointed, panicle sparse often subsimple, rachis densely villous its prickles few and weak, sepals reflexed, petals pale. $\quad$. mucronatus, Blox. not Seringe.-Local.
Sub-sp. Sprenge'lii, Weilue (sp.) ; stem weak wide-trailing terete with a few spreading hairs and often a few glandular hairs, leaflets coarsely toothed finely and shortly grey-pubescent or finally subglabrous beneath, often only three on the fully-developed leaves, terminal obovate with a point, panicle broad sparse often subsimple, rachis finely pubescent with few prickles, sepals ascending often leaf-pointed, petals pink. R. Borreri, Salter; R. rubicolor, Blox.-A well-marked but local form.

## *** Stems with copious bristles and glandular hairs, prickles unequal, often very numerous. <br> + Leaves of the barren shoot 5-foliolate.

Sub-sp. DUMETO'RUM, Weike (sp.) ; stem between arching and trailing subcylindric sometimes pruinose, bristles few or many, hairs 0 or few on the
barren shoots, generally fewer on the rachis of the panicle than in all the following, leaflets broad finely grey-pubescent or subglabrous below, the two lateral pairs much imbricated, the toothing open but not deep, terminal suborbicular, sepals reflexed or ascending not leaf-pointed, petals broad, fruit of a few large drupes. R. nemorosus of many, scarcely of Hayne. The glandular representative of conylifolius in fruit, leaves, and prolonged flowering. R. tubercula'tus, Bab., is a variety with subequal prickles, appressed sepals, few bristles and glandular hairs. R. diversifólius, Lindl., Bab., is a variety with more copious and irregular prickles and sepals mostly reflexed.-Common in hedges, very variable.
Sub-sp. Rad'0LA, Weihe (sp.); stem arching angular, prickles strong subequal, bristles and hairs and glands of barren stem copious, hairs few, leaflets not imbricated grey or often white-pubescent beneath, toothing moderately fine in the typical form, terminal leaflet obovate, sepals reflexed not leaf-pointed, petals broad. - R. ru'dis, Weihe, Bab., is a variety with stronger prickles and leaflets deeply and very irregularly toothed. R. Leighto'ni and denticula'tus, Bab., are closely allied.-Common in hedges.
Sub-sp. Bloxa'm, Lees (sp.) ; stem arching angular, prickles smaller than in the preceding subequal, hairs bristles and glands moderately numerous, leaflets not imbricated moderately coarsely toothed green finely pubescent beneath, terminal suborbicular often cordate, sepals reflexed'not leaf-pointed, petals broad.-R. sca'ber, Weihe, Bab., R. Babinyto'uii, Salter, is an allied form with stronger prickles and the panicle often very large and lax with patent branches.-R. fusco-a'ter, Weihe, Bab., is a rare form connecting this with villicau'lis.-R. Brigg'sii, Blox., is an allied form with shortly petioled leaflets and appressed sepals.-Local.
Sub-sp. Koshléri, Weihe (sp.) ; stem trailing nearly terete, prickles very numerous irregular strongly hooked, bristles numerous, glandular and simple hairs few, leaflets not imbricate pubescence thin grey, toothing moderately coarse, terminal orbicular, sepals reflexed not leaf-pointed, petals broad.$R$. infétus, Weihe, a variety with an arching stem, prickles and bristles much less dense.-Local.
Sub-sp. Hys'trix, Weihe (sp.) ; stem arching angular, prickles weak subequal, bristles glandular and simple hairs moderately numerous, leaflets not imbricate green thinly pubescent or finally glabrous below, terminal obovate, toothing fine, sepals ascending remarkably leaf-pointed, petals broad. $-R$. Lejeu'nii, Weihe, a variety with a large lax panicle with patent branches. $-R$. rose'ceus, Weihe, a trailing variety with more irregular prickles and narrow petals.-Local.
Sub-sp. Pal'Lidus, Weihe (sp.); stem angular wide-trailing, prickles small copious very unequal, bristles simple and glandular hairs copious, leatlets not imbricate finely toothed densely grey or sometimes whitepubescent below, terminal obovate, sepals reflexed not leaf-pointed, petals narrow. $-R$. humifu'sus, Weihe, Bab., and R. folio'sus, Weihe, Bab., are varieties with the leaves prolonged into the panicle.- $\boldsymbol{R}$. hir'tus, Weihe (fuscens, Lees), is a closely allied form.-Common in woods.

## 十 Leaves of barren shoot 3-foliolate.

Sub-sp. olandulo'sus, Bell (sp.); stem subterete trailing, prickles small straight weak, bristles simple and glandular hairs copious, leaves green thinly pubeseent beneath, panicle thyrsoid compound, the bristles of the rachis very fine and copious, sepals ascending leaf-pointed densely bristly on the back, petals narrow. R. Bellar'di, Weihe. $-R$. denta'tus, Blox. is a variety
with less prickly rachis and sepals and membranous leaves green and nearly glalrous bencath. $-R$. rotundifólius, Blox., prickles stronger, leaves more hairy beneath, sepals less distinctly leaf-pointed.-Local.
Sub-sp. Guxther't, Weike (sp.); stem trailing terete, prickles small very unequal, bristles glandular and simple hairs much fewer than in the last, leaves densely shortly pubescent often white below, panicle compound, rachis very wavy, sepals reflexed not leaf-pointed, petals narrow.-Local.
Sub-sp. pyramida'Lis, Bub. (sp.) ; stem trailing clothed as in the last, leaves green thinly hairy beneath, panicle subracemose, rachis straight, sepals ascending leaf-pointed, petals narrow.-Wales and Devonshire.
Of R. pyy mueus, Weihe, nothing is known satisfactorily.

## 4. DRY'AS, $L$.

Prostrate, tufted, scapigerous shrubs. Leuves simple, white beneath; stipules adnate to the petiole. Flowers solitary, large, white or yellow. Calyx persistent ; lobes 8-9, valvate in bud. Petals 8-9. Stamens many, crowded; filaments free. Disk concave, hairy. Carpels many, sunk in the calyx-tube; style terminal ; ovule 1 , ascending. Achenes many ; styles slender, feathery.-Distrib. Arctic and Alpine regions of N. temp. zone ; species 2 or 3.-Еtym. סpúas, from the Oak-like foliage.

1. D. octopet'ala, $L$.; leaves oblong-ovate coarsely crenate-serrate. D. dcyressa, Bab.

Stony, chiefly limestone and mountain districts in Wales, Yorkshire, and Scotland, ascending to 2,700 ft. ; N. and W. of Ireland ; fl. June-July.Stem tortuous, much branched. Leaves $\frac{1}{2}-1$ in., crowded, obtuse, hoary beneath, shining above, margins reflexed, midrib hairy and scurfy; scape 1-3 in., glandular and hairy, longer in fruit. Florers $1-1 \frac{1}{2}$ in. diam., white.
Sepuls about 8, woolly and with black glandular hairs, obtuse or subacute.
Petuls oblong. Achenes hispid ; awn 1-2 in.-Distrib. that of the genus.

## 5. GE'UM, L. AVENs.

Erect perennial herbs. Radical leaves crowded, pinnate; terminal leaflet very large; stipules adnate to the petiole. Flowers solitary or corymbose, white yellow or red. Calyx persistent, with 5 bracteoles above its base ; lobes 5, imbricate or valvate in bud. Petels 5. Stamens crowded. Disk smooth or with radiating grooves. Carpels many, receptacle short or long ; style filiform, straight or bent ; ovule 1, ascending. Achenes many, on a dry receptacle, ending in elongated, filiform, straight or bent styles which are often hooked at the tip.-Distrib. Temp. and cold regions of both hemispheres ; species 30.-ETyM. $\gamma \in \dot{u} \omega$, from the aromatic roots.

1. G. urba'num, $L$. ; flowers erect, head of achenes sessile, awn with a short glabrous hook at the tip, calyx-lobes reflexed in fruit.
Borders of copses, hedgebanks, \&c. from Ross and Elgin southwards, ascending to near $1,700 \mathrm{ft}$. in the Lake district; fl. June-Aug.-Softly hairy. Stom $1-3 \mathrm{ft}$. Radical leaves long-petioled, interruptedly pinnate ; terminal leaflets 2-3 in. broad, suborbicular, obscurely lobed, crenate ; lateral $\frac{1}{2} \frac{1}{2} \mathrm{in}$., oblong, sessile ; cauline leaves variable; stipules foliaceous, lobed and toothed. Floncers $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam., yellow ; peduncles slender. Petals obovate, spreading, as long as the acute calyx-lobes. Achenes hispid, spreading; awn $\frac{1}{2}$ in.; receptacle hispid.-DisTrib. Europe (Arctic), N. Africa, Siberia,
W. Asia to the Himalaya, E. and W. N. America.
2. G. riva'le, L.; flowers drooping, head of achenes stalker, awn jointed and hairy beyond the middle, calyx-lohes appressed in fruit.
By streams, in copses, \&ce., rare in the S. of England ; ascends to near $2,800 \mathrm{ft}$. in the Highlands ; fl. May-July. - Stem 1-1 $\frac{1}{\mathrm{f}} \mathrm{ft}$., lower parts with soft reflexed hairs, very pubescent above. Lettess very variable, much as in $\theta$. arbhenmm, but the segments are often numerous, the lateral larger, and all more toothed ; stipules small. Floners 1-1 $\frac{1}{2}$ in. diam. Culyp-sefgments red-brown, acuminate, pubescent. Petuls yellow, obcordate. Freit more or less hispid. -Distrib. Europe (Arctic), Siberia, W. Asia, E. and W. N. America, Fuegia, Australia, New Zealand.
O. intermédium; Ehr. (hybrid) ; flowers sometimes erect, petals of the form of (i. urbemm but deeper-coloured, calyx intermediate hetween wrbuthum and ricule not reflexed in fruit, fruit usually sessile.-Damp woods, not uncommon (often with ricule, seldom with whbmam, Syme). Bell-Salter produced this hybrid, and it proved fertile.

## 6. FRAGA'RIA, L. Strawberity.

Perennial scapigerous herbs, with creeping stolons. Lerves 3 -foliolate, very rarely pinnate or simple; stipules alnate to the petiole. Flomers white or yellow, often polygamous. Calyx persistent, with 5 bracteoles at its base ; lobes 5 , valvate in bud. Petals 5 . Stamens many, persistent. Carpols many, on a convex receptacle; styles ventral, persisteut; ovule 1, ascending. Achenes many, minute, sunk in the surface of a large fleshy recepitacle.-Distrib. Temp. and mountain regions of the N. hemisphere, S. Ameriea, Sandwich Islands, Bourbon ; species 3 or 4.-Etym. The old Latin name for the fragrant fruit.

1. F. ves'ca, L.; leaflets usually sessile, pedicels with silky appressed hairs, flowers hermaphrodite. Wihd Struaberry.
Shady places ; ascending to near $2,000 \mathrm{ft}$. in the Highlands ; fl. April-May.-
Silky and hairy. Rootstork short or long, woody, with a terminal tuft of leaver.
Reulical leares petioled; leaflets 1-2 in., obliquely ovate or oblong, coarsely
toothed or serrate, plaited; lateral sometimes cleft; stipules searious.
Scapes 1-6 in., lateral. Floners $\frac{1}{2} \frac{3}{4}$ in. diam., in irregular cymes, inclined,
white ; bract at the base of the cyme leafy, at the pedicel smaller, stipuli-
form; bracteoles ovate, smaller than the acute calyx-lobes. Pekuls obovate.
Recreptacle of fruit obovoid or glohose, red or white covered to the base
with achenes, calyx-lobes spreading.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to the Himalaya, E. and W. N. America.
F. blatront. Ehr.; much larger than $F$. vesca, leaflets often shortly stalked, perlivels with spreading hairs, flowers sub-1-sexual.
A garden escape ; fi. April-May.-The cultivated Haut-bois strawberry, whose origin is probably $F$. corcu.

## 7. POTENTIL'LA, L. Cinquefoil.

Perennial herbs, rarely shrubs. Leuves compound ; stipules adnate to the petiole. Fhaves white or yellow, ravely red, solitary or in corymbose cymes. Caly/x persistent, 5 -rarely 4 -bracteolate; lobes as many, valvate in bud. Petels as many, sometimes narrow. Stemens many, rarely few and definite. Disk amnular or coating the calyx-tube. C'arpels many, rarely 1 or few, on a small dry receptacle ; style persistent or deciduous,
ventral or basal ; ovule 1, pendulous. Achenes many, on a dry receptacle. -Distrib. N. temp., Arctic, and mountain regions, 2 are found in the south; species 120.-Etym. Potens, from the powerful medicinal effects attributed to some.

Sectios 1. Trichothal'amus, Lehm. (gen.). Shrubby. Petals 5, orbicular, yellow. Achenes many, hairy, on a very hispid receptacle.

1. P. frutico'sa, L.; silky, leaves subdigitately-pinnate.

Rocky banks by rivers, local; Upper Teesdale, Durham, Cumberland, West. moreland; N. Clare and Galway ; fl. June-July.-A much-branched, leafy shrub, 2-4 ft.; bark flaking. Leaves oblong or lanceolate ; leaflets 3-5, $\frac{1}{2} \frac{3}{4}$ in.; margins entire, revolute; stipules entire. Flowers $1-1 \frac{1}{2}$ in., few, in terminal subcorymbose cymes, golden yellow, sub-1-sexual ; bracts lanceolate, longer than the ovate calyx-segments.-Distrib. N. Europe (Arctic), Siberia, W. Asia to the Himalaya, E. and W. N. America.-In T'eesdale the flowers appear to be functionally 1 -sexual ; those of the sexes differ in appearance.
Section 2. Comárum, L. (gen.). Petals 5, small, oblong-lanceolate, acuninate, purple-brown. Stamens many. Achenes many, glabrous, on a conical dry spongy downy receptacle.
2. P. Coma'rum, Nestl. ; leaves pinnately 5 -7-foliolate. Comarum palustre, L.
Bogs and marshes, ascending to nearly $2,800 \mathrm{ft}$. in the Highlands ; fl. June-July.-Sparingly hairy. Rootstock long, woody; roots fibrous. Stems $\frac{1}{2}-1 \frac{1}{2} \mathrm{ft}$., ascending, purple-brown. Leaves $2-4 \mathrm{in}$.; leaflets $1 \frac{1}{2}-2 \mathrm{in}$., narrow-oblong, obtuse, coarsely serrate, pale below; stipules large, membranous, free portion often cut. Flowers $1-1 \frac{1}{2} \mathrm{in}$. diam., few. Bracts smaller than the ovate-lanceolate acuminate sepals, purplish ; petals much smaller, dark purplish-brown. -Distrib. Europe (Arctic), except Turkey, all N. Asia, E. and W. N. America.-Rootstock powerfully astringent, and yields a yellow dye.
Section 3. Sibbald'ia, L. (gen.). Petals 5-7, linear-oblong or 0 (yellow in the British species). Stamens 4-10. Achenes 4-10, glabrous, on a concave pubescent receptacle.
3. P. procum'bens, Clairv. ; leaves 3-foliolate, leaflets obovate truncate and 3-5-toothed at the tip. Sibbaldia procumbens, L. Stony places on the Scotch alps, from Peebles northward, between 1,500 and $4,000 \mathrm{ft}$. ; fl. July.-More or less hairy and glaucous. Rootstock woody, depressed, branches leafy at the tip. Leaves 1-3 in.; leaflets $\frac{1}{3}-1 \mathrm{in}$. Floveriny stems 3-5 in., lateral, ascending, leafy. Flowers $\frac{1}{4} \mathrm{in}$. diam., few, in terminal close cymes. Petals small. Calyx-segments lanceolate, acute; bracteoles linear.-Distrib. Alpine and Arctic Europe, Asia from the Himalaya northwards, N. America.
Section 4. Potentil'la proper. Petals 5, rarely 4, orbicular or obcordate, usually yellow or white. Stamens many. Achenes many, glabrous or nearly so, on a concave glabrous or hairy receptacle.

> * Flowering stems annual, from below the crown of the rootstock.
4. P. Tormentil'la, Sibthorp; stem slender rarely rooting, leaves 3rarely 5 -foliolate, flowers usually cymose, petals usually 4 yellow, achenes reticulate. Tormentilla officinalis, Curtis.

Heaths, copses, dry pastures ; ascending to 3.300 ft . in the Highlands; fl. June-Sept.-Slightly hairy. Rootstock stout, almost tuberous. Ntems 6-10in., slender, lateral, prostrate then ascending, leafy, clothed with curly hairs. Leucks sessile ; radical petioled, leaflets $\frac{1-1}{4}$ in., obovate-cuneate, $3-4$-toothed or -lohed near the tip; cauline subsessile, leaflets much narrower; stipules foliaceous, cut. Flowers $\frac{1}{2} \frac{3}{2} \mathrm{in}$. diam., rarely solitary, yellow. Ciulyx. sogments ovate, bracteoles linear, as long.-Distrib. Europe (Arctic), W. Silieria, Azores.--Rootstock strongly astringent, used for tanning.
Var. 1, erec'ta, L. (sp.); suberect, cauline leaves sessile 3 -foliolate, cyme corymbose. P. syluestris, Necker.-Var. 2, provum'liens, Sibthorp (sp.) ; procumbent, often rooting, cauline leaves $3-5$-foliolate, often petioled, flowers very few or solitary. P. mixta, Neck. ; Tormentil'le rep'tuns, L.
5. P. rep'tans, $L$.; stem slender creeping and rooting, leaves digitately 5- rarely 3 -foliolate long-petioled, flower solitary on slender axillary peluncles, petals 5 yellow, achenes granulate. P. ncmoralis, Nestl.
Meadows, waysides and pastures; fl. June-Aug.-Very variable in size ; usually larger than $P$. Tormentille, and having besides the above characters bracteoles as broad as the sepals, and flowers ${ }^{-1} 1 \mathrm{in}$. diam.-Distrib. Burone, N. and W. Asia to the Himalaya, W. Europe from Gothland southwards to Italy (exel. Spain), Canaries and Azores.
6. P. ver'na, $L$.; stem prostrate, leaves digitately 5 - 7 -foliolate, leaflets obovate or cuneate truncate deeply crenate or lobulate towards the tip, flowers several yellow, achenes smooth glabrous.
Hilly pastures and rocky places, local ; from Forfar to Cambridge and Somerset : absent in Ireland; fl. April-June.-More or less hairy. Rowtstock woodly, branched, tufted. Rulical lewees 2-3 in.; stipules with narrow subulate tips; leaflets 高 $\frac{3}{4} \mathrm{in}$., green on both surfaces; terminal tooth short : cauline 1-3-foliolate, their stipules ovate-lanceolate. Flourers few, $\frac{1}{2} \mathrm{in}$. diam. $\cdots$ Distrib. Europe (Arctic), Siberia, W. Asia to the Himalaya.
7. P. salisburgen'sis, Haenke; stem ascending, leaves digitately 5-7foliolate, leaflets obovate or cuneate deeply crenate or serrate usually above the middle, flowers several yellow, achenes smooth glabrous. P. ulpestris, Hall. f.; P. aurer, Sm. not L.
Rocky ledges in alpine districts, Breadalbane, Braemar, Yorkshire, Westmoreland, and Cardigan ; ascends to $2,700 \mathrm{ft}$. in the Highlards ; fl. June-July. -Probably a larger form of $P^{2}$. verna, with ascending stems, 4-10 in., larger less tmuncate leaflets (but not constantly so), and flowers 1 in . diam.Distuib. Europe (Arctic), N. and W. Asia, Greenland, Labrador.-Lehmamn, Bahington, and others adopt Pourret's name of $P$. murantutee for this; it is coeval with that of sulishmrypensis, and I have taken the latter because the spotted-petalled form (which occurs on Ben Lawers) is a scarce one.
8. P. anserína, L.; stoloniferous, silky, leaves intertuptedly pimate, leaflets many deeply serrate or pinnatifil, the alternate minute, Howers solitary yellow, achenes glabrous smonth. Silver Weed.
Roadsides and damp pastures ; ascends to $1,000 \mathrm{ft}$. in Yorkshire ; f. July-Aug. -Softly silky, especially on the leaves (hence silvery) beneath. Riowtstock slender, hrinched. Nemes 0. Leaces 2-5 in., stoloniferous from their axils; leatlets $\frac{1}{2}-2 \mathrm{in}$., alternate, close-set, sessile, ohovate-oblong, obtuse, serratures tipped with silky hairs. Floncers $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam. on solitary axillary slender
peduncles; bracteoles often serrate.-Distrib. Temp. and Arctic regions of the N. and S. hemispheres.-Rootstock eaten in times of scarcity in the Hebrides.
9. P. Fragarias'trum, Ehr.; leaves 3 -foliolate, leaflets obovate, flowers white, achenes pilose below reticulate. Fragaria sterilis, L.
Waysides, woods and banks ; ascending to 2,100 ft. in Wales ; fl. March-May. -Similar to Frugaria vescu, but has no runners, nerves of leaflets not sunk above, and fruit very different. More or less pilose or silky. Rootstock stout, woody, branched, depressed. Leaves $2-6$ in., tufted; petioles with spreading hairs ; leaflets $\frac{1}{2}-1 \mathrm{in}$. coarsely crenate towards the tip; very hairy beneath. Flowering stems or scapes 1-6 in., axillary, slender, naked or 1 -2-leaved, 1 - 3 -flowered. F'lowers $\frac{1}{2} \mathrm{in}$. diam. Receptacle with very long hairs (as in P. fruticosa).-Distrib. Europe, N. Africa.
** Flowering stems annual, from the top of the branches of the rootstock. Receptacle hairy.
10. P. rupes'tris, $L_{\text {. }}$; leaves pinnate, radical 5 -cauline 3 -foliolate, flowers white.
Limestone rocks, Craig Breidden, Montgomery ; fl. May-June. - Hairy, especially below. Rootstock woody, branched. Stems 1-2 ft., erect, branched above. Rudical leaves 3-6 in., petioles very slender; leaflets $\frac{3}{4}-1 \mathrm{in}$., unequal at the base, oblong or obliquely obovate, irregularly crenate, cauline few, subsessile. Flowers few, 妾 1 in . diam. Achenes smooth, gla-brous.-DisTrib. Europe, from Gothland southwards (excl. Greece), Siberia, Dahuria, N.W. India.
11. P. argen'tea, $L$; leaves digitately 5 -foliolate, leaflets cuneate much cut white beneath, flowers yellow.
Dry pastures and roadsides ; England and E. Scotland, from Moray southwards, local ; absent from Ireland ; fl. June-July.-More or less covered, especially the leaves beneath, with white appressed wool. Rootstock short, woody. Stems 6-18 in., slender, suberect or decumbent, branched, leafy ; branches divaricating. Leaves petioled, uppermost sessile ; leaflets $\frac{1}{2}-1 \frac{1}{2}$ in., narrowly cuneate, $\frac{1}{2}$-pinnatifid upwards, margins recurved. Flowers $\frac{1}{3} \frac{1}{2} \frac{1}{2}$. diam., subcorymbose. Achenes smooth, glabrous.-Distrib. Europe (Arctic), Siberia, E. N. America.

## 8. alchemili'La, L. Lady's Mantle.

Annual or perennial herbs. Leaves orbicular, lobed or deeply divided; stipules adnate to the petiole. Flowers minute, in lax or crowded corymbose cymes. Calyx urceolate, persistent, $4-5$-bracteolate; lobes 4-5, valvate in bud. Petals 0. Stamens 1-4, inserted on the mouth of the calyx. Disk coating the calyx-tube, and all but closing its mouth by its thickened margin. Carpels 1-5, basal in the calyx-tube; styles basal or ventral ; ovule 1, basal. Achenes 1-4, enclosed in the membranous calyx-tube.-Distrib. Natives chiefly of the American Andes; a few are European, N. Indian, and American ; species 30.-Etym. Arabic.

Section 1. Aph'anes, L. (gen.). Annual. Cymes leaf-opposed, dense. Bracteoles minute or 0. Antheriferous stamens 1-2.

1. A. arven'sis, Lamk.; leaves cuneate or fan-shaped 3-lobed, lobes cut. Aphanes, L.

Fields and waste places in dry soil ; ascending to $1,600 \mathrm{ft}$. in the Highlands; fl. May-Aug.-Hairy, much branched from the base ; branches 2-8 in., erect or prostrate. Leuves $\frac{1-1}{2} \frac{1}{2} \mathrm{in}$., narrowed into the short petiole, lobes cuneate ; stipules palmately cut. Flower minute, hidden by the stipuliform hracts. Culy.x usually 4 -cleft. Achenes 1-3.-DisTrib. Europe, N. Africa ; introd. in N. America.

Section 2. Alchemil'la proper. Perennial. Cymes corymbose or panicled. Bracteoles conspicuous. Antheriferous stamens usually 4.
2. A. vulga'ris, $L$.; leaves reniform plaited 6-9-lobed green beneath.

Moist pastures and streams, except in the S.E. of England ; ascending to
$3,600 \mathrm{ft}$. in the Highlands; fl. June-Aug.-More or less hairy. Ruotstock blask, stout, short. Stem 6-18 in., ascending. Radical leares 2-6 in. diam., lobes serrate, petioles 6-18 in., cauline smaller ; stipules connate and sheathing, toothed. Cymps irregularly racemed or panicled. Flurers $\frac{1}{1}$ in. diam., yellow-green ; pedicels short. Achenes 1 or 2, glandular.-Distrib. Europe (Arctic), Siberia, W. Asia to the Himalaya, Greenland, Labrador. - Rootstock astringent and edible.
VAR. monta'na, Willd. (sp.); leaves and petioles very pubescent or silky. A. kylvida, Pers.
3. A. alpi'na, L.; leaves 5-7-partite or -foliolate silvery beneath.

Rocks and streams, Mts. of Scotland, and N. of England ; between 400 and $4,000 \mathrm{ft}$., absent in Wales ; Brandon Mt. and Benbulben, Ireland; fl. June-Aug.-More or less clothed with silky hairs, except the upper surface of the leaves. Rootstock slender, branched. Stems 3-9 in., ascending, sleuder. Leazes on slender petioles, upper 1-2 in. diam., sessile, orbicular-reniform ; leaflets $\frac{3}{-}-1 \frac{1}{4} \mathrm{in}$., narrow oblong, sharply toothed at the tip ; stipules connate and sheathing, eleft. Cymes interruptedly spiked and panicled. F/orevs $\frac{1}{6} \mathrm{in}$. diam., yellow-green ; pedicels short, pilose. Achenes minutely glandular. - Distrib. Europe (Arctic), Siberia, W. Asia, Greenland.

Vir. conjunc'ta, Bab. (sp.) ; leaflets connate for $\frac{1}{3}$ their length. A. aryentec, Don.-Faroe Isles.

## 9. AGRIMO'NiA, L. Agrimony.

Slender perennial herbs. Leaves pinnate; leaflets serrate; stipules partially adnate to the petiole. Flowers small, yellow, in terminal spikelike racemes; pedicels bracteate at the base, 2 -bracteolate. Calys persistent; tube turhinate, spinous; mouth contracted ; lobes 5, imbricate. Petels 5. Strmens 5-10 or more, inserted at the mouth of the calyx. Disk lining the calyx-tube, its margin thickened. Carpels 2, included in the calyx-tube ; styles exserted, stigma 2 -lobed; ovule pendulous. Fruit pendulous, of 1 or 2 achenes enclosed in the hardened spinous calyx.Distrib. N. temp. regions, and S. America; species 8.-Etym. obseare.

1. A. Eupatória, L.; leaves interruptedly pinnate, spines of calyx hooked.
Hedgebanks, eopses, and horders of fields; ascending to 1,200 feet in Yorkshire ; fl. June-Aug.-Hairy or villous, crect, leafy. 12-3 ft., rarely branched. Rootstock woody, short. Lewers 3-7 in.; leaflets 3-10 pairs, larger upwards, largest 1-3 in., sessile, oblong or lanceolate. deeply coarsely serrate ; smaller $\frac{1}{4}-\frac{1}{2}$ in., obovate or cuneate, $3-5$-lobed ; stipules foliaceous,
$\frac{1}{2}$-lunate. Racemes leng thening and pedicels recurved in fruit; bracts 3 -fid; bracteoles close to the calyx. Flowers $\frac{1}{3} \mathrm{in}$. diam. Culyx-tube $\frac{2}{3}$ in., woody in fruit, spines many around the thickened mouth; segments conniving, triangular, acute.-Discimis. N. temp. regions, N. and S. Africa.-Rootstock astringent, and yields a yellow dye.
Sub-sp. Eupato'ria proper; calyx-tube obconic deeply furrowed, lower spines spreading.
Sub-sp. odora'ta, Mill. (sp.) ; more branched, resinous-scented, racemes denser, flowers larger, calyx-tube campanulate searcely furrowed, lower spines spreading or reflexed.-From Westmoreland southwards to Jersey, local ; very rare in Ireland.

## 10. POTE'RIUM, $L$.

Erect perennial herbs. Lcaves piunate; leaflets stalked; stipules adnate to the sheathing petiole. Flowers small, subsessile, in dense longpeeluncled heads or centrifugal spikes, bracteate, 2 -bracteolate, often polygamous. Calyj-tube persistent, turbinate, mouth contracted; lobes 4, petaloid, deeiduous, imbricate in bud. Petals 0. Stumens 4 or more, inserted at the month of the calyx, filaments slender pendulous. Disk lining the calyx-tube and closing its mouth. Carpels 1-3, enclosed in the calyx-tube ; styles filiform, stigma penicillate ; ovule 1 , pendulous. Achenes solitary, enclosed in the hardened 4 -angled often winged or muricate calyx-tube.-Distaib. N. temp. regions; species 20.-Етум. obscure.

1. P. Sanguisor'ba, L.; upper flowers of each head female, lower male or 2 -sexual, stamens $20-30$ much exserted, fruiting calyx 4 -winger reticulate but not pitted between the wings, edges of reticulation smooth. Salud Burnet.
Dry pastures, from Perth and Forfar southwards; ascending to $1,600 \mathrm{ft}$. in Yorkshire ; rarer in Scotland and in Ireland; fl. June-Aug.-Erect or decumbent, 6-18 in., glabrous or uearly so, slender, much branched. Rootstock stout. Rutical letves 4-10 in.; leafl3ts $5-10$ pair, $\frac{1}{4} \frac{3}{4} \mathrm{in}$., petioled, broadly oblong, coarsely serrate ; stipules leafy. Flover-lieculs $\frac{1}{3}-\frac{-}{3}$ in., on long peduncles, shortly oblong, purplish. Calyx-loles in in., oblong; wings thin ; bracteoles ciliate. Stigmus exserted. Achene dark, striate.-DIstrib. Europe, N. Africa, Siberia.
P. murica'tem, Spach ; flower-heads and flowers as in P. Sanguisorba, but fruiting calyx with thick entire or toothed wings, pitted and reticulated between the wings, ridges muricate and toothed.
Cultivated ground in Mid. and S. England ; an alien or colonist, Watson; fl. July.-Chiefly distinguished from $P^{\prime}$. Sunguisorba by the larger fruit and calyx.-Distrib. Mid. and S. Europe.
2. P. offeina'1e, Hook. f.; flowers 2 -sexual, stamens 4 not longer than the calyx-lobes, fruiting calyx 4 -winged smooth between the wings. Sanguisorba officinalis, L. Great Burnet.
Damp meadows, from Roxburgh and Kirkcudbright southwards ; ascending to $1,501 \mathrm{ft}$. in Yorkshire ; W. and N. of Ireland ; ft. June-Aug.-Very similar to $P$. Sanguisorba, but leaflets fewer, longer, less deeply serrate, usually cordate at the base, and flower-heads often cylindric and $\frac{1}{2} \mathrm{in}$. long.Distrib. Europe (Arctic), excl. Spain, Siberia, Dahuria, W. Asia.

## 11. RO'SA, L. Rose.

Erect, sarmentose or climbing shrubs, usually prickly. Leaves pinnate; leaflets serrate ; stipules adnate to the petiole. Flowers terminal, solitary or corymbose, white yellow or red, rarely bracteate. Calyz-tube persistent, glohose ovoid or pitcher-shaped; mouth contracted; lobes leafy, imbricate in bud. Petals 5. Stumens many, inserted on the disk. Disk coating the calyx-tube, all but closing its mouth by its thickened margin, silky. Carpels many, rarely few, in the bottom of the calyx-tube ; styles suliterminal, free or connate above, stigma thickened; ovule 1 , pendulous. Achenes coriaceous or bony, enclosed in the fleshy calyx-tube.-Distmb. N. temp. regions, rare in America ; extending into Abyssinia, India, and Mexico ; species about 30.-Etym. The old Latin name.
The following account of the British roses is condensed from Mr. Baker's valuable monograph (Limn. Jowr. xi. 197), and has been kindly revised by himself; -with this difference, Baker's species are here reduced to subspecies. As with the fruticose Rubi group, so with this genus, all the so-called species are connected by intermediates; but whereas, in the fruticose Rubi, the 4 or 5 most distinct British forms are connected by so many links that various excellent botanists regard them as forms of one species; in Rosa, on the contrary, the five most distinct British forms are connected by so few (comparatively) intermediates, that no good botanists have reduced them to one species.

1. R. spinosis'sima, $L$.; small, erect, bushy, prickles crowdel very unequal nearly straight passing into stiff bristles and glandular hairs, leaves not or slightly glandular, sepals more or less persistent, fruit short, disk small or 0. Scotch Rose.
Open places ; f. May-June.-Shreb 1-4 ft., much branched. Leares small; leaflets 7-9, singly or doubly serrate, usually broad. Fharers 1-1 $\frac{1}{2}$ in. diam., often only $1-2$, rarely 3 or more, white or pink; calyx-tube usually glabrous. Styles free.
Sub-sp. pimpinellifo'lia, $L$. (sp.) ; leaflets 7-9 glabrous simply serrate, flowers always solitary, sepals glabrous simple, fruit subglohose dark purple, disk 0 . -Dry places, especially sandy sea-shores ; ascends to $1,700 \mathrm{ft}$. in Scotland. Burnet Rose.-Distrib. Europe (Arctic), N. Africa, Siberia to N. China, W. Asia to the Himalaya.

Sub-sp. involu'ta, Smith (sp.); leaflets glabrous or pubescent beneath usually doubly-serrate, flowers 1-3, sepals densely glandular on the back more or less pinnate, fruit erect subglobose red. - Banks and hedges. - Distrib. Belgium, Switzerland (near Geneva only).-Var. 1, Sulb'ini, Woods (sp.); prickles $\frac{1}{3} \mathrm{in}$. straight, leaflets with copious compound serratures thinly pubescent above, petioles and peduncles densely hairy glandular and bristly, calyx-tube subglobose more or less setuse, sepals pinnate, fruit subglohose. R. Irucilis, Woods ; R. niertis, Don ; R. coronata, Crep. The most common form.-Var. 2, Don'iana, Woods (sp.); small, leaflets more densely hairy, flowers solitary, sepals hardly pinnate, calyx-tube and fruit densely prickly. Dry places. Approaches R. mollissima.-VAR. 3, gruciles'cms, Baker; robust, leaflets thinly hairy on both surfaces, eglandular beneath, much toothed, terminal $1-1 \frac{1}{2} \mathrm{in}$., flowers 3-5, calyx-tube glabrous ellipsoid. Antrim.-Var. 4, Robertso'ni, Baker; sepals of Saljini, but teeth of leaflets sharper and less compound, upper surface glabrous when mature,
calyx-tube sometimes nazed. Newcastle, Yorkshire, Antrim. - Var. 5, S'mith'ii, Baker; stunted, mature leaflets glabrous above hairy and eglandular below, serratures sharp and close, flowers solitary, calyx-tube densely aciculate, sepals simple. R. incolitta, Sm. Arran, Yorkshire.--VAR. 6, luciga'tu, Baker; leaflets of Sabini, petioles villous and glandular rarely bristly, peduncle and calyx-tube glabrous, sepals simple eglandular, fruit depressed globose. Yorkshire, Antrim and Derry.-Var. 7, Moon'ei, Baker ; prickles very stout $\frac{1}{2}$ in., leaflets densely glandular beneath, petiole perduncle and calyx-tube densely setose and glandular the larger prickles curved, sepals slightly pinnate. Derry. Approaches $R$. rubiginosa.-VAR. 8, occidenta'lis, Baker; near Wilsoni, but leaflets smaller and petioles and perluncles glandular and bristly, calyx-tube globose. Ireland, locality unknown.-Var. 9, Wilso'ni, Borrer (sp.); tinged with purple, prickles as in Sulini, leaflets often cordate terminal large glabrous above, ribs thinly hairy and subeglandular beneath, serratures simple, calyx-tube almost glabrous, sopals nearly simple, fruit subovoid. Menai Straits; Derry. Approaches R. rubella.
Sub-sp. Hiber'nica, Smith (sp.); prickles stout curved, leaflets glabrous above glaucous slightly pubescent beneath eglandular simply serrate, petiole pubescent, flowers 1-3 (rarely 4-12), sepals pinnate glabrous, fruit ereet subglobose naked, disk moderate. R. pubescens, Baker.-N. of England, Scotland and Ireland, ascending to $\mathbf{1}, 000 \mathrm{ft}$. Unknown on the Continent. -Var. 1, gla'lbra, Baker; leaflets glabrous, serratures sharper, peduncle naked. Resembles R. canina.-Var. 2, condifólia, Baker; prickles more slender and denser, leaflets almost glabrous below, terminal $1 \frac{1}{2}$ in., serratures more open and obtuse, peduncle bristly and glandular. Northumberland.
2. R. villo'sa, L.; bush large, erect, or branches elongate and axching, prickles uniform scattered slender nearly straight, leaflets very hairy eglandular or nearly so beneath, sepals more or less persistent densely glandular, fruit globose or turbinate densely prickly rarely naked.
Hedges and thickets, especially in the N. of England and Ireland, ascends to $1,500 \mathrm{ft}$. in Yorkshire ; fl. June-July.-Chiefly distinguished from $R$. spinosissima by its larger size, equal prickles, fewer very downy leaflets, which are more constantly doubly serrate, and the more glandular fruit; and from $R$. canina by the straight prickles, and globose glandular fruit.-Distrib. Europe (Aretic), W. Asia.
Sub-sp. POMF'ERA, Herm. (sp.); branehes arching, sepals copiously pinnate quite persistent, corolla often ciliate and glandular, fruit ripening early, disk 0. - Stafford and Gloucestershire ; not indigenous, common in gardens.
Sub-sp. Mollis'sima, Willd. (sp.); branches erect, leaflets softly pubescent, sepals sparingly pinnate quite persistent, fruit ripening early, disk 0 . R. mollis, Sm. ; heterophylla, Woods.-From Derby northwards, N. Wales, Derry, Antrim.-VAR. 1, coervilea, Baker; glands and bristles few on the petiole, ovary glandular, fruit broad glabrous, peduncle naked or with few bristles.-VAr. 2, pseu'do-rubigino'sa, Lejeune ( sp .) ; leaflets nearly glabrous above glandular below, petiole and calyx-tube densely bristly.
Sub-sp. Tomento'sa, Sm. (sp.); branches long ( $6-10 \mathrm{ft}$.) arching, prickles sometimes curved, leaflets pubescent, sepals copiously pinnate not quite persistent, fruit not ripening early, disk distinct.-Common ; extends into Aretic Europe.-Var. 1, subglobo'sa, Sm. (sp.); (R. Sherardi, Davies), -

Var. 2, farino'sa, Raw. (sp.), -Var. 3, sculrins'cula, Sm. (sp.),-Var. 4, syles'tris, Woods (R. Jumdzillitna, Baker; R. Initannica, Des.),-Var. 5, ohoca'te, Baker;-are forms differing in pubescence and amount of glands on the leaves petioles peduncles calyx-tube and sepals, amount of domble serration of the leaflets, number of flowors in a cluster, and of prickles, their length strength and curvature.
3. R. rubigino'sa, L.; bush small, branches erect or arching, prickles stout at the base scattered hooked with often glandular hairs and bristles intermixed, leaflets densely glandular aromatic glabrous or thinly hairy, flowers 1-3, sepals subpersistent, fruit globose ovoid or oblong.
Best distinguished by its subereet habit and copious glandular pubescence, which gives out the strong sweetbriar odour ; this, however, becomes fainter in the forms that pass into R. canina and R. villosa--Europe, Siberia, W. Asia to N.W. India ; introd. in N. America.
Sub-sp. Rubiginio'sa proper; very sweet-scented, ereet, branches compact, prickles with a few bristles and glandular hairs intermixed, peduncles densely bristly, leattets at length glabrous above pubescent beneath, sepals densely glandular pinnate, fruit globose. R. Eiglenteriu, Woods.-Chalk hills, S. of England, native ; probably an escape in the N. of England, Seotland, and Ireland. Siceethriur.-Var. 1, perimie'tu, Deseg. (sp.); leaves and styles glabrous, sepals deciduous, fruit ovoid. Box-hill. Approaches mirrenthet. -Var. 2, syleic'ola, Deseg. and Ripart (sp.); less scented, prickles more slender, leatlets hairy and less glandular beneath, styles hairy, fruit ovoid. N. Yorkshire.

Sub-sp. micrantha, Smith (sp.); branches long arched, prickles equal, odour faint, leaflets small more pointed glabrous ahove, densely glandular below, flower 1'in. diam., sepals deciduous densely glandular with a leafy point and 1-2 leaflets, styles glabrous, fruit urceolate scarlet, disk evident.Midway between rubiginesse and cunineu. -Throughout England; Irelant, Cork only.-Var. 1, Brigys'ii, Baker; large and luxuriant, leatlets layger less glandular beneath, peduncles and frut naked, sepals more pinuate eglandular on the back. Plymouth.-VAr. 2, lyys'trix, Leman (sp.) : small, leaflets narrow glabrous, calyx-tube glabrous, peduncle densely aciculate. Box-hill, Oxfordshire, Bristol.
Sub-sp. sk'Pium, Thuill. (sp.); laxer in habit than ruhiginosa, priekles with a few bristles and glandular hairs intermixed, leatlets small narrowed to both ends glabrous but densely glandular beneath, peduncle and oveid frnit naked, sepals subpersistent, disk moderate, styles pubascent. - Siurrey.... V.ir. 1, Billiet'ie, Puget (sp.); differs only by its leaves rather hairy below and rounded at the base. R. sepium, Borrer, E.B.S. Warwicknhire.Var. 2, pulierulen'tu, M. Bieb. (sp.); much taller, flowers $1 \frac{1}{2} \mathrm{in}$. diam., leatlets larger rounded at the base, sopals more copiously pinnate, fruit ovoid. R. inorloru, Fries. England, lucal.-Var. 3, wryptopsidu, Baker: differs from the last prineipally by its very short peduncles and round fruit. West Yorkshire.
4. R. canína, L. ; bush large, branches long arching, prickles seattereal uniform stout broad hookel thickenel at the base, leaflets eylandular (exeept ravely on the midrib) and veins beneath) glabrous or thinly hairy acute very sharply toothed, peduncle usually maked, flowers 1 or more, sepals usually naked reflexed pimate, styles free or nearly so hirsute, fruit ovoid urceolate or subglobose, disk conspicuous. Doy Rose.

Thickets, hedges, \&c. ascending to $1,350 \mathrm{ft}$. in Yorkshire ; fl. June-Aug.Of the above characters, most disappear in one or other of the following 29 varieties, which Mr. Baker has systematized with great skill. In its common form, this is the largest and freest growing of British roses, and may be distinguished from spinosissima by the hooked prickles and habit, from villosa by being more glabrous, from mbiginosa by being eglandular, and from arcensis by the free styles.-Distrib. Europe, N. Africa, Siberia.

Sfries 1. Ecristat'æ. Leaves eglandular beneath. Sepals reflexed after the fall of the petals, deciduous before the fruit (which ripens late) changes colour.

## * Leaves glabrous on both surfaces. Peduncles not bristly.

Var. 1, lutetia'na, Leman (sp.); 10-12 ft., leaflets about 7 green or glaucous, terminal obovate, serratures simple, flowers 1-4 pink 2 in . diam., sepals naked. Abundant.-Var. 2, surculo'sa, Woods (sp.); robust, flowers 10-31, leaflets flat rounded at the base, teeth open.-Var. 3, spluérica, Gren. (sp.); like luteticna, but leaflets broader, petioles pubescent, fruit globose $\frac{2}{3}$ in. diam., styles villous.-Var. 4, sentico'su, Ach. (sp.); slender, flexuous, leaflets 1 in., teeth acute, fruit small globose.-VAR. 5, duma'lis, Bechst. (sp.); petiole glandular, stipules and sepals more densely gland-ciliated, leaflets doubly-serrate. R. sarmenta'cea, Sm.; glaucophylle, Winch. Very common.-Var. 6, biser'rata, Merat (sp.); quite like var. 5, but serratures more open and very compound, petioles very glandular.-R. vina'cea, Baker, has leaflets and bracts narrow acute, and fruit oblong.

## ** Leaves glabrous above, hairy on the nerves beneath. Peduncles not bristly.

Var. 7, ur'bica, Leman (sp.); like lutetiana, but leaves pilose below and petioles pubescent scarcely glandular. R. collina, Woods ; Forsteri, Smith ; plutypleylla, Rau.-VAR. 8, fronelo'sa, Steven (sp.); leaflets smaller flatter ovate-oblong more rounded at the base, fruit smaller globose. R. dume$\iota_{n} n^{\prime} u m$, Woods.-VAr. 9, arvatica, Baker; like urbica, but leaves doublyserrate, fruit ovoid. Common in the N. of England.

## *** Leaflets more or less hairy on both surfaces. Peduncles not bristly.

Var. 10, dumeto'rum, Thuill. (sp.); leaflets green terminal often large thinly hairy above softly below simply-serrate, fruit large ovoid, styles villous. R. uncinel'la, Besser.-Var. 11, pmino'sa, Baker ; leaflets glaucous doublyserrate, petioles glandular. R. cesicu, Borrer.-Var. 12, inca'na, Woods (sp.); leaflets very glaucous above densely pubescent beneath with few inconspicuous glands doubly-serrate, fruit large oblong. R. canescens, Baker.Var. 13, tomentel'lu, Leman (sp.); flexuous, leaflets short green above very hairy below doubly serrate, petioles prickly, peduncles very short, flowers small white, fruit small short. R. inodoru, Hook. Fl. Lond.

```
**** Pedluncles more or less bristly and glandular.
```

VAR. 14, Andevagen'sis, Bast. (sp.), is lutetiana with bristly peduncles. S. of England, rarer in the N. and Scotland. - VAR. 15, verticillaceri'tha, Merat, iss demalis with ditto. Not uncommon.-VAR. 16, colli'na, Jacq. (sp.), is urbira with ditto. Surrey and Devonshire.-Var. 17, ca'sia, Smith (sp.) ; near collina, but leaflets grey-green, stipules and bracts pubescent on the hack. Argyle, Northumberland, Leicester.-Var. 18, соисіn'na Baker; prickles much hooked, leaflets very small simply-serrate, petioles not setose pubescent, ovary small, styles short thinly hairy. Devonshire.-VAR. 19, deci, $\boldsymbol{\prime}^{\prime \prime}$ ius, Dumort.; like tomentella, but for the bristly peduncles, more glandular
midrib, pubescent and glandular petiole, and sepals densely glandular not fully reflexed. Northumberland, Chester, Leicester.
Series 2. Subcrista'tæe. Leaves eglandular beneath. Sepals ascending after the fall of the petals, not deciduous till after the fruit (which ripens early) changes colour.
$\mathrm{V}_{\mathrm{AR}}$. 20, Reu'teri, Godet (sp.) ; near lutetiana, but prickles more slender, peduncles short almost concealed by the bracts, leatlets glaucous, bracts stipules and branches turning red. R. vuиh, Woods; C'repiniuna, Deseg. N. England, common.--VAR. 21, subcristu'tu, Baker; like dumulis, except for characters of subcristutce. N. of England and Scotland.-VAR. 22, Huilstone'i, Baker; leaves as in subcristuta, fruit later, styles less villous, sepals sooner deciduous, prickles passing into unequal bristles. Yorkshire.-IAR. 23, implex' $a$, Gren. (sp.) ; like ur'bica, but iruit of this series. Richmond, Yorkshire.-Var. 2 t , corrifo'lia, Fries (sp.); like dumetorum, but fruit of this series, peduncles very short and bracts large. R. bractescens, Woods. From Yorkshire northward.-Var. 25, Wutso'ni, Baker; differs from coriifoliu in the doubly-serrate leaves, smaller densely gland-ciliated l.racts and glabrous back of stipules, petioles pubescent and ylandular. N. of England and Scotland.-VAr. 26, celera'ta, Baker; habit and foliage of tomentella, but fruit of this series. Holy-well Dene, Northumberland.
Series 3. Subrubigino'sæe. Leaflets glandular beneath on the midrib and principal nerves only (not on the surface, as in $R$. rubiginosa).
Var. 27, Bor'reri, Woods (sp.) ; prickles stout much hooked, leaflets flat doubly serrate glabrous above, glands obscure, stipules and bracts densely glandciliate, backs of these and sepals naked, Hlowers many, peduncles bristly, calyx-tube ovoid naked, sepals at length spreading or reflexed deciduous on the fruit changing colour. R. dumetorum, Eingl. Bot. Yorkshire to Sussex.Var. 23, Bukéri, Deseg. (sp.) ; prickles less hooked, leaflets obovate doubleserrate, flowers 3-4, peduncles very short, back of sepals bracts and stipules thinly glandular, sepals at length ascending not deciduous till the naked oblong fruit has changed colour. N. Yorkshire.-VAR. 29, muryinuith, Wallroth (sp.); branches purple, prickles more slender less hooked, leatlets altogether glabrous glaucous above pale beneath, veins prominent glandular, flowers 3-4, sepals and fruit much as in R. Bukeri. R. Blondwanu, Ripart. Arran on the Clyde, N. Yorkshire, N. Wales, Derry.
5. R. arven'sis, L. ; bush large, branches long arching or trailing, prickles uniform stout strongly hooked, leaflets eglandular glabrous or slightly pubescent, flowers 1-6, sepals deciduous, styles glabrous counate into an exserted column, fruit ripening late, disk much thickened.
Hedges and thickets, rare in mountain districts; from Lanark and Haddington southwards, and in Ireland ; fl. June-July.-A low trailing plant in its usual form, with the foliage and hooked prickles of R. camimu. Leaflets glabrous and shining above, rarely downy. Floacers rarely solitary, generally white, scentless. Fruit naked; achenes sessile or stalked.-Distrib. W. and Mid. Europe, from Belgium southwards.
Sub-sp. ARvEN'sis proper; bush 2-3 ft., branches trailing purple glaucous, prickles often very large, leaflets quite glabrous glaucous beneath, flowers white throat yellow, calyx purple, sepals naked on the back short broad rellexed after tlowering deciduous not much pinnate, fruit subglobose small, styles glabrous as long as the stamens. R. repens, Scopoli.--Common in S .
of Encland, rare to the N. and in Scotland.-VAR. 1, bibractea'ta, Bast. (sp.); shonts stronger, more arching, leaflets large more acute, fruit obovoid, peduncles thinly glandular. (Easily mistaken for sub-sp. stylosa var.)
Sub-sp. strio'sa, Bust. (sp.); bush tall, rarely low, leaflets pubescent beneath, peduncles elongate more or less bristly and glandular, sepals reflexed much pinnate, styles as long as or shorter than the stamens.-Connects arcensis with canina.-VAR. 1, stylo'sa proper ; leaflets oblong acute rounded at the base hairy all over beneath, petioles and peduncles with few glands and bristles, flowers 3-6 white, stvles protruded, disk very prominent. Sus-sex.-Var. 2, systyl${ }^{\prime} a$, Bast., differs from var. 1 only in the usually pink flowers, leaflets hairy only on the nerves beneath, and petioles less hairy. R. collinat (Eugl. Bot., not of Jacquin). Mid. and S. England.-Var. 3, opa'cu, Baker; leaflets still more hairy beneath rounded at the base, peduncle shorter naked, flower white 1 in . diam., styles scarcely protruded. Kent. Var. 4, gallicoi'des, Baker ; habit and leaflets of systyla, but prickles of stem mixed with copious glands and bristles, leaflets almost doubly-serrate, fonvers white, fruit narrow, styles as long as stamens. Warwickshire.Var. 5, Monso'mic, Lindl.; hush low erect, flowers red very large, styles scarcely protruded, fruit sukglobose orange-red. Herefordshire.-VAr. 6, fustigici'ta, Bast. (sp.) ; column of styles not protruded.

## 12. PY'rus, L. Pear, Apple, Service, \&c.

Trees or shrubs. Leaves deciduous, simple or pinnate; stipules deciduous. Flowers white or pink, in terminal cymes or corymbs; bracts sub-ulate. Catyr-tube urceolate, lohes 5 , reflexed, persistent or deciduous. Potals 5. Stamens many, filaments sometimes connate at the base. Disk annular, or coating the calyx-tube. Curpels 2-5, connate and adnate to the calyx-tube; styles free or connate below, stigmas truncate ; ovules 2 in each cell, ascending. Fruit (a pome) fleshy, $2-5$-celled ; cells with a cartilaginous or bony often 2 -valved endocarp, $1-2$-seeded. Distrib. N. temp. and cold regions; species 40.-Еtym. The old Latin name.

Section 1. Py'rus proper. Fruit large, 5-celled; cells 1-2-seeded; endocarp cartilaginous. Cymes simple. Styles 5.

1. P. commu'nis, L.; cymes corymbose, styles distinct to the base, fruit pyriform. Wild Pear.
Woods and thickets, from Yorkshire southwards, uften a garden escape ; a denizen? Wutson ; fl. A pril-May.-A shrub or small tree, 20-10 ft. ; branchlets more or less spinescent and pendulous. Leaves $1-1 \frac{1}{2} \mathrm{in}$., fascicled on the last year's wood, alternate on the shoots, oblong-ovate, acute, obtusely serrate, more or less pubescent or flocculent below when young, those of the young tree often lobed; petiole slender. Flovers 1-1 $\frac{1}{2}$ in. diam., white. Fruit 1-2 in. long.-Distrib. Europe.
Vir. 1, Pyrus'ter, L. ; leaves shortly acuminate pubescent below when young, base of fruit ohconic.-Var. 2, Ach'ras, Gærtn. (sp.) ; leaves broader acute or cuspidate flocculent on both surfaces when young, fruit rounded at the base. Rarer.
2. P. Ma'lus, L. ; peduncles umbellate, styles united below, fruit subglobose indented at the base. Wild or Crab-apple.

Copses and hedges, from the Forth and Clyde southwards; an escape in Scotland; wild in Ireland; fl. May.-A shrub or small tree; branches spreading. Leuves 1-2 in., oblong, rounded acuminate or cuspidate at the tip, glabrous, or downy below when young. Flowers few, 1-1 $\frac{1}{2}$ in. diam., pink and white. Culyx-segments woolly. Fruit 1 in. diam., yellow.-DisTrib. Europe.
V.ar. 1, acer'ba, DC. (sp.) ; young leaves and tube of calyx glabrous, pedicels slender glabrons or nearly so, fruit drooping.--VAR. 2, mi'tis; young leaves tube of calyx and stout-pedicels pubescent, fruit erect.
Section 2. Sor'bus, L. (gen.). Fruit small, 2-8-celled; cells 1 -seeded; endocarp brittle. Flowers in compound corymbose cymes.
3. P. tormina'lis, Ehr.; leaves 6-10-lobed serrate glabrous when mature on both surfaces. Wild Service.
Woods and hedges, rare and local from Anglesea and Nottingham southwards ; H. April-May.-A small tree, branchlets and young leaves below pubescent. Leaces 2-4 in., oblong-ovate or cordate; lobes triangular, serrate, acuminate. Floucers $\frac{1}{2} \mathrm{in}$. diam., many, white. Curpels usually 2 . Fruit $\frac{1}{3}$ in., pyriform or subglobose, greenish-brown, dotted, 2 -celled.-Distrib. Europe, N. Africa. - Fruit sold in country markets. The true Service ( 1 . Sorbus, Giertn.) is a very different plant, more like the Mountain Ash, and is not a native.
4. P. A'ria, L.; leaves simple or pinnatifid rarely pinnate at the base, deeply lobed white and floceulent beneath.
Copses and borders of forests, local ; ascending to $1,500 \mathrm{ft}$. in Yorkshire ; W. and N. of Ireland ; fl. May-June. - A bush or small tree, 4-40 ft. Letces 2-6 in., very variable, glabrous above, plaited, coarsely irregularly serrate. Flowers $\frac{1}{2} \mathrm{in}$. diam., in lax corymbs, white. Fruet $\frac{1}{2} \mathrm{in}$. diam., subylubose, dotted red.-Distrib. Europe, N. Africa, Siberia, W. Asia to the Himalaya.-The following sub-species all run into one another ; the leaf characters are taken from tlowering branches.
Sub-sp. A'riA proper; leaves ovate or oblong lobulate or hardly lobed beyond the middle snow-white below, nerves $8-13$ on each side.-Mid. England southwards.
Sub-sp. rupic'ola, Syme; leaves obovate-oblong lobed above, snow-white below, nerves 5-8 on each side.-Local in England, scotland, and Ireland.
Sub-sp. inthrme'dia, Eler. (sp.) ; leaves oblong rather distantly lobed along the sides ashy-white below, nerves $5-8$ on each side. $P$. scundica, Bab.-D. of England; local.
sub-sp. fen'iica, L. (var.); leaves oblong pinnatifid snow-white beneath, fruit scarlet. $P$. pinnutiffida, Sm.-Arran Is. in the Clyde.
5. P. Aucupa'ria, Gurtn.; leaves pinnate, leaflets glabrous below when old or nearly so. Mountain Ash, Rowun-trec.
Woods and hillsides, chiefly in mountainous distriets ; ascending to $2,600 \mathrm{ft}$. in the Highlands; f1. May-June. -Tree $10-30 \mathrm{ft}$. Leuzes $5-8 \mathrm{in}$. ; leaflets 6-8 pair, $1-1 \frac{1}{2} \mathrm{in}$., linear-oblong, subacute, serrate, pale below and hairy along the miurib and nerves. Cymes 4-6 in. diam., compound, corymbose. dense-flowered. F'lourers $\frac{1}{3} \mathrm{in}$. diam., cream-white ; pedicels and calyx villous. leerres $\frac{6}{}$ in diam., globose, searlet, flesh yellow, 2-4-celled ; endocarp ulmost woody.-Distrib. Europe, Siberia, Dahuria, Madeira.

Section 3. Mes'pilus, L. (gen.). Fruit large, 5-celled ; cells 1 -seeded ; endocarp bony. Flowers solitary.
P. German'ica, L. (Mespilus); leaves obovate or oblong-lanceolate entire or serrulate. Mcdlar.
Hedges and thickets in Mid. and S. England, but not indigenous ; fl. MayJune. - A small much-branched spinous tree. Leares subacute, pubescent beneath. Flowers $1 \frac{1}{2}$ in. diam., white; peduncles $\frac{1}{2} \mathrm{in}$. C'alyx woolly, lobes with dilated foliaceous tips. Fruit $\frac{1}{2}-1 \mathrm{in}$. diam., globose, with a large depressed area at the top, and persistent calyx-lobes.-Distrib. Europe from Holland southwards, N. Africa? W. Asia.

## 13. CRAtre'gus, L. Hawthorn, Whitethorn.

Shrubs or small trees, often spiny. Leaves simple lobed or pinnatifid; stipules deciduous. Flowers in terminal corymbose cymes, white or red; bracts caducons. Calyx-tube urceolate or campanulate ; mouth contracted ; lohes 5, persistent or deciduous. Yetals 5, inserted at the mouth of the calyx. Stamens many. Carpels 1-5, adnate to the calyx-tube; styles $1-5$, stigma truncate; ovules 2 in each cell, ascending. Fruit ovoid or globose, with a bony 1-5-celled stone, or with 5 bony 1- rarely $\underline{2}$-seeted stones.-Distrib. N. temp. regions, chiefly American, extending south into New Grenada ; species about 50.-ЕтуM. крáтоs, from the strong wood.

1. C. Oxyacan'tha, L. ; spinescent, leaves deeply pinnatifid.

Forests and hedges from Moray and Isla southwards, but often only where planted ; ascending to $1,800 \mathrm{ft}$. in Yorkshire ; fl. May-June.-A small roundheaded tree, $10-20 \mathrm{ft}$., much branched. Leaves 1-2 in., very variable, cuneate, shortly petioled, lobes cut or crenate ; stipules leafy, $\frac{1}{2}$-sagittate, toothed. Cymes corymbose, many-flowered. Florer's $\frac{3}{4} \mathrm{in}$. diam., white; pericels and calyx glabrous or pubescent. Anthers pinkish-brown. C'arpels 1-2 very rarely 3 . Fruit ovoid or subglobose, usually scarlet, rarely yellow or black.-Distrib. Europe, N. Africa, Siberia, W. Asia to India ; introd. in N. America.
Sub-sp. oxyacanthoi'des, Thuill. (sp.) ; peduncles and calyx-tube glabrous, carpels 2-3. -Not common.
Sub-sp. monogy'na, Jucquin (sp.) ; leaves more deeply lobed or pinnatifid, peduncles and calyx-lobes pubescent, flowers and fruit smaller (appearing later), carpel solitary.

## 14. COTONEAS'TER, Lindl.

Shrubs or small trees. Leaves coriaceous, often downy ; stipules deciduous. Floners solitary or in few-flowered axillary or terminal cymes, small, white or pink, sometimes polygamous. Calyx-tube turbinate or campanulate ; lobes 5, short, persistent. Petals 5. Stamens many, inserted at the mouth of the calyx. Carpels 2-5, adnate wholly or by their backs only to the calyx-tube; styles $2-5$, free, stigma truneate ; ovules 2 in each cell, erect. Fruit small, ovoid, globose, or turbinate, with $2-5$ bony 1 -seeded stones.-Distrib. Europe, temp. Asia, N. Ifriea, Mexico ; species 15.-Etym. The old Latin name.

1. C. vulgar'is, Lindl.; leaves broadly elliptic-oblong densely pubescent beneath, cymes lateral, few-flowered.

Great Orme's Head, on limestone cliffs, very rare ; a native? Wetson; fl. May-June.-A small erect shrub; branchlets pubescent. Letces $\frac{3}{-1 \frac{1}{2}}$ in., romuled or acute at the tip; petiole very short; stipules searious. Flocers $\frac{1}{f}$ in. diam., pink; perlicels short, decurved, pubescent; bracts minute. Cirlyge turbinate, lobas obtuse, margins woolly. Petals small, persistent. Styles about 3. Fruit $\frac{1}{}$ in. diam.. globose, shining, red. -Distrib. Europe, Siboria, Dahuria, W. Asia to the Himalaya.

## Order XXVIII. saxif'ragefe.

## Tribes Saxifrag'ee proper and Ribésiees.

Shrubs or herbs. Leaves alternate or opposite ; stipules 0 , or ailnate to the often dilated petiole. Calyx free or more or less adnate to the ovary, 5 - rarely 4 -lobed, valvate or imbrieate in bud. Petals 5, rarely 4 or 0 , imbricate in bud. Stamens 5 or 10 , rarely 4 or 8 , perigrnous, free; anthers dorsally insertel, connective frequently glandular at the back. Disk tumid, annular or glandular. C'arpels 2 or more, usually connate into a 2 - rarely a 1 -celled ovary; styles as many as cells, free or combined, stigmas capitellate; ovules many, 2 -seriate, placentas attached to the inner angles of the cells, parietal in the 1 -eelled ovaries. Fruit a $1-3$-cellell berry or capsule, or of 2 or more follinles, many-seeded. Seeds small, albumen copious fleshy or horny ; embryo minute, terete or clavate.-Distrib. (of the British tribes). Temp. and Aretic regions of the N. hemisphere; a few oceur on lofty tropical mountains and in the S. hemisphere ; genera 19 ; species 250 . - Affinities. So close to Rosucece and Crossulacece as to be scarcely separable ; also allied to Lythrucee, Rhizophorce, and Droseracee.-Properties unimportant.
Tribe I. SAXIF'RAGEAE proper. Herbs. Flowers 4-5-merous. Ooary 1-3-celled. Petals 5. Stamens 10. Fruit capsular.
Ovary 2 -celled ; styles 2

1. Saxifraga.

Petals 0. Stamens 8 or 10 . Ovary 1-celled ; styles 2......2. Chrysosplenium.
Petals 5. Stamens 5. Ovary 1 -celled ; stigmas 3-4................3. Parnassia.
Tribe II. ribe'siefe. Shrubs. Doary 1-celled. Fruit a berry:
4. Ribes.

## 1. SAXIF'RAGA, L. SAXIfrage.

Perennial, rarely annual herhs. Leaves various, radical and cauline; petiole sheathing. Flowers cymose white or yellow, rarely red or purple. Cailys-lube free or partially adnate to the ovary; lobes 5 , imbrieate. Petuls 5. St mens 10, rarely 5. Ovary superior or partially inferior, 2 -loberd, 2 -celled; styles 2; placentas on the inuer angles of the cells. C'apsule 2-heakel, 2 -valved between the heaks, many-seeded. Seerls small, smooth or rough.-Distrib. N. and S. temp. and dretic zones ; absent in Australia, S. Africa, and the Pacific ; species 160.-DTYM. Surum and franyo, from this species rooting into rocks and breaking them up.

Section 1. Porphyr'ion, Tuusch. Perennial. Stems trailing, leafy. Lerwas opposite, small, with a pore at the tip, ciliate. Flowers solitary, subsessile. Sepals erect in fruit.

1. S. oppositifo'lia, $L$.; tufted, leaves small 4 -farious ovate-oblong.

Alpine rocks, from Wales northwards ; ascending to near 4,000 ft. in the Highlands ; N.W. and N. Ireland ; fl. April-May.-Glabrous, dark green, depressed. Stems 6-8 in., creeping. Leaves $\frac{1}{4} \mathrm{in}$., 4 -fariously imbricate, thickened and obtuse at the tip, ciliate with stout bristles. Flowers $\frac{1}{2}$ in. diam., sessile on short annual shoots, campanulate. Sepals obtuse, connate to the middle. Petals obovate, bright purple. Capsule free, $\frac{1}{2} \mathrm{in}$.; beaks diverging, subulate.-Distrib. Aretic and Alpine Europe, Asia and America, W. Asia to the Himalaya.

Section 2. Micran'thes, Hau. (gen.). Perennial, stemless, scapigerous. Radical leaves petioled. Cymes dense-flowered. Sepals adnate to the base of the carpels. Petals white.
2. S. niva'lis, $L$.; leaves broadly spathulate crenate-dentate.

High alps, between 2,000 and $4,300 \mathrm{ft}$., of Snowdon, Westmoreland, Argyle, Perth, Aberdeen, and Ben Bulben in Sligo ; fl. July-Aug.-Glandularhairy on the leaf-margins, scape, bracts and pedicels, elsewhere glabrous. Rootstock small. Leaves $\frac{1}{2} 1 \mathrm{in}$. diam., subcoriaceous, red beneath; petiole 1-2 in. Scape 3-6 in., erect, simple. Flowers $\frac{1}{4} \mathrm{in}$. diam., white, in capitate 4-12-flowered cymes. Bracts linear. Calyx-lobes connate, purplish. Capsule with short divergent beaks.-Distrib. Alpine and Arctic Europe, N. Asia, E. and W. N. America.

Section 3. Hydat'ica and Arabide'a, Haw. (gen.). Perennial, scapigerous. Stem short or 0 . Cymes lax-flowered. Sepals almost free, reflexed. Petals white with 2 purple dots above the base.
3. S. stella'ris, $L$.; stemless, leaves rosulate subsessile cuneate-lanceolate coarsely toothed, scape leafless, filaments subulate.
Alpine and subalpine rills, from Wales northwards, and in Ireland ; ascending to $4,300 \mathrm{ft}$; fl. June-July.-Glabrous or sparsely hairy. Rootstock small, branched. Leaves $\frac{1}{2}-1 \mathrm{in}$., subsucculent, ciliate. Scape 3-8 in.; cyme panicled. Flowers few, $\frac{1}{3}$ in. diam., white ; anthers and pistils red ; bracts linear. Sepals lanceolate. Capsule with suberect slender beaks.-Distris. Aretic and Alpine Europe, N. Asia, N. America.
4. S. umbro'sa, L.; more or less glandular-hairy, leaves petioled orbicular or broadly ovate coarsely crenate or toothed, base rounded cuneate or reniform, filaments dilated slightly upwards.
Mts. in W. and S.W. of Ireland ; naturalized elsewhere ; fl. June-July.Leaves $\frac{1}{2}-2 \mathrm{in}$. diam., rosulate, coriaceous; petioles $\frac{1}{2}-1 \mathrm{in}$., $\frac{1}{2}$-terete or flattened. Scape 6-12 in., leafless. Cyme panicled ; bracts linear. Flozers $\frac{1}{4} \mathrm{in}$. diam., white, sometimes sprinkled with red. Sepals reddish. Anthers red. Capsule with short divergent beaks. - Distrib. N. of Spain and Portugal.
Sub-sp. UMBRo'sA proper ; leaves obovate or suborbicular suddenly contracted into a short broad petiole crenate or toothed.-Var. 1, umbro'sa proper; leaves compactly rosulate oblong-obovate crenate. W. and S. of Ireland; ascending to $3,400 \mathrm{ft}$.; naturalized in woods elsewhere. London Pride, St. Patrick's Cabbage.-VAR. 2, puncta'ta, Haworth (sp.); leaves loosely rosulate orbicular crenate-serrate.-VAR. 3, serrutifo' ${ }^{\prime}$ 'iu, Mackay (sp.); leaves ascending obovate sharply-toothed sometimes with intermediate teeth, var. duplicato-serra'ta, Lond. Cat.

Sub-sp. Ge'um, $L$. (sp.) ; leaves orbicular more or less reniform or cordate crenate or toothed, petiole slender.-Var. 1, serra'ta, Syme ; leaves cordate erenate or toothed. Mts. of Kerry and Cork.-Var. 2, eleyans, Mackay (sp.); leaves abruptly narrowed into the short petiole, aentely toothed. A transition form to sub-sp. umbro'sa.-VAR. 3, crenci'lu, Syme ; leaves deeply cordate obtusely crenate. A naturalized form, woods, N. of England and Scotland. -Var. 4, gracitis, Mackay (M.S. sp.) ; leaves orbicular hairy on both surfaces. Connor Hill, Dingle.
Sub-sp. Hinst'T., L. (sp.) ; more hairy, leaves long-petioled broadly ovate margins cartilaginous sharply toothed or serrate rounded at the base or narrowed into the petiole. Kerry and Cork, local and rare.
S. Andrewsir, Harven; leaves linear-spathulate sessile obtuse glabrous coriaceous, margin membranous ciliate, cyme panicled, filawents subulate, sepals connate at the base hardly adnate to the ovary.
Stated to have been found at the head of Glen Caragh, Kerry, but no indigenous specimens exist. It is identical with S. Giuthrianu, Hort., a hybrid between S. umbrosa and a species of the Aizoon group.
Section 4. Hir culus, Haw. (gen.). Perennial. Stem leafy. Leaves alternate, linear-lanceolate or oblong, entire or toothed. Scpals free or $\frac{1}{2}$-adnate to the ovary, spreading or reflexed. Petals yellow.
5. S. Hir'culus, L.; stem subsimple erect leafy stoloniferous, flowers subsolitary, sepals free reflexed, capsule superior.
Bogs and wet moors, rare and local ; Clackmannau, Lanark, Perth ; ascending to $2,100 \mathrm{ft}$. in Yorkshire ; Antrim, W. Meath and Tipperary ; ft. Aug.Pubescent above, 4-8 in., branched from the base. Rudicul lewees $\frac{1}{2}-1 \frac{1}{2}$ in., rosulate, petioled, lanceolate or spathulate ; cauline linear, sometimes faintly serrulate. F/ocers 1-2 in . diam. Sepuls ciliate. l'etals obrovate, dotted red at the base, where there are 2 tubercles. Capsule with short divergent beaks.-Distrib. Arctic and Alpine Europe, N. Asia, N. America, Himalaya.
6. S. aizoi'des, L.; stems tufted decumbent leafy much branched, leaves linear-oblong crowded below, scattered on the flowering stems, sepals erect connate, adnate below to the ovary.
Stony places by alpine and subalpine rills; ascending to $3,000 \mathrm{ft}$. in the Highlands ; common in Ireland ; absent from Wales ; H1. June-July.-Often forming bright green cushions a foot across; branches 3-8 in. Letces $\frac{1}{3}-2$ in., spreading, lower rellexed, often ciliate (S. autumna'lis, L.) ; on the flowering stem narrower, strongly ciliate. Flozers 1-10, $\frac{1}{2} \mathrm{in}$. diam., orange or grollen yellow, dotted red. Culyx-tube obconic. P'etals narrowly ob-ovate-spathulate, distant. Ocury orange, depressed. Cupsule with erectopatent, subulate beaks.-Distrib. Alpine and Arctic Europe, N. Asia, N. America.

Section 5. Nephrophyl'lum, Gaud. Annual or perennial. Leaves chiefly radical, broad, palmately lobed. Sepals suberect, more or less commate and adnate to the ovary. Petals white.-Hairs articulate.
7. S. tridactyli'tes, $L . ;$ annual, stem erect many-flowered glandularhairy, leaves cuneate $3-5$-fid, uppermost entire, petioles broad, calyx-lobes short erect obtuse.

Wall-tops and dry places, E. of Scotland, from Caithness southwards, all England and Ireland, ascending to 1,800 ft. in Yorkshire; fl. April-June. -stem 2-6 in., simple or branched above. Radical leaves $\frac{1}{3}-1$ in., rosulate; segments linear-oblong, outer cleft. Cyme subracemose ; bracts subopposite ; pedicels slender. Flower's $\frac{1}{8}$ in. diam., erect, white. Calyx-tube oblong. P'etals small. C'upsule inferior ; beaks short, divergent.-Distrib. Europe, N. Africa, E. Siberia, W. Asia.
8. S. rivular'is, L.; perennial, stems decumbent rooting 1-3-flowered, leaves reniform palmately 5 -lobed, petioles slender, calyx-lobes acute.
Alpine damp rocks and streams, between 3,000 and $3,600 \mathrm{ft}$.; Ben Lawers, Braemar, Ben Nevis ; fl. July-Aug.-Tufted, slender, succulent, 1-4 in., slightly glandular-hairy. Leaves $\frac{1}{2} 1 \mathrm{in}$. diam., lobes entire ; petioles as long as the stems. Flowers 1-2, in . diam., erect, white; bracts leafy, opposite, usually undivided. Caly $/ x$-tube $\frac{1}{2}$ as long as the lobes, hemispherical. Petals distant, small, obovate-oblong. Capsule with short divergent beaks.-Distrib. Aretic and sub-Aretic Scandinavia, Siberia, E. and W. N. America.
9. S. cer'nua, L.; perennial, stem erect simple 1 - 3 -flowered, leaves petioled reniform palmately deeply crenate or lobulate, cauline sessile with axillary scarlet buds, calyx-lobes erect obtuse.
Schistose rocks near the top of Ben Lawers, alt. 4,000 ft.; fl. July.-Sparingly glandular-hairy, 2-6 in., leafy. Rootstock with scaly buds at its top. Radicul lectees $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam., often tinged red ; cauline more deeply lobed. Flozers $\frac{1}{3}-\frac{2}{3}$ in. diam., campanulate, drooping, white, rarely produced in Britain. Cal $\mu x$-tube very short. Petals large, obovate.- Distrib. Aretic and Alpine regions of Europe, N. Asia, America, and the Himalaya.-I doubt if this is more than an alpine and arctie state of S. granuluta.
10. S. granula'ta, L.; glandular-pubescent, stem erect bulbiferous at the base branched and many-flowered above, leaves petioled reniform palmately lobulate cauline sessile, calyx-lobes erect obtuse.
Sandy banks and meadows from Aberdeen southwards, ascending to $1,500 \mathrm{ft}$. in Yorkshire ; rare in Ireland ; fl. April-May.-Gregarious, glandular-hairy. Bulls as large as a pea, brown. Stem $6-18 \mathrm{in}$. Radical leaves $\frac{3}{4}-1 \frac{1}{4} \mathrm{in}$. diam.; petioles slender ; cauline deeper and more acutely cut. Flowers 1 in. diam., campanulate, inclined or drooping, white. Petals large, obovate. Calyxlobes as long as the tube. Stigmas large, reniform. C'apsule with slender beaks.-Distrib. Europe, N. Africa, W. Asia to the Himalaya.

Section 6. Dactyloi'des, Tausch. Perennial, tufted, with many flowerless leafy shoots (except $S$. cosspitosa). Leaves alternate, palmatelypartite or lobed. Sepals connate at the base and adnate to the ovary, suberect. Flowers white.-Hairs articulate, glandular.
11. S. ceespito'sa, $L$.; flowerless shoots short densely tufted, leaves cuneate $3-5$-lobed, lobes subparallel obtuse, calyx-tube oblong or subcylindric, lobes short erect, upper $\frac{1}{3}$ of carpels free.
Very rare and local, Ben Nevis, and Ben Avon, at about 3-4,000 ft. elevation; fl. July-Aug. - Tufts compact, bright green. Flovering-shoots 2-4 in., sparingly leafy. Leaves with the broad compressed petioles $\frac{1}{3} \frac{3}{4} \mathrm{in}$., lobed to or beyond the middle, upper cauline undivided. Fimoers $\frac{1}{3}$ in. diam.,
few, crowded, small, campanulate, white. Culyx green; lobes short, obtuse. Cupsule almost included in the calyx-tube, beaks short, suberect, exserted.
-Distrib. Alps and Arctic regions of Europe, N. Asia, and N. America.-
Though amongst a large suite of Aretic specimens of this plant some oceur
which are inseparable from states of hypuoides, sub-sp. hirta, this is usually
so well marked a plant that I incline to regard it as distinct.
12. S. hypnoi'des, $L$.; flowerless shoots usually elongate, leaves cuneate $3-5$-cleft, lobes divergent acute, those of the shoots often entire, calyx-tube short obconic or hemispheric, lobes usually spreading.
Alpine and subalpine districts, from N. Somerset and Glamorgan northwards ;
ascending to near $4,000 \mathrm{ft}$. in the Highlands ; frequent in Ireland; H. May-
July.-Tufts often forming large cushions, glabrous or glandular hairy.
Leuves lax or dense, with the broad compressed petioles $\frac{1}{2}-1 \mathrm{in}$.; lobes entire or the lateral cleft, flat or channelled. Flowering-shoots 3-18 in., stout or slender, leafy or nearly naked, their leaves simple, linear, or broad and more or less lobed like the radical. Flowers $\frac{1}{3}-1 \mathrm{in}$. diam., few or many, campanulate, white. Sepals rarely connate above the middle, oblong linear or ovate, obtuse or acyte. Capsule not concealed in the calyx-tube, beaks sub-ereet.-Distrib. W. and Mid. Europe from Belgium to Spain and Austria, Iceland and Greenland.
Sub-sp. hypNoi'dFs proper; leaves of flowerless shoots entire or 3 -lobed, leaves or their lobes narrowed from below the middle acuminate or mucronate, calyx-lobes narrow triangular acute.-Common and widely distributed. -Var. 1, platypel'ala, Sm. (sp.); flowerless shoots (at flowering time) with usually 3 -cleft leaves and no axillary buds, flowers sometimes pink. S. elongella, Sm.; condensuta, Gmel.-VAR. 2, gemmif'era, Syme; flowerless shoots with simple leaves and axillary buds. S. leptophlylla, Haw.-S. pygmeen, Don, doubtfully placed here in Lond. Cat., is a small garden plant like cesspitosa, of which nothing satisfactory is known.
Sub-sp. Decir'iens, Ehr. (sp.) fide Syme; leaves of all the shoots rosulate 3-7-cleft, lobes abruptly acuminate, calyx-lobes ovate obtuse as long as the tube. S. cerspitosa, Koch ; palmata, Smith. Approaches S. cerspitosa.Carnarvonshire.
Sub-sp. hir'TA, Don (sp.); flowerless shoots short, leaves 3-lobed lobes linear suddenly contracted beyond the middle acute, calyx-lobes triangular-ovate subacute.-Alpine rocks; S.W. Ireland.-Var. 1, hir'ta proper, Syme; very hairy, sepals broad, petals obovate flat.-VAR. 2, uffíuis, Don (sp.); slightly hairy, sepals narrow, petals oblong margins incurved.--VAR. 3, incurcify'iu, Don (sp.); lobes of leaves incurved obtuse, sepals subacute. A doubtful form.

## 2. Chrysosple'nium, $L$. Golden Saxifrage.

Small, succulent, annual or perennial herbs. Leaves alternate or opposite, exstipulate. Flowers minute, green or yellow, in axillary or terminal cyines. Calyx-tube urceolate or obconic, aulnate to the ovary ; lobes 4-5, obtuse, imbricate in bud. Petals 0 . Stumens 8 or 10, inserted on the margin of an epigynous disk, filaments short. Ovary inferior, 1 -celled, 2 -lobed at the top; styles short, recurved; ovules many, placentas 2 parietal. Capsule $\frac{1}{2}$-superior, 2 -lohed, membranous, opening at the top by a cruciate mouth. Secils oblong or compressed.-Distrib. N. temp, and Aretic regions, temp. S. America: sjecies 15.-EtyM. रpuods and $\sigma \pi \lambda y$, $\nu$, golden spleen, of doubtful application.

1. C. alternifo'lium, $L$.; stem simple erect, leaves alternate.

Banks of streams and wet places, from Nairn and Elgin southwards to Kent and Dorset ; ascending to near $3,200 \mathrm{ft}$. in the Highlands ; N. of Ireland only; fl. April-June.-Perennial. Stems 2-4 in., tufted, glabrous above, clothed below with soft white hairs. Radical leaves $\frac{3}{4} 2 \mathrm{in}$. diam., longpetioled, reniform, crenate ; cauline few. Florcers $\frac{1}{6} \mathrm{in}$. diam., 4-merous, yellow, in compact leafy cymes. Calyx-lobes obtuse, spreading. Capsule almost inferior, beaks short. Seeds smooth.-Distrib. Europe (Arctic), Siberia to Kamtschatka, W. Asia to the Himalaya, N. America.
2. C. oppositifo'lium, L. ; stem creeping below, leaves opposite.

Marshy and shady places, ascending to $3,300 \mathrm{ft}$. in the Highlands ; rare in the south ; fl. May-July.--size and general habit of C. alternifolium, but stem more leafy, branched, creeping and rooting at the base ; leaves $\frac{1}{2}-1 \mathrm{in}$. diam., nearly orbicular, suddenly contracted into a short broad petiole; cauline many.-Distrib. Europe, Siberia.

## 3. Parnas'sia, $L$. Grass of Parnassus.

Slender, stemless, glabrous, scapigerous, perennial herbs. Leares radical, quite entire, exstipulate. F'lower solitary, large, yellow or white. Calyxtube short, free or adnate to the base of the ovary ; lobes 5 , imbricate, persistent. Petals 5, thickish, persistent. Stamens 5, hypogynous or perigynous, alternating with 5 staminodes. Ovary superior or $\frac{1}{2}$-inferior, 1 -celled ; style short, stigmas 3-4 opposite the parietal placentas; ovules many. Capsule membranous, loculicidally $3-4$-valved, many-seeded. Sceds small, testa lax, albumen scanty.-Distrib. Arctic, Alpine, and temp. regions of the N. hemisphere from S. India northwards; species 12.

## 1. P. palus'tris, L. ; leaves ovate-cordate, stamens hypogynous.

Wet moors and bogs, from Hampshire and Somerset northwards, ascending to
2,700 ft. in the Highlands; most common in the north; fl. Aug.-Sept.-
Glabrous. Radical leaves 1-2 in., ovate-cordate ; petiole slender 2-3 in. Scupe slender, angular, twisted, with one sessile leaf about the middle.
Flower $\frac{1}{2}-1 \mathrm{in}$. diam. Sepals nearly free, obtuse. Petals coriaceous, with
strong veins. Staminodes with a fan-shaped tuft of white gland-tipped filaments. Ovary globose, superior; stigmas 4.-Distrib. E irope, N.
Africa, Siberia, W. Asia to the N. W. Himalaya, E. and W. N. America.
4. Ri'bes, L. Currant, Gooseberry.

Shrubs, often glandular and spinous, buds scaly. Leaves alternate, entire or lobed, plaited or convolute in bud; stipules 0 , or adnate to the petiole. Flowers solitary or racemose, white red yellow or green, often polygamous ; pedicels bracteate (often minutely), 2-3-bracteolate. Calyxliind tubular or campanulate, $4-5$-fid, imbricate or subvalvate in bud. Petcals small and stamens $4-5$, inserted in the throat of the calyx. Orary inferior, 1-celled; styles 2 ; ovules few or many, on 2 slender parietal placentas. Berry oblong or globose, 1 -celled, few or manyseeded. S'ecds horizontal, testa with a gelatinous coat, raphe free, alhumen adhering to the testa ; embryo minute.-Distrib. N. Temp. recrions and Andes of S. America; species 56.-Etym. An Arabic word for Rikeum, wrongly applied to this genus.

Section 1. Grossula'ria. Branches spinous. Leaves plaited in bud. Pedunctes 1-3-flowered.

1. R. Grossula'ria, L.; leaves orbicular 3-5-lobed. Wild Gooscherry. Copses in the hilly districts of the N. of England, ascending to near 1,(00) ft.; an escape elsewhere; fl. April-May.-A small spreading shrub with 1-3 spines under the leaf-buds. Leeres 1-2 in. diam., fascicled on short lateral branches, lobes irregularly crenate. Florers $\frac{1}{4} \mathrm{in}$., greenish, drooping; peduncle short, pubescent, $1-3$-bracteate about the middle. Calyn--laitus reflexed, purplish, throat and stamens bearded. Petuls white, erect, iminute. Fruit $\frac{1}{2}-1$ in.-Distrib. Europe, N. Africa, N.W. Himalaya.
Var. 1, Grossula'ria proper; leaves shining above, fruit glandular-hairy.Var. 2, Uva-cris'pa, L. (sp.) ; leaves smaller, ripe fruit glabrous.

Section 2. Ribe'sia. Branches not spinous. Leaves plaited in bud. Racemes many-flowered.
2. R. alpi'num, L.; direcious, leaves deeply 3 - 5 -lobed coarsely serrate almost glabrous and shining beneath, racemes glandular erect in flower and fruit, bracts exceeding the pedicels.
Woods in the N. of England, indigenous in Yorkshire, \&ce., not so in Scotland or Ireland; fl. April-May. - A small, all but glabrous hush; branches slender. Leaves $1 \frac{1}{2}-2 \mathrm{in}$. diam., broadly ovate, lobes usually 3 acute cut and serrate ; slender petiole and both surfaces sparingly hairy. Recems glan-dular-pubescent; male $2-2 \frac{1}{2} \mathrm{in}$., 20 -30-flowered; female shorter, 8-10flowered. Flowers $\frac{1}{6} \mathrm{in}$. diam., yellowish; bracts linear. I'etuls much shorter than the calyx-lobes. Styles very short, cleft. Fruit $\frac{1}{4} \mathrm{in}$. diam., globose, scarlet, insipid. -Distrib. Europe, Siberia to Kamtschatka, Himalaya, N. America, Labrador.
3. R. ru'brum, L.; leaves $3-5$-angled and lobed, base cordate, lohes triangular-crenate, racemes drooping in fruit eglandular, bracts shorter than the pedicels. Wild Currant.
Woods and thickets from Mid. Scotland southwards, ascending to $1,000 \mathrm{ft}$. in Yorkshire, usually an escape; not a native of Ireland; fl. April-May. -Leaces $2-4 \mathrm{in}$. diam., glabrous or pubescent above, usually tomentose beneath; petiole pubescent or setose. Riucemes 1-3 in., many-flowered, puhescent or glabrous, never glandular ; bracts ovate. Florers $\frac{1}{4} \mathrm{in}$. diam. C'alyx: glabrous, limb flat. Petels minute. Fruit $\frac{1}{}$ in. diam., red, acid. -Distirb. Europe, Siberia to Kamtschatka, N.W. Himalaya, E. and W. N. Anserica.

Var. 1, sylues'tre, Reich.; leaves hairy above tomentose beneath, raceme pubescent usually suberect in flower and drooping in fruit, flowers purplish, filaments very short, fruit contracted at the top, pedicels equalling or exceeding the fruit. Vars. Smithici'unm and Bromfieldici'sum, Syme. $R$. petro'um, Sm. not of Wulfen. - Var. 2, spica'tum, Robson (sp.); leaves hairy above when young and tomentose heneath, fruit as in V.AR. 1, its pedicels short. Isle of skye.-VAr. 3, sati'inm, Reieh.; leaves glabrous on both surfaces when mature, racemes glahrous always drooping, flowers green, fruit glohose. An escape from cultivation.
4. R. ni'grum, L.; leaves angled 5-7-lohed glandular-dottel beneath, lobes triangular arute serrate, racemes drooping lax-flowered, bracts minute, pedicels long. Black Currant.

Woods, \&cc. from Mid. Scotland southwards, probably always a garden escape ; an alien or denizen, Wutson ; fl. April-May.-A stout erect bush, smelling strongly when bruised. Leaces 2-3 in. diam., similar to those of $R$. rabrum, but rather deeper lobed; petioles slender, pubescent. Racemes slender, tomentose, eglandular, few-flowered. Florers $\frac{1}{4}-\frac{1}{3} \mathrm{in}$. diam.; pedicels $\frac{1}{4} \mathrm{in}$. C'alyx campanulate, glandular. Petals minute. Berry $\frac{2}{3}$ in. diam., globose, black.--Distrib. Europe, Siberia, Dahuria, W. Himalaya.

## Order XXIX. Crassula'cere.

Herbs or shrubs, usually succulent. Leaves opposite or alternate, exstipulate. Flowers in terminal or axillary cymes, bracteate or not. Sepals $3-5$, rarely $10-12$ or more, free or connate. Petuls as many, free or connate, imbricate in bud. Stamens perigynous or almost hypogynous, as many as the petals, or twice as many, when those opposite the petals are adnate to their bases; anthers dorsally fixed. Hypogynous scales opposite each carpel, rarely 0 . Carpels $3-5$, rarely more, 1 -celled, free, rarely connate; styles short or long, stigma small; ovules many, rarely few, attached to the ventral suture, erect or pendulous. Fruit of 3 or more membranous or coriaceous 1-celled many-seeded follicles. Seeds oblong, minute, albumen fleshy; embryo terete.-Distrib. Aretic, temp. and warm regions, but chiefly S. African ; genera 14 ; species 400 .-Affinities. With Saxifragew, and separable only by habit or the hypogynous scales, or both.Properties. Astringent roots, acrid foliage, emetic and purgative qualities, and tartaric and malic acids occur.

Leaves opposite. Petals 3-5 free. Stamens 3-5........................1. Tillæa.
Leaves alternate. Corolla 5-lobed. Stamens 10......... ........2. Cotyledon.
Leaves alternate. Petals usually 5, free. Stamens usually 10.....3. Sedum.
Leaves alternate. Petals 6-20. Stamens 12-40 .........3*. Sempercivum.

## 1. TILLEA, $L$.

Small or minute subsucculent herbs. Leaves opposite, quite entire. Flowers minute, axillary solitary or cymose, white or reddish. Calyx 3-5-lobed or -parted. Petals 3-5, free or connate at the very base. Scales $3-5$, linear, or 0 . Carpels $3-5$; styles short; ovules 1 or more. Follicles few or many-seeded.-Distrib. Ubiquitous; speeies 20.-Etym. M. A. Tilli, an early Italian botanist.

1. T. musco'sa, L.; leaves oblong, flowers solitary subsessile 3 -merous. Sandy heaths in England, rare, Norfolk, Suffolk, Hants, Dorset, Devon; th.

June-July.-Annual. Stems 1-2 in., tufted, decumbent, glabrous, reddish;
branches slender, leafy and flowering throughout. Leaces thick, concave,
obtuse or apiculate. Flowers rarely 4 -merous. Sepals ovate, acuminate,
green. Petals smaller, subulate, white. Scales 0 . Follicles constricted,
2 -seeded.-Distrib. W. Europe from Holland southwards, N. Africa.

## 2. Cotylie'don, $L$. Pennywort, Navelwort.

Herbs or small shrubs. Leaves opposite or alternate, sometimes peltate. Flowers in terminal spikes or racemes. C'alyx 5-parted. Corolla-tube urceolate or cylindric, terete or 5 -angled ; lobes 5 , small, twisted in bud.

Stamens 10, inserted in the tube of the corolla. Scales 5, linear-oblong or 4 -angular. Carpels 5 ; styles filiform; ovules many. Follicles many-seedel.-Distrib. W. and S. Europe, all Africa, temp. Asia, Mexico ; species 60.-Етум. коти入й, from the cup-like leaf of some species.

1. C. Umbil'icus, L. ; leaves peltate orbicular crenate, raceme long.

Rocks and walls, especially on the W. coasts from Argyle southwards; ascending to $1,000 \mathrm{ft}$. in Wales ; throughout Ireland ; fl. June-July.-Glabrous. Rootstock tuberous. Stem 6-18 in., simple, stout, terete. Radical leaves 1-3 in. diam., petioled, depressed in the centre; cauline spathulate, upper cuneate. Raceme continued almost throughout the stem, sometimes leafy (var. foliosa) ; bracts minute; pedicels short, slender. Flowers close-set drooping, green. Corolla cylindric, shortly 4-5-lobed. Stumens adnate to the corolla-tube, included.-Distrib. Europe from France southwards, W. Asia, Mts. of N. and trop. Africa.

## 3. SE'dum, L. Orpine, Stonecrop.

Succulent herbs, erect or prostrate. Leaves opposite alternate or whorled. Flowers eymose, rarely axillary and solitary, sometimes diœecious. Calyx 4-5-lobed. Petals 4-5, free. Stamens 8-10, alternately opposite and often adnate to the petals. Scales 4-5, entire or notched. Curpols 4-5, free or connate at the base; styles short; ovules many. Follicies many or few-sceded.-Distrib. N. temp, and cold regions, rare in America; species 120.-Etym. sedeo, from the squatting habit of the species.

Sfaction 1. Tele'phium. Rootstock stout, perennial. Stems annual. Leaves broad or concave.

1. S. Rhodi'ola, $D C$.; leaves alternate sessile, flowers 8 -merous diœecious. Rhodi'ola ro'sea, L. Rose-root.
Moist alpine and subalpine rocks, from S. Wales northwards ; aseending to near $4,000 \mathrm{ft}$. in the Highlands, also on maritime rocks in Scotland; common in Ireland; fl. May-Aug.-Rootstock 2-3 in., as thick as the thumb, branched, woody, cylindric, scent of roses ; buds scaly. Stems 6-18 in., fleshy. Letices 1-1 $\frac{1}{2}$ in., glaucous, larger and more crowded upwards, obovate-oblong or lanceolate, acute, toothed at the tip. C'ymes compact, corymbose. Flurer $\frac{1}{4}$ in. diam., yellow or purplish. Sepuls narrow. P'etuls linear, smaller or 0 in the female flower. Scales notched.-Distrib. W. Europe (Arctic), Himalaya, E. and W. N. America.
2. S. Tele'phium, L. ; leaves subsessile, flower 5 -merous hermaphrodite. Orpine.
Stony hedgehanks and copses, \&c. from Argyle southwards, local ; ascending to $1,210 \mathrm{ft}$. in Yorkshire; very rare in Ireland; often a garden escape; fl. July-Aug.--Routxtock short, stout ; roots many, elongate, tuberous. Stems 6-2 4 in., stout, green or spotted red. Leaties $1-3$ in., rarely opposite below, ovate or oblong, obtuse, flat or coneave, obtusely toothed or serrate. Cifmes dense. corymbose Plorers 合 in. diam., rosy white or speckled. Sopuls ovate-lanceolate. Pefuls twice as long, lanceolate. - Distrib. Europe, Siberia to Kamtschatka, W. Asia to the Himalaya.
Var. 1, purpurus'cens, koch (sp.) ; upper leaves sessile rounded at the hase, carpels furrowed at the back. - Vak. 2, Fiche'rice, Koch (sp.) ; more slender, upper leaves all cuneate at the base, carpels not furrowed. Common.

Section 2. Cepre'a. Annual or biennial. Stem simple. Leaves subcylindric.
3. S. villo'sum, $L$. ; glandular-pubescent, leaves sessile $\frac{1}{2}$-cylindric. Bogs and marshes in hilly districts from York and Westmoreland to Argyle and Elgin, ascending to 2,000 ft. in Yorkshire; absent from Ireland; fl. June-July.-Biennial. Stem with a tuft of leaves the first year, lengthening in the second, then slender, $3-6 \mathrm{in}$., and flowering. Leaves $\frac{1}{+\frac{1}{3}} \mathrm{in}$., scattered, linear, obtuse. Cyme few-flowered, subscorpioid. F'lowers' $\frac{1}{2}$ in. diam., white or purplish. Sepuls ovate, obtuse Petals broad, acute.-Distrib. W. Europe (Aretic), Norway to Italy and Hungary, Greenland.
Section 3. Se'dum proper. Perennial. Stems branched, with many flowerless leafy prostrate or ascending shoots. Leaves cylindric or $\frac{1}{8}$ cylindric.

* Flovers vhite.

4. S. al'bum, L. ; glabrous or slightly glandular, leaves alternate subcylindric oblong contracted at the base, petals oblong-lanceolate.
Malvern Hills, Gloucestershire, and Somerset, indigenous (Syme); a garden escape on walls from Forfar southwards ; an alien, Watson ; fl. July-Aug.Flowerless stems prostrate ; flowering erect, 6-10 in. Leaves $\frac{1}{3} \frac{1}{2}$ in., obtuse, bright green. Cyme corymbose, glabrous. Florers $\frac{1}{6} \frac{1}{8} \frac{\mathrm{in} \text {. diam. Petals }}{2}$ twice as large as the green sepals.--Distrib. Europe, Siberia.
Var. 1, teretifólium, Haw. (sp.); leaves much flattened above, sepals and petals obtuse.-V'AR. 2, micran'thum, Bast.; leaves flattened on both surfaces, sepals rounder, petals more acute. Naturalized in Sussex, Ireland, \&c.
5. S. ang'licum, L.; glabrous, leaves alternate ovoid-oblong gibbous at the base below, petals lanceolate acuminate keeled.
Rocks and banks, chiefly by the sea on the W. coasts, but ascending to $3,300 \mathrm{ft}$. in N. Wales ; all round Ireland; fl. June-Aug.-Tufts matted, pale green or reddish. Flowering stems $1-2 \mathrm{in}$., ascending, leafy. Leares $\frac{1}{8}-\frac{1}{4} \mathrm{in}$., crowded, tumid at the base. Cymes short, scorpioid. Flowers $\frac{1}{3}$ in. diam., few, crowded at the top of the flowering stem, white, or pink. Sepals obtuse, short. Carpels pink.-Distrib. W. Europe.
S. Dasyphyl'lu'm, L. ; glandular-pubescent, glaucous, leaves on the flowerless shoots mostly opposite subglobose or shortly ovoid equal at the base below.
Old walls, \&c. in Mid. and S. England ; Wales and Scotland, rare ; an alien, Wutson; fl. June-July.-Loosely tufted, very glaucous and pink, much branched. Floxerless stems short, with rosulate leaves; flowering 2 in ., flexuous, slender. Leatess $\frac{1}{8}-\frac{1}{6} \mathrm{in}$. Cyme forked, few-flowered. Flowers $\frac{1}{3} \mathrm{in}$. diam. Petals often streaked with pink.-Distrib. S.W. and S. Europe.

## * Flovers yellovo.

6. S. a'cre, L. ; glabrous, leaves densely imbricate alternate erect terete ovoid-oblong, sepals slightly gibbous at the base, petals lanceolate acmminate. Biting Stone-crop, Wall-pepper.
Rocks. walls, and sandy places, especially near the sea; ascends to $1,500 \mathrm{ft}$. in
lorkshire ; fl. June-July.-Tufts or eushions 3-10 in. diam. Stems 3-5 in.
Letiees $f-\frac{1}{4}$ in., obscurely 6 -seriate, broadest at the base, gibbosity in contact
with the stem. Flowers $\frac{1}{3} \mathrm{in}$. diam., few, golden-yellow. Sepals ohtuse, not half as long as the petals. Authers yellow.-Distrib. Europe, N. Africa, Siberia.-Taste acrid ; is a vesicant, emetic and cathartic.
7. s. rupes'tre, Hudson; glabrous, leaves linear-lanceolate flattenerl gibbous at the base, sepals oblong not gibbous at the base.
Rocks in S.W. England and Wales, rare ; fl. June-July.-Ntems stout. loosely tufted, green or tinged with pink; flowerless with closely rosulate leaves; flowering 6-10 in., with suberect scattered leaves. Leutes k-1 in.. acute or acuminate, the gibbosity close to the stem. C'ymes 3-4 in. diam., branches scorpioid. Flowers $\frac{2}{3} \mathrm{in}$. diam., golden yellow. Sepals oblong, ohtuse. Petuls lanceolate, acute. Anthers yellow.-Distris. Europe from Belgium south-wards.-I follow Syme in the diagnosis of the following sub-species.
Sub-sp. Ei'mgans, Lej.; glaucous, eyme rather flat-topped.- Car. 1. mujzers: stout, 6-12 in., leaves $\frac{3}{4}-1 \mathrm{in}$. , cyme $3-5 \mathrm{in}$. diam. Cheddar Cliffs.-- Yir. 2, mi"nus; smaller and more slender. St. Vincent's Rocks, Bristol, Shropshire and Wales, indigenous ; elsewhere in England an escape.
Sub-sp. Forsthria'num, Sim. (sp.); more slender, cymes rather round-topperl sometimes capitate. Wet rocks; W. Somerset and Wales.
S. sexanglla're, $L$; glabrous, leaves cylindric spreading gibbous at the base, sepals not gibbous at the base.
Old walls in the E. of England, not indigenous ; fl. July. Stems loosely tufted, flowerless with crowded leaves in about 6 rows; flowering $3-6$ in., laxer spreading or recurved with leaves $\frac{1}{4} \mathrm{in}$.; basal gibbosity of the leaf acute, in contact with the stem. Cyme 1-2 in. diam., corymhose. Florrers $\frac{1}{3} \mathrm{in}$. diam., yellow. Sepals obtuse. Petals lanceolate, acute.-Distrib.
Mid. and E. Europe.
S. reflex'cm, $L$.; glabrous, leaves crowded cylindric-subulate spreading and reflexed, sepals not gibbous at the base.
On rocks and housetops in England, Wales, and Ireland, not indiqenous ; fl. July-Aug.-Very similar to S. rupestre, but usually much larger, the leaves are almost cylindric, and in about 6 series with subulate tips; the flowers are usually bracteate, often 6 -merous.-Distibib. Europe.
Var. 1, reflex'um proper; leaves green, those of the flowering shoots reflexed, flowers bright yellow.-VAR. 2, alles'cens, Haworth (si.); smaller, leaves glaucous those of the flowering-stems not reflexed, flowers pale yellow. S. glaucum, Sm. Mildenhall, Suffolk; Babbicombe, Devon.

## 3*. SEMPERVI'VUM, L. House-leek.

Suceulent herbs or undershrubs. Rudical leaves densely rosulate, stoloniferous from their axils; cauline alternate. Flowers in corymbose or panicled cymes. Calyp: 6-multi-fid or partite. Petuls as many, free or connate and adnate to the alternate filaments below, narrow, acute. Stamens usually twice as many, the alternate sometimes deformed or transformed into carpels. Seales various, simple, or connate in pairs, 2 -fid or fimbriate, rarely 0 . C'arpels as many as petals, free or connate and adnate with the calyx-tule ; styles filiform ; ovules many. Folliches many-seeded.-Distrib. Europe, N. Africa, especially Malcira and the Canaries, W. Asia and the Himalaya; species 40.-Etym. semymer and viro, from their retention of vitality.
S. tectórum, L.; perennial, glandular pubescent above, leaves ciliate. Tops of walls and houses, not indigenous; fl. June-July. - Barren shoots 2-4 in. diam., in globose tufts, densely clothed with rosulate leaves; flowering-stems 1-2 ft., erect, stout, with the leaves scattered. Leaves 1-2 in., very fleshy, oblong or obovate-lanceolate, mucronate, edged with purple, tips flat. Cyme $2-5 \mathrm{in}$. diam., branches scorpioid. Flowers ${ }_{3}^{2}-1 \mathrm{in}$. diam., dull red-purple. Sepals 12, narrow, acute. L'etals lanceolate, ciliate. Stumens 12, perfect, with as many imperfect or transformed into carpels. S'eales very small.-Distrib. Europe and W. Asia.

## Order XXX. drosera'cere.

Perennial herbs, rarely shrubby below, usually very glandular. Leaves radical and rosulate, or cauline and alternate, circinate in bud, stipulate. Inflorescence various, often circinate cymes. Sepals 4-8, imbricate in bud, persistent. Petals 4-8, hypogynous or perigynous, free or connate at the base, imbricate, persistent. Stamens 420 , inserted with the petals, rarely adnate to them ; anthers versatile or basifixed, bursting outwards. Disk 0, or obscure. Ovary free or adherent by a broad base, 1-5-celled ; styles 1-5, simple or divided, stigmas simple or multifid; ovules many, parietal, anatropous. Capsule 1-5-celled, loculicidally 3 -valved, many-seeded. Secds small, albumen fleshy, testa often lax; embryo axile, straight.-Distrib. Sandy or marshy places; most common in temp. Australia; genera 6 ; species 110.-Affinities. Close to Saxifragea.-Properties. Yield a deep red-purple dye, and are said to be acrid and poisonous.

## 1. Dros'era, I. Sundew.

Slender glandular herbs. Leaves alternate or rosulate ; stipules scarious, aldate to the petiole or 0 . Flowers in scorpioid racemes, rarely solitary. Sepals and petals 4-6 or 8. Stamens as many, hypogynous or perigymous. Ovary free, ovoid or globose, 1-celled; styles 2-5, free or comnate below ; ovules in many series, on $2-5$-parietal placentas. Crppsule oblong, $2-5$-valved. Seeds minute, testa lax ; embryo large or small. Distrib. Of the Order; species 100.-Etym. סpogepís, from the dew-like glands.

1. D. rotundifo'lia, $L$.; leaves horizontal orbicular or broadly obovate, petiole hairy, testa loose reticulate.
Spongy bogs and heaths; ascending to $2,300 \mathrm{ft}$. in the Highlands ; fl. July-Aug.-Rootstock slender. Stem very short. Leaces $\frac{1}{3} \frac{1}{2}$ in. diam., rosulate, margin glandular, nearly glabrous above ; petiole $1-1 \frac{1}{2}$ in., gradually dilated at the sheathing hase. Ncupes 3-6 in., axillary ; bracts subulate; pedicels short. F'lorers $\frac{1}{5} \mathrm{in}$. diam., many, in 2 series, white, usually 6 -merous. Petals a little longer than the sepals. Styles 2 -fid, incurved, segments clavate. C'apsule acute, exceeding the sepals. Seeds elongate.-Distrib. Europe (Arctic), Siberia, W. Asia, E. and W. N. America, from the Arctic circle to Florida.
2. D. interme'dia, Hayme ; leaves erect obovate or oblong-spathulate, petiole glabrous, testa close granulate. D. longifolia, L. in part.

Bigs and moist heaths, from Inverness southwards; local in Scotland; W. of Ireland chiefly ; fl. July-Aug. - Stem short, leafy. Leates gradually contracted into the petiole, together 1-2 in. Scapes 2-4 in., curved at the base. Florers much as in 1). rotundifolia, usually $5-8$-merous. (iopsule pyriform, equalling the sepals. Seeds ovoid.-Distrib. Europe (Arctic), W. Asia, E. America from C'anada to Brazil.
3. D. ang'lica, Hudson; leaves suberect linear-spathulate, petioles glabrous, testa loosely reticulate. D. longifolia, L. in part.
Wet moors, ascending to $1,700 \mathrm{ft}$. in the Highlands; rare in S. England and in Ireland; fl. July-Aug.-Very similar to D. intermedia, but larger. Leaces $\frac{1}{6} \mathrm{in}$. broad; petioles $2-4 \mathrm{in}$. Scrpes 4-8 in. Fluners $\frac{1}{3} \mathrm{in}$. diam., 5-8merous. Capsule obovoid, longer than the sepals. - Distrib. Europe, Siberia to Kamtschatka, E. and W. America. I. oboca'tu, Mert. and, Koch, with broader leaves, styles often notched, capsule half as long as the sepals, seeds imperfect, is probably a hybrid between this and D. rotumilifoliu.Scotch moors.

## Order XXXI. halora'gere.

Herbs or shrubs, often marsh or aquatic, with much-reduced or imperfert perianths. Leaves opposite alternate or whorled, exstipulate. Fiocers often minute and 1 -sexual. Calyp superior; lobes 2, 4, or (3, valvate or slightly imbricate in bud. Stamens 1-8, epigynous in the 2 -sexual flowers, filaments usually short; anthers (exeept in Callitriche) long. 4 -angled, basifixed and bursting laterally. Disk small or 0. Ocury inferior, mostly of 2-4 connate (rarely of 1) carpels; styles or stigmas as many as the carpels, except in Callitriche; ovules 1 in each cell, pendulous, anatropous. Fruit 2-4-celled, dry and indehiscent, or of 1-4 small 1 -seeded drupes. Seed pendulous, testa membranous, albumen fleshy ; embryo cyliudric, axile, or minute in the base of the albumen.-Distrib. Widely dispersed; genera 9 ; species 80.-Affinities. Usually placed near onuyrariea, but differing in the valvate petals, solitary peudulous ovule, separate styles, fleshy albumen, and embryo, and I think much nearer Sussifragea and Rhizophorea.- Properties unimportant.
Leaves all whorled, entire. Stamen and style 1 ....................1. Hippuris.
Leaves all or lower whorled, much cut. Stamons 4 or 8....2. Myriophyllum.
Leaves all opposite, quite entire. Stamen 1.......................3. Callitriche.

## 1. HIPPU'RIS, $L$. Mare's-tail.

Glabrous, aquatic herbs. Stems stout, erect, simple, leafy. Leaves whorled, narrow, quite entire. Flowers minute, solitary, axillary, sometimes 1 -sexual. C'alyp-tube subglobose, limb entire. Potrls 0 . Shamen 1; anther basifixed. Ocary 1 -celled, style 1, subulate, stigmatose throughout its length. Drupe ovoid, stone crustaceous. Seed ohlong, alhumen scanty.-Distrib. Aretic and temp. N. hemisphere, Chili and Fuegia; species 1 or 2.-Etym. \%raus and oúpá, horse-úuil.

1. H. vulga'ris, $L$.; leaves 6-10 in a whorl linear acute.

Margins of lakes, ponds, \&c.; local ; fl. June-July.-Rutttock submerged, stout, creeping. Stems 6-24 in., terete, very many-jointed, as thick as a
goose-quill or less; rarely floating flaccid and flowerless. Leaves $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$., close-set, tips withered. Flowers green, sessile. Anthers red. Drupe minute, smooth, green.-Distrib. Of the genus.

## 2. MYRiophyl'Lum, $L$. Water Milfoil.

Glabrous marsh or aquatic herbs ; branches often floating. Leaves opposite alternate or whorled. Flowers small, axillary, solitary or spikel ; upper male, lower female, intermediate often 2 -sexual.-Male fl. Caly; 4- rarely 2 -lobed or 0 . Petals 2 or 4, concave. Stamens 2, 4, or 8 ; anthers long, basifixed, bursting laterally.-Fem. fl. Calyx-tube 4 -grooved; lobes 4, minute or 0 . Petals minute or 0 . Ovary 4 - rarely 2 -celled. Styles 4, very short, plumose ; drupes 4. Seeds oblong ; albumen copious. -Distrib. Ubiquitous; species 15. - Etym. $\mu v \rho$ íos and фúdдov, from the finely-divided leaves.

1. M. verticilla'tum, $L$. ; spike erect in bud, floral leaves all whorled in about fives pinnatifid or pectinate all longer than the flowers, upper axils usually flowerless.
Ditches and ponds, from Northumberland southwards, and in Ireland; rare ; fl. July-Aug.-Rootstock creeping. Stems floating, leafy. Leaves 1-2 in., in close-set whorls ; segments distant, capillary, collapsing when removed from the water. Spike elongate. Flowers white. Anthers linear. Fruit suhglobose, green, rounded on the back.-Distrib. Europe, N. Africa, Siberia to Dahuria, W. Asia to India, E. and W. N. America.
Var. pectina'tum, DC. (sp.) ; floral leaves hardly longer than the flowers.
2. M. alternifo'rum, $D C$.; spike curved at the tip in bud, female floral leaves whorled in threes or fours pectinate longer than the flowers, male opposite or alternate entire or serrate shorter than the flowers.
Ponds and ditches ; ascending to $1,200 \mathrm{ft}$. in the Highlands ; fl. June-Aug.
-Habit of M. spicutum, L.; but more slender and flowers fewer, and inhabits lakes in billy and upland districts.-Distrib. Europe (Aretic), N. Africa, Arctic America.
3. m. spica'tum, L.; spike erect in bud, floral leaves all whorled in about fours pectinate shorter than the flowers.
Ponds and ditches, ascending to $1,200 \mathrm{ft}$. in the Highlands; fl. June-Aug.-The small floral leaves, giving the inflorescence a more spicate appearance than M. verticillatum, is its best character; the fruit also is less globose.-Distrib. Europe (Arctic), N. Africa, Siberia, N. America.

## 3. Callit'riche, $L$. Water Star-wort.

Slender glabrous marsh or aquatic plants. Leaves opposite, quite entire, upper often rosulate. Flowers moncecious, minute, solitary, axillary.Made fl. Stamen 1, subtended by two bracts, filaments slender; anther-cells confuent above. -Female fl. Bracts 2 or 0 . Ovary sessile or shortly peduncled, 4-lobed longitudinally, 4-celled ; styles 2, slender, stigmatose all over. Fruit compressed, indehiscent, 4-lobed, 4-celled, lobes margined or winged at the back, at length separating.-Distrib. Chiefly temp. waters; species 3 or 4.-Етум. ка入ós and $\theta \rho \grave{\text { ¢ , from the elegance of its capillary }}$ ramification.-I have followed Hegelmaier's limitation of the British forms of this very variable genus. Its affinities are doubtful.

1. C. ver'na, I. ; leaves not dilated at the base, flowers bracteate, earpels slightly keeled connate for about half their breadth.
Ponds, ditehes and sluggish streams, ascending to $2,200 \mathrm{ft}$. in the Highlands ;
fl. April-Oct.-Very variable in size and habit, covered with scatteren stellate hairs or scales. Stems 3-12 in., submerged, terete, sparingly branched. Leures $\frac{1}{2}-1 \mathrm{in}$., submerged linear; floating rosulate, obovate, notched, 3 -nerved. Flozers, male and female often in opposite axils. Bracts white, deciduous, incurved. Filuments very slender. Furwor on the carpels shallow, not extending to the base of the lobes. --Disthib. All temp. and cold climates (Aretic).
Sub-sp. verna'iss, Kuetzing (sp.); fruit sessile, carpals turgid sharply keeled

Sub-sp. Platycan'P., Kutzing (sp.); fruit subsessile, carpels flattish sharply keeled sinus deup, styles at length reflexed persistent, pollen subglobose.
Sub-sp. hascla'ta, íretziny (sp.); fruit subsessile, carpels flattish shortly broadly keeled sir.us shallow, styles long at length reflexed deciduous, pollen subglobose.
Sub-sp. pedenctlata, DC. (sp.), leaves always linear, fruit peduncled or sessile, carpols flattish shortly sharply keeled sinus shallow, styles long at length reflexed deciduous, pollen suhglobose.-Flowers earlier.
2. C. autumna'lis, $L$.; leaves dilated at the base, bracts 0 , carpels hroailly winged connate at the base only.
Lakes, rare and local ; Isla and Kincardine to Anglesea ; N. and N.W. Ireland ; fl. June-Oct.-Ntem brittle and leaves without stellate hairs. Letcess $\frac{1}{8}-\frac{1}{2}$ in., all linear, dark green. Fruit much larger than in C. verna.-Distinis. Europe (Arctic), Siberia, N. America.

## Order XXXII. onagratriere.

Herbs (rarely shrubs or trees). Leaves opposite or alternate, exstipulate. Flowers usually axillary, regular. Calyx superior; lobes 2-4, valvate in bud. Petuls $2-4$, rarely 0 , inserted at the base of the disk, fugarious, twisted in bud. Stamens 1-8, 1-2-seriate, sometimes declinate; anthers oblong. Disk epigynous and coating the calyx-tube. Overy 4- (rarely 1-6-) celled; style filiform, stigma entire or 4-lobed; ovules 1 or more in the inner angle of each cell, pendulous or ascending, anatropous. Fruit a drupe. berry, or capsule. Seeds 1 or more, smooth papillose or hairy, albumen 0 or very scanty ; embryo ovoid, cotyledons plano-convex.-Distrib. Temp. regions, rarer in tropical ; genera 22 ; species 300 .-Apfinitiss. With Lythrucer and Melastomacee, but not strong.-Properties unimportant.

## 1. EPILO'BiUM, $L$. Willow-hyrb.

Herbs or under-shrubs, stolons creeping. Leaves alternate or opposite. Flowers solitary axillary, or in terminal leafy spikes, pink or purple, rarely yellow. C'uly.e-tube sleuder; limb 4 -partite, deciduous. Petuls 4 , usually 2 -lobed. Stamens 8 , the alternate shorter. Ovary 4 -celled; style filiform,
stigma obliquely clavate or 4 -lobed; ovules many, 2 -seriate, ascending. Capsule elongate, 4 -celled, loculicidally 4 -valved ; valves separating from a 4 -winged seed-bearing axis. Seeds broadest above, tipped with a long pencil of hairs, minutely tubercled.-Distrib. Arctic, temp. and cold regions, abundant in New Zealand; species 50.-Eтум. è $\pi i$ and $\lambda 6 \beta o \nu$, from the position of the corolla, \&cc. on the pod.

Section 1. Chamænérion. Corolla irregular, rotate. Calyx-lobes free to the base, spreading. Stamens declinate.

1. E. angustifo'lium, L. ; stem tall simple, leaves lanceolate. Rose-bay or French Willow.
Moist river-sides and copses, most common in Scotland ; ascending to 2,700 ft. in the Highlands ; E. and N. of Ireland, rare; fl. July-Aug.-Glabrous, inflorescence pubescent. Stem 2-4 ft., erect, terete. Leaves 3-6 in., petioled, alternate, obscurely toothed, glaucous below. Racemes elongate. Florers 1 in. diam., bracteate, dark rose-purple. Petals obovate-spathulate, 2 lower smaller. Style bent down, stigmas 4, erect then revolute. Capsule 2-4 in. Seeds ohovoid.-Distrib. Temp and Aretic Europe, N. and W. Asia to the Himalaya, and America.
VAR. brachycur' pum, Leighton (sp.); stem 4-6 ft., buds very oblique, capsules $1-1 \frac{1}{2}$ in.-Only known in cultivation and as a garden escape.
Section 2. Lysima'chion. Flowers regular, campanulate or funnelshaped. Calyx-lobes connate at the base. Stamens erect.

> * Stem terete. Stigma 4-cleft.
2. E. hirsu'tum, $L$.; glandular-pubescent and hirsute, leaves opposite oblong-lanceolate $\frac{1}{2}$-amplexicaul serrulate, buds erect. Codlins-and-cream. Sides of ditches and rivers, from Aberdeen southwards; fl. July-Aug. Odorous. Stolons subterranean, thick, fleshy, scaly, leafless. Stems $3-5 \mathrm{ft}$., terete with raised lines from the leaf-bases. Leaves 3-5 in., teeth incurved. Florers very many, $\frac{1}{4} \frac{3}{4}$ in. diam., rose-purple. Petals broad, notched. Filaments bearded at the base. Stigma-lobes revolute. Capsule 2-3 in.-Distrib. Europe, N. Africa, Siberia, W. Asia; introd. in N. America.
3. E. parvifior'um, Schreb. ; pubescent or glabrate, leaves mostly alternate sessile lanceolate obscurely toothed, buds erect.
Ditches and river-hanks, from Moray and the Hebrides southwards;
fl. July-Aug.-Stolons autumnal, with subsessile rosulate leaves. Stem
1-3 ft., terete, branched above. Leaves 1-2 in., linear or oblong-lanceolate, rounded at the base. Flowers $\frac{1}{3} \mathrm{in}$. diam., many, rose-purple. Stigma-lobes short, not revolute. Capsules $1 \frac{1}{2}-2$ in., pubescent.-Distrib. Europe, N. Africa, Himalaya.
Var. 1, rioula're, Wahl. (sp.); almost glabrous.-Var. 2, intermédium, Mérat (sp.) ; most or all the leaves alternate.
4. E. monta'num, L.; stem pubescent, leaves mostly opposite glabrous oblong-ovate acute toothed, buds drooping.
Shady banks, walls and cottage roofs, ascending to near $1,700 \mathrm{ft}$. in the Lake district; fl. June-July.-Stolons autumnal, subterranean and fleshy, or subærial with suberect rosulate leaves. Stem 6-24 in., erect, subsimple, slender. Leaves 1-3 in., sometimes petioled, or whorled in threes. Flowers $\ddagger-\frac{1}{3}$ in. diam., pale purple. Stigma-lobes short, not revolute. Capsules $2-3 \frac{1}{2}$
in., finely pubescent. - Distrib. Europe (Arctic), Siberia, W. Asia to the Himalaya.
5. E. lanceola'tum, Sebrst. and Maur. ; finely pubescent. leaves mostly alternate petioled oblong-lanceolate toothed, buds inclined.
Roadsides and stony places by streams, Devonshire, Somerset, Monmouth, Derhyshire ; fl. July-Oct. - Stolons autumnal, with spreading rosulate leaves. Stem 1-3 ft., erect, branched, terete, pubescent, hairs short recurved. Leares $1 \frac{1}{2} 3$ in., lowest opposite, petioles terminating in obscure decurrent lines on the stem. Florrers $\frac{1}{4} \mathrm{in}$. diam., many, pale rose. Stimma-lohies short, spreading. Pods 2-3 in., finely pubescent.-Distrib. Europe from the Channel southwards, and eastwards to Turkey.
** Stem often more or less 2-4 anyled, or woith 2-4 raised lines. Stigma oblique, clavate.
6. E. ro'seum, Schreb.; pubescent above with 2-4 raised lines, leaves petioled mostly alternate ovate-oblong narrowed above and below toothed glabrous, buds inclined acuminate.
Copses and moist places from Mid. Scotland southwards, rare in the north; a doubtful native of Ireland; fl. July-Aug.-Stolons autumnal, with loosely rosulate leaves. Stem $1-2 \frac{1}{2} \mathrm{ft}$., erect, brittle, much branched. Leaces $1 \frac{1}{2}-2 \frac{1}{2} \mathrm{in}$. Florers many, 6 in . diam., rose-red. Capsules 2-3 in., pubescent. -Distrib. Europe, Siberia, Himalaya, N.W. America.
7. E. tetrag'onum, L.; pubescent above, stem 2-4-angled, leaves sessile oblong- or ovate- or linear-lanceolate toothed, buds erect acute.
Wet places, ascending to $2,100 \mathrm{ft}$. in the Highlands; fl. July-Aug.-Stem 1-2 ft., erect, branched, rather tough. Leerres 1-3 in., narrow, lower or all below the branches opposite, rarely slightly petioled, base decurrent. Floarers $\frac{1-3}{3}$ in., rose-lilac. Pods 2-4 in.-Distrib. Europe (Arctic), N. and S. temp. and colder zones.

Sub-sp. Tetrag'onum proper; stolons autumnal with rosulate leaves, leaves linear-oblong or -lanceolate shining above, capsules 2-4 in. slightly incurved.
Sub-sp. obscu'rum, Schreb. (sp.); stolons restival with few distant pairs of opposite leaves, leaves ovate-lanceolate not shining above, capsules $1-2 \mathrm{in}$. suberect or rather spreading. E. virgatum, Gren. and Godr.-The most common form.
8. E. palus'tre, $L$.; finely pubescent above, stem terete without raised lines, leaves subsessile mostly opposite lanceolate from a cuneate base, buds notding obtuse, seed fusiform, testa produced at the tip.
Bogs and ditches ; ascending to near 2,000 ft. in Yorkshire ; f. July-Aug.-
Stoloms esstival, subterranean, filiform, sealy, bearing in autumn scaly buds.
Stem 6-24 in., simple or branched, with often two lines of pubescence.
Lences $1 \frac{1}{2}-2 \frac{1}{2}$ in., flaccid, spreading, almost all opposite, scarcely toothed, tip narrowed but obtuse. Floarers horizontal, $\frac{1}{2} \mathrm{in}$. diam., rose-lilac. Poc/s $2-2 \frac{1}{\mathrm{in}}$. Seeds much narrower than in all preceding species, with a distinctly produced testa.-Distrib. Temp. and Arctic zones of the N. hemisphere.
Var. ligula'tum, Baker ; leaves lanceolate faintly toothed, seeds shorter.
9. E. alsinifo'hum, Villars ; almost glabrous, stems tufted ascending with 2-4 ohscure pubescent lines, leaves usually opposite subsessile ovate or ovate-lanceolate acuminate toothed glabrous shining, buds drooping obtuse, seeds narrow clavate, testa produced at the tip.

Spongy rills, \&c. in alpine and subalpine districts, Wales, N. of England, and Scotland, ascending to near $2,900 \mathrm{ft}$; absent from Ireland ; fl. July.Stulons æstival, subterranean, filiform, scaly, bearing in autumn a scaly bud. Stem 4-12 in., simple or branched, flexuous, subsucculent. Leaves 1-2 in., like those of E. montunum, flaccid, bright green. Flowers $\frac{1}{3} \mathrm{in}$. diam., few, bright rose-purple. Capsule $1 \frac{1}{2}-2$ in., almost glabrous.-DIstrib. Arctic, Northern and Mits. of Mid. Europe, E. and W. N. America.
10. E. alpi'num, $L$. ; small, slightly pubescent, stem with 2 pubescent lines, leaves opposite elliptic-oblong obtuse entire or toothed, buds obtuse and flowers pendulous, seeds narrow-obovoid, testa not produced.
Alpine rills, of Scotland only, ascending to near $4,000 \mathrm{ft}$; fl. July.-Stolons rosulate, æstival. Stem usually ascending, 3-9 in., slender, simple, often curved. Leares $\frac{1}{2}-\frac{2}{3} \mathrm{in}$., few, shortly petioled. Flovers $1-3$, $\frac{1}{-\frac{1}{3}} \frac{1}{3} \mathrm{in}$. diam., bright or pale rose-purple. Capsules $1-1 \frac{1}{2}$ in., almost glabrous.-Distrib. Aretic and Alpine Europe, Asia, the Himalaya, N. America.
Var. anagallidifo'lium, Lamk. (sp.); stolons elongate with opposite pairs of green leaves, flowers small pale.-The commonest form.

## 2. LUDWIG'IA, $L$.

Annual or perennial herbs, sometimes aquatic. Leaves opposite or alternate, quite entire. Flowers usually axillary solitary and sessile; peduncles 2-bracteate. Calyx-tube cylindric or angled or turbinate; lobes 3-5, persistent. Petals 3-5 or 0, and stamens (3-5) inserted under the margin of an epigynous disk. Ovary 4-5-celled; style short, stigma 3-5-lobed; ovules many, in many series, on prominent axile placentas. Capsule septicidal or dehiscing by terminal pores, or irregularly rupturing longitudinally. Seeds minute.-Distrib. Temp. and warm regions, chiefly of N. America ; species 20.-Etym. C. G. Ludwig, a Leipsic botanical professor.

1. L. palus'tris, Elliot ; leaves all opposite ovate or elliptic. Isnardia, L.
Boggy pools, Buxted, Sussex; Petersfield Heath and Brockenhurst, Hants; Jersey ; fl. June-July.-Glabrous, perennial. Stem 6-10 in., rooting at the nodes, procumbent or floating, 4 -angled, branched. Leaves $\frac{1}{2}-1 \mathrm{in}$., petioled, acute, shining. Flowers 4 -merous, minute, axillary, sessile, green; bracts subulate. Calyx-tube $\frac{1}{8} \mathrm{in}$., oblong, truncate, with 4 green ribs; lobes triangular, acute. Petals 0 (or small and red in American specimens). Style short, stigma large capitate. Seeds angular.-Distrib. Europe from Hamburg southwards, N. Africa, Mid. Asia, E. and W. N. America.

## 2*. ENOTH'ERA, L. Evening Primrose.

Herbs, rarely shrubby. Leaves alternate. Flowers axillary, solitary or in leafy spikes or racemes, large, yellow red or purple. Calyx-tube elongate, 4 -angled ; limb cylindric, 4-lobed, deciduous. Petals 4. Stamens 8 ; anthers usually long. Ovary 4 -celled; style filiform, stigma capitate entire or 4-lobed; ovules many, 1-2-seriate, horizontal or ascending. Capsule 4. rarely 1 -celled, splitting from the top downwards into 4 septiferous valves, usually leaving the seeds on the axis, sometimes indehiscent. Seeds many or few, sometimes appendaged.-Distrib. Temp. N. and S. America, rarely tropical ; one is Tasmanian ; species 100.-Etym. obscure.
©. bien'ais, L.; erect, petals obcordate, pods ohlong subeylindric.
Cultivated ground at Crosby, Liverpool ; a garden escape ; fl. July-Sept.-
Annual or biennial, pubescent or hairy, $2-3 \mathrm{ft}$. Leeves 3-6 in., ovate-lance-
olate, remotely toothed; petiole short, midrib stout, white. Flowers $3-3 \frac{1}{2}$ in. diam., subspicate, sessile, golden yellow. C'ulyc-- obes much longer than the
ovary. Capsule 1-2 in., obtusely 4-ribbed.-Distrib. N. America.

## 3. CIRC居'A, Tourn. Enchanter's Nightshade.

Slender ereet herbs, with creeping rootstocks. Stem simple. Leaves opposite, petioled, toothed. Flowers small, white, in terminal and lateral peduncled racemes. Culyx-tube ovoid; limb 2 -parted, reflexed, deciduous. Petuls obcordate and stamens 2, inserted under the margin of an epigynous disk. Ovary 1-2-celled; style filiform, stigma capitate 2-lobed ; ovules 1 in each cell, ascending, placentas axile. Fruit ovoid or pyriform, 1-2celled, indehiscent, covered with hooked bristles, cells 1 -seeded. Seed oblong, attached by the middle.-Distrib. Europe, temp. Asia, and N. America; species 2 or 3.-Etym. Circe, the enchantress.

1. C. Iutetia'na, L. ; glandular-pubescent, leaves ovate faintly toothed not shining, fruit broadly obovoid 2 -seeded.
Damp woods, common ; ascends to $1,200 \mathrm{ft}$. in Yorkshire ; fl. June-Aug.-
Rootstock ereeping. Stem 1-2 ft., erect or ascending, terete, subsimple; nodes swollen. Leaves 1-3 in., petioles almost as long, covered with translucent dots, rounded truncate or cordate at the base. $\boldsymbol{F}$ lorrers $\frac{1}{8} \mathrm{in}$. diam., in lax erect terminal racemes, white or pink; pedicels $\frac{1}{2}$ in., slender, patent, reflexed in fruit ; bracts usually 0 . Disk tumid. Fruit $\frac{1}{8}$ in.-Distrib. Europe, N. Africa, Siberia, W. Asia to the Himalaya, temp. America.
2. C. alpi'na, $L$.; smaller, less hairy, leaves shining more deeply toothed, overy less hispid, fruit 1 -seeded.
Hilly distriets from York northwards, ascending to $1,300 \mathrm{ft}$. in the Lake distriet; W. and N.W. of Ireland; fl. July-Aug.--Searcely entitled to specific rank, though usually a well-marked plant all round the grlobe; comparatively stouter, 6-8 in.; leaves longer petioled ; pedicels with minute subulate bracts.-Hybrids or intermediate varieties are designated as ( : lutetin'na, var. intermédia, and C. alpina, var. interme'dia, Ehr. (sp.) according to their affinities with one or the other parent.-Distrib. as $C$ : luteticma, omitting N. Africa, and extending to within the Arctic circle.

## Ormer XXXIII. LYthra'cerz.

Herbs, shrubs (or trees), branches usually 4 -angled. Leaves opposite or whorled, quite entire, exstipulate. Flowers regular or irregular. Caly: inferior, tubular or campanulate, persistent ; lohes 3-6, valvate in bud, with as many alternating projerting lobes or teeth. Petuls 3-6 rarely 0 , inserted in the calyx-tule, membranous, crumpled in bud. Stamens usually definite, inserted in 1-3 series in the calyx-tuhe, sometimes trimorphic, equal or unequal, inflexed in bud ; anthers versatile, often recurved. Diske anmular or 0, sometimes glanlular and unilateral. Ozary, sessile or stipitate, 2-6-celled; style straight or flexuous, stigma capitate; ovules many, on the inner angles of the cells, anatropous, horizontal or erect. Capsule sur-
rounded by the calyx, $2-6$-celled, or 1 -celled by the septa vanishing; placentas usually forming a central seed-bearing column. Seeds various, albumen seanty or 0 ; cotyledons oblong or orbicular, 2 -auricled.-Dis'ris. Chiefly trop. ; genera 30 ; species 250.-Affinities. With Onagraricee, Myrtacece, and Haloragea.-Properties. Astringent, acrid, and vesicatory. Pomegranate bark is astringent.
Calyx tubular. Petals exceeding the calyx-teeth ..................1. Lythrum.
Calyx campanulate. Petals minute or 0 . Peplis.

## 1. LY'THRUM, $L$. Loosestrife.

Herbs or shrubs, with 4 -angled branches. Leaves opposite, rarely whorled or alternate, quite entire. Flowers axillary, solitary or cymose, red or purple. Calyx-tube cylindric, straight ; teeth and ribs 8-12. Petals 4-6, sometimes unequal or 0 . Stamens $8-12,1-2$-seriate in the calyx-tube, filaments filiform often declinate. Ovary sessile, 2 -celled; style filiform, stigma obtuse ; ovules very many, placentas thick. Capsule 1-2-celled, septicidally 2 -valved or bursting irregularly. Seeds plano-convex or angular. -Distrib. Temp. and trop. regions; species 12 -Etym. $\lambda u ́ \theta p o \nu, ~ g o r e, ~ f r o m ~$ the blood-red flowers.

1. L. Salicar'ia, L. ; leaves opposite or whorled lanceolate cordate at the base, flowers whorled, stamens 12.
River-banks and ditches, \&c. from Argyle and Perth southwards; fi. July-Sept. -Glabrous or pubescent. Rootstock creeping. Stem 2-5 ft., branched, 4-6angled or winged. Leaves 2-5 in., often 3-4 in a whorl, acute. Cymes glomerate, in terminal spiked racemes. Flowers ${ }^{3}-1 \mathrm{in}$. diam., red-purple ; hracts small or 0 . Culyx-tube $\frac{1}{4}$ in., 12 -riboed, outer teeth lanceolate, longer than the inner. Petals narrow-oblong, wrinkled. Capsule ovoid.-Distrib. Temp. N. regions (Arctic), Australia.-Flowers trimorphic in respect of length of style and filaments in 3 sets of individuals. Of those growing by the Thames at Kew, the long-styled is glabrous, slender, with small narrow leaves, and bright flowers; that with very short styles is a larger, coarser, very pubescent plant, with dull purple flower.
2. L. Hyssopifo'lia, L. ; leaves chiefly alternate linear-lanceolate, flowers solitary, stamens about 6 .
Moist places, often inundated, very local, Rochester, Oxford, Cambridgeshire,
Brrkshire, \&c.; fl. June-Sept.-Glabrous, annual. Stem $\frac{1}{2}-1 \frac{1}{2} \mathrm{ft}$., prostrate or ascending. Leaves $\frac{1}{2}-1 \mathrm{in}$., sessile, cuneate at the base, very narrow. Flowers small, pink. Culyr-tube 2-bracteolate; teeth subulate, subequal. Petuls oblong. Capsule cylindric.-Distrib. Europe from Hanover southwards, N. and S. Africa, Siberia, India, N. and S. America.

## 2. pep'lis, $L$. Water-Purslane.

Small weak annual herbs. Leaves alternate and opposite, quite entire, Flowers minute, axillary, subsessile, 2 -bracteolate. Calyx campamulate, 6 -lobed, with as many alternate spreading teeth. Petals 6, in the throat of the calyx, fugacious, or 0 . Stamens 6 or 12, in the middle of the calyxtube. Ovary subylobose, membranous, 2-celled; style short, stignna capitate; ovules very many, placentas semicylindric, attached to the septum. Capsule 2 -celled, 2 -valved, or bursting irregularly, many-seeded. Seeds
minute, plano-convex.-Distrib. Europe, N. Africa, temp. Asia; species 3.-Еtym. $\pi \epsilon ́ \pi \lambda t o \nu$, the old name for Portulaca transferred.

1. P. Por'tula, L. ; leaves obovate obtuse, flowers axillary solitary.

Moist places, ascending to $1,200 \mathrm{ft}$. in Yorkshire ; fl. July-Aug. Glabrous, branched, tufted. Stems $3-8$ in., 4 -angled, creeping, fragile. Letues $\frac{1}{-1}$ in., opposite, short-petioled. Flovers very minute, in almost all the leaf-axils, purplish. Calyx 12 -ribbed, hemispheric ; teeth triangular. Petals minute or 0 . Stamens 6 or 12. Capsule globose.-Distrib. Europe, N. Africa.,

## Order XXXIV. cucurbitacem.

## Tribe Cucumeri'nef.

Prostrate or climbing annual or perennial herbs. Leaves alternate, exstipulate. Tendrils lateral, simple or divided. F'lowers usually cymose. moncecious or dioccious. Calys superior; limb rotate, campanulate or tubular ; lobes 5, valvate in bud. Petals 5, inserted on the calyx-limb, free or connate below, valvate or induplicate in bud. Stamens 3 , inserted on the base or sides of the calyx ; filaments and anthers free or comate, the latter adnate to the filaments, bursting outwards, one 1 -celled, two 2 -celled, cells straight curved or flexuous. Ovary inferior, 3 -celled; placentas 3 , fleshy, projecting to and confluent in the axis of the ovary and thence reflexed to its walls; style simple or divided, stigmas varions ; ovules 2 -seriate, parietal, horizontal, anatropous, buried in pulp. Reerry 1 -celled, many-seeded, filled with pulp. Seeds usually tlattened, albumen 0 , testa coriaceous or crustaceous; embryo flattened, cotyledons planoconvex or foliaceous, radicle short.-Distrib. Chiefly Indian and African ; genera 47 ; species 360.-Affinities. With Passiflorcoc.-The above characters comprise the mass of the Order, which is included in the tribe Cucumerinere.-Properties. Purgative and bitter, but many yield by cultivation esculent fruits.

## 1. BRYO'NIA, L. BRyony.

Slender climbing perennial herbs. Leaves $3-5$-angled or -lobed.--Malb fl. in racemed corymbose or fascicled cymes. Culyx-tube campanulate, 5 -toothed. Corolla rotate or campanulate, 5 -partite. Stamens 3 , rarely 5 ; anthers free or slightly cohering, cells flexuous.-Female fl. solitary or crowded, callyx and corolla of the male. Ovary ovoid or globose; style slender, 3-fid, stigmas simple or 2-lobed. Berry spherical, many or fewsceded. Seeds tumid or compressed.-Distmib. Temp. and trop. ; species 12. - Etym. Bpúw, to shoot, from the rapid growth of the shoots.

1. B. dioíca, $L$. ; hispid, dioccious, leaves palmately 5 -lobed.

Hedyes and thickets in England, rare in the North ; absent from Sentland and Ireland; ff. May-Sept.-Acrid, fæetid. Rootstock of very large Heshy tubers; juice natseous, milky. Stems many, annual, slender, angled, tendrils simple. Lenties 3-5 in. diam., petioled, suborbicular, cordate, lohes sinuate. Cymes of male corymbose, $3-8$ floweren; of fem. umbelled. Corolle $\frac{1}{2}-\frac{3}{2} \mathrm{in}$. diam., hairy, greenish. Ovury smooth, stigmas 2 -cleft. Berry $\ddagger$ in. diam., red, 3-6-seeded.-Distrib. Eurepe from Denmark southwards, N. Africa, W. Asia.Root acrid and cathartic.

## Order XXXV. umbelinfers.

Herbs. Stems usually fistular, solid at the nodes. Leaves alternate, pinnately or 3-nately compound, rarely simple ; petioles dilaterl at the base. Inforescence of usually regular and compound umbels, with an involucre of whorled bracts at the base of the primary rays, and of bracteoles at the secondary; rarely simple or capitate. Flowers small, all 2-sexual and similar ; or outer in each umbel male, with large unequal petals and longer stamens, inner female or 2 -sexual. Calyx superior; limb 0 or 5 toothed. Petals 5, epigynous, usually obovate or obcordate, tip often inflexed, imbricate, induplicate, or valvate in bud. Stamens 5 , at the base of the disk ; filaments incurved, anthers versatile. Disk epigynous, usually of 2 lubes confluent with the bases of the styles, rarely free. Ovary 2 celled; styles 2, erect or recurved, stigmas obtuse ; ovules 1 in each cell, pendulous, anatropous, raphe ventral, micropyle superior, integuments conHuent with the nucleus. Fruit of 2 indehiscent, dorsally or laterally compressed carpels, separated by a commissure ; carpels each normally 5 - or 10 ridged, attached to and often pendulous from an entire or split slender axis (carpophore) ; pericarp often traversed by oil-canals (vittce). Sced pendulous, usually adherent to the pericarp, testa membranous, albumen copious dense ; embryo minute, next the hilum, cotyledons ovate-oblong or linear, often very unequal.-Distrib. Chiefly N. Europe, N. and W. Asia, and N. Africa; rarer in America, S. Africa, Australia, and tropical mountains ; genera 152; species 1,300.-Affinities. Intimate with Araliacece and Cornece.-Properties. 1. Poisonous, acrid, watery sap in Aithusa, Conium, Cicuta, (Enanthe. 2. Esculent in Angelica, Samphire, Parsley, Celery, \&c. 3. Sugar and starch abound in Carrot, Parsnip, Pig-nut. 4. Milky foetid gum-resins in stems of Asafoetida, Galbanum, \&c. 5. Essential oils in the fruit of Anise, Dill, Caraway, Coriander, and Cummin.-The ridges are normally 9 on each carpel ; viz. 5 primary, of which 2 are lateral next the commissure, 1 dorsal, 2 intermediate; and 4 secondary, alternating with them. The vittæ occur between the ridges, rarely in them; normally there are 6 in each carpel, 4 between the primary ridges and 2 on the commissural face.
Series 1. HETEROSCTA'DEA. Umbels simple, or very irregularly compound, or flourers capitate. Vittce 0 or obscure. See 34. Caucalis.
'Tribe I. HYDROCOT'YLEEE. Fruit laterally much compressed ; commissure narrow.

1. Hydrocotyle.

Tribe II. Sanic'uleze. Fruit subterete, or dorsally compressed; commissure broad.
Leaves spinous. Umbels densely capitate. .........................2. Eryngium.
Leaves palmate. Bracts very large .....................................2*. Astrantia.
Leaves palmate. Fruit with hooked spines ...........................3. Sanicula.
Series 2. HAPLOZYG'IEA. Umbels compound. Primary ridges the most conspicuous (except in 22*. Coriandrum). Vitte usually obvious.
Tribe III, AMmi'NEes. Fruit laterally compressed ; commissure narrow.
Nection 1. Smyrn'ieæ. Fruit short, ovoid or didymous; ridges not winged. Seed grooved in front.
Vitter solitary in the interstices; ridges slender.
4. Physospermum.
Vittæ several. Disk-lobes depressed ; ridges elevated .5. Conium.
Vittæe several. Disk-lobes conical.
.6. Smyrnium.

Section 2. Ammi'nere proper. Fruil as in 1, but seed flat in front.
*Petals entire, tip acute or shortly inflexed. Vittæ 1-2.
Leaves simple. Flowers yellow
7. Bupleurum.

Leaves compound. Flowers white, diøecious..................................8. Trinia.
Leaves compound. Flowers white, 2 -sexual ............................9. A pium.
** Petals 2 -lobed, tip long, inflexed. Vittæ solitary in the interstices. Calyx-teeth obsolete. Vitte as long as the fruit .....................10. Carum.
Calyx-teeth obsolete. Vitte very short. 11. Sison.

Calyx-teeth ovate, acute. Vittæ long .......................................12. Cicuta.

Calyx-teeth acute. Leaves pinnate........................................13. Sium.
Calyx-teeth obsolete. Leaves 2-ternate. Vittæe 0............14. .Egropedium.
Calyx-teeth obsolete. Leaves various. Vittæ many ..........15. Pimpiuella.
Section 3. Scandici'neæ. Frecit elongate. Seed grooved in front.

* Vitte many in each interstice, often faint

16. Conoporlium.
** Vittæ 0, or 1 in each interstice.
Fruit in.; ridges almost winged ......................................17. Myrrhis.
Fruit 1-3 in.; ridges prominent
17. Scandix.

Fruit in.; ridges vanishing upwards ......................19. Cherophyllum.
Fruit $\frac{1}{8}-\frac{1}{3}$ in. ; ridges 0 or obscure..................................20. Anthriscus.
Tribe IV. SEsELI'NEAE. Fruit globose or ovoid, not laterally compressed; commissure broad ; lateral ridges distinct (except in 22*. ('oriundrom), rarely winged, if so wings of opposite carpels not in contact.
Sub-tribe 1. Seseli'neæ proper. Fruit subterete; ridges not thickened or corky.
Calyx-teeth small. Petals white, notched ............................21. Seseli.
Calyx-teeth obsolete. Petals yellow, entire .....................22. Fœeniculum.
Sub-tribe 2. Corian'drese. Fruit glabose; ridges lon, secondury broulest.
22*. Coriandrum.
Sub-tribe 3. Cachry'deæ. Fruit subterete; primary ridges acute; outer coat of pericarp lax .............................................................23. Crithmum.
Sub-tribe 4. ©Enan'theæ. Fruit subterete; primary ridges thick, lateral forming a corky rim round the carpel.
Bracteoles whorled
24. Enanthe.

Bracteoles unilateral .........................................................25. Ethusa.
Sub-tribe 5. Schultz'iese. Fruit subterete; lateral vंdyes thickened or vinged ..........................................................................26. Silaus.
Sub-trile 6. Sell'nese. Fruit dorsally compressed; primary ridyes Iroad thick.
Seed concave in front 27. Meum.

Seed almost flat in front
28. Ligusticum.

Sub-tribe 7. Angel'iceæ. Fruit much dorsally compressed; lateral ridyes broadly winged 29. Angelica.

Tribe V. peuceda'nere. Fruit much dorsally compressed; lateral ridges broadly winged, those of the opposite carpels contiguous (face to face) ; other ridges filiform. Styles short, stout, erect.

[^1]SERIES 3. DIPLOZYG'TEAE. Umbels compound (sometimes simple in Caucalis); secondary ridges more distinct than the primary (see also $22^{*}$. Coriandrum), spinous in the British genera.
Bracts pinnatifid or laciniate. Seed flat in front .....................33. Daucus.
Bracts entire or 0 . Seed grooved in front
34. Caucalis.

## ARTIFICLAL KEY TO THE GENERA.

III. Leaves simply pinnate, rarely compound at the base. a. Fruit dorsally much compressed, winged.

Border of wings very thick. Petals pink........................32. Tordylium.
Border of wings not thickened. Petals white .................31. Heracleum.
$\beta$. Fruit not much compressed, terete or didymous.

* Fruit spiny. Seed grooved in front.

34. Caucalis.
** Fruit glabrous. Seed flat or nearly so in front.

+ Petals entire.
Carpophore 2-partite.

10. Carum.

Carpophore entire or 2-fid..........................................................9. Apium.

+     + Petals notched or 2-lobed.
Ridges of fruit slender ; vittæ clavate, solitary, short................11. Sison.
Ridges of fruit prominent ; vittæ several, long...................15. Pimpinella.
Ridges of fruit slender; vittæ several, long.

13. Sium.

## IV. Leaves 2-3- pinnate or 2-3- ternate.

a. Fruit terete or angled, not much dorsally compressed or flattened.

* Seed grooved in front, or with involute margins.
+ Fruit muricate or prickly.
Ridges of fruit elevated, with strong spines .........................34. Caucalis.
Ridges obscure ............................................................20. Anthriscus.
$\dagger \dagger$ Fruit smooth, glabrous, rarely pubescent. $\ddagger$ Fruit short, ovoid, subglobose or didymous.
Flowers white. Ridges filiform ; vittæ solitary ..............4. Physospermum.
Flowers white. Ridges thick, waved ; vittæ several ..................5. Conium.
Flowers yellow. Ridges stout, even; vittæ several.................6. Smyrnium.
$\not \ddagger$ Fruit narrov, but not beaked. Floveers white.
Ridges slender; vittæ numerous....................................16. Conopodium.
Ridges sharp ; vittæ 0........................................................17. Myrrhis.
Ridges obtuse ; vittæ solitary ....................................19. Chærophyllum.
++ Fruit narrow, beaked. Flowers white.
Beak long; ridges obtuse.

18. Scandix.

** Seed flat in front or nearly so. (Fruit short in all.)

+ Petals white, entire, with an incurved point.
Ridges slender ; vitte 1-3. Carpophore entire or 2-fid. ............ 9. Apium.
Ridges stont, sharp; vittæ numerous...............................23. Crithmum.
$\dagger+$ Petals yellow, entire or with an incurved point.
Ridges slender ; carpophore 2-partite ....................................10. Carum.
Dioecious. Vittæ within the stout ridges ................................8. Trinia.
Bracteoles 0. Vittæ solitary . ........................................22. Fœmiculum.
Bracteoles many. Vittæe 2-3 ................................................27. Meum.
Bracteoles many. Vittæ many ..............................................26. Silaus.
$\dagger+\dagger$ Petals white, obcordate, notched or 2 -lobed.
- Calyx-teetl distinct.

Fruit didymous ; ridges flat ; vittæ solitary ............................12. Cicuta.
Fruit subterete ; ridges thick ; vittæ 1-2 ........... ...................21. Seseli.
Fruit globose ; ridges obscure; vitte 0 ........................22*. Coriandrum.

- $\mathbb{T}$ Calyx-teeth obscure or 0 .

Fruit covered with hooked bristles ............................ ..........33. Daucus.
Bracts and bracteoles linear ................................................10. Carum.
Bracteoles 0 . Ridges slender; vitte 0 ; styles slender ...14. Egopodium.
Bracts few or 0 , bracteoles many. Ridges obtuse ................24. Enanthe.
Bracts and bracteoles unilateral, deflexed...................................25. ※thusa.
Bracts few or 0 , bracteoles many. Ridges almost winged ...28. Ligusticum.
$\beta$. Fruit much dorsally compressed, broadly winged.

* Lateral vings of the opposite carpels closely contiguous.

Petals white, notched. Wings thin, vittæ club-shaped .....31. Heracleum.
Petals various. Wings thin, vitte long
30. Peucedanum.

Petals white. Wings with a thickened border
32. Tordylium.
** Lateral wings of opposite carpels with a space between them.
Petals white, notched. Wings thin
29. Angelica.

## 1. hydrocot'yle, $L$. White-rot, Peniy-wort.

Small perennial herbs, often creeping. Leaves entire, lobed, or 3-5foliolate. Umbels usually simple; bracts few or 0 . Calys-teeth 5 or ohsolete. Petals not inflexed, valvate or imbricate in bud. Fruit much laterally compressed; commissure narrow carpophore undivided 2 -fid or 0 ; carpels nearly orbicular, with $1-5$ ridges on each side; vitte 0 or slender; styles filiform, on the flattened disk.-Distrib. Temp. and trop.; speecies 70.-ЕтуM. $\dot{\prime} \delta \omega \rho$ and кoтí $\eta$, from the cupped peltate leaf.

1. H. vulga'ris, $L$.; leaves orbicular peltate crenate, petiole pilose. Marshes, hogs, \&c., ascending to $1,000 \mathrm{ft}$. in the Lake district ; fl. May-Aug. -Ntem filiform, white, creeping, rarely floating. Leaves $\frac{1}{2}-2 \mathrm{in}$. diann, 1 or 4 at the nodes ; petioles 2-6 in. C'mbels axillary, shortly peduncled. Florers small, capitate, pinkish-green ; bracts minute, triangular, concave. Fruit f in. diam.; carpels covered with resinous points, with 2 ridges on each side.-Distrib. Europe, N. Africa.

## 2. ERYNGiUm, L. Eryngo.

Rigid, branched, often glaucous, perennial herbs. Leaves spinous-toothed, lobed or cut. Flowers sessile, in very dense bracteolate heads, surrounded at the base by a whorl of rigid bracts. Calyx-tube scaly; teeth rigid,
acute, longer than the petals. Petals narrow, deeply notched, point long, inflexed. Disk-lobes concave, crenulate. Fruit ovoid ; commissure broad, carpophore 0 ; carpels $\frac{1}{2}$-terete, primary ridges obscure 1 -vittate; styles filiform, slender, erect. Seeds flat or subconcave in front-Distrib. Temp. and sub-trop. regions, chiefly S. American; speeies 100.-Etym. uncertain.-Very slender vittæ often occur in the endocarp.

1. E. marit'imum, $L$.; very glaucous, radical leaves suborbicular 3-lobed spinous, cauline palmate. Sea Holly.
Sandy shores, from Aberdeen and Argyle southwards, all Ireland; fl. July-Aug.-Rootstock creeping, stoloniferous. Stems 1-2 ft., stout, 3 -chotomously branched. Radical leaves 2-5 in. diam., margins cartilaginous. Heuds about 3 together, $\frac{1}{2}-1 \mathrm{in}$. diam., at length ovoid. Primary involucre of 3 bracts; partial of $5-7$ ovate spinous-serrate bracts; bracteoles 3 -fid, equalling the flowers. Flowers $\frac{1}{8} \mathrm{in}$. diam., bluish-white.-Distrib. Europe, N. Africa.-Roots formerly candied as a sweetmeat.
E. campes'tre, L.; pale green, radical leaves pinnately 3-5-foliolate, cauline 2-pinnatifid.
Near ballast heaps, Plymouth, Weston-super-Mare, the Tyne, Cardiff, Waterford, \&c.; partially naturalized; a denizen, Wutson; f. July-Aug.-Erect, 1-2 ft., less glaucous and more branched than E. maritimum.-Distrib. Europe, from Denmark southwards; N. Africa, W. Siberia.

## 2*. ASTRAN'TIA, L.

Erect, simple or branched, perennial herbs. Rootstock short, creeping. Leares palmately lobed or cut. Umbels simple or irregularly compound; hracts many, radiating, often coloured. Flowers polygamous, males on shorter pedicels. Calyx-limb campanulate; teeth exceeding the petals, with long points. Petals notched ; point long, inflexed. Disk-lobes cupshaped. Fruit ovoid or oblong, nearly terete ; commissure broad, carpo$1^{\text {hore }} 0$; carpels dorsally compressed, primary ridges equal, with plaited wrinkled or toothed inflated ribs, interstices 1 -vittate ; styles filiform.Distrib. Europe and W. Asia; species 4 or 5.-Etym. a $\sigma \tau \rho o v$, from the star-like umbels.
A. MA'Jor, $L$.; leaves with 3-7 ovate-lanceolate serrate lobes.

Naturalized in woods, Ludlow and Malvern; fl. June-July. - Stem 1-2 ft.
Radical leaves 3-4 in. diam., aeute, serratures bristle-pointed; petiole 4-10 in.
Bructs $\frac{1}{2} \frac{3}{4} \mathrm{in}$, ovate-lanceolate, reticulate, white below, above dark green
tinged with pink, serrulate. Flowers white or pink; pedicels filiform.
Fruit $\frac{1}{8}$ in.; styles spreading.-Distrib. Mid. and S. Europe.

## 3. Sanic'ula, $\mathscr{L}$. Sanicle.

Slender, erect, perennial herbs. Rootstock stout, short, creeping. Leaves palmately cut. Umbels small, subglobose, irregularly compound ; bracts leafy ; bracteoles few. Flowers usually 1 -sexual. Calyx-teeth as long as the petals, subherbaceous, pungent. Petals minute, deeply notched; point long, inflexed. Drisk-lobes dilated. Fruit ovoid; covered with hookel prickles ; commissure rather broad, carpophore 0 ; carjels $\frac{1}{2}$-terete, xidges inconspicuous, interstices 1-vittate; styles filiform. Seed flat in front.-Distrib. N. temp. regions ; species 10.-Etym. sano, to heal.

1. s. europæ'a, $L$. ; fertile flowers subsessile, males pedicelled.

Copses, \&c. ; aseending upwards of $1,000 \mathrm{ft}$. in the N. of England ; fl. June-July.-Glabrous. Stem 1-2 ft., simple, almost leafless. Rurlical letcees 1-3 in. diam., long-petioled, suborbicular, 3 - 5 -lobed or -partite ; lobes cuneate, cut, acutely serrate. Cimbel $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam., irregular, rays few; bracts $2-5$, unequal, simple or pinnatifid, serrate. Flowers pink or white. Fruit $\frac{1}{6}$ in.: styles spreading.-Distrib. Europe, N. and Mts. of trop. Africa.

## 4. PHYSOSPER'MUM, Cusson. Bladder-seed.

Erect, herbs, perennial ; root fusiform. Leaves 3-nately compound, segments cuneate. Umbels compound; bracts and bracteoles few, linear; flowers white. Calyx-teeth small or 0. Petals with a long inflexed point. Disk-lobes conical. Fruit didymous, bladdery, broader than long ; commissure narrow, carpophore simple; carpels terete, smooth, primary ridges slender, interstices 1 -vittate. Seed loose, concave in front.-Distrib. Europe, W. Asia; species 2 or 3.-Етym. фv́ $\sigma \alpha$ and $\sigma \pi \epsilon ́ \rho \mu \alpha$, from the bladdery fruits.

1. P. cornubien'se, $D C$.; branches panicled, umbels long-peduncled.

Thickets, Tavistock, Bodmin (on the Priory lands) ; fl. July-Aug.-Glalirous, except the puberulous margins and ribs of the leaf. Stem $1-2 \mathrm{ft}$.. ereet, striate. Rulical leaves long-petioled, flat, 2-3-ternate ; segments $\frac{1}{2}-\frac{2}{3}$ in., deeply laciniate, long-petioled. Cmbel-rays $10-20,1-3$ in., suberect, fur-rowed.-Distrib. S. of France and Spain eastward.

## 5. Conitum, L. Hemlock.

Tall, glabrous, biennial herbs. Leaves pinnately compound. Umbels compound, many-rayed; bracts and bracteoles many, small; flowers white, polygamous. Calyx-teeth 0. Petals obtuse, or the tip shortly inflexed. Disk-lobes depressed. Fruit broadly ovoid, laterally compressed ; commissure constricted, carpophore undivided; carpels 5 -angled, primary ridges prominent, obtuse, lateral distinct ; vittæ many, slemder, irregular; styles short, reflexed. Seed deeply grooved in front.-Distrib. Europe, Asia, N. Africa ; species 2.-Еtym. The old Greek name.

1. C. macula'tum, $L$. ; stem spotted, leaf-segments pinnatifid.

Banks, roadsides, \&cc., ascending to near $1,000 \mathrm{ft}$. in Yorkshire ; fl. June-July. -Fœetid. Stem 2-5 ft., stout, leafy, furrowed, purple-spotted, pauiculately branches above. Leaves large, deltoid, finely 2 -pinnate ; segments $\frac{1}{p}$ in., ovate oblong or deltoid, flaccid, lower petioled, ultimate serrate. (mbhelx terminal and axillary, shortly peduncled; bracts reflexed, short, unilateral ; rays $10-20, \frac{1}{2}-1 \mathrm{in}$.; outer flowers rather larger. Fruit $\frac{1}{} \mathrm{in}$., greenish-brown.-Distrib. Europe, N. Africa, Siberia ; introd. in N. America.

## 6. SMYRN'IUM, L. Alexanders.

Stont, erect, glabrous, biennial or perennial herbs. Radical leaves 3 -nately compound, segments broad. Umbels compound; brauts and bracteoles few or 0 ; flowers yellow, polygamous. Calys-teeth mimite or 0 . Petals with a short inflexed point. Disk-lobes conieal or depressed. Fruit ovoid, laterally compressed or didymous ; commissure much constricted, carpophore 2-partite; carpels subterete or angular, with 3 prominent rihs; vitte many; styles short, recurved. Seed deeply grooved in front.
-Distrib. Europe, W. Asia, N. Africa; species 6 or 7.-Etym. The old Greek name.-Ridges variable in prominence and number; outer coat of the pericarp often loose, with the vittæ adhering to the inner.

1. S. Olusa'trum, $L$.; cauline leaves petioled 3 -foliolate serrate.

Waste places, especially near the sea and amongst ruins, from Stirling southwards, rare; frequent in Ireland; a denizen on the coast, an alien inland, Watson ; fl. April-June.-Shining. Root stout, biennial. Stem 1-3 ft., solid, furrowed, panicled, branches often opposite. Petioles large, sheathing, margins hairy. Leaflets $1 \frac{1}{2}-2 \mathrm{in}$., broadly obovate or ovate, obtusely serrate or lobed. Umbels lateral and terminal, subglobose; rays few or many, long or short. Fruit $\frac{1}{3} \mathrm{in}$., dark brown.-Distrib. Europe from Holland southwards, N. Africa, W. Asia.-Formerly cultivated as a pot-herb.

## 7. bupleu'rum, L. Hare's-ear.

Annual or perennial, glabrous herbs or shrubs. Leaves simple, quite entire. Umbels compound, many-rayed, or irregular and few-rayed; bracts and bracteoles many and leafy, or few and small, or 0 ; flowers yellow, sessile or pedicelled. Calyx-teeth 0 . Petals hooded, with an inflexed point. Disk-lobes tumid or dilated. Fruit laterally compressed; commissure broad, carpophore 2 -fid; carpels 5 -angled, primary ridges prominent or winged or 0 ; vittæ 0 or 1 or more in the interstices, continuous or interrupted; styles short, reflexed. Seed subterete, flat concave or deeply grooved in front.-Distrib. Europe, temp. Asia, N. and S. Africa, N. W. America.-Etym. obscure.

1. B. rotundifo'lium, L.; anqual, stem fistular, leaves perfoliate. Chalky fields, rare, E. and S. counties, from Durham to Somerset; fl. June-July.-Glaucous. Stem 8-18 in., simple or branched above, terete. Leaves $1-2 \frac{1}{2}$ in., lower oblong, upper suborbicular, apiculate; nerves radiating. Bracts 0 ; bracteoles $3-5$, ovate, leafy, longer than the many short rays, connate at the base, suberect in fruit. Fruit broad, $\frac{1}{8}$ in.; vittw 0 ; ridges slender.-Distrib. Europe, W. Asia; introd. in N. America.
2. B. falca'tum, $L_{*}$; perennial, stem erect slender fistular, leaves oblong-lanceolate, nerves many parallel, upper broader $\frac{1}{2}$-amplexicaul.
Hedgerows and fields, between Ongar and Chelmsford ; a doubtful native ; fl. Aug.- Rootstock branched. Stems $1 \frac{1}{2}-4 \mathrm{ft}$,, simple or branched above. Radical leaves $1-3 \mathrm{in}$., acute ; petiole $\frac{1}{2}$-amplexicaul ; cauline recurved. Umbels very small ; bracts 2-5, short, unequal ; bracteoles 4-5, oblong, aristate. Flourers minute. Fruit $\frac{1}{8} \mathrm{in}$., narrow ; ridges prominent ; vitte in threes.-Distrib. Europe from Belgium southwards, W. Asia to India and Japan.
3. B. tenuis'simum, L.; annual, stem solid, leaves linear-lanceolate acuminate 3 -nerved, bracts subulate.
Waste places and salt marshes, from Cheshire and Lancashire southwards and westwards to Dorset ; fl. Aug.-Sept.-Stem 6-18 in., ereet or procumbent, flexuous, ribbed, Leaves $\frac{1}{2} 1 \mathrm{in}$., rigid, lowest slightly dilated upwards. Umbels axillary, very small, racemed or subspicate along the branches; bracts 3-5, unequal ; bracteoles similar. Fruit broad, minute, granulate ; ridges prominent ; vittæ 0.-Distrib. Europe, N. Africa, W. Asia.
4. B. arista'tum, Bartl. ; annual, stem short solid, leaves ensiform pungent 3-5-nerved, bracts oblong aristate. B. Odontites, Sm . not of L.

Sandy and rocky banks, \&c., very rare; Torquay ; E. Sussex; Channel Islands, common ; fl. July. -Stem 2-8 in., rigid, simple or forked; branches stout, divaricate, ribbed. Leaves $\frac{1}{2}-1$ in., lowest sometimes petioled. Bructs 3-5, concealing the umbels, rigid; nerves strongly reticulate; margins scarious. Fruit minute, oblong; ridges slender, smooth; vitte solitary.-Distrib. Europe from France southwards.

## 8. trin'ia, Hoffmann. Honewort.

Glabrous, branched herbs. Leaves pinnately compound. Umbels compound, few-rayed ; bracts and bracteoles 1, 2, or 0 ; flowers white, usually diœecious, males with narrower petals. Calyx-teeth 0 or small. Petuls aente or with an inflexed point. Disk-lobes conical or depressed; margins undulate. Fruit broadly ovoid, laterally compressed or didymous ; commissure narrow, carpophore 2 -partite; carpels subterete or 5 -angled, primary ridges subequal, thick, smooth, rugose or plaited, with a large vitta inside each. Seed terete.-Distrib. S. Europe and temp. Asia; species 8.-Etym. Dr. Trinius, a Russian botanist.

1. T. vulga'ris, $D C$.; glabrous, bracts 0 or solitary, ridges smooth.

Limestone rocks, rare; S. Devon, N. Somerset, St. Vincent's Rocks, Bristol ; fl. May-June.-Glaucous. Root fusiform, biennial, fibrous at the top. Stem $3-6$ in., branched from the base, solid, stout, deeply grooved ; branches divaricate. Leaies spreading, petioles and linear segments very slender. Male umbels depressed; female irregular, rays longer; bract 3 -cleft or 0 ; bracteoles 2-3, linear. Flocers minute. Fruit 左 in., ovoid; styles slender; segments of carpophore flattened.-Distrib. Europe from
Belgium southwards to Greece.

## 9. ápium, L. (and Helosciadium, Koch). Celery.

Annual or perennial, glabrous herbs. Leares pinnate or 3-nately compound. Umbels compound, often leaf-opposed, or in the forks; bracts few or 0 ; bracteoles many or 0 ; flowers white. Calyx-teeth 0 . Pctals entire, acute, or with a short incurved point. Disk-lobes depressed or conical, margins entire. Fruit broadly ovoid, laterally compressed; commissure constricted, carpophore simple ; carpels 5 -angled, primary ridges equal prominent obtuse ; vittæ solitary in the interstices. Seed subterete.Distrib. Temp. and subtrop.; species 14.-Еtym. obscure.

## Section 1. A'pium proper. Bracteoles 0. Petals much incurved.

## 1. A. grave'olens, L.; leaves pinnate or 3 -foliolate. Wild Celery.

Marshy places by the sea, common in England and Ireland, Cantire in sicotland ; fl. June-Aug.-Rank-scented. Rout fusiform, biennial. Ntem 2 ft ., erect, stout, grooved. Leccess 6-18 in.; leaflets $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$., cuneate obrovate or rhomboid, lower petioled, cut or lobed. UmLels shortly peduncled or sessile. Flocers', , rreenish-white. Fruit $\frac{1}{1}$ in., roundish ; ribs prominent; vittee solitary; styles short, recurved, divergent.-Distrib. Europe, N. Africa, W. Asia to N.W. India.
Section 2. Heloscia'dium, Koch (gen.). Bracteoles many. Petals nearly straight. - Aquatic or subaquatic.
2. A. nodiflor'um, Reich.; prostrate or creeping, leaves pinnate or 3 -foliolate, leaflets slightly lobed serrate.

Marshy places, from Isla and Haddington southwards; fl. July-Aug. Perennial. Stems $1-3 \mathrm{ft}$., slender. Leaflets $\frac{1}{4}-1 \frac{1}{2} \mathrm{in}$., very variable, sessile, oblong, crenate serrate or lobulate. Umbels leaf-opposed, sessile or shortly peduncled; rays unequal ; bracts usually 0 ; bracteoles many, oblong, scarious. Flowers small. Fruit $\frac{1}{1 / 6}$ in.; ribs prominent ; vittæ solitary ; styles short, divergent. - Distrib. Europe from Belgium southwards, N. Africa.
Yar. 1, nodiflon'um proper; stem decumbent, flowering branches rooting at the base only, peduncles short, bracts 0 or $1-2 .-V_{A R}$. 2, répens, Koch (sp.) ; smaller, stem creeping, leaflets sharply toothed, peduncles long, bracts 2-3 unequal unilateral. Sium repens, Sm. Rather rare.
3. A. inunda'tum, Reich.; decumbent or floating, submerged leaves 2-3-pinnate, leaflets capillary rarely linear, floating leaves pinnate, lower leaflets deeply 3 -cleft.
Wet places, local ; ascending to $1,600 \mathrm{ft}$. in Yorkshire ; fl. June-July.Perennial, flaccid, small, straggling. Stem 4-10 in., stout, flexuous. Leaflets of upper leaves $\frac{1}{6} \mathrm{in}$. , cuneate, cut or lobed. Umbels very small, leafopposed, peduncles short, rays 2-4 unequal; bracts 0 ; bracteoles 4-6, lanceolate, 3-nerved. Flowers minute. Petals incurved. Fruit on in., subsessile, elliptic-oblong; ridges prominent; vittæ solitary ; styles re-curved.-Distrib. Europe, from Gothland southwards (excl. Spain and Greece).

## 10. Ca'rum, l. Caraway.

Annual or perennial, glabrous herbs. Leaves pinnate or decompound. Umbels compound, few- or many-rayed; bracts few or 0 ; bracteoles more numerous or 0. Flowers white or yellow, 2-sexual or polygamous. Ca'yxteeth minute or 0 , sometimes unequal. Petals with an inflexed point and usually very deep notch ; of the male flowers often irregular. Disk-lobes conical. Fruit ovoid or oblong, often hispid, laterally compressed, hardly constricted at the commissure, carpophore 2 -fid; carpels 5 -angled, primary ridges obtuse, equal, lateral close to the commissure ; vittee 1 (rarely 2) in the interstices. Sced, $\frac{1}{2}$-terete-Distrib. Temp. and subtrop.; species 50.-Etym. The old Latin name.

Section 1. Ca'rum proper. Root fusiform or fibrous. Leaves 1-2pinnate. Calyx-teeth minute. Petals white, deeply notched.

1. C. verticilla'tum, $L_{\text {. ; res res }}$ root fascicled fibres, leaves linear pinnate, leaflets sessile short whorled palmately multifid, segments capillary.
Meadows in the W. counties, from Argyle and Dumbarton southwards, local ;
N.E. and W. Ireland ; fl. July-Aug.-Root-fibres 1-2 in., thickened down-
wards. Stem 1-2 ft., erect, striate. Radical leaves 6-12 in., subeylindric ;
leaflets curved upwards, capillary-multifid. Umbels regular, flat-topped;
ravs 1-2 in., peduncles slender; bracts and bracteoles many, slender, short,
reflexed. Flowers white or pink. Fruit ovoid ; ridges strong; vittæ large;
styles recurved.-Distrib. W. Europe from Holland southwards.
C. Car'ur, L.; root fusiform, leaves narrow triangular- or linearoblong 2 -pinnate, leaflets cut to the base into linear lobes, bracts 1 or 0 , bracteoles 0 . Caraway.
Waste places, naturalized only; fl. June-July.-Stem 10-24 in., slender, branched, striate, fistular. Leaves 6-10 in.; pinnules opposite, segments acuminate. Umbels rather irregular, peduncles slender. Flowers white,
outer larger irregular. Fruit oblong, ridges short; vittæ conspicnous; styles spreading.-Distrib. Europe (Arctic), Siberia, W. Asia to the Himalaya.
Section 2. Petroseli'num, Hoffm. (gen.). Root fusiforin. Leaves pinnate or 2-3-pinnate. Cralyx-teeth obsolete. Pituls white or yellowish, scarcely notched. (Intermediate between Apium and Carum.)
2. C. seg'etum, Benth.; leaves pinnate, flowers white. Corn Parsley. Hedgebanks and waste places, local, from Hull southwards ; fl. Aug.-Sept.Glalrous, annual. Stem 2-3 ft., erect, branched, terete, striate, solid. Leuces 4-6 in, oblong ; leaflets $\frac{1}{4}-\frac{1}{2} \mathrm{in}$., subsessile, lobed or pinnatifid, segments crenate. C'mbels small, irregular, rays very unequal, outer $\frac{1}{2}-1 \mathrm{in}$. ;
bracts and bracteoles 3-5, linear or subulate. Florers minute. Fruit $\frac{1}{8}$ in., ovoid; styles very short, erect. - Distrib. Mid. and S. Europe, from Holland southwards; W. Asia.
C. Petroseli'xum, Benth.; leaves 3 -pinnate, flowers yellow. Petroselinum sutivum, Hoffin. C'ommon Parsley.
Castle walls and waste places ; a garden escape ; fl. June-Aug.-Glabrous, shining, biennial. Stem 1-2 ft., erect, much-branched, terete, striate, solid. Leaces deltoid; leaflets many, $\frac{1}{2}-1$ in., close-set, broadly ovate, 3 -cleft ; segments cuneate, crenate, of upper leaves few, narrow. U'mbels regular, flat-topped ; rays many, 1-2 in.; bracts 2-3, often divided ; bracteoles many. Florers minute. Fruit in in., ovoid, green; styles slender, reflexed.-Disticti. Unly known as a cultivated plant or an escape.
Section 3. Bu'nium, L. (gen.). Root a solitary tuber. Leaves 2-3pinnate. Calyx-teeth minute. Petals white, deeply notched.
3. C. Bulbocast'anum, Koch; leaves broadly triangular 3-pinnate, primary segments petioled, leaflets cut into few slender lobes.
('hal'sy fields, rare, Hertford, Bedford, and Cambridge ; fl. June-July.-Root glo oose, as large as a chestnut, black. Stem erect, striate, much branched, and petioles flexuous at the hase. Leaves 4-6 in., ultimate segments $\frac{1}{2}-\frac{1}{3}$ in., tips callous. C'mbels rather irregular, many-rayed; bracts and bracteoles small, narrow ; peduncles stout, grooved, angular. Florers white, outer
 short, reurved.-Distrib. Europe from Belgium southwards, N. Africa, Siberia.-Pigs are fod on the tubers in Hertfordshire.

## 11. SI'SON, $L$.

Characters of Carum, but vitte very short, often obscure, occupying only the upper half of the fruit.-Jistrib. One species, native of Europf, from France southwards and eastwards.- Etym. unknown.

1. S. Amómum, L.; leaves pinnate or 2 -pinnate below, upper smaller 3-lobed toothed or entire.
Moist places, hedgehanks, \&c., from York and Chester southwards, rare in the N. of England ; a native? Wutson ; H. Aug.-Sept.-Annual or biennial, glahrous, nauseous-smelling. Root fusiform. Stem $2-3 \mathrm{ft}$., ereet, branched, slender, leafy, solid. Lecteses 6-12 in., deltoid-oblong; leaflets $1-3 \mathrm{in}$.. shortly petioled, linear-oblong or ovate, base cuneate. Cmbels terminal and axillary, compound ; rays few, slender, unequal; bracts and bracteoles 2-4, short, subulate, rarely 0 . Flowers minute. white. P'etuls broadly obeordate, deeply notched, with a long inflexed point. Fruit ovoid or subglobose;
ridges strong ; vittæ very short, narrowed upwards ; styles short, recurved, on thick depressed disk-lobes.-Closely resembles Carum segetum.

## 12. Cicu'ta, L. Water-Hemlock, Cowbane.

Tall, perennial, glabrous herbs. Leaves pinnate or decompound. Umbels compound, many-rayed; bracts few or 0 ; bracteoles many, small; Howers white. Calyp-teeth acute. Petals with an inflexed point. Disklobes depressed, entire. Fruit orbicular or broadly ovoid, constricted at the commissure, didymous, carpophore 2 -partite ; carpels slightly compressed, primary ridges thick broad flat; vittæ solitary in the interstices. Seeds subterete, slightly convex in front.-Distrib. Marshes of the N. hemisphere ; species 3.-Etym. The old Latin name of the Hemlock.

1. C. viro'sa, I. ; root fibrous, leaflets lanceolate doubly serrate.

Watery places, from Dumbarton and Forfarshire southwards. Mid. and N.
Ireland, local; fl. July-Aug.-Rootstock short, stout, hollow and septate.
Stem 2-4 ft., stout, leafy, furrowed. Leaves large, deltoid, 2-3-pinnate;
petioles stout; leaflets 2-4 in., oblique. Umbels $3-5 \mathrm{in}$. diam., longpeduncled, terminal and leaf-opposed, flat-topped, rays long, slender;
bracts 0 ; bracteoles many, short, slender. Flowers minute. Calyx-teeth ovate. Fruit $\frac{1}{10}$ in. broad, broader than long; styles slender, recurved.Distrib. Europe (Arctic), Siberia to Kamtschatka.

## 13. SI'UM, $L$. Water-Parsnip.

Glabrous herbs. Leaves pinnate; leaflets toothed. Umbels compound, terminal or lateral ; bracts and bracteoles many ; flowers white. Culyyteeth acute. Petals with an inflexed point. Disk-lobes thick, conical, or depressed. Fruit ovoid or oblong, laterally compressed or constricted at the commissure, carpophore undivided; carpels 5 -angled, primary ridges equal, prominent, obtuse or thickened, lateral next the commissure ; vitte many, in the interstices. Seed subterete.-Distrib. N. temp. regions, S. Africa, St. Helena; species 4.-Etym. unknown.

1. S. latifo'lium, L.; leaflets regularly serrate, umbels terminal.

Watery places, common in the Fen counties, rare elsewhere ; Falkirk in Scotland; local and rare in Ireland; fl. July-Aug.-Rootstock short, stoloniferous. Stem $5-6 \mathrm{ft}$., erect, stout, fistular, grooved, branched above. Lerves large ; leaflets 4-6, 2-6 in., sessile, linear- or oblong-lanceolate ; submerged sometimes pinnatifid. Umbels large, flat-topped, rays many ; bracts and bracteoles often foliaceous, large. Flowers small, outer rather larger. Finit $\frac{1}{8}$ in., broadly ovoid, ridges prominent; styles rather slender.-DisTRIB. Europe (except Turkey), N.W. Asia to India, N.W. America.
2. S. angustifo'lium, $L$.; leaflets of radical leaves regularly of stemleaves very irregularly serrate, umbels leaf-opposed.
Wet places, from Elgin southwards; rarer in Scotland and Ireland ; fl. summer.
-liootstock creeping stoloniferous, leafing at the nodes. Leaves 4-8 in.;
leatlets of lower leaves 5-10, 1-2 in., sessile, ovate-oblong ; of cauline leaves
fewer, smaller. Stem $1-3 \mathrm{ft}$., leafy. Umbels with few and unequal rays; bracts irvegularly ent. Fruit shorter than in S. latifolium, with more immersed vitte and conical disk-lobes.-Distrib. Europe, W. Asia to India.
14. mgopo'dium, L. Goat-, Gout-, or Bishop's-weed.

Stem stout, glabrous. Rootstuck creeping. Leaves 2-3-ternate; leaflets broad. Umbels compound, many-rayed; bracts and bracteoles few or 0; flowers white. Calyx-teeth 0. Petals broad, unequal, point inflexed. Disk-lobes tumid; styles slender, reflexed. Fruit ovoid, laterally compressed, carpophore 2 -fid ; carpels 5 -angled, primary ridges slender equal distant; vittie 0. Seed subterete.-Distrib. Europe, exel. Spain, W. Asia.-Etym. alk and $\pi 0 \hat{s}$, from the likeness of the leaf to a goat's juot.

1. $\boldsymbol{Z E}$. Podagra'ria, L. ; leaves deltoid. Herb Gerard.

Waste places near buildings or gardens, from Elyin southwards ; a doubtful native ; a denizen in N. Britain, Watson; fl. June-Aug.-Glabrous. Routstock white, pungent, aromatic. Stem 1-2 ft., fistular, grooved, branched above. Leaves 4-5 in., uppermost opposite; leaflets sessile, obliquely lanceolate or ovate-acuminate, irregularly serrate. Uinbels terminal. Flocers small. Fruit $\frac{1}{6}$ in., narrow-ovoid.

## 15. PIMPINEL'LA, $L$. BURNET-SAXIFRAGE.

Perennial, rarely annual herbs. Leuves pinnate or 3 -nately compound. Umbels compound ; bracts 0 bracteoles few or 0 ; flowers white or yellow. Calyx-teeth sinall, or 0. Petals deeply notehed, point long inflexed. Disk-lobes thick, conical. Fruit ovoid or oblong, laterally compressed, constricted at the broad commissure, carpophore 2 -fid; carpels 5 -angled, primary ridges equal slender; vittæ many, in the interstices ; styles short or long. Seed subterete, nearly flat in front, usually free from the pericarp.-Distrib. N. temp. regions, S. Afriea, rare in S . America; species 70.-Етум. bipennula, from the 2 -pinnate leaves.

1. P. Saxif'raga, L.; stem terete, radical leaves pinnate, leaflets suborbicular, cauline 2 -pinnate.
Dry pastures from Sutherland southwards, ascends to $1,800 \mathrm{ft}$. in Yorkshire; fl. July.-Perennial, glabrous or pubescent. Rootstock slender, hot, acrid. Stem 1-3 ft., slender, furrowed, branched. Leaflets 4-8 pair, very variable, serrate lobed or almost pinnatifid ; lobes of cauline much narrower. Uuthels flat-topped. Flowe"s small, white. Fruit $\frac{1}{8}$ in., glahrous, hroally ovoid; styles short, reflexed.-Distrib. Europe (Arctic), Siberia to Dahuria.
2. P. mag'na, L.; stem angular, leaves all pinnate, leaflets of radical ovate subcordate, of cauline narrower.
Bushy waste places, local in England, from York and Durham southwards; rare in Ireland; fl. July-Aug.-Much larger than P. Suxifraga, but similar, 3-4 ft. ; leaflets often 1-2 in., membranous and broad; styles longer and more slender; outer flowers 2 -sexual, inner male. - Distrib. Chiefly Western and Mid. Europe,

## 16. Conopo'dium, Koch. Earth-nut.

Glabrous or pilose herbs. Rontstock tuberous. Leaves 3-nately divided. Umbels compound, many-rayed; bracts and bracteoles 0 or membranous; flowers white, polygamous, outer sometimes raliating. Calys-tecth obsolete. Petals of outer flowers often irregular, 2-fid, with an inflexed point. Disklobes conical or depressed. Fruit ovoid or oblong, often shortly beaked; commissure constricted, carpophore 2 -fid; carpels subterete, primary
ridges slender; vittæ several in the interstices, often obscure or interrupted. Seed deeply grooved in front.-Distrib. Europe, N. Africa, temp. Asia; species 8. -Еtym. кш́vos and noûs, from the conical disk-lobes.

1. C. denuda'tum, Koch; leaf-lobes linear, bracts and bracteoles 0 . Bunium flexuosum, With.
Woods and fields ; fl. summer.-Glabrous. Rootstock size of a chesnut, brown. Stem 2-3 ft., slender, terete, flexuous. Leaves 3-ternate, broadly deltoid, on slender petioles; segments pinnatifid, lobes linear, the central largest. Umbels terminal, drooping when young, 6-10 rayed; flowers small. Fruit $\frac{1}{8}$ in., narrow-ovoid, ridges obscure; styles short, erect.-Distrib. Western Europe.-Very similar to Carum Bulbocastanum.

## 17. MYR'RHIS, Scop. Cicely.

Pereunial tomentose herbs. Leaves decompound. Umbels compound, many-rayed ; bracts few or 0 ; bracteoles many, membranous; flowers white, polygamous. Calyx-teeth minute or 0 . Petals with a very short inflexed point. Disk-lobes tumid. Fruit much elongate, hardly beaked, commissure broad, carpophore 2 -fid; carpels very convex at the back, primary ridges equal, hollow, very often rough, prominent; vittæ in the interstices solitary, slender, or obsolete. Seed concave or deeply grooved in front.-Distrib. Mts. of Europe and temp. S. America; species 2.Etym. The old Greek name.

1. M. odora'ta, Scopoli; leaves whitish beneath, bracteoles lanceolate. Mountain pastures, usually near houses, from Chester and Derby northwards to Renfrew; ascending to $1,200 \mathrm{ft}$. in Yorkshire; not indigenous in Ireland; a denizen or alien, Watson; fl. May-June--Sparingly and finely hairy. Root fleshy, fusiform. Stem 2-3 ft., leafy, terete, fistular, grooved, branched akove. Leaves deltoid, 3-pinnate ; leaflets pinnatifid, lobes serrate ; sheaths large. Umbels terminal ; bracteoles membranous, awned ; flowers small, outer only fertile. Fruit $\frac{1}{4}$ in., linear-oblong, dark brown, ridges often scabrid; styles very slender, diverging.- Distrib. Europe from France southwards and eastwards, W. Asia.-Aromatic and stimulant ; once cultivated as a pot-herb, still used in salads in Italy.

## 18. SCAN'dix, L. Shepherd's Needle.

Annual berbs. Leaves pinnately decompound ; segments small, narrow. Umbels simple or compound, bracts 1 or 0 ; bracteoles several, entire or cut ; flowers white, polygamous, outer often radiating. Cal」x-teeth minute or 0 . Petals often unequal, point short inflexed or 9. Disk dilated, margin undulated. Fruit slender, subcylindric, produced into a long beak, carpophore undivided or 2 -fid; carpels subterete, primary ridges broad or filiform, secondary 0 ; vitte solitary in the interstices, often obscure. Seed deeply furrowed in front.-Distrib. Europe, N. Africa, temp. Asia ; species 8 or 10 .-Etym. The Greek name for a Chervil.

1. S. Pecten-Ven'eris, $L$. ; fruit ciliate rough dorsally compressed.

A cornfield weed from Ross southwards ; ascending to $1,000 \mathrm{ft}$. in Yorkshire ; a colonist, Watson; fl. June-Sept.-Branched from the base, pubescent with spreading hairs ; branches 6-18 in., rarely more. Leaves oblong, 2-3pinnate, segments very slender. Umbels terminal and lateral ; rays 1-2
bracteoles many, green, sometimes leafy at the point. Floters very irregular. Fruit 1-3 in., very slender, seabrid ; styles very short.-Distrib. Europe, N. Africa, W. Asia to N.W. India.

## 19. CHIEROPHYL'LUM, $L$. Chervil.

Herhs, often hairy. Lcaves pinnately- rarely 3 -nately decompound. Umbels compound, many-rayed; bracts 1-2 or 0; bracteoles many; flowers white, rarely yellow, often polygamous. Calyp-tenth subulate or 0 . Petrls with a long or short inflexed point. Disk-lobes small. Fruit oblong or linear, hardly beaked, laterally compressed, constricted at the commissure, carpophore undivided or 2 -fill ; carpels subterete, primary ridges equal, obtuse; vitte solitary in the interstices. Seed decply grooved in front.-Distrib. Europe, N. Africa, N. Asia, N. America; speecies 30. -Etym. xalpo and фúл入ov, from the agreeable odour of the leaf.

1. C. tem'ulum, $L$. ; stem swollen below the nodes purple-spotted, fruit glabrous, bracteoles reflexed. C. temulentum, Sm.
Fields and waste places from Moray and Ross southwards ; ascending to $1,200 \mathrm{ft}$. in Yorkshire ; very rare in Ireland ; fl. June-July.-Perennial, laxly hairy. Stem 1-3 ft., slender, solid, grooved, leafy, branched. Letirx deltoid, 2 -pinnate, petioles and peduncles very slender; leaflets ovate, membranous, pinnatifid, crenate. Cimbels lateral, drooping when young; rays unequal, slender ; bracts 0 ; bracteoles small oblong-lanceolate ; flowers small, white. Fruit $\frac{1}{4}$ in., ovoid, narrowed into a slender beak ; styles very short, spreading.-Distrib. Europe, N. Africa.

## 20. anthris'cus, Hoffm. Beaked-Parsley.

Annual or biennial, hairy herbs. Leives deltoid, pinnately or 3 -nately decompound. Umbels compound; nodding when young ; bracts 1,2 , or 0 ; bracteoles many, entire ; flowers white, often polygamous. Calys-teeth minute or 0 . Petals with an inflexed point. Disk-lubes conical or depressed. Fruit ovoid or oblong, shortly beaked, commissure constricted, carpephore undivided or 2 -fid; carpels sub- or $\frac{1}{2}$-terete, primary ridges confined to the smooth or rough upper part; vitte very slender, solitary in the interstices, or 0 . Seed deeply grooved in front.-Distrib. Temp. Europe, Asia, N. Africa, N.W. America; species 10.-Etym. unknown.

1. A. vulga'ris, Pers.; stem glabrous, umbels peduncled leaf-opposed, fruit hispid. Scandix Authriscus, L.; Cherophyllum, Lamk.
Hedgebanks and roadsides, rather rare in Ireland ; fl. May-June. - Sparingly hairy. Stem 2-3 ft., branched, leafy, fistular, swollen below the nodes. Leres 3-pinnate ; leatlets ovate, pinnatifid ; segments short, ohituse. C'mbluls of unergual rays ; hracts 0 ; hracteoles short, oblong ; flowers minute. Firwit $\frac{1}{8}$ in., ovoid, muricate, heak short glabrous, pedicel with a ring of hairs at the tip: styles very short.-Distrib. Europe, N. Africa, Siberia, W. Asia.Formerly cultivated as a pot-herb.
2. A. sylves'tris, Hoffin.; stem hairy below, umbels peduncled terminal, fruit glabrous. Chuerophyllum syluestre, L.
Hedgebanks and woods ; f. April-June.-Hairy. Stem 2-3 ft., stout, erect, leafy, fistular, furrowed. Leries $2-3$-pinnate; leaflets pimnatifid, ovate, coarsely serrate. Bructs 0 ; bracteoles oblong-lanceolate, ciliate, green,
spreading or reflexed, often pink ; flowers white. Fruit $\frac{1}{4} \frac{1}{3}$ in.-Distrib. Europe (Arctic), Siberia, Dahuria.
A. Cerefo'lium, Hoffim. ; stem hairy above the nodes, umbels sessile lateral and leaf-opposed, fruit glabrous. Scandix, L. ; Chorophyllum sativum, Gærtn. Chervil.
Waste places, rare ; always an escape from cultivation ; fl. May-July.-Habit of A. vulgaris, but stouter, leaflets broader and flowers larger. Fruit $\frac{1}{3} \mathrm{in}$., very narrow.-Distrib. Europe, excl. Spain and Greece, W. Siberia, W. Asia ?-Root reputed poisonous.

## 21. SES'ELI, $L$.

Biennial or perennial, erect, branched herbs. Leaves 2-3-pinnate or decompound. Umbels compound; bracts many, few, or 0 ; bracteoles many, undivided; flowers white. Calyx-teeth prominent or minute. P'etals notched, with a long inflexed point. Disk depressed or conic, undulate or crenate. Styles very short. Fruit ovoid or oblong, subterete, commissure broad, carpophore 2 -partite; carpels dorsally compressed, primary ridges prominent; vittæ 1 or very rarely 2 in the interstices. Seed flat in frout.-Distrib. Europe, temp. Asia, N. Africa, Australia; species 40. -Etym. A Greek name.

1. S. Libano'tis, Koch ; glabrous or slightly pubescent, leaves 2 -pinnate, leaflets pinnatifid. Athamanta, L.
Chalk hills, Sussex, Herts, and Cambridge; fl. July-Aug.-Rootstock perennial, crowned with fibres. Stem 1-2 ft., stout, erect, furrowed, solid, sparingly branched. Leaflets sessile, variable, ovate, petioles short. Umbels when in flower subhemispheric ; rays many, pubescent ; bracts and bracteoles many, subequal, subulate, ciliate, reflexed ; flowers small, white. Fruit it in., broadly ovoid, pubescent; styles slender, recurved. - Distrib. Europe (Arctic), excl. Spain Greece and Turkey, W. Asia to the Himalaya.

## 22. Fcinic'ulum, Adunson. Fennel.

Tall, glabrous, biennial or perennial herbs. Leaves pinnately decompound, segments slender. Umbels compound; bracts and bracteoles 0 ; flowers yellow. Calyx-teeth 0 . Petals with a short obtuse point. Disklobes large, conical, entire. Styles short. Fruit ovoid or oblong, subterete, commissure broad, carpophore 2 -partite ; carpels $\frac{1}{2}$-terete, primary ridges stout; vittæ solitary in the interstices. Seed furrowed, flat or slightly concave in front.-Distrib. S. Europe, E. Asia, N. Africa; species 4.-Etym. The old Latin name.

1. F. vulga're, Gcertn.; leaves shortly petioled, segments slender.

Sea-cliffs, perhaps native from Anglesea southwards and eastwards to Kent, not so elsewhere ; S. coast of Ireland ; a native? Watson; fl. July-Aug.Glabrous, peremnial. Stem 2-3 ft., terete, striate, polished, almost solid. Leaves much divided ; segments very many, linear. Umbels large, glaucous ; rays very many ; flowers small. Fruit long, ovoid.-Distrib. Europe from Belgium southwards, N. Africa, W. Asia to India.

## 22*. CORIAN'DRUM, L. Coriander.

An annual, slender, branched, glabrous herb. Leaves pinnately decompound. Umbels compound ; rays few ; bracts 0 ; bracteoles few, filiform;
flowers white or pink, outer often irregular. Calyx-tecth acute. Petals 2-lobed, point inflexed. Disk-lobes conical. Fruit subglobose or ovoid, carpophore 2 -fid; carpels $\frac{1}{2}$-terete, ridges depressed, slender, secondary broadest ; vittæ obscure, solitary under each secondary ridge. Seed globose, dorsally compressed, top and base incurved.-Distrib. S. Europe, N. Africa, W. Asia; species 2.-Etym. кópis, from the bug-like smell.
C. satívem, $L$.; leaflets of lower leaves ovate lobed and crenate.

Waste places in S. and E. of England ; an escape from cultivation ; fl. June.-
Stem 1-2 ft., slender, erect, fistular. Leaves membranous, lowest 1-2- upper 2-3-pinnate with narrow leaflets. Umbel peduncled, rays 5-10; bracteoles short, linear, acute ; flowers small, very irregular. Fruit $\frac{1}{8}$ in. diam., subglobose ; carpels cohering; styles slender, flexuous.-DIstrib. S.E. Europe, W. Asia.-Three carpels and styles occur. Foetid of bugs.

## 23. CRITH'MUM, L. Samphire.

A fleshy, glabrous, much-branched herb, woody at the base. Leaves 3-nately compound; segments quite entire. Umbels compound, manyrayed ; bracts and bracteoles many, short. Calyx-teeth 0 . Petals minute, broad, fugacious, point long inflexed. Disk-lobes thick, depressed or subeonic. Fruit ovoid-oblong, terete, commissure broad, earpophore 2 -partite, outer layer corky loose ; carpels $\frac{1}{2}$-terete, primary ridges thick, acute; vitte many; styles short. Seed flat in front.-Distrib. Coasts of Europe from France southwards, N. Afriea. - Etym. obscure.

1. C. marit'imum, $L$. ; leaflets linear, lax, fleshy.

Maritime rocks from Ayrshire southwards, all coasts of Ireland ; fl. June-Aug.-Stem 6-10 in., ascending, flexuous, solid, striate. Leares deltoid; leaflets few, 1-2 in., terete, subulate or subfusiform ; petioles short, sheaths long adnate membranous. Umbels flat-topped, peduncles stout fleshy; bracts and bracteoles acute, spreading ; flowers small, white. Fruit $\frac{1}{4}$ in., oblong, dark green or purplish.-Yields the well-known pickled condiment.

## 24. cenan'the, $L$. Water Dropwort.

Glabrous herbs, often aquatic. Roots fibrous or tuberous. Leaves 1-2-3pinnate, rarely reduced to a fistular petiole. Umbels compound; bracts or bracteoles many, rarely few or 0 ; flowers white, often polygramous and outer rayed. Calyx-tecth acute. Petals notehed or 2-lobed, point long inflexed. Disk-lobes conical. Fruit ovoid, cylindric or globose, subterete, commissure broad, carpophore 0 ; carpels $\frac{1}{2}$-terete, 2 lateral primary ridges grooved or much thickened, sometimes obscure ; vittæ in each interstice. Seed flat in front.-Distrib. N. temp. regions, S. Africa, trop. Australia; species 20.-Etym. olvos and äv日os, from the vinous scent of the flowers.

## *Root-fibres many, fleshy. Umbels terminal or terminal and lateral, peduncled; outer flozers of each partial umbel often irregular and male.

1. Cs. fistulo'sa, L.; leaves pinnate, stem and petioles terete swollen fistular, fruit narrow obconic angular.
Ditches and marshes from Argyle southwards, rare in Scotland ; common in Ireland ; fl. July-Sept.-Roots burrowing deep. Stem $2-3 \mathrm{ft}$., stoloniferous, and with whorls of slender root-fibres below, thin-walled, constricted at the nodes. Leaves long-petioled; segments few, narrow, distant. Umbels
on stout fistular peduncles ; rays short, few ; bracts 0 ; partial umbels $\frac{1}{2}$ in. diam., spherical in fruit. Fruits $\frac{1}{4}$ in., crowded, angular; styles long, erect, spinescent ; carpels cohering; pedicel not thickened at the top.-Distrib. Europe, N. Africa.
2. ©. pimpinel'loides, L. ; root-fibres usually tuberous beyond the middle, leaves 2 -pinnate, segments broad short entire or acutely cut, fruit cylindric grooved and ribbed.
Meadows and banks, rare ; Worcester and Suffolk to Devon and Sussex ; fl. June-Aug.-Root-fibres slender, their tuber $\frac{1}{2} \mathrm{in}$. or less. Stem 1-3 ft., ereet, furrowed. Lower leaves with broad small segments, upper with few long ones, or reduced to petioles. Umbels 6-12-rayed, flat-topped ; bracts 1-8; partial umbels crowded; bracteoles subulate. Fruit $\frac{1}{1}-\frac{1}{8}$ in.; pedicels short, stout, much thickened at the top; styles erect, rigid.-Distrib. Europe from Belgium southwards, N. Africa, W. Asia.
3. ©\&. Lachena'lii, Gmelin; root-fibres usually cylindric, leaves 2 -pinnate, segments obtusely-lobed, fruit oblong. CE. pimpinelloides, Sm. Marshes fresh and salt, from Argyle and Haddington southwards; rare in Scotland ; all coasts of Ireland; fl. July-Sept.-Very similar to $\boldsymbol{E}$. pimpinelloides, but root-fibres never tuberous; root-leaves soon withering; partial umbels not crowded ; fruit $\frac{1}{5}$ in., much broader, rounded at the top; styles shorter and slender ; pedicel very short, not thickened at the top.Distrib. Europe from Denmark southwards, exel. Greece and Turkey.

## 4. CE. silaifo'lia, Bieberstein; root-fibres usually fusiform, leaves

 2 -pinnate, segments cut into narrow acute lobes, fruit subcylindric thickened at the base. (E. peucedanifolia, Sm. not Pollich.; CE. Smithii, Watson.Moist meadows and ditches, local, from Notts. to Lincoln, and Dorset to Kent ; fl. June-July.-Very near ©. pimpinelloides, but larger, stouter ; root-fibres rarely tuberous in the middle ; rays fewer, longer, stouter in fruit; partial umbels not crowded; styles short, erect, rigid.-Distrib. Europe from Belgium southwards, excl. Spain Greece and Turkey, N. Africa.
5. ©e. croca'ta, L.; root-fibres large fusiform, leaves large deltoid 3-4-pinnate, segments cuneate 2-3-lobed, fruit narrow oblong subeylindric. Marshes and ditches, from Argyle and Elgin southwards; H. July.-Rootfilres as thick as the thumb, with yellow or colourless juice. Stem $2-5 \mathrm{ft}$., stout, branched, fistular. Petioles large, sheathing throughout. Umbels many, rays long; bracts and bracteoles 0 or many. Fruit $\frac{1-\frac{1}{5}}{} \mathrm{in}$. ; styles erect, rigid ; pedicel not thickened at the top.-Distrib. Europe from France to Spain and Italy.-A rank poison, often mistaken for celery.

## ** Aquatics. Root simple, fusiform, with many slender fibres. Umbels lateral or leaf-opposed, subsessile. Flowers all 2-sexual.

6. ©s. Phellan'drium, Lamk. ; erect floating or ascending, leaves 2-3pinnate finely cut, segments pinnatifid, fruit terete narrow-oblong or ovoid twice or thrice as long as the styles. Phellandrium aquaticum, L. Ponds and ditches, from Haddington southwards ; rare in Scotland ; fl. July-Sept.-Stem 1-4ft., very stout. Leaves sometimes submerged with capillary segments ; emersed with broad small obtuse segments. Umbels 7-10-rayed; bracts 0 ; bracteoles many ; outer flowers slightly irregular. Fruit variable,
$\frac{1}{\frac{1}{8}-\frac{1}{6}} \mathrm{in}$ ．；styles slender，flexuous ；pedicel not thickened at the top．－Drs－
TRIB．Europe，excl．Greece and Turkey，Siberia．
Sub－sp．Phellan＇drium proper；erect，leaves 3 －pinnate，segments of sub－ merged leaves capillary，fruits twice as long as the styles．
Sub－sp．fluviat＇ilis，Coleman（sp．）；ascending，leaves 2－pinnate，segments of sulmerged leaves obcuneate，fruit three times as long as the styles．－
S．half of England ；Kildare Canal，Ireland．

## 25．在thu＇sa，L．Fool＇s－Parsley．

An annual，leafy，glabrous herb．Leaves 3 －nately pinnate．Umbels com－ pound，terminal and leaf－opposed；bracts 1 or 0 ；bracteoles $1-5$ ，deflexe！， on the outer side of the umbel ；flowers white，outer often rayed．Culy．r－ teeth small or 0．Petals notched，with an inflexed point．Disk－lobes broad，depressed．Fruit broadly ovoid，subterete，carpophore slender， 2 －partite ；carpels dorsally compressed，primary ridges very thick，keeled， or the lateral narrowly winged；vitte in the interstioes solitary；styles very short．Seed flattish in front．－Distrib．Europe，Siberia ；introd．in N．America．－Etym．a九eco，because of its buming qualities．

1．尼．Cyna＇pium，L．；leaves deltoid，leaflets pinnatifid．
A weerl in cultivater grounds，from Elgin southwards；fl．July－Aug．－Ront fusiform．Stem 1－2 ft．corymbosely branched，terete，striate，fistular． Leceves $6 \mathrm{in} . ;$ segments $\frac{1}{2}-1 \mathrm{in}$ ．，membranous，cuneate at the base，lobes acute ；petioles slender．Umbels small，rays spreading，irregular ；bracteoles 3－5，slender；flowers irregular，small．Fruit os in．，green．－A virulent poison，odour nauseous．

## 26．Silàus，Besser．Pepper Saxifrage．

Perennial，glabrous herbs．Leaves pinnately decompound ；segments slender．Umbels compound ；bracts 1，2，or 0 ；bracteoles many，small ； flowers yellowish．Calyx－teeth 0．Petals with an incurved tip，base broad truncate．Disk－lobes depressed，margins crenate．Fruit ovoid， oblong，subterete，commissure broad，carpophore 2 －partite；carpels $\frac{1}{2}$－terete，ridges obtusely winged ；vittre obscure；style short，recurved． Seed flattish in front．－Distrib．Europe，Siberia；species 2．－Etym． unknown．

1．S．praten＇sis，Besser；leaflets linear－lanceolate entire or 3 －lobed．
Meadows and commons，from Fife southwards ；very rare in Scotland and Ireland ；f．July－Sept．－Rootstock elongate．Stem 1－3 ft．，angular，grooverl， solid，leafless above．Leaves 1－3－pinnate；leaflets few， $\mathrm{f}^{-3} \mathrm{in}$ ．Umhel－vays 1－2 in．，few or many，incurved；bracteoles short，margins scarious；flowers
small．Fruit $\frac{1}{6}$ in．，dark brown．－Distrib．Of the genus．
27．Me＇um，Jacquin．Meu，Bald－money，Spignel．
A perennial，glabrons，very aromatic，tufted herb．Leaves mostly radical，pinnately decompound ；segments setaceous，densely crowded． Uimbels compound；bracts linear， $1-3$ ，or 0 ；bractenles $4-8$ ，small； Howers white or purplish．Calys－teeth obsolete．Petals acute，narrowed to the base，sometimes with a short inflexed point．Disk－lobes depressed， margins entire．Fruit ovoid－oblong，subterete，commissure broad，carpo－ phore 2 －partite；carpels $\frac{1}{2}$－terete，primary ridges winged；vittæ many ；
styles very short. Seed concave in front.-Distrib. W. Europe, from Belgium to Austria and Italy.-Etym. Perhaps the Greek $\mu$ éov.

1. M. athamant'icum, Jacq.; stem subsimple, leaves oblong.

Alpine pastures, from Wales and Yorkshire northwards to Moray ; ascending to near $1,400 \mathrm{ft}$. in the Highlands ; absent from Ireland ; fl. June-July.-: Rootstock elongate, crowned with fibres. Stem 6-18 in. Leuf-segments multifid, spreading in all directions; petiole as long as the blade. U'mbels many-rayed; bracts few; bracteoles membranous, subunilateral ; some flowers often male only. Fruit brown, $\frac{1}{3}$ in.-Rootstock eaten in Scotland.

## 28. LIGUS'TICUM, L. Lovage.

Perennial, glabrous herbs. Leaves $1-3$-ternately-pinnate. Umbels compound, many-rayed; bracts many, few, or 0 ; bracteoles many ; flowers white pink or yellow. Calyx-lobes small or 0. Petals notched, point long inflexed. Disk-lobes conical, thick. Fruit ovoid or oblong, subterete or dorsally compressed, commissure broad, carpophore 2 -partite ; primary ridges prominent, acute or winged, lateral often broadest; vittæ many, slender, or obscure. Seed flat, or slightly concave in front.Distrib. N. temperate regions; species 20.-Etym. Liguria, where a species abounds.

## 1. L. scot'icum, L.; leaves 2-ternately pinnate. Haloscias, Fries.

Rocky coasts, local, Northumberland and all Scotland; N. of Ireland, very rare ; fl. July. - Dark green, shining. Rootstock stout, branched. Stem $1-3 \mathrm{ft}$. , erect, sparingly branched, grooved, terete, fistular. Leuflets $1-3 \mathrm{in}$., ovate- or orbicular-cordate, 3-lobed or -partite, crenate. Umbel-rays 8-12, 1-2 in.; bracts few, and bracteoles linear-subulate ; flowers white or pink, nearly regular. Fruit $\frac{1}{3}$ in., brown ; ridges winged; styles short recurved. -Distrib. Europe (Arctic), from Denmark northwards, N. Asia, E. and
W. N. America.-Leaves eaten as a pot-herb, root aromatic and pungent.

## 29. ANGEL'ICA, $L$. Angelica.

Tall perennial herbs. Leaves ternately 2 -piunate, segments large. Umbels compound, many-rayed; bracts few or 0 ; bracteoles usually many, small ; flowers white or purplish. Culyx-teeth small or 0 . Petals with a short inflexed point. Disk-lobes depressed. Fruit ovoid, dorsally compressed, commissure broad, carpophore 2 -partite ; carpels broad, flat, lateral primary ridges with flat contiguous membranous wings, dorsal and intermediate elevated; vittre 1-2 in the interstices. Seed dorsally compressed, flat or slightly concave in front.-Distrib. Temp. and sub-Arctic N. regions; species 18. -Etym. Angelicus, from its properties.

1. A. sylves'tris, $L$.; leaflets petioled obliquely ovate serrate.

Damp copses and banks of streams ; ascending to $2,700 \mathrm{ft}$. in the Highlands ; f. July-Aug.-Glabrous, except the inflorescence. Stem $1-5 \mathrm{ft}$, stout, fistular, striate, green or purple. Leaves $1-2 \mathrm{ft}$, deltoid; leaflets $1-2 \mathrm{in}$. Undels large, pubescent ; rays very many, 1-3 in.; bracts 0 , or 1-2, deciduous ; bracteoles few, subulate, persistent ; flowers white, nearly regular. Fruit $\frac{1}{6-\frac{1}{-1}}$ in.; styles slender, reflexed.-DisTRIB. Europe (Arctic), Siberia to Dahu-
riâ, W. Asia.-Aromatic, leaf bitter.

## 30. peuced'anum, $L$. Hog's-fennel.

Perennial, rarely annual. Leaves pinnately or 3-nately compound. Umbels compound, many-rayed; bracts many, few, or 0 ; bracteoles many or 0 ; flowers white, yellow, or pink, often polygamous. Calys-tecth 0 or small. Petals with an inflexed, often 2 -fid point. Disk-lobes small; margin often expanded, undulate. Fruit ovoid, oblong or suborbicular, much dorsally compressed, commissure very broad; carpels flattish, lateral primary ridges of each forming flat contiguous wings, dorsal and intermediate filiform; vittæ 1-3 in each interstice. Seed nearly flat. -Distrib. Trop. and temp. regions ; species 100.-Etym. obscure.

Section 1. Peuced'anum proper. Perenvial. Bracts few or many, bracteoles many. Calyx 5 -toothed. Fruit with narrow wings.

1. P. officina'te, $L$.; leaves 3 -ternately pinnate, segments long and narrow, bracts few deciduous, flowers yellow. Sulphur-uort.
Salt marshes, very rare, Faversham, Whitstable, and Walton; fl. July-Sept.
-Glabrous. Stem 2-3 ft., terete, solid, furrowed. Leures oblong, segments
1-4 in., flaccid. Umbels on spreading subopposite branches; rays many,
2-4 in., spreading ; bracteoles short, filiform ; flowers minute, central imperfect, pedicels slender. Fruit $\frac{1}{4}$.; wings narrow ; styles stout, recurved.
-Distrib. Europe from Belgium southwards, N. Africa, Siberia.-Root yields a stimulant resin ; odour of sulphur.
2. P. palus'tre, Monch.; leaves 3 -pinnate, leaflets pinnatifid, segments narrow, bracts many persistent, flowers white. Milk Parsloy.
Marshes, local, from York and Lincoln to Essex and Somerset; fl. July-Aug. -Glabrous ; juice milky. Stem 3-5 ft., terete, fistular, grooved. Leaees $\frac{1}{2}-1$ in., deltoid ; leaflets petioled, lanceolate. Umbels 1-2 in.; rays many, stout, seabrid; bracts deflexed ; flowers minute. Fruit $\frac{1}{6}$ in., broadly oblong; wings narrow, thick ; styles very short.-Distrib. Europe, excl. Greece and TJurkey, Siberia. - Root abounds in a yellow foetid gum-resin.

Section 2. Imperator'ia, L. (gen.). Perennial. Bracts 0 ; bracteoles many. Calyx-tecth 0 . Fruit with broad wings.
P. Ostru'thium, Koch ; leaves 1-2-ternate, leaflets ovate or suborbicular inciso-serrate, base unequal, flowers white. Muster-wort.
Moist meadows, rare, N. of England and Scotland, naturalized only; f. July-Aug. - Glabrous. Stem $2-3 \mathrm{ft}$., stout, terete, fistular, furrowed. Leues deltoid ; leaflets few, 1-4 in., large, often confluent ; petiole very long. Unhels large, many-rayed. Fruit $\frac{1}{6}$ in.; wings very broad; styles short.-Distaib. Mid. Europe.-Formerly cultivated as a pot-herb and medicine.
Section 3. Pastina'ca, L. (gen.). Bracts and bracteoles 0. Calyxteeth 0 . Fruit with rather narrow wings.
3. P. sati'vum, Benth.; leaves pinnate, leaflets sessile ovate incisoserrate, flowers bright yellow. Wild Parsnip.
Roadsides and waste places, from Durham and Lancaster southwards; a garden escape in Scotland; a doubtful native of Ireland ; fl. July-Aug.-Annual or biennial, pubescent. Stem 2-3 ft., stout, angled, furrowed, fistular. Leares
shining ; leaflets 2-5 pair, 1-3 in. Umbel-rays many, stout, long; flowers small. Fruit $\frac{1}{5}$ in., broadly oblong; styles very short.-Distrib. Europe, Siberia ; introd, in N. America.-Cultivated since the time of the Romans.

## 31. herac'leum, L. Cow-Parsnip, Hogweed.

Biennial or perennial herbs, sometimes gigantic. Leaves 1-3-pinnate ; segments broad, lobed and toothed. Umbels compound, many-rayed ; bracts few, many, or 0 ; flowers often polygamous and outer rayed, white pink or yellowish. Calyx-teeth small or 0. Petals often unequal, the larger or all notched or 2-lobed, point inflexed. Disk-lobes small, depressed or conical. Fruit orbicular obovate or oblong, much dorsally compressed, commissure very broad, carpophore 2-partite ; carpels flat, lateral primary ridges expanded into flat, contiguous, membranous wings, dorsal or intermediate slender ; vittæ 1 in each interstice, short, thickened downwards. Seed flat.-Distrib. Europe, N. and trop. Africa, temp. Asia, and N. America; species 50.-Etym. The god Hercules.

1. H. Sphondylíium, L.; leaves pinnate, leaflets few largè lobed.

Moist woods and meadows ; ascending to $2,700 \mathrm{ft}$. in the Highlands; fl June-Aug.-Rough, with rather rigid scattered hairs. Stem very stout, 3-6 ft., fistular, grooved, branched above. Leaves 1-3 ft. ; segments 2-6 in., pubescent beneath, very variable in size lobing and toothing, sometimes narrow and pinnatifid ( $\boldsymbol{H}$. angustifolium, Sm. ), terminal connate at the base; sheath of petiole broad. Umbel-rays $\frac{1}{2} 1 \frac{1}{2}$ in., many, stout; flowers large, outer very irregular, petals very broad deeply obcordate, white or pink. Fruit $1-\frac{1}{3}$ in., obovoid, retuse ; styles very short.-DisTrib. Europe, N. Africa, N. Asia.-Stem eatable.

## 32. TORDYL'IUM, $L$.

Annual, hairy or woolly. Leaves simple or pinnate. Umbels compound ; rays many, or few and unequal ; bracts and bracteoles linear, sometimes small or 0 ; flowers white or purplish, outer often rayed. Calyx-teeth subulate and unequal or 0 . Petals with an incurved point, the larger or all 2-lobed. Disk flat and undulate, or conical. Fruit orbicular or oblong, much dorsally compressed ; lateral primary ridges closely contiguous, broad, thickened, dorsal and intermediate slender; vittæ 1-3 in each interstice. Seed flattened.-Distrib. Europe, N. Africa, temp. Asia; species 12.-Etym. The old Greek name.

1. T. max'imum, L.; leaves pinnate, leaflets 1-3 pair pinnatifid.

Hedgebanks, Eton, Oxford, and Isleworth; an alien or denizen, Watson; fl. June to July.-Hispid with short hairs, reflexed on the stem. Stem 1-2 ft., slender, erect, deeply grooved, fistular. Leaflets $\frac{1}{4}-1 \mathrm{in} .$, oblong or lanceolate, more or less cut and toothed ; petioles with small sheaths. Unibels small; rays 6-8, stout, short, hispid ; bracts and bracteoles as many, stiff, short; flowers small, white or pink, subsessile. Fruit broadly-oblong, hispid, margin thickened glabrous ; styles short, stiff, erect.-Distrib. Europe from Belgium southwards.

## 33. DAU'CUS, L. Carrot.

Annual or biennial, hispid herbs. Leaves pinnately decompound, segments small. Umbels compound; rays many, outer arching over the
inner or few and irregular ; bracts and bracteoles many or 0 , entire or cut; flowers white, outer often rayed. Calyx-teeth slender or 0. Petuls notehed, with an inflexed point, often unequal. Disk-lobes depressed or conieal. Fruit ovoid or oblong, carpophore undivided or 2-fid; carpels convex, secondary ridges more prominent than the primary, all, or the secondary only, with rows of spines; vittæ solitary under each secondary ridite. Seed flattish in front.-Distrib. Europe, N. Africa, W. Asia ; species 20. -Etym. The old Greek name.

## 1. D. Carot a, $L$.; leaves 3 -pinnate, leaflets ovate cut.

Fields and sea-shores ; fl. June-Aug.-Hispid. Stem 1-2 ft., branched, solid, furrowed. Leeflets very many, small. Umbels peduncled, rays 1-2 in.; bracts usually pinnatifid, bracteoles lanceolate ; flowers white, central purplish. Freit $\frac{1}{8}$ in., broadly oblong; styles short, stout, straight.-Distikib. Europe, N. Africa, N. Asia, W. Asia to India ; introd. in N. America.
Vir. 1, Carot'a proper; erect, branches above spreading, leaf-segments narrow subdistant, umbels concave, spines of the fruit distinct usually hooked at the tip.-Var. 2, gum'mifer, Lamk. (sp.) ; branches spreading from the base, leaf-segments broader closer, umbels convex, spines of fruit dilated and connate at the base. D. maritimus, With. Shores of S. England.
34. CAUCA'LIS, $L$.

Annual, hispid herbs. Leaves 1-3-pinnate. Umbels compound, terminal or leaf-opposed, usually of few rays, sometimes capitate ; bracts few or 0 ; bracteoles more numerous ; flowers white or purplish, polygamous, outer often rayed. Calysx-teeth acute or 0 . Petals often unequal, the larger notched, point inflexed. Disk-lobes thick, conical. Fruit ovoid or oblong, constricted at the commissure, carpophore undivided or 2 -fid; carpels subterete, ridges with 1 or 2 series of spines; vittee solitary in each secondary ridge. Seed deeply grooved in front.-Distirib. Europe, N. Africa, temp. Asia; species 18.-Etym. The old Greek name.

Section 1. Cauca'lis proper. Secondary ridges very prominent, with 1 row of spreading spines. Bur-Parsley.

1. C. daucol'des, L.; leaves 2-3-pinnate, segments oblong pinnatifid.

Chalky fields on the E. and S. coasts, from York and Durham southwards ; a colonist, Watson ; fl. June-July.-Stem 6-18 in., erect, hispid at the nodes, angular, grooved, solid; branches spreading. Leuces 3-4 in.; segments small. Uwhel-rays 2-5; bracts few or 0; bracteoles linear ; male flowers (outer) white or pink, perlicelled, female subsessile. Fruit $\frac{1}{3} \frac{1}{2}$ in., oblong ; spines hooked, of the secondary ridges longest ; styles short, stout, erect. Distrib. Europe from Denmark southwards, N. Africa, W. Asia.
Section 2. Turge'nia, Hoffm. (gen.). Secondary ridges with 2-3 rows of spreading spines.
C. latifo'lia, $L$.; leaves pinnate, leaflets few subpinnatifid.

Cornfields, very rare, Somerset, Hertford, Cambridge ; a colonist or alien, Wutson; fl. July.-Hispid. Stem 6-18 in., simple, terete, striate, fistular.
Leatlets narrow-oblong, lobes $\frac{1-3}{4} \mathrm{in}$. Umbel-ways 2-4, stout ; bracts broadly
lanceolate, membranous; flowers much as in C. daucoides, pink. Firuit
$\frac{1}{4}-\frac{1}{3}$ in., broad ; spines long, nearly equal, rough ; styles short, stout, erect.
-Distrib. Europe from Belgium southwards.
Section 3. Torílis, L. (gen.). Fruit covered between the primary ridges with spreading or appressed bristles. Hedge Parsley.
2. C. Anthris'cus, Huds.; leaves 1-2-pinnate, leaflets broad, umbels terminal compound, bracts 4-6, spines of fruit incurved not hooked.
Hedges and waste places, from Moray and Isla southwards; ascending to
$1,350 \mathrm{ft}$. in Yorkshire ; fl. July-Sept.-Hispid more or less. Stem erect,
branched, solid, striate, hairs reflexed. Leaflets many, close set, $\frac{1}{4} \frac{1}{3} \mathrm{in}$., pinnatifid or lobed. Cmbels 5-12-rayed; bracts small, subulate; flowers minute, white or pink, outer pedicelled, fertile. Fruit $\frac{1}{8}$ in., ovoid; styles short, straight.-Distrib. Europe, N. Africa, W. Asia to N.W. India.
3. C. infes'ta, Curtis; leaves 1-2-pinnate, leaflets lax narrow, umbels terminal compound, bracts 0 or 1 , spines of fruit spreading hooked.
Fields and waste places from Lancaster and Yorkshire southwards; a colonist,
Watson; fl. July-Sept.-Hispid. Stem 6-10 in., much branched, often from
the base, angled, solid, leafy. Leaflets pinnatifid, or cut and serrate, oblong.
Umbel-rays 2-8, short; bracteoles linear or setaceous; flowers white or pink, irregular, outer fertile. Fruit oblong, covered with spines; styles rather slender.-Distrib. Europe from Belgium southwards, N. Africa.
4. C. nodo'sa, Scop.; leaves 1-2-pinnate, leaflets very small, umbels leaf-opposed simple, spines of fruit spreading hooked and barbed.
Dry banks from Forfar southwards, rare in Scotland and Ireland; fl. May-July.-Hispid. Stem 6-18 in., often prostrate, slender, flexuous, angled, solid. Leaflets pinnatifid. Umbels shortly peduncled, subglobose ; pedicels very short, stout ; bracts 0 ; flowers small, regular, pink ; female subsessile. Fruit $\frac{1}{6}-\frac{1}{5}$ in., ovoid, inner of each umbel tubercled, outer with one or both carpels furnished with hooked spines; styles very short.--Distrib. Europe, from Denmark southwards, W. Africa, W. Asia to India.

## Order XXXVI. ARALIA'cera.

Erect or climbing shrubs or trees; pubescence often stellate. Leaves alternate, simple or compound; stipules adnate to the petiole or 0 . Flowers regular, $1-2$-sexual, umbellate or capitate. Calyx-limb superior, very short, entire toothed or lobed. Petals 5, often coriaceous, very deciduous, valvate or slightly imbricate in bud. Stamens 5, filaments inflexed; anthers didymous, versatile. Disk epigynous. Ovary 2- or -more celled; styles 0 , or as many as cells, free or connate, stigma terminal or decurrent on the inner face of the style; ovule 1 in each cell, pendulous, anatropous, raphe ventral, integuments confluent with the nucleus. Drupe or berry with 1 or more 1 -seeded cells. Seed pendulous, testa membranous, albumen dense, fleshy ; embryo minute, ovoid or oblong.-Distrib. Chiefly trop.; genera 38 ; species 340.-Affinities. Close with Cornece and Um-belliferce.-Properties unimportant.

## 1. hed'era, $L$. Ivy.

Climbing shrubs. Leaves undivided or lobed, exstipulate. Umbels panicled; bracts minute or 0 ; pedicels not jointed; flowers polygamous.

Calyx-limb entire or 5 -toothed. Petals and stamens 5. Disk tumid. Ovary 5 -celled ; styles short, connate, stigmas terminal. Berry subglobose, cells with a parchment-like endocarp closely investing the ovoid seed. Albumen lobulate.-Distrib. Temp. regions of the Old World, Australia; species 2.-Etym. unknqwn.

1. H. He'lix, $L$. ; shrubby, climbing by adhesive rootlets.

Rocks, woods, and walls ; ascends to $1,350 \mathrm{ft}$. in Yorkshire ; fl. Oct.-Nov.-
Trunk 4-10 in. diam., trailing and flowerless, or ascending, and flowering at the terminal free branches. Leares very variable, I-3 in. broad, cordate, 5 -lobed, lobes deep or shallow acute or obtuse ; those of flowering branches ovate or lanceolate. Umbels subracemose, subglobose, clothed with stellate hairs ; bracts small, concave ; peduncles $\frac{1}{3}-1 \mathrm{in}$. Flovers yellow.green, $\frac{1}{4} \mathrm{in}$. diam.; calyx-teeth deltoid; petals triangular-ovate. Berry black, rarely yellow, globose, $\frac{1}{3} \mathrm{in}$. diam.-Distrib. Europe, N. Africa, W. Asia to the Himalaya.-The small sylvestral form, with longer leaf-lobes and often pale nerves, never flowers. The so-called Irish Ioy, with broad rather fleshy leaves and 8 -rayed stellate hairs, is a doubtful native of Ireland.
Var. Hodgen'sii, another doubtfully native Irish form, has deeply 5-7-lobed leaves and 12-15-rayed scaly hairs.

## Order XXXVII. cornácera.

Shrubs or trees, rarely herbs. Leaves opposite or alternate, exstipulate. Flowers small, regular, in terminal or axillary cymes, umbels or heads, sometimes involucrate. Calyx-limb superior 0 or small, open or valvate in bud. Petals 4-5, at the base of the disk, valvate or imbricate in bud. Stamens 4-5, inserted with the petals, free; anthers adnate or versatile, bursting in front or laterally. Disk epigynous, annular. Ovary 1-4-celled; style 1, stigma simple or lobed; ovules solitary in each cell, pendulous, anatropous, raphe dorsal or lateral, integuments confluent with the nucleus. Drupe with a 1-4-celled stone, or 1-4 stones. Seed oblong, testa membranous, albumen copious fleshy ; embryo minute or elongate.-Distmib. Chiefly N. temp. regions; genera 12 ; species 75.-Affinities. Close to Caprifoliacear and Araluecea.-Properties unimportant.

## 1. COR'NUS, $L$. Cornel, Dogwoon.

Herbs, trees, or shrubs. Leaves opposite, rarely alternate. Flowers small, in dichotomous cymes or involucrate umbels or heads, white or yellow. Calys-teeth 4, minute. Petals 4, valvate in bud. Stamens 4. Dish tumid or obsolete. Ovary 2 -celled; stigma capitate or truncate. Drupe ovoid or oblong, areolate at the top, stone 2 -celled. Cotyledons foliaceous.Distrib. N. temp. regions, Peru; species 25.-Etym. cornu, from the horny hardness of the wood.

1. C. sanguin'ea, L.; shrubby, cymes corymbose ebracteate. Dogwood, Dogberry, Prichwood.
Copses and hedges in Eugland, N. and W. of Ireland, rare ; fl. June-July. Pubescent, $6-8 \mathrm{ft}$., branchlets and leaves red in autumn. Leaves $2-3 \mathrm{in}$., petioled, ovate, or ovate-oblong, acute; lateral nerves subbasal. C'ymes terminal, peduncled, subglobose, dense-flowered. Floners $\frac{1}{3} \mathrm{in}$. diam., cream-white. Berry small, black.-Distrib. Europe, Siberia, W. Asia.-

Wood used for skewers, formerly for arrows, and indiscriminately with that of Rhamnus Frangula, as Dogwood, by gunpowder makers. An oil used for soapmaking is extracted from the berries in France.
2. C. suécica, L.; herbaceous, umbels involucrate.

Alpine moors, Yorkshire, Cheviots, and Scotland, ascending to nearly $3,000 \mathrm{ft}$.; fl. July-Aug.-Puberulous with appressed hairs. Rootstock slender, creeping. Stem 6-8 in., ereet, forked at the top, 4 -angled, scaly below. Leaves $\frac{1}{2}-1 \mathrm{in}$., sessile, in few pairs, oblong or ovate, acute, 5 -7-nerved, glaucous below. Umbel in the fork, peduncled; bracts $4, \frac{1}{4} \mathrm{in}$., white, ovate, acute. Floxers minute, purplish. Drupe f diam., red.-Distrib. N. and Arctic Europe, Asia, E. and W. N. America.

## Division II. MONOPET'ALEE.

## Order XXXVIII. CAprifolia'cese.

Shrubs or small trees, rarely herbs. Leaves opposite, simple, ternately cut, or pinnate, usually exstipulate. Flowers cymose. Calyx-limb superior, $3-5$-toothed or lobed. Corolla regular or irregular, sometimes 2 -lipped; lobes 5, imbricate in bud. Stamens 4, 5, 8 or 10, inserted on the corollatube, equal or unequal; anthers versatile, rarely bursting outwardly. Disk epigynous, glandular, or 0. Ovary 1-6-celled ; style simple or 3-5-lobed or 0 , stigmas capitate ; ovules solitary, pendulous from the top of the cell, or many from its inner angle, or solitary in one cell and several in others, anatropous, raphe dorsal or lateral, integuments confluent with the nucleus. Fruit a berry or drupe, rarely capsular, 1- or many-seeded. Seeds small, testa usually membranous, albumen copious, fleshy ; embryo minute, ovoid, rarely large and terete.-Distrib. Temp. and sub-trop. regions of the N. hemisphere ; rare in the south, absent in trop. and S. Africa ; genera 14 ; species 200.-Affinities. With Cornece and Rubiacea.-Properties unimportant.
Tribe I. SAmbu'cee.e. Corolla rotate, regular. Ovary cells 1 -ovuled; style short, 2-3-partite, or stigma sessile.
Shrubs. Leaves simple ....................................................1. Viburnum.
Herbs, shrubs, or trees. Leaves pinnate...............................2. Sambucus.
Herbs. Leaves 3-nately compound .........................................3. Adoxa.
Tribe II. Lonice'refe. Corolla tubular or campanulate. Ovary-cells 1- or many-ovuled; style slender.
Ovary $2-3$-celled, cells with several ovules 4. Lonicera.

Ovary 3 -celled, 1 cell 1 -ovuled, 2 many-ovuled. 5. Linnæa.

## 1. VIBUR'NUM, $L$.

Shrubs or trees ; branches opposite. Leaves simple ; stipules 0 or small. Flowers in terminal or axillary corymbs or panicles, white or pink, jointed on the pedicel, 1-2-bracteolate ; outer sometimes male or neuter, with larger petals. Calyx-tube turbinate or ovoid; limb 5 -toothed. Corolla rotate, tubular or campanulate, 5-lobed. Stamens 5. Disk 0. Ovary 1-3-celled; style conical, 3 -fid, or stigmas 3 sessile ; ovule 1, pendulous in each cell.

Drupe dry or fleshy, terete or compressed, 1- or spuriously 2-3-celled, 1 -seeded. Seed compressed ; embryo minute.-Distirb. Temp. and subtrop. regions of the N. hemisphere, Andes.-Etym. unknown.

1. V. Lanta'na, L.; scurfily pubescent, leaves broadly oblong-cordate serrulate exstipulate, flowers all perfect. Wayfaring-tree.
Dry copses and hedges, from Yorkshire southwards, naturalized elsewhere ; f. May-June.-Shrubby, 6-20 ft. ; pubescence stellate. Leares 2-4 in., rugose, obtuse. Cymes flat-topped, rays stout. Flowers $\frac{1}{4} \mathrm{in}$. diam., white, 2 -hracteolate at the base. Corolla shortly funnel-shaped. Stumens shortly exserted. Irupe flattened, $\frac{1}{3}$ in., black when ripe. Deed grooved in front. -Distrib. Europe from Belgium southwards, N. Africa.-Bark acrid.
2. V. Op'ulus, L.; subglabrous, leaves 3-lobed stipulate, outer flowers larger neuter. Guelder-rose.
Copses and hedges from Ross and Moray southwards; rare in Scotland; common in Ireland ; fl. June-July.-Shrubby, 6-8 ft., buds scaly ; branches slender, lenticellate. Leaves 2-3 in., young downy, lobes unequal, serrate ; stipules linear, glandular, adnate to the petiole. Cymes 2-4 in. diam., subglobose ; flowers white, outer $\frac{3}{4} \mathrm{in}$. diam., rotate ; inner cream-white, campanulate, $\frac{\ddagger}{} \mathrm{in}$. diam. Drupe $\frac{1}{3} \mathrm{in}$., subglobose, compressed, red, translucent. Seed compressed, keeled on the flat surfaces.-Distrib. Europe, Siberia, Dahuria, E. and W. N. America.

## 2. SAMBU'CUS, L. Elder.

Large herbs, shrubs, or trees; branches stout, pith thick. Leaves pinnate. Flowers small, in umbellate corymbs or panicles, jointed on to the pedicel, bracteolate. Calyx-limb 3-5-toothed. Corolla rotate or campanulate, 3-5-partite. Stamens 5; anthers dehiscing outwardly or laterally. Disk 0 or convex. Ovary 3-5-celled ; style short, 3-5-partite, or stigmas $3-5$ sessile ; ovules 1 in each cell, pendulous. Irupe with 3-5 cartilaginous cells. Seed compressed; embryo long.-Distrib. All temp. regions (S. Africa excepted) and trop. mountains; species 10-12.-ETYM. $\sigma \alpha \mu$ Búк $\eta$, being formerly used for musical instruments.

1. S. Eb'ulus, L.; herbaceous, stipules leafy serrate, cymes 3 -rayed corymbose compact. Dwarf Elder, Dune-wort.
Waste places, rare and local, from Forfar southwards; introduced in Ireland ; a denizen, Wutson ; fl. July-Aug.-Glabrous. Rootstock creeping. Stems $2-4 \mathrm{ft}$., many, stout, ribbed and grooved. Leatlets 4-6 in., 4-6 pair, oblong-lanceolate, serrate. Cyme $3-4 \mathrm{in}$. diam. Corolla broadly campanulate, white tipped with pink. Filaments crumpled. Berry small, globose, black.Distrib. Europe, N. Africa.-Plant feetid, emetic, and purgative.
2. s. ni'gra, $L$.; a tree, stipules small or 0, cymes 5 -rayed. Elder. Hedges and thickets from Fife and Forfar southwards, ascending to $1,350 \mathrm{ft}$. in Yorkshire ; a denizen in Scotland, Watson; fl. June.-Truikk often as thick as the thigh ; bark corky ; buds scaly ; branchlets angular, lenticellate. Leaflets 2-4 pair, 1-3 in., ovate oblong or lancoolate, serrate. Cymeex 4-6 in. diam., flat-topped. Corolla $\ddagger \mathrm{in}$. diam., white, rotate, lobes rounded. Filaments slender. Berry small, globose, black, rarely green.-Distrib. Europe, N. Africa. - Berries used for wine ; flowers for making perfumes. The "Cut-leaved Elder," a laciniate-leaved variety, occurs as a garden escape.

## 3. ADOX'A, L. Moschatel.

A small glabrous succulent herb. Rootstock creeping; buds scaly; stem simple, 2-leaved. Leaves ternately cut. Flowers small, green, in a 5 -flowered peduncled head, terminal 4 lateral 5 -merous. Calyx-tube hemispherical ; limb $\frac{1}{2}$-superior, 2 - 3 -lobed. Corolla rotate, 4-5-lobed. Stamens $8-10$, on the tube of the corolla, in pairs alternating with its lobes; anthers peltate, 1 -celled. Disk 0. Ovary 3-5-celled; style short, 3 -5-partite, stigma terminal ; ovules solitary in each cell, pendulous. Drupe girt by the calyx-teeth, with 3-5 compressed cartilaginous cells. Seeds obovate, embryo minute.-Distrib. Europe, N. Asia, Himalaya, E. and W. N. America.-Etym. ä and $\delta \delta \xi \bar{\xi} \alpha$, in allusion to its insignificance. -Each pair of stamens is perhaps one, with separate anther-cells.

## 1. A. Moschatelli'na, L.; leaflets broadly triangular-ovate.

Damp hedgebanks and tree roots, rather local ; ascends $3,300 \mathrm{ft}$. in the Highlands ; fl. April-May.-Stems 6-8 in., 4 -angled. Radical leaves 1-2ternate, leaflets $\frac{1}{2}-\frac{3}{4} \mathrm{in}$., irregularly 3 -lobed ; petiole slender, dilated at the base ; cauline 3 -foliolate. Head $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam., sub-4-angular, yellow-green. Corolla $\frac{1}{4} \mathrm{in}$. diam. Fruit succulent, green.-Odour musky. A Kashmir variety has 5-6-merous flowers.

## 4. lonice'ra, L. Honeysuckle.

Erect, prostrate, or climbing shrubs, with scaly buds. Leaves opposite, entire, exstipulate, of the young shoots sometimes lobed. Flowers in peduncled cymes or heads, often connate in pairs by the ovaries, and subtended by connate bracteoles. Calyx-tube ovoid or subglobose; teeth 5 , often unequal. Corolla tubular, funnel- or bell-shaped ; tube equal or gibbous at the base ; limb oblique or 2 -lipped, 5 -lobed. Stamens 5. Disk tumid. Ovary $2-3$-celled ; style filiform, stigma capitate ; ovules many in the inner angle of each cell. Berry fleshy, 2-3-celled ; cells few-seeded, septa sometimes wanting. Seeds ovoid or oblong, testa crustaceous.Distrib. Temp. and warm regions of the N. hemisphere ; species 80 . Etym. A. Lonicer, a German botanist.

1. L. Pericly'menum, L.; leaves ovate or oblong upper sessile, flowerheads terminal peduncled. Woodbine or Honeysuckle.
Hedges and copses ; ascends to 1,500 ft. in Durbam ; f. June-Sept.-Glabrous or slightly pubescent. Stem $10-20 \mathrm{ft}$., climbing. Leaves 1-3 in., lower shortly petioled, upper sessile, glaucous below. Bracts small. Calyx-teeth persistent. Corolla 1-1 $\frac{1}{2}$ in., glandular-pubescent, dirty red outside, yellow within. Berries globose, crimson.- Distrib. Europe, N. Africa.
L. Caprifo'lium, $L$.; upper leaves connate, heads terminal sessile.

Copses in Cambridge and Oxford ; doubtless introduced ; fl. May-June.-Glabrous. Stem twining. Leaves glaucous beneath; lower petoiled, broadly ovate or oblong; upper oblong or triangular, connate by very broad bases. Bracts leafy, very large, connate. Calyx-limb short, persistent. Corolla as in L. Periclymenum. Berries globose, scarlet. - Distrib. Mid. and S. Europe.
L. Xylos'teum, L.; leaves petioled, flowers axillary in pairs.

Copses, Sussex, Hertfordshire; not indigenous; fl. May-June.-Pubescent.

Stem suberect. Leaves 2-3 in., shortly petioled, ovate or obovate. Perluncles shorter than the leaves, 2 -flowered; bracts 2, linear; bracteoles minute. Flozers sessile, connate by the ovaries. Calyx-limb deciduous. Cimollu $\frac{1}{2}$ in., pubescent, yellow. Berries small, crimson.-Distrib. Europe, Siberia.

## 5. LINN居', Gronovius.

A very slender, creeping, evergreen shrub; branches ascending, ending in a slender, erect, 2 -flowered peduncle. Leaves opposite, exstipulate. Flowers nodding, on slender 2-bracteolate pedicels. Calyc-tube ovoid; lobes 5, narrow, deciduous. Corolla subcampanulate; lobes 5, rather unequal. Stamens 4, inserted near the base of the corolla, 2 longer than the others. Disk obsolete. Ovary 3-celled; style filiform, stigma capitate ; ovules many in 2 of the cells, one in the third, pendulous. Fruit obliquely subglobose, 3 -celled, one cell 1 -seeded, the others seedless. Seed oblong; embryo cylindric.-Distrib. Lapland to N. Italy, cold and Aretic Asia, and N. America.-Etym. Linnæus.

1. L. borea'lis, Gronov.; leaves broadly ovate obtuse crenate.

Fir forests and plantations, chiefly in Mid. and E. of Scotland, ascendins to $2,400 \mathrm{ft}$.; also doubtfully indigenous in Northumberland and Dorset : H. July.-Almost glabrous, except the glandular inflorescence. Stems 3-1ti in., filiform. Leaves in distant pairs, $\frac{1-3}{4}$ in., petioled, rarely obovate or orbicular, coriaceous. Peduncles erect, filiform, 2 -bracteate at the top. Corolla $\frac{1}{3}$ in.. pink, sweet-scented. Fruit very small.-Fruit very rare indeed. I have taken the description of it from Wahlenberg.

## Order XXXIX. rubiácer.

## Tribe Stella'ta.

Slender herbs, sometimes shrubby below; stems 4 -angled. Leaves whorled, entire. Flowers very small, in axillary or terminal subsessile or peduncled cymes; pedicels jointed under the flower. Calyx-limb superior, annular or 4-6-toothed or 0 . Corolla rotate, bell- or funnel-shaped; lubes $3-5$, valvate in bud. Stamens $3-5$, inserted in the corolla-tule, filaments usually short ; anthers dorsally fixed, didymous. Ovary 2 -celled; styles 2, stigmas terminal ; ovules solitary in each cell, attached to the septum, pendulous, amphitropous, raphe ventral, integuments confluent with the nucleus. Fruit didymous, of 2 plano-convex indehiscent 1 -seeded cocci. Seed ascending, plano-convex, testa membranous adnate to the pericarp, albumen horny ; embryo axile, cotyledons foliaceous, radicle terete.-This Tribe is the representative in N. temp. regions of the enormous family of Ruliacece, for an account of which I must refer to general works on Botany. -Distrib. All cold and temp. regions; genera 7 ; species about 300 .Affinities. With Caprifoliacea and Valerianea.-Properties unimportant. Rubia yields Madder.

Calyx-limb entire or obsolete.
Corolla rotate or bell-shaped, 5 -lobed. Fruit fleshy 1. Ruhia. Corolla rotate, 4 -lobed. Fruit dry 2. Galum.

Corolla beil-shaped. Fruit dry .........................................3. Asperula.
Calyx-limb 4-6-toothed. Corolla funnel-shaped. Fruit dry....4. Sherardia.

## 1. RU'BIA, L. Madder.

Perennial herbs, often woody below. Cymes axillary and terminal. Calyx$\operatorname{limb} 0$, or annular. Corolla campanulate or rotate, 5 -lobed. Styles 2, short, connate at the base, stigmas capitate. Berry didymous or globose, succu-lent.-Distrib. Chiefly temp. regions ; species about 50.-Etym. ruber, from the red dye.

1. R. peregri'na, L.; leaves $4-6$ in a whorl elliptic or oblong.

Rocky copses and waste places from N. Wales, southwards and eastwards, to Kent ; local in Ireland ; fl. June-Aug.-Evergreen, shining, 1-2 ft., glabrous except for the recurved prickles on the angles of stem, midrib, and margins of the leaves. Leaves 1-3 in. Cymes panicled, longer than the leaves. Corolla yellowish, $\frac{1}{3}$ in. diam., lobes spreading. Stamens short. Fruit small, black, globose and 1 -celled, or didymous. -Distrib: W. and S. Europe.

## 2. Ga'lium, L. Bedstraw.

Annual or perennial herbs. Flowers minute, in axillary or terminal cymes. Calyx-limb annular. Corolla rotate, 4 -rarely 5 -lobed. Stamens 4. Styles 2, short, connate at the base; stigmas capitate. Fruit didymous, dry, often hispid or tubercled.-Distrib. Chiefly temp. climates; species about 150.-Etym. $\gamma \dot{\alpha} \lambda a$, from some species being used to curdle milk.

* Perennial. Flowers yellow. Fruit glabrous, minute, smooth.

1. G. ve'rum, L. ; leaves in whorls of 8-12. Lady's Bedstraw.

Sandy banks, shores, \&c.; ascends to near 2,000 ft. in the Highlands; fl. JüneSept. - Pubescent ; rootstock stoloniferous. Stems many, 1-3 ft., erect or ascending, 4 -angled. Leaves $\frac{1}{4} 1 \mathrm{in}$., linear, deflexed, rough above, mucronate; margin recurved. Cymes very compound, axillary and terminal, leafy; flowers 2 -sexual. Fruit small, black.--Distrib. Temp. Europe, N. Africa, Siberia Dahuria ; introd. in N. America.-Flowers used to curdle milk.
Var. 1, ve'rum proper ; black when dry, flowers golden-yellow: Var: lu'teum, Syme.-Var. 2, ochroleutcum, Syme ; greenish when dry, flowers pale yellow. Sand-hills, Deal, with G. Cruciata; perhaps a hybrid:
2. G. Crucia'ta, Scopoli; leaves 4 in a whorl elliptic hairy above and beneath. G. cruciutum, With.; Valantia Cruciata, L. Crosswort.
Copses and hedges, from Elgin and the Hebrides southwards; fl. April-June.Rootstock creeping. Stems 6 in. -2 ft ., slender, decumbent, branched at the base. Leaves $\frac{1}{2}-1$ in., 3 -nerved. Cymes axillary, few-flowered, peduncles short; flowers $\frac{1}{8} \mathrm{in}$. diam., outer male. Fruit globose, pedicels recurved. -Distrib. Europe from Holland southwards, Siberia, W. Asia.
** Perennial. Cymes both axillary and terminal. Flowers white. Fruit
glabrous, smooth granulate or rough, very minute.
3. G. palus'tre, $L$.; stems rough prickly lax, leaves 4-6 in a whorl ohtuse, cymes diffuse, frriting pedicels divaricate.
Marshes and ditches ; ascends to near 2,000 ft. in Northumberland ; fl. July-Aug.-Glabrous except the leaf-margins, black when dry, very variable. Rootstock creeping. Stems $6 \mathrm{in} .-3 \mathrm{ft}$. , flaccid, decumbent or ascending, branched throughout." Leaves $\frac{1}{2}-1 \mathrm{in}$., shining, oblong linear or lanceolateoblong, margins with reflexed prickles. Cymes corymbose, longer than the leaves. Corolla-lobes acute. Fruit minute, smooth.-Distrib. Europe (Arctic), N. Africa, Siberia, Persia, Greenland.

Var. 1, palus'tre proper; stem smoother, leaves shorter and narrower, branches of cyme patent or reflexed after flowering, corolla and fruit smaller.-VAR. 2, elonga'tum, Presl. (sp.) ; stem thick, branches of cyme not reflexed after flowering, corolla $\frac{\frac{1}{5}}{} \mathrm{in}$. diam., fruit in in. diam.-VAR. 3, Witherin'gii, Sm. (sp.) ; stem rough with recurved bristles, leaves linear recurved, cyme narrow, its branches short.
4. G. uligino'sum, L.; stem rough prickly, leaves 6-8 in a whorl aristate, cymes small few-flowered, fruiting pedicels erect.
Marshes and ditches, from Banff and Skye southwards; ascending $1,600 \mathrm{ft}$. in Northumberland ; very rare in Ireland; fl. July-Aug.-Similar in habit and appearance to $G$. palustre, L., but green when dry ; leaves 6-8 in a whorl (rarely 4), always narrower, more rigid, mucronate ; stem more bristly at the angles; panicle narrower and fruit smaller and granular.-Distrib. Europe (Arctic), N. Africa, Siberia, Dahuria.
5. G. saxat'ile, L.; tufted, stem prostrate smooth, leaves usually 6 in a whorl mucronate, cymes small, frtiting pedicels erecto-patent.
Rocks, heaths, \&c. ; ascends to $3,700 \mathrm{ft}$. in the Highlands ; fl. July-Aug.Glabrous, black when dry. Stems 4-6 in., with many barren shoots, flowering shoots ascending, internodes very short. Leaves $\frac{1}{8}-\frac{1}{4}$ in., obovate or linearobovate. Cymes compact, panicled. Corolla-lobes subacute. Fruit minute, rough.-Distrib. Europe, W. Siberia.
6. G. sylves'tre, Poll.; diffuse, stem smooth glabrous or pubescent below, leaves $6-8$ in a whorl narrow ciliate aristate, cymes much longer than the leaves, fruiting pedicels spreading.
Dry rocky hills and pastures ; ascending to 2,400 ft. in Yorkshire; fl. July-Aug.-Very similar to G. saxatile, but less tufted, more erect and rigid ; leaves narrower, stiffer, awned.-DIstrib. Europe, except Russia.
Var. 1, monta'num, Vill. (sp.) ; stem strict glabrous acutely 4-gonous, leaves suddenly acuminate, margins slightly revolute, cymes lax-flowered. $G$. pusillum, Sm. not L.-VAR. 2, nitid'ulum, Thuill. (sp.) ; stem glabrous or hairy below obtusely 4 -gonous, leaves narrower, margin strongly revolute, cymes rather compact. G. comnuttatum, Bab. not Jordan.
7. G. Mollu'go, L. ; stem flaceid glabrous or hairy, leaves $6-8$ in a whorl, cymes horizontal, corolla-lobes with slender tips.
Hedges and copses throughout England ; ascending to 1,000 ft. in Yorkshire; E. of Scotland and of Ireland, very rare ; Al. July-Aug.-Pale when dry. Stem 1-4 ft., erect or decumbent, angles hairy or scabrid. Leaves variable, margins with erect or reversed bristles. Cymes large, panicled many-flowered. Fruit $\frac{1}{1} \mathrm{in}$. diam., black, shagreened.-Distrib. Europe (Arctic), Siberia.
Sub-sp. erec'tum, Huds. (sp.); suberect, leaves linear or lanceolate, cyme with slender ascending branches. G. aristatum, Sm. not L.
Sub-sp. SCa'brum, With. (sp.); decumbent, branches divaricate, leaves obovate-lanceolate, cyme with spreading branches. G. ela'tum, Thuill.; G. insulnicum, Gaud.-Var. Bakéri, Syme ; leaves linear, cyme few-flowered.
*** Perennial. Floners white. Fruit hispid.
8. G. borea'le, $L_{\text {. }}$; stem erect, leaves 4 in a whorl lanceolate, cymes axillary and terminal many-flowered.
Moist rocks in mountain districts ; ascends to 2,800 ft. in the Highlands; f. June-Aug.-Glabrous or pubescent ; blackish when dry. Rootstock ereeping.

Stems 1-2 ft., tufted, rigid, sparingly branched above. Leaves $\frac{1}{2}-1 \frac{1}{2}$ in., 3 -nerved. Cymes panicled; branches suberect; bracts ovate. Flower $\frac{1}{8}$ in. diam. Fruit is in. diam., hispid with hooked hairs.-Distrib. N. and Mid. Europe (Arctic), N. Asia, Himalaya, E. and W. N. America.
**** Annual. Flowers white or greenish. Fruit often large, usually hispid or tubercled. Angles of stem and margins of leaves prickly.
9. G. Apari'ne, $L$.; leaves 6-8 in a whorl, cymes axillary 3-9-flowered, pedicels divaricate, fruit large usually hispid. Goose-grass, Cleavers.
Hedges and waste places, ascending to 1,200 feet in Yorkshire ; fl. June-July. -Stem 1-5 ft., weak, straggling, often forming matted masses, very rough. Leaves $\frac{1}{2}-2$ in., narrow-lanceolate, usually hispid all over. Fruit purplish. -Distrib. Europe (Arctic), N. Africa, N. Asia, W. Asia to India, temp. N. and S. America.
Sub-sp. APARI'NE proper; cymes usually 3 -flowered, flowers white, fruit tubercled tubercles crowned by hooked bristles.
Sub-sp. Vaillan'tiI, DC. (sp.); cymes 3-9-flowered, flowers very minute greenish, fruit hispid with hooked bristles.-Saffron Walden, in fields.
10. G. tricor'ne, With., leaves $6-8$ in a whorl, cymes axillary 3 flowered, fruit large granulate on recurved pedicels.
Cultivated fields on chalky soil, from Cumberland southwards; absent in Scotland and Ireland ; a colonist, Watson ; fl. June-Oct.-Habit and appearance of $G$. A parine, but leaves narrower at the tip, and the fruiting pedicels very peculiar.-Distrib. Europe from Holland southwards, N. Africa, India.
11. G. parisien'se, $L$.; sub-sp. anglicum, Huds. (sp.) ; leaves about 6 in a whorl, cymes axillary and terminal panicled , few-flowered, fruit minute tubercled.
Walls, and sandy places in S.E. of England, from Norfolk to Sussex ; fl. June-July.- Stem diffuse, branched, 6-12 in., without barren shoots. Leaves $\frac{1}{8}-\frac{1}{2}$ in., narrow, mucronate, finally reflexed, margins rough with prickles that point forwards. Flovers greenish-white.-Distrib. Europe, from Holland southwards, N. Africa.-The typical $G$. parisiense has hispid fruit.

## 3. ASPER'ULA, $L$.

Herbs or small shrubs. Leaves whorled, lower often opposite. Flowers in terminal or axillary cymes, small. Calyo-limb 4 -toothed, deciduous or 0 . Corolla funnel- or bell-shaped, 4 -fid. Stamens 4 . Styles 2, more or less connate, stigmas capitate. Fruit dry or rather fleshy.-Distrib. Temp. regions ; species 50 ?-Етум. asper, from the rough hairs of many.

1. A. odora'ta, $L_{.}$; upper leaves $7-9$, lower 6 in a whorl. Wood-ruff.

Shaded hedgebanks, copses, \&c. ; ascends to $1,200 \mathrm{ft}$. in Scotland ; fl. May-June.-Almost glabrous, odoriferous in drying, shining. Rootstock perennial, creeping, often stoloniferous. Stems 6-18 in., subsimple, hairy beneath the modes. Leaves $1-1 \frac{1}{2} \mathrm{in}$., oblong-lanceolate, euspidate, ciliate. Cymes subterminal, subumbellate. Corolla-tube $\frac{1}{\text { in. diam., as long as the limb, white, }}$ lobes obtuse. Fruit small, hispid with hooked hairs.-Distrib. Europe, N. Africa, Siberia, W. Asia.
2. A. cynan chica, $L$.; leaves 4 in a whorl. Squinancy-wort.

Dry banks, local, from Yorkshire and Westmoreland southwards; S. and W.
Ireland ; f. June-July.--Glabrous or nearly so, tufted ; branches 6-10 in.,
ascending. Leares $\frac{1}{4}$ in., close set, 2 of each whorl much smaller than the others, narrow-linear, mucronate, rigid, recurved, not ciliate. C'ymes laxflowered. Corolla $\frac{1}{6} \mathrm{in}$. diam., pink and papillose externally, white inside. Fruit minute, papillose.-Distrib. Europe, from Holland southwards; N. Africa, Siberia, W. Asia.

## 4. Sherar'dia, Dillen. Field-Madder.

An annual or biennial herb. Flowers small, blue or pink, in terminal involucrate heads. Calyx-limb 4-6-toothed, persistent. Corolla funnelshaped, tube slender; limb 4 -fid. Stamens 4, filaments slender. Style 2 -fil, stigmas capitate. Fruit didymous, dry, crowned with the enlarged calyx-limb, separating into 2 plano-convex cocci.-Distrib. Europe, N. Afriea, Siberia.-Etym. James Sherard, an eminent botanist.

1. S. arven'sis, Li; leaves 4-6 in a whorl, lower often opposite.

Fields and waste places ; fl. April-Oct.-Hispid. Stems 6-18 in., prostrate, spreading from the root. Leares $\frac{18}{4} \mathrm{in}$., oblong-lanceolate, acute. Cinvolla lilac, $\frac{1}{8}$ in. diam. Fruit minute, hispid, crowned by the erect ciliate calyxteeth.

## Order XL. Valeria'nere.

Herbs, rarely shrubs. Leaves opposite, exstipulate. Flowers small, usually irregular, in dichotomous cymes. Calyx superior ; limb lobed or a feathery pappus, involute in bud. Corolla funnel-shaped, tube equal gibbous or spurred at the base ; lobes 3-5, unequal, obtuse, imbricate in bud. Disk small, epigynous. Stamens 1-3 or 5, inserted at the base of the corolla-tube, filaments free slender exserted; anthers versatile. Ovarycells 3,2 empty or suppressed, 1 with a solitary pendulous anatropous ovule; style simple, filiform, stigma obtuse or 2-3-lobed. - Fruit small, indehiscent, coriaceous membranous or woody ; cells 1 fertile and 2 small empty or 0 , the latter sometimes confluent. Seed pendulous, testa membranous, inner coat sometimes thickened, albumen 0 ; embryo straight, cotyledons oblong, radicle cylindric.-Distrib. Europe, N. Africa, temp. Asia and N. and S. America, unknown in Australia, one sp. is S. African ; genera 12 ; species 185.-Affinities. Close with Dipsaceer and Composito.Properties. Aromatic, antispasmodic, sometimes stimulant.

Calyx-limb pappose. Corolla-tube gibbous. Stamens 3.........1. Valeriana. Calyx-limb pappose. Corolla-tube spurred. Stamen 1. 1*. Centranthus. Calyx-limb toothed or lobed. Corolla-tube obeonic............2. Valerianella.

## 1. Valeriána, $L$. Valerian.

Perennial, rarely annual herbs. Radical leaves crowded; cauline opposite or whorled, entire or pinnatifid. Flowers in corymbose capitate or panicled cymes, bracteolate. Culyx-limb annular, crenulate, developing into a feathery deciduous pappus. Corolla-tube obconic or cylindric, equal or gibhous at the base ; lobes 5 , rarely $3-4$, unequal. Stamens 3 . Stigma capitate. Fruit compressed, coutate, membranous, 1 -celled, 1 -seeded.Distisib. Temp. Europe, Asia, N. and S. America.-Etym. valere, from its powerful medicinal properties ; species about 130.-Flowers sometimes almost dioe ious, the female with very imperfect anthers.

1. V. dio'ica, L. ; cauline leaves pinnatifid, flowers polygamous.

Wet meadows and bogs, local, from Fife and Dumbarton southwards ; ascends to near $2,000 \mathrm{ft}$. in Northumberland; absent from Ireland ; fl. May-June.Glabrous, ciliate at the nodes and leaf-margins. Rootstock creeping, stoloniferous. Stem 6-18 in., ascending. Leaves $\frac{1}{2}-1 \mathrm{in}$., radical long-petioled, ovate or spathulate ; cauline with a large terminal lobe and narrow lateral segments. Cymes terminal, corymbose ; flowers $\frac{1}{6} \mathrm{in}$ diam., pinkish; females denser, smaller, darker; bracts linear. Fruit small.-Distrib. Europe.

## 2. V. officina'lis, $L$.; leaves all pinnate. Cat's Valerian, All-heal.

Wet meadows and banks of streams; ascends to near 2,500 ft . in the Lake district; fl. June-Aug.-Glabrous or hairy below, foetid. Rootstock short, stoloniferous. Leaves radical long-petioled, soon withering; cauline 2-5 in., sessile ; leaflets $\frac{1}{2}-2$ in., lanceolate, entire or serrate. Cymes terminal and axillary, corymbose. Flowers 2 -sexual. Corolla $\frac{1}{5}$ in., pale pink. Fruit small, narrow, ovoid.-Dis'rrib. Europe (Arctie), Siberia, Dahuria, Japan, W. Asia. - Rootstock a well-known antispasmodic.

VAR. 1, officina'lis proper; leaflets 6-10 pairs.-VAR. 2, sambucifo'lia, Mikan (sp.); leaflets 4-6 pairs.
V. pyrena'ica, L.; leaves very large cordate deeply toothed.

Naturalized in plantations; fl. June-July.-A large coarse herb, with no pretensions to be considered indigenous. Stem 2-4 ft. Leaves often a foot in diam., upper with a few basal leaflets. Flowers much as in V. officinalis.Distrib. S. of France and Spain.

## 1*. CENTRAN ${ }^{\prime}$ THUS, DC. Spur-Valerian.

Perennial, glabrous, leafy herbs. Flowers in terminal unilateral panicled cymes, bracteolate, red or white. Calyx-limb annular, crenulate, developing into a feathery deciduous pappus. Corolla-tube compressed, elongate, with a longitudinal septum, spurred at the base ; lobes 5 , unequal. Stamen 1. Stigma capitate. Fruit membranous, 1-celled, 1 -seeded.-Distrib. Europe, N. Africa, W. Asia ; species about 10.-EțM. кévт $o s$ and ă้ $\theta o s$, from the spurred corolla.
C. Ru'ber, $D C$.; lower leaves lanceolate, upper triangular ovate.

Old walls and chalk-pits, naturalized in the S. of England and Ireland, rarer northwards; fl. June-Sept.-Stem woody below; branches $2-3 \mathrm{ft}$., erect, terete, fistular. Leaves $2-4 \mathrm{in}$., thick; lower 2-3 in., petioled, lanceolate or subspathulate ; upper sessile, entire or toothed at the base. Cymes long; flowers dense, secund. Corolla $\frac{1}{2} \mathrm{in}$., red or white ; spur slender. Fruit $\frac{1}{4}$ in., rough, narrow, ovoid, compressed.-DISTRIB. Mid. and S. Europe, N. Africa, W. Asia.

## 2. Valerianel'La, Tournef. Corn Salad.

Small annuals, dichotomously branched. Flowers solitary or cymose in the forks of the branches, small, bracteate. Calyx-limb toothed lobed or 0 . Corolla funnel-shaped, regular, not spurred; lobes 5 , obtuse. Stamens 3. Stigma simple or 3 -fid. Fruit compressed, unequal-sided, grooved, 2-3-celled, 1 -seeded.-Distrib. Europe, N. Africa, W. Asia, N. America, species about 50.-Etym. Diminutive of Valeriana.

1. V. olito'ria, Mernch; cymes capitate, bracts leafy toothed, fertile
cell of fruit corky on the back, empty ones contiguous or confluent, calyxlimb obsolete. Valeriana Locusta, L. in part. Lamb's Lettuce.
Cornfields and hedgebanks; a native? Watson; fl. April-June.-Glabrous, flaccid, brittle, $6-12 \mathrm{in}$. Leaves 1-3 in., linear-oblong, or oblong-lanceolate, quite entire or toothed, cauline $\frac{1}{2}$-amplexicaul. Flouers minute, pale lilac; bracts linear, ciliate. Fruit minute, glabrous or hairy.-Distrib. Europe, N. Africa, W. Asia ; introd. into N. America.-An excellent salad.
V. carina'ta, Loisel; cymes capitate, fruit oblong boat-shaped, fertile cell not corky, empty cells contiguous inflated, calyx-limb indistinct.
Cultivated ground, \&c. from Yorkshire southwards, naturalized; fl. April-
June. - Probably a variety of $F$. olitoria, which it resembles in all characters, save those of the fruit given above. - Distrib. Europe from Holland southwards, N. Africa, W. Asia.
2. V. Auric'ula, $D C$.; crmes lax, fruit broadly ovoid turgid narrowly grooved in front, fertile cell not corky, empty cells contiguous inflated, calyx with one large unilateral lobe. F. tridentata, Stev.
Cornfields, rare, from Fife southwards, and in Ireland; a colonist, W'atson ;
f. June-Aug.-Very similar in size, habit, and foliage to $F$. olitoria, but more slender, inflorescence different, and fruit widely so.-Distrib. Europe from Holland southwards, W. Asia.
3. V. denta'ta, Poll.; cymes lax, fruit narrow-ovoid slightly compressed, fertile cell not corky, empty cells remote slender on one side of the fruit, calyx with one large unilateral lobe. V. Morisonii, DC. Cornfields, \&ce. from Moray and Lanark southwards, and in Ireland; a colonist,

Wutson; fl. June-Aug.-Hahit, \&c. of V. Auricula. Flowers flesh-coloured.

- Distrib. Europe from Gothland southwards, N. Africa, N.W. India.

Var. mix'ta, Desf. (sp.) ; fruit hispid. F. eriocarpa, R. and S. not Desv.

## Order XLI. dipsaceme.

Perennial or biennial herbs. Leaves opposite, rarely whorled, exstipulate. Flowers small, capitate; outer bracts involucriform; inner 0 or beneath the flowers; bracteoles forming an involucel embracing the calyxtube and enclosing the fruit. Calyx superior, suddenly expanding into a cup-shaped, entire, lobed, or ciliate limb. Corolla-tube funnel-shaped or cylindric, often curved; lobes 4-5, obtuse, imbricate in bud, the larger or anterior overlapping. Stamens 4, inserted on the corolla-tube ; filaments filiform, free, often unequal, incurved in bud, exserted; anthers versatile. Ocary 1-celled ; style filiform, stigna simple oblique or notched; ovule solitary, pendulous from the top of the cell, anatropous. Fruit indehiscent, surrounded by the hardened and grooved involucel, and often crowned by the calyx-limb. Seed pendulous, testa membranous, albumen fleshy ; embryo axile, straight, cotyledons broad flat, radicle short. -Distrib. Chiefly Oriental ; genera 6 ; species 150 . -Affinities. With Compositce.-Properties unimportant.
Floral bracts spinescent exserted, covering the head 1. Dipsacus.
Floral bracts concealed, scale-like or 0..................................2. Scabiosa.

## 1. DIP'SACUS, Tournef. Teasel.

Erect, biennial, hairy or spinulose herbs, with angular stems. Leaves usually connate at the base, toothed or cut. Heads oblong or cylindric; receptacle columnar; invol. bracts many, rigid, spreading; floral bracts exserted, spinescent ; involucel 4 -angled. Calyx-limb discoid or cupular, lobulate. Corolla-tube slightly dilated upwards; lobes 4, short, unequal. Stamens 4. Style filiform, stigma dilated obliquely decurved.-Distrib. Europe, W. Asia ; species about 17.-Etym. obscure.

1. D. sylves'tris, L.; leaves sessile simple obovate-lanceolate, heads oblong, invol. bracts upcurved. Wild Teasel.
Copses and hedges in England and Ireland, rare and local in Scotland;
fi. Aug.-Sept.-Glabrous. Stem 3-4 ft., stout, rigid, ribs priekly. Leaves, radical on the first year's growth only, spreading ; cauline 6-8 in., oblonglanceolate, entire or crenate, midrib prickly. Heads 2-3 in.; bracts linear, rigid, longer than the head; floral bracts very long, rigid, subulate, strict, ciliate ; involucel pubescent, 4 -angled in fruit. Calyx-limb deciduous. Corolle purplish.-Distrib. Europe from Denmark southwards, N. Africa, W. Asia.-D. Fullonum, L. (Fuller's Teasel), known by its hooked bracts, is probably a form of this plant only known in cultivation.
2. D. pilo'sus, $L$. ; leaves petioled with usually a pair of basal leaflets, heads subglobose hairy, invol. bracts deflexed.
Moist hedges and banks, local, Yorkshire to Hants and Kent; absent from Ireland ; fl. Aug.-Sept.-More or less hairy. Stem 2-4 ft., slender, ribs with soft, short, hair-pointed prickles. Leaves, radical petioled, hairy, crenate ; cauline $6-12 \mathrm{in}$., oblong, crenate-serrate. Heads $\frac{3}{4}-1 \mathrm{in}$. diam., drooping in bud; bracts many, shorter than the head, linear, toothed and ciliate; floral bracts obovate, with long cuspidate ciliate points; involucel calyx-tube and corolla white, very hairy.-Distrib. Europe from Gothland southwards, W. Asia.

## 2. SCABIO'SA, $L$.

Perennial herbs. Leaves entire or pinnatifid. Heads hemispheric or depressed ; invol. bracts 1-2 seriate ; receptacle hemispheric or columnar, hairy or with scaly floral bracts ; outer flowers often larger and rayed. Calyxtube contracted at the top, included in the tubular, 4-8-angled, truncate, or 4-5-lobed involucel ; limb cup-shaped, with 4-10 rigid bristles or teeth. Corolla curved, oblique or 2-lipped; lobes 4-5, obtuse. Stamens 4, exserted. Style filiform, stigma capitellate notched.-Distrib. Europe, W. Asia, N. and S. and trop. Afriea ; species about 90.-Etym. seabies, from its use in skin-diseases.

Sub-gen. Scabio'sa proper. Receptacle elongate, covered with scaly bracteoles. Involucel 8 -furrowed. Calyx-teeth of $4-5$ persistent bristles.

1. S. succi'sa, $L$.; leaves entire, involucral bracts shorter than the 4-lobed subequal corollas. Devil's-bit-Scabious.
Pastures and open places ; ascends to $2,500 \mathrm{ft}$. in the Highlands ; f. July-
Oct.-Rootstock short, abruptly truncate. Stem 1-2 ft., branched above.
Leaves glabrous or hairy ; radical oblong or obovate, petioled ; cauline few, toothed. Heads $\frac{2}{3}-1 \frac{1}{2}$ in. diam.; peduncles with appressed hairs ; invol.
bracts lanceolate, Horal linear-spathulate. Flowers blue-purple or white;
involucel, villous, with 4 ovate teeth. Calycine bristles 4 rigid. Corolla
pilose, tube curved. Anthers red-brown. Fruit oblong, concealed in the involucel.- Distrib. Europe (Arctic), Siberia, N. Africa.
2. S. Columbária, $L$. ; cauline leaves pinnatifid, invol. bracts longer than the 5 -lobed corollas, outer corollas larger very irregular.
Dry pastures and banks, from E. Scotland and Aberdeen southwards ; ascends to $1,600 \mathrm{ft}$. in Yorkshire ; absent from Ireland ; fl. July-Sept.-Revisteck tufted, often woody. Stem 1-2 ft., simple or branched above, pilose. Leaves glabrous or pubescent, very variable ; radical narrow, petioled, entire or divided; cauline segments often cut. Heads $1-1 \frac{1}{2} \mathrm{in}$. diam. ; peduncles slender; invol. bracts 1 -seriate, slender, floral linear-spathulate. Flowers lilac or blee-purple; involucel sutcampanulate, limb white, membranous, many-nerved. Calycine bristles 5, rigid, rough. Corolla pubescent, of inner flowers regular, of outer rayed. Anthers yellow. Fruit narrow-obovoid, shortly beaked.-Distrib. Europe, N. Afriea.
Sub-gin. Knau'tia, Coulter (gen.). Receptacle hemispheric, covered with hairs. Inrolucel 4 -furrowed. Calyx-teeth of 8-16 deciduous bristles.
3. S. arven'sis, $L$. ; invol. bracts shorter than the usually 4 -lobed corollas, of which the outer are much larger and 2 -lipped.
Dry banks and flelds; fl. July-Sept. Rootstock stout. Stem 2-5 ft., stout, very hairy, usually branched above. Leaves variable, pilose ; radical oblonglanceolate, entire serrate or crenate; cauline toothed lobed or pinnatifid. Heads 1-1 $\frac{1}{2}$ in. diam., depressed ; peduncle long, stout ; invol. bracts broad, leafy, 2 -seriate. Florers pale lilac or blue; involucels villous, obscurely 4 -toothed. Corolla pilose, inner redder, outer larger, radiating. Authers yellow. Fruit ovoid, beaked ; oalyx-limb deciduoas.-Distrib. Europe (Arctic), Siberia, N. Africa.

## Order XLII. compos'itas.

Herbs (the British species). Leaves alternate, rarely opposite or whorled, simple or compound ; stipules 0. Inflorescence a centripetal head of many small flowers, sessile on the dilated top of the peduncle (recrptacle), enclosed in an involuere of whorled bracts ; bracteoles 0 , or scales or bristles on the receptacle. Flowers all tubular (head discoid), or the outer, or all, ligulate (head rayed); 2-sexual, or the imner 2 -sexual or male, the outer female or neuter. Calyx superior ; limb 0, or of hairs (papquis) or scales. Corolla of 2 forms : 1st, tubular, or campanulate, 4-5-lohed, lobes valvate, with marginal nerves; 2dly, ligulate, lobes elongate and connate into a strap-shaped or elliptic ligule. Disk epigynous. Stamens 4-5, inserted within the corolla-tube, filaments usually free; anthers hasifixed, usually connate ; connective produced upwards; cells simple or tailed at the base ; pollen suhglobose, rough. Ovary l-celled; style slender 2 -fid, arms (sometimes connate) linear, $\frac{1}{8}$-terete, naked or externally pubescent or tipped by pubescent cones, margins stigmatic ; ovule solitary, basal erect, anatropous, nuclens with 1 coat. Fruit dry, indehiscent. Sced erect, testa membranous, albumen 0 ; emliryo straight, cotyledons plano-convex, radicle short.-Afrinitiss. Close with Dipsucece, Valerianea, and Lobeliacess.-Distrib. Co-extensive with dicotyledonous
vegetation; genera about 1,000 ; species about 8,000 .-Properties. Too numerous to mention here.
Series 1. TUBULIFLO'REA. Flozers all tubular or the outer only ligulate. Juice watery.
Tribe I. CYNA'REAE. Leaves alternate, usually spinous-toothed. Involucre often globose, bracts spinous. Flowers all tubular, 2-sexual, or the outer female or neuter (diæecious in Serratula and some Cardui), tube slender, ventricose above, lobes very narrow. Anthers much exserted; connective elongate, stiff. Style-arms usually combined into a pubescent 2 -fid cylinder, with a ring of hairs or swelling at their base.
Anther-cells tailed.
Outer bracts hooked

1. Arctium.

Outer bracts spinous, inner spreading
2. Carlina.

Bracts all unarmed
3. Saussurea.

Anther-cells not tailed or scarcely so.
Pappus short unequal or 0 .
4. Centaurea.

Pappus-hairs long.
Bracts unarmed
5. Serratula.

Bracts spinescent. Fruit compressed
.6. Carduus.
Bracts spinescent. Fruit 4 -angled and ribbed.
7. Onopordon.

Tribe II. eupato'riest. Leaves mostly opposite. Flowers all tubular, 2 -sexual. Anther-cells not tailed. Style-arms slender, $\frac{1}{2}$-terete, pubescent, stigmatic lines not continued to the base.
8. Eupatorium.

Tribe III. TUSSILAG'INEFE. Leaves alternate, all radical, broad. Outer flovers female, very slender and tubular, or ligulate. Disk flowers tubular, usually 2 -sexual. Anther-cells not tailed. Style-arms connate, pubescent, with 2 -fid conical tips.
Heads racemose ; outer flowers tubular
9. Petasites.

Heads solitary ; outer flowers ligulate.
10. Tussilago.

Tribe IV. ASTEROI'DEs. Leaves altemate. Ray-flowers female or neuter, ligulate (tubular in Linosyris) ; style-arms linear, obtuse, glabrous, stigmatic lines 'confluent. Disk-flowers 2 -sexual ; anther-cells not tailed; style-arms linear, glabrous, tipped with a pubescent cone. Pappus-hairs or seales rigid or 0 .
Ray-flowers purple, 1 -seriate. Pappus rigid..............................11. Aster.
Ray-flowers in 2 or more series. Pappus-hairs rigid...............12. Erigeron.
Ray-flowers white or pink. Pappus 0 13. Bellis.

Ray-flowers yellow. Pappus-hairs rigid.
14. Solidago.

Ray-flowers 0. Pappus-hairs rigid.
15. Linosyris.

Tribe V. I'NuLEfe. Leaves alternate. Ray-florers ligulate, yellow; diskflowers tubular ; anther-cells with slender tails. Style-arms and pappus as in Asteroidece
16. Inula.

Tribe VI. helian'thexe. Leaves opposite. Ray-flozers 0 or ligulate, yellow, female or neuter. Disk-flowers 2 -sexual. Style-arms as in Asteroideue.
Pappus of 2 barbed bristles
17. Bidens.

Pappus of broad ciliate scales
17*. Galinsoga.
Tribe VII. ANTHE'MIDEIE. Leaves alternate. Ray-flovers ligulate, or tubular and very slender. Anther-cells not tailed. Style-arms linear, with truncate papillose or penicillate tips; stigmatic margins confluent below. Pappus 0 or minute.
Outer floners ligulate, white or 0. Receptacle with scaly or inristly bracteoles.
Ligule oblong. Fruit terete or angled. 18. Anthemis.
Ligule broad, short. Fruit compressed, winged ..... 19. Achillea.
Flowers all tubular and compressed. ..... 20. Diotis.
Outer flowers ligulate, white or yellow. Receptacle naked.
Receptacle conic, often elongating 21. Matricaria.
Receptacle flat or convex ..... 22. Chrysanthemum.
Flowers all tubular. Receptacle naked.
Receptacle broad. Epigynous disk broad. 23. Tanacetum.
Receptacle narrow. Epigynous disk small 24. Artemisia.
Tribe VIII. GNAPHA'Liese. Leaves alternate, quite entire. Incol.bracts scarious. Flowers all tubular, outer excessively slender, female.Anther-cells with filiform tails. Style-arms linear, truncate or obtuse, tipspapillose. Pappus-hairs very slender, silky.
Heads 2 -sexual. Receptacle flat, naked 25. Gnaphalium.
Heads almost diœecious. Pappus of male clavate 26. Antemnaria.
Heads 2 -sexual. Receptacle conical ; bracteoles few ..... 27. Filago.
Tribe IX. SENECION'IDEA. Leaves alternate. Floicers all yellow,tubular and 2 -sexual, or outer ligulate. Receptacle naked. Anther-cellswithout tails. Style-arms as in Ginaphaliea, but sometimes tipped withshort papillose cones (as in Asteroidece). Pappus-luairs usually very soft(rigid in Doronicum).
Invol. bracts in many series ..... 27*. Doronicum.
Invol. bracts in one series. ..... 28. Senecio.
SEries 2. LIGULIFLO'RE. Fluners all ligulate. Juice milliy.
Tribe X. Cichora'cefe. Leaves alternate. Style cylindric, pubescentabove ; arms linear, $\frac{1}{2}$-terete, obtuse, pubescent at the back ; stigmaticlines not confluent.
Pappus 0 .29. Lapsana.
Pappus a coriaceous raised border ..... 30. Arnoseris.
Pappus of short broad scales. 31. Cichorium.
Pappus of inner fruits of feathery hairs, often dilated at the base.

* Receptacle covered with narrow bracteoles 32. Hypochæris.
** Receptacle naked.Fruit vith a long slender beak.
Leaves toothed. Outer invol. bracts cordate 33. Helminthia.
Leaves quite entire. Invol. bracts narrow ..... 34. Tragopogon.
Fruit with a short beak.
Invol. bracts 1 -seriate, with a few outer short ones 35. Picris.
Invol. bracts 2-3 seriate 36. Leontodon.
Pappus of simple hairs not dilated at the base.
* Pappus-hairs white, silky (except Crepis paludosa).
Fruit with a long slender beak.
Fruit compressed, not muricate. Leafy branched herbs 37. Lactuca.
Fruit muricate upwards. Scapigerous herbs. 38. Taraxacum.Fruit terete, not muricate39. Crepis, sect. Barkhausice.Fruit with a short thick beak or 0 .Fruit angled or terete, much compressed40. Sonchus.
** Pappus-hairs rigid, discoloured (see Crepis paludosa in *).
Fruit compressed. Pappus-hairs in several series............41. Mulgedium.
Fruit terete. Pappus-hairs in one series.........................42. Hieracium.

## 1. ARC'TIUM, L. BURDOCK.

A stout, erect, branching, biennial herb. Leaves alternate, the lower very large. Heads solitary racemed or corymbose, not rayed, purple or white ; involucre globose, bracts imbricate, very many, coriaceous, appressed below, with long, stiff, spreading, hooked tips; receptacle flat; bracteoles rigid, subulate. Corollas regular, campanulate; lobes 5 , slender. Filaments papillose ; anthers with a long terminal appendage, cells with subulate tails. Style-arms connate, pubescent below, obtuse. Fruit large, oblong or obovoid, laterally compressed, transversely wrinkled, areolate at the base ; pappus-hairs multi-seriate, short, free, filiform, scabrid.-Distrib. Europe, N. and W. Asia ; introd. into N. America.Етум. äрктоs, a bear, from its coarse appearance.

1. A. Lap'pa, $L$. ; leaves ovate-cordate entire or sinuate-toothed.

Waste places ; fl. July-Aug.-Glabrous or cottony, 2-4 ft., very variable. Leaves often 1 ft ., glabrous above, usually densely cottony beneath. Heads $\frac{3}{4}-1 \frac{1}{2} \mathrm{in}$. diam., webbed or not ; peduncle very stout ; invol. bracts slender, angled, rigid, spreading. Corolla and stamens purple, styles white. Fruit compressed, angled, ribbed, grey mottled with black.-Young stalks formerly eaten boiled, and as salad.-The following sub-species and varieties present no constant characters ; I have followed Syme in their discrimination.
Sub-sp. LAP'PA proper (sp.) ; petioles hollow, heads subcorymbose globose glabrous all green, corolla-tube longer than the limb. A. majus, Schkuhr.From Lancaster and Derby southwards.
Sub-sp. Mi'Nus, Schkuhr (sp.) ; heads subracemose more ovoid glabrous or cottony, inner invol. bracts purplish, corolla-tube as long as the limb.Advances North to Skye. - Var. 1, mi'nus proper; root-leaves coarsely toothed, petioles hollow, heads $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam. subsessile cottony. Common.

- Var. 2, intermédium, Lange (sp.) ; root-leaves crenate, petioles with a
slender tube, heads arachnoid, lower ones $\frac{3}{4}-1 \mathrm{in}$. diam., of the raceme
peduncled purple. A. pubens, Bab.-VAR. 3, nemoro'sum, Lej. (sp.) ; root-
leaves narrower coarsely crenate, crenatures apiculate, heads subsessile globose.

## 2. CARLi'NA, L. Carline-thistle.

Rigid, spinous herbs. Leaves pinnatifid. Outer invol. bracts leafy, spinous-toothed, spreading; inner longer, narrower, scarious, coloured, shining; receptacle flat, deeply pitted, edges of the pits scaly. Corollas all tubular, glabrous, erect; limb campanulate, 5 -toothed. Filaments glabrous; anthers with a terminal appendage, cells with short plumose tails. Style-arms connate into a pubescent cone. Fruit oblong, terete, silky with 2 -fid hairs; pappus-hairs 1 -seriate, feathery, connate in threes or fours at the base.-Distrib. Europe, N. and S. Africa, W. Asia; species about 15.-Etym. After Charlemagne, who used it medicinally.

## 1. C. vulgar'is, L.; heads 2 or more, bracts ciliate.

Dry fields and pastures; from Arran to Elgin southwards ; ascends to 1,200 ft.
in Northumberland; local in Ireland ; f. June-Oct.-Biennial, hoary
root tapering. Stem 6-18 in., stout, simple or branched above, purple. Radical leaces 3-5 in., spreading, lanceolate, pinnatifid, spinous, cottony beneath ; cauline many, shorter, $\frac{1}{2}$-amplexicaul. Heculs $\frac{3}{3}-1 \frac{1}{2} \mathrm{in}$. diam.; outer bracts cottony, spreading ; middle purplish; inner $\frac{1}{2}$ in., narrow, rigid, acute, yellow, sprea ing, erect when moist. Bristles of receptacle rigid, yellow, longer than the soft pappus. Flowers purple. Fruit brown.-Distrib. Europe, Siberia.

## 3. SAUSSU'REA. $D C$.

Herbs. Leaves entire or divided. Heals corymbose, purple or violet ; invol. bracts multi-seriate, imbricate, obtuse or acute; receptacle flat, covered with chaffy bracteoles. Corollas all tubular, ventricose above, 5 -fid. Filaments glabrous ; anthers terminated by a long acute appendage, cells with ciliate tails. Style-arms connate below, pubescent, with a ring of hairs at the base. Fruit glabrous; pappus-hairs 2 -seriate, outer filiform, rough, usually persistent; inner feathery, connate at the base, deciluous.-Distrib. N. temp. regions; species about 45.-Etym. De Saussure, the Swiss philosopher.

1. S. alpína, L.; leaves oblong-lanceolate toothed cottony beneath. Alpine rocks, N. Wales, Lake district, Dumfriess! ire, and the Scotch Highlands, ascending to near $4,000 \mathrm{ft}$. ; Mts. of Kerry in Ireland ; f. August.-Rootstock short, stoloniferous. Stem 6-8 in., stout, erect, leafy, simple, cottony. Leares, lower petioled, 4-7 in., acuminate; upper smaller, sessile. Heurls 2-3 in., in dense corymbs; involucre ovoid, hacts oblong, obtuse, woolly, inner longer. Flowers exserted, purple, anthers bluish. Fruit brown, ribbel; pappus dirty white--Distrib. Scandinavia (Aretic), N. Russia, and Alps of Mid. Europe, N. Asia, E. and W. N. America (a form).

## 4. Centau'rea, $L$. Knapweed.

Herbs of various habit. Leares entire or cut, often spinous-toothed. Involucre ovoid or globose ; bractspressed, imbricate, entire and searious, or spinous, or dilated fringed or teethed ; receptacle flattish; bracteoles bristly. Corolles all tubular, oblique or 2-lipped, ventricose above ; outer usually larger, neuter, inner 2 -sexual ; lobes 5, slender. Filaments glandular; anthers with a long terminal coriaceous appendage, cells tailed or not. Fruit compressed, basal areole oblique, top broad; pappus-hairs short, slender, seabrid, usually in many series, inner smaller often scaly, ravely 0.--Distrib. Europe, W. Asia, N. Africa; species 200.-Etym. Mythical.

Section 1. Ja'cea. Invol. bracts with a dilated broad appendage.

1. C. ni'gra, $L$. ; leaves hispidulous lanceolate entire or distantly lobed, peduncles leafy, pappus-scales short unequal or 0 . K'napuced.
Meadows and pastures, ascending to $1,600 \mathrm{ft}$. in Northumberland ; fl. June-Sept.-Perennial, Stem $\frac{1}{2}-3 \mathrm{ft}$., slender, grooved, simple or brauched. Lewoes scattered, variable, lower petioled, uppermost quite entire. Heulx $1-1 \frac{1}{2} \mathrm{in}$. diam. ; invol. appendage very variable, pale or dark brown, orbicular, pectinate on the margin or to the axis. Flocers purple, outer often larger. Fruit grey.-Distrib. Europe; introd. in N. America.
VAR. 1, niggra proper; outer flowers larger, peduncles thickened, appendages dark brown deeply pectinate.-Var. 2, decip'iens, Thuill.; outer flowers usually larger, peduncles slender, appendages paler less deeply pectinate. C. nigres'cens, Bab. Southern counties.

Section 2. Cya'nus. Invol. bracts with the upper part and margins scarious and pectinate or ciliate.
2. C. Scabio'sa, L. ; erect, leaves deeply pinnatifid segments entire or lobed, peduncles glabrous, involucre globose, bracts with brown pectinate tip and margins, pappus as long as the fruit.
Dry pastures and waste places, from Moray southwards, and in Ireland; fl. July-Sept.-Rootstock woody. Stem 2-3 ft., grooved, sparingly branched, pilose with soft hairs. Leaves $4-10 \mathrm{in}$., almost pinnate, segments obovate. Heads $1 \frac{1}{2}-2$ in. diam., rayed ; invol. bracts with a broad brown tip which is de urrent on the sides of the bracts ; flowers bright purple. Fruit grey, pubescent.-Distrib. Europe, Siberia.
3. C. Cya'nus, $L$.; erect, leaves narrow entire or lobes few spreading, peduncles cottony, involucre ovoid, margins of bracts deeply toothed scarious, pappus shorter than the fruit. Bluebottle, Cornflower.
Cultivated fields, from Moray and Renfrew southwards ; ascending to $1,000 \mathrm{ft}$. in the Highlands ; a colonist, Watson.; fl. June-Sept.-Annual or biennial. Stem 1-2 ft., slender, grooved, sparingly branched. Leaves 2-4 in., variable, sessile, acute, lower $\frac{1}{2}-1 \mathrm{in}$., upper $\frac{1}{10} \mathrm{in}$. broad. Heads $\frac{1}{2}-1 \mathrm{in}$. diam., cobwebby ; teeth of bracts triangular, spreading, of outer white, of inner brown and white ; bristles of receptacle silvery. Flowers of ray few, large, bright blue ; of disk smaller, purplish. Fruit grey, silky ; pappus dirty white.Distrib. Europe, W. Siberia, N.W. India ; introd. in N. America.
Section 3. Serid'ia. Invol. bracts tipped by spreading reflexed spines.
4. C. asp'era, L. ; ascending, leaves linear-oblong entire toothed or lyrate, peduncles leafy, involucre globose, bracts tipped with 5 palmately spreading reflexed spines, pappus shorter than the fruit. C. Isnardi, L. Vazon Bay, Guernsey, very rare ; fl. July-Sept.-Perennial. Stem 1-2 ft., slender ; branches spreading, sparsely pubescent, tips cottony. Leaves very variable, lower sessile or petioled, lanceolate or oblong. Heads 1 in . diam.; bracts coriaceous, yellow-brown, spines $\frac{1}{2 n} \frac{1}{8} \frac{i n}{}$ in.; bristles of receptacle white. Fruit grey, pubescent ; pappus white.-Distrib. France and S. Europe.

## Section 4. Calcit'rapa. Invol. bracts ending in a long strong spine.

5. C. Calcit'rapa, L.; rigid, diffusely branched from beneath the heads, leaves pinnatifid, lobes recurved aristate, spines of bracts long spreading, with a few smaller on each side the base, pappus 0 . StarThistle.
Dry waste places, rare, from Norfolk and S. Wales to Cornwall and Somerset ; a native? Watson; fl. July-Sept.-Biennial, 1-2 ft., cottony or glabrous; branches leafy, spreading, stout. Leaves $1-3 \mathrm{in}$., often interruptedly pinnatifid, lobes distant, slender. Heads lateral and sessile, or terminating leafy branches, $\frac{1}{3}$ in. diam., spines as long, yellow and channelled above. Flowers rose-purple. Fruit white or mottled brown.-Distrib. Europe from Holland southward, N. Africa, N.W. India ; introd. in N. America.
C. solstitia'lis, $L$.; erect, branched, cottony, stems winged, lower leaves lyrate, upper linear entire decurrent, spines of upper bracts long spreading with a few smaller ones at the base, pappus soft.
Fields in E. and S. of England, rare ; introd. with lucern, \&c. ; fl. July-Sept.
-Annual, much branched, 1-2 ft. Stem rigid, branches twiggy, terminated
by peduncled heads. Leaves very variable. Meads globose, $\frac{1}{2} \mathrm{in}$. diam., spines as long, not channelled, those of the outer bracts very small. Flowers yellow. Fruit white ; pappus copious, white, as long as the fruit.-Distrib.
Europe from Holland southwards, Siberia.

## 5. serrat'ula, DC. Saw-wort.

Perennial herbs. Leaves alternate; radical simple ; cauline usually pinnatifid. Heads solitary or corymbose, sometimes diœecious, purple or white; invol. bracts many, imbricate, outer shorter, inner more or less scarious at the tip; receptacle bracteolate. Corollas regular, tubular. limb ventricose, lobes 5, narrow, oblique. Filaments papillose ; anther-cells simple or shortly tailed. Style tumid or papillose or with a ring of hairs at the tip; arms free or connate. Fruit oblong, compressed, glabrous, smooth ; pappus-hairs multi-seriate, rigid, scabrid, coloured, outer shorter, deciduous.-Distrib. Europe, Asia; N. America; species about 30.Etym. serrula, from the serrate foliage.

1. S. tincto'ria, $L$.; leaves lyrate-pinnatifid, lobes distant serrate.

Copses, \&ce. from the N. of England, ascending to near $1,000 \mathrm{ft}$., southwards ; doubtfully indigenous in Scotland; absent from .Ireland; fl. Aug.Glabrous or nearly so. Stem 2-3 ft., slender, erect, grooved, leafy, corymbosely branched. Leaves $5-9 \mathrm{in}$., rarely entire ; lobes linear-oblong, acute or acuminate ; cauline sessile. Heads $\frac{1}{2} \frac{2}{3}$ in., corymbose, subsessile in var. monticola (Boreau sp.), cylindric-ovoid, subdioecious, female largest ; invol. bracts ciliate, rigid, striate; outer oblong or ovate, acute; inner linear-oblong, purplish. Flowers red-purple; male with blue anthers and contiguous style-arms ; female with white anthers and spreading style-arms. Fruit grey, glabrous ; pappus dirty white.-DIsTrib. Europe, W. Siberia.

## 6. Car duus, $L$. Thistle.

Erect herbs. Leaves usually spinous-toothed. Heads sometimes dicecious, purple, rarely white ; involucre ovoid or globose ; bracts many, imbricated, appressed, narrow, rigid, acuminate or spinous-tipped; receptacle deeply pitted, covered with bristly bracteoles. Corollas all tubular, tube short, ventricose above, oblique; lobes 5, narrow, elongate. Filaments free or connate, pilose or glandular; anthers terminated by a linear appendage, cells usually with toothed tails. Style-arms connate into a cylindrical 2 -fid pubescent column, with a ring of hairs at the base. Fruil oblong, compressed or terete, glabrous ; pappus-hairs multi-seriate, filiform, scabrid or feathery, connate at the base, deciduous.-Distrib. Chiefly Europe and W. Asia; species about 150.-Etym. doubtful.

Su'b-gen. 1. Car'duus proper. Filaments free, pilose. Fruit compressed, smooth ; pappus-hairs rough not feathery, copious, white, shining. Leaves decurrent, wings of stem very spinous.

1. C. nu'tans, $L$.; wings of stem interrupted, head large solitary hemispheric drooping, invol. bracts subulate-lanceolate, outer spreading and reflexed. Musk-Thistle.
Waste places, from Skye and Moray southwards; ascending to $1,600 \mathrm{ft}$. in
Yorkshire ; rare in Scotland and Ireland; fl. July-Sept.-Biennial, rarely
branched, more or less cottony. Stem 1-3ft., grooved ; wing sinuous, very
spiny. Leaves 6-12 in., variable, undulate, entire or 1-2 pinnatifid. Heads 1-2 in. diam.; peduncle slender, and involucre cottony; outer bracts $\frac{2}{3} \mathrm{in}$., green, spinous tip long. Flowrers crimson. Fruit pale brown, glabrous, granulate.-Distrib. Europe, N. Africa, Siberia; introd. in N. America.
2. C. cris'pus, $L$.; wings continuous, headssmall erect fascicled, peduncles leafy, involucre webbed, bracts erect very slender. C. acanthoides, Sm.
Hedgebanks and waste places, from Moray and Dumbarton southwards; ascending to near $1,000 \mathrm{ft}$. in Yorkshire ; rare in Scotland; S. of Ireland; fl. June-Aug.-Annual or biennial. Stem 1-3 ft., erect, cottony or pubescent above ; branches ascending ; wings narrow, waved. Leaves variable, cottony below, usually pinnatifid; lobes broad, lobulate. Heads variable, $\frac{1}{3-\frac{2}{3}}$ in. diam.; involucre ovoid, bracts subulate, webbed. Flowers purple or white. Fruit pale, shining, furrowed.-Distrib. Europe (Aretic), Siberia, Dahuria, N.W. Himalaya.-A hybrid with nutans occurs at Saffron Walden.
VAR. 1, cris'pus proper; leaves hoary beneath, heads crowded, involucre sub-globose.-Var. 2, polyan'themos, Koch (sp.) ; leaves pubescent on the nerves only, heads crowded, involucre ovoid.-Var. 3, litigio'sus, Gr. and Godr.; leaves as in Var. 2, heads subsolitary, involucre as in var. 1.
3. C. pyenoceph'alus, Jacq.; wings of stem continuous, heads small fascicled, involucre glabrous narrow, bracts broadly subulate-lanceolate with recurved spines. C. tenuiflorus, Curtis.
Sandy waste places, especially on the coast, from Forfar southwards; rare in
W. Scotland, common in Ireland.-Annual or biennial, erect, $1-4 \mathrm{ft}$., branched, hoary. Leaves oblong lanceolate, pinnatifid; lobes broad, sinuatetoothed. Heads $\frac{3}{4}-1 \mathrm{in}$., sessile; invol. bracts few. Flowers pale purple. Fruit grey, shining, minutely pitted, not furrowed.-Distrib. Europe, from Denmark southwards ; N. Africa.--C. tenuiflorus is hardly distinguished from C. pycnocephalus by its usually more numerous and smaller heads and outer invol. bracts with a narrow scarious border.
Sub-gen. 2. Cirs'ium, Tourn. (gen.). Filaments free. Fruit compressed, smooth ; pappns-hairs feathery, very slender, white. CNicus, $L$.

## * Upper surface of leaves scabrid. Flowers 2 -sexual.

4. C. lanceola'tus, $L$.; stem winged, leaves pinnatifid, heads fascicled, involucre ovoid cottony, bracts lanceolate spreading. Spear-thistle.
Waste places, \&ce.; fl. July-Oct. -Stout, erect, annual or biennial, 2-5 ft. Leaves $\frac{1}{2}-1 \mathrm{ft}$., obovate-lanceolate, setose above, cottony below ; lobes few, large, 2 -fid, toothed, with long stout spines. Heads $\frac{3}{4}-1 \frac{1}{2}$ in. diam., few, erect; peduncle short ; invol. bracts very many, subulate, midrib strong, spines long. Flowers purple. Fruit striped, smooth, shining.-Distrib. Europe, N. Africa, Siberia ; introd. in N. America.
5. C. erioph'orus, L. ; stem not winged, leaves pinnate, head very large woolly, involucre globose, bracts ciliated, spine slender recurved.
Waste grounds in dry soil, local, from Lancaster and Durham southwards; absent from Ireland ; fl. July-Sept.-Tall, stout, handsome, woolly, biennial, $3-5 \mathrm{ft}$., branched above. Leaves 1-2 ft., cop ously setose above and cottony beneath ; lobes distant, slender, usually 2 -partite, the divisions spreading upwards and downwards, margins ciliate and spinous. Heuds 2-3 in. diam.; invol. bracts very many. Flowers pale purple, anthers blue. Fruit shining,
smooth, mottled.-Distrib. Europe from Holland southwards, W. Asia.Young parts eatable as salad, and cooked.
** Upper surface of leaves hairy or pubescent.
$\dagger$ Stem branched, very leafy, or 0 . Leaves harsh, vigidly spinous.
6. C. acau'lis, L.; stem usually very short, leaves pinnatifid, segments 3-4-lobed, heads sessile or on naked peduncles, involucre ovoid glabrous, bracts appressed ciliate mucronate.
Gravelly and chalky pastures in England, from Chester and Lincoln southwards; fl. July-Sept.-Perennial, glabrous or pilose ; usually stemless with one subsessile head, rarely elongate with a leafy branched stem, $8-18 \mathrm{in}$., and several peduncled heads. Leaves sessile or petioled, oblong-lanceolate, rigid, very spinous. Heuds 1-2 in. ; involucre ovoid in flower, campanulate in fruit; bracts ovate-lanceolate, mucronate ; inner very long, linear. Floxers crimson. Fruit smooth, glabrous, brown ; pappus dirty white.-Distris. Europe from Gothland southwards (excl. Greece and Turkey), Siberia, Dahuria, W. Asia.-A troublesome weed in pastures.
7. C. arven'sis, Curtis; erect, diœecious, rootstock creeping, leaves pinnatifid, heads many, male involuce subglobose, female ovoid, outer bracts with short spreading spines, inner acuminate.
Fields and waste places, \&-e., ascending to near $2,000 \mathrm{ft}$. in Northumberland ; f. July-Sept.-Perennial, very spinous, 2-4 ft.; male and female plants in separate, large patches. Stem angled and grooved, more or less cottony, rarely glabrous. Leaves oblong-lanceolate, lower petioled, upper slightly decurrent, sinuate lobed or pinnatifid, setose or spinous. Heads $\frac{1}{2}-1 \mathrm{in}$. diam., corymbose ; peduncle short ; involucre $\frac{1}{2}-\frac{3}{4}$ in., bracts appressed, ciliate, tips rigid spinous; inner obtuse, tips toothed. Flovers dingy purple. Frait smooth, shining; pappus dirty white.-Distrib. Europe, Siberia, W. Asia to India, N. Africa; introd. in N. America. - The commonest pest of agriculture. A hybrid occurs between this and C. acuulis.
Sub-sp. arven'sis proper; stem flexuous, leaves pinnatifid very spinous, upper $\frac{1}{2}$-amplexicaul.
Sub-sp. skto sus, Bieb. (sp.); stem more simple and strict, leaves sessile oblong-lanceolate obtuse sinuate-lobed or subpinnatifid, margins setose.Orkney, Fife, \&c. ; very rare, and supposed to be introduced.
8. C. palus'tris, L.; stem winged, leaves decurrent pinnatifid, lobes $2-3$-fid, segments acuminate spinescent, heads in leafy clusters, involucre cottony, bracts appressed, outer mucronate, inner acuminate.
Wet meadows, ditches, \&c., ascending to $2,400 \mathrm{ft}$. in the Highlands ; fl. July-
Sept. - Biennial, soft, stout, erect, 2-4 ft., branched, very spinous. Leaves very decurrent, hairy on both surfaces ; lobes narrow. Heads $\frac{3}{4} \mathrm{in}$. diam.; involucre $\frac{1}{2} \mathrm{in}$., ovoid, bracts purplish-green. Flowers dark purple. Fruit pale, narrow, smooth ; pappus dirty white.-Distrib. Europe (Arctic), Siberia.-Stalks formerly eaten. A hybrid between this and C. pratensis (C. Forsteri, Sm.) is found in bogs in Kent, Surrey, and Sussex.

It Stem usually simple, not voinged. Leaves soft, spines feno. Heads 1 or fero.
9. C. praten'sis, Hudson; cottony, rootstock stoloniferous, roots fibrous, leaves lanceolate sinuate-toothed or subpinnatifid, heads usually solita:y, involucre hemispherical. Cirsium anglicum, Lamk.

Wet meadows, rare, from York (ascending to 1,200 ft.) and N. Wales south wards, and in Ireland; fl. June-Aug.-Perennial. Stem 10-18 in., terete, cottony. Leaves few, 6-10 in., lower long-petioled, lobes angled not deep or long ; upper $\frac{1}{2}$-amplexicaul, auricled. Heads $1-1 \frac{1}{2}$ in., peduncled ; involucre cottony; bracts appressed, outer mucronate, inner slender purple acuminate. Flowers dark purple. Fruit pale, slender, smooth; pappus dirty white.-Distrib. Holland, Spain, France, and Germany.-C. Woodwardi, Watson, is, according to Syme, probably a hybrid between acaulis and pratensis; it has been found in Wilts and Glamorganshire.
10. C. tubero'sus, $L$.; rootstock not stoloniferous, roots fusiform tuberous, leaves deeply pinnatifid, lobes remote narrow 2-4 cleft, heads $1-3$, involucre ovoid depressed at the base.
Meadows, Boyton, Wilts, and near Swindon; fl. Aug.-Sept.-Very closely allied to C. pratensis, and perhaps only a sub-species of it.-Distrib. Europe, from France and Germany southwards.
11. C. heterophyl'lus, L.; rootstock stoloniferous, roots fibrous, leaves lanceolate serrulate ciliate white beneath, upper entire or pinnatifid, heads few large depressed at the base. Melancholy Thistle.
Subalpine pastures and rivulets, from Skye and Ross southwards to Glamorgan and Derby ; ascending to $2,700 \mathrm{ft}$. in the Highlands ; absent from Ireland ; fl. July-Sept.-Rootstock creeping. Stem 2-3 ft., white, cottony, terete, furrowed. Leaves soft, radical long-petioled, 8-18 in.; upper often ovate, $\frac{1}{2}$-amplexicaul, cordate at the base. Heads $1 \frac{1}{2}-2 \mathrm{in}$. diam.; involucre ovoid, bracts finely pubescent, appressed, outer mucronate, inner linear. Flowers red-purple. Fruit smooth, small, brown; pappus-hairs brownish-white. -Distrib. Europe (Arctic), except Spain Greece and Turkey, Siberia, Dahuria.-C. Carolorum, Jenner, is a hybrid with C. palustris.
Sudi-gen. 3. sil'ybum, Gcertn. (gen.). Filaments glandular, connate. Fruit terete, rugose ; pappus-hairs silky, connate at the base.
C. maria'nus, Gaertn.; leaves sinuate or pinnatifid, nerves white.

Waste places near gardens, \&c., not indigenous; rare in Scotland and Ireland; fl. July-Sept.-Glabrous, erect, annual or biennial, shining Stem, 1-4 ft. grooved, not winged. Leaves large, spines strong, stout. Heads globose, 1-2 in. diam.; invol. bracts coriaceous, closely appressed, very broad, with one very stout recurved, terminal, subulate spine $\frac{1}{2} \frac{3}{4}$ in., and several shorter ones at its base, outermost merely spinous-toothed, mucronate ; receptacle fleshy, hairy, not pitted. Flowers rose-purple. Fruit 1 in., oblong, transversely wrinkled, black or grey ; pappus white.-Distrib. Europe, from Holland southwards.-Stalks formerly eaten.

## 7. ONOPOR'DON, $L$. Cotton Thistle.

Tall, erect, branched herbs. Stems broadly winged. Leaves alternate, decurrent, spinous-toothed. Heads large, purple, rarely white ; involucre subglobose ; bracts very many, imbricate, coriaceous, spinescent; receptacle fleshy, pitted, edges of the pits membranous toothed. Corollas all tubular, ventricose above ; lobes 5, long, slender. Filaments nearly glabrous; anthers with a terminal appendage, cells shortly tailed. Stylc-arms connate into a 2 -fid cylinder, with a ring of hairs at the base. Fruit obovoid, compressed, 4-ribbed, rugose ; pappus-hairs multi-seriate, filiform or flat-
tened, barbed or toothed, connate at the base.-Distrib. S. Europe, W. Asia, N. Africa; species 20.-Etym. The old Greek name.

1. O. Acan'thium, $L$.; leaves sinuate-pinnatifid woolly.

Waste dry places, from Chester and Lincoln southwards; an alien or denizen,
Watson; fl. July-Sept.-A stout, hoary or cottony biennial, 2-5 ft. Stem spinous-winged to the top. Leaves decurrent, toothed and strongly spinous.
Heed $1 \frac{1}{2}-2 \mathrm{in}$. diam.; involucre mueh contracted at the mouth, very cobwebby ; bracts subulate, spinescent, recurved, green. Florers pale purple.
Fruit 4 in., mottled grey ; pappus-hairs white.-DISTRIB. Europe, Siberia;
introd. in N. America.

## 8. eupatorium, L. Hemp Agrimony.

Herbs or undershrubs. Leanes usually opposite. Heads few-flowered, white or purplish, in terminal corymbs; invol. bracts imbricate, $2-3$-seriate; receptacle flat, naked. Flowers few, all tubular, 2 -sexual, 5 -fid. Anthercells without tails. Style-arms long, exserted, cylindric, obtuse, grooved in front, pubescent all over. Pruit angular or striate ; pappus-hairs 1 -seriate, pilose or seabrous.-Distrib. Chiefly trop. and temp. American, rarer in the Old World ; species about 300.-Etym. The classical name.

1. E. cannabi'num, $L$.; leaves 3-5-foliolate, leaflets lanccolate serrate. River-banks and moist places ; fl. July-Sept.-Pubescent, perennial, woody below. Stem 2-4 ft., subsimple, terete; branches short. Leaces opposite ; radical petioled, obovate-lanceolate; cauline subsessile ; leaflets 2-4 in., lanceolate, coarsely serrate. Heads in dense terminal 5 - 6 -flowered corymbs, whitish or pale purple ; invol. bracts about 10 , $\frac{1}{\text { in., scarious, linear-oblong, }}$ obtuse, outer shorter. Flowers 5-6, longer than the involuere. Pappus white, scabrous. Fruit angled, and corollas covered with seattered resinous points.-Distrib. Europe, Siberia to Japan, W. Asia to the Himalaya, N. Africa.-Leaves reputed tonic.

## 9. petasi'tes, Toumef. Butter-bur.

Perennial herbs. Lcuves produced after the flowers, large, broad. Hoads purplish or white, subdiæecious, in a spiciform panicle terminating an erect bracteate scape; male heads with a few fem. ray-flowers, female with a few males in the disk ; invol. bracts sub-2-seriate, the exterior few and small; receptacle flat, naked. Made fl. Corolle tubular, limb bell-shaped, 5eleft ; anther-cells simple ; styles exserted, stout, arms connate, ovoid or clavate, papillose, terminated by 2 short small cones. Female fl. Cmolla tuhular, short, very slender, mouth ohliquely truncate, minutely toothed; style much exserted, arms short. Fruit cylindric, glabrous; pappus of many very soft slender hairs (much fewer in the inale flowers).-Distrib. Europe, N. Asia, Aretic America; species about 10.-Etym. пé $\boldsymbol{\tau} \alpha \sigma$ os, an umbrella, from the size of the foliage.

1. P. vulga'ris, Desf.; leaves reniform or orbicular-cordate irregularly toothen. Tussilago Pelasites, L. and T. hybrida, L.
Wet meadows and roadsides, from Skye and Moray southwards; ascends to $1,000 \mathrm{ft}$. in Northumberland ; fl. March-May.-Rootstock extensively creeping, fleshy, stout. Leuves $3 \mathrm{in} .-3 \mathrm{ft}$. diam., white or cobwebhy beneath, and when young above also; petiole long, stout. Stem 4-18 in., stout,
purplish below ; sheath ending in small leaves. Thyprsus 3-10 in., female longest, elongating after flowering ; pedicels slender, shortest in the male, bracts subulate. Male heads $\frac{1}{3}$, female $\frac{1}{2}$ in. Fruit striate ; pappus white, silky.-Distrib. Europe, N. Africa, Siberia, W. Asia.

## 10. TUSSILA'GO, Tournef. Coltsfoot.

A scapigerous herb, with creeping rootstock. Leaves large, produced after the flowers. Heads yellow, solitary, many-flowered ; invol. bracts 1 -seriate, with a few outer short ones; receptacle flat, naked. Ray-flowers female, multi-seriate, ligulate, narrow ; disk-flowers male, campanulate, 5 -toothed. Anthers without tails. Style-arms connate, clavate, papillose, with 2 very small cones. Fruit of the ray subcylindric, pappus-hairs very slender, multi-seriate, rough; of the disk imperfect, pappus 1 -seriate.Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to N.W. India; introd. in N. America. Etym. tussis, from its use as a cough medicine.

1. T. Far'fara, $L$. ; leaves broadly cordate angled or lobed toothed.

Damp heavy soils, ascending to $2,700 \mathrm{ft}$. in the Highlands ; fl. March-April.-
Rootstock stout; stolons many, burrowing. Leaves 3-10 in. broad, cobwebby above, densely tomentose and white beneath. Scapes 1 or more, 4-10 in., tomentose, with many oblong appressed scales. Head $1-1 \frac{1}{2}$ in. diam., bright yellow, drooping in bud. Pappus soft, snow-white.-Leaves used for cigarmaking and smoked in cases of asthma. Wool made into tinder.

## 11. AS'TER, $L$.

Perennial herbs. Leaves alternate or radical, quite entire or toothed. Heads solitary or many, usually radiate; disk yellow, ray white blue or purple ; invol. bracts multi-seriate, herbaceous or leafy ; receptacle flat, pitted, edges of the pits toothed. Ray-flowers 1 -seriate, ligulate, female; disk-flowers tubular, 5 -toothed, 2 -sexual. Anther-cells simple. Style-arms of the ray-flowers linear with thickened margins, of the disk short, tipped with papillose cones. Fruit compressed ; pappus-hairs multi-seriate, persistent, seabrid, unequal.-Distrib. Most temp. and cold regions, but chiefly America; species about 150.-Etym. from the star-like flowers.

1. A. Tripo'lium, L. ; leaves lanceolate or obovate-lanceolate.

Salt marshes, abundant; fl. July-Sept.-Root fusiform. Stem 2-3 ft., ereet, sparingly branched, stout. Leares 3-5 in., scattered, fleshy, slightly toothed or not, faintly 3-nerved, upper linear. Heads $\frac{1}{3}-\frac{2}{3}$ in., corymbose, campanulate ; peduncles slender, bracts small ; invol. bracts few, oblong, obtuse, appressed. Ray-flowers whitish or purple, many few or 0 (var. discoideus). Frit pilose ; pappus dirty white--Distrib. Europe (Arctic), N. Africa, Siberia, Dahuria.-Used as a bad substitute for Samphire.

## 12. ERIGERON, $L$.

Characters of Aster, but ray-flowers multi-seriate; fruit compressed.Distmb. Temp. and cold regions ; species about 80.-Etym. obscure.

1. E. alpi'num, L.; leaves radical, scape with 1 or few broad heads, ligules much longer than the reddish pappus. E. uniforum, Sm. not L. Alpine rocks, ascending to $3,000 \mathrm{ft}$., Breadalbane and Clowa Mts.; f. July-
Aug.-Perennial, hispid, hairy. Rootstock short. Radical leaves spreading,
oblong-lanceolate ; cauline few, linear-oblong. Scapes solitary or few, 6-8 in.

Heads 1-3, $\frac{3}{4} \mathrm{in}$. diam.; peduncles stout, eglandular ; invol. bracts almost villous, subulate-lanceolate. Ray-tlowers very many, purple, ligule very slender. Disk-flowers yellow. Fruit hispid.-Distrib. Alps and Aretic regions of Europe, Asia, America; S. Chili and Fuegia.
2. E. a'cre, L.; stem leafy branched above, heads $\frac{1}{2} \frac{-3}{4} \mathrm{in}$. diam. panicled, ligules scarcely longer than the reddish pappus.
Dry banks, \&ce. in England ; sandy coasts of Forfarshire ; E. and S. of Ireland ; fl. July-Aug.-Annual or hiennial, hispidly hairy. Stem 1-2 ft., panicled above. Leaves quite entire; radical 2-3 in., obovate-lanceolate; cauline linear-oblong, obtuse, $\frac{1}{2}$-amplexicaul. Heads axillary and terminal ; peduncles slender, naked or bracteate ; invol. bracts narrow-linear, hispid. Ray-flowers narrow, pale purple ; disk pale yellow. Fruit hispid.-Distrib. Europe (Arctic), temp. and N. Asia, Himalaya, N. America.
E. canaden'se, L.; stem leafy branched above, heads $\frac{1}{4} \mathrm{in}$ diam. panicled, ligules white, scarcely longer than the white pappus.
Introd. from America into waste places in England, common near London; absent from Scotland and Ireland ; fl. Aug.-Sept.-Annual, sparingly hairy or glabrous. Stem 1-2 ft., corymbosely branched. Leaves all linear- or oblonglanceolate, quite entire or sparingly toothed. Heads very many, small; peduncles slender. Invol. bracts slender, green with scarious margins, glabrous. Ray-flowers sometimes faintly purple, disk pale yellow.-DIsTRIB.
Widely spread over most temp. and warm countries.

## 13. BEL'LIS, L. DAisy.

Annual or perennial small herbs. Leaves usually all radical, petioled, toothed. Heads solitary, disk yellow, ray white or pink ; involucre campanulate, bracts 1-2-seriate, herbaceous; receptacle conical, papillose. Rey-flowers many, 1-seriate, female, ligulate ; style-arms linear, obtuse, margins thickened. Disk-flowers tubular, 2-sexual, 4-5-toothed; anthercells simple ; style-arms short, thick, tipped by papillose cones. Fruit compressed, obovate, subhispid ; pappus 0.-Distrib. Europe, N. Africa, N. America ; species 3 or 4.-Etym. bellus, from its pretty appearance.

1. B. peren'nis, $L$. ; perennial, stemless, leaves obovate-spathulate.

Pastures and neadows ; ascends to near $3,000 \mathrm{ft}$. in the Highlands ; fl. all the year.-Glabrous or pilose. Rootstock short, fibres stout. Leaves 1-3 in., fleshy, obtuse or rounded at the crenate tip, midrib broad. Scape 2-5 in. Head s-1 in. diam., solitary ; invol. bracts green, obtuse, often tipped with black. Ray-flowers white or tipped with pink, disk bright yellow.-Distrib.
Europe.

## 14. SOLIDA'GO, L. GOLDEN-ROD.

Herbs, often shrubby at the base. Leaves alternate, entire or serrate. Heads usually in branched scorpioid cymes, yellow, rayed; involucre oblong, bracts multi-seriate, appressed; receptacle naked, smooth or pitted. Ray-flowers 1 -seriate, ligulate, female ; style-arms slender, linear, obtuse. Disk-flowers tubular, 2 -sexual, 5 -fid ; anther-cells simple ; stylearms $\frac{1}{2}$-terete, tipped with papillose cones. Fruit many-ribbed; pappushairs 1-seriate, scabrid.-Distrib. Arctic and temp. N. hemisphere, chiefly N. American ; species about 100 ,-Етуm. obscure.

1. S. Virgau'rea, $L$, ; leaves linear- or lanceolate-oblong.

Thickets, rocky banks, \&c.; ascending to $2,800 \mathrm{ft}$. in the Highlands; fl. July-Sept.-Rootstock stout. Stem erect, sparingly branched, $4-24$ in., glabrous, or pubescent with curled hairs. Leaves 1-4 in., obscurely toothed, obtuse or acute. Heads crowded, $\frac{1}{3}$ in., shortly peduncled, golden yellow; invol. bracts linear, acute, glabrous, green, margins scarious. Ray-flowers 10-12, spreading ; disk 10-20. Fruit pubescent; pappus white.-Distrib. N. temp. and Arctic Europe, Asia, Himalaya, and America.
Var. 1, virguu'rea proper; tall, leaves all oblong-obovate quite entire.Var. 2, angustifólia, Gaud.; tall, leaves oblong-lanceolate upper narrower often serrate.-VaR. 3, cambrica, Huds. (sp.); short, leaves broader ciliate, cyme simple, heads larger. Usually in mountainous situations.

## 15. LINOSY'RIS, Cassini. Goldielocks.

Erect, perennial herbs. Leaves crowded, alternate, small, narrow. Heads solitary or corymbose, yellow, not rayed; invol. bracts in many series, imbricate, shorter than the flowers; receptacle flat, pitted, margins of the pits fleshy, toothed. Flowers all tubular and 2 -sexual, deeply 5 -fid ; anthers exserted, cells simple ; style-arms short, with long papillose cones. Fruit oblong, compressed, silky; pappus-hairs 2 -seriate, scabrid. Distrib. Europe, W. Asia ; species about 10.-Еtym. obscure.

1. L. vulga'ris, Cass.; leaves quite entire. Chrysocoma, L.

Limestone rocks, Orme's Head, Worle Hill, and Berry Head; a native? Watson ; fl. Aug.-Sept.-Glabrous. Stems $\frac{1}{2}-1 \frac{1}{2}$ in., woody at the base, ribbed, simple, wiry, leafy. Leaves 2-3 in., very narrow, acute, rather thick, gradually narrowed from beyond the middle to the base, dotted, 1-nerved.
Heads $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam., in terminal, dense, hemispheric corymbs; peduncles slender, bracteate ; involucre gummy, puberulous, its bracts subulate, much shorter than the flowers. Pappus reddish.-Distrib. Europe from the Baltic southwards, N. Africa.

## 16. I'NULA, $L$.

Rather rigid herbs. Leaves alternate, erect, entire or toothed. Heads panicled corymbose or solitary, rayed, yellow ; involucre campanulate, bracts in many series, herbaceous, outer often leafy ; receptacle flat, naked. Ray-flowers female or neuter, 1 -seriate, ligulate; style-arms slender, obtuse. Disk-flowers tubular, 2 -sexual ; anther-cells tailed; stylearms short, terminated by papillose cones. Fruit terete or angled ; pappushairs 1-seriate, scabrid, or outer row short.-Distrib. Europe, temp. and subtrop. Asia ; species about 50.-Етум. The old Latin name.

* Pappus without an outer series of short bristles or scales.

1. I. Cony'za, $D C$.; pubescent, leaves ovate-lanceolate, corymbs branched, fruit terete subglabrous. Conyza squarrosa, L. Ploughman's spikenard.
Copses and dry banks, from York and Westmoreland southwards ; fl. July-
sept.-Biennial. Stem 2-5 ft., erect. Leaves 3-5 in., downy beneath, lower
petioled, upper subsessile. Heads $\stackrel{3}{3}$ in.; invol. bracts very unequal, linear-
oblong, outer slightly recurved obtuse, inner acuminate ; ligule inconspicuous.
Fruit with a few scattered hairs; pappus shining, reddish.-Distrib. Europe
from Denmark southwards, W. Asia.
2. I. crithmoi'des, $L$.; glabrous, leaves linear fleshy, heads few in simple corymbs, fruit terete silky. Golden Samphire.

Maritime marshes and rocks; Wigton, S.W. Wales, Cornwall, S. and E. of Ireland ; fl. July-Aug.-Perennial, glabrous, yellow-green. Stem 6-18 in., stout, rarely branched, very leafy. Leaves 1-2 in., sessile, gradually contracted to the base, entire or shortly 2-4-lobed at the tip. Heads 1 in . diam., on long bracteate peduncles ; invol. bracts linear-lanceolate; ligule short. Pappus-hairs rigid, unequal, dirty white.-Distrib, Coasts of Europe from Belgium southwards, N. Africa.
3. I. salici'na, $L$.; leaves linear-oblong toothed and ciliate, upper sessile auricled, heads solitary, fruit terete glabrous.
Shores of Lough Derg, Galway ; Al. July-Aug.--Perennial, glabrous or slightly hairy. Stem 12-18 in., leafy. Leaves 2-3 in., rigid, lower obovate-lanceolate, glabrous above, slightly hairy beneath with reticulate nerves. Heads $1 \frac{1}{2}$ in. diam.; invol. bracts linear-oblong, ciliate, outer leafy reflexed ; ligules slender. Pappus dirty white.-Distrib. All Europe.
4. I. Hele'nium, L.; tall, stout, downy, leaves large toothed, heads very large, invol. bracts leafy, fruit 4 -angled glabrous. Elecampane.
Copses and meadows in England, rare and local ; often naturalized ; wild in Yorkshire (Baker); a native? Watson; fl. July-Aug. - Rootstock large, succulent. Stem 2-5 ft., very stout, branched. Leaves velvety beneath; radical 1-12 ft ., oblong-lanceolate, long-petioled ; cauline sessile, auricled, ovate-cordate, acute. Heads 3 in . diam.; peduncles long, stout, naked; invol. bracts broadly ovate, velvety; ligules long, slender. Pappus pale reddish.-Distrib. Europe from Gothland southwards, Siberia; introd. in N. America.-Formerly cultivated by cottagers as an aromatic and tonic ; its rootstock is still used candied.
** Pappus with an outer row of very short scales.-Pulicar'ia, Gaitn.
5. I. dysenter'ica, L.; woolly or cottony, leaves oblong-cordate $\frac{1}{2}$-amplexicaul, ligules long, scales of pappus connate toothed. Plea-bane. Moist places, from Isla and Haddington southwards ; rare in Scotland, common in Ireland; fl. July-Sept. - Rootstock creeping, stoloniferous. Stem branched above, very leafy. Leaves $1 \frac{1}{2}-2 \frac{1}{2}$ in., irregularly waved and toothed. Heads 1 in . diam., few, terminal ; peduncles naked, and involucre densely woolly ; bracts setaceous; ray twice as long as the disk, very slender. Fruit silky ; pappus-hairs dirty white, few, unequal.-Distrib. Europe from Denmark southwards, N. Africa.-Bitter, formerly used in dysentery.
6. I. Pulicar'ia, L. ; pubescent, leaves oblong-lanceolate sessile, ligules very short, scales of pappus free. P. vulgaris, Gærtn.
Moist sandy places, rare, from Hereford and Leicester to Dorset and Kent; fl. Aug.-Sept.-Annual, slightly glandular. Stem 6-18 in., irregularly much branched, leafy. Leaves $1-1 \frac{1}{2}$ in., obscurely toothed, base with small auricles. Heads $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. diam., subsolitary, terminal ; peduncles short, stout; invol. bracts subulate, glandular-puhescent; ligules erect. Fruit terete, silky ; pappus-hairs few, irregular, dirty white.-Distrib. Europe from Gothland southwards, N. Africa, Siberia, W. Asia.

## 17. Bi'dens, $L$. Bur-Marigold.

Annual herbs, usually glabrous. Leaves opposite, entire or divided, upper sometimes alternate. Heculs solitary or corymbose, not or rarely rayed, yellow; invol. bracts $2-3$-seriate, outer often leafy; receptacle flattish, with bracteoles under each flower. , Ray-flowers, if present, in

1 series, ligulate, neuter. Disk-flowers or all campanulate above, 5 -toothed; anther-cells simple; style-arms linear, tipped by papillose cones. Fruit compressed, ribbed, ribs often aculeate; pappus of 2-5 rigid barbed bristles.-Distrib. All temp. and trop. regions ; species about 60.-Etym. From the 2 stiff pappus-bristles of some species.

1. B. cer'nua, $L$. ; leaves sessile undivided, heads drooping.

Watery places from Elgin and Dumbarton southwards ; fl. July-Oct.-Glabrous, or slightly hispid above. Stem 1-2 ft., stout, succulent, terete, branched above, leafy. Leaves 2-3 in., in connate pairs, oblong-lanceolate, coarsely serrate. Heads $1-1 \frac{1}{2} \mathrm{in}$. diam.; peduncles ebracteate; outer invol. bracts leafy, spreading or reflexed ; inner shorter, broadly-oblong, obtuse, streaked with black. Ray-flowers few, short, broad, or 0 . Fruit narrowobovoid, ribs 4 with reversed bristles; pappus-bristles usually 4.-Distrib. Europe, Siberia, N.W. India, N. America.
Var. 1, discoidea; ray 0. Abundant.-Var. 2, radiáta; rayed. Rare and local, England only.
2. B. triparti'ta, L. ; leaves petioled simple or 3 -cleft, heads suberect. Watery places from Isla and Clackmannan southwards ; fl. July-Sept.-Habit of $B$. cernua, but more slender ; leaves often 3-partite; head smaller ; outer invol. bracts narrower, inner acute, and pappus-bristles 2 shorter.-DISTRIB. Europe (Arctic), N. Africa, W. Asia, N.W. India, N. America.

## 17*. GALINSOGA. Ruiz and Pavon.

Annual trichotomously branched herbs. Leaves opposite, triple-nerved, serrate. Flower-heads small, yellow, rayed; invol. bracts 1 -seriate, margins scarious; receptacle conical, with entire or 3 -fid lanceolate bracteoles under each flower. Ray-flowers female; tube short, pubescent ; ligule very broad, short, 3 -fid ; style-arms linear, obtuse. Disk-flowers tubular, 2 -sexual, 5 -toothed; anthers short, with a short terminal appendage, cells shortly tailed. Fruit hispid; pappus of 1 series of ciliate scales.-Distrib. S. America; species 1 or 2.-ETYM. Don M. M.de Galinsoga, a Spanish botanist.
G. parviflo'ra, Cav.; leaves ovate obtusely-serrate ciliate.

Cultivated fields and roadsides; abundant at Kew, and increasing ; introd-
from Peru; f. July-Oct.-More or less pubescent. Stem 1-2 ft., slender.
Leaves 1-2 in., shortly petioled. Heads in dichotomous cymes, $\frac{1}{6}-\frac{1}{4} \mathrm{in}$. diam..
peduncles ebracteate, glandular; involucre hemispherical ; bracts unequal; oblong, ciliate. Ray-flowers 4-6. Fruit obovoid, compressed, black ; pappus, scales $10-15$, narrow-oblong.-Distrib. Trop. S. America.

## 18. ANTHE'MIS, $L$.

Herbs, sometimes shrubby below, strong-scented. Leaves alternate, 2 -pinnatifid. Heads solitary, yellow, with (rarely without) a broad white ray; invol. bracts imbricate, in few series ; receptacle flat or conic ; bracteoles membranous, slender. Ray-flowers 1 -seriate, ligulate, female or neuter; style-arms short, edges thickened, tips obtuse papillose. Diskflowers tubular, 2 -sexual, 5 -toothed ; anther-cells not tailed; style-arms as in the female. Fruit subterete, grooved or striate, crowned with a tumid disk; pappus 0 , or a short membrane.-Distrib. Europe, N. Africa, W. Asia; species about 35.-Etyry. The old Greek name.

1. A. arven'sis, $L_{.}$; annual, bracteoles of receptacle mucronate, rayflowers female white, disk-flowers winged. Corn Chamomile.
Fields and waste places, local, from Lanark and Moray southwards; S. and E. of Ireland, rare ; a colonist, Watson ; fl. June-Aug.-Pubescent or hoary. Stem 1-2 ft., usually erect from a decumbent base, branched. Leaf-segments $\frac{1}{8}-\frac{1}{4}$ in., linear, acute, not dotted. Heads $1-1 \frac{1}{2} \mathrm{in}$. broad; peduncles rather long, slightly swollen upwards; invol. bracts scarious, pale, obtuse, inner lacerate. Frrit glabrous, subequally ribbed all round, truncate ; disk broad, crenulate.-Distrib. Europe, N. Africa, W. Asia ; introd. into N. America.
Var. any'lica, Spr. (sp.); leaves fleshy pinnatifid, pinnules deeply serrate, receptacle flat. A. maritima, Sm. not L. Sea-coast, Northumberland, Durham.
2. A. Cot'ula, $L$. ; annual, erect, bracteoles of receptacle setaceous, ray-flowers usually neuter white, disk-flowers winged. Stinking May-weed. Cultivated fields, from Dumbarton and Fife southwards; rare in the N. of England and in Scotland; common except in the N.W. of Ireland ; a colonist, Watson ; fl. June-Sept. -Glabrous or pilose, feetid. Stem 8-18 in., corymbosely branched. Leaves glandular-dotted, segments very narrow. Heuds as in A. arvensis, but peduncles more slender and invol. bracts narrower at the tip. Fruit faintly ribbed, more strongly on the back.Distrib. Europe, N. Africa, Siberia, W. Asia; introd. in N. America.Acrid, emetic ; a troublesome weed; foliage blisters the hand.
3. A. nob'ilis, $L$.; perennial, bracteoles of receptacle lanceolate obtuse, ray-flowers female white, disk-flowers cylindric. Chamomile.
Pastures and dry soils, from Anglesea and Durham southwards ; rare and not indigenous in Scotland; common in Ireland ; fl. July-Sept.- Woolly or pubescent, aromatic. Branches spreading from the root, leafy. Lenf-segments linear. Heuls $1-1 \frac{1}{2} \mathrm{in}$. diam., few ; peduncles long, slender ; invol. bracts pubescent, scarious. Ray-florers sometimes 0 . Fruit obovoid, terete; disk very small, concealed by the inflated base of the corolla.-Distrib. France, Spain, Germany, Austria, N. Africa.-Tonic and febrifuge.

## 19. ACHILLE'A, $L$.

Perennial herbs. Leaves alternate, entire or divided. Heads corymbose, rayed, yellow, or with the ray white or purple ; invol. bracts oblong, margins sometimes discoloured and scarious ; receptacle narrow, elongate, covered with chaffy bracteoles. Ray-flowers female, few; ligule broad, short. Disk-flowers tubular, 2 -sexual, compressed, 5 -toothed ; anther-cells not tailed. Fruit oblong, compressed, margined ; pappus 0.-Distrib. Europe and N. Asia ; rarer in America ; species about 50.-Etym. Mythical.

1. A. Ptar'mica, L.; leaves linear serrulate, heads few. Sneeze-wort.

Meadows, banks, and waste places ; ascends to $2,260 \mathrm{ft}$. in the Highlands;
H. July-Sept.-Glabrous or pubescent. Rowtstock creeping extensively. Ntem

1-2 ft., erect, rigid, ribled, sparingly branched. Leares $2-3$ in., sessile, scattered, teeth cartilaginous. Heuds corymbose, $\frac{1}{3} \mathrm{in}$. diam., hemispheric ; peduncles ebracteate ; receptacle convex, invol. bracts pubescent, rigid, outer lanceolate, acute, margins purple, inner oblong, obtuse. Ruy-floureis $8-12$, ligule reflexed broad, as long as the involuere ; disk greenish-white.
Fruit glabrous, shining.-Distrib. Europe except Greece and Turkey, Siberia; introd. in N. America.-Rootstock pungent, a sialogogue.
2. A. Millefo'lium, L.; leaves 3 -pinnatifid. Yarrow, Milfoil.

Pastures, ascending to near $4,000 \mathrm{ft}$. in the Highlands; fl. May-Sept.Glabrous, pubescent or woolly. Rootstock extensively creeping, stoloniferons. Stem $\frac{1}{2}-1 \frac{1}{2}$ in., erect, furrowed, usually simple, leafy. Leaves $2-6 \mathrm{in}$., linearoblong, radical petioled; leaflets and linear-acute segments very closeplaced. Heads many, $\frac{1}{4} \mathrm{in}$. diam., corymbose, ovoid; peduncles short, stout, ebracteate ; invol. bracts oblong, obtuse, rigid, brown-edged. Rayflowers many, white pink or purple; ligule orbicular, shorter than the involucre, reflexed; disk white or yellowish. Fruit glabrous, shining.Distrib. Europe (Arctic), temp. and cold N. Asia, Himalaya, N. America. -A reputed astringent.

## 20. DIO'tis, Desf. Cotton-weed.

An erect, branched, perennial herb, everywhere densely clothed with felted white, grey, or buff wool. Leaves alternate, oblong. Heads subglobose, discoid, yellow ; involucre campanulate, bracts oblong; receptacle Hlattish, bracteolate. Flowers all tubular and 2 -sexual, much compressed, 5 -toothed, corky, with 2 wings produced downwards over the ovary as persistent spurs; anther-cells not tailed. Fruit angular, crowned by the corollabase ; pappus 0 . -Еtym. סís and ouss, from the ear-like corolla-lobes.

1. D. marit'ima, Cass.; stems very many, leaves sessile obtuse.

Sandy shores, Landguard Fort, Suffolk; Kerry and Waterford; St. Ouen's Bay, Jersey ; formerly in other localities on the E. and S. coast of England; f1. Aug.-Sept.-Rootstock creeping, woody. Ntems 6-12 in., stout, ascending, branched at the top. Leaves $\frac{1}{2}$ in., entire or toothed. Heads $\frac{1}{3}$ in. diam., in small dense terminal corymbs ; bracteoles of receptacle oblong, acuminate, with woolly tips. Fruit curved, smooth, glabrous, 5 -ribbed.-Distrib. Shores of Europe from France southwards and eastwards, N. Africa.

## 21. MATRICA'RIA, $L$.

Annual, rarely perennial, branched herbs. Leaves alternate, much divided; lobes narrow. Heads yellow, ray white or 0 ; invol. bracts in few series, nearly equal ; receptacle broad, flat or conical, elongate after flowering, ebracteolate. Ray-flowers, if present, 1 -seriate, ligulate, female. Diskflowers tubular, 2 -sexual, 4-5-toothed; anther-cells not tailed. Fruit ribbed or angled, not winged ; epigynous disk large ; pappus 0.-Distrib. Europe, N. and S. Africa, W. Asia; species about 70.-Etym. From its former use in uterine affections.

Sub-gen. 1. Matrica'ria proper. Receptacle very convex or conical.

1. M. Chamomil'la, L.; aromatic, leaves 2 -pinnatifid, segments very narrow, invol. bracts without dark edges, fruit 5 -ribbed on the inner face. Wild Chamomile.
Fields, \&c., from Cornwall to Kent, sporadic north of it, and in Scotland and Ireland; a colonist, Watson; fl. June-Aug.-Habit and appearance of glabrous forms of Anthemis arvensis and of the following, with the scent, \&c. of A. nobilis, but fainter. Stem much branched. Heads $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam., corymbose, ligules retlexed after tlowering or 0 ; receptacle elongating during fruiting. Fruit small, grey ; ribs slender, white; disk oblique.Distrib. Europe, Siberia, W. Asta to N.W. India.-A tonic.

Sub-gen. 2. Pyre'thrum, Gertn. (gen.). Receptacle almost flat.
2. M. inodo'ra, L.; inodorous, leaves 2 -pinnatifid, segments very narrow, invol. bracts edged with brown, fruit with 3 thick ribs on the inner face and 2 pits on the outer above.
Fields, \&c., ascending to $1,200 \mathrm{ft}$. in the Highlands ; fl. June-Oct.-Glabrous, very similar to $\boldsymbol{M}$. Chamomilla, but not aromatic, leaf-segments usually large and more slender ; heads larger, 2 in . diam. ; ligules narrower, not reflexed till long after flowering; receptacle much less conical. Disk of fruit entire or 4 -toothed.-Distrib. Europe (Arctic), Siberia, W. Asia.
Var. 1, inodo'ra proper ; annual or biennial, stem erect, barren shoots 0 , leaflobes slender.-VAR. 2, maritima (sp.); more succulent, perennial, stem ascending, barren shoots 0 , heads fewer, receptacle narrower, spaces between the ribs of the fruit narrower. Maritime localities.
M. Parthe'nium, $L$.; leaves pinnate, segments broad lobulate and cut, fruit equally ribbed all round. Pyrethrum, Sm. Fever-fow.
Hedgebanks, \&c., rare in Scotland, usually a garden escape ; a denizen, Watson; fl. July-Sept.-Perennial, pubescent and branched above, $1-2 \mathrm{ft}$. Heads many, $\frac{1}{2} \frac{-5}{4} \mathrm{in}$. diam.; invol. bracts ribbed, border scarious. Recerptucle hemispheric. Ligules short, broad. Disk of fruit cup-shaped, membranous. -Distrib. Mid. and S. Europe, introduced elsewhere.-'Tonic and bitter.

## 22. CHRYSAN'THEMUM, $L$.

Herbs or shrubs. Leaves alternate or radical, toothed or cut. Heculs solitary or corymbose, yellow, or the ray white; involucre campanulate; bracts imbricate, margins scarious ; receptacle flat or convex, naked. Ruy-flowers 1 -seriate, ligulate, female. Disk-flowers tubular, 2 -sexual, terete or compressed, 4-5-toothed ; anther-cells simple. Fruit of the rayflowers ribbed or winged, of the disk-flowers compressed; pappus 0.Distrib. Europe, W. Asia, N. Africa; species about 12.-Etym. xpugós and $\alpha ้ \nu \theta \in \mu o \nu$, from the golden flowers.

1. C. seg'etum, L.; ray-flowers golden yellow, invol. bracts very broad with broad scarious margins. Corn Marigold.
Cultivated fields ; a colonist, Watson; fl. June-Sept.-Annual, glahrous,
glaucous. Stem $1-1 \frac{1}{2} \mathrm{ft}$., ereet, sparingly branched. Leaves petioled, ob-
ovate, toothed and lobed, lower pinnatifid, upper oblong $\frac{1}{2}$-amplexicaul.
Heads 2 in . diam.; perluncles stout, thickened upwards. Ligmles with
retuse or lobed tips. Fruit of the rays ribbed and narrowly 2 -winged, of
the disk not winged.-Distrib. Europe, N. Africa, W. Asia.
2. C. Leucan'themum, L.; ray-flowers white, invol. bracts narrow with dark purple margins. Ox-eye Daisy.
Meadows and waste places, ascending to $2,100 \mathrm{ft}$. in Wales ; fl. June-Ang. Perennial, glabrous or slightly hairy. Stem 1-2 ft., erect, simple or branched.
Leaves obtusely cut or subpinnatifid; lower spathulate, petioled; up er oblong or lyrate with pinnatitid $\frac{1}{2}$-amplexicaul bases. Ilteals 2 in , diam.; peduncles slender. Ligules notehed at the tip. Fruits all terete, equally ribbed, of the ray with a small crown.-Distrib. Europe (Arctic), Siberia, W. Asia ; introd, in N. America.

## 23. TANACE'TUM, $L$. TANSY.

Herbs, often shrubby below, strong-scented. Leaves alternate, usually much divided. Heads solitary or corymbose, subglobose, discoid, yellow ; invol. bracts scarious at the edges; receptacle convex, naked. Outer flowers 1-seriate, female, tubular, 3-4-toothed. Disk-flowers tubular, male, 4-5-toothed ; anther-cells not tailed. Fruit angled, with a large disk; pappus 0 , or an irregular membrane.-Distrib. Europe, N. and S. Africa, all temp. and cold Asia, N. America; species about 50.-Etym. doubtful.

1. T. vulga're, $L$.; leaves $1-2$-pinnatifid, segments inciso-serrate.

Waste places in England, often naturalized; not wild in Ireland; and doubtfully in Scotland; fl. Aug.-Sept.-Perennial, glabrous or pubescent. Stem 2-3 ft., grooved and angled, leafy. Leaves $2-5$ in., oblong, glandulardotted, upper $\frac{1}{2}$-amplexicaul, lower petioled. Heads many, $\frac{1}{3}$ in. diam., corymbose, dull yellow ; peduncles stout, ebracteate ; invol. bracts coriaceous, appressed, outer acute shorter, inner obtuse with narrow scarious edges. Onter flowers exceeding the involucre, rarely 0 , obliquely truncate. Fruit obovoid, 5 -ribbed, disk membranous lobed.-Distrib. Europe (Arctic), Siberia,.N.W. America ; introd. in the U. States.-Bitter, tonic, vermifuge and febrifuge.

## 24. ARTEMIS'IA, L. WORMWOOD.

Herbs, often shrubby below, bitter or aromatic. Leaves alternate, often much cut. Heads small, racemed or panicled, discoid, yellow or purplish; invol. bracts with scarious margins ; receptacle very narrow, flat or convex, naked pilose or fimbriate. Flowers few, all tubular ; outer female with 3 -tonthed corollas; the rest male or 2 -sexual with 5 -toothed corollas ; anther-cells not tailed. Fruit obovoid, disk minute; pappus 0.-Distrib. N. temp. zone ; species about 180.-Етym. The Greek Diana.

1. A. campes'tris, L.; leaves nearly glabrous, segments very slender, heads drooping glabrous, outer flowers only fertile.
Sandy heaths, Brandon, Thetford, and Bury ; fl. Aug.-Sept.-Perennial, not aromatic. Stem and branches ascending, very slender, grooved. Leaves 1-2-pinnatifid, young silky ; segments very few, $\frac{1}{4}$ in., acute, margins recurved ; floral linear, entire. Heads very many, $\frac{1}{6} \mathrm{in} .$, yellow, in long slender racemes, subsessile, ovoid ; receptacle glabrous. Ray-corollas dilated below.-Distrib. Europe, temp. Asia.
2. A. vulga'ris, $L$.; leaves broad white woolly beneath, segments broad acuminate, heads erect woolly, flowers all fertile. Mugwort.
Hedgebanks, \&c., ascending to $1,200 \mathrm{ft}$. in Northumberland ; fl. July-Sept. -Perennial, aromatic. Stem 2-4 ft., erect, reddish, angled, grooved, branched. Leaves 2-3 in., 1-2 in. broad, glabrous above, margins recurved ; petiole with pinnatifid auricles. Heads in crowded, panicled, short, erect, woolly spikes, ovoid, reddish-yellow ; receptacle glabrous. Ray-flowers with slender cylindric corollas. -Distrib. Europe (Aretic), N. Africa, Siberia, W. Asia to the Himalaya.-Formerly used to flavour drinks.
3. A. Absin'thium, L.; leaves silky on both surfaces, segments oblong obtuse, heads drooping silky, outer flowers fertile. Wormwood.
Waste places, local, from Forfar southwards ; ascends (cultivated) to $2,200 \mathrm{ft}$. in
Northumberland; rare in N. and W. of Scotland; doubtfully native in Ireland;
fl. Aug.-Sept.-Perennial, very aromatic, silkily pubescent. Stems 1-3 ft., ascending, grooved and angled. Leuves 1-2 in., dotted, 2-3-pinnatifid; segments many, spreading. Heuds hemispheric, subsessile, in panicled leafy racemes, yellow ; receptacle pilose. Ray-corollas dilated below.-Distrib. Europe, N. Africa, Siberia, Dahuria, N.W. India, N. America.-Aromatic, tonic, vermifuge, and used to flavour drinks.
4. A. marit'ima, L.; leaves white and woolly beneath, segments linear obtuse, heads erect or drooping cottony, flowers all fertile.
Sait marshes and ditches, rare in Scotland, from Wigton and Aberdeen southwards ; Co. Dublin in Ireland; fl. Aug.-Sept.-Woolly or hoary, scarcely aromatic. Rootstock woody, branched. Stem 10-18in., ascending. Leaves 1-2 in., 2 -pinnatifid; segments many, very narrow, spreading. Heads crowded in short, erect, panicled spikes, reddish, narrow oblong ; receptacle glabrous.
-Distrib. Coasts of Europe and salt tracts of siberia, and W. Asia.
-A. gallica, Willd. (sp.), is not distinguishable as a well-marked variety,
either by its more compact habit or erect heads.

## 25. GNAPháhium, $L$. Cud-weed.

Herbs, sometimes shrubby below, usually tomentose or woolly. Leaves radical, or radical and cauline. Heads small, usually in terminal or axillary fascicled cymes or corymbs; invol. bracts appressed, almost transparent, as long as the flowers, coloured; receptacle flat, naked. Outer flovers female, in 1 or more series, very slender; style-arms slender, tips truncate, papillose. Disk-flowers 2 -sexual, limb dilated 5 -lobed; anthercells tailed; style-arms short. Fruit terete or compressed; pappushairs 1 -seriate, very slender.-Distrib. All temp. and sub-trop. regions; species about 100.-Etym. $\gamma \boldsymbol{y}$ ápaлov, from their woolly habit.

## * Stem leafy. Female flowers in many series. Fruit terete.

1. G. Iuteo-al'bum, $L$.; annual, stems simple, heads very glistening in dense ebracteate corymbs.
Light soils, Jersey and Guernsey ; sporadic and doubtfully indigenous in Norfolk, Suffolk, and Sussex ; fl. July-Aug.-Densely cottony. Stems many, 6-12 in., decumbent at the base, leafy. Leaves 1-2 in., linear-oblong, obtuse or acute, $\frac{1}{2}$-amplexicaul, margin sinuate. Heads $\frac{1}{2} \mathrm{in}$. diam., pale yellow; invol. scales hyaline. Fruit papillose.-Distrib. All warm countries.
2. G. sylvat'icum, L.; perennial, stems simple, heads in leafy racemes or spikes, or in alternate fascicles along the spike.
Woods, pastures, and copses, ascending to $1,600 \mathrm{ft}$. in the Highlands ; rare in the south; fl. July-Sept.-White, cottony. Rootstock woody. Stems 2-12 in. Leuves 1-3 in., narrowly linear or obovate-lanceolate, acute, 1 . nerved; petiole not $\frac{1}{2}$-amplexicaul. Heads subeylindric, $\ddagger \mathrm{in}$; invol. bracts unequal, searious, yellow or red-brown above, obtuse, outer cottony. Fruit puberulous.-Distrib. Europe (Arctic), Siberia, W. Asia, N. America.

Var. 1, rec'trm, Sm . (sp.) ; leaves narrow usually woolly below only, spike elongate, pappus white or brown.-Var. 2, uorce'gicem, Gunn. (sp.); leaves broader, woolly on both surfaces, floral suddenly smaller, spike short, invol. bracts very dark, fruit longer, pappus white. Mits. of Forfarshire, Atholl, Perth and Ross ; absent from England and Ireland.
3. G. uligino'sum, $L$.; annual, stems diffuse, heads terminal.

Damp places, especially in light soil ; fl. July-Sept.-Cottony above, rarely glabrate. Stems $2-6 \mathrm{in}$., usually many, erect from the decumbent base. Leaves narrow, gradually dilated upwards, acute or obtuse; petiole not amplexicaul. Heads $\frac{1}{8} \mathrm{in}$. long, sessile, clustered, subtended by long linear leaves; invol. bracts narrow, subacute, pale brown. Fruit very minute. Distrib. Europe (Arctic), Siberia, N. America.-Syme distinguishes a var. pilula're, Wahl. (sp.), with papillose fruit, found by him at Toft in Cambridgeshire.
** Leaves chiefly radical. Female flowers in one series. Fruit compressed.
4. G. supínum, L.; perennial, tufted, scapes with 1 or few heads.

Alpine and subalpine rocks and streams, from Stirling northwards, ascending to near $4,300 \mathrm{ft}$.; fl. July-Aug.-Dwarf ; tufts 1-6 in. diam., covered with cottony appressed wool ; roots fibrous, dark brown. Leaves $\frac{1}{2}-1 \mathrm{in}$., narrow, linear-lanceolate, subacute. Scapes $\frac{1}{2}-3$ in., slender, with few linear leaves. Heuds 1-3, $\frac{1}{3}$ in. diam., sessile ; invol. bracts scarious, brown above, woolly, outer obtuse, inner acute. Fruit pukescent; pappus white.-DIsTRIB. Alpine and Arctic Europe and N. America.

## 26. ANTENNA'RIA, Brown.

Characters of Gnophalium, but heads diœecious or nearly so. Flowers all tubular; female filiform, 5 -toothed; style slender, funnel-shaped; male tubular, limb dilated above ; anthers partly exserted, cells tailed; style undivided. Fruit nearly terete; pappus-hairs 1 -seriate, of female flowers filiform, of males thickened upwards and serrate.-Distrib. Temp. and cold Europe, N. Asia, India, N. America.-Etym. From the likeness of the male pappus to the antennas of a butterfly. Species about 12 .

1. A. dioi'ca, $B r$.; herbaceous, heads in a simple corymb. Cat'sfoot.
Mountain heaths and sandy pastures, ascending to near 2,000 ft. in Scotland, rarer in the south ; fl. June-Aug.-Perennial. Stems densely tufted ; barren shoots many. Leaves chiefly radical, $\frac{1}{2}-1 \frac{1}{2}$ in., spathulate, apiculate, silky below. Scapes 2-8 in., slender, cottony, with many linear bracts. Heads $2-8$, crowded ; male subglobose, $\frac{1}{4} \mathrm{in}$. diam., outer invol. bracts scarious cottony, inner longer with a white or pink radiating obtuse ligule, stamens exserted ; female twice as large, invol. scales more numerous, shorter than the flowers. Fruit papillose ; pappus-hairs silky.-Distrib. Europe (Arctic), N. and W. Asia, E. and W. N. America.

Var. hyperbo'rea, Don (sp.); leaves broader slightly cottony above. Skye.
A. margarita'cea, $B r$.; half shrubby, heads in a compound corymb.

Naturalized in S. Wales, Jersey, Guernsey, and several places in Scotland; fl. July-Aug.-Perennial, stoloniferous. Stem 2-3 ft., leafy, stout, and leaves below and corymb densely clothed with white or buff cottony tomentum. Leaves 3-5 in., narrow-lanceolate, acuminate, sessile and $\frac{1}{2}$-amplexicaul, glabrous above. Heads $\frac{1}{3} \mathrm{in}$. diam., of male fl. globose; female more campanulate ; invol. bracts oblong, brown below, white and radiating above.-Distrib. N. America.

## 27. FILA'GO.

Slender annual cottony herbs. Lcaves alternate, quite entire. Heads in axillary and terminal clusters ; invol. bracts imbricate, often opposite in series, scarious, acuminate, woolly; receptacle elongate, slender, with bracteoles under the outer flowers. Outer flowers in 1 or more series, female, outermost usually concealed in the concave inner invol. bracts; corolla very slender; style-arms slender. Disk-flowers numerous, 2 -sexual or male; corolla-limb dilated, 4-5-toothed; anther-cells tailed; style-arms short. Fruit terete, papillose ; pappus-hairs of the central florets very slender, in 1- or more series, of the marginal often 0.-Distrib. Europe, N. Africa, W. Asia ; species 8-10.-Етум. filum, from the cottony hairs.

1. F. german'ica, L.; leaves linear-oblong acute waved, heads 20 or more in terminal spherical clusters, invol. bracts in many opposite series not spreading acuminate and mucronate.
Dry pastures and banks, from Ross and Cantire southwards ; rare in Scotland ; common in Ireland ; fl. July-Aug.-Stem 6-18 in., stiff, erect or ascendling, dichotomously branched, flower-heads in the forks ; branches ascending, leafy. Leaves $\frac{1}{2}-1 \mathrm{in}$. Heads $\frac{1}{2} \mathrm{in}$. broad; invol. bracts glistening, subulatelanceolate, longer than the flowers, pale reddish-brown; female flowers in several series. Frieit compressed, papillose.-Distrib. Europe from Gothland southwards, Siberia, W. Asia to India ; introd. in N. America.
Var. 1, canes'cens, Jord. (sp.) ; heads obscurely 5 -angled leafless, invol. bracts folded longitudinally, tips yellowish.-Var. 2, upicula'ta, G. E. Sm. (sp.) ; taller, leaves broader, heads acutely 5 -angled, invol. bracts purplish boat-shaped, tips reddish. Rare.-Var. 3, spathulu'ta, Presl (sp.); stem short, leaves spathulate, heads 5 -angled subtended by acute leaves, invol. bracts beat-shaped, tips pale. Not uncommon.
2. F. min'ima, Fries; leaves small lanceolate, heads 3-6 in terminal and axillary clusters longer than the subtending leaves, invol. bracts in 1-2 series at length spreading. F. montana, DC. not L. ; Gnaphalium arvense, Willd. not L.
Dry places, rather local, from Ross southwards ; N.E. and S.E. of Ireland ; fl. June-Sept.-Slender, erect, 6-12 in., dichotomous. Leaves $\ddagger \mathrm{in}$., erect.
Heuds $\frac{1}{6} \mathrm{in}$., woolly, sessile ; invol. bracts very gibbous and concave at the
base, lanceolate, obtuse, glabrous, tips discoloured; female flowers in 1-2
series. Fruit terete, papillose.-Distrib. Europe, N. Africa, Siberia.
F. gal'lica, $L$.; leaves slender subulate, heads $2-6$ in axillary elusters shorter than the subtending leaves, invol. bracts in 1-2 series subacute at length spreading.
Sandy fields, rare and local, Essex, Herts, and Bucks ; a colonist, Watson; fl. July-Sept. - Very slender, much dichotomously branched. Letees $\frac{1}{3}-\frac{-2}{3}$ in., $\frac{1}{2}$-amplexicaul. Heads $\frac{1}{8}$ in., sessile, woolly ; invol. scales very gibbous, concave at the hase ; tips scarions and discoloured. Fruat slightly compressed, papillose. - Distrib. Europe from Denmark southwards.

## 27*. DORON'ICUM, L. Leopard's-bane.

Herbs with creeping or tuberous rootstocks. Radical leaves petioled, cauline alternate, amplexicaul. Heads solitary or corymbose, rayed, yellow ; invol. bracts in few series, linear, acuminate, nearly equal ; re-
ceptacle conical, naked or pubescent. Ray-flowers ligulate, usually female only; style-arms truncate, penicillate at the tip only. Disk-flowers dilated above, 5 -toothed ; anther-cells not tailed; style-arms obtuse. Fruit oblong-turbinate, furrowed ; pappus-hairs of the ray 0 or 1-3, of the disk in many series.-Europe, N. Asia, Mts. of India.
D. Pardalian'ches, $L$. ; radical leaves ovate-cordate, heads usually 3-5. Naturalized in plantations; fl. May-July.-Pubescent and pilose. Rootstock creeping, stoloniferous. Stem $2-3 \mathrm{ft}$. Radical leaves $2-5 \mathrm{in}$., long-petioled, rounded at the tip; lower cauline ovate with dilated amplexicaul petioles, upper sessile. Heads $1 \frac{1}{2}-2 \mathrm{in}$. diam., long-peduncled; invol. bracts long, subulate-lanceolate, glandular ; receptacle pubescent. Fruit black, ribbed, of the ray glabrous without pappus, of the disk hairy with white pappus.Distrib. Mid. and S. Europe.-Reputed poisonous.
D. plantaginetm, $L$.; radical leaves ovate, head usually solitary.

Naturalized in plantations; fl. June-July.-Habit of the preceding, but more slender and glabrous; leaves narrower, not cordate, usually narrowed into the petiole, repand-toothed, 3-5-ribbed, uppermost oblong.-DISTRIB. W. Europe from Belgium southwards.

## 28. SENE'CIO, L.

Herbs (the British species). Leaves alternate. Heads solitary or corymbose, usually yellow ; invol. bracts 1 -seriate with sometimes a few smaller at the base, narrow, appressed, herbaceous, usually discoloured at the tip; receptacle naked, smooth or pitted. Ray-flowers when present 1 -seriate, female; style-arms truncate, tips penicillate. Disk-flowers tubular, 2 -sexual, 5 -toothed; anther-cells not tailed ; style-arms obtuse. Fruit terete or angled, furrowed ; pappus-hairs in many series, soft, slender, equal in length, caducous. - All temp. and cold climates; species about 500 .-Etym. senex, from the abundant hoary pappus.

Section 1. Sene'cio proper. Involucre with a few small bracts at the base. Leaves pinnatifid or 2-pinnatifid; except S. aquaticus.

1. S. vulga'ris, $L$.; annual, eglandular, heads few drooping, outer invol. bracts many, ligules usually 0 . Groundsel.
Waste places, ascending to $1,600 \mathrm{ft}$. in Northumberland ; fl. all the year. -Glabrous or cottony. Stem 6-15 in., often branched from the base, succulent. Leaves pinnatifid, irregularly coarsely toothed. Heads $\frac{1}{3}$ in., cylindric, conical after flowering ; outer invol. bracts dark, ovate-subulate. Fruit ribhed, silky.-Distrib. Europe (Arctic) ; introd. in all cool climates.
Var. radia'tus, Koch ; ray-flowers with short ligules. Channel Islands.
2. S. sylvat'icus, $L$. ; annual, slightly glandular-pubescent, heads many spreading, outer invol. bracts very few subulate or 0 , ligule short.
Dry hanks and pastures, ascending to $1,000 \mathrm{ft}$. in the Highlands; fl. July-Sept.-Foetid. Ntem $\frac{1}{2}-8 \mathrm{ft}$., erect, leafy. Leaves as in S. vulyaris, hut more deeply cut. Heads $\frac{1}{3}$ in., cylindrie ; peduncles slender. Fruit faintly ribhed, silky.--Distrib. Europe, Siberia.-S. lividus, Sm. not L., is a form with larger auricles to the upper leaves.
3. S. visco'sus, L. ; anuual, glandular-pubescent viscid, heads few broad erect, outer invol. bracts few green $\frac{1}{2}$ as long as the inner.

Waste dry ground, local, from Forfar and Dumbarton southwards, very rare in Ireland ; f. July-Aug.-Fœetid. Stem 1-2 ft., stout, rigid, grooved and angled, flexuous, branched. Leaves broad, sub-2-pinnatifid. Heuds campanulate, nearly $\frac{1}{2} \mathrm{in}$. long and $\frac{1}{3} \mathrm{in}$. diam. Fruit slender, ribbed, glabrous. - Distrib. Europe.
4. S. Jacobæ'a, $L_{.}$; perennial, tall, erect, almost glabrous, heads in a dense corymb, fruit of ray ribbed glabrous. Ragwort.
Roadsides and pastures, ascending to $2,100 \mathrm{ft}$. in the Highlands ; fl. June-Sept.-Glabrous or slightly cottony. Stem 1-4 ft., stout, leafy. Leares pinnatifid or irregularly 2 -pinnatifid, lobed and toothed, terminal lobe large or small ; upper leaves auricled, sessile; lower petioled. Heads $\frac{2}{3}-1 \mathrm{in}$. diam., bright yellow, campanulate ; outer invol. bracts few, small, subulate; peduncle slender, bracteate.-Distrib. Europe, Siberia, Dahuria, N.W. India.-A variety without ray rarely occurs.
5. S. erucæfo'lius, L.; perennial, tall, erect, cottony or pubescent, heads in a dense corymb, fruits all ribbed hairy. S. tenuifolius, Jacq.
Roadsides and banks from Berwick and Lanark southwards; E. of Ireland, very rare ; fl. July-Aug.-Habit of S. Jacobrea, but more pubescent with curled hairs, especially above ; rootstock shortly creeping ; leaves broader, simply pinnatifid, with narrower lobes; heads larger, and pappus dirty white.-Distrib. Europe from Gothland southwards, Siberia, Dahuria.
6. s. aquat'icus, Huls.; biennial, tall, erect, rarely glabrous, heads in a very lax corymb, fruits all ribbed glabrous.
Sides of rivers, ditches, \&c., abundant; ascending to $1,500 \mathrm{ft}$. in the Lake district ; fl. July-Aug.-Very similar to S. Jacobea, but usually of laxer growth, with longer petioled leaves, and larger heads. Radical leaves very variable, petioled, ovate or oblong, irregularly toothed, undivided or lobed, auricled or pinnatifid at the base, often purple below ; upper irregularly lyrate-pinnatifid. Heads 1-1 in . diam.; peduncles slender.-Distrib. Europe, Siberia.-S. barbaraifo' 'ins, Reich., is a state with pinnatifid leaves.
S. sQualindes, L.; annual or biennial, glabrous, stem short flexuous leafy, heads in a very lax corymb, fruits all ribbed silky.
Naturalized on old walls, \&c., Oxford, Bideford, Allesley Church, Warwick, Cork ; fl. June-Oct.-Stem 8-12 in., rather stout. Leaves irregularly lyratepinnatifid, lobes long or short, toothed lobulate or subentire, upper auricled and $\frac{1}{2}$-amplexicaul. Heads $\frac{3}{4} \mathrm{in}$. broad; involucre broadly campanulate, bracts narrower than in the other species of this section; outer numerous, small, all usually dark-tipped.-Distrib. S. Europe.

## ** Leaves undivided, toothed.

S. saracen'icus, $L$.; leaves glabrous or nearly so, ray-flowers few.

Naturalized by river-sides and in moist meadows, from Aberdeen southwards, and in Ireland ; fl. July-Aug. - Rootstock creeping, stoloniferous. Stem 3-5 ft., erect, stout, leafy. Leaves $5-8 \mathrm{in}$., linear-oblong, acute, sessile, lower shortly petioled, lowest auricled and $\frac{1}{2}$-amplexicaul. Heads $\frac{1}{3} \mathrm{in}$. diam., many, in lax puberulous corymbs ; peduncles short, bracteate ; involucre broadly campanulate, outer bracts subulate, inner narrowly linearoblong, tipped with brown. Fruit glabrous.-Distrib. Europe from Holland southwards, Siberia.-Used as a styptic by Irish peasants.
7. s. paludo'sus, L.; leaves cottony beneath, ray-flowers very many.

Fens of Lincoln, Norfolk, Suffolk, and Cambridge, but now almost extinct; fl. June-July.-Rootstock short. Stems 3-6 ft., stout, erect, branched at the top, glabrous or slightly cottony, leafy. Leaces 3-6 in., sessile, narrowly oblong-lanceolate, coarsely serrate. Heads 1 in . diam., in lax, spreading, simple or compound corymbs ; peduncles long, bracteate ; involucre broadly campanulate, outer bracts long subulate, inner obtuse. Fruit glabrous.Distrib. Europe from Gothland southwards, Siberia.

Section 2. Cinera'ria, L. (gen.). Outer invol. bracts 0. Ray-flowers spreading.
8. s. palus'tris, DC.; tall, erect, leafy, pubescent or villous, stem hollow, leaves sessile, heads many, fruit ribbed glabrous.
Fens of the Eastern counties, but now almost extinct ; fl. June-July.Biennial. Stem erect, 2-3 ft., stout, ribbed, unbranched. Leares 3-5 in., $\frac{1}{2}$-amplexicaul, oblong-lanceolate, sinuate-toothed, acute or obtuse. Meads $\frac{3}{4}-1 \mathrm{in}$. diam., pale yellow, crowded in compound corymbs, broadly campanulate, villous with crisped hairs, short, as are the peduncles; invol. bracts many, slender. Ray-flowers short.-Distrib. Europe from Gothland to France and Austria, Siberia, Dahuria, N. America (Arctic).
9. S. campes'tris, $D C$.; scapigerous, pubescent and cottony, leaves petioled, heads few, fruit ribbed silky. Cineraria integrifolia, With.
Dry banks and chalk downs, from Anglesea and Cambridge to Sussex and Dorset; fl. May-June. Rootstock short, fibres thick. Radical leaves 1-2 in., spreading, coriaceous, shortly petioled, ovate, obtuse, entire or sinuatetoothed, pubescent under the cottony hairs. Sicape 4-12 in., stout or slender bracts, narrow long appressed. Heads 1 in. diam., pale yellow; peduncle stout, erect, bracteate at the base ; involucre broadly campanulate; bracts narrow, obtuse. Ray-flozers as long as the bracts.-Distrib. Europe (Aretic) to France and Italy, Siberia, Dahuria, N. America.
Var. marit ima, Syme; leaves broadly toothed. Maritime rocks, Holyhead.

## 29. LapsA'NA, $L$. Nipplewort.

A slender, erect, annual, branched herb ; juice milky. Leaves alternate, petioled, lower lyrate, upper toothed or entire. Flower-heads small, yellow; invol. bracts few, 1 -seriate, erect, outermost small; receptacle flat, naked, dotted. Corollas all ligulate ; anther-cells not tailed; top of style and its linear obtuse arms pilose. Fruit slightly compressed, curved, striate, not beaked ; pappus 0.-Distrib. Europe, W. Asia, N. Africa; species 4.-Etym. An old Latin name.

1. L. commu'nis, $L$.; lower leaves lyrate-pinnatifid, upper entire.

Waste and cultivated ground; ascending to $1,300 \mathrm{ft}$. in Northumberland; ff. July-Sept.-Stem 1-2 ft., paniculately branched, hairs spreading. Leures contracted into the petiole, membranous, terminal lobe very large, sinuatetoothed, lateral small. Heads many, $\frac{1}{4}$ in.; peduncles short, slender, naked ; invol. bracts 8-10, linear, rigid, keeled, green, glandular or glabrous, tip contracted obtuse. Fruit pale.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to N.W. India ; introd. in the United States.Formerly eaten as a salad.

## 30. Arnose'ris, Goertn. Lamb's or Swine's Strceory.

A small, annual, seapigerous herb; juice milky. Leaves all radical. Heads few, small, yellow; peduncles clavate, fistular ; invol. bracts in 1 series, many, after flowering arching over the fruit ; receptacle flat, naked, pitted. Corollas all ligulate; anther-cells not tailed; upper part of style and its short obtuse arms pilose. Fruit obpyramidal, furrowed and ribbed, not beaked, crowned by a coriaceous angular ring.-Distrib. Europe to Mid. Russia.-Etym. ápvos, a lamb, and $\sigma$ épis, succory.

## 1. A. pusil'la, Goortn.; leaves obovate-spathulate or -lanceolate toothed.

Dry pastures and fields, from Banff and Elgin southwards ; rare in Scotland and the E. and S. counties of England ; not found in Ireland ; a colonist, Wutson; fl. June-July.-Glabrous or slightly hairy. Leaess 2-4 in., narrow. Scopes 4-12 in., many, slender, rigid, sparingly branched above. Heuds campanulate, $\frac{1}{3}$ in., inclined in bud ; invol. bracts herbaceous, puberulous, line.arlanceolate, tips contracted obtuse. Fruit pale brown, rugose between the ribs.

## 31. CICHOR'TUM, $L$. Chicory.

Perennial herbs, with spreading branches and milky juice. Leaves radical and alternate, toothed or pinnatifid. Heads axillary, solitary or crowded, sessile or stalked, blue or yellow; involucre cylindric ; bracts in 2 series, inner erect, connate at the base, outer shorter appressed ; receptacle flattish, naked, pitted or bristly. Corollas all ligulate; anthercells not tailed; upper part of style and its slender arms pilose. Fruits crowded on the indurated receptacle, firmly embraced by the rigid invol. bructs, smooth, obovoid or turbinate, not heaked; pappus in 2 series of short obtuse scales. -Distrib. Europe, W. Asia; species 5.-Etym. An old Greek name.

1. C. In'tybus, $L$.; lower leaves runcinate, heads usually in pairs.

Waste places, roadsides, \&c. throughout England ; rare, if native, in Scotland and Ireland ; fl. July-Oct. - Rather hispid. Root fleshy, tapering. Stem 1-3 ft., angled and grooved; branches straight, rigid, spreading. Leuwes glandular-ciliate, oblong-lanceolate, upper ovate-cordate, amplexicaul. Heuds many, $1-1 \frac{1}{2} \mathrm{in}$. diam.; peduncle thickened in the middle; invol. bracts herbaceous, outer linear-lanceolate, glandular-ciliate. Flowers bright blue, rarely white ; ligule rather broad, truncate, 5 -toothed. Fruit angled, pale, mottled.-Distrib. Europe, N. Africa, Siheria, N.W. India; introd. in N. Amsrica.-The origin of the cultivated Chicory ; the roots are boiled and eaten, or dried and used as Coffee.

## 32. HYPOCH $\boldsymbol{I}^{\prime}$ RIS, $L$, CAT's-EAR.

Annual or perennial seapigerous herbs with milky juice. Leaves radical, pinnatifid. Heads on simple or dichotomously branched seapes; invol. bracts in many series, imbricate ; receptacle flat, with narrow membranous bracteoles. Corollas all ligulate; anther-cells shortly tailed ; upper part of style and its short obtuse arms hairy. Fruits striate, scabrous, heak of the outer very short, of the inner long, slender; pappus of one row of feathery hairs with usually an outer row of short, stiff bristles.-Distrib. Europe, W. Asia ; species 6.-Етуm. doubtful.

1. H. gla'bra, L.; annual, leaves narrowly obovate-oblong toothed or sinuate, scapes many branched, involucre as long as the flowers, outer pappus short.
Dry fields, \&c. from Ayr and Moray southwards ; rare in Scotland; not found in Ireland ; fl. June-Aug.-Almost glabrous. Leaves spreading, 2-4 in., rarely pinnatifid, obtuse or subacute. Scapes several, 6-12 in., slender or stout, naked or with 1-2 seale-like leaves ; peduncles erect. Heads $\frac{1}{2}-\frac{2}{3}$ in., yellow, cylindric ; involucre subcylindric ; bracts very unequal, few, green, linear, acute. Fruit red brown ; pappus dirty white, longer than the in-volucre.-Distrib. Europe from Gothland southwards, N. Africa, W. Asia.
Var. 1, gla'lra proper; marginal fruits not beaked.-Var. 2, Balbr'sii, Lois (sp.); all the fruits beaked.
2. H. radica'ta, $L$.; perennial, leaves narrowly obovate-oblong sinuateor runcinate-pimnatifid, scapes many branched, involucre shorter than the flowers, outer pappus short.
Meadows, waste places, \&c., ascending to $1,600 \mathrm{ft}$. in the Highlands ; fl. June-
Sept.-Hispid, rarely glabrous. Leaves many, 3-10 in., hispid on both surfaces. Scapes 6-18 in., stout; peduncles with small scale-like leaves. Hecuds $1-1 \frac{1}{2}$ in. diam., yellow; involucre subcampanulate ; bracts many, green, attenuated to the tip, often strongly ciliate on the margin and back. Fruits red-brown, all beaked, strongly muricate.--Distrib. Europe, N.Africa.
3. H. macula'ta, L.; perennial, leaves obovate-spathulate sinuatetoothed, scapes one or few, involucre shorter than the flowers ciliate with curly hairs, outer pappus 0 . Achyrophorus maculatus, Scop.
Chalk and limestone pastures, rare, Westmoreland, N. Wales, Cornwall, Cambridge, Essex ; fl. July-Aug.-Hispid. Leaves sessile, 1-4 in., often spotted above. Scape stout, glabrous above, rarely forked, with 1-2 scale-like leaves. Heads 1 in . diam., yellow; involucre broadly campanulate; bracts many, slender. Fruits all beaked, faintly muricate; pappus white.-Distrib. Europe, Siberia, Dahuria.

## 33. HELMIN'THIA, Juss. Ox-TONGUE.

Hispid, branched, annual herbs ; juice milky. Leaves alternate, uppermost opposite, $\frac{1}{2}$-amplexicaul, toothed. Heads terminal, solitary, yellow; invol. bracts 2 -seriate, ciliate, outer cordate spreading, inner erect; receptacle flat, naked, papillose. Corollas all ligulate; anther-cells shortly tailed; upper part of style and its slender arms pilose. Fruit compressed, transversely rugose, beak long erect slender ; pappus of many series of feathery hairs.-Distrib. Europe, W. Asia, N. Africa; species 5.-Etym. é $\lambda \mu i \nu \theta \iota o \nu$, from the worm-like fruits.

1. H. echioi'des, Gcertn.; lower leaves sinuate-toothed, upper cordate. Fields and waste places in stiff soil in England, local; Berwick and Dunbar, doubtfully indigenous ; S. and E. of Ireland, rare ; fl. June-Oct.-Stout, erect, $2-3 \mathrm{ft}$., paniculately branched, hispid and setose, hairs with tumid bases. Leaves oblong-lanceolate, radical petioled, upper amplexicaul. Heads 1 in . diam., peduncles stout, stiff, rather swollen, diverging, naked; invo lucre hemispheric ; outer bracts broadly cordate, foliaceous, inner acuminate. Ligules short. Fruit red-brown, long, curved; pappus pure white.-Distrib.
Europe from Holland southwards, N. Africa.

## 34. TRAGOPO'GON, $L$.

Erect, usually simple glabrous herbs, with biennial or peremnial taproots; juice milky. Leaves alternate, entire, amplexicaul. Heculs solitary, yellow or purple ; invol. bracts 1 -seriate, usually exceeding the flowers, narrow, nearly equal, connate at the base; receptacle convex, naked or fimbriate. Corollus all ligulate; anther-cells tailed; upper part of style pilose, arms slender obtuse. Fruit slemier, muricate, beak long; pappushairs in many series, rigid, feathery with naked tips, the hairs of the bristles horizontal and interlacing.-Distrib. Europe, N. Africa, W. Asia ; sjuecies ubout 20.-ETYм. $\tau \rho \alpha \gamma o s$ and $\pi \omega ́ \gamma \omega \nu$, gout's-beard.

1. T. praten'sis, L.; leaf-sheaths much dilated, scape scarcely thickened upwards, flowers yellow. G'oat's-beard.
Meadows, pastures, and waste places, from Lanark and Moray southwards ; rare in Scotland and Ireland ; fl. June-July.-Glabrous or slightly cottony on the involucre, glaucous. Stem 1-2 ft., stout, erect, simple or sparingly branched above. Leaves flexuous, slender, gradually contracted upwards from above the dilated sheath, linear towards the tip; radical with shorter sheaths, keeled, channelled above, midrib tubular. Heculs $\frac{1}{2}-2 \mathrm{in}$. diam., yellow ; involucre obconic, bracts about 8, 2 -seriate, flat, often streaked with brown. Fruit variable in roughness ; beak about as long as the body.Distrib. Europe, W. Siberia.-Root edihle. Flowers close at noon.
Var. 1, praten'sis proper ; flowers as long as the invol. hracts.-VAR, 2, minnor, Fries (sp.); flowers $\frac{1}{2}$ as long as the invol. bracts. The most common form. -Var. 3, grandiftorus, Syme ; flowers much longer than the invol. bracts. Kent and Surrey, rare.
T. PORrifo'liUS, L.; leaf-sheaths slightly dilated, peduncle much thickened upwards, flowers purple. Sulsify.
Wet meadows, rare and local, nowhere wild ; a denizen, Watson ; May-Junc.
-Habit and chief characters of T. prutensis, but usually larger. with more muricate fruits; ligule as long or shorter (var. parviftorus, Syme) than the invol. bracts.-Distrib. N. Europe, Siberia.-Occasionally cultivated in England, abundantly on the Continent.

## 35. PI'CRIS, $L$.

Erect, branched, hispid herbs ; juice milky. Leaves alternate, entire or sinuate-toothed. Heads corymbose, yellow ; invol. bracts many, unequal, outer spreading ; receptacle flat, naked, pitted. Flowers all ligulate ; anther-cells shortly-tailed; upper part of style and its slender obtuse arms pilose. Fruit curved, grooved, transversely rugose, not beaked; pappus-hairs 2 -seriate, deciduous, feathery, connate below, outer fewer slender, inner broader at the base, plumose.-Distrib. Europe, temp. Asia; species about 20.-Etym. $\pi \iota \kappa \rho o ́ s$, from its bitterness.

1. P. hieracioi'des, $L$.; leaves obovate-lanceolate, upper $\frac{1}{2}$-amplexicaul. Borders of fields and waste places in a stiff suil, chiefly in S. and E. of England, from Durham southwards; absent from Ireland ; fl. July-Sept.- Hispid with stiff straight curled or hooked hairs. Stem $2-3 \mathrm{ft}$., stout, corymbosely branched. Leuves 4-12 in., narrow, lower petioled, upper sessile. Hewds 1 in . diam., peduncles bracteate ; involucre subeampanulate; outer bracts
short, elothed with black hairs. Fruit red-brown, angled ; pappus snow-white.-Distrib. Europe, Siberia, Himalaya, Australia, New Zealand.
VAR. 1, hierucioi'des proper; branches divaricate, heads irregularly corymbose. -Vir. 2, arva'lis, Jord. (sp.); branches ascending, heads subumbellate. Leicestershire.

## 36. LEON'tODON, L. HAWkbit.

Perennial, scapigerous herbs ; juice milky. Leaves all radical, obovate, sinuate-toothed or pinnatifid. Heads on simple or branched seapes, yellow ; invol. bracts many, in several series, outer smaller ; receptacle flat, naked. Flowers all ligulate; anther-cells not tailed; style-arms linear, obtuse, and upper parts of style pilose. Fruit terete, grooved, transversely rugose ; beak short ; pappus-hairs rigid, 1-2-seriate, slightly dilated at the base, outer simple and rough, or the outer of toothed scales and the inner of one series of feathery hairs.-Distrib. Europe, W. Asia; species about 25. -Етчm. $\lambda \epsilon \epsilon \omega \nu$ and $\dot{\delta} \delta o$ és, from the toothed leaves.

Sub-gen. 1. Thrincia, Roth (gen.). Pappues of outer flowers of toothed scales, of inner of feathery hairs. Buds drooping.

1. L. hir'tus, L.; leaves hispid oblong or lanceolate. Hedypnois, Sm.
Gravelly pastures, \&c. from Fife and Lanark southwards, S. and Mid. Ireland; th. July-Aug.-A hispid biennial ; hairs often forked. Leares 3-6 in., longpetioled. Scapes very many, 4-8 in. Heads $\frac{1}{2} \frac{-3}{4} \mathrm{in}$. diam.; involucre campanulate; bracts lanceolate, subacute, keeled, glabrous, hispid or ciliate on the edges and back. Fruit $\frac{1}{5}$ in., closely grooved and minutely muricate ; outer stouter, curved, almost smooth; pappus white.-Distrib. Europe from Gothland southwards.
Sub-gen. 2. Apar'gia, Willd. (gen.). Pappus of all the flowers 2 -seriate, slender ; outer short, scabrid ; inner longer, dilated at the base, feathery. Buds drooping.
2. L. his'pidus, L.; leaves hispid oblong-lanceolate. Hedypnois, Sm. Meadows, \&ce., on dry soil, from Skye and Kincardine southwards, ascending to near $2,000 \mathrm{ft}$. in Northumberland ; rather rare in Ireland ; fl. June-Sept. -A hispid biennial ; rootstock truncate ; hairs often forked. Leaves 3-5 in. Scapes 6-18 in., few, slender, swollen at the top. Heads $1 \frac{1}{2} \mathrm{in}$. diam.; involucre obconic ; bracts linear-lanceolate, tips woolly obtuse. Fruit slender, ribs very muricate above ; pappus brownish-white.-Distrib. Europe.
Sub-gen. 3. Oporin'ia, Don (gen.). Pappus of all the flowers 1seriate, feathery, dilated at the base. Buds erect.
3. L. autumna'lis, L.; leaves glabrous lanceolate. Apargia, Willd. Pastures and waste places ; ascends to $3,000 \mathrm{ft}$. in the Highlands ; fl. July-Sept. -Glabrous below, hispid above ; rootstock truncate. Leaves 4-10 in., variable. Scupe ascending, usually solitary, branched, rarely simple, bracteate ; perduncles swollen above. Heads $\frac{1}{2}-1 \frac{1}{2}$ in. diam., involucre obconic or campanulate ; bracts glabrous hispid or clothed with black hairs, outer subulate, inner linear obtuse. Fruit very slender, ribbed, slightly muricate ; pappus brownish-white.-DIsTrib. Europe (Arctic), Siberia, W. Asia, Greenland; introd. in N. America,

VAR. 1, autumna'lis proper; involucre nearly glabrous.-VAR. 2, muten'six, Koch (sp.) ; involucre clothed with (often black) woolly hairs. Hedypnois Taraxaci, Sm. Subalpine districts.

## 37. LACTU'CA, L. Lettuce.

Erect, annual or perennial, leafy, branched herbs ; juice milky. Leaves alternate, upper often sagittate. Heads corymbose, small, yellow, rarely purple or blue, few-flowered ; involucre narrow, cylindric; bracts few, in several series; receptacle flat, naked. Corollas all ligulate; anthercells shortly tailed; style-arms slender and upper part of style pilose. Fruit flattened, beak long slender ; pappus of many soft, slender, silvery, fugacious hairs.-Distrib. Temp. regions of the N. hemisphere and $\mathbf{S}$. Africa; species about 50.-Етум. The classical name.

* Leaves with the keel usually setose. Beak as long as the bordered fruit.

1. L. viro'sa, L.; distantly scabrous, leaves spreading, radical obovateoblong sinuate-toothed, cauline amplexicaul with deflexed auricles, branches of panicle long spreading, fruit black.
Hedgebanks and waste places, from Stirling and Perth southwards; rare in Scotland ; absent from Ireland ; fl. July-Aug.-Erect, 3-6 ft., prickly, glaucous, biennial. Leaves 6-18 in., green, radical petioled, often spotted with black; cauline oblong, hardly narrowed at the base. Heads $\frac{1}{2} \frac{-3}{4}$ in., pale yellow, in slender panicles, subsecund ; peduncles slender, bracteate ; involucre narrow conical ; bracts few, green, tips red. Fruit with a thick cel-
lular wing and ribbed faces.-Distrib. Europe from Belgium southwards,
N. Afriea, W. Siberia.-Juice foetid, milky, nareotic, used as an opiate.
2. L. Scari'ola, L.; rather scabrous below, leaves suberect, radical ob-ovate-oblong sinuate-toothed or runcinate, upper sagittate amplexicaul, auricles acute spreading, branches of panicle long spreading, fruit grey.
Waste places, rare, Worcester, Norfolk, Essex, Kent, and Surrey ; native?
Watson; fl. July-Aug.-Closely allied to L. viro'sa, but prickly only towards the base ; branches more erect ; leaves usually more runcinate ; heads smaller ; fruit narrower.-Distrib. Europe, Siberia; introd. in N. America.
-Possibly the origin of the garden lettuce.
3. L. sallg'na, L.; almost glabrous, leaves entire or runcinate acute, cauline hastate amplexicaul, auricles spreading acute, uppermost narrow entire, branches of panicle very short erect, fruit grey.
Waste grounds, Suffolk to Sussex, especially near the sea, rare ; fl. July-Aug. -A more slender plant than the preceding, much less bristly, with the flowers often fascicled on short erect branches so as to appear almost spiked. -Distrib. Europe from Holland southwards, N. Africa, W. Asia.
** Leaves not selose. Beaki shorter than the terete fruit.
4. L. mura'lis, Fresen.; glabrous, leaves broad lyrate-pinuatifid, upper amplexicaul auricled often entire, branches of panicle slender diverging, fruit black. Prenunthes muralis, L.
Old walls and rocky copses, from Skye and Moray southwards, rare ; ascends to $1,300 \mathrm{ft}$. in Yorkshire ; doubtfully wild in Scotland; Wieklow and Louth in 1reland ; fl. June-Aug.-Tall, slender, annual or biennial, 1-3 ft. Leaves membranous, glaucous below, narrow ; radical with winged petioles, lohes few toothed ; terminal lobe large, 3-angular, sinuate-loved. Heuds ${ }_{3} \mathrm{in}$.,
yellow ; peduncles slender, bracteate ; invol. bracts few, linear, green and purplish. Fruit ribbed and muricate.-Distrib. Europe, W. Asia.

## 38. TARAX'ACUM, Juss. DANDELION.

Perennial, scapigerous herbs ; juice milky. Leaves all radical, entire or pinnatifid. Heads solitary, yellow, scapes fistular leafless ; invol. bracts imbricate ; inner equal, erect ; outer smaller, often recurved; receptacle flat, naked, pitted. Corollas all ligulate ; anther-cells not tailed; stylearms slender and upper part of style pubescent. Fruit compressed, ribbed, muricate above the middle, abruptly beaked; pappus-hairs in many series, simple, white.-Distrib. All temp. and cold climates ; species, one variable, or many.-Etym. тapá $\sigma \sigma \omega$, from its alterative effects.

1. T. officina're, Wiggers; leaves toothed sinuate or runcinate-pinnatifid. Leontodon Taraxacum, L.
Meadows and waste places ; fl. March-Oct.-Glabrous or cottony at the crown and involucre. Root long, stout, black. Leaves oblong-obovate or spathulate, lobes usually toothed. Scapes 1 or more, ascending or erect. Head $\frac{1}{3}-2 \mathrm{in}$. broad, bud erect; involucre campanulate, outer bracts more or less recurved, inner erect. Corollus bright yellow, outer often brown on the back. Fruit brown, with a beak of equal length.-Distrib. Arctic and N . and S . temp. regions.--A well-known medicine.
Var. 1, Dens-leo'nis, Desf. (sp.); leaves bright green runcinate-pinnatifid, outer bracts recurved, fruit pale slightly murieate. The common form most frequent in cultivated ground ; ascends to $2,700 \mathrm{ft}$. in the Highlands.-V Ar. 2 , erythrosper'mum, Andrz. (sp.); leaves dull green often glaucous runcinatepinnatifid, outer bracts spreading, inner appendiculate below the tip, fruit dark brown spinulose upwards. Dry places.-VAR. 3, laviga'tum, DC. (sp.); leaves dull green pinnatifid, outer bracts erect broader, inner appendiculate or gibbous below the tip, fruit as in Var. 2, but paler. Sandy places.-Var. 4, palus'tre, DC. (sp.); leaves sinuate-toothed or pinnatifid, lobes broad, outer bracts ovate spreading or erect, inner simple at the tip, fruit pale spinulose upwards. Moist moorlands ; ascends to $4,000 \mathrm{ft}$. in the Highlands.

## 39. CRE'PIS, L. Hawk's-beard.

Branched herbs, juice milky. Leaves chiefly radical. Heads panicled or corymbose, small, yellow or purplish ; invol. bracts many, linear, equal, with a few smaller at their base ; receptacle flat, naked, pitted, margins of the pits hairy or toothed. Corollas all ligulate ; anther-cells not tailed; style-arms slender and upper part of style pilose. Fruit terete, striate, beak long, short or 0 ; pappus-hairs in many series, slender, simple, white, silky, brown in C. paludosa.-Distrib. Europe, N. and W. Asia to the Himalaya; species about 90.-Етум. The classical name.

Sub-gen. 1. Cre'pis proper. Peduncles slender; buds erect. Fruit not beaked. Pappus white, silky.

1. C. vi'rens, $L$. ; glabrous below, lower leaves toothed runcinate or lyrate, upper linear sagittate, inner bracts glabrous within as long as the pappus. C. tectorum, Sm. not L.
Waste and cultivated ground, cottage roofs, \&c., ascending to $1,000 \mathrm{ft}$. in the
Highlands ; fl. June-Sept.-Annual, very variable. Stems 1 or more, 1-3 ft.
furrowed, much branched ; inflorescence usually glandular hairy. Leaves often pinmatiseet with narrow acute or ohtuse lohes, petioled. Hearls $\frac{1}{4}-\frac{3}{4} \mathrm{in}$. diam.. campanulate ; outer bracts subulate, inner linear. Fruit red-brown, ribs 10 or more, smooth.-Distrib. Europe from Denmark southwards, Canaries.
2. C. biennis, $L$.; hispid, leaves all runcinate lyrate, upper simple sessile, inner bracts pubescent within shorter than the pappus.
Chalky pastures, from Leicester and Northampton southwards, rare ; Dublin in Ireland; fl. June-July.-Biennial. Stem 1-4 ft., stout, channelled, ribheri. Lenees 6-10 in., lobes very irregular. Heals $\frac{3}{4}-1 \mathrm{in}$. diam.; involucre campanulate, bracts glabrous externally, outer spreading. Fruit $\frac{1}{3} \mathrm{in}$., slender, twice as long as in C. virens, red-brown, ribs close set, prominent, rough. -Distrib. Europe.-Closely resembles C. taraxacifolia.
3. C. hieracioi'des, Wuldst. and Kit.; glabrous or hairy, lower leaves oblong-spathulate, upper linear-oblong $\frac{1}{8}$-amplexicaul, bracts with glandtipped hairs. C. succisufolin, Tausch.; Hieracium molle, Sm.
Mountain woods, from Yorkshire northwards to Dumbarton and Forfar; ascending to $1,200 \mathrm{ft}$. in Northumberland; not found in Ireland ; fl. JulyAug. -Slender, perennial, variable in pubescence. Leaves 2-4 in., obtuse, entire or sinaate-toothed. Heculs $\frac{3}{-3}-1 \mathrm{in}$. diam., few ; involucre subcylindric ; outer bracts appressed, short, about as long as the pappus. Fiwit contracted at the base and tip, ribs many, smooth.-Distrib. Mid. Europe to the Caucasus.
Sub-ges. 2. Barkhau'sia, Moench (gen.). Peduncles slender or thickened upwards. Fruit beaked, many-ribbed, minutely hispid.
4. C. foe'tida, $L$.; hispid, stem branched from below, leaves runcinatepinnatifid, peduncles bracteate incurved thickened upwards, buds drooping, invol. bracts tomentose inner hardening and enclosing the outer fruits.
Chalky and gravelly banks in England, rare, from Cambridge and Norfolk to
Sussex and Kent ; fl. June-July.-Annual or biennial. Stem 1-2 ft., terete, faintly furrowed, usually with many ascending corymbose branches. Hreadx $\frac{3}{4} \mathrm{in}$. diam., bright yellow; peduncles long ; invol. bracts often setose and glandular, outer erect or spreading. Frnit yellow-brown, beak of outer shorter than the bracts, of inner longer.-Distrib. Europe from Belgium southwards, N. Africa.
5. C. taraxacifo'lia, Thuill.; hispid, stem branched above, leaves runcinate-pimatific, peduneles very slender not thickened, buds erect, imner invol. bracts not enclosing the outer fruits.
Dry hanks and chalky pastures in S.E. England, local, from Yorkshire to Surrev, and in Carnarvon ; fl. June-July.-Habit and foliage of C: hiennis, biemnial. Stem 1-2 ft., ribbed and furrowed. Heculs 3-1 in. diam. ; involucre eylindric-campanulate, often glandular as well as tomentose, outer bracts spreading, not hardening. Flonery yellow, outer striped with brown on the back. Fruits yellow-brown, all long-beaked and very slender.-Distrib. W. Europe from Bulgium southwards, N. Africa.
C. seto'sa, Haller ; hispid, lower leaves sinuate-toothed or runcinatepimnatifid, upper amplexicaul, peduncles slender not thickened, buds erect, invol. bracts prickly, imner not enclosing the outer fruits.
Cultivated fields of clover in England, not naturalized even ; ff. Aug.-Biennial.
Stem 1-3 ft., erect, brauched from the base, angled and furrowed, leafy.

Leaves very variable. Peduncles rigid, deeply grooved. Heads $\frac{1}{2}$ in. diam., campanulate ; involucre contracted in fruit; bracts very rigid, slender, keeled, outer subulate spreading, inner linear shorter than the pappus, hardening. Fruits all slender with long beaks.-Distrib. Mid. and S. Europe.
Stb-gex. 3. Ara'cium, Monn. (gen.). Peduncles very slender; buds erect. Fruit slender, not beaked, many-ribbed, quite smooth. Pappus of dirty-white fragile hairs.
6. C. paludo'sa, Meench; radical leaves obovate-lanceolate, petiole slender, cauline sessile amplexicaul auricled. Hicracium paludosum, L.
Moist mountain meadows, copses, \&c. from S. Wales and Leicester northwards; ascending to near 2,000 ft. in the Highlands ; N. of Ireland ; fl. July-Sept. -Perennial ; glabrous, inflorescence, covered with black glandular hairs. Stem 1-3 ft., slender, furrowed. Leaves membranous, runcinate-toothed, long-acuminate ; radical $3-5 \mathrm{in}$.; cauline contracted in the lower third. Henels few, ${ }_{3}^{2}-1 \mathrm{in}$. diam., corymbose ; bracts of peduncles minute, subulate with toothed bases; ligules yellow; styles livid. Fruit cylindric, deeply grooved, strongly ribbed, obscurely contracted at the top, pale.-DISTRIB. Europe (Arctic), excl. Turkey, W. Siberia.- Intermediate between Hieracium and Crepis, having the pappus of the former and all other characters of the latter.

## 40. SON'CHUS, L. Sowthistle.

Annual or perennial, often succulent brittle herbs ; juice milky. Leaves alternate, toothed or pinnatifid. Heads corymbose or subumbellate, yellow; involucre conical after flowering, scales in many series, imbricate ; receptacle flat, naked, pitted. Corollas all ligulate; anther-cells shortly tailed; style-arms slender, and upper part of style hairy. Fruit truncate, much compressed, grooved, ribbed, usually transversely rugose, pappus-hairs in many series, simple, silky.-Distrib. N. and S. temp. regions; species about 40.-Етум. doubtful.

1. S. arven'sis, L. ; rootstock creeping stoloniferous, leaves sharply toothed, lower runcinate, upper oblong-lanceolate $\frac{1}{2}$-amplexicaul, auricles obtuse, inflorescence glandular-hispid.
Cultivated fields, ascending to near $1,000 \mathrm{ft}$. in Northumberland ; fl. Aug.-
Sept.-Stem 2-4 ft., tubular, angled, simple or branched. Leaves very variable, margin waved, almost spinous; glaucous below. Heads 1-2 in. diam.; involucre broadly campanulate. Fruit light-brown. - Distrib. Europe (Arctic), N. Africa, temp. Asia; introd. in America.
2. S. palus'tris, L.; rootstock branched, leaves minutely toothed, lower runcinate with few segments, upper entire sessile sagittate, auricles :cute, inflorescence glandular-hispid.
Marshes in England, very rare ; formerly found in Suffolk, Huntingdon, Kent, and Essex, now all but extinot except on the Thames below Woolwich; fl . Oct.-Stem 5-7 ft., strict, stout, tubular, angled, leafy. Leares longacuminate, lower very large and long, often reduced to one sagittate blade and a broad winged petiole, very glaucous beneath. Heads $\frac{3-1}{4} \mathrm{in}$. diam., pale yellow, subumbellate; peduncles stout, very hispid and glandular. Fruit 4 -ribbed, pale.-Distrib. Europe from Denmark southwards.
3. S. olera'ceus, $L$. ; annual, leaves sharply toothed entire or pinnatifid lanceolate $\frac{1}{2}$-amplexicaul, auricles rounded, inflorescence subumbellate glabrous rarely glandular.
Fields and waste places, ascending to $1,200 \mathrm{ft}$. in Yorkshire ; fl. June-Sept.-
Stem 2-3 ft., ereet, usually branched, tubular, grooved. Leaces sessile or
petioled, bright green, glaucous, usually much lobed, often spinous-toothed.
Heuds crowded, ${ }^{3}-1 \mathrm{in}$. diam.; peduncles sometimes cottony. Frwit pale
hrown.-Distrib. Eurupe, N. and W. Asia, N. Africa, apparently wild in
S. Australia and New Zealand ; introd. in America.-Sometimes used as a
pot-herb by peasants.
Sub-sp. olera'ceus proper ; fruit ribbed and transversely wrinkled.
Sub-sp. As'per, Hoffim. (sp.) ; leaves waved spinous, auricles suborbicular de-
flexed and recurved, fruit ribbed but not transversely wrinkled.

## 41. mulge'dium, Cassini. Blle Sowthistle.

Erect, perennial, usually branching herbs; juice milky. Leaves alternate, entire or pinnatifid. Heads corymbose, blue ; invol. bracts many, imbricate, outer smaller; receptacle flat, naked, pitted. Corollas all ligulate ; anther-cells simple or tailed; style-arms slender and upper nart of style pilose. Fruit compressed, ribhed, with a scabrid disk; pappushairs in many series, rigid, simple, dirty white.-Distrib. N. temp. and Arctic regions ; species about 20.-Eтym. mulgere, from the milky juice.

1. M. alpi'num, Less. ; leaves sagittate lyrate or runcinate toothed, terminal lobe very large deltoid. Sonchus alpinus, L.; S. caruleus, Sm. High wet alpine rocks in Forfar and Aberdeen, between 2,000 and 3,000 ft.;
H. Aug.-Glabrous except the glandular-pilose inflorescence. Stem $3-4 \mathrm{ft}$., simple, stout, succulent, grooved. Leaves 4-8 in. broad, membranous, narrowed into $\frac{1}{2}$-amplexicaul auricled winged petioles; upper broadly ovate or triangular-cordate, acute, shortly petioled. Heads 1 in . diam., pale blue, in erect simple or branched racemes ; peduncles ascending, bracteate; involucre subeylindric, bracts linear. Fruit 4-gonous, slightly compressed.
-Distrib. Arctic and Alpine Europe, W. Siberia.

## 42. hiera'cium, $L$. Hawkweed.

Perennial herbs of various habit, often covered with glandular or stellate hairs ; juice milky. Leaves chiefly radical ; cauline alternate sessile. Hereds yellow, rarely orange, solitary corymbose or panicled; invol. bracts many, imbricate, unequal ; receptacle flattish, naked, pitted, margins of the pits toothed or hairy or fimbriate. Corollas all lignlate; anther-cells not tailed; style-arms slender, and upper part of style pilose. Frwit angled or striate, not beaked ; pappus-hairs 1 -seriate simple, rigid, unequal, tawny or brownish, brittle, often surrounded at the base with a short crenulate ring.-Distilib. N. temp. and Aretic regions; speeies 20 or more--Etym. iépák, a havk.
In the following attempt to classify the British forms of Hieracium, I have been guided by Mr. J. G. Baker. I believe that there are no characters whereby the 9 forms here regarded as species, from alpinum to horeale inclusive, can be more than approximately defined; of these 9 Bentham makes 4 , and Backhouse (regarding a considerable amount of constancy under cultivation as a test of specific value) makes 30. Variable as the genus is, it is a curious
fact, that the sequence of the species is so obvious as to have boen recognised by all botanists; and that this sequence represents to a very considerable extent the spread of the species in altitude and area in the British Isles.

Section 1. Piloselloi'dea. Rootstock stoloniferous. Stem scapelike. Invol. scales irregularly imbricate. Ligules glabrous. Fruit minute, furrowed, crowned with a crenate disk ; pappus-hairs slender, equal.

1. H. Pilosel'ia, $L$.; stolons long, scape leafless, heads solitary, invol. bracts acute, ligules pale yellow, styles yellow. Mouse-ear Hawkweed.
Banks, wall-tops, \&c. ; ascends to 2,400 ft. in Yorkshire; fl. May-Aug.-
Villous with long soft hairs. Stolons creeping. Leaves 2-4 in., oblonglanceolate or obovate-spathulate, stellately downy beneath. Scapes 2-10 in., with $1-3$ leaves or 0 . Heads $\%-1 \mathrm{in}$. diam.; involucre subcampanulate and top of scape stellately downy and with glandular hairs ; ligule often striped with brown on the back. Fruit io in., dark.-Distrib. Europe, N. Africa, Siberia, W. Asia.
Var. Peletérianum, Mer. (sp.); more densely silky, stolons shorter, heads larger. H. pilosissimum, Fries.
H. auranti'acum, L.; rootstock creeping, stolons short or 0 , heads corymbose, invol. bracts obtuse, ligules orange, styles brown.
Naturalized in copses in the N. of England and Scotland; fl. June-July.A larger plant than H. Pilosella; leaves not pubescent below; flowers orange-red.-Distrib. Scandinavia, and Pyrenees to the Carpathians.
2. H. collínum, Fries; stolons short, scape slender laxly hairy below, involucre floccose and covered with glandular black hairs, heads small corymbose, invol. bracts linear obtuse, ligules pale yellow.
Ettrick river, between Selkirk and Philiphaugh ; fl. June.-Rootstock 1-2 in., oblique, truncate, with several short branches, the outer being stolons. Leares 2-3 in., narrow oblong- or spathulate-lanceolate, subacute, narrowed into petioles, quite entire, covered like the scape below with long flexuous seattered (tawny when dry) hairs or setæe with bulbous bases, slightly stellately downy beneath. Scape $10-14 \mathrm{in}$., with one sessile narrow leaf below the middle. Heads $\frac{1}{3}$ in., rather crowded; involucre cylindric-campanulate.Distrib. Scandinavia (Arctic).-Probably the H. Auricula, L., found in Westmoreland by Hudson (H. dubium, "Flora Danica," t. 1,044).
Section 2. Pulmona'rea. Stolons 0. Rootstock with a persistent rosette of leaves. Stem or scape naked or 1 -few-leaved. Invol. bracts irregularly imbricate. Ligules hairy at the back and tip, or tip only. Fruit short, furrowed, without a crenate disk; pappus-hairs rigid, unequal.
3. H. alpínum, $L$.; green, not glaucous, softly pilose and shaggy, scape 4-10 in. with 1-2 small leaves or 0, invol. bracts softly silky, outer lax or spreading, ligules hairy on the back or tip.
Alps of Aberdeen and Forfar, alt. 2,000-4,000 ft., rare; Breadalbane Mts., Ben Nevis, and in Cumberland ; absent from Ireland ; f. July-Aug.-Heads 1-1 $\frac{1}{2}$ in. diam., bright or pale yellow.-Distrib. N. and Arctic Europe, Asia, and America, Alps of Mid. and S. Europe, exclusive of Pyrenees.-A scarce plant: the following varieties appear to be very local.
Var. 1, melunoceph'alum, Tausch. (sp.).; leaves lanceolate or spatkulate nearly glabrous above, head solitary, invol. hemispheric, hairs black, bracts all
acute, outer lax, style yellow. II. alpi'num, Backh. Scotland.-V Ar. 2, holuseric'eum, Backh. (sp.); leaves as in VAR. 1, or lanceolate hut olituse entire and pilose on hoth surfaces, heads solitary, invol. turbinate, hairs long white, outer bracts broad obtuse, inner acute appressed, style yellow. Scotland and Cumberland. - Var. 3, exim'ium, Backh. (sp.) ; taller, 6-15 in., leaves lanceolate hairy on both surfaces, heads 1 or few, invol. truncate below, hairs black, bracts many slender acute, style yellow or livid. Scotland. -Var. 4, culendulith'rum, Backh. (sp.) ; stem simple or hranched, leaves broadly obovate obtuse toothed, primordial orbicular, invol. rounded at the base, hairs silky black, bracts acute, style livid. Cumberland and Scotland. The handsomest form, indicating a passage to $H$. wigrescens.
4. H. nigres'cens, Willd.; more or less covered with seattered soft hairs, seape 6-18 in. with 1-2 small leaves or 0 , involucre villous, hairs black glandular, outer bracts lax, ligules glabrous or nearly so.
Alps of Scotland and Cumberland; ascends to $4,500 \mathrm{ft}$.; absent from Ireland ; fl. Aug.-Sept. - Quite intermediate between II. alpinum and Lausoni in size, altitudinal distribution, and area. Usually larger and more slender than alpinum, with broader, narrower, coarsely toothed leaves, much shorter soft hairs, and blacker bristles and glands on the involucre; heads as large.
Var. 1, pulmona'rium, Sm. (sp.); leaves with large irregular teeth, cauline few, involucre dark green ovoid at the base, bracts rather broad outer obtuse, tips woolly, flowers deep yellow, style dark. H. nigrescens, Backh. Alps of Scotland, ascending to $3,000 \mathrm{ft}$-VAB. 2, grucilen'tum, Backh. (sp.) ; green, root-leaves lanceolate, cauline few large, involucre ventricose black with soft hairs and glands, bracts broad woolly at the tips, ligules nearly glabrous on the back, styles livid. Seotland. Very near alpinum indeed.-- Vis. 3, gluhor'sum, Backh. (sp.); glaucous or green, radical leaves ovate, cauline few small bract-like or 0, buds globose, heads large, involucre rounded at the base at last spherical, bracts appressed, styles yellow. Cairngorm range.Var. 4, choysun'them, Backh. (sp.); green, radical leaves ovate sharply coarsely toothed long-petioled, cauline minute narrow petioled, involucre rounded at the base, hairs and glandular hairs short, bracts many, styles yellow or faintly livid. II. rupestre, Bab. Frequent in Scotland, rare in Cumberland.-VAr. 5, senes'cens, Backh. (sp.); green, radical leaves lanceolate evenly toothed, cauline linear-lanceolate petioled, heads 2 or more, involucre ovoid at the base, bracts woolly at the tip incurved in bud, styles yellow. Scotch Alps.-Var. 6, lingula'tum, Backh. (sp.); green, 15-24 in., radical leaves few toothed coarsely hairy above, petioles short, cauline few sessile, heads several, involucre broad at length truncate at the base, dark with hairs, bracts straight in bud, styles livid. HI. sur.ifragum, Bab. ; II. divaricutum, Don. Scotch mountains, ascending to $2,500 \mathrm{ft}$.
5. H. Lawso'ni, Sin. (not Villars) ; glaucous green, 1-2 ft., stem more or less leafy slightly hairy or glabrous below, radical leaves ovatelanceolate, petioles shaggy, cauline oblong or ovate broad sessilo amplexicaul, heads 1-5 1-1 $\frac{1}{2} \mathrm{in}$. diam., ligules many, styles livid.
Mountain districts of England, Scotland, and Ireland ; ascending to $2,700 \mathrm{ft}$.; not found in Wales ; Hl. July-Aug.-A handsome species, hest characterised by its size, ovate-lanceolate leaves, shaggy petioles, several (rarely 1) large bright-coloured heads, and livid styles.--Distrib. Pyrenees.
Sub-sp. ANG'Licum, Fries (sp.) ; petioles long shaggy winged, cauline leaves

1-2 ovate, heads $2-5$, involucre ventricose rounded at the base, bracts slender, ligules pilose at the tip. H. cerinthoides, Backh. not L.
Sub-sp. I'ricum, F'vies (sp.) ; more robust and leafy, radical leaves in a less marked rosette or seattered, petioles shorter, cauline broadly ovate not contracted above the base, involucres truncate at the base constricted after flowering, ligules glabrous. H. Lapeyrousii, Bab. not Frœel. This, which is confined to Great Britain, bears much the same relation in foliage to anglicum that tridentatum does to vulgutum.
6. H. muro'rum, L.; green or glaucous, stem 1-2 ft. glabrous or nearly so below, primordial leaves suborbicular, radical in a distinct rosette ovate cordate or rounded at the base entire or toothed, cauline 0 or very few, heads 2-6 $\frac{3}{4}-1 \mathrm{in}$. diam., peduncles floccose and covered with scattered simple and gland-tipped hairs.
Woods, heaths, walls and rocks ; ascends to 2,000 ft.; fl. July-Sept.-This is the commonest Hieracium of Britain except Pilosella and sylraticum, and best distinguished from the preceding by the smaller heads and less robust habit; and from $H$. nigrescens by its large size and less villous or hairy stem and involucres ; but there is every transition between these and the follow-ing.-Distrib. Europe (Arctic), Siberia, W. Asia to N. W. India, N. America. - 1 can make nothing of the following sub-species and varieties, which are adopted from Backhouse's monograph.
Sub-sp. MURO'ruM proper ; green, radical leaves toothed slightly hairy, petioles slender, cauline often large and petioled, hears many small, peduncles short, involucre rather ventricose more or less villous with black and glandtipped hairs, styles livid or yellow. The common form.-VAR. 1, nitid'um, Backh. (sp.) ; radical leaves dark green lanceolate coarsely toothed, involucre more ventricose, style yellow. Aberdeen alps. The passage to H. nigrescens.-VAR. 2, aggreyátum, Backh. (sp.); radical leaves broader obtuse toothed below, glabrous or hairy beneath and ciliate, cauline subsessile, peduncles ereet crowded umbellate and narrow turbinate involucres densely floccose, bracts obtuse. Aberdeen alps.
Sub-sp. Pal'Lidum, Backh. (sp.) ; very glaucous, radical leaves ovate or lanceolate conspicuously fringed with long hairs, cauline sessile or the lower petioled, heads $2-6$, involucre ventricose ovoid at the base constricted above with few simple or gland-tipped hairs, bracts appressed acute, styles yellow. England, Scotland, and Ireland, 1,000-2,000 ft. Very near $\boldsymbol{H}$. anglicum.Var. 1, cineras'cens, Jord. (sp.); still more hairy and glaucous, stem pilose fragile, peduncles and involucres more densely setose and hoary. H. lasiophyllum, Backh.-Var. 2, argen'teum, Fries (sp.); very glaucous, almost glabrous, stem fragile tubular and subentire radical leaves almost glabrous, cauline sessile or the lower stalked, peduncles long rigid and small involucres with seattered hairs.
Sub-sp. ce'siom, Backh. (sp.); dull glaucous-green, radical leaves coriaceous usually narrowed to a toothed base, glabrous above, cauline 0 or very small and sessile, heads few large, involucre subglobose almost glandless and less hairy hoary with stellate down, ligules bright yellow glabrous, styles livid. Yorkshire and Scoteh Mts. Forms the passage to H. sylvaticum.-VAR. 1, Gibso'ni, Backh. (sp.) ; stem wiry often forked, radical leaves broadly ovate, base obtuse, teeth small spotted with purple, petioles slender short, peduncles rigid floceose and setose, invol. bracts short broad obtuse margins downy, styles yellow. H. hypocheeroides, Gibson. Yorkshire on mountain limestone (this I have not seen).-Var. 2, tlocculo'sum, Backh. (sp.); ashy-green,
stem floceose thronghout rather leafy, radical leaves more or less toothed narrowed into long petioles stellately downy on both surfaces, cauline large $\frac{1}{2}$-amplexicaul, involucre ovoid hoary with whitish hairs, bracts acuminate. Fi. stellinerum, Backh. not Froel. Clova Mts.-Var. 3, obtusifólium, Backh. (sp.); yellow-green, stem 1-leaved, petioles densely villous, peduncles spreading, involucres ventricose truncate at the base, ligules pilose at the tips. H. cessiem, var. obtusifuliem, Bab. Clova Mts.
7. H. sylvat'icum, $S i m$. green or glaucous, stem $1-3 \mathrm{ft}$. nearly glabrous below, primordial leaves lanceolate, radical petioled distinctly alternate lanceolate sharply toothed or subpinnatifid, teeth pointing forwards, cauline 2-8, heads $\frac{s}{4}-1 \mathrm{in}$. diam. panicled or corymbose and peduncles floccose and with simple and gland-tipped hairs rarely naked, ligules glabrous, styles livid.
Banks and copses especially in hilly districts ; ascending to $3,500 \mathrm{ft}$. in the Highlands; rare in Ireland ; fl. July-Sept.-Very variable, best distinguished from H. murorum by the narrower leaves less crowded in a rosette, and more leafy stem ; but some vars. of marorum, as cussium and reititum, would rank with this in form of foliage. The more leafy states, as gothicum and tridentatum, show a passage to boreale and crocutiem.-Distrib. Europe (Arctic), Siberia, Dahuria, N. America.
Sub-sp. vulga'tum, Fries (sp.) ; green or glaucous, stem 1-1 $\frac{1}{2} \mathrm{ft}$. hardly leafy, radical leaves petioled in a persistent loose rosette toothed in the middle or nearly entire often spotted, cauline petioled upper sessile, heads many, peduncles straight, involucre cylindric in bud floccose and with gland-tipped hairs, bracts equal alternate subacute. H. naculatum, Sm . Very common.-Var. 1, cinéreum, Backh.; ashy green or glaucous, stem hranched, radical leaves few, cauline subentire, heads nearly glabrous, bracts broad more obtuse. Orme's Head.-Var. 2, rubes'cens, Backh.; green, stem robust purplish, leaves ovate, cauline 1-2, heads few large, bracts broad subacuminate. Settle, Yorkshire.
Sub-sp. 由отн'icum, Fries (sp.) ; dark green, stem 2-4 ft. rigid slender leafy simple or branched above, radical leaves withering in summer shortly petioled, cauline ovate or lanceolate acute toothed in the middle, upper sessile, heads small few, involucres subglobose dark green glabrous or nearly so, bracts imbricate broad obtuse, likules glabrous, styles yellow or witil livid hairs.-Suhalpine districts of York, Wales, Scotland, and Ireland; ascending to $1,000 \mathrm{ft}$.-Very distinct at first sight, but intermediates occur with II. syleaticum, as also with bereale.-Distrib. N.W. Europe.
Sub-sp. Trinenta'tum, Fries (sp.); green, stem 2-5 ft. rigid leafy subeorymbosely branched, radical leaves 0 or withering in summer obtuse, cauline ovate or lanceolate sparingly toothed in the middle acute rounded at the base, branches and peduncles slender leafless, involucre constricted in the middle after flowering.-Hilly districts of N. of England, aseending to $1,200 \mathrm{ft}$., also in Cheshire, Surrey, Sussex, and Kent; not found in Ireland. --Distrib. Europe from Norway to Italy and Turkey.--This forms the passage to the Accipitrina group, and should perhaps be referred there.
Section 3. Accipitri'na. Stolms 0. Rootstock without radical leaves,
forming in autumn closed buds that produce leafy stems the following year. Stem erect, very leafy. Invol. bracts imbricate in 2 or many series. Ligules glabrous or minutely pilose at the tip. Fruit short, furrowed, without a crenate disk ; pappus-hairs rigid, unequal.
8. H. prenanthoi'des, Villars; stem $2-3$ ft., branches spreading, leaves oblong or linear-oblong reticulate and glancous below minutely toothed, lower with amplexicaul petioles, upper cordate and auricled, heads in branched leafy corymbose panicles usually thickly clothed with black gland-tipped hairs, peduncles short floccose, ligules pilose at the tip, styles dark or yellowish.
Subalpine regions of N. England and Scotland, ascending to 2,400 ft. ; Wicklow only in Ireland; fl. Aug.-Sept.-Stem rigid, hairy or glabrous, leafy, often much branched. Leaves ciliate, hairy on both sides. Peduncles spreading short, hoary. Heads $\frac{2}{3} \mathrm{in}$. diam. ; involucre cylindric in bud; bracts few, outer short.-Distrib. Europe (Arctic and Alpine), Siberia.
Sub-sp. stric'tum, Fries (sp.) ; stem hollow, leaves glaucous scarcely amplexicaul lower lanceolate, peduncles erect or ascending longer straighter and involucres more glabrous, ligules almost glabrous at the tip. $H$. denticulatum, Sm.; H. Borreri, Syme.-Intermediate between prenanthoides and crocatum, next to which Syme places it.
9. H. umbella'tum, L. ; stem 1-2 ft. wiry hairy or shaggy below, leaves narrowly linear or oblong-lanceolate sessile narrowed at the base toothed, heads subumbellate and peduncles stellately downy but hairless, bracts many, tips recurved, ligules glabrous, styles yellow.
Thickets, \&c. in dry and rocky places, from Berwick and Kirkcudbright southwards, ascending to $1,200 \mathrm{ft}$. in Yorkshire ; local in Ireland ; fl. July-Sept.-Usually very distinct, from its short stem, wiry habit, many narrow leaves, large subumbellate glabrous heads and recurved bracts, but varieties pass into crocatum. Leaves generally uniform throughout the plant, teeth small distant, reticulate, stellately downy beneath. Involucre ovoid or subeylindric, dark or pale ; peduncles slender, rigid, bracteate.-Distrib. Europe (Arctic), Siberia to Kamtschatka, W. Asia to the N.W. Himalaya, E. and W. N. America (H. canadense, Fries).

Var. filifó'ium, Backh. ; stem leafy throughout, leaves very narrow margins revolute quite entire. Lough Neagh.
10. H. croca'tum, Fries ; stem 2-4 ft., glabrous or pilose, 'branches spreading erect or ascending, leaves lanceolate or oblong sessile rounded or truncate at the base toothed or entire often glaucous below, heads tew or many and peduncles downy glabrous or hairy, bracts appressed obtuse, ligules glabrous, style livid or yellow, pappus almost white or discoloured. Mountain districts, from York and Durham northwards ; ascending to $1,200 \mathrm{ft}$; E. and N.E. of Ireland, rare ; fl. July-Sept.-Intermeriate between umbellatum and boreale.-Distrib. Arctic, Northern, and Mts. of Mid. Europe.
Sub-sp. invLoi'des, Tausch. (sp.) ; branches erect or ascending, leaves linearlanceolate entire or toothed glabrous above hairy beneath, nerves indistinct, heads few, involucres generally glabrous.-Teesdale, Scotch alps, Antrim and Connemara.
Sub-sp. Curymbo'sum, Fries (sp.); branches spreading or ascending, leaves ovate irregularly toothed hairy above, glaucous and loosely reticulate beneath, heads many, involucre ultimately truncate sparsely hairy, pappus tawny. H. rigidum, Backh, not Fries. - Scotch alps, Yorkshire, and Antrim. -Leaves of $\boldsymbol{H}$. boreale, but upper amplexicaul, more glaucous and nerved.
11. H. borea'1e, Fries; stem $2-4 \mathrm{ft}$., very hairy below stellately downy above, branches erect or ascending, leaves broad at the base ovate or ovate-
lanceolate toothed lower petioled upper broader sessile, heads many in leafy bracteate panicles or corymbs, peduncles floceose, involure ovoid dark nearly glabrous, bracts broad obtuse, ligules glabrous, style livid or darker. H. sabaudum, Sm. ; H. heterophyllum, Bladon.
Hedgebanks and margins of woods, common on railway banks ; rarer in Scot-
land ; fl. Aug.-Oct.--Stem often reddish, leafy throughout. Letees with
teeth pointing forwards, lowest with villous petioles. $H$ eceds ${ }_{3}-1 \mathrm{in}$. diam. Distrib. Mid. and S. Europe, rare in Scandinavia.-Allied to gotlicum, but without radical leaves, heads smaller, invol. bracts more numerous.

## Order XLIII. Campanula'ceze (including lobelia'cere).

Herbs, rarely shrubs; juice milky. Leaves alternate, exstipulate. Caly,r $\frac{1}{2}$ or wholly superior ; limb 5 -cleft. Corolla epigynous, usually persistent, tube entire or cleft posteriorly; limb regular or oblique or 2 -labiate, 5 lobed, valvate or induplicate in bud. Disk 0 or tumid. Stamens 5 , epigynous or epipetalous, filaments free or subconnate ; anthers comniving round the style, basifixed, free or cohering, equal or unequal, naked or tipped with a pencil of hairs; pollen spherical or oblong. Ovary 2-8-celled; style simple, tipped with a ring of hairs or clothed with deciduous hairs; stigmas 2-8, hairy on the back, glandular interually, coherent till protruded beyond the anthers, then spreading ; ovules many, axile, horizontal, anatropous, placentas fleshy. Fruit 2 - or more-celled, a berry, or a capsule dehiscing above or below the calyx-limb by pores or valves, many-seeded. Secils minute, testa usually pitted, albumen fleshy ; embryo subeylindric. -Distrib. All regions, most abundant in temp. climates; genera 55 ; species 800 . Affinities. With Goodeniacea, and Cichoracea.-Properties. Acrid and often poisonous, diuretic.
SUb-order I. Lobelia'cere. Corolla irregular. Anthers cohering in a tube.

1. Lobelia.

Sub-order II. Campanule'æ. Corolla regular. Anthers usually free. Corolla campanulate, segments broad................................2. Campanula. Corolla-segments linear. Anthers free...............................3. Phyteuma.
Corolla-segments linear. Anthers connate.
4. Jasione.

## 1. LOBE'LIA, $L$.

Perennial herbs. Flowers in terminal racemes. Calyx-tube ovoid or obeonic, limb 5 -fid. Corolla very irregular ; tube split at the back; limb 2 -labiate, 2 upper lobes smaller erect or recurved, 3 lower pendulous. Stamens 5, epipetalons ; anthers connate, all, or the 2 lower only, bearded at the tip. Ovary 2-3-celled ; style filiform, included, girt with a ring of lairs, stigmas 2 broad spreading. Capsule $2-3$-celled, top exserted and loculicidally $2-3$-valved. Testa pitted.-Distrib. All but very cold regions ; species about 200.-Etym. Mathias Lobel, a Flemish botanist.

1. L. Dortmanina, L.; leaves all radical submerged subcylindrical 2 -fistular, scape slender cylindric fistular, flowers drooping.
Gravelly mountain lake-bottoms, Scotland, ascending to $1,650 \mathrm{ft}$.; Cumberland,
Wales, Shropshire, and Ireland ; fl. July-Aug.-Rootstock short, stoloni-
ferous; root-fibres white, cellular. Leares 2-3 in., linear, obtuse, recurved. Scape 1-2 ft., bracteate near the base ; raceme lax, emersed. Flowers $\frac{3}{4}-1 \mathrm{in}$., pedicelled ; bracts short, oblong, obtuse. Calyx obconic, terete; lobes short, obtuse. Corolla pale lilac; lobes linear obtuse, upper erect, lower longer. Anthers included. Capsule clavate, inclined.-Distrib. N. Europe from W. France to Mid. Russia, N. America.
2. L. u'rens, $L$.; stem leafy, leaves obovate or oblong-spathulate obtuse sinuate-toothed, upper linear decurrent, flowers erect or spreading. Heaths near Axminster ; fl. Aug.--Sept.-Glabrous or puberulous. Stem 1-2 ft., erect, slender, angular. Leaves 2-3 in., subsessile, teeth callous. Rucemes 4-8 in., pedicels very short; bracts lanceolate, exceeding the 5 -angled narrow obconic calyx. Flowers $\frac{2}{3}$ in. Culyx-lobes subequal, subulate, shorter than the tube. Corolla blue or purple; lobes subequal, lanceolate, acute. Capsule erect.-Distrib. W. France, Spain, Madeira.-Acrid and pungent.

## 2. CAMPAN'ULA, $L$.

Perennial, rarely annual herbs. Radical leaves usually petioled, cauline alternate. Flowers spiked or racemed, white blue or lilac. Calyx-tube ovoid or subglobose ; limb 5 -fid, lobes flat or folded at the sinus. Corolla campanulate or rotate, 5-lobed. Stamens 5, epigynous, filaments short, bases broad dilated; anthers linear, free. Ovary-cells 3-5, opposite the senals; style clavate, with rows of deciduous hairs opposite the antherrells, stigmas 3-5 filiform. Capsule ovoid or turbinate, 3-5-celled, cells dehiseing below or above the calyx-limb by pores or valves. Seeds usually flattened.-Distrib. All temp. and most trop. climates ; species about 200. -Etym. campanula, from the bell-shaped corolla.

Sub-gen. 1. Campan'ula proper. Corolla campanulate. Capsule wholly inferior, opening by valves or pores below the calyx-limb.

## * Stem-leaves linear or linear-lanceolate, usually nearly entire. Terminal flower of the raceme opening first.

1. C. rotundifo'lia, L.; glabrous, stem angled slender, lower cauline leaves lanceolate, upper narrow linear quite entire acute, flowers racemed drooping, corolla broadly campanulate, lobes short recurved. Hare-bell. Pastures heaths and wall-tops, especially in hilly regions; ascending to $3,500 \mathrm{ft}$. in the Highlands; rather local in Ireland ; fl. July-Sept. - Glabrous or slightly pubescent. Rootstock slender. Stem $\frac{1}{2}-2 \mathrm{ft}$., ascending, simple or branched, sparingly leafy. Primordial leaves long-petioled, broadly ovatecordate, crenate. Racemes few or many-flowered; pedicels slender, bracts minute or 0 ; buds erect. Calyx-lobes erect, subulate. Corolla $\frac{1}{3}-1 \mathrm{in}$., blue, sometimes white, lobes subacute. Capsule subglobose, valves basal.-Distrib. Europe (Arctic), N. Africa, N. Asia, E. and W. N. America.
VAR. 1, rotundifo'lia proper; cauline leaves all slender, flowers many.-
Var. 2, monta'na, Syme ; lower cauline leaves oblong-lanceolate, flowers subsolitary.
2. C. Rapun'culus, L.; hispid or glabrous, stem angled, cauline leaves oblong- or obovate-lanceolate obscurely toothed, flowers panicled erect, calyx-lobes very long subulate, corolla broadly campanulate 5 -lobed almost to the middle. lobes recurved.

Gravelly roadsides and hedgebanks from Stafford southwards; fl. July-Aug. -Biennial ; root fleshy. Stem $2-3 \mathrm{ft}$., simple or branched. Loures $1-3 \mathrm{in}$., variable, sessile ; primordial broadly ovate, long-petioled. Petlicels slenter. Calyx-lobes 1 in . after flowering. Corolla $\frac{3}{4} \mathrm{in}$., red purple or blue. Capsule short, erect, valves close under the calyx-lobes.-Distrib. Europe from Denmark southwards, N. Africa, W. Siberia.
3. C. pat'ula, L.; scabrid, stem slender angled, cauline leaves linear or lanceolate, flowers subcorymbose erect, calyx-lobes linear, corolla broadly campanulate 5 -lobed to the middle, lobes spreading.
Copses and hedges, rare, from York and Westmoreland to Dorset and Hants,
chiefly in the W. counties ; fl. July-Sept.-Variable in duration; root slender. Stem 1-3 ft., branched above. Rudical leaves obovate or oblong, petioled, obscurely crenate, cauline subsinuate. Pedicels long slender. Calyx-tube obconic, lobes-very variable in width. Corolla $1-1 \frac{1}{2}$ in. diam., purple. Capsule erect, obconic, valves close under the calyx-lobes.-Distrib.
Europe, W. Siberia.
C. persic'ifolia, L.; glabrous, stem terete, leaves coriaceous, cauline linear-oblong obtuse finely serrate, flowers few racemed, calyx-lobes trian-gular-lanceolate, corolla-tube hemispheric, lobes short erect.
Naturalized in woods near Cullen, Banffshire, and Thorp Arch, Yorkshire ; ff. July-Aug.-Perennial. Rootstock creeping, branched, stoloniferous. Leuces 1-3 in., radical spathulate-lanceolate, sessile, nerves obscure. Pedicels stout, 2-bracteolate at the base. Calyx-tube small, subglobose ; lobes broader than in the preceding species and coriaceous. Corolla 1 in . diam., blue, sometimes white. Capsule erect, ovoid, pores large under the calyx-lobes.Distrib. Europe, N. Africa, Siberia, W. Asia.

## ** Stem-leaves ovate, toothed or serrate.

4. C. latifo'lia, L.; pubescent, stem tall stout furrowed, cauline leaves oblong-ovate, lower petioled, upper sessile obtusely serrate, flowers large, lower bracts large leafy.
Copses and woods, from Moray and Isla to Surrey and Gloucester; ascends to $1,200 \mathrm{ft}$. in Yorkshire ; S.E. of Ireland? fl. July-Aug. - Rootstork stout, woody. Stem 3-4 ft. Rudical leaves long-petioled, triangular-cordate, tispidly pubescent beneath. Raceme very leafy ; flowers many, erect or inclined. Calyx-tube broad, short, 5-ribbed; lobes large, ovate-lanceolate. Corolla blue or white, lobes subereet, acuminate. Cupsule short, valves basal.Distrib. Europe (Arctic), W. Siberia, W. Asia to the N.W. Himalaya.
5. C. rapunculoídes, L.; puberulous, stem tall nearly terete, cauline leaves ovate, lower petioled, upper sessile obtusely serrate, flowers large, bracts all small linear.
('ultivated fields, from Fife (where it is a weed) southwards to Bedford; rare and local; an alien or denizen, Wutsom; fl. July-Aug.-Rootstocic creeping ; stolons subterranean. Stem 1-2 ft ., rather slender, usually simple. Raulical lecrevs cordate. Rucemes long, simple, secund ; flowers drooping; perlicels slender, short. Culyr-tulue obconic, 5 -ribbed ; lobes short, reflexed, linear or ovate. C'orolla bright blue, lobes recurved. Capsule subglohose, valves basal.-Distrib. Europe, W. Siberia.-The lowest flower opens first.
6. C. Trache'lium, $L$.; hispid, stem tall angled, leaves all petioled ovate-lanceolate from a broad base irregularly coarsely obtusely serrate, bracts leafy. Nettle-leaved Campanula.
Woods and copses in dry soil, from Anglesea and York to Devon and Kent; Kilkenny only in Ireland; f. Sept.-Oct.-Rootstock short, stout. Stem 1-3 ft., hairs reversed. Leaves doubly-serrate ; radical long-petioled cordate ; cauline gradually attenuated from the base, acute. Racemes panicled, peduncles short ; bracteoles lanceolate ; flowers 1 or many, erect or inclined. Calyxtube hispid, very short and broad ; lobes ovate-lanceolate. Corolla $\frac{1}{2}-\frac{3}{4} \mathrm{in}$., blue-purple, broadly campanulate; lobes suberect, acute. Capsule drooping, valves basal.-Distrib. Europe, N. Africa, Siberia. -The uppermost flower in each raceme opens first.
7. C. glomera'ta, $L$. ; pubescent, stem short terete leafy, leaves crenate, radical very long-petioled oblong- or ovate-cordate, cauline sessile ovate $\frac{1}{2}$-amplexicaul, flowers erect in leafy heads or irregularly spiked.
Chalky and dry pastures, from Forfarshire to Dorset and Kent; rare or absent in the West and in Ireland; fl. Sept.-Oct.-Rootstock short, stout. Stem 6-18 in., slender. Cauline leaves $\frac{1}{2}-\frac{3}{4}$ in. Flowers bright blue, mostly in a terminal head with a few axillary buds below it, subsessile. Calyx-tube short, obconic, 5 -ribbed ; lobes ovate. Corolla $\frac{1}{2} \frac{-3}{4} \mathrm{in}$. ; lobes recurved, acute. Cupsule short, valves basal.-Distrib. Europe to S. Russia, W. Asia, Siberia, Dahuria.-The central flower opens first.
Sub-gen. 2. Wahlenber'gia, Schrad. (gen.). Corolla campanulate. Capsule $\frac{1}{2}$-superior, opening by loculicidal valves above the calyx-tube.
8. C. hedera'cea, $L$.; glabrous, very slender, creeping, leaves all petioled orbicular or cordate angled or obscurely lobed, peduncles 1-flowered leaf-opposed, corolla cylindric-campanulate, lobes short.
Bogs and damp woods, especially in the West, from Renfrew and York southwards ; S. and E. of Ireland, rare ; fl. July-Aug.-Rootstock creeping. Stems filiform. Leaves $\frac{1}{3} \frac{1}{2} \mathrm{in}$. diam., membranous, subacutely 5 -angled or -lobed, upper often opposite; petiole slender, dilated upwards. Feduncles much longer than the petioles. Calyx-tube shortly turbinate; lobes triangularsubulate, erect. Corolla $\frac{1}{3}$ in., pale blue ; lobes obtuse, recurved. C'apsule subglobose, membranous.-Distrib. Europe from Denmark and France to Germany, and from Spain to Dalmatia.
Sub-gen. 3. Specula'ria, Heist. (gen.). Corolla rotate: Capsule fusiform, angled, opening by slits beneath the calyx-limb.
9. C. hyb'rida, $L$.; annual, hispid or puberulous, leaves oblong waved, flowers subsessile axillary, calyx-lobes exceeding the corolla.
Cornfields in dry soils, from York and Durham southwards; Fife and Haddington in Scotland, but introduced ; a colonist, Watson; fl. June-Sept.-Stem 6-10 in., erect or decumbent, simple or branched from the base, angled. Leuves small ; radical with broad petioles, ovate or spathulate; cauline sessile, obtuse. Calyx-tube longer than the floral leaves, sharply angled; lobes linear-oblong, rather foliaceous. Corolla blue inside, lilac outside, cleft to near the middle; lobes acute. Capsule $1-1 \frac{1}{2} \mathrm{in}$. Seeds polished, ovoid.-Distrib. Europe from Holland southwards, N. Africa.

## 3. Phyteu'ma, L. Rampion.

Perennial herbs. Radical leaves petioled, cauline usually narrow, sessile. Flowers in dense spikes or heads; involucre of several bracts. Culyx ovoid or obconic ; limb superior 5 -fid. Corolla curved in bud, 5 -eleft, segments linear, tardily opening, sometimes at length free. Stamens 5 , epigynous, filaments linear dilated at the base; anthers free. Ovary 2-3celled; style filiform, pilose above, stigmas 2-3 short filiform. Capsule ovoid, dehiscing below the middle by longitudinal valves. Seerls many, ovoid or compressed ; embryo straight, cotyledons divaricating.-Distrib. Europe, W. Asia ; species about 35.-Erym. Obscure.

1. P. orbicula're, $L$.; glabrous or slightly hairy, heads globose in flower, oblong in fruit, stigmas usually 3.
Chalk downs, from Kent to Wilts, local ; fl. July-Aug.-Rontstock tuberous below. Stems $6-18 \mathrm{in}$., several, erect or ascending. Radical lerves 1-2 in., oblong- or ovate-lanceolate, rarely cordate, crenate, long-petioled; cauline few, smaller upwards, narrower, sessile. Heads $\frac{2}{3}-1 \frac{1}{2}$ in. diam.; bracts short, oblong, acute. Flowers deep blue. Calyx-tule short; lobes triangular. Corolla-lobes at length free to the base. Capsule short, usually 2-3-celled.-Distrib. Europe from Belgium southwards, S. Russia.
2. P. spica'tum, L.; glabrous, heads oblong or cylindric in flower elongate in fruit, styles very long, stigmas 2.
Woods and thickets, Waldron and Mayfield in Sussex ; native? Watson; fl . May-June.-Taller and more robust than P. orbiculare; stem 2-3 ft.,
ribbed. Radical leaves cordate at the base, ovate or oblong; cauline spreading and recurved. Heads 1-4 in., yellowish. Capsule usually 2 -celled.-
Distrib. Europe to S. Russia.-Formerly cultivated and the root eaten.

## 4. jasi'one, L. Sherp's-bit.

Annual or perennial herbs. Radical leaves usually rosulate; cauline narrow, alternate. Flowers small, in terminal centripetal heads; involucre of many bracts. Calyx-tube short, limb 5 -fid. Corolla regular, 5 -cleft to the base. Stamens 5, epigynous, filaments free; anthers connate, their tips free. Ovary 2 -celled; style clavate, with 10 hairy ridges, stigmas 2 short. Capsule opening at the top by 2 gaping valves. Seed: minute, testa shining.-Distrib. Europe, N. Africa, W. Asia; species about 10.-Etym. Doubtful.

1. J. monta'na, L.; hispidly pubescent, leaves obovate-oblong.

Heathy pastures and light soils in England, Ireland, and W. of Scotland (Moray only in the E.) ; aseending to 1,000 ft. in Northumberland ; fl. June -Sept-Habit of Scaliosa. Annual. Stem 6-18 in., branched from the base. Leaves $\frac{1}{2}-1 \mathrm{in}$., radical petioled, cauline linear-oblong, obtuse, waved or crenate, ciliate. Pedurcles long, slender, naked. Heads 1-6, $\frac{1}{2}-\frac{3}{4}$ іи. diam., hemispheric ; bracts ovate, acute, as long as the lilac-blue flowers. Calyx-tube turhinate ; lohes subulate. Corolla-lobes at first coherent, persistent. Capsule small, subglobose.-Distrib. Europe, N. Africa. W. Asia.

## Order XLIV．Erica＇cerz．

Evergreen shrubs，rarely herbs or trees ；（Monotropa is a leafless para－ site．）Leares alternate opposite or whorled，simple，often articulate with the stem，exstipulate．Flowers regular or nearly so．Calyx superior or inferior，4－5－fid or－partite．Corolla hypogynous or epigynous，usually campanulate and 4－5－toothed or－lobed，rarely of 5 petals；lobes imbricate in bud．Stamens 4，5，8，or 10，hypogynous or epigynous；anthers 2－celled，cells obtuse or with tubular tips，opening by terminal pores or slits，often with basal or dorsal awns．Disk epigynous or hypogynous， annular and lobed or of glands or scales．Ovary 4－5－celled－angled or －lobed；style terminal or from between the lobes，stigma small simple or 4－5－lobed ；ovules many in each cell，rarely few or solitary，pendulous from simple or 2 －fid axile placentas．Fruit 3－5－celled，a berry or 3－5－ valved cajsule ；cells many－rarely 1 －seeded．Seeds small，testa reticulate sometimes lax and produced at both ends，albumen fleshy ；embryo minute， clavate．－Distrib．Chiefly temp．and cold climates ；genera about 70 ； species about 1，000－Affinities．With Epacridece－Properties unim－ portant．
Sub－order I．Vaccin＇ieæ．Buds clothed with scales．Stamens epigynous． Ovary inferior．
Corolla campanulate or urceolate
1．Vaccinium．
Corolla rotate
2．Oxycoccos．
Sub－order II．Eri＇ceæ．Buds naked or scaly．Stamens hypogynous．Ovary superior．
Tribe I．ArBu＇tere．Buds naked．Leuves usually broad．Corolla deciduous．Fruit a berry or drupe．
Ovary－cells many－ovuled
3．Arbutus．
Ovary－cells 1－ovuled
4．Arctostaphylos．
Tribe II．ANDROMEDE＇里．Shrubs．Buds clothed with scales．Leaves usually broad．Corolla deciduous．Capsule loculicidal．．．．5．Andromeda．
Tribe III．ERICI＇NEAs．Buds naked．Leaves small．Flowers 4 －merous． Corolla persistent．Anthers usually connate in bud．Capsule loculicidal， rarely septicidal．
Corolla 4－fid．Capsule loculicidal，cells many－seeded．．．．．．．．．．．．．．．．6．Erica．
Corolla 4－partite．Capsule septicidal，cells few－seeded．．．．．．．．．．．7．Calluna．
Tribe IV．RHODORE＇理．Buds clothed with scales．Leaves usually broad．Flovers 4－5－merous．Corolla deciduous．Capsule septicidal．
Corolla urceolate．Anthers 8，with pores ．．．．．．．．．．．．．．．．．．．．．．．．．．．．8．Dabeocia．
Corolla urceolate．Anthers 10，with pores．．．．．．．．．．．．．．．．．．．．．．．9．Phyllodoce．
Corolla campanulate．Anthers 5，with slits．．．．．．．．．．．．．．．．．．．10．Loiseleuria．
Tribe V．PYROLE＇正．Herbs．Buds scaly．Leaves chiefly radical． Petals 5，free or connate，concave．Capsule loculicidal．Seeds with a loose testa produced at both ends far beyond the nucleus．

11．Pyrola．
Sub－order III．Monotro＇per．Herbs，fleshy．Lewees replaced by scales． P＇etals perigynous，free or connate，deciduous．Stamens hypogynous． Coury free．Capsule loculicidal．Seeds as in Pyrolex．．．．．．12．Monotropa．

## 1. VACCIN'IUM, $L$.

Shrubs; buds clothed with usually persistent scales. Leaves alternate, often evergreen. Flowers solitary or racemose, white or red. Cralym-tube short ; limb 4-5-toothed. Corolla epigynous, urceolate or campanulate, 4 -5-fid. Stamens $8-10$, epigynous ; anther-cells with tubular tips, awned or not. Ovary 4-5-celled; style filiform, stigma obtuse ; placentas prominent, many-ovuled. Berry 4-5-celled, areolate at the top. Seeds angled, testa reticulate.-Distrib. Europe, temp. and subtrop. Asia and America; species about 100.-ЕтуM. Obscure.

1. V. Myrtil'lus, $L$.; glabrous, stems erect angular, leaves deciduous ovate serrate, peduncles 1 -flowered, anthers with dorsal awns. Whortleberry, Bilberry.
Woods, copses, and heaths, chiefly in hilly districts ; ascends to $4,200 \mathrm{ft}$. ; fl. April-June. Rootstock creeping. Stems many, 6-24 in., rigid. Letrices $\frac{1}{2} 1 \mathrm{in}$., nerves reticulate, young rosy. Flowers drooping; peduncles $\ddagger \mathrm{in}$., naked. Calyx-tube turbinate ; lobes 5, short. Corolla $\frac{1}{4}$ in. diam., globose, rosy tinged with green. Berry $\frac{1}{3}$ in. diam., dark blue, glaucous.-Distrib. Europe (Arctic), Siberia, Dahuria, W. Asia, N.W. America.-Berries much used for preserves, \&c. in northern countries.
2. V. uligino'sum, L. ; glabrous, stem procumbent terete, branches ascending, leaves deciduous oblong or obovate quite entire glaucous beneath, peduncles 1 -flowered, anthers with dorsal awns.
Mountain bogs and copses, from Westmoreland and Durham northwards, ascending to near $3,500 \mathrm{ft}$. in the Highlands ; absent from Ireland ; fl. May-June.-Stems 6-10 in., woody, rigid, naked below. Leaves $\frac{1}{2}-1 \mathrm{in}$., coriaceous, obtuse or acute, veins reticulate beneath. Peduncles 1-3 together, $\frac{1}{8} \mathrm{in}$. Flowers drooping. Calyx-tube hemispheric ; lobes 4-5, broad, obtuse. Corolla $\frac{1}{6}$ in., pale pink, subglobose. Berry smaller than in V. Myrtillus, of the same colour.-Distrib. Europe (Arctic), Siberia to Kamtschatka, Persia, E. and W. N. America.
3. V. Vitis-Idæ'a, L.; procumbent, branches pubescent, leaves evergreen obovate dotted beneath, margins revolute, racemes short terminal drooping, anthers awnless. Cowberry.
Woods and heaths, chiefly in mountain districts, from S. Wales and Notts northward, also on Dartmoor ; ascends to $3,300 \mathrm{ft}$. in the Highlands ; fl. June July.-Stems wiry, rigid, tortuous, branched and naked below; branches 6-18 in., trailing or ascending. Leaves $\frac{1}{2}-1 \frac{1}{4} \mathrm{in}$., glossy green above (like box), bifarious, very coriaceous, margins thickened entire or obtusely serrulate, pale below; nerves not reticulate. Flowers crowded; pedicels 2 bracteolate. Calyp-tube hemispheric; lohes 4, broadly ovate, ciliolate. Corolla campanulate. Berry $\frac{1}{2} \mathrm{in}$. diam., glohose, red.-Distrib. Europe (Aretic), Siberia to Kamtschatka, E. and W. N. America.-Berry acid.

## 2. oXycocicos, Tournef. Cranberry.

Stems filiform, decumbent or erect, woorly ; buds clothed with persistent scales. Lewess small, alternate, evergreen. Flowers drooping, on terminal, slender, 2-bracteolate peduncles. Calyx-tube short; lobes 4. Corolla epigynous, rotate, 4-partite, segments reflexed. Stamens 8,
epigynous; anther-cells with tubular tips, not awned. Ovary and fruit as in Vaccinium.-Distrib. N. temp. and Arctic regions; species 2.-Etym. д̧̧ús and коккоз, from the acid berries.

1. O. palus'tris, Pers.; creeping, leaves ovate-oblong, base cordate, margins strongly recurved. Vaccinium Oxycoccus, L.
l'eat bogs, usually amongst Sphagnum, local ; ascending to $2,700 \mathrm{ft}$. in the Highlands ; common in Ireland; fl. Aug.-Stems puberulous. Leaves $\frac{1}{6}-\frac{1}{3}$ in., seattered, spreading, shortly petioled, deep green above with a median channel, glaucous beneath with reticulate nerves. Peduncles 1-3, 1 in., capillary, erect, puberulous. Flowers $\frac{1}{3} \mathrm{in}$. diam., red. Calyx-limb minute. Cimolla-lobes linear-oblong. Stamens exserted, filaments pubescent purple; anthers yellow. Berry $\frac{1}{4} \mathrm{in}$. diam., globose, dark red.-Distrib. Europe (Arctic), excl. of Turkey, N. Asia and America. - The berries are an excellent antiscorbutic, and used as such upon long voyages.

## 3. ARBU'TUS, $L$.

Shrubs. Leaves alteruate, usually evergreen. Flowers in terminal pavicled racemes, braeteate, white or pale red. Sepals 5. Corolla hypogynous, globose or subcampanulate ; lobes 5, reflexed. Stamens 10, on the base of the corolla, filaments short dilated below; anthers deffexed, ovoid, opening by 2 pores, awns 2 reflexed. Disk annular. Gvary 5 -celled; style simple, stigma obtuse; ovules many, placentas pendulous from the upper angles of the cells. Berry globose, granulate ; cells 5, 4-5-seeded. Seeds angled, testa coriaceous.-Distrib. N. temp. regions; species about 15. - Etym. The old Latin name.

1. A. Une'do, L.; leaves obovate- or oblong-lanceolate acute doublyserrate, panicles drooping many-flowered. Strawberry-tree.
Woods at Killarney, Muckross, and Bantry, probably indigenous ; fl. Sept.-Oct.-A small rounded much-branched evergreen tree, 8-10 ft.; bark rough ; branchlets and petioles hairy and glandular. Leaves 2-3 in., petioled. Penicles glabrous, lax; pedicels short; bracts deciduous. Sepals short, rounded. Corolla $\frac{1}{3}$ in., creamy. Berry $\frac{2}{3}$ in. diam., orange-scarlet, subglobose, muricate.-Distrib. S. of France, Spain, Mediterranean region.Berries eatable when perfectly ripe; made into a wine in Corsica.

## 4. ARCTOStAPH'Ylos, Adanson. Bearberry.

Characters of Arbutus, but cells of ovary 5-10, 1-ovuled; disk of 3 fleshy scales ; and fruit a drupe with $5-10$ stones.-Distrib. of Arbutus, but more abundant in America; species about 12.-Етуm. ápктos and $\sigma \tau a \phi \cup \lambda \gamma$, the fruit being a food of bears.

1. A. alpína, Spreng.; branches depressed, leaves deciduous obovate or spathulate crenate-serrate above the middle, nerves netted, drupe black.
Dry barren Scotch Mts., rare, from Perth and Forfar northwards; ascending to $2,700 \mathrm{ft}$.; fl. May-July.--Forms depressed woody glabrous patches, with stout leafy interlaced branches ; bark scaly. Leaves $\frac{1}{2}-1 \frac{1}{2}$ in., narrowed to a short petiole, wrinkled above, ciliate. Flowers 2-3, appearing with the young leaves, shortly pedicelled; bracts ciliate. Calyx minute. Corolla $\frac{1}{4} \mathrm{in}$. broad, white ; lobes $4-5$, pubescent within. Filaments subulate; anthers brown, awns very short. Berry $\frac{1}{2} \mathrm{in}$. diam.-Distrib. Scandinavia (Arctic), Mts, of Mid. Europe, cold and Arctic Asia and America.
2. A. Uva-Ur'si, Spreng.; branches trailing, leaves evergreen obovate or spathulate quite entire very coriaceous, drupe red.
Heathy rocky places from York and Cumberland northwards; ascending to near $3,000 \mathrm{ft}$. in the Highlands; N.W. of Ireland ; fl. May-June.-Forms depressed trailing masses ; branches 1-2 ft., stout, woody, young puberulous; bark dark, scaling. Leaves $\frac{1}{2}-1 \mathrm{in}$., petiole and margin tinely woolly, deep green, nerves reticulate on both surfaces. Rucemes crowded, very short, few-flowered; scales and bracteoles persistent, ciliate ; pedicels very short. Sepuls short, broad. Corollu $3_{3} \mathrm{in}$., pink, urceolate ; teeth 4-5, hairy within. Anthers with long awns. Berry $\frac{1}{4} \mathrm{in}$. diam.-Distrib. Aretic and Alpine Europe, excl. Greece and Turkey, Siberia, E. and W. N. America.

## 5. ANDROM'EDA, $L$.

A small shrub; buds clothed with scales. Leaves alternate, glaucous beneath, margins revolute. Flowers in subterminal umbels, white or pink. Sepals 4. Corolla hypogynous, globose; limb 5-fid, reflexed. Strmens 10, hypogynous, included, filaments bearded; anthers obtuse, with 2 dorsal awns. Ovary 5 -celled; style simple, stigma obtuse or dilated; placentas many-ovuled, pendulous. C'apsule subglobose, loculicidally 5 -valved. Seeds attached to a central column, small, testa hard, smooth, raphe much thickened.-Distrib. Aretic and Alpine Europe, excl. Greece and Turkey, Siberia, N. America.-Etym. Mythical.

1. A. polifo'lia, $L$.; leaves elliptic-lanceolate glabrous shining.

Peat bogs from Perthshire southwards to Norfolk and Somerset; local in Ireland ; fl. May-Aug. - Ntems long, ascending, rooting at the base ; branches 6-12 in., suberect, twiggy ; bark smooth, brown. Leuses shortly petioled, ${ }_{3}^{2}-1 \frac{1}{2} \mathrm{in}$., acute, thickly coriaceous, margins strongly recurved. Rucemes short. Flowers drooping ; pedicels $\frac{1}{2}-1 \mathrm{in}$., slender, red. Sepels small, obtuse. Corolla $\frac{1}{4} \mathrm{in}$., purplish; lobes 5 , revolute. Filaments bearded ; anthers short. Ciupsele erect, 5 -lobed. Deeds turned in all directions, ovoid.-Distrib. N. Arctic and Alpine Europe, excl. Greece and Turkey, E. and W. N. America.

## 6. erica, L. Heath,

Rigid, much-branched shrubs. Leaves whorled, rarely alternate or seattered, narrow, rigid. Flowers usually nodding ; pedicels 2-3-bracteate. Sepuls 4. Corolla hypogynous, ovoid globose campanulate or tubular, 4 -lobed, persistent. Stamens 8, inserted on the glandular disk; anthercells awned, opening by pores or slits. Ovary 4 -celled; style filiform, stigna capitate dilated 4 -lobed; ovules many. C'apsule 4 -celled, loculicidally 4 -valved, many-seeded. Seeds attached to a central axis, ovoid or compressed, testa smooth or reticulate.-Distrib. Europe, N. Asia, N. Africa, abundant in S. Africa ; species about 400.-ETyM. Classical.

1. E. Tet'ralix, $L$.; pubescent and sometimes glandular, leaves 4 in a whorl, flowers subumbellate, corolla regular ovoid, anthers included with subulate awns. Cross-leaved Heath.
Heaths, abundant ; ascending to near $2,400 \mathrm{ft}$. in the Highlands ; fl. July-Sopt. -Pubescence sometimes almost woolly ; glandular hairs stiff or slender or 0 . Stems 12-18 in., wiry ; branches slender. Lewes $\frac{1}{6}-\frac{1}{2}$ in., in close or distant
whorls, spreading, linear, obtuse, rarely glabrous; margins revolute to the midrib. Flowers drooping; pedicels short, bracteolate in the middle. Sepuls oblong-lanceolate. Corolla $\frac{1}{3} \mathrm{in}$., mouth scarcely oblique, rose-red, upper side darkest. Ovary rarely glabrous, usually woolly and with gland-tipped cilia.-Distrib. N. and W. Europe, eastwards to Russia and Transylvania.
Sub-sp. Tet'ralix proper ; pubescent, branches irregular, leaves linear-oblong. Sub-sp. Mackay'r, Hook. (sp.) ; puberulous or almost glabrous, hairs not glandtipped, branches subcorymbose, leaves ovate-oblong strongly ciliate glabrous above and on the midrib, margins less recurved, sepals and capsule glabrous. E. Mackaiana, Bab.-Heaths between Roundstone and Clifden, Galway. (A hybrid, Moore and More, C'yb. Hib.; also found in Spain.)
2. E. cine'rea, L.; glabrous, leaves 3 in a whorl, flowers in whorled racemes, corolla ovoid mouth regular, anthers included with toothed appendages at the base.
Heaths and commons ; ascending to $2,200 \mathrm{ft}$. in the Highlands ; fl. July-Sept. Stems 1-2 ft., much-branched; branches slender, ultimate pubescent. Leaves $\frac{2}{6}-\frac{1}{4}$ in., irregularly whorled, with short leafy branches in the axils, linear, acute, margins revolute to the midrib. F'lowers drooping or horizontal; pedicels short, puberulous; bracteoles under the calyx. Sepals ovatelanceolate. Corolla $\frac{1}{4}-\frac{1}{3} \mathrm{in}$., crimson-purple. Ovary glabrous.-Distrib. W. Europe from Norway to Spain, eastwards to Germany and N. Italy.
3. E. cilia'ris, L. ; ciliate and glandular, leaves $3-4$ in a whorl, flowers in unilateral racemes, corolla ovoid, anthers included awnless.
Sandy heaths, Cornwall, Dorset, and Galway ; f. June-Sept.-Stem 12-18 in., slender ; branches many, erect, pubescent, flowering elongate. Leaves $\frac{1}{8}$ in., close set, subsessile; ovate, pubescent above, beneath glaucous with minute scales, margins recurved. Flowers inclined ; pedicels very short, bracteolate in the middle. Sepals ovate, pubescent and ciliate. Corolla $\frac{1}{8} \frac{1}{2}$ in., curved, crimson, mouth small oblique. Style exserted. Ovary glabrous.-Distrib. Normandy, Spain.-A hybrid between E. ciliaris and Metralix (E. ciliaris, var. Watsoni, Benth.) grows near Truro.
4. E. va'gans, $L$.; glabrous, leaves $3-4$ in a whorl, flowers long-pedicelled in dense axillary racemes, corolla campanulate, anthers exserted 2-partite awnless. Cornish Heath.
Heaths in Cornwall ; fl. July-Aug.-Stem 1-3 ft., stout, woody ; branches stiff, erect, fascicled, densely leafy. Leaves $\frac{1}{3}$ in., linear, recurved, margins so reflexed as to cover the midrib. Floweers erect ; pedicels slender, bracteolate about the middle. Sepals ovate, ciliolate. Corolla $\frac{1}{6}$ in., pink; lobes short. Ovary glabrous.-Distrib. W. of France, Spain.
5. E. mediterra'nea, $L$.; stem erect, leaves 4 rarely 3 in a whorl, flowers in dense racemes, corolla subcampanulate, anthers $\frac{1}{2} \cdot$ exserted awnless. E. mediterranea, var. hibernica, Hook. ; E. hibernica, Syme.

Boggy heaths, Mayo and Galway ; fl. April-May.-Bushy, 2-5 ft., glabrous. Leuves $\frac{1}{4} \frac{1}{3}$ in., crowded, shortly petioled, linear, margins revolute to the midrib and connate to the under-surface. Racemes terminal and axillary ; pedicels solitary or in pairs, short, 2 -bracteolate in the middle. Sepals ovate-lanceolate. Corolla pink, cylindric-campanulate, lobes broad. Anthers 2 -fid at the tip.-Distrib. W. of France, Spain, Mediterranean shores.

## 7. CALLU'NA, Salisbury. Ling.

A small, much-branched, gregarious shrub. Leaves mimute, opposite, imbricate (whence the branches appear tetragonal). Flowers on axillary peduncles with 2 pairs of opposite bracts under the calyx. Sepals 4, searious, coloured. Corolla shorter than the sepals, hypogynous, 4 -partite. Stamens 8, inserted on the disk; anthers awned, cells opening by short lateral slits. Ovary 4 -celled; style exserted, stigma dilated obscurely 4 -lobed ; ovules 2, pendulous from the top of each cell. Cupsule 4 -celled, septicidally 4 -valved, septa attached to the axis. Seeds 1-2 in each cell, attached to the central column.-Distrib. Europe (Arctic), W. Siberia, Azores, Greenland, Newfoundland, and N. U. States (very rare).-Etym. $\kappa а \lambda \lambda \dot{v} \nu \omega$, the twigs being used for sweeping.

1. C. vulga'ris, Salisb.; leaves 3 -gonous, gibbous at the base. Erica, L. Heaths and moors, ascending to $3,300 \mathrm{ft}$. in the Highlands ; fl. July-Sept.Stom 1-2 ft., woudy, inclined; branches elongate. Leaces in in., linearoblong, glabrous (vars. glabrate and atlantica, Teem. sp.) or ciliate or pubescent or hoary (var. incana). Florers very many ; pedicels very short ; outer bracts leaf-like, inner scarious. Sepals in in., concave, obtuse, rosepurple or white, shining. Corolla much shorter, lobes triangular. A futhers short, dorsally fixed, 2 -fid. Style exserted. Ovary pubescent.
2. dabeócia, Don. St. Dabeoc's Heath.

A small shrub; buds scaly. Leaves alternate, evergreen. Floucers terminal, racemose. Sepals 4. Corolla hypogynous, ureeolate; lohes 4, reflexed. Stamens 8, hypogynous, included; anthers oltuse, cells opening by pores, awnless. Ovary 4 -celled; style simple, stigma dilated; ovules many. Capsule 4 -celled, septicidally 4 -valved, axis persistent. Sceds small, testa smooth or pitted.-Distrib. Ireland, W. France, Spain.Etym. St. Dabeoc.

1. D. polifo'lia, Don ; leaves elliptic-ovate obtuse ciliate.

Boggy heaths, Connemara and Mayo; fl. Aug.-Stem 1-2 ft., woody, decumbent; bark flaking; branches slender, erect, pilose and glandular. Leutes ${ }_{3}^{3-\frac{1}{2}} \mathrm{in}$., shortly petioled, margins recurved, bright green, glossy above, white and woolly below. Ruceme terminal, lax, 5-10-Howered, glandular; flowers drooping; pedicels stout, curved; bracts leafy. Sepuls ovate-lanceolate, ciliate. Corolla 3 in., crimson purple or white, lobes shert. Fillenuruts flat ; anthers sagittate, 2 -fid, purple. Overy villous and glandular; stigma truncate.

## 9. PHYLLODO'CE, Salishury.

Small shruhs; buds sealy. Lewres evergreen, seattered. Flowers solitary or umbelled. Sepals 5. Corolla urceolate or campanulate, 5 -fid. Stamens 10, hypogynous, filaments slender; anthers truacate, opening ly proses, awnless. Ocary 5 -celled; style slender, stigma capitate. Capsule 5 -celled, septieidally 5 -valved, many-seeded. Nects shining.-Distims. Aretic regions; species 3 or 4.-Etra. Mythological.

1. P. carru'lea, Bub.; leaves shortly petioled crowded spreading linear obtuse glabrous. P. tuxifolin, Salish.; MIenziesiu, Swartz.
Heathy moors, Sow of Atholl, alt. $2,700 \mathrm{ft}$., extremely rare ; fl. May.-Short, depressed, much branched, woody; branches 5-10 in., tubercled. Leates
$\frac{1}{4}-\frac{1}{3}$ in., rigidly coriaceous, glossy and channelled above, margins reflexed to the puberulous midrib beneath. Flowers few, drooping, in terminal umbellate corymbs; pedicels $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$. Sepals ovate-lanceolate, glandular-pubescent. Corolla $\frac{1}{3}$ in., lilac, urceolate. A nthers purple. Ovary glandular-pubescent.-Distrib. Scandinavia (Arctic), Mts. of W. France, Pyrenees, Siberia to Kamtschatka, E. and W. N. America.

## 10. LOISELEU'RIA, Desvaux.

A small glabrous depressed, branching, rigid, evergreen shrub; buds scaly. Leaves small, opposite, quite entire, margins revolute. Flovers on terminal 1-flowered peduncles, pink, small. Sepals 5. Corolla hypogynous, broadly campanulate, 5 -fid. Stamens 5, hypogynous, slightly adnate to the corolla; anthers short, included, slits lateral. Ovary subglobose, 2-3-celled; style short, straight, stigma capitate ; ovules many. Capsule $2-3$-celled, septicidally $2-3$-valved, valves 2 -fid. Seeds several, ovoid, testa thick pitted.-Distrib. Aretic and Alpine (excl. Pyrenees) Europe, cold and Arctic Asia and America.-Etym. Loiseleur-Deslongchamps, a French botanist.

1. L. procum'bens, Desv, ; leares rigidly coriaceous recurved linearoblong obtuse. Azalea, L.
Moorlands on the high Scotch Alps, alt. 1,500-3,600 ft., from Ben Lomond northwards ; fl. May-June. -Forms flat patches with interlaced rigid woody branches. Leaves $\frac{1}{8}-\frac{1}{4}$ in., crowded, petioled, deep green, glossy, deoply channelled above, beneath densely pubescent, midrib very stout. Flowers usually $2-3$, inclined, subcorymbose ; peduncle red, $\frac{1}{8}-\frac{1}{4}$ in., stout, ebracteolate. Sepals ovate-lanceolate, red. Corolla $\frac{1}{6}$ in. diam., pink ; lobes obtuse. Stamens included. Capsule minute, valves 2 -fid.

## 11. $\mathbf{P Y} \mathbf{Y}^{\prime}$ ROLA, Tournef. Winter-green.

Biennial or perennial herbs; rootstocks slender, creeping ; stems short, almost woody ; buds scaly. Leaves chiefly radical, alternate, broad, petioled, evergreen. Flowers secund, racemose, rarely solitary, white pink or yellowish, nodding; scapes bracteate; pedicels bracteolate at the base. Sepals 5, Corolla globose, rarely spreading, of 5 free or slightly connate orbicular petals, subpersistent. Stamens 10, in pairs opposite the petals, hypogynous, erect or deelinate, filaments subulate, tip incurved; anthercells opening by terminal pores. Ovary 5 -celled ; style erect or declinate, stigma capitate 5 -lobed or -cleft ; ovules many. Capsule globose, 5 -angled, 5 -celled, loculicidally 5 -valved; valves septiferous, usually with tomentose edges ; central column bearing the seeds on fungous placentas. Seeds very minute, elongate, testa produced loose, nucleus minute.-Distrib. N. temp. zone ; species about 12.-Etym. Pyrus, from a similarity in the foliage to that of the pear.

Sub-gen. 1. Py'rola proper. Flowers racemose. Petals 5, free, incurved. Anther-cells short, obtuse. Stigmatic lobes short. Valves of capsule cohering by fibres.

1. P. mínor, Sw.; leaves orbicular-ovate obscurely crenate, stamens erect as long as the short straight style, stigma-rays large.

Woods, heaths and commons, from Ross and Moray to Kent and Devon ; rare in the S. of England ; ascends to $1,500 \mathrm{ft}$. in the Highlands; Mid. and N.E. Ireland, rare and local ; f1. June-Aug.-Stem 1-3 in., ascending. Letces usually in a rosette, but sometimes alternate, coriaceous, $1-1 \frac{1}{2}$ in., contracted into the longer petiole. Scupe 8-12 in., slender. Raceme short, bracteoles subulate-lanceolate. Floners $\frac{1}{4} \mathrm{in}$, diam., drooping, globose, white tingerl with rose. Stumens very short. Style without a ring below the stigma, not lengthening in fruit. C'apsule drooping.-Distrib. Europe (Arctic), excl. Turkey, E. and W. N. America.
2. P. me'dia, $L$.; leaves orbicular-ovate crenate, stamens erect shorter than the straight or slightly decurved style, stigma-lobes minute erect.
Woods and heaths, local, from Sussex and Worcester northwards; ascending to $1,800 \mathrm{ft}$. in the Highlands ; N. and W. of Ireland; fl. July-Aug.-Very like $l^{\prime}$. minor, but larger and stouter ; leaves broader, sometimes orbicular and $1 \frac{3}{4}$ in. diam., and bracts larger. Flomers $\frac{1}{2}$ in. diam. Style with a ring round the base of the stigma.-Distrib. Europe, excl. Greece and 'Turkey.
3. P. rotundifo'lia, $L$.; leaves orbicular-obovate, stamens ascending shorter than the long decurved style, stigma-lobes minute erect.
Moist woods and copses, rare, from Forfar and Aberdeen to Shropshire and Kent ; ascends to $2,500 \mathrm{ft}$. in Scotland; absent from Ireland ; fl. July-Sept. --Habit and stature of $P$. minor, but petioles all longer and very slender; raceme usually longer ; bracts larger, spreading; flowers $\frac{1}{2} \frac{\mathrm{in}}{}$. diam., pure white ; style with a ring below the stigma.-Distrib. Europe (Arctic), except Greece and Turkey, N. Asia, Himalaya, N. America.
Var. 1, votundifo'lia proper ; bracts on the scape few, pedicels a little longer than the lanceolate sepals.-VAR. 2, arena'ria, Koch ; leaves smaller, bracts many on the seape, pedicels as long as the ovate sepals. P. maritima, Keuyon. Sea-shore, Lancashire.
4. P. secun'da, $L$.; leaves ovate acute serrate, raceme secund, stamens incurved shorter than the long ascending style, stigma broad lobed.
Rocky mountain woods, rare ; Teesdale, Keswick, Dumfries, and from Perth and Argyle northwards, ascending to $2,400 \mathrm{ft}$.; N.E. of Ireland, very rare ; fl. July.-Stem straggling, branched ; branches 1-4 in., ascending. Leaves $1-1 \frac{1}{2} \mathrm{in}$., rosulate or alternate, rather thin, reticulate, petioles shorter. Scape slender, 2-5 in., with 1-5 bracts. Racemes 1-2 in., bracteoles linearoblong. F'lovers horizontal, $\frac{1}{4} \mathrm{in}$. diam. Sepals obtuse, erose. P'etuls concave, greenish-white. Style without a ring below tire stigma, elongate in fruit. Capsule drooping.-Distrib. Europe (Arctic), Siberia, Dahuria, W. Asia, N. America.
Sub-gen. 2. Mone'ses, Salish. (gen.). Flower solitary. Petals slightly adherent at the base, spreading. Anther-cells with tubular tips. Stigmatic lobes long. Valves of capsule free.
5. P. unifio'ra, L.; scape 1-bracteate at the top, leaves orbicular spathulate sinuate serrate. Moneses grandifura, Salisb.
Woods, chietly of fir, in the N. Highlands, from the Hebrides, Perth, and Aberdeen northwards.- Stem $\frac{1}{2}-2 \mathrm{in}$., short, leafy. Leaves $\frac{1}{2}-1 \mathrm{in}$., alternate, narrowed into a short petiole, rather membranous. Floxers $\frac{3}{4} \mathrm{in}$. diam., nordding, then ereet. Nepuls hroad, obtuse, ciliate. Petals almost flat, white, spreading. Filaments curved. Style not terminated by a ring. C'apsw/e
erect, crowned with the style and persistent elongate stigmas.-DISTRIB. Europe (Arctic), except Greece and Turkey, Siberia, N. America.

## 12. MONOT'ROPA, $L$. BIRD'S-NEST.

Simple, brown or pale, erect herbs; rootstock scaly. Leaves reduced to scales, alternate. Flowers campanulate, in terminal racemes, rarely solitary, uppermost 5-6-merous, the rest 4-merous. Sepals and petals erect, coloured, membranous, saccate at the base. Stamens 8-10, hypogynous, filaments subulate ; anthers reniform, 1 -celled, dehiscing across the top, valves very unequal. Ovary 4-5-celled, 8 -10-furrowed; style columnar, stigma discoid; ovules innumerable, on fleshy placentas filling the eavity. C'apsute loculicidally 5 -valved. Seeds very many, minute, testa loose reticulate produced at both ends.-Distrib. N. temp. regions; species 3 or 4.-Етум. $\mu$ óvos, one, and $\tau \rho \sigma$ ótos, from the curved raceme.

1. M. Hypop'itys, $L$.; flowers racemose, sepals and petals erose obtuse.
Woods near roots of fir and beech, from Aberdeen and Moray southwards; local in Scotland; Mid. Ireland, very rare ; fl. July-Aug.-Probably a parasite, from its colour and habit. Stem 6-12 in., stout, fleshy, creamwhite. Scales oblong. Raceme drooping till after fertilization, then erect. F'lowers $\frac{1}{2}$ in., many, drooping ; pedicels short, erect in fruit; bracts scalelike. Sepals irregularly disposed. Filaments incurved, the alternate longer; anthers reaching the stigma. Style short. Fruit ovoid or globose.-Distrib. Europe (Arctic), excl. Greece and Turkey, Siberia, Dahuria, N. America.
Var. gla'bra, Bernh.; all glabrous.-Var. hirsu'ta, Roth.; bracts ciliate, inner surface of sepals petals stamens and ovary pubescent.

## Order XLV. OLEI'NE居.

Shrubs or trees; branches opposite ; buds terminal, scaly. Leaves opposite, simple, or pinnate with a terminal leaflet, exstipulate. Flowers in terminal or axillary 3 -chotomous cymes, small, white or greenish, $1-2$-sexual ; pedicels opposite, 2 -bracteolate. Calyx inferior, 4 -lobed or 0. Corolla hypogynous, regular, 4 -partite, deciduous, rarely 0 , or of 4 free petals, valvate in bud. Stamens 2, anthers dorsally inserted, dehiscence inwards. Disk 0 . Ovary 2-celled ; style simple or 0, stigma entire or 2-fid; ovules 2 collateral in each cell rarely 3 , pendulous from the septum, anatropous, raphe dorsal. Fruit 1-2-celled, cells 1- rarely 2 -seeded. Seed pendulous, testa sometimes winged, albumen fleshy or horny; embryo straight, cotyledons flat thin. -Distrib. Trop. and temp. regions, chiefly northern; genera 24 ; species 150.-Exceptions. (British) Petals 0 in Fraxinus, which has 3 -ovulate cells.-Affinities. With Jasminear.-Properties. Olea europoea yields oil in its fleshy sarcocarp, a bitter bark, and hard durable wood. O. fragrans and others yield the odoriferous flowers used to scent China tea. Manna is the produce of several Ashes. Various barks are febrifuges, and that of Ash is cathartic.
Corolla funnel-shaped, 4-lobed. Fruit a berry .....................1. Ligustrum.
Corolla 0 (in the Brit. sp.). Fruit a samara.
2. Fraxinus.

## 1. Ligus trum, Tournef. Privet.

Shrubs, rarely small trees. Leaves often evergreen, quite entire. Flowers in terminal thyrsoid cymes. Calyx shortly tubular, 4 -toothed, deciduous. Corolla funnel-shaped, 4 -lobed. Stamens 2, included in the corolla-tube. Ovary ovoid ; style very short, stigma 2 -fid lobes obtuse ; ovules 2 in each cell. Berry globose, 2-celled, cells 1-2-séeded, flesh oily. Seeds ovoid or angled, albumen hard, cotyledons ovate-lanceolate.-Distrib. Europe, N. Asia, especially Japan ; species about 10.-Etym. ligare, to bind, from a use of the twigs.

1. L. vulga're, $L$. ; shrubby, leaves oblong-lanceolate quite entire. Thickets in England, from York and Durham southwards; naturalized in Scotland ; apparently wild in S. of lreland, fl. June-July.-A glabrous bush, 4-10 ft., almost evergreen ; branches slender, bark smooth. Leawes 1-2 in., shortly petioled, acute. Panicles $1-3 \mathrm{in}$. Corolla $\frac{1}{6}-\frac{1}{4} \mathrm{in}$. Berry $\frac{1}{3} \mathrm{in}$. diam., globose, purple-black.-Distrib. Europe, N. Afriea.-Berries yield a rosedye and a bland oil used for cooking in Germany.

## 2. FRAX'INUS, Tournef. Ash.

Deciduous trees. Leaves simple or pinnate, leaflets opposite with an odd one, toothed or serrate. Flowers polygamous or diœecious. Calyx 4 -fid or 0 . Petals 0 , or 4 connate at the base. Stamens 2, hypogynous. Ovary oblong; stigma subsessile 2 -fid; ovules $2-3$ in each cell. Fruit a compressed $1-2$-celled samara, winged at the tip, cells 1 -seeded. Seed compressed, albumen fleshy; embryo straight, cotyledons broad.-Distrib. Europe, N. Asia, N. America ; species about 30.-ЕтуM. Doubtful.

1. F. excel'sior, $L$.; leaflets oblong-lanceolate serrate, perianth 0 .

Woods and hedges, but generally planted, ascending to $1,350 \mathrm{ft}$. in Yorkshire ; A. April-May. - Tree $50-80$ ft. ; bark smooth ; branchlets stout; buds large, black. Leaftets 1-3 in., 4-7-pair. F'lowers small, polygamous, in dense small axillary panicles. Stamens purple-black. Samaras $1 \frac{1}{2} \mathrm{in}$., in large drooping panicles, pedicelled, linear-oblong, notched at the tip; nucleus oblong, ribibed. Seed $\frac{1}{2} \mathrm{in}$.-Distrib. Europe (excl. Greece), N. Africa. --Wood excellent. A 1 -foliolate state occurs, F. heterophylla, Vahl.

## Order XLVI. Apocy'ners.

Trees or shrubs, rarely herbs, often climbing; juice milky. Leaves opposite, rarely whorled, quite entire; stipules 0 or rudimentary. Flonsers regular, axillary or terminal, solitary or cymose. Calyx 4-5-fid. Cmrolla hypogynous, funnel- or salver-shaped ; throat naked or with seales; lobes usually oblique, contorted in bud. Stumans 4-5, on the tube or throat of the corolla, filaments very short often dilated above ; anthers basifixed, dehiscence introrse, usually elongate, free or connate and adhering to the stigma ; cells sometimes obliterated below; pollen granular. Jisk 0 or annular. Ovary of 2 free or connate carpels; style short, dilated, stigma entire or 2 -fid often constricted in the middle; ovules many, anatropous or amphitropous, placentas marginal. Fruit usually of 2 many-seeded
follicles, sometimes a berry or drupe. Seeds compressed, sometimes winged, hilum basilar or lateral, with often a pencil of silky hairs at the hilar (rarely at the other) end, albumen fleshy or hard or 0 ; embryo straight, cotyledons flat thin, radicle variable in direction.-Distrib. Chiefly trop.; genera 100 ; species $500-600$. - Affinities. With Asclepiadere, and Rubiaceoe.-Properties. Usually poisonous drastic purgatives, or febrifuges.

## VIN'CA, L. Periwinkle.

Perennial herbs or slender decumbent undershrubs. Leaves evergreen. Flowers solitary, white blue or purple. Calyx 5-partite, lobes acuminate, glandular at the base inside. Corolla salver-shaped ; tube hairy inside; throat thickened angled; lobes 5, oblique. Stamens 5, filaments short; anthers inflexed, tipped with a bearded membrane, pollen glutinous. Disk of 2 glands alternating with the carpels. Ovary of 2 carpels; style thickened above, terminated by a cup-shaped reflexed membrane, within which is the short conical entire or 2-lobed stigma. Follicles 2, slender, terete, many-seeded. Seeds subcylindric, testa black tuberculate, hilum lateral, albumen fleshy ; embryo axile.-Distrib. Europe, Asia, Africa; species about 10.-Етум. vincere, from a use of the stems in binding.
V. Mi'vor, L. ; flowerless-stems prostrate rooting, leaves elliptic-ovate margins glabrous, calyx-lobes glabrous $\frac{1}{3}$ the length of the corolla-tube.
Woods, copses, and hedgebanks, from Stafford southwards, but often only naturalized ; a denizen, Watson; not indigenous in Scotland or Ireland; fl. April-May.--Stems 1-2 ft., trailing, tough, flowering ones short, erect. Leaves $1-1 \frac{1}{2}$ in., very shortly petioled. Floxers 1 in . diam.; peduncles not as long. Corolla blue-purple. Fruit rarely found.-Distrib. Europe from Denmark southwards (excl. Greece), W. Asia.
V. MA'Jor, L.; flowerless-stems prostrate not rooting, leaves ovate or cordate at the base ciliate, calyx-lobes ciliate equalling the corollatube.
Copses and hedges, naturalized ; an alien, Watson; f. April-May.-Much larger in all its parts than $V$. minor; flowerless-stems not tough, rooting at the tip only; flowering erect in flower, elongating afterwards.-Distrib. Mid. and S. Europe, N. Africa.

## Order XLVII. Gentianere.

Herbs, usually glabrous, erect, 3-chotomously branched ; juice bitter. Leaves opposite, quite entire, rarely whorled (alternate and 3 -foliolate in Menyantines, alternate and floating in Limnanthemum); exstipulate. Flowers regular, solitary, or in 2-3-chotomous cymes. Calyx inferior, $4-8$-toothed or lobed; lobes twisted or valvate in bud. Corolla hypogynous, often persistent, rotate campanulate or funnel-shaped ; throat naked fimbriate or sealy; lobes 4-8, usually contorted in bud. Stamens $4-8$, inserted on the corolla-tube, filaments filiform ; anthers introrse, turning over and becoming extrorse during flowering, sometimes twisted. Ovary 1- or almost 2 -celled; style continuous with the ovary or 0 ; stigma 2 -fid or 2-lamellar; ovules many, 1 -2-seriate on 2 opposite placentas,
horizontal, anatropous. Capsule 1- or incompletely 2 -celled, septicidally 2 -valved, rarely indehiscent, many-seeded. Seeds minute, testa reticulate, albumen copious fleshy; embryo minute, cotyledons small, cohering or diverging.-Distrib. Chiefly in cold and temp. mountain regions, rarely polar; genera 60 ; species 450.-AFFinities. Close with Apocyizce.Properties. Bitter and tonic.
Sub-order I. Gentia'neæ. Leaves opposite. Corolla-lobes twisted.
Corolla rotate. Stamens 6-8. Leaves perfoliate.......................1. Chlora.
Corolla funnel-shaped. Stamens 4. Stigma entire...................2. Cicendia.
Corolla funnel-shaped. Stamens 5. Anthers twisted.............3. Erythrea.
Corolla-tube subelavate. Anthers straight. Stigmas 2...........4. Gentiana.

## SUb-order II. Menyan'there. Leaves alternate. Corolla induplicate. <br> Leaves 3 -foliolate. <br> 5. Menyanthes. <br> Leaves orbicular, floating <br> 6. Limnanthemum.

## 1. Chlóra, L. Yellow-wort, Yellow Centaury.

Annual or biennial, erect, glaucous herbs. Leaves broadly connate at the base. Flowers yellow, in 3 -chotomous cymes. Calyx 6-8-partite. Corolla rotate, persistent, 6-8-partite. Stamens 6-8, inserted on the throat of the corolla. Ovary 1 -celled ; style 2 -fid, deciduous, stigmas oblong obtuse. Capsule septicidally 2 -valved, many-seeded. Seeds mimute, sunk in the placentas.-Distrib. Europe, N. Africa, W. Asia; species 2,Etym. $\chi \lambda \omega \rho \delta \dot{s}$, yellow.

1. C. perfolia'ta, $L$.; radical leaves obovate-spathulate, cauline ovate. Chalk or clay banks and pastures from York southwards; S. and Mid. Ireland ; fl. June-Sept.-Glabrous. Stems 1 or more from the root, 6-18 in., terete. Radical leaves 1-2 in., rosulate, obtuse ; cauline smaller, broadly ovate, acute. Flowers $\frac{1-1}{2} \frac{1}{3}$ in. diam., many. Sepals slender, lanceolatesubulate. Corolla-lobes bright yellow, oblong, obtuse ; tube finally ruptured by the capsule. Stigma 2 -fid. - Distrib. Europe (excl. Greece) from Belgium southwards, N. Africa, W. Asia.

## 2. CICEN'DIA, Adanson.

Small annual branched herbs. Leaves oblong or filiform. Flowers small, yellow or pink, in 3 -chotomous cymes or fascicles. Calyx 4-5-lobed or -partite. Corolla funnel-shaped, persistent ; tube short or 0, throat naked; lobes 4-5. Stamens 4-5, inserted on the corolla-tube. Ovary 1- or partially 2 -celled ; style deciduous, stigma capitellate; ovules many, on 2 parietal placentas. Capsule 1- or almost 2 -celled, 2 -valved, many-seeded. Seeds minute, immersed in the placenta.-Distrib. Europe, N. America; species 3 or 4.-Etym. Doubtful.

1. C. filifor'mis, Reich.; leaves subulate, calyx campanulate, teeth deltoid acute, corolla-lobes obtuse equalling the tube. Exacum, Sm. Sandy bays, Pembroke and Cornwall to Sussex ; Cork in Ireland ; fl. July-Oct.- (ilabrous. Sten 4-8 in., angled, simple or sparingly branched above, very slender, branches suberect. Leures $\frac{1}{-1} \frac{1}{4} \mathrm{in}$. Flozers 4 -merous, yellow; pedicels stout, very long, $\frac{1}{2}-2 \frac{1}{2}$ in. C'apsule ovoid, $\frac{1}{6} \mathrm{in}$.--Distrib. Europe from Denmark southwards (exel. Russia), Azores.
2. C. pusil'1a, Griseb.; branches spreading, leaves linear, calyx-tube 0 , lobes subulate, corolla-lobes mucronate $\frac{1}{2}$ as long as the tube.
Sandy commons at Paradis in Guernsey ; fl. July-Sept.-Smaller and more slender than C.filiformis. Stems several, spreading ; branches divaricate. Leaves $\frac{1}{4} \mathrm{in}$. Flocers sometimes 5 -mergus, pink; peduncles slender. Calyxlobes erect. Capsule fusiform.-Distrib. Belgium and France.

## 3. erythra'i, Pers. Centaury.

Annual herbs. Stems erect, angular. Leaves connate. F'lowers small, pink white or yellow, in terminal 3-chotomous cymes. Calyx 4-5-partite. Corolla funnel-shaped, persistent ; tube cylindric, throat naked; lobes 4-5. Stamens 4-5, on the corolla-tube ; anthers spirally twisted, exserted. Ovary almost 2-celled ; style deciduous, stigmas 2; ovules many. Capsule linear, 1 - or almost 2 -celled, 2 -valved, many-seeded. Seeds minute.-Distrib. ,Temp. Europe, N. Africa, N. Asia, rare in N. America; species about 15. - Etym. द́puөpós, from the red flowers.

1. E. Centau'rium, Pers.; radical leaves ovate or oblong-spathulate.

Dry pastures and sandy coasts ; fl. June-Sept.-Erect, glabrous, 6-18 in., usually branched above. Radical leaves $\$-2 \mathrm{in}$., upper sometimes linear. Flowers $\frac{1}{6} \frac{1}{2}$ in. diam., many, red or pink. Calyx-lobes linear-subulate. Corolla-lobes oblong, obtuse or subacute. Capsule slender.-Distris. Europe from Gothland southwards, N. Africa; introd. in N. America.
Sub-sp. Centau'rium proper; leaves $3-7$-nerved, cymes fascicled, lateral flowers pedicelled, calyx-lobes about $\frac{1}{2}$ as long as the corolla-tube, corolla $\frac{1}{3} \mathrm{in}$. diam., capsule exceeding the calyx. E. latifolia, Engl. Bot.; (a stunted var.). Chironia Centaurium, Sm.-Var. littona'lis, Fries (sp.); margins of leaves and sepals usually puberulous, cymes compact, calyx-lobes longer, corolla rather larger, capsule not exceeding the calyx.-Sandy shores, local ; not found in Ireland.
Sub-sp. latifo'lia, Sm. (sp.) ; glabrous, 2-4 in., stout, leaves all broad subacute 5-7-nerved, cymes compact, flowers all subsessile, calyx-lobes about as long as the corolla-tube, corolla $\frac{1}{6} \mathrm{in}$. diam., capsule scarcely exceeding the calyx. -Sand-hills, Lancashire.
Sub-sp. Pulchel'la, Fries (sp.); glabrous, leaves 3-5-nerved, cymes rarely compact, flowers all pedicelled, calyx-lobes about $\frac{1}{2}$ as long as the corollatube, corolla $\frac{1}{4} \mathrm{in}$. diam., lobes narrow, capsule slightly exceeding the calyx. -Wet sandy places ; rare in Scotland; S. of Ireland only.

## 4. Gentiaina, L. Gentian.

Herbs of various habit. Leaves opposite. Flowers solitary, or in terminal cymes. Calyx 4-5-fid or -partite, sometimes spathaceous. Corolla 4-5-lobed, angles sometimes folded and produced, throat naked bearded or with 5 scales. Stamens 4-5, inserted on the corolla-tube, included; anthers dehiscing extrorsely. Disk annular. Ovary 1-celled; style 0 or short, stigmas 2 persistent recurved; ovules many. Capsule septicidally 2 -valved, many-seeded. Seeds immersed in the broad membranous placentas.-Distrib. Temp. regions and high mountains, rare in arctic; species about 150.-Etym. The classical name.

1. G. campes'tris, $L$. ; annual, calyx ebracteate 4 -partite, lobes very unequal, corolla-tube subcylindric, throat ciliate.

Moist especially hilly pastures ; ascending to $2,400 \mathrm{ft}$. in the Highlands; fl. July-Oct.-stem +12 in ., simple below. Rutical leares obovate-spathulate ; cauline ovate-oblong or lanceolate, acute, 3-7-nerved. Flocens 1 in., eymos. ly panicled, pedicelled. C'alyx-tube short ; outer lobes oblong-ovate, acuminate, inner much narrower. Corolla pale lilac ; lobes oblong, acute. Ciupsule subsessile.-Distrib. Europe (excl. Turkey), W. Siberia.
2. G. Amarel'1a, L. ; annual, calyx ebracteate 5 -lobed, lobes nearly equal, corolla-tube subcylindric, throat ciliate.
Dry pastures ; ascending to $2,100 \mathrm{ft}$. in Yorkshire ; fl. July-Sept.-Habit and stature of $G$. campestris, but calyx less deeply divided, lobes 5 , much smaller, subulate-lanceolate.-Distrib. Europe (Arctic), Siberia, Dahuria.
Sub-sp. Amarec'la proper ; calyx-lobes subequal from half as long to as long as the corolla-tube.
Sub-sp. (hirmin'ica, Willd. (sp.); larger, stouter, calyx-lohes unequal, 2 broader and more acute, much shorter than the corolla-tube.
3. G. Pneumonan'the, $L$. ; perennial, calyx 2 -bracteate, lobes 5 equal, corolla narrow-campanulate, throat uaked.
Moist heathy places, from Cumberland to Dorset, and from York and Norfolk to Anglesea, rare and local ; fl. Aug.-Sept.-Rootstock short. Stems $1-2 \mathrm{ft}$. , few, slender, sealy below, simple or nearly so, leafy above. Leaves 1-1 $\frac{1}{2}$ in., linearoblong, obtuse, $1-3$-nerved. Flowers 1-2 in., few, axillary and terminal, shortly pedicelled ; bracts 2, long, linear. Calyx-tube obconic ; lobes linear, obtuse, much shorter than the corolla, which is pale blue outside and hright blue within. Cupsule stipitate-Distrib. Europe (excl. Greece and Turkey), N. Asia, N. America (a form).
4. G. ver'na, L.; perennial, calyx 2 -bracteate, lobes 5 equal, corolla salver-shaped, throat with 2 -fid scales between the lobes.
Wet subalpine limestone rocks of York and Durham, ascending to $2,400 \mathrm{ft}$. in Upper Teesdale; Mayo, Galway, and Clare ; fl. May-June.-Tufted, stoloniferous. Reulical lectres rosulate, ovate or ovate-oblong, obtuse or subacute, 1 -nerved; cauline few, smaller, oblong. Strm 1-2 in., curved or ascending. Florers 1 in . diam., solitary, sessile ; bracts foliaceous. Culy/x-tuhe large, 5 -winged; lobes acute, much shorter than the corolia-tube. Corollu bright blue ; lobes ovate, obtuse. Cupsule subsessile.-DISTRIB. Europe from France and Germany to Spain and Turkey, Siberia, W. Asia.
5. G. niva'iss, L. ; annual, calyx 2 -bracteate, lobes 5 equal, corolla funnel-shaped, throat with a 2 -fid scale between each lobe.
High alpine rocks of the Breadalbane and Clova Mts., from 2,700-3,000 ft., very rare ; fl. Aug.-Sept.-Stem slender, 2-8 in., simple or branched above. Riulicul leaves $\frac{1}{2}$ in., few, obovate-ohlong, obtuse or acute ; cauline smaller, in distant pairs, all $3-5$-nerved. Florers $\frac{1}{2}-\frac{1}{4}$ in., solitary or few, shortly pedicelled ; bracts small, oblong. C'elyx narrow-eampanulate, 5 -angled and ribbed; lobes subulate, much shorter than the corolla-tube. C'orolla $f_{\text {in. }}$ diam., blue; lohes ovate, obtuse. C'apsule subsessile.-Distrib. Arctic, Northern and Mts. of Mid. Europe, Aretic America.
5. MENYAN'thes, Tournef. Buck-or Bog-bean.

A peremial scapigerous marsh herb. Rootstock ereeping. Leaves alternate, 3 -foliolate, petioles sheathing. Flowers racemose ; pedicels bracteate. C'alyx 5 -partite. C'orolla fleshy, fumnel-shaped, deciduous, limb 5-partite,
segments fimbriate on the disk, induplicate valvate in bud. Stamens 5 , inserted on the corolla-tube. Disk of 5 hypogynous glands. Dvary 1celled; style filiform, persistent, stigma 2-lobed; ovules in 1 series on 2 parietal placentas. Capsule globose, 1 -celled, obscurely loculicidally 2 -valved, many-seeded. Seeds small, testa polished.-Distrib. Europe (Arctic), Siberia, Dahuria, N.W. India, N. America.-Etym. obscure.

1. M. trifolia'ta, $L$.; leaflets subsessile oblong or obovate.

Marshes and spongy bogs ; ascending to $1,800 \mathrm{ft}$. in the Lake district ; fl. May-July.-Ruatstocks stout, matted. Leaflets $1 \frac{1}{2}-3$ in., obtuse, quite entire, ultimate nerves with free tips within the larger areoles ; petioles $3-7 \mathrm{in}$., sheath long narrow. Scape longer than the petioles, many-flowered. Flowers $\frac{2}{3} \mathrm{in}$. diam., white or pink, bearded ; pedicels $\frac{1}{4} \frac{1}{2}$ in., stiff, spreading ; bracts broad, short, obtuse. Sepals oblong, obtuse. Corolla-lobes recurved, subacute. Stamens reddish. Capsule apiculate.-Bitter, reputed tonic and febrifuge ; used to add bitterness to beer ; rootstock full of starch, hence eaten.

## 6. LIMNAN'THEMUM, Link.

Perennial water-herbs. Leaves alternate or opposite, floating, peltate or cordate. Flowers yellow in sessile umbels that terminate short axillary branches. Calyx 5-partite. Corolla rotate, membranous, deciduous; segments $5-8$, erose, with $5-8$ fimbriate scales at the base, margins broadly inflexed in bud. Stamens 5-8, inserted on the very short corolla-tube. Disk of 5-8 hypogynous glands. Ovary 1-celled; style persistent, stigmas 2 simple or lobed; ovules many, placentas 2 parietal. Capsule bursting irregularly, few- or many-seeded. Seeds small, testa smooth or muricate.Distrib. Temp. and trop. regions; species about 12.-Еtym. $\lambda\{\mu \nu \eta, a$ pool, and àvos, a flower.

1. L. nymphæoi'des, Link; leaves opposite on the flowering-stems. Villarsia nymphoeoides, Vent.
Still waters, rare, from Norfolk and Gloucester to Sussex ; naturalized further north, and in Scotland and Ireland; fl. July-Aug.-Rootstock creeping, with alternate leaves. Flowering-stems floating; their branches short, in the axils of opposite leaves. Leaves all petioled, orbicular, base deeply cordate, quite entire, green shining purple-spotted above, opaque purplish and studded with glands beneath ; petioles of radical leaves long, slender, not sheathing; of floating leaves shorter, stout, sheathing. Peduncles 1-3 in., crowded. Florers 1 in . diam., subumbellate, opening one at a time. Sepals linear oblong, obtuse. Corolla bright yellow; lobes erose or fimbriate. Capsule flagon-shaped, green. Seeds few, compressed, winged, ciliate.-Distrib. Europe from Denmark southwards, N. Asia, W. Asia to N.W. India.

## Order XLVIII. POLEmonia'cere.

Amnual or perennial herbs (rarely shrubs). Leaves alternate, or the lower opposite, entire or divided, exstipulate. Flowers in terminal centrifugal 2 -chotomous cymes, usually blue or white. Calyx inferior, 5 -lobed, imbricate in bud. Corolla slightly perigynous, regular or nearly so, 5 partite ; lobes contorted in bud. Stamens 5 , inserted on the corolla-tube,
usually unequal ; anthers fixed dorsally, 2-celled, dehiseence introrse, pollen subglobose reticulate. Disk fleshy. Ovary 3 -celled; style simple, stigmas 3 linear revolute; ovules 1 or more, attached to the inner angle of each cell, amphitropous. Capsule 3 -celled, loculicidally 3 -valvel ; valves separating from the persistent axis; cells 1- or many-seeded. Secds angled or plano-convex, testa spongy sometimes winged, hilum ventral, albumen fleshy ; embryo axile, cotyledons subfoliaceous.-Distrib. Chiefly arctic and temp., especially W. American ; geuera 17 ; species about 100.Affinities. With Convolvulacece.-Properties unimportant.

## 1. POLEMO'NIUM, L. Jacob'S-ladder.

Perennial herbs. Leaves alternate, pinnate. Flowers corymbose, usually ebracteate. Calyx campanulate, 5 -lobed. Corolla rotate ; lobes 5 , obovate. Stamens declinate, inserted on the corolla-throat, filaments dilated and hairy at the base. Disk cup-shaped, crenate. Ovary ovoid; style filiform, stigma 3 -fid; ovules many in each cell, 2 -seriate. Capsule ovoid, 3 -celled, many-seeded, loculicidally 3 -valved. Seeds ovoid, angled, with a short wing or 0 , testa thick, abounding in spiral vessels.-Distrib. N. temp. and aretic regions; species about 12 .-ETYM. obscure.

1. P. cæru'leum, L. ; leaflets 6-12 pairs subsessile. Greck Valerian. Copses and streams, apparently indigenous from Stafford and Derby northwards to the Cheviots, doubtfully elsewhere; an outcast of gardens in Scotland and Ireland ; fl. June-July.--Rootstock short, ereeping. Stems 1-3 ft., glabrous or pubescent and glandular above, angular, fistular, leafy. Leaves 4-18 in.; petiole very slender, winged ; leaflets $\frac{3}{4}-1 \frac{1}{2}$ in., quite entire, ovate or oblong-lanceolate, acute. Flowers many, drooping, $\frac{1}{2}-1 \mathrm{in}$. diam., blue or white. Calyx campanulate; lobes oblong, aeute. Corolla-lobes spreading, subacute. Capsule erect, included in the calyx. Seeds compressed, angular; testa costate and rugose, shortly winged.-DIsTRIB. Europe (Arctic) to France and Italy, N. Asia, N.W. Himalaya, N. Amerioa.

## Order XLIX. convolvulateere.

Herbs or shrubs, usually twining (rarely trees); juice often milky. Leaves alternate, 0 in Cuscuta, exstipulate. Flowers in axillary or terminal racemes cymes or heads, rarely solitary, often large, of all colours ; pedicels often articulate with the peduncle and bracteate. Sepals 5 , equal or unequal, in 1-3 series, persistent. Corolla hypogynous, regular, tubular bell- or funnel-shaped; limb 5-lobed or -angled, plaited and contorted in bud. Stamens 5, inserted on the corolla-tube, filaments often unequal and dilated at the base; anthers sagittate, basifixed, 2 -celled, dehiscence introrse, often twisted after flowering, pollen angular or spherical. Disk angular, hypogynous. Ovary of 2-4-connate carpels, 2-4-(rarely 1)-celled; style slender, 2 -4-fid, stigmas capitate linear or lamellar ; ovules 1 or 2 in each cell, erect from its base, 4 in the 1 -celled ovaries. Capsule 1-4-celled, 2-4-valved or bursting transversely at the base. Seeds attached to the base of the central column, ereet; testa coriaceous or membranous, often villous, albumen scanty mucilaginous
(fleshy in Cuscuta); embryo curved, cotyledons very broad thin folded, radicle short (embryo spiral and undivided in Cuscuta).-Distrib. Chiefly trop., rarer in the temp. zones ; genera 40 ; species about 650. -A AFFinities. With Cordiaceoe and Hydrophyllacce.-Properties. Often purgative; some (Batatas) yield esculent roots.
SUb-order I. Convolvula'ceæ proper. Leafy. Allumen scanty. Cotyledons foliaceous.

1. Convolvulus.

Sub-order II. Cuscu'teæ (Presl, order). Leafless parasites. Allumen copious, fleshy. Embryo filiform, spiral...............................2. Cuscuta.

## 1. CONVOL'VULUS, L. Bindweed.

Slender, often perennial twining herbs; juice milky. Leaves alternate, often cordate or sagittate. Flowers axillary, solitary or corymbose, white pink purple or blue, bracteate or ebracteate. Sepals 5. Corolla funnel- or bell-shaped, limb 5-angled and -plicate. Stamens 5, inserted at the bottom of the corolla-tube, filaments dilated at the base. Ovary 2-celled ; style filiform, stigmas 2 oblong or linear ; ovules 2. Capsule 2 -celled, the dissepiment sometimes imperfect. Seeds 2 in each cell, erect, testa hard.-Distrib. Temp. and trop. regions ; species about 100.Etym. convolvo, to entwine.

Sub-gen. 1. Convol'vulus proper. Bracts small, placed low on the peduncle. Stigmas slender.

1. C. arven'sis, $L$.; leaves hastate or sagittate, entire or sinuate. Small Bindweed.
Fields and waste places, from Renfrew and Moray southwards ; local in Scotland ; chiefly in S.E. Ireland; fl. June-Sept.-Glabrous or pubescent. Rootstock slender, extensively creeping underground. Stems many, 6-24 in., trailing or twining, slender. Leaves 1-3 in., very variable, apiculate, lobes acute. Flovers 1 in. diam., white or pink; peduncle recurved in fruit, solitary, 1-4-flowered, 4-gonous; bracts 2, small, linear. Sepals unequal, broadly oblong, obtuse. Capsule 2 -celled, globose, apiculate. Seeds 4, obtusely 3 -gonous, muricate.-Distrib. Europe, N. Africa, all N. and W. Asia to N.W. India.-A pest to agriculture.
Sub-gen. 2. Calyste'gia, Br. (gen.). Bracts 2, large, enclosing the calyx. Stigmas broad.
2. C. se'pium, $L$.; stem twining, leaves hastate or sagittate.

Hedges and thickets from Isla and Elgin southwards, and in Ireland ; ff. June-Aug.-Glabrous, rarely pubescent.-Rootstock stout, fleshy, creeping. Stems twining, 3-5 ft., slender. Leaves 3-5 in., membranous, entire, obtuse or acute, deeply cordate, lobes rounded or angled. Flowers 2 in . diam., white or pale pink ; peduncle solitary, 1 -flowered, 4 -gonous ; bracts ovate-cordate or triangular. Sepals subequal, ovate-lanceolate. Capsule $\frac{1}{2} \mathrm{in}$. diam., globose, apiculate, 1 -celled above, 2-celled below. Seeds smooth, obtusely 3 -gonous.-Distrib. Europe, Siberia, Dahuria, N. Africa, temp. N. and S. America, Australia, New Zealand.--Rootstock purgative.
3. C. Soldanel'ta, L.; stem procumbent, leaves orbicular or reniform.

Sandy sea-shores from Isla and Forfar southwards, rather local in Ireland; fl.
June-Aug.-Glabrous. Rootstock slender, running extensively. Stems

6-12 in., slender, never twining. Leaves $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$. diam., fleshy, usually much broader than long, lobes rounded; petiole 1-3 in., suddenly dilating at the tip. Floxers 1-1 $\frac{1}{2} \mathrm{in}$. diam., pale purple or pink ; peduncle solitary, 1 -flowered, 4-quetrous. Bracts $\frac{1}{3}$ in., broadly oblong, obtuse, shorter than the similar or retuse unequal sepals. Cupsule large, incompletely 2 -celled. Seeds $\frac{1}{4}$ in. diam., obtusely 3 -gonous, smooth, black.-Distrib. Lurope from Belgium northwards, N. Africa, W. Asia, S. temp. regions.

## 2. CUS'CUTA, Tournef. Dodder.

Slender, branched, twining, leafless, pink yellow or white, annual parasites. Flowers in compact bracteate heads (in all British species), rarely spiked. Calyx 4-5-fid. Corolla ureeolate, persistent ; limb 4-5-fid; tube naked, or with a ring of seales below the stamens. Stamens 4-5, inserted on the middle of the corolla-tube, included. Oevery 2 -celled; styles 2, free or connate, stigmas acute or capitate; ovules 2 in each cell, ervet. C'apsule 2 -celled, bursting transversely at the base, cells 2 -seeded. seods angled, embryo filiform, undivided, spirally coiled round the Heshy albumen, radicle thickened.-Distrib. Temp. and trop. regions; species about 40.-Etym. doubtful.

1. C. europæ'a, L.; sepals erect obtuse, tips spreading, corolla twice as long ventricose above, seales short or 0 , stamens included.
On nettles, vetches, \&c. in England, from York to Dorset, rare ; fl. July-Sept. - Stoms as thick as twine, reddish or yellow. Florer-lecteds $\frac{1}{2}-3 \mathrm{in}$. diam., globose, tinged with red. Sipels tleshy at the base only. Corollu-lobers about as long as the tube, obtuse, spreading. Nectl-s appressel to the corolla-tube, remote, 2 -fid. Styles included.-Distrib. Europe, N. Afriea, Siberia.
2. C. Epithy'mum, Murr.; sepals suberect acute shorter than the cylindric corolla-tule, scales concealing the ovary toothed, stamens exserted. On Furze, Thyme, Ling, \&c. from York southwards; said to grow in Galloway, Scotland, and formerly near Drogheda, Ireland ; H. July-Oct.Ntems filiform, very slender, reddish. Hecels $\frac{1-3}{}$ in. diam., variahle in colour. Corolle--lolies spreading. S'cules large, incurved. Nityles exserted.Distrib. Europe from Denmark southwards, N. Africa, W. Asia.
Var. Trifó'lii, Bab. (sp.), does not seem entitled to sub-specific rank. Mr.
E. T. Bennett has sent me, from Hazlemere, specimens of the two forms grown upon heath, one with pink flowers and reddish anthers, and the other (Trifolii), with white flowers and yellow anthers, the scales in both $\frac{3}{3}$ the length of the corolla-tabe.
C. Epili'num, Weike; sepals acute appressed to the equally long inflated corolla-tuhe, scales small distant toothed, stamens included.
On Flax in England, Scotland, and Ireland, but not naturalized ; fl. July-Aug. -About as large and stout as $C$. curopcea, but usually paler and more succulent. Sopuls fleshy, triangular-ovate. C'orolle-loles obtuse. Scules incurved as in C. Eprithymum, but smaller, distant, often 2 -fid. Styles short, included.-Distrib. Eirope (exel. Russia).

## Order L. borragin'em.

Herbs, rarely shrubby below, usually hispid scabrid or pilose. Stems terete. Leaves alternate, quite entire or sinuate ; nerves usually strong, saink above, very prominent below ; exstipulate. Flowers regular or irregular, bracteate or not, in simple forked spiked or racemed often scorpioid cymes, rarely axillary. Calyx persistent, 5 -lobed or -partite, ralvate in bud. Corolla hypogynous, rotate tubular campanulate or salver-shaped; throat often closed by hairs or hollow folds placed opposite the 5 lobes, imbricate in bud. Stamens 5, inserted on the corolla-tube or throat, filaments usually short; anthers dorsally inserted, 2 -celled, bursting inwards, often subulate. Disk 0 , or confluent with a tumid receptacle. Ovary of 2 2 -lobed 2 -celled carpels connate at the very base; style simple, arising from the base of the carpels, stigma simple or 2 -fid ; ovules solitary in each cell, ascending, anatropous. Fruit : the 4 lobes of the ovary become indehiscent 1 -seeded nutlets, inserted on the receptacle, which is continuous with the base of the style. Seed straight or curved, attachment basal or ventral, narrow or broad, often concave with thickened margins, testa membranous, albumen 0 or scanty and fleshy ; embryo straight or curved, cotyledons foliaceous, radicle superior.-Distrib. All climates, abundant in S. Europe and E. Asia; genera 50 ; species 600--Affinities. With Verbenacea, Labiute, and Convolvulacece.-Propfrties. Mucilaginous and emollient; often abounding in alkalies. Roots often yield purple or brown dyes. - The ahove character does not include the tropical suborder Heliotropeo, chiefly distinguished by the obscurely lobed ovary.
Tribe I. e'chiees. Corolla irregular ; throat usually naked. Nutlets inserted by a flat base on the flat receptacle. Stamens exserted...1. Echium. Tribe II. ANCHU'Sefe. Corolla regular; throat closed with scales. Nutlets inserted by broad cup-shaped bases on the flat receptacle.
Corolla rotate. Anthers exserted, conniving in a cone............1*. Borrago. Corolla tubular, 5 -toothed. Anthers included ...................2. Symphytum.
Corolla salver-shaped ........................................................3. Anchusa.
Iribe III. Lithosper'mere. Corolla regular ; throat naked or closed by scales. Nutlets inserted by small flat bases to the flat receptacle.
Calyx-tube 0. Stamens included. Nutlets stony .........4. Lithospermum. Calyx-tube short. Stamens protruding. Nutlets fleshy ........5. Mertensia. Calyx-tube long, funnel-shaped. Stamens included. Nutlets smooth.
6. Pulmonaria.

Calyx-tube long. Corolla salver-shaped. Nutlets smooth .......7. Myosotis. Tribe IV. CYnoglos'sefe. Corolla regular ; throat naked or closed with scales. Nutlets inserted by broad ventral surfaces on an elevated receptacle. Calyx-lobes leafy. Nutlets granulate
.7*. Asperugo.
Calyx-lobes not leafy. Nutlets with hooked bristles
8. Cynoglossum.

## 1. E'CHIUM, Tournef. Bugloss.

Herbs, sometimes shrubby, usually large, stout, hispid or scabrous with tuberons-based hairs. Leaves entire. Flowers white red purple or blue, in spiked or panicled racemes. Calyx 5 -partite. Corolla-tube cylindric or funnel-shaped; throat dilated; limb unequally 5 -lobed. Filaments unequal, adnate to the corolla below, exserted. Style filiform, stigma 2-lobed. Nut-
lets 4, inserted by flat bases on the flat receptacle, ovoid or turbinate, wrinkled, scabrid.-Distrib. Chiefly S. Europe and Oriental ; species 50. -Etym. ※́Xts, a viper, of disputed application.

1. E. vulga're, L. ; cauline leaves lanceolate or oblong, rounded at the base, cymes short, calyx exceeding the corolla-tube, stamens much protruded. E. italicum, Huds. not of L. Viper's Bugloss.
Waste ground on light soils in England ; an alien or colonist in Scotland,
Watson ; S.E. of Ireland ; fl. June-Aug.- Root fusiform, annual or biemnial.
Stem 1-3 ft., erect or ascending below, stout, leafy. Radical leuves petioled,
4-8 in.; cauline sessile, acute, rounded at the base. C'ymes 1 in . or more,
axillary, recurved, lengthening in fruit, panicled towards the ends of the
branches; bracts and calyx-lobes linear. Corolla $\frac{3}{4} \mathrm{in}$., red-purpte in bud,
then bright blue, rarely white. Nutlets angular, rugose.-Distrib. Europe,
N. Africa, W. Siberia ; introd. in N. America.
2. E. plantagin'eum, $L$.; cauline leaves linear-oblong cordate at the base, calyx much shorter than the corolla-tube, cymes elongate, stamens slightly protruded. E. viola'ceum, Brit. Fl., not of L.
S.W. of Jersey ; fl. June-Aug.-Root fusiform, annual or biennial. Stem 1-3 ft., ereet or ascending, diffusely branched. Leaves, radical 4-6 in., lanceolate, petioled ; cauline spreading, obtuse, sometimes dilated at the base. Cymes 4-b in., spreading, curved. Calyx-lobes subulate-lanceolate. Corolla 1 in., dark blue-purple. Nutlets as in E. vulgave. - Distrib. Spain and Mediterranean region to Greece.

## 1*. BORRA'GO, Tournef. Borage.

Annual or perennial herbs, hispid with tuberous based hairs. Flowers in lax forked cymes, bracteate, blue. Calyx 5 -partite. Corolla rotate, throat closed by notched scales, lobes acute. Stamens 5, on the throat of the corolla, filaments stout, concave, with an obtuse tooth above; anthers elongate, mucronate, comniving, exserted. Style filiform, stigma capitate. Nutlets 4, rugose, inserted by a truncate concave base on a flat fleshy recep-tacle.-Distrib. S. Europe, N. Africa; species 3.-Etym. doubtful.
B. officina'lis, $L$. ; corolla rotate, scales broad erect notched.

Waste ground, near habitations, in England and the Channel Islands only, rare ; an alien, Watson; fl. June-July.-Root annual or biennial. Stem 1-2 ft., stout, succulent, leafy, branched. Leaves waved or sinuate-toothed, subacute ; radical 4-6 in., ovate-lanceolate, petioles broad, winged ; cauline sessile or contracted towards the auricled base, upper oblong. Cymes axillary and terminal, few-flowered, branched ; pedicels $1-1 \frac{1}{2}$ in., decurved ; bracts linear or lanceolate. Calyx-lobes subulate-lanceolate. Corolla $\frac{3}{4} \mathrm{in}$. diam., bright blue; lobes triangular-ovate. Anthers purple-black, spurred at the back. Nutlets $\frac{1}{6} \mathrm{in}$.-Distrib. Mid and S. Furope, N. Africa ; introd. in America.-Used as a cordial, but has no sensible properties.

## 2. SYM'PHYTUM, Tournef. Comfrey.

Perennial coarse hispid herbs, with tuberous or fascicled roots. Leaves, radical petioled, cauline sessile or decurrent, upper often opposite. Flowers in terminal forked cymes, bracteate, white blue purple or yellow. Calyx 5 -partite or -toothed. Corolla tubular, dilated above the middle,
shortly 5 -toothed, throat closed by elongate ciliate scales. Stamens 5 , on the middle of the corolla, filaments slender; anthers long, included. Style sleuder, stigma capitate. Nutlets 4, ovoid, smooth, inserted by a broad perforated base on a flat receptacle, rim of the perforation striate. Distrib. Europe, W. Asia; species 15.-Etym. doubtful.

1. S. officina'le, $L$. ; stem broadly winged above, leaves decurrent.

River-banks and watery places, from Forfar southwards; a denizen in N. Britain, Watson; frequent in Ireland; fl. May-June.-Hispid and hairy. Rootstock branched; roots fleshy, fibrous. Stem 1-3 ft., stout, angular, branched. Leaves ovate-lanceolate, radical 4-8 in., petioles long, winged; cauline shortly petioled. Cymes scorpioid ; flowers drooping; pedicels $\frac{1}{4} \frac{1}{2} \mathrm{in}$. Calyx-lobes small, narrow-lanceolate. Corolla $\frac{3}{4} \mathrm{in}$., yellow red or purple. Nutlets $\frac{1}{8}$ in., shining.-Distrib. Europe, W. Siberia; a garden escape in the U. States.-An old styptic ; young leaves sometimes cooked and eaten.
Var. 1, officina'le proper ; corolla ochreous.-VAR. 2, pa'tens, Sibthorp (sp!); corolla purple.
2. s. tubero'sum, L.; stem hardly winged, leaves scarcely decurrent.

Copses in wet places, from N. Wales and York, to Isla and Elgin ; most common in S. of Scotland ; absent from Ireland ; fl. June-July.-Hairy, not hispid, often glandular. Rootstock short, horizontal; root-fibres slender. Stem 1-2 ft., rather slender, leafy. Radical leaves much as in S. oficicinale in form, but longer petioled. Flozers rather smaller, ochreous-Distrib. Mid. Europe from France to Turkey.

## 3. ANCHU'SA, L. Alkanet.

Annual or perennial herbs, usually villous and hispid. Flowers in scorpioid cymes, usually bracteate, blue or purple, rarely white or yellow. Calyx 5 -fid or -partite. Corolla-tube straight or curved, throat closed by hairs or scales; limb oblique or spreading, 5 -partite. Stamens included. Nutlets 4, rugose or granulate, inserted by a very broad deeply concave base on a flat receptacle, rim of the concavity often wrinkled.-Distrib. Europe, W. Asia ; species 30.-Etym. doubtful.

Section 1. Lycop'sis, $L$. (gen.). Corolla-tube curved, equalling or exceeding the oblique limb. Nutlets with the ring equal at the base.

1. A. arven'sis, Bieb. ; hispid, bristles tuberous-based. Bugloss. Cornfields and waste places in light soils ; ascends to $1,000 \mathrm{ft}$. in the Highlands; fl. June-July.-Annual ; root fusiform. Stem simple below, $\frac{1}{2}-1 \frac{1}{2} \mathrm{ft}$., angular, rather slender. Leaves, radical 1-4 in., petioled, obovate-lanceolate; cauline linear-oblong, sessile, acute, margin waved and toothed, upper $\frac{1}{2}$-amplexicaul. Cymes 4-5 in., terminal, simple or forked, short, at length elongate, drooping, recurved; bracts leafy; Hlowers subsessile. Calyx-lobes $\frac{1}{2}$ in., narrow. Corolla $\frac{1}{4}$ in. diam., bright blue, scales white. Nutlets small, reticulate.-Distrib. Europe, W. Siberia, W. Asia to N. W. India; introd. in the U. States.
Section 2. Anchu'sa proper. Corolla-tube straight, equalling or exceeding the limb. Nutlets with the basal ring not produced.
A. officina'lis, $L$.; densely softly hispid, leaves narrow-lanceolate. Ballast hills, Hartley Links, Northumberland; also found near Glasgow ; an
alien, Watson; fl. June-July.-Root stout, biennial. Stem 1-2 ft., angled, simple or branched. Leaves, radical 3-6 in., gradually narrowed into long winged petioles ; cauline oblong-lanceolate or linear-oblong, sessile, uppermost $\frac{1}{2}$-amplexicaul. ('ymes forked or in pairs, 1-2 in., lengthening to 4-6 in.; bracts and calyx-lobes ovate-lanceolate; flowers subsessile. Corollu $\frac{1}{3}$ in. diam., violet-blue, seales white papillose. Nutlets small, brown.-Distrib. Europe, W. Asis.
Section 3. Caryolo'pha, Fisch. et Traut. (gen.). Corolla-tube straight, shorter than the limb. Nutlets with the ring produced towards the style. A. sempervirens, $L$.; hispidly hairy, leaves ovate acute.

Hedges and waste places from Ross southwards, rare and local, and in Ireland; a denizen or alien, Wutson; fl. May-June.-Root stout, perennial. Stem 1-2 ft., simple. Leutes, radical $\gamma-12$ in., oblong-ovate, long-petioled; cauline ovate, shorter petioled. C'ymes in pairs, very hispid, sulcapitate, long-peduncled, 2 -bracteate, not lengthening much, axillary; peduncles $2-3$ in., spreading, very slender; bracts $\frac{1}{2}-1 \mathrm{in}$., ovate-lanceolate; flowers shortly pedicelled. C'alyr-lohes linear. Corolla $\frac{2}{3}$ in. dian., bright bhe, seales white. Vutlets small, reticulate.-Distrib. W. Europe fron Belgium to Lombardy.

## 4. LITHOSPER'MUM, Tournef. Gromwell.

Annual or perennial herbs, sometimes shrubhy, hispid or hairy. Flourers in bracteate cymes. Cotyx 5-partite. C'orollat funnel- or satior-shaped, throat naked or with 5 tumid folds; lohes 5, spreading. Authers whlong. included in the corolla-tube. Style simple, stigma capitate olscurely loked. Nutpets 4, hony or stony, inserted hy a truncate hase on a flat receptacle, smooth or rugose.-Distmb. Europe, temp. Asia and America; speries about 50 . -Etym. $\lambda$ itoos and $\sigma \pi \epsilon$ ' $\rho \mu \alpha$, from the stonyl mutlcts.

1. L. officina'le, $L$.; perennial, stems many all erect branched and flowering, leaves $\frac{1}{2}$-amplexicaul narrow-Janceolate, nutlets smooth white.
Copses, hedgehanks, \&c. from Ross southwards ; rare and douhtfully native in Scotlaud ; rather rare in Ireland; fl. June-July--Rootstock stout, wooly. Stom 1-3 ft., rough with the tuberous hases of the stiff hairs, very leafy: Lerwes 2-4 in., puhescent ahove, strigose beneath. C'rmes capitate, small, strigose, on short leafy axillary branches; bracts longer than the calyx; flowers subsessile. Culyn-Luless equalling the corolla. C'omollu $\frac{1}{3} \mathrm{in}$. diam., yellow-white. Nuflets 1-2, narrowed uywards, shining.-Distisib. Europe,
W. Asia, Siberia, Dahuria ; introd. in N. America.
2. L. arven'se, L.; annual, stems solitary erect branched, leaves sessile $\frac{1}{2}$-amplexicaul linear-oblong, nutlets grey shining wrinkled.
Cornfields and waste places, from Ross southwards, and in Ireland; ff. May-June.--Rout tapering. Stem $10-16 \mathrm{in}$. , stout, flexuous, shortly hivid Leures, radical obovate-lanceolate, petioled; cauline 2-3 in., obtuse. C'ymes short, terminal ; bracts large, leafy; perlicels very short. Ciulyx-loles narrow-linear, almost equalling the corolla. Corolla $\frac{1}{3}$ in., cream-white. Nutlefs narrowed upwards.-Distrib. Europe, N. Africa, Siberia, W. Asia to N.W. India ; introd. in the U. States. - Yields a red dye.
3. L. purpu'reo-cæru'leum, $L$.; peremnial, barren stems creeping, flowering erect, leaves subsessile narrow-lanceolate, nutlets white smooth.

Copses on limestone and chalk, very rare, Wales, Somerset, Devon, Kent; fl . June-July.-Rootstock creeping, woody, slender. Stems 1 ft. , scabrid, flowering 1-2 ft., leafy, rigid, simple or branched. Leaves $1 \frac{1}{2}-3$ in., rather softly strigose. Cymes terminal, few-flowered; bracts large, leafy ; pedicels very short. Calyx-lobes very slender, much shorter than the corolla. Corolla $\frac{3}{4}$ in., bright blue-purple. Nutlets 1-2, nearly globose, shining.-Distrib. Europe from Belgium southwards.

## 5. MIERTEN'SIA, Roth.

Perennial herbs. Leaves usually obovate, lower petioled, upper sessile. Flowers in terminal cymes, blue-purple. Calyx 5 -fid or -partite. Corollatube cylindric, limb campanulate, 5-fid or -partite, throat naked or with 5 transverse folds between the stamens. Stamens 5, towards the top of the corolla-tube. Style filiform, lengthened after flowering, stigma obtuse. Nutlets 4 , inserted by a contracted base on a small $2-4$-lobed receptacle, rather fleshy, smooth or rough.-Distrib. N. and Aretic Europe, Asia, and America ; species 20.-Etym. Prof. F. C. Mertens, a German botanist.

## 1. M. marit'ima, Don; glabrous, glaucous, leaves ovate or obovate.

Sea-shores, Wales, Lancashire, and Cumberland, common on the W. coast of Scotland, rare on the E.; N. and E. of Ireland ; fl. May-June.-Succulent. Rootstock fleshy, dark brown, branched, stoloniferous. Stems 1-2 ft., decumbent, leafy, much branched. Leaves 2 -farious, 1-3 in., lower petioled, upper sessile, fleshy, marked with prominent callous points when dry. C'iymes dichotomous, with 2 opposite leafy bracts at the base ; pedicels short, decurved in fruit. Calyx angular in fruit; lobes ovate. Corolla $\frac{1}{\frac{1}{2}} \mathrm{in}$. diam., campanulate, 5 -lobed to the middle, pink then blue, throat with 5 folds. Nutlets flattened, large, fleshy, outer coat becoming inflated and papery, rounded at the back.-Distrib. Europe (Aretic) southwards to Denmark, N. and Arctic shores of Asia and America.

## 6. PULMONA'RIA, Tournef. Lungwort.

Perennial herbs; rootstock creeping. Radical leaves usually terminating sterile branches. Flowering-stems simple. Cymes terminal. Flowers often polygamous or dimorphic, purple white or pink in bud. Calyx 5 -angled at the base, 5 -fid, after flowering campanulate, lohes erect. Corolla funnelshaped, 5 -cleft, with 5 peneils of hairs between the stamens. Strmens 5 , included. Stigma subglobose, 2-lipped. Nutlets 4, turbinate, smooth, sessile by a truneate base on a flat receptacle.-Distrib. Europe, N. Asia; species 5.-Etym. pulmo, from its former use in lung complaints.

1. P. angustifo'lia, L.; leaves narrow-lanceolate cauline sessile.

Copses, \&ce on clay soil ; Isle of Wight, Hants, and Dorset ; fl. April-June.Rootstock short, stout; root-fibres fleshy. Stem 1-1 $\frac{1}{2}$ ft., hairy, hardly hispid, brittle. Leaves, radical 6-10 in., petioled, often spotted with pale green ; cauline sessile, much smaller, more oblong, acute, $\frac{1}{2}$-amplexicaul. Cymes short, much incurved, bracts leafy; pedicels rather slender. Calyx-lobes lanceolate, $\frac{1}{3} \mathrm{in}$., enlarging in fruit. Corolla $\frac{3}{4} \mathrm{in}$., pink, then bright blue. Nutlets smooth, black.-Distrib. Europe, excl. Greece and Turkey.
P. officina'lis, L.; leaves ovate or ovate-lanceolate.

Woods and copses, S. of Scotland and England ; rare and naturalized only.-

Habit, \&c. of $P$. angustifulia, but the leaves are of a very different form, and always blotched with pale green, and the flowers are pale purple.Distrib. Europe.

## 7. MYOSO'TIS, L. SCORPION-GRASS.

Annual or perennial strigose herbs. Radical leaves petioled; cauline sessile, linear-oblong. Cymes terminal, scorpioid ; flowers small, bracteate or not. Calyx 5 -toothed or -eleft. Corolla salver- or funnel-shaped, throat closed by 5 short notched scales; limb 5 -fid, lobes contorted in bud. Anthers included, connective slightly produced. Style short, stigma capitate. Nutlets 4, minute, usually highly polished, compressed or 3-gonous, attached by a small base to a small receptacle.-Distrib. N. and S. temp. regions, most common in Europe and Australia; species about 25.-EtYM. $\mu$ ús and oủs, from the leaves resembling a mouse's ear.

Section 1. Perennial. Hairs of stem appressed or spreading. Pediecls slender, longer than the calyx. Calyx campanulate, strigose with straight appressed hairs only.

1. M. palus'tris, With.; hairs scanty slightly spreading or appressed, calyx-lobes triangular equalling $\frac{1}{4}-\frac{1}{3}$ of the tube, corolla $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. diam., style nearly equalling the calyx. Forget-me-not.
Wet places, from Forfar southwards ; fl. May-July.-Light green and rather shining. Rootstock creeping; stolons creeping, subterranean, with small leaves. Stem 1-2 ft., erect or ascending, rather stout, flexuous. Leuces 1-3 in., linear-oblong or narrowly spathulate, obtuse ; upper sessile or shortly decurrent. Cymes variable, flowering pedicels $\frac{6-\frac{1}{4} \mathrm{in} \text {. Corolla sky-blue, }}{\text { d }}$ disk yellow, lobes retuse. Nutlets small, black, bordered, hard keeled in front.-Distrib. Europe (Aretie), Siberia, Dahuria; introd. in N. America.
Var. 1, palus'tris proper; stem with lax spreading hairs.-VAR. 2, strigulo'se, Reich. (sp.); stem more erect, with more copious appressed hairs, leaves sessile, flowers smaller.
2. M. lingula'ta, Lehm. ; hairs appressed, calyx-lobes triangular nearly as long as the tube, corolla $\frac{1}{6} \mathrm{in}$. diam., style much shorter than the calyx. M. ccespitosa, Schultz.

Wet places, ascending to $1,600 \mathrm{ft}$. in Yorkshire, \&c. ; fl. May-Aug.-Light green, tufted, rather shining. Rootstock short, without stolons. Ntem 6-15 in., much branched from the base, branches slender. Leaces, radical spathulateoblong, polished ; cauline 1-2. $\frac{2}{2}$ in., linear-oblong, tip rounded, narrowed to the sessile hase. Cymes usually long and slender, pedicels $\frac{1}{4} \frac{1}{3} \mathrm{in}$. Cirlyxlobes oblong-ovate, obtuse. Corolla sky-blue, disk yellow. A utlets black, bordered, not keeled in front, short, broad.--Distrib. Europe (Arctic), N. Africa, Siberia, Dahuria, W. Asia to the Himalaya, N. America.-This and the preceding are the only species with bright green shining foliage.
3. M. re'pens, Don; hairs long spreading, calyx-lobes narrow acute exceeding the tube, corolla $\frac{1}{3} \mathrm{in}$. diam., style nearly as long as the calyx.
Wet places, most common in Scotland ; ascends to $2,200 \mathrm{ft}$. in Yorkshire ; fl.
June-Aug.-Rootstock short ; stolons creeping above ground, leafy, rooting
at the tip only. Stem 4-18 in., very slender, branched, flexuous. Leases, radical obovate-spathulate ; cauline 1-2 in., linear-oblong or oblong-obovate, usually broad at the base. C'ymes slender, elongate ; pedicels very slender,
sometimes $\frac{3}{4}$ in., lower often axillary or bracteate, much decurved in fruit. Nutlets short, bordered, not keeled in front. Flowers sky-blue, disk yellow. -Distrib, uncertain.
Section 2. Hairs of stem spreading. Calyx with spreading and hooked hairs. * Pedicels usually much longer than the calyx.
4. M. sylvat'ica, Hoffim.; stolons 0 , lower leaves petioled, calyx campanulate cleft $\frac{3}{4}$ of the way, with few straight and many incurved or hooked hairs, closed in fruit, corolla $\frac{1}{3} \mathrm{in}$. diam. flat.
Dry woods, $\& \mathrm{c}$. from Aberdeen southwards ; ascends to $1,200 \mathrm{ft}$. in Yorkshire ; absent from Ireland; fl. May-Sept.-Biennial or perennial. Rootstock 0 or short. Stem $\frac{1}{2}-2 \mathrm{ft}$., branched from the base, erect or the lateral branches ascending. Leaves $1 \frac{1}{2}-2 \frac{1}{2}$ in., acute or apiculate, hairs spreading. Cymes very lax in fruit ; pedicels about twice as long as the calyx ; corolla bright blue, tube very short. Nutlets dark-brown, bordered, keeled at the tip in front.-Distrib. Europe (Arctic), Canaries, Siberia, Dahuria, W. Asia.
5. M. alpes'tris, Schmidt; perennial, lower leaves petioled, calyx campanulate cleft $\frac{9}{4}$ of the way with many straight and few incurved or hooked hairs, open in fruit, corolla $\frac{1}{3} \mathrm{in}$. diam. flat. M. rupicola, Sm.
Moist alpine rocks, Ben Lawers, alt. nearly $4,000 \mathrm{ft}$., and Mickle-fell, Teesdale, alt. 2,400 ft. ; fl. July-Aug.-Hairs long, soft, spreading. Rootstock short, stout, branched at the base. Stem 5-10 in., leafy. Leawes 1-2 in., cauline linear-oblong, acute or obtuse. Cymes short, not lengthening much ; pedicels short, stout, the fruiting ascending. Culyx large, lobes narrow. Corolla deep hright blue. Style half as long as the calyx. Nutlets jet-black, largest of this section, ovoid-oblong, obtuse, bordered, keeled at the tip in front.Distrib. Arctic and Alpine Europe, N. Asia, and N. America.
6. M. arven'sis, Hoffm.; annual, lower leaves petioled, calyx shortly campanulate cleft $\frac{1}{2}$ way or lower with few appressed and many spreading hooked hairs, closed in fruit, corolla $\frac{1}{6} \mathrm{in}$. diam. usually concave.
Fields and waste places ; ascends to $1,200 \mathrm{ft}$. in Yorkshire ; fl. June-Aug. -
Closely allied to M. sylvatica, but pedicels usually much longer, slender, and flowers very small and paler blue. Nutlets brown, bordered, keeled in front. -Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to N.W. India; possibly a native of the N. U. States.
VAR. 1, arven'sis proper; annual, corolla-limb concave.-VAR. 2, umbro'sa, Bab.; biennial, corolla-limb flatter. Shaded places.
7. M. colli'na, Hoffm. ; annual, lower leaves subsessile, calyx shortly campanulate cleft $\frac{1}{2}$ way with many spreading hooked and few straight hairs, open in fruit, corolla $\frac{1}{8} \mathrm{in}$. diam. usually concave bright blue, tube short.
Field banks and waste grounds, from Banff southwards ; ascends to $1,000 \mathrm{ft}$. in the Highlands ; E. coast of Ireland, rare ; fl. May-July.-Stems 3-12 in., usually branched from the base. Leaves $\frac{1}{2}-1 \mathrm{in}$., linear-oblong, obtuse or apiculate, strigose. Cymes very long and slender in fruit, often exceeding
the leafy part of the stem; lowest flower sometimes bracteate. Style not half as long as the calyx. Nutlets turgid, brown, scarcely bordered. Distrib. Europe, N. Africa, W. Asia.
8. M. versic'olor, Reich.: annual, lower leaves subsessile, calyx shortly campanulate cleft $\frac{1}{2}$ way with many spreading hooked and few straight hairs, closed in fruit, corolla to in. diam. usually concave yellow then dull blue, tube long.
Waste grounds ; ascends to $1,500 \mathrm{ft}$. in Northumberland ; fl. April-June.Stems 3-12 in., usually much branched from the base. Leaves $\frac{1}{2}-1 \mathrm{in}$., linearoblong, subacute, strigose. Cymes elongate ; flowers not secund, lowest sometimes bracteate. Style nearly as long as the calyx. Nutlets black, bordered.-Distrib. Europe, N. África, W. Asia ; introd. in the U. States.

## 7". ASPER'UGO, Tournef. Madwort (Madderwort).

An annual hispid procumbent herb. Radical leaves petioled; cauline alternate subopposite or whorled. Cymes axillary, 1-3-flowered ; flowers on short recurved pedicels, small, blue. Calyx deeply 5 -lobed, with alternating teeth ; lobes leafy, spreading, veined, enlarged after flowering, and forming a compressed 2 -lipped laciniate covering to the fruit. Corollu funnel-shaped, throat closed by scales; lobes 5, rounded. Stamens included. Stigma subcapitate. Nutlets laterally compressed, subacute, tubereled, attached by the edge to an elevated receptacle.-Disthib. Europe (Arctic), W. Asia to N.W. India.-Etym. asper, from the rough leaves.
A. procum'bens, $L$. ; stem prickly, leaves linear-oblong.

Waste places, rare, from Moray southwards; a denizen, Watson ; fl. May-July.-Stem 1-2 ft., stout or slender, soft, simple or branched, sharply ridged, covered with seattered short hooked prickles. Leaves 2-5 in., lower petioled, uppermost sessile, variable in form, obtuse or acute, thin, hispid. C'ymes reduced to 1-3 axillary flowers; pedicels very short, decurved in fruit. Corolla $\frac{1}{6} \mathrm{in}$. diam., blue-purple. Fruiting-calyx $\frac{1}{3} \mathrm{in}$. broad ; lips unequal, fan-shaped, palmately lobed. Receptacle of nutlets with 2 membranous scales formed of the detached cuticle of the calyx.

## 8. CYNOGLOS'sum, Tournef. Hound's-tongue.

Coarse hispid villous or silky biennial herbs. Flowers small, blue purple or white, in forked cymes, usually ebracteate. Calyx 5-partite. Corolla funnel-shaped, mouth closed by prominent scales; lobes obtuse. Stumens included. Style rigid, persistent in fruit, stigma entire or notched. Nuthets 4, depressed or convex, covered with hooked or barbed bristles, peltately attached to a thickened conical receptacle.-Distrib. Temp. and trop. regions, especially Asiatic ; species about 40.-Etym. кú $\omega \nu$ and $\boldsymbol{\gamma} \lambda \hat{a} \sigma \sigma \alpha$, dog's tongue, from the texture of the leaf surface.

1. C. officina'le, L.; hoary with soft rather appressed hairs, nutlets with a thickened border.
Fields and waste places, not common, from Ross and E. Scotland southwards; S.E. of Ireland, rare ; f. June-July.-Root fleshy, tapering. Stem 1-2 ft., stout, erect, branched, leafy. Leaves, radical $8-10 \mathrm{in}$., long-petioled, oblong or oblong-lanceolate ; cauline sessile, linear-oblong or oblong-lanceolate, obtuse, rounded or cordate at the base. Cymes lengthening to 6-10 in.; pedicels recurved, stout, lower often bracteate. Calyx-lolees oblong, obtuse, enlarged to $\frac{1}{\mathrm{i}} \mathrm{in}$. in fruit. Corolla $\frac{1}{3} \mathrm{in}$. diam., dull red-purple. Nutlets $\frac{1}{4} \mathrm{in}$., face flat ovate covered with short hooked spines; border
thickened.-Distrib. Europe, N. Africa, Siberia, W. Asia; introd. in U. States.-Narcotic and astringent ; smells like mice.
2. C. monta'num, Lamk.; scabrid with short spreading hairs, nutlets without a thickened border. C. sylvaticum, Hænke.
Copses and waste places in Mid. and E. England, rare, from Essex to Surrey
and Northampton to Gloucester; naturalized in Perth and Forfar ; near
Dublin only in Ireland ; f. May-July.-Habit, \&c. of C. officinale, but greener,
more slender, with linear calyx-lobes $\frac{1}{3} \mathrm{in}$. long in fruit, bluer corollas, and the spines of the nuts largest on their margins.-Distrib. Europe from France and Germany southwards (excl. Spain and Greece).

## Order LI. sola'nerz.

Herbs or shrubs (rarely trees). Leaves alternate, or in pairs, or subopposite, simple lobed or pinnatisect, exstipulate. Flowers regular, on 1or more-flowered supra-axillary or axillary ebracteate cymes. Calyx inferior, 5 -fid, usually persistent, often enlarged in fruit. Corolla hypogynous, rotate campanulate or salver-shaped ; lobes 5, imbricate plicate or induplicate-valvate in bid. Stamens 5, rarely unequal, inserted on the corolla-tube, short ; anthers 2 -celled, connivent or cohering by their tips, cells opening inwards by slits, or terminal pores. Disk annular, hypogynous. Ovary 2 - or incompletely 4 -celled ; style simple, stigma simple or lobed; ovules many, amphitropous, placentas attached to the septum. Fruit a many-seeded capsule or berry. Seeds small, usually compressed, reniform, hilum ventral or lateral, testa thick, albumen fleshy ; embryo'terete, straight or curved, within or outside the albumen, radicle next the hilum.-Distrib. Chiefly tropical ; genera 60 ; species about 1,000.-Affinities. With Convolvulacese and Scrophularinece.-Properties. Narcotic and excitant, or tonic and bitter, pungent or stimulant.

Corolla subcampanulate. Capsule 2-celled........................1. Hyoscyamus.
Corolla rotate, anthers with pores. Berry 2-celled...................2. Solanum.
Corolla subcampanulate, anthers with slits. Berry 2 -celled. 3. Atropa.

## 1. hyoscy'amus, Tournef. Henbane.

Annual or biennial, heavy-scented herbs, often viscid. Leaves toothed or sinuate-pinnatifid. Flowers axillary or in bracteate scorpioid cymes. Calyx ureeolate, 5 -toothed. Corolla irregular, bell- or funnel-shaped; lobes 5, plaited, obtuse, unequal. Stamens 5, inserted at the base of the corollatube, leclinate; anthers with slits. Ovary 2 -celled; style simple, stigma capitate ; ovules many. Capsule hidden in the calyx-tube, constricted in the middle, 2 -celled, membranous, bursting transversely at the crown, many-seeded. Seeds reniform, punctate. - Distimb. Warm and temp. Europe, Africa, and Asia; species about 14.-Etym. obscure.

1. $\mathbf{H}$. ni'ger, $L$. ; leaves angled toothed or subpinnatifid.

Sandy waste places from Ross and Dumbarton southwards; not native in
Scotland ; common in Ireland; fl. June-Aug.-Pubescent foetid and viscid, with pale soft glandular hairs. Stem 1-2 ft., stout, branching, terete. Rudical leaces 6-8 in., petioled, ovate ; cauline oblong, amplexicaul, with
few large lobes or teeth. F'lorers 2 -seriate subsessile. Calyr-tulue ovoid; limb subeylindric, 5 -toothed. Corolla $1-1 \ddagger \mathrm{in}$. diam., lurid yellow, veined with purple ; lobes broad, nearly equal. A nthers purple. Calyp-tulne globose in fruit, $\frac{3}{4}$ in. diam., veined.-Distrib. Europe, N. Africa, Siberia, Dahuria, W. Asia to N.W. India.-Anodyne and antispasmodic. A var. without purple veins in the corolla has been found in Surrey, Norfolk, and Edinburgh.

## 2. SOla'num, Toumef. Nightshade.

Herbs or shrubs (rarely trees). Leaves scattered or in pairs, entire or divided. Flowers in the forks of the stem, or supra-axillary, rarely terminal, solitary fascieled or cymose, white or blue. Calyx 5-10-fid. Corolla rotate, tube short ; lobes 5-10, plaited. Stamens 5, inserted on the corolla-throat, exserted ; filaments very short ; anthers comniving, opening by 2 terminal pores. Ovary 2 - rarely $3-4$-celled; style simple, stigma obtuse ; ovules many. Berry 2 - rarely 4 -celled, many seeded. Seeds reniform.-Distrib. An immense tropical genus, rarer in temp. regions ; species probably 500-600.-Etym. doubtful.

1. S. Dulcama'ra, $L$. ; perennial, stem flexuous, leaves ovate or cordate sometimes 3-partite, cymes panicled leaf-opposed or lateral. Bitter-sweet. Hedges and copses from Isla and Ross southwards ; a denizen in Scotland, Wutson; rather rare in Ireland ; ff. June-Aug.-Glabrous or pubescent. Rootstock extensively creeping. Stem 4-6 ft., trailing. Lewers 1-3 in., acuminate, cordate, or upper hastate or with 2 auricles or petioled pinnules at the base. Flocers many, drooping ; pedicels slender. Calyx-Iobes broad, obtuse. Corolla $\frac{1}{2} \mathrm{in}$. diam., purple or white, lobes revolute. Authers yellow, cohering in a cone. Berry $\frac{1}{2}$ in., ovoid, mueronate, red.-Distrib. Europe, N. Africa, W. Asia to N.W. India ; introd. in N. America.

VAr. mucri'uum, Syme ; stem prostrate branched, leaves fleshy. S. coast.
2. S. ni'grum, L.; annual, stem erect angled usually tubereled, leaves rhomboid-ovate narrowed into the petiole, cymes umbellate lateral.
Waste places from Ayr and Fife southwards; not indigenous in Scotland or Ireland ; fl. July-Oct.-Glabrous or pubescent. Stem 6-24 in., rarely more.
Leaves 1-3 in., sinuate or toothed. Flovers few, drooping; pedicols slender. C'alyx-lobes broad, obtuse. Corolla $\frac{1}{3}-\frac{2}{3}$ in. diam., white ; lobes ciliate, recurved. Berries $\frac{1}{3} \mathrm{in}$. diam., globose, black yellow or red.-Distrib. Widely dispersed in temp. and trop. regions.
Var. 1, nigrum proper ; hairs usually curved upwards, leaves sinuate, berry black.-VAr. 2, minia'tum, Bernh. (sp.); hairs usually. straight, leaves toothed, berry scarlet. Jersey and Guernsey.

3. AT'ROPA, L. DWALE.

A branched herb. Leaves scattered or in pairs, quite entire. Flowers solitary or few, peiluncled, lurid violet or greenish. Calyce 5 -partite. Corolla campanulate, regular ; lobes 5, plaited. Stamens 5, inserted at the bottom of the corolla-tube, filaments filiform ; anthers with slits. Ovary 2-celled ; style simple, stigma peltate; ovules many. Berry 2celled, subtended by the spreading calyx, many-seeded. Seeds reniform, minutely pitted.-Distrib. Europe from Denmark southwards, N. Africa; introd. in N. America.-Еtym. "Atpotos, one of the Fates.

## 1. A. Belladon'na, L.; leaves ovate acuminate. Deadly Nightshade.

Waste places, especially in chalk and limestone soils, oftenest near ruins, from Westmoreland southwards; also rare and near houses in Forfar, Argyle, and Ireland ; fl. June-Aug.-Glabrous or pubescent and glandular: Routstock stout, fleshy, stoloniferous. Stem 2-3 ft., stout. Leaves usually in unequal pairs, larger 3-8 in., contracted into the petiole. Flowers axillary supra-axillary and from the forks, drooping ; peduncles $\frac{1}{2}-1$ in., slender. Calyx $\frac{1}{2}-\frac{3}{4}$ in., lobes broadly ovate. Corolla 1 in ., greenish-purple ; lobes subequal, spreading, acute. Filaments subequal, tip incurved ; anthers pale, included. Berry spheroidal, obscurely 2 -lobed.

## Order LII. plantagin'ere.

Annual or perennial scapigerous herbs. Leaves usually all radical with parallel ribs, rarely cauline and opposite or alternate. Scapes axillary. Flowers small, green, usually spiked, regular, bisexual (1-sexual in Littorella). Sepals 4, persistent, imbricate in bud. Corolla hypogynous, salver-shaped, scarious, tube slender; lobes 4, spreading, imbricate in bud. Stamens 4, inserted on the corolla-tube, alternate with its lobes (hypogynous in Littorella), filaments capillary, inflexed in bud, pendulous in flower, persistent; anthers large, versatile, deciduous. Ovary free, 2-4-celled (1-celled and 1-ovuled in Littorella); style filiform, with 2 lines of stigmatic glands ; ovules solitary and basal, or many and attached by their faces to the septum. Fruit a 1-4-celled, 1- or more-seeded, membranous capsule, bursting transversely (bony and indehiscent in Littorella), seed-bearing septum with free margins. Seeds peltate, albumen fleshy; embryo cylindric parallel to the hilum, cotyledons oblong or linear, radicle inferior.-Distrib. All temp. regions; genera 3; species about 50.Affinities. Altogether doubtful.-Properties. Mucilaginous, unimportant.
Terrestrial. Flowers spiked, 2 -sexual.

1. Plantago.

Aquatic. Flowers few, 1 -sexual
2. Littorella.

## 1. planta'go, $L$. Plantain, Rib-grass.

Perennial or annual herbs. Flowers 2 -sexual, in terminal spikes or heads. Sepals 4. Stamens 4, inserted on the corolla. Ovary $2-4$-celled. Capsule dehiscing transversely. Seeds with a mucilaginous testa.Distrib. of the Order; species about 48.- Etym. the old Latin name.

1. P. ma'jor, $L$.; leaves petioled oblong or ovate-oblong toothed 3-7ribbed, scape short not furrowed, spike very long, sepals free, capsule 2celled $8-16$-seeded, seeds flat in front.
Pastures and waste places, ascending to near $2,000 \mathrm{ft}$. in Northumberland;
f. May-Sept.-Glabrous or hairy. Rootstock stout, truncate. Leaves 2-5 in., petioles broad short, teeth very irregular. Scape about as long as the leaves; spike slender, longer than the scape; bracts equalling the calyx, oblong-ovate, concave, obtuse, glabrous. Sepuls $\frac{1}{5}$ in., obtusely keeled, margins scarious. Corolla-tube glabrous. Filaments short; anthers purple. Seeds black, rough.-Distrib. Europe, N. Africa, N. Asia, W. Asia to the Himalaya ; introd. in N. America.--Seeds used for feeding cage-birds.
2. P. me'dia, $L$. ; leaves subsessile elliptic-oblong toothed $5-9$-ribhed, seape long not furrowed, spike short, sepals free, capsule 2 -celled 2 -seeded, seeds flat in front.
Roadsides and waste places, usually on a dry soil, ascending to $1,600 \mathrm{ft}$. in Northumberland; rare or introduced only in Seotland and Ireland; f1. June-Oct.-Pubescent with jointed hairs. Reotstork tapering. Leaces 6-10 in., very variable. Scupe $6-12 \mathrm{in}$. ; spike 1-3 in. ; bracts often purple, concave, ohtuse, edges silvery, shorter than the glabrous unkeeled sepals. Corollutube glabrous. Filuments long, purple ; anthers whitish. Seeds brown, rough. -Distrib. Europe, N. Africa, Siberia, W. Asia to the Himalaya.
3. P. lanceola'ta, L.; leaves petioled lanceolate entire or toothed 3-6ribhed, seape long deeply furrowed, spike short, 2 dorsal sepals often connate, capsule 2 -celled 2 -seeded, seeds concave in front.
Pastures and waste places, ascending to $2,200 \mathrm{ft}$. in the Highlands; fl. May-
Oct.-Glabrous or pubescent. Rootstock tapering, crown woolly. Letcees
1-12 in., very variable. Scape as long; spike $\frac{1}{2} 3$ in., ovoid globose or
cylindric ; bracts flat, acuminate. Sepals hairy at the tip, 2 dorsal keeled.
Corolla longer than the calyx-tube, glabrous. Stamens long, all white. Nieeds
black, shining.-Distrib. Europe, N. Africa, N. and W. A sia to the Hima-
laya; introd. in N. America.-Leaves formerly employed for dressing sores
in Scotland.

- AR. 1, lanceola'ta proper ; bracts and sepals blackish at the tips.-VAR. 2, Timbe'li, Jord. (sp.) ; bracts and sepals with broad silvery margins. Fields of clover, \&c., not indigenous.

4. P. marit'ima, L.; leaves narrow linear fleshy faintly 3 - 5 -ribbed, scape not furrowed, spike short or long, 2 dorsal sepals connate, capsule 2 -celled 2 -seeded, seeds flat in front.
Salt marshes and mountain streams, ascending to $1,800 \mathrm{ft}$. in the Highlands; f. June-Sept. - Perennial, glabrous or hairy. Routstock woody, branched, woolly at the crown. Leates 1-12 in., $\frac{1}{8}-\frac{1}{2} \mathrm{in}$. diam., very variable, sometimes narrowly lanceolate, quite entire or remotely toothed. Sictpes as long as or longer than the leaves; spikes $\frac{1}{4}-3$ in.; bracts ovate-lanceolate. Sepels nearly glabrous, the 2 dorsal with a toothed keel, margins narrowly scarions. Corolla-tulbe pubescent. Stameens pale yellow. Seeds brown, faintly winged at one or both ends.-Distrib. Europe (Aretic), N. Africa, Siberia, Dahuria, W. Asia to the Himalaya, N. America.
5. P. Corono'pus, $L$. ; leaves narrow linear 1 -ribbed toothed 1-2pinnatifid, seape not furrowed, spike short or long, 2 dorsal sepals with a winged scarious keel, capsule 3 -4-erlled 3 - 4 -seeded, seeds flat in front. Sandy and gravelly places, most common near the sea ; fl. June-Aug.Anmual or hiennial, usually pubeseent with long hairs. Leutes 1-12 in., very variable. Scurpes usually ascending equalling or exceeding the leaves; spikes $\$ 6 \mathrm{in}$.; bracts ovate, long acuminate, much exceeding the obtuse sepals. C'orolla-tube pubescent. Stamens pale yollow. Seeds pale brown.-Distrib. Europe, N. Africa, W. Asia.

## 2. hittorelila, $L$. Shore-weed.

A creeping aquatic perennial herb. Leaves all radical, $\frac{1}{2}$-cylindric. Scapes short, few-flowered; flowers moncecious. Male fl. solitary. Sepals 4. Corolla-tube eylindric, lobes 4. Stumens 4, hypogynous. Ovary rudi-
mentary. Female fl. usually 2 at the base of the male scape. Sepals 3-4, unerqual. Corolla urceolate, mouth 3-4-toothed. Stumens 0. Ovary flagonshaped, 1 -celled ; style very long, rigid ; ovule 1 rarely 2 , erect, campylotropous, flanked by a column of placental tissue. Fruit bony. Seed erect, testa membranous. - Distrib. Europe (Arctic) except Turkey, Azores.-Etym. littus, from growing near shores.

1. L. lacus'tris, L.; leaves fleshy lacunose internally.

Sandy or gravelly edges of lakes and ponds; ascends to $1,600 \mathrm{ft}$. in the High-
lands; fl. Aug.-Glabrous or puberulous, often forming a matted turf.
Rootstock creeping, white, stoloniferous. Leaves 1-4 in., linear-subulate, sheathing at the base. Male fl. Scape axillary, much shorter than the leaves, $1-2$-bracteate below the middle, papillose. Sepals $\frac{1}{3}$ in. obtuse, green, edges scarious. Stamens long; anthers very large, pale. Female fl. subsessile, enclosed in lanceolate bracts.

## Order LIII. SCROPHULARI'NEEE.

Herbs or shrubs (rarely trees). Leaves, lower opposite or whorled, upper alternate, rarely all opposite or alternate and stipulate. Inflorescence various, flowers usually irregular, peduncles 2 -bracteate at the forks. Calyx inferior, usually persistent, 5 -merous. Corolla hypogynous ; lobes 4-5, imbricate or subvalvate in bud. Stamens 4, rarely 2 or 5 , inserted on the corolla-tube, didynamous, with or without a rudimentary 5 th ; anthers 1- or 2-celled. Disk hypogynous, annular glandular or cup-shaped. Ovary 2 -celled; style simple, stigma capitate or 2 -lobed; ovules many, very rarely 2 in each cell, anatropous or amphitropous, placentas on the septum. Fruit a many-seeded capsule, rarely a berry, dehiscence various. Seeds small, testa various, hilum lateral or ventral, albumen fleshy ; embryo straight, rarely curved, radicle next the hilum or lateral.-Distrib. All climates; genera 180; species about 1,800 .-Affinitirs. Many, nearest with Orobanchece, and Solanece.-Properties. A few are purgative, or emetic, or intensely bitter or very poisonous.
SUB-ORDER I. Antirrhi'nidere. Corolla with the posticous (upper) lobes external in bud.
Tribe I. Verbas'cem. Leaves alternate. Inflorescence centripetal. Corolla rotate. Stamens 5, declinate, unequal...............1. Verbascum.
Tribe II. ANTIRRHi'NEete. Lower leaves or all opposite or whorled. Inflorescence centripetal. Corolla personate, tube saccate or spurred. Capsule opening by pores.
Corolla spurred at the base.
2. Linaria. Corolla saccate at the base 3. Antirrhinum.

Tribe III. Chelo'nefe. Inforescence composite. Corolla not spurred or saceate. Capsule 2-4-valved.................................4. Scrophularia.
Tribe IV. Grati'oleese. Inflorescence centripetal. Corolla not spurred or saceate. C'apsule 2-valved .......................................4*. Mimulus.
SUb-order II. Rhinan'thideæ. Corolla with the posticous (upper) lobes never exterior in bud.

Tribe V. SIBTHORP'IE正. Flowers axillary. Leaves alternate. Corolla short, subregular. Stamens 4, nearly equal.

$$
\text { Leaves fascicled, linear. Anthers } 1 \text {-celled .....................5. Limosella. }
$$

Leaves alternate, orbicular. Anthers sagittate, 2 -celled.....6. Sibthorpia.
Tribe Vi. digita'leme. Intlorescence centripetal. Leaves alternate, lower petioled. Stamens 2 or 4; no rudiment of a 5th ......7. Digitalis.
Tribe VII. Veron'icere. Inflorescence centripetal. Leares opposite. Corolla almost regular. Stamens 2, diverging .
8. Veronica.

Tribe VIII. EUPHRA'SIEfe. Inflorescence centripetal. Leaves usually opposite. Corolla 2 -lipper. Stamens 4, converging.
Leaves opposite. Seeds many, small, not winged. Upper corolla-lip entire or notched...................................9. Bartsia. Upper corolla-lip with 2 spreading or reflexed lobes .......10. Euphrasia.
Leaves opposite. Seeds few, compressed, winged .........11. Rhinanthus.
Leaves alternate. Seeds many, small, not winged..........12. Pedicularis.
Leaves opposite. Seeds 1-2 in each cell, not winged....13. Melampyrum.

## 1. verbas'cum, L. Mullein.

Tall, erect, usually biennial, tomentose or woolly herbs. Leaves alternate. Flowers fascicled in simple or compound racemes, red yellow or purple, rarely white. Calyg 5 -partite. Corolla rotate ; segments 5 , nearly equal. Stamens 5, 3 posterior filaments bearded ; anthers adnate, cells confluent. Stigma undivided or 2 -lamellate. Capsule septicidally 2 -valved, many-seeded. Seeds pitted.-Distrib. Chiefly Europe and W. Asia; species about 80.-Etym. A corruption of Barbaseum, the old Latin name. The following hybrids occur ; their names indicate their parentage : ThapsoLychnitis, Thapso-nigrum, nigro-pulverulentum, nigro-Lychnitis.

1. V. Thap'sus, $L$. ; densely woolly, eglandular, stem terete simple, leaves very decurrent, flowers in a dense simple woolly spike.
Waste dry places, local, from Arran and Forfar southwards, and in Ireland ; often an escape ; a denizen in Seotland, Wutson; fl. June-Aug.-Ntem 2-3ft., stout. Radical leares 6-18 in., obovate-lanceolate, entire or crenate; cauline oblong, acute, upper acuminate. Spike 6-10 in. ; bracts longer than the flowers. Corolla $\frac{-1}{1} \mathrm{in}$. diam., woolly externally. Filaments with white hairs; anthers of long stamens slightly decurrent. Seeds ribbed.-Distrib. Europe, Siheria, W. Asia, Himalaya; introd. in N. America. - Wool formerly used for lamp-wicks.
2. V. Lychni'tis, L. ; stem angled, leaves stellately-pubescent, racemes panicled narrow, flowers small whitish, hairs of filaments white.
Waste places, from Suffolk, Stafford, and Denbigh southwards ; an escape in
Scotland; a native? Wutson; fl. July-Aug.-Stem $2-3 \mathrm{ft}$. Rudical leuves
4-10 in., petioled, oblong-lanceolate, obtuse, coarsely crenate, green above, white below; cauline sessile, ovate, acuminate. Racemes erect, manyflowered. Floners $\frac{1}{3} \mathrm{in}$. diam., several to each bract. Calyx small, very woolly. Anthers not docurrent. Style slender. Capsule small, ovoid.-Distrib. Europe from Denmark southwards, W. Asia ; introd. in N. America.
3. V. puiverulen'tum, Vill.; mealy, stem terete, leaves stellatelypubescent, racemes panicled pyramidal, flowers yellow, hairs of filaments white.

Waste places in Norfolk and Suffolk, especially about Norwich ; a native? Watson ; fl. July.-Habit of V. Lychnitis, but leaves much broader, sessile, with small crenatures and more matted with woolly hairs ; cauline cordate. Flowers $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam., several to each bract, bright yellow. Depuls small, lanceolate. Anthers not decurrent. Capsule small, ovoid.-Distrib. Europe from Belgium southwards, excl. Greece and Russia.
4. V. ni'grum, $L$. ; stem angular, leaves stellately pubescent, raceme nearly simple, flowers yellow, hairs of filaments purple.
Waste places, fields, \&c. from Notts and Stafford southwards, but often an escape ; H1. June-Oct.-Ntem 2-3 ft., and whole plant covered with long hairs, not so matted as in the former species. Radical leaves sometimes 1 ft ., ovate-oblong or oblong-lanceolate, often cordate, petioled, crenate ; cauline, except the upper, petioled, ovate-cordate, hardly white below. Puceme $1-1 \frac{1}{2}$ ft., slender, erect. Flowers $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam., many to each bract, pedicelled. Anthers not decurrent. Sepals small, lanceolate, tomentose. -Distrib. Europe, Siberia.
5. V. Blattária, L. ; nearly glabrous, stem subangular, panicle with slender branches glandular, flowers yellow, hairs of filaments purple.
Waste places, rare, from Norfolk and Stafford southwards, and in S. and W. of Ireland; probably always an escape; a denizen or alien, Wutson; fll. June-Oct. - Stem 8 in . to 4 ft ., rather slender, simple or branched. Rudicul leaves 4-10 in., oblong-lanceolate, obtuse, crenate lobulate or subpinnatifid; cauline small, sessile, ovate or oblong, acute or acuminate, sometimes cordate, irregularly toothed or suberenate. Flowers $\frac{3}{4}-1 \frac{1}{4} \mathrm{in}$. diam., bright yellow, lax or dense ; lower bracts leafy ; peduncles $\frac{1}{4}-1 \mathrm{in}$. Sepals oblong, often large. Anthers of long stamens decurrent. Cupsule nearly globose. -Distrib. Europe from Holland southwards, N. Africa, W. Asia to the Altai and Himalaya; introd. in N. America.
Sub-sp. blatta'ria proper ; upper leaves not decurrent, racemes lax-flowered, pedicels solitary slender longer (often much) than the calyx. - Native (?) of S.W. England, probably introd. elsewhere.

Sub-sp. virga'tum, With. (sp.) ; more glandular, upper leaves shortly decurrent, racemes dense-flowered, pedicels more fascicled shorter than the calyx.

## 2. Lina'ria, Tonernef. Toad-flax.

Herbs, rarely shrubby. Lower leaves opposite whorled or alternate. Flowers in bracteate racemes or spikes, rarely axillary and solitary. Calyx 5-partite. Corolla personate, tube spurred; upper lip erect; lower with the mid-lobe smallest ; palate sometimes closing the throat. Stamens 4 fertile, 5 th 0 or rudimentary ; anthers oblong. Stigma notched or 2 -lobed. Capsule ovoid or globose; cells nearly equal, dehiscing by simple or toothed pores. Seeds angled or rugose, sometimes discoid and winged. Distrib. Europe, W. Asia ; species 100.-Etym. linum, Alax, which some sp. resemble. - F'lowers sometimes regular (Peloria), with 5 spurs and lobes to the corolla and 5 stamens.

Section 1. Cymbala'ria, Chav. Trailing and creeping. Peduncles axillary, 1-flowered. Spur short ; palate not projecting. C'apsule dehiscing by small 3 -fid valves.
L. Cymbala'ria, Mill.; glabrous, leaves petioled subsucculent broadly reniform irregularly 3-7-angled or -lobed. Ivy-leaved T'oad-flax.

Old walls, from the Forth and Clyde southwards, and in Ireland; an alien, Watson ; fl. May-Sept.-Perennial. Brunchess 6-24in., slender. Leaces $\frac{1}{2} \frac{3}{4}$ in. diam.; lobes acute. Flowers $\frac{1}{3}$ in., blue-purple ; peduncles slender. Nvects linear-lanceolate. Palate yellow, closing the throat. C'upsule small, globose. Seeds wingless, testa wrinkled.-Distrib. Europe from Holland southwards, excl. Turkey.-Eaten as a salad in S. Europe.
Section 2. Elatinoi'des, Chav. Diffuse. Peduncles axillary, 1flowered. Spur as long as the corolla; palate projecting. Cupsule dehiscing by pores which are furnished with deciduous valves.

1. L. spu'ria, Mill.; hairy or villous and glandular, leaves shortly petioled ovate or orbicular entire or obtusely toothed. Male Fluellin.
Sandy and chalky cornfields, from Lincoln and Notts southwards ; a colonist, Wutson; fl. July-Oct.-Annual. Stem 4-18 in., erect; branches many, prostrate, slender. Leaves $\frac{1}{2}-1 \mathrm{in}$., opposite or alternate, ravely cordate, acute or apiculate. Peduncles longer than the leaves. Sepals oblong or ovate-cordate. Corolla $\frac{1}{3} \mathrm{in}$., yellow, throat purplish above ; spur at right angles to the tube. Fifih stamen a small seale. Capsele subglobose. Needs with broad deep pits.-Distrib. Europe from Holland southwards (exel. Turkey), N. Africa, W. Asia ; introd. in N. America.
2. L. Elat'ine, Mill.; hairy or villous and slightly glandular, leaves shortly petioled, cauline alternate broadly hastate acute.
Sandy and gravelly cornfields, from Anglesea and Yorkshire southwards; S. and W. of Ireland, rare ; a native or colonist, Wutson ; fl. July-Oct.-Annual. Branches 6-30 in., many from a very short stem, prostrate, very slender. Leaves, radical and lower opposite, ovate ; cauline $\frac{1}{4}-1$ in., sometimes toothed towards the very acute basal lobes. Pecluncles capillary, longer than the leaves, curved at the top. Sepals oblong-lanceolate. Corolla $\frac{1-\frac{1}{3} \mathrm{in} ., \text { yellow : }}{}$ upper lip purple within. Cupsule globose. Seeds much as in L. spuria.-Distrib. Europe from Denmark southwards, N. Africa to Abyssinia, W. Asia to the Himalaya; introd. in N. America.
Section 3. Linarias'trum, Chav. Flowers racemed. Spur long or short ; palate prominent. Capsule $4-10$-valved at the top.
3. L. vulga'ris, Mill. ; perennial, erect, almost glabrous glancous, leaves linear or lanceolate, sepals ovate or lanceolate shorter than the spur or capsule, corolla yellow.
Waste ground from Moray and Dumbarton southwards, rarer in Ireland ; ft. July-Oct. - Rentstock creeping. Stem 1-2 ft., stout or slonder, leafy. Letces $1-3 \mathrm{in}$., often whorled. Ruceme dense-flowered; pedicels variable; bracts linear. Corolla ${ }^{3}$ - $1 \mathrm{in}$. ; spur short in a line with and as long as the tube, acute. Capsule broadly ohlong. Seeds scabrous, winged.-Distrib. Europe (Arctic), excl. Turkey, Siheria, Dahuria; introd. in N. America.-A reputed purgative and diuretic.
VAR. 1, vulga'ris proper; leaves obscurely 3 -nerved, raceme glandular-pubescent, sepals ovate-lanceolate.-VAR. 2, lutifóliu, Bah.; leaves 3-1erved, raceme glabrous, bracts foliaceous, sepals lancenlate, corolla $1 \frac{1}{2}$ in. $L$. speciosa, Bromf.-Isle of Wight and Kent.
4. L. Pelisseria'na, Mill.; annual, erect, glahrous, leaves linear, sejals subulate shorter than the slender spur longer than the capsule, corolla purple.

Near St. Ouen's Pond, Jersey ; fl. June-July.-Small, 6-10 in., with short barren stolons at the base. Leaves on the stolons oblong, $\frac{1}{4} \frac{-1}{2}$ in., opposite and whorled in threes ; cauline $\frac{3}{4} \mathrm{in}$., scattered, linear, obtuse. Raceme short, few-flowered; bracts longer than the pedicels. Corolla $\frac{2}{3} \mathrm{in}$.; spur in a line with the tube, acute. Capsule broad, 2-lobed. Seeds flat, winged, tubercled on one face, wing fimbriate.-Distrib. Europe from Belgium southwards, W. Asia.
5. L. re pens, Ait. ; perennial, creeping, glabrous, sepals lanceolate as long as the spur shorter than the capsule, corolla violet. L. striuta, DC.
Waste places, from Westmoreland, Oxford, and Gloucester southwards, rare; naturalized north of this and in Scotland ; S. and E. of Ireland, very rare ; fl. July-Sept. - Rootstock slender, creeping. Stems 1-3 ft., many, very slender, branched, leafy. Leaves $\frac{2}{3}-1 \frac{1}{2}$ in., whorled or scattered, narrowly linear-lanceolate. Racemes elongating; bracts very small. Corolla $\frac{1}{2} \mathrm{in}$.; spur almost in a line with the tube, obtuse. Capsule broad, compressed. Needs angled, wrinkled transversely.-Distrib. Europe, excl. Turkey and Greece.-A hybrid (L. sepium, Allman.) occurs between this and L. vulgaris.
SECTION 4. Chænorrhínum, DC. Flowers axillary or racemed. Spuir short ; palate depressed ; upper lip horizontal.
6. L. mi'nor, Desf.; leaves alternate linear or oblong-lanceolate.

Cornfields in chalky and sandy soils, from Lanark and Roxburgh southwards, but local ; S. and E. of Ireland, very rare ; a colonist, Wutson; fl. May-Oct.-Annual, glandular-pubescent. Stem 6-18 in., slender; branches ascending. Leaves $\frac{1}{2}-1 \mathrm{in}$. Pedrucles axillary, longer than the leaves. Nepals linear-oblong. Corolla scarcely exceeding the calyx, $\frac{1}{4} \mathrm{in}$., pale purple; lower lip whitish ; palate yellow ; spur short. Capsule gibbous at the base, cells subequal, opening by ragged pores. Seeds truncate, furrowed.-Distrib. Europe (excl. Turkey), N. Africa.

## 3. antirrhi'num, Tournef. Snapdragon.

Annual or perennial herbs. Leaves entire, rarely lobed, lower opposite, upper alternate. Flonvers solitary and axillary, or racemose and bracteate. Culyx 5-partite. Corolla personate, tube saccate, compressed ; upper lip erect; lower spreading, mid-lobe smallest; palate broad, bearded, closing the throat. Stamens 4 fertile, 5th rudimentary or 0; anther-cells oblong. Stigma shortly 2 -lobed. Capsule 2 -celled, upper cell bursting by one pore, lower by 2 many-toothed pores, rarely globose with 1 pore to each cell. Seeds minute, oblong, truncate, rugose or pitted.-Distrib. Europe, W. Asia; species 11.-Erym. àv $\hat{i}$ and piv, from the snout-like flower.

1. A. Oron'tium, $L$.; low, annual or biennial, leaves linear-lanceolate, raceme leafy or flowers axillary, sepals longer than the corolla.
Cornfields, from Norfolk and Anglesea southwards; very rare in Ireland ; a colonist, Watson; fl. July-Oct.-Glabrous below, usually glandular-pubescent above. Stem 6-18 in., much branched from the base. Letues 1-2 in., sessile, sometimes ciliate. Bracts leafy ; pedicels short, erect. Sepals $\frac{1}{2} 1 \mathrm{inn}$.,
very narrow, spreading. Corolla $\frac{1}{2} \frac{2}{3} \mathrm{in}$., rose-purple. C'apsule $\frac{1}{2}$ in., pubescent.
Sireds compressed, concave on one face, 1 -ribbed on the other, margin thickened.-Distrib. Europe from Denmark southwards, N. Africa, Siberia, W. Asia to N.W. India ; introd. in N. America.
A. ma'sus, $L$.; tall, perennial, leaves lanceolate-oblong or linear, raceme bracteate glandular-pubescent, sepals short.
Old walls; an alien, Watson; fl. July-Sept.-Erect, branched, shrubby and glabrous below, above glandular-pubescent. Leaves 1-3 in., very variable. Rucemes dense-flowered; bracts ovate, acuminate ; pedicels erect. Sepals unequal, very obtuse. Corolla $1 \frac{1}{2} \mathrm{in}$., purple white yellow or crimson ; palate yellow. Capsule $\frac{1}{2}$ in., glandular. Seeds ribbed and muricate.-DIsTRIB, Europe from Holland southwards; introd. in N. America.-Seeds yield oil in Russia. Leaves, \&c. bitter and stimulant.

## 4. SCROPHULA'ria, Tournef. Fig-wort.

Herbs, often feetid. Leaves opposite, or the upper alternate, entire or divided, often with pellucid dots. Flowers in panicled thyrsoid cymes, greenish-purple or yellow ; peduncles glandular-pubescent. Calyx 5 -partite. Corolla-tube oblong or ventricose ; lobes short, 4 upper erect, lowest spreading. Stamens 4, 5th usually rudimentary, declinate ; anther-cells adnate to the filaments, confluent, bursting tramsversely. Disk oblique. Stigma notched. Capsule acute, septicidally 2 -valved; valves entire or 2 -fid. Sceds ovoid, rugose.-Distrib. Europe, temp. Asia, N. Africa, rare in America; species about 80. - Етym. In reference to its former use in Scrofula.

Section 1. Scrophula'ria proper. Sepals obtuse. Corolla purplish, throat not contracted, upper lobes longer than the lateral. Stamens 4 , included, 5 th reduced to a seale on the upper lip.

1. S. nodo'sa, L. ; glabrous below, stem acutely 4 -angled, leaves ovate or triangular-cordate acutely doubly-serrate, border of sepals narrow. Shady places, from Ross and Harris southwards, ascending to $1,500 \mathrm{ft}$. in Yorkshire ; fl. July-Oct.-Rootstock tuberous, nodose. N'tem $1-3 \mathrm{ft} .$, simple. Lences $2-4$ in., shortly petioled, acute or acuminate, nerves strong, teeth largest near the base. C'ymes lax; bracts linear acute, lower leafy ; pedicels erect, slender, glandular at the base. Flowers $\frac{1}{3}$ in., green or brownish; scale of upper lip notched. Capsule broadly ovoid, acuminate. Seeds rugose, brown.-Distrib. Europe, Siberia, W. Asia, N. America.
Sub-sp. ala'ta, Gilit). (sp.); laxer, upper part of stem broadly winged, bracts foliaceous. S. umbrosa, Dumort ; S. Elirharti, Stev.
2. §. aquatica, $L$.; glabrous below, stem 4 -winged, leaves oblonglanceolate obtuse or acute doubly crenate-toothed, petiole winged, border of sepals broad. S. Balbisiv, Hornem.
Ditchos and edges of ponds, \&c. from the Clyde and Berwick southwards; local in Ireland ; fl. July-Sept.-Rootstock stout, creeping. Stems 2-4 ft., petioles winged and lobed or leaves pinnatisect below. Letues $3-8 \mathrm{in}$., lower cordate at the base, glabrous or pubescent, teeth largest upwards. Panicles large, erect; cymes opposite, dichotomously branched, densely many-flowered; lower bracts small, linear. Corulla $\frac{1}{4}-\frac{1}{2}$ in., greenish below, brown above; upper lip 2 -fid with a broad entire scale. Cupsule small, ovoid, aciminate.-DISTRIB. Europe from Denmark southwards, N. Africa, Siberia, W. Asia to the Himalaya.
3. S. Scorodónia, L.; glandular-pubescent, stem obscurely 4-angled, leaves ovate or triangular-ovate doubly crenate, petiole not winged, border of sepals broad.

Shaded places, Cornwall, Devon, Jersey, Guernsey ; fl. July-Aug.-Rootstock creeping. Stem $2-4 \mathrm{ft}$., simple. Leaves $1 \frac{1}{2}-4 \mathrm{in}$., coarsely crenate-serrate, usually deeply cordate, much wrinkled. Cymes corymbose, in long lax panicles; bracts leafy; pedicels slender. Corolla $\frac{1}{2}$ in., dull purple; upper lip 2-partite; seale broad, entire or notched. Capsule subglobose or ovoid, acuminate. -Distrib. Belgium, W. France, S. Europe, N. Africa.
Section 2. Ceraman'the, Reich. Sepals linear-oblong, subacute. C'orolla yellow, throat contracted ; lobes nearly equal. Stamens 4, exserted, 5 th absent.
S. verna'lis, $L$.; glandular-hairy, stem obscurely 4 -angled, leaves broadly ovate or deltoid, petioles not winged, sepals not bordered.
Waste places, very local ; absent from Ireland ; a denizen, Watson; fl. April-June.-Pale green, flaceid. Rootstock creeping. Stems $1 \frac{1}{2} 4 \mathrm{ft}$. Leaves 2-3 in., deeply doubly-crenate or lobulate. Cymes subumbellate, on axillary peduncles arranged in a terminal leafy panicle ; pedicels short or slender; bracts and bracteoles leafy. Corolla urceolate. Capsule broadly ovoid, acuminate.-Distrib. Europe, excl. Spain Greece and Turkey.

## 4*. MIM'ULUS, L.

Erect or decumbent herbs. Leaves opposite. Flowers solitary, axillary. Calyx tubular, 5 -angled, 5 -toothed. Corolla 2 -lipped; upper lip erect or reflexed, 2 -lobed; lower spreading, 3 -lobed; throat usually with 2 swellings ; lobes flat, rounded. Stamens 4 ; anther-cells subconfluent. Stigma with 2 equal iamellæ. Capsule loculicidally 2 -valved, valves separating from a seed-bearing column, many-seeded. Seeds minute, oblong.-Disthib. American, a few Australian and New Zealand; species 30.-Etym. $\mu \mu \omega^{\prime}$, an ape, from the form of the corolla.
M. Lu'teus, $L$.; suberect, leaves ovate-oblong coarsely toothed.

River-sides, \&ce., ascending to $1,000 \mathrm{ft}$., from Skye southwards, and in Ireland; naturalized from N. America ; fl. July-Sept.-Glabrous or glandular-pubescent. Stems $\frac{1}{2}-3 \mathrm{ft}$, with many prostrate barren shoots, stout, hollow, terete. Leaves $\frac{1}{2}-3 \frac{1}{2}$ in., $6-9$-nerved; lower petioled with of cen a few lobes on the petiole ; upper sessile. Floxers 1-2 in., yellow ; peduncles slender, exceeding the leaves. Calyx-teeth short, upper longest. Capsule enclosed in the intlated calyx, ovoid, compressed.-Distrib. N. America.

## 5. himoselíla, L. Mudwort.

Very small, tufted, creeping, glabrous, annual, aquatic herbs. Leaves narrow, fascicled at the nodes, rarely alternate, petiole dilated at the base. Flowers minute, ebracteate, axillary, solitary. Calyx campanulate, 5 -toothed. Corolla subcampanulate, tube short, limb 5 -fid. Stamens 4 ; anther-cells confluent. Style short, stigma clavate. Capsule septicidally 2 -valved, valves entire, septum incomplete. Seeds grooved and transversely rugose.-Distrib. All temp. and cold latitudes.-Etym. limus, mud.

1. L. aquat'ica, L.; leaves narrow-oblong-lanceolate or spathulate.

Edges of ponds from Kincardine southwards, but very rare in Scotland; unknown in Ireland ; fl. July-Sept.--Rootstock filiform. Leaves 1-2 in., tufted. Petiole long. Peduncles shorter than the leaves, recurved in fruit. Corolla th in., pink or white. Capsule globose.

## 6. SIBTHOR'PIA, $L$.

Slender, creeping, hairy herbs. Leaves petioled, alternate or fascicled, reniform, lobulate. Flowers yellow or pink, very small, axillary, solitary, ebracteate. Calyx $4-8$-fid. Corolla subrotate, $5-8$-fid. Stamens as many as the corolla-lubes or one fewer; anthers sagittate, cells contiguous at the top, not confluent. Stigma capitate. Cupsule membranous, compressed, loculicidally 2 -valved. Seeds dorsally convex, flat or concave on the ventral face, hilum ventral. - Distrib. Europe, N. and W. trop. Africa, Andes ; species 4 or 5.-Etym. Dr. H. Sibthorp, an Oxford Professor of botany.

1. S. europæ' $\mathbf{a}$, L.; leaves 7-9-lobed, pedicels short.

Moist shady banks, very rare; S. Wales, and from Sussex (formerly) to
Cornwall, Channel and Scilly Is.; Kerry in Ireland ; fl. July-Oct.-Huirs
flaceid, jointed. Stem 6-14 in., filiform, creeping. Leates $\frac{1-3}{4} \mathrm{in}$. diam.,
membranous; lobes broad, rounded or retuse. Florers minute ; peduncle
short. C'alyx-lobes lanceolate. Corolla pink, two smaller lobes yellowish.
C'apsule very small.-Distrib. W. France, Spain, Greece, Turkey, Azores.

## 7. DIGITA'Lis, L. Foxglove.

Tall, biennial or perennial herbs, rarely shrubs. Lower leaves crowded, petioled; upper alternate. Flowers in a long terminal raceme, purple orange yellow or white, spotted inside; throat bearded. Calyx 5 -partite. Corolla deelinate, tube campanulate or ventricose, constricted above the base ; upper lobe short, spreading, notched or 2 -fid ; lower longer, horizontal. Stamens 4, ascending; anthers in pairs, cells diverging confluent. Stigma 2 -lobed. Capsule septicidally 2 -valvel, valves entire with inflexed margins, separating from the seed-bearing column. Seels minute, oblong, angled.-Distrib. Europe, N. Africa, W. Asia; species 18.Etym. digitus, a finger.

1. D. purpu'rea, L.; leaves ovate-oblong or lanceolate crenate.

Copses, banks, \&c., ascends to near 2,000 ft. in the Highlands ; fl. July-Sept. -Glandular-pubescent and hoary. Stems 2-4 ft., stout, erect, rarely branched. Leaves) 6-12 in., rugose above, radical petioled; upper cauline sessile. Raceme $1-2 \mathrm{ft}$., elongate, secund, dense-tlowered; bracts leafy ; pedicels short, 1 -flowered. Florers pendulous. Culyp-loles oblong-lanceolate. Corolla $1 \frac{1}{2}-2 \frac{1}{2} \mathrm{in}$., purple spots, speekled with ocellated ravely white ; lobes ciliate. Cupsule ovoid, exceeding the calyx. Seeds alveolate. -Disthib. Europe. excl. Greece and Turkey.-A well-known drug.

## 8. VERON'iCA, L. Speedwell.

Herbs or shrubs. Leaves lower or all opposite, rarely whorled. Flower's in axillary or terminal racemes, rarely solitary, usually blue, never yellow. Calyx 4-5-partite. Corolla rotate or subrampanulate: limb 4-fid, spreading, lateral lobes usually narrower. Stamens 2 , inserted on the corolla-tuhe at the sides of the upper lobe, exserted ; anther-cells diverging, or parallel and confluent at their tips. Stigme subcapitate. Capsule compressed or turgid, septi- or loculicidal. Sceds ovoid or orbicular, peltate, smooth or rugulose.-Distrib. North temp. regions, Australia, New Zealand; species about 160.-Etym. obscure.

Section 1. Omphalo'spora. Annual. Peduncles 1-flowered, solitary, axillary in alternate leaf-like bracts. Seeds cup-shaped.

1. V. agres'tis, L.; prostrate, slightly hairy and glandular, leaves petioled ovate-cordate coarsely serrate, sepals ovate or oblong, capsule suborbicular deeply 2 -lobed, cells $4-10$-seeded.
Waste places, ascending to $1,200 \mathrm{ft}$. in Northumberland ; fl. April-Sept.Branches 4-8 in., slender. Leaves $\frac{1}{3}-\frac{4}{3} \mathrm{in}$., obtuse ; floral similar, about as long as the decurved pedicels. Sepals $\frac{1}{4}$ in., ciliate, 3 -nerved, $\frac{1}{2} \mathrm{in}$. when in fruit, unequal. Corolla $\frac{1}{6}-\frac{1}{3} \mathrm{in}$. diam., shorter or longer than the sepals. Capsule $\frac{1}{4}$ in. diam.-Distrib. Europe, N. Africa, W. Asia to the Altai and the Himalaya; introd. in N. America.
Sub-sp. AGRES'TIS proper ; leaves $\frac{1}{3}-\frac{2}{3}$ in., serratures regular not deep, sepals linear-oblong, corolla pale-blue or white, seeds $4-5$ in each cell.
Sub-sp. poli'Ta, Fries (sp.); leaves $\frac{1}{4} \frac{1}{2} \mathrm{i}$. broader, serratures deeper and rather irregular, sepals ovate subacute, corolla bright blue, seeds $8-10$ in each cell.
V. Buxbau'mir, Ten.; prostrate, hairy, eglandular, leaves shortly petioled oblong or ovate-cordate coarsely serrate, sepals lanceolate subacute spreading in fruit, lobes of the capsule diverging, cells 5-8seeded.
Fields from Moray southwards, ascending to $1,000 \mathrm{ft}$. in Northumberland; * also in Ireland ; an alien becoming a colonist, Watson; A. April-Sept.Brauches 6-12 in., tips often ascending. Leaves $\frac{1}{3}-1 \frac{1}{3} \mathrm{in}$., obtuse, petioles variable ; floral similar, shorter than the decurved pedicels. Sepuls usually large, ciliate, $5-7$-ribbed and reticulate in fruit. Corolla $\frac{1}{2} \mathrm{in}$. diam., bright blue. Cupsule $\frac{1}{2} \mathrm{in}$. diam., reticulate and glandular-pubescent.-DISTRIB. Europe from Belgium southwards, N. Africa, W. Asia to the Himalaya; introd. in N. America.
2. V. hederæfo'lia, L.; prostrate, pubescent, leaves petioled very broadly-ovate $5-7$-lobed, sepals cordate ciliate exceeding the corolla, cells of the didymous capsule 1-2-seeded.
Cultivated ground ; fl. March-Aug.-Branches 6-18 in. Leaves $\frac{1}{3} \frac{2}{3}$ in. broad, petioles dilated upwards, lobes rounded obtuse ; floral similar, about equalling the decurved or straight peduncles. Flowers appearing in succession as the branch lengthens. Sepals acuminate, membranous. Corolla $\frac{1}{6} \mathrm{in}$. diam., pale blue. Seeds large, rugose, with a small deep pit on the inner face.-
Distrib. Europe, N. Africa, W. Asia ; introd. in N. America.
3. V. triphyl'ios, $L$.; suberect, glandular-pubescent, leaves small, upper incised, lower petioled, sepals linear-oblong, cells of the obcordate capsule many-seeded.
Sandy fields, Norfolk and Suffolk, also York and Doncaster ; fl. May-June.-
Stem 3-8 in., rigid, branches few. Leaves $\frac{1}{4} \frac{1}{2}$ in. long and broad, palmately 3-7-lobed ; lobes entire, obtuse, oblong or linear; floral subdigitate. Flowers
few, subracemose ; bracts 3-5-partite ; peduncles slender, ascending. Sepals
subequal, obtuse. Corolla $\frac{1}{4}$ in. diam., dark blue. Capsule \& in. diam., as
broad as long, deeply-lobed, glandular. Seeds rugose.-Distrib. Europe
from Gothland southwards, N. Africa, W. Siberia, W. Asia to N.W.
India.

Section 2. Veronicas'trum. Leares all opposite, or floral alternate. Flovers in terminal racemes. Crapsule flat, valves adhering to the axis. siceds plano-convex, turgid or compressed.
4. V. arven'sis, $L$.; annual, erect or ascending, pubescent, leaves ovate-cordate irregularly crenate-serrate, bracts alternate, pedicels short, capsule obcordate, seeds 6-7 in each cell nearly flat.
Dry sandy, \&c. places, ascends to near 2,000 ft. in Yorkshire ; fl. May-Oct.Branches 4-18 in., stiff, 2 -fariously pubescent, of ten very long and simple. Leave8 $\frac{1}{3} \frac{3}{4}$ in., mostly sessile, lower petioled, serratures few obtuse. Bracts alternate, often very crowded in dense leafy cylindric racemes, linear or oblong-lanceolate, obtuse, entire or obscurely lobed, exceeding the flowers. Sepals narrow, obtuse, ciliate. Corolla minute, pale blue with a white eye. style very short. Capsule $\frac{1}{8}-\frac{1}{\frac{1}{5}} \mathrm{in}$. broad, glandular, shorter than the sepals. -Distrib. Europe, N. Africa, Siboria, W. Asia ; introd. in N. America.
5. V. ver'na, L.; annual, erect, glandular-pubescent, leaves lobed or pimatifid, bracts lanceolate entire, pedicels short, capsule deeply obcordate, seeds 6-7 in each cell flat.
Sandy fields in Norfolk and Suffolk; fl. May-June.-Habit of V. arcen'sis, but always small, $2-4 \mathrm{in}$., densely leafy and more glandular-pubescent ; flowers always much crowded ; capsule and seeds much the same in both.Distrib. Europe, Siberia, W. Asia to N. W. India.
6. V. serpyllifo'lia, L. ; perennial, ascending, stem glandular-pubescent, leaves subentire, racemes many-flowered, pedicels short erect, style as long as the didymous flat capsule, seeds plano-convex minute.
Fields, moist waste places, \&c., ascends to $2,500 \mathrm{ft}$. in the Highlands; f. May-June.--Much branched from the base; branches $3-10 \mathrm{in}$. Lewrex $\frac{1}{2}-\frac{4}{2}$ in., sessile, ovate-rotundate or oblong, obtuse, rather coriaceous. Huceme $1-4 \mathrm{in}$.; bracts alternate, quite entire, lower leaf-like, upper narrow. Stpuls oblong-obovate, obtuse, ciliate, shorter than the corolla. C'orolle $\ddagger \mathrm{in}$. diam., white or lilac. C'apsule shorter than the sepals, glabrous.-Disthib. Europe (Arctic), N. Africa, N. Asia, W. Asia to the Himalaya, N. America.
Vir. lumifu'su, Dicks. (sp.); decumbent, rooting at the nodes, leaves entire. Hlowers few, corolla blue, capsule glandular-pubescent. Alps of Scotland, Denbigh ? and Northumberland ? ascending to 3,700 ft. in the Highlands.
7. V. alpína, L.; perennial, erect, glandular-pubescent above, leaves ovate entire or serrulate, raceme corymbose few-flowered, bracts alternate, pedicels short erect, eapsule obovate notched, seeds plano-convex.
Springs and rills on the high Scotch Alps, rare, from 2,000 to $3,700 \mathrm{ft}$.; ff. July-Aug. - Resembles 1. serpyllifólia, but more erect; leaves rather larger ; tlowers fewer, in a denser raceme ; sepals narrower, subacute, half as long as the obscurely notched capsule; corolla dark blue ; style short, and seeds larger.-Distrib. Arctic, N. and Alpine Europe, Asia, and America.
8. V. saxat'ilis, L. ; perennial, decumbent, subglabrous, lower leaves olovate, upper oblong, raceme subcorymbose few-flowered, bracts subopposite, pedicels long erect, style long, capsule oblong, seeds nearly flat.
High Scotch Alps of Clova, Braedalbane, Ben More and Ben Cruachan,
alt. 2,000-3,000 ft., rare ; fl. July-Sept.-Stem woody ; branches many 2-4 in., ascending, with leafy barren shoots. Leaves $\frac{1}{4} \frac{1}{2} \mathrm{in}$., coriaceous, teeth very few or 0 . Pedicels stiff, $\frac{1}{3} \frac{1}{2} \mathrm{in}$. Sepals linear-oblong, obtuse, shorter than the capsule. Flowers $\frac{1}{2}$ in. diam., bright blue, very beautiful. Style short, slender. Capsule $\frac{1}{4} \mathrm{in}$., exceeding the sepals.-Distrib. Arctic, N. and Alpine Europe, Greenland.

Section 3. Chama'drys. Perennial. Branches diffuse, ascending. Leaves all opposite. Racemes axillary. Capsule flat, notched or 2-lobed, valves adhering to the axis. Seeds plano-convex or turgid.
9. V. officina'lis, L.; glandular-pubescent or subglabrous, stem hairy all round, leaves shortly petioled obovate-oblong or orbicular serrate, pedicels very short, capsule triangular or obcordate truncate or retuse.
Banks and pastures, especially in hilly regions; ascends to near $3,000 \mathrm{ft}$. in the Highlands ; fl. May-July.-Decumbent; branches 2-18 in., ascending. Leaves $\frac{1}{-1} \mathrm{in}$. , contracted into the petiole, sharply or obtusely serrate. Racemes slender, many-flowered ; peduncles erect; bracts lanceolate or subspathulate, obtuse. Sepals linear-oblong. Corolla $\frac{1}{6} \mathrm{in}$. diam., pale blue or lilac. Style very long. Capsule $\frac{1}{6}$ in., much longer than the sepals. Seeds nearly flat.-Distrib. Europe, Siberia, W. Asia to the Himalaya; N. U. States.-Leaves bitter and astringent.
Var. hirsu'ta, Hopkirk (sp.); stem 1-3 in. very hairy, leaves narrower smaller, capsule seedless entire at the tip. Ayrshire. I have seen no fruit.
10. V. Chamæ'drys, L. ; hairy, stem pubescent on opposite sides, leaves subsessile ovate-cordate deeply serrate, pedicels slender, raceme long lax, capsule obcordate shorter than the calyx.
Copses, pastures, banks, \&co; ascends to $2,700 \mathrm{ft}$. in the Highlands; fl. May-June.- Branches 8-24 in., slender, ascending. Leaves $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$. Raceme with its slender peduncle $2-5 \mathrm{in}$. ; bracts linear, much shorter than the pedicels. Sepals linear-lanceolate, acute. Corolla $\frac{1}{3}-\frac{1}{2}$ in. diam., bright blue. Style capillary. Capsule broader than long, pubescent and ciliate.-Distrib. Europe (Arctic), Siberia ; introd. in N. America.
11. V. montána, L.; hairy, stem pubescent all round, leaves petioled ovate-cordate serrate, pedicels slender, racemes short lax, capsule orbicular longer than the calyx glabrous, margin subcrenulate ciliate.
Moist woods from Skye and Moray southwards ; ascending to $1,000 \mathrm{ft}$. in Yorkshire ; rather rare in Scotland and Ireland ; fl. June-Sept.-Habit of $V$. Chumoedrys, but sepals much broader ; corolla not $\frac{1}{4} \mathrm{in}$. diam., paler blue; capsule glabrous except the ciliate margins; and the foliage turns darker (though not black) in drying.-DIsTrib. Europe from Gothland southwards (excl. Greece and Turkey), N. Africa, W. Siberia.
12. V. scutella'ta, L.; suberect, leaves sessile linear-lanceolate faintly toothed, racemes subopposite peduncled, pedicels slender deflexed in fruit. Bogs, edges of ditches, \&c., not very common ; ascends to 2,200 ft. in Yorkshire ; fl. July-Aug.-Glabrous, rarely hairy (var. pubescens). Stem 6-24 in., slender, brittle, decumbent and rooting below, sparingly branched, stoloniferous. Leares 1-2 in., $\frac{1}{2}$-amplexicaul. Racemes many, seound; peduncles filiform, usually as long as the leaves; pedicels spreading; bracts small.

Sopals ovate-oblong, acute. Corolla $\frac{1}{4} \mathrm{in}$. diam., white or pinkish. Capsenls $\frac{1}{\mathrm{f}} \mathrm{in}$. diam., broader than long, deeply 2 -lobed, margins ciliate.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia, N. America.
Section 4. Beccabun'ga. Perennial. Leaves opposite, serrate. Racemes axillary, opposite, many-flowered. Capsule flat, loculicidal ; valves 2 -fid, falling away from the seed-bearing axis.
13. V. Beccabun'ga, L. ; procumbent, glabrous, succulent, leaves petioled oblong obtuse serrate, capsule orbicular notched. Brooklime. Margins of brooks, ditches, \&cc.; ascends to near 2,800 ft. in the E. Highlands; fl. May-Sept. - Stem hollow, rooting below ; branches 1-2 ft., spreading.
Leares 1-2 in., sometimes obovate. Racemes 2-4 in. ; bracts narrow, usually shorter than the pedicels. Sepals small, ovate-oblong, subacute, glabrous. Corolla $\frac{1}{3} \mathrm{in}$. diam., bright blue or pink. Stule moderate. Capsule turgid, a little exceeding the sepals. Seeds minute, plano-convex.-Distrib. Europe, N. Africa, N. Asia, W. Asia to the Himalaya, N. Africa to Abyssinia.-A reputed antiscorbutic.
14. V. Anagal'is, L.; erect, glabrous, stout, succulent, leaves sessile $\frac{1}{3}$-amplexicaul ovate- or oblong-lanceolate serrate, capsule orbicular notehed.
Watery places, rarer in the north; fl. July-Aug.-Stem 1-3 ft., simple or sparingly branched. Leares $2-5 \mathrm{in}$., subacute, sometimes auricled at the base, teeth small. Racemes ascending, 4-10 in., elongating in fruit ; bracts lanceolate, about equalling the pedicels. Sepals ovate-lanceolate, subaeute, glabrous or glandular. Corolla $\frac{1}{6} \frac{1}{6} \mathrm{in}$. diam., pale lilac or white. Style moderate. Capsule shorter than sepals, rather turgid. Seeds as in V. Bec-cabunga.-Distrib. Europe, N. Africa, Siberia, Dahuria, W. Asia to the Himalaya, N. America.
Section 5. Pseudo-Lysima'chia. Perennial. Leaves opposite or whorled. Raceme terminal. Corolla-tube cylindric. Capsule slightly compressed; valves adhering to the axis. Sceds plano-convex.

## 15. V. spica'ta, L.; pubescent, leaves oblong, spike dense.

Chalky pastures in Cambridge and Suffolk, and limestone rocks in the W. of England and Wales ; fl. July-Aug.-Rootstock creeping. Stem 6-18 in., stout, erect from a decumbent base, leafy. Leaves $1-1 \frac{1}{2} \mathrm{in}$., coriaceous, sessile or petioled ; lower ovate, obtuse, narrowed below, crenate-serrate.
Spike $1 \frac{1}{2} 3 \mathrm{in}$.; bracts ovate-lanceolate, exceeding the obtuse ciliate sepals.
Corolla $\frac{1}{4} \mathrm{in}$. diam., bright blue, tube as long as broad, throat bearded;
lobes narrow, acute. Stamens very long; anthers large, purple. Style long.
Capsule equalling the sepals, ovoid, pubescent.-Distrib. Europe, siberia.
Var. 1, eqica'ta proper ; leaves subsessile narrow-oblong or oblong-lanceolate
serrated above the middle. Eastern counties.-VAR. 2, hylívila, L. (sp.);
larger, stouter, leaves petioled broader, serrate throughout. Westem counties from Westmoreland to Bristol.

## 9. BART'SIA, $L$.

Erect herbs, parasitic on roots. Leaws opposite or upper alternate, crenate or serrate. Flowers in bracteate spikes; bracts leafy. Culy.n tubular or campanulate, 4 -fid. Corolla tubular, 2-lipped; upper lip arched, entire or notched, its sides not reflexed ; lower as long or shorter, 3 -fid at the tip. Stamens 4, didynamous, hidden by the upper lip; anther-
cells mucronate. Stigma obtuse, sometimes 2-lobed, posticous lobe very small. Capsule ovoid or oblong, compressed, loculieidally 2 -valved, septa and placentas attached to the valves. Seeds transversely ovoid.-Distrib. N. temp. regions of the Old World ; species about 30.-Etym. John Bartsch, a Prussian botanist.

Sub-gen. 1. Bart'sia proper. Capsule ovoid, acuminate. Seeds many, large, ribbed or winged on the back; hilum lateral.

1. B. alpína, L. ; perennial, glandular-pubescent, leaves sessile ovate obtusely serrate, upner cordate amplexicaul.
Subalpine meadows and wet banks, Teesdale; Craven, and Orton in Westmoreland ; Braedalbane and Mts. of Inverness and Ross; ascends to near 3,000 ft. in Scotland, absent from Ireland ; fl. June-Aug.-Black when dry. Rootstock woody. Stem $4-8 \mathrm{in}$., erect, simple, terete, leafy. Leaves $\frac{1}{3} \frac{2}{3} \mathrm{in}$., rather coriaceous, obtuse. Spike short, few-flowered; bracts purplish. Calyx-lobes ovate-lanceolate. Corolla $\frac{1}{2}$. $\frac{3}{4} \mathrm{in}$., dull blue-purple, glandular, lips small. Anthers exserted, bearded with white hairs. Capsule longer than the sepals. -Distrib. Europe (Arctic) from Gothland northwards, alps of France Germany and Italy, Greenland, Labrador.
Sub-gen. 2. Eufra'gia, Griseb. (gen.). Capsule oblong, acute. Seeds very minute, faintly granulate; hilum basal.
2. B. visco'sa, L. ; annual, viscid, leaves sessile ovate or oblong-lanceolate coarsely serrate.
Meadows, \&ce., S. and W. of England, from Sussex to Cornwall, and northwards to Argyle ; S.W. of Ireland, local ; Channel Is. ; fl. June-Oct.-Stem 6-18 in., terete, usually simple, often flowering throughout much of its length. Leaves $\frac{1}{2}-1 \frac{1}{2}$ in., rather scabrid, nerves prominent beneath. Calyxtulbe curved; lobes triangular lanceolate, acuminate. Corolla $\frac{3}{4}$ in., yellow, glandular; lower lip large. Anthers yellow, slightly bearded. Capsule pubescent, shorter than the calyx.-Distrib. W. Europe from Spain to Switzerland and Lombardy, N. Africa, the Caucasus, Caspian.
Sub-gen. 3. Odonti'tes, Persoon (gen.). Capsule ovate or oblong, compressed, obtuse. Seeds strongly ribbed, pendulous; hilum basal.
3. B. Odonti'tes, Huds.; annual, pubescent, leaves linear-lanceolate distantly serrate. Euphrasia Odontites, L.
Fields and waste places; ascends to $1,200 \mathrm{ft}$. in the Highlands ; fl. June-Aug.Stem 6-18 in., erect or ascending, wiry, 4-gonous, paniculately branched; branches opposite, terminating in slender leafy racemes. Leaves $\frac{1}{4}-2 \mathrm{in}$., sessile, very variable. Spikes subsecund; lower bracts leafy, upper narrower. Calyx campanulate ; lobes ovate, acute, as long as the tube. Corolla $\frac{1}{2}$ in., pink, pubescent; upper lip long, entire; lower 3 -lobed. A nthers usually exserted, yellow, almost glabrous. Style moderate. Capsule $\ddagger$ in., rather exceeding the calyz. Seeds narrow-oblong.-Distrib. Europe, N. Africa, Siberia, Dahuria.-Often placed in Euphrasia, and with reason.
Var. 1, ver'na, Reich. (sp.); branches ascending, leaves rounded at the base, bracts longer than the flowers, calyx-teeth equalling the tube.-VAR. 2, seroti'na, Reich. (sp.); branches flexuous upcurved, leaves narrow at the base, bracts shorter than the flowers, calyx-teeth equalling the tube. Vir. 3, rotunda'ta, Ball (sp.); bracts equalling the flowers or shorter,
calyx－teeth shorter than the tube，anthers included．Sussex and Cambridge （I have seen no specimens）．－Var．4，diver＇gens，Jord．（sp．）；much branched， branches widely spreading．

## 10．EUPHRA＇SIA，Tournef．Eyebright．

Annual or perennial herbs，on parasitic roots．Leaves opposite，toothed or cut．Flowers in dense secund or interrupted bracteate spikes，white yellow or purple．Calyx tubular or campanulate， 4 －fid．Corolla tubular， 2 －lipped； upper lip concave， 2 －lobed，lobes broad spreading；lower spreading 3 －fid． Stamens hidden by the upper lip ；anther－cells mucronate．Stigma dilated， obtuse，entire or with a small posterior lobe．Capsule oblong，compressed， loculicidally 2 －valved，few or many－seeded．Seeds pendulous，oblong， furrowed．－Distrib．Temp．regions；species 12．－Еtym．єúфpa⿱丷天дy，to clear，in allusion to its former use as an eye－medicine．
1．E．officina＇lis，$L$ ．；annual，lower leaves crenate，upper cut．
Meadows，heaths，\＆c．；ascending to $3,600 \mathrm{ft}$ ．in the Highlands；ft．May－ Sept．－Glabrous or glandular－pubescent．Stem 1－10 in．，erect，wiry，usually with many opposite branches．Leaves $\frac{1}{6}-\frac{1}{2}$ in．，sessile，ovate or lanceolate． Spikes terminal；bracts leafy；flowers minute．Calyx about equalling the bracts，tube ribbed；lobes acute．Corolla $\frac{1-1}{2}$ in．，white or lilac，purple－ veined ；mid－lobe of lower lip yellow．Anthers brown，pubescent，one cell spurred．Capsule included or exserted．Seeds as in Burtsiu Odontites． －Distrib．Europe（Arctic），N．Asia，W．Asia to the Himalaya，N．America．
Var．1，officina＇lis proper；bracts triangular－ovate broad at the base，lower corolla－lip equalling or exceeding the tube．－Var．2，gracitis，Fries（sp．）； more slender，bracts broader narrowed at the base，lower corolla－lip shorter than the tube．－VAR．3，maritima；capsule much longer than the calyx． Shores of the Shetlands．

## 11．RHinan＇thus，$L$ ．Yellow－rattle．

Annual erect herbs，black when dry，on parasitic roots．Leaves opposite， narrow，serrate．Flowers in secund spikes，yellow spotted with violet； bracts broad，cut，euspidate－toothed．Calyx ventricose，compressed， 4 －toothed．Corolla 2 －lipped，tube subcylindric ；upper lip obtuse com－ pressed，entire，with a toothed appendage on each side the tip ；lower shorter，lobes 3 spreading．Stamens 4，hidden by the upper lip；anthers hairy，not spurred．Style filiform，tip inflexed，stigma subeapitate． Capsule orbicular，compressed，loculicidally 2 －valved；valves membranous， entire，bearing the placentas in the middle．Seeds suborbicular，com－ pressed，winged，hilum lateral ；embryo small．－Distrib．Europe（Aretic）， excl．Turkey，N．Asia，N．America．－Etym．piv，the nose，and ǎyos，flower， in allusion to the form of the corolla．

1．R．Crista－gai＇i．$L$ ．；erect，leaves deeply crenate－serrate．
Damp pastures and wet places；ascending to $2,500 \mathrm{ft}$ ．in the Highlands； f．May－July．－Glabrous or glandular－pubescent．Stem 6－18 in．，simple or
with opposite branches， 4 －gonous．Leuves distant，1－2 in．，oblong－lanceolate or linear－oblong，obtuse or acute．Bracts longer than the calyx，ovate， taper－pointed．Culyx $\frac{1-1}{2}$ in．，mouth small，teeth triangular．Corolla $\frac{1}{2}-1 \mathrm{in}$ ．，yellow ；lobes of upper lip blue．Authers included，bluish．Capsule included in the bladdery calyx－tube．

Sub-sp. Ma'JOR, Ehr. (sp.) ; tall, much branched, bracts yellow at the base, corolla-tube exceeding the calyx-teeth, lower lip shorter than the upper, lobes of the latter longer than broad, seeds winged or not. - Cultivated tields, local from Moray southwards. Var. ap'terus, Fries; seeds ribbed not winged.
Sub-sp. Mi'NOR, Eler. (sp.); much smaller, stem subsimple, bracts green, corolla-tube equalling the calyx-teeth, lower lip equalling the upper, lobes of the latter shorter, seeds broadly winged.-Grassy places.

## 12. PEDICULA'RIS, Tournef. Lousewort.

Herbs, black when dry ; parasitic on roots. Leaves alternate whorled or opposite, toothed or pinnatisect. Flowers in bracteate spikes or racemes, white red purple or yellow. Calyx tubular or campanulate, split anteriorly ; teeth 2-5, mequal, entire lobed or crested. Corolla 2 -lipped, tube cylindric or dilated at the throat ; upper lip compressed, entire or notched, or with 2 teeth below the tip; lower 3 -lobed. Stamens 4, concealed by the upper lip, filaments or the 2 posterior only hairy; anther-cells obtuse. C'apsule compressed, oblique at the top, loculicidally 2 -valved, seeds few, in its lower part. Seeds ovoid, testa firm or lax rugose or smooth; embryo short or long.-Distrib. N. temp. regions; speeies upwards of 100 .Etym. pediculus, being supposed to encourage lice in sheep.

1. P. palus'tris, L. ; stem erect branched above, calyx ovoid compressed hairy ribbed, lobes subequal crenate.
Bogs and marshes, ascending to $1,800 \mathrm{ft}$. in the Highlands ; fl. May-Sept.Glabrous or sparingly hairy, annual. Stem 6-18 in., stout. Leuves 1-3 in., linear-oblong, pinnate; segments oblong, obtuse, crenate or pinnatifid, ultimate rounded. Bracts leafy. Calyx $\frac{1}{4}-\frac{1}{3}$ in., reddish-green, ventricose in fruit. Corolla 1 in., dull pink ; upper lip obtuse 3 -toothed ; lower broad. Capsule exceeding the calyx, curved.-Distrib. Europe (Arctic), excl. Spain Greece and Turkey, Siberia, Dahuria.
2. P. sylvat'ica, L.; stem branched at the base, branches spreading, calyx oblong angled glabrous, lobes unequal foliaceous crenate.
Copses, heaths, and damp meadows, ascending to $2,000 \mathrm{ft}$. in the Highlands; ti. April-July.-Glabrous, perennial. Stems many, 3-10 in., decumbent and ascending from a very short rootstock, leafy. Leares and bracts much as in $P$. palustris, but segments acute. Spike lax-flowered. Calyx $\frac{1}{2}$ in., 5 -lobed, upper lobe entire, the rest foliaceous. Corolla 1 in ., rose-coloured, tube slender, upper lip 2 -toothed. Capsule longer than the calyx, obliquely truncate.-Distrib. Europe, exel. Greece and Turkey.

## 13. MELAMPY'RUM, Toumef. Cow-wheat.

Erect, branched, annual herbs, black when dry, parasitic on roots. Leaves opposite, cauline narrow entire. Flowers axillary and solitary or in leafy spikes. Calyx tubular or campanulate; teeth 4, acuminate. Corolla 2-lipped, tube cylindric, dilated above; upper lip short, compressed, truncate in front, margins narrowly recurved; lower shorter, 3 -lobed, palate prominent. Stamens 4, hidden by the upper lip; anthers oblong, hairy, cells mucronate. Disk an hypogynous anticous gland. Stigma small, obtuse; ovules 2 in each cell, collateral, near the base of the septum, one subsessile erect, the other stalked fixed laterally. C'upsulc compressed, ovate, oblique or faleate, loculicidally 2 -valved, $2-4$-seeded.

Sueds oblong. testa smooth thickened at the hilnm; embryo small.Distrib. Europe, temp. Asia; species 6.-Etim. $\mu$ é $\lambda a s$ and $\pi v \rho o ́ s$, bluck veheat.

1. M. praten'se, $L$. ; flowers axillary secund, bracts entire or toothed, corolla much longer than the calyx-teeth, lips closed, lower straight.
Copses, heaths, and pastures, ascending to $3,000 \mathrm{ft}$. in the Highlands ; fl. June -Sept.-Glabrous or pubescent, very variable. Stem 6-24 in., terete, wiry ; branches spreading. Leutes $\frac{1}{2}-3 \mathrm{in}$., ciliate, linear- or ovate-lancenlate, sessile or very shortly petioled, quite entire. Bracts ciliate, very variable, often toothed laciniate or pimnatifid and sometimes hastate. Culyx-teet/o lanceolate, ascending. Corolla pale yellow, horizontal, tube straight. Capsule ovoid, deflexed.-Distrib. Europe (Aretic) exel. Turkey, Siberia.
Vir. 1, praten'se proper; leaves linear-lanceolate acute, bracts toothed or pinnatifid with slender tips.--Var. 2, latifólium; leaves ovate-lanceolate from a broad base, bracts deeply toothed, the upper with short tips. Chalk and limestone distriets, Oxford, Monmouth, 1. of Wight.-Var. 3, monta'num, Johnst. (sp.) ; leaves linear-lanceolate, bracts entire with long slender tips.
2. M. sylvat'icum, $L$. ; flowers axillary secund, bracts quite entire, corolla not much longer than the calyx-teeth, lips not closed, lower deflexed. Subalpine woods and copses, rare, from Aberdeen to York and Durham; ascending to $1,060 \mathrm{ft}$. in the Highlands ; N.E. of Ireland, rare ; fl. July-Aug.--Similar in habit and foliage to M. pratense, but flowers suberect ; hracts always quite entire ; calyx-teeth spreading; corolla smaller, shorter, deep yellow; its tube curved, and capsule not deflexed.-Distrib. Europe (Arctic), except Greece and Turkey, Siberia.
3. M. arven'se, $L$.; flowers spiked, luracts stratght broad pinnatifid, corolla-tube longer than the long slender calyx-teeth, lips closed.
Cornfields, very local, Norfolk, Essex, Herts, I. of Wight ; casual or a colonist, Watson; fl. July-Aug.-Stem 1-2 ft., obtusely 4 -gonous, stout, erect, branched, scaberulous. Leares 1-3 in., lanceolate, quite entire or the upper toothed at the base. Spike 3-4 in., stout, obscurely 4 -gonous ; bracts leafy, $\frac{3}{4}-1 \mathrm{in} .$, rose-purple. Cilyp-teeth nearly equal, subulate. Comolla $\frac{3}{3} \mathrm{in}$., erect, tube curved, puberulous, rosy, throat yellow; lips dark pink. Cupsule shorter than the calyx, ovoid, cells 1 -seeded. Seed oblong, like a black wheat-grain.-Distrib. Europe, W. Asia.
4. M. crista'tum, L.; flowers densely spiked, bracts ovate-cordate acuminate recurvel finely pectinate, corolla-tube much longer than the unergual acute ealyx-teeth, month closed.
Copses and fields in the E. counties, rare, from Hampshire to Norfolk, and Suffolk to Bedford ; a colonist? W'atson ; f. Sept.-Oct. - Puberulous. Stem $6-18 \mathrm{in}$., rigid, ereet, obtusely 4 -angled. Leuves $2-4 \mathrm{in}$. , spreading, narrow linear-lanceolate. Sprike $1 \frac{1}{2}-2 \mathrm{in}$., oblong, obtuse, acutely 4 -angled with hollow faces; bracts densely imbricate, cordate, purple, teeth very slender, margins folded enclosing the calyx. Ciclyx-tulee short, teeth very unequal, upper long subulate. Corolla $\frac{1}{\mathrm{~d}} \mathrm{in}$., tube bent, yellow tipped with purple. Copsule exceeding the calyx.-Distrib. Europe, Siberia.

## Order LiV. oroban'cherz.

Leafless brownish root-parasites. Stem usually stout, subsimple, scaly. Rootstock thick, prostrate, tuberous, naked or scaly. Flowers usually in dense spikes or racemes, sometimes secund, irregular. Sepals 4-5, inferior, free or connate. Corolla hypogynous, tube curved; limb 2-lipped, rarely regular; upper lip arched, lower 3 -fid; throat with 2 villous folds. Stamens 4, didynamous, inserted on the corolla-tube ; anthers 2 -celled, cells spurred at the base, opening by lateral slits or basal pores. Disk hypogynous, unilateral, or a gland or 0 . Ovary of 2 connate carpels; style simple, curved at the tip, stigma capitate 2 -lobed; ovules many, rarely few, anatropous, inserted on 2 pairs of free or confluent parietal placentas. Capsule 1-celled, 2-valved, few- or many-seeded. Seeds minute, testa thick pitted or tubercled, raphe obsolete, albumen fleshy ; embryo ovoid, undivided or 2 -fid.-Distrib. Temp. and trop. ; most abundant in S. Europe and E. Asia ; genera 14, species 125.-Affinities. With Scrophularinece and Cyrtandraceer, and possibly parasitic forms of these. -Properties. Astringent and bitter.

Base of corolla persistent.. 1. Orobanche.

Corolla deciduous 2. Lathræa.

1. OROBAN'CHE, $L$. BROOM-RAPE.

Flowers usually glandular-pubescent, 1-3-bracteate. Sepals 4, usually connate in pairs, with sometimes a small 5th. Corolla gaping; upper lip erect, 2 -lobed ; lower spreading, 3-lobed. Stamens included, filaments flattened below ; anther-cells spreading. Dislo glandular or 0 . Ovary ovoid; style usually glandular, stigma 2 -lobed. Capsule incompletely 2 -valved, many-seeded; valves cohering at the base and usually at the top also.-Distrib. Of the Order ; species about 70.-Еtym. бооßos, a vetch, and $\alpha_{\nu} \nu \in \iota \nu$, to strangle, from its parasitic habit.

Sub-gen. 1. Oroban'che proper. Stem usually quite simple. Flowers 1-bracteate, ebracteolate. Calyx-lobes 2, 2-fid, rarely entire. Capsule with the valves coherent above.

1. O. ma'jor, $L$. ; brown, sepals 1-3-nerved nearly as long as the corollatube, upper lip entire, mid-lobe of lower lip longer than the lateral, filaments glabrous below glandular above, stigma yellow. O. Rapum, Thuill.
On roots of shrubby Papilionaceex, from Kirkeudbright southwards, rare in Scotland and Ireland, fl. June-Aug.-Stem stout, 1-2 ft., swollen at the base. Spike rather dense-flowered; bracts equalling or exceeding the corolla. Sepals entire or 2 -fid. Corolla 1 in., yellow and purplish, subcampanulate, curved; lobes small, waved, scarcely toothed; upper lip arched, scarcely notched.-Distrib. Europe from Holland southwards (excl. Turkey), N. Africa. - Reichenbach figures the lobes of lower lip as small and equal, and flower as red-brown. I take this to be O. major of Linnæus, who states that it is parasitic especially on Leguminose, and quotes for it the Rapum genistoe of Lobel. There are no specimens in Linn. Herb.
2. O. ela'tior, Sutt. ; yellow, sepals 2 -fid 2 -3-nerved as long as the corolla-tube, lobes of lip subequal acute, filaments glandular below glabrous above, stigma yellow.

Parasitic on Centaurea Scaliosa, chiefly in the E. counties from York and Durham southwards, rare ; fl. June-Aug.-Habit of O. major, of which it is probably a sub-species ; but the corolla is narrower, more compressed ahove, the lobes more toothed. Bructs shorter than the corolla, upper lip deeply notched, margins inflexed.-Distrib. Europe from Denmark southwards to the Caucasus, Siberia.
3. O. caryophylla'cea, Sm. ; brown, sepals 2-fid several-nerved shorter than the corolla-tube, lobes of lower lip subequal waved and toothed, filaments hairy below glandular above, stigma purple. O. Galii, Duby.
On Galia, Rubi, \&c., S. Kent ; fl. June.-Stem 6-12 in., stout, swollen at the base. Spike lax-flowered ; bracts shorter than the corolla. Corolla 1 in., tube broad, curved; lobes large. reddish-brown or purplish, spreading; upper lip arched, notched.-Distrib. Europe from Denmark southwards (excl. Spain and Greece), Siberia, W. Asia.
4. O. ru'bra, Sm.; red; sepals entire 1-nerved subulate longer than the corolla-tube, lobes of lip toothed and crisped, lower with the mid-lohe longest, filaments subpilose below, glandular above, stigma pale red. 0 . Epithymum, DC.
On Thymus when growing on trap rocks, chiefly on the W. coast, from Ross to Cornwall ; N. and W. of Ireland ; fl. June-Aug.-Stem $4-8$ in., tuberous below. Spike lax-flowered. Corolla $\frac{1}{2} \frac{3}{4}$ in., equalling or shorter than the bracts, dull red ; tuhe broad, curved; lobes small, erose ; upper lip arched, almost entire. -Distrib. Baltic, France, Italy, Turkey, Germany, Himalaya.
5. O. mi'nor, Sutt.; yellow-brown or purplish, slender, sepals 1 - or more-nerved with long slender points, corolla-tube contracted in the middle, lobes of lower lip subequal or the middle a little the largest, filaments more or less hairy below, stigmas subglobose.
On various plants in many English counties, from the Border to Cornwall ; absent from Scotland ; one sub-sp. only is found in Ireland; fl. June-Oct. -Stem $\frac{1}{2}-2$ ft., rather slender. Spike elongate, many-flowered, lax or dense. Floarers $\frac{1}{2}-\frac{3}{4}$ in.-Distrib. Europe from Denmark southwards, N. Afriea.
Sub-sp. M'NOR proper ; bracts equalling or exceeding the corfla whose tube is gently curved, limb white or yellowish, lobes of upper lip spreading, of lower nearly equal toothed and waved, stigmas purple. On clover; very rare in Ireland.
Sub-sp. amethys'tea, Thuill. (sp.) ; corolla much curved in the lower third, upper two-thirds nearly straight, mid-lohe of lower lip much the largest. Cornwall, Devon, S. Kent, Channel Islands.
Suh-sp. Picridis, F. Nchultes (sp.); very pale, bracts aloout equalling the flowers, sepals entire or 2 -cleft exceeding the slightly-curved corolla-tuhe 1-nerved, upper lip retuse, tip inflexed, lobes of lower lip toothed nearly equal, stigmas purple.-On Picris. Cambridge, S. Kent, I. of Wight, Tenby. Sub-sp. hED'ERA, Imhly (sp.) ; spike more lax, sepa's 1 -nerved, stigma yellowish. O. burbatu, Eng. Bot. Suppl.-On ivy, Carnarvon and Leicester to Cornwall, I. of Wight.
Sub-gen. 2. Phelipæ'a, Tournef. (gen.). Stem simple or branched. Flowers 3-bracteate. Calyx tubular, 4-5-lobed. Capsule with the valves free above.
6. O. cseru'1ea, Vill.; blue-purple, stem simple, calyx-lobes 5 laneco-
late, corolla-tube curved, lobes of both lips acute, filaments almost glabrous, suture of anthers glabrous, stigma white.
On Achillea Millefolium, from Norfolk and Monmouth southwards, and in the Channel Is.; fl. June-Oct.-Stem 6-12 in., slender, tough, not tumid below. Spike usually dense ; bracts lanceolate. Corolla-tabe $\frac{3}{4}-1$ in., curved, upper lip 2-lobed, lobes pale blue with darker veins.-Distrib. Europe from Holland southwards, W. Asia to the Himalaya.
O. arena'ria, Bork., erroneously supposed to have been found in Jersey and Alderney, is only distinguishable from 0 . coerulea by the pilose anthers.

## 2. Lathrie'A, $L$. Toothwort.

A pale purplish fleshy root-parasite. Flowers 2 -seriate in a secund raceme, bracteate. Calyx campanulate, regular, 4 -fid. Corolla gaping, upper lip arched entire, lower smaller 3 -toothed. Stamens 4, anthercells spreading at the base. Disk glandular, opposite the lower lip of the corolla. Uvary with broad placentas subconfluent in pairs, stigma large capitate 2 -lobed. Capsule 2 -valved, many-seeded.-Distrib. E. Europe, W. Siberia, Syria, the Himalaya.-Etym. $\lambda \alpha \theta p a b \delta s$, hidden, from its locality.

1. L. squama'ria, L.; raceme decurved in bud, flowers subsessile.

On roots chiefly of hazel in shady places, from Stirling to Devon and Kent ; rather rare in Ireland; fl. April-May.-Perennial, white or purplish, glabrous or pilose, fleshy, black when dry. Rootstock branched, scaly, rootlets attached by tubercular faces to the rootlets of the plant it preys upon. Stems 4-10 in., stout, sealy. Raceme 4-6 in., bracts like the seales, broadly oblong. Flozers $\frac{1}{2}$ in. Culy.x 2-lipped, lobes broad subacute, shorter than the dull purple arched corolla, which has small erect lobes. Anthers coherent, pubescent. Style exserted, decurved, stigma purple. Capsule ovoid.

## Order LV. Labiater.

Herbs or shrubs, usually with immersed reservoirs of essential oil ; branches 4 -angled, opposite or whorled. Leaves opposite or whorled, entire or divided, exstipulate. Flowers solitary or in axillary opposite centrifugal cymes, irregular ; bracts 2 at the forks, bracteole opposite the flower. Calyx inferior, persistent, 5 -cleft, ribbed. Corolla hypogynous, deciduous, 5 merous, 2 -lipped, imbricate in bud, upper lip outermost. Stamens inserted on the corolla-tube, usually 4 , uppermost and sometimes the two lateral 0 or imperfect; anthers 2 -celled, polymorphous. Disk annular. Ovary of 2 connate deeply-lobed carpels, hence 4 -partite, 4 -celled; style from between the lobes, slender, stigma entire or 2 -fid; ovules solitary in each cell, erect, anatropous. Fruit of 1-4 one-seeded nutlets (the mature lobes of the ovary). Seed erect or ascending, testa thin, albumen 0 ; embryo straight, rarely curved, cotyledous Heshy, radicle next the hilum. Distrib. Abundant in warm and temp. regions, rare in arctic and alpine; genera 120 ; species about 2,500.-AfFinities. With Boruginere and Verbenacece. - P'roperties. stimulant, fragrant, aromatic.

Tribe I. Saturei'sefz. Corolla-loles flat. Stamens 2-4, remote, spreading or conniving under the upper lip, 2 upper shorter or 0 ; anther-cells contiguous or confluent. Nutlets free, smooth, or nearly so.

* Corolla subregular. Stamens spreading ; anthers 2 -celled.

## Perfect stamens 4 <br> 1. Mentha.

Perfect stamens 2 ...................................................................2. Lycopus.
** Corolla 2-lipped. Stamens distant.
Erect, leaves broad. Calyx equally 5 -toothed..
3. Origanum.

Procumbent, leaves small. Calyx 2 -lipped.....................................4. Thymus.
*** Corolla 2-lipped. Stamens 4, conniving under the upper lip.
Corolla-tube straight ; upper lip flat.................................5. Calamintha.
Corolla-tube curved, ascending; upper lip concave..................5*. Melissa.
Tribe II. MONAR'DEse. Stamens 2, erect or ascending ; anthers 1 -celled, or if 2 -celled cells remote. Nutlets free, smooth, or nearly so.
Calyx 2 -lipped
6. Salvia.

Tribe III. Nepete'e. Stamens 4, 2 upper longer, ascending or diverging ; anther-cells 2 parallel or nearly so. Nutlets smooth or tubercled.
Upper lip of corolla truncate
7. Nepeta.

Tribe IV. STACHYDE'昰. Stamens 4, parallel, 2 upper shorter, ascending under the concave upper lip or included in the tube. Nutlets free, smooth, or tubercled.

* Calyx 2 -lipped, not inflated, lips closing over the fruit.

Filaments 2-fid, anthers all 2-celled
8. Prunella.

Filaments simple, 2 lower anthers 1 -celled .................................9. Seutellaria.
** Calyx inflated or 2 -lipped. Anthers under the corolla lip......10. Melittis.
*** Calyx tubular. Anthers within the corolla-tube.............11. Marrubium. **** Calyx 5 -10-toothed, subcampanulate, equal or oblique.
Calyx 5 -toothed. Anthers glabrous. Nutlets obtuse .............12. Stachys. Calyx-teeth 5 , spinous. Anthers ciliate. Nutlets compressed...13. Galeopsis.
Calyx-teeth 5, spinous. Anthers glabrous. Nutlets 3 -quetrous, truncate. 13*. Lеонигия.
Calyx 5-nerved. Anthers hairv. Nutlets 3 -quetrous, truncate...14. Lamium.
Calyx-limb spreading; teeth 5 broad. Anthers glabrous. Nutlets obtuse.
15. Ballota.

Tribe V. AJ'ugoidere. Stamens 4, parallel, ascending, exserted, 2 uppor shorter. Nutlets connate, base oblique, reticulate and rugose.
Calyx tubular, 5 -tootherd. Upper corolla-lip 2 -partite..........16. Teucrium.
Calyx ovoid, 5 -cleft. Upper corolla-lip entire or notched...........17. Ajuga.

## 1. MEN'tha, L. Mint.

Strong-scented perennial herbs; rontstock stoloniferous, creeping. Whorls many-flowerel, axillary and remote, or crowded and forming terminal spikes ; bracts subulate or foliaceous ; bracteoles snall or 0 ; flowers small. Culyx campanulate or tubular, 5 -toothed; throat naked or villous. Corolla-tube short, limb campanulate 4 -lobed; lobes nearly equal, upper broader. Stamens 4, equal, erect, distant, glabrous; anther-cells parallel. Style shortly 2 -fid. Nutlets dry, smooth.-Distrib. Chiefly natives of N.
temp. regions ; species about 28.-Etys. The old Greek name.-Species very variable, and often difficult to discriminate.

* Whorls in terminal spikes; bracts minute. Throat of calyx glabrous. $\dagger$ Leaves all sessile, or the lower only petioled.

1. M. sylves'tris, L.; leaves broadly or narrowly oblong-obovate or lanceolate subacute serrate smooth above hoary beneath, spike contiuuous, calyx-teeth lanceolate, corolla hairy glabrous within. Horse-mint.
Moist waste places, rare, from Moray and Dumbarton southwards ; a doubtful native of Ireland ; fl. Aug.-Sept. -Stem 2-3 ft., robust, tomentose with white hairs. Leaves $1-3 \mathrm{in}$., $\frac{2}{3}-2 \mathrm{in}$. broad, rounded or cordate at the base. Sprikes 1-3 in., $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. broad, dense; bracts lanceolate; bracteoles subulate; pedicels hairy. Corolla lilac, about $\frac{1}{8} \mathrm{in}$. diam. -Distrib. Europe, N. Africa, Siberia, W. Asia to N.W. India.
Var. 1, sylvestris proper ; leaves oblong-lanceolate acute rounded at the base slightly hairy above hoary beneath, spikes slender.-VAR. 2, nemoro'sa, Willd. (sp.); leaves broadly oblong acute rounded at the base slightly hairy above tomentose beneath, spike stouter.-VAR. 3, mollis'sima, Bork. (sp.); leaves broadly ovate acute subcordate at the base finely serrate hoary above felted beneath, spikes stout. Rare.-Var. 4, alopecuroides, Hull (sp.); leaves broad large coarsely serrate subcordate at the base somewhat wrinkled above very hairy beneath, spikes short stout, bracts broader. Kent, Essex, Norfolk, \&c., rare. The transition state to M. rotundifolia.
2. M. rotundifo'lia, L.; leaves broadly ovate-oblong very obtuse crenate much wrinkled above shaggy or densely tomentose beneath, spikes interrupted, calyx hairy teeth subulate, corolla hairy glabrous within.
Wet places, S. of England, indigenous ; a denizen in the N., Watson ; not found in Scotland; rare in Ireland; fl. Aug.-Sept.-Habit of M. sylvestris, but usually much branched. Leaves often densely woolly below. Spikes dense, cylindric. Flowers white or pink.-Distrib. Europe from Belgium southwards, N. Africa, Siberia, W. Asia.-A garden escape in N. America.
M. vir'idis, $L$.; glabrous or nearly so, leaves oblong-lanceolate subacute serrate smooth above, spikes slender, corolla glabrous without and within. Spear-mint.
Wet places in England and Scotland, rare ; indigenous in the N. of England, Buker; a denizen, Wutson; not a native of Ireland; fl. Aug.-Sept. Probably a cultivated form of M. sylvestris, easily distinguished by its pungent smell. - Distrib. Cultivated for culinary purposes.

## $\dagger+$ Leares petioled.

3. M. píperi'ta, Huds.; glabrous, leaves ovate or oblong-lanceolate acute serrate upper smaller, spikes cylindric interrupted below, pedicels and Howers glabrous or very sparingly hispid. Peppermint.
Damp places from Aberdeen southwards and in Ireland; a doubtful native, Watson; fl. Aug.-Sept.-Usually smaller and more slender than the preceding. Leaves 1-4 in., acute or obtuse at the base, coarsely serrate, smooth above, rarely sparingly hairy on the nerves below, uppermost sometimes hracteiform. Culy. often red.--Dis'irib. Europe; introd. in the N. U. States. Probably a garden form of M. aquaticu, as suggested by Bentham.
Var. 1, oficina'lis, Hull (sp.); leaves acute or rounded at the base, spikes
elongate.-Var. 2, melyaris, Sole; leaves rounded or subcordate at the base, spikes shorter.
4. M. aquat'ica, $L_{\text {.; }}$ usually softly hairy, leaves ovate-oblong or corlate, upper hracteiform, spikes oblong continuous or interrupted below, pedicels and flowers usually hairy or villous.
River-sides, marshes, \&cc., ascending to $1,500 \mathrm{ft}$. in Yorkshire ; fl. Aug.-Sept. -Very common and variable ; some forms are with difficulty distinguished from M. sutiru. Stem $1-5 \mathrm{ft}$. Lettes $1-3 \mathrm{in}$. Sipikes $3-1 \mathrm{in}$. diam., long or short, usually stout. Flourers lilac or purplish. Brouts and Invecteoles lancen-late-subulate. Culyp-teeth slender.-Distrib. Europe, N. Africa, N. and W. Asia ; introd. in the N. U. States.
Sulb-sp. pubes'cens, Willd. (sp.); leaves ovate-oblong or lanceolate pubescent abuve tomentose or woolly beneath sharply serrate, spikes eylindric stout dense, calyx-teeth $\frac{2}{3}$ the length of the tube. -Mid. and S . England only.Var. 1, pulus'tris, Sole (sp.); leaves ovate-oblong tomentose above, woolly beneath.-Var. 2, lierci'ne, Hull (sp.); leaves ovate-oblong green and subglabrous above hairy beneath.
Sub-sp. HIRsu't., L. (sp.); leaves ovate rounded or subeordate at the hase serrate more or less hairy on both surfaces, spikes axillary and terminal ovoid or suhglobose, caly $x$-teeth $\frac{1}{2}-\frac{2}{3}$ the length of the tuhe. Common.Var. 1, hirsn'ta proper; leaves tomentose on both surfaces, calyx perlicels and corolla hairy.-VAR. 2, sulygla'bra, Baker; leaves narrower glabro as except on the nerves beneath, calyx pedicels and corolla hairy. - Var. 3, citra'tu, Ehr. (sp.); leaves glabrous on both surfaces, calyx pedicels and corolla glabrous. Staffordshire, Wales, \&c., rare. Bergamot Mint.
** Whorls in axillary clusters, shorter than the leaves; bracts foliaceous. Throut of calyx glabrous.
5. M. sativa, $L$.; leaves petioled ovate- or oblong-lanceolate acutely serrate, upper smaller, bracteoles usually shorter than the flowers acuminate, calyx-teeth lanceulate acuminate $\frac{1}{2}-\frac{2}{3}$ the length of the tube.
Wet waste places, from Isla and Kincardine southwards ; rather rare in Irelan.l; fl. July-Sept.-Probably a form of M. aquatica, distinguished by the inflorescence alone.-Distrib. Europe, Canaries ; introd. in N. America. - The forms here enumerated are not characterised by certain characters ; I have taken their diagnoses from Baker's and Syme's works.
Sub-sp, sati li proper ; green, 2-3 ft., leaves hairy on both surfaces, perlicels calyx and corolla hairy. Common in England, rare in Scotland and Ireland. - Vir. 1, hairy, whorls all separate, hracts all foliaceons, upper sometimes flowerless.-V.ir. 2, pulidotose, sole (sp.); hairy, upper whorls cullected into a spike with smaller bracts. The passage to M. aquatica. Vir. 3, sulugheibra, Baker; almost glabrous, whorls all separate, bracts all foliaceous.
Sub-sp. Ru'bra, Sm. (sp.) ; stem 3-5 ft. and nerves of leaves purple, leaves glabrous or sparingly hairy, calyx hairy, pedicels and corolla glabrous. Not uncommon in England, rare in Scotland and Ireland.
Sub-sp. GRac'ulis. Sim. (4p.) ; slemder, green, leaves ohlong-lanceolate glahrons or sparingly hairy, whorls all separate, bracts all smallor and narrower than the leaves, bracteoles equalling and exceeding the flowers, calyx ciliate, pedicels and corolla glabrons. Var. 1, grow itio proper, stem hairy below, lower bracts shortly petioled 5-6 times as long as the rather remote whorls, Wiltshire (gathered by Sole only).-VAR. 2, cardíws, Baker ; nearly gla-
brous, bracts sessile 2-4 times as long as the crowded whorls. From Middlesex N. to the Tyne ; often cultivated; smells of Basil.
Sub-sp. pratex'sis, Sole (sp.) ; leaves drooping rounded at both ends finely serrate, hairy above, glabrous except on the close-set nerves beneath, whorls in the upper leaves only all separate, calyx-teeth ciliate, pedicels and corolla glabrous. New Forest, gathered by Sole only in 1789.
Sub-sp. Gentílis, $L$. (sp.) ; leaves spreading ovate acute serrate slightly hairy above and on the (few) nerves especially beneath, bracts all leaf-like uppermost flowerless, pedicels and corolla glabrous, calyx-teeth ciliate. Common in England, rare in Scotland.-Var. 1, genti'lis proper; stem hairy, leaves rather coriaceous most hairy below, calyx-teeth densely hairy.-VAR. 2, Wirtgenia'na, F. Schultz (sp.) ; stem subglabrous, leaves slightly hairy above, but on the nerves only below, calyx-teeth sparingly hairy.-VAR. 3, Paulia'na, F. Schultz (sp.) ; stem subglabrous, leaves as in var. 2, calyxteeth densely hairy.
6. M. arven'sis, $L$. ; leaves petioled ovate- or oblong-lanceolate obtusely serrate, upper smaller, bracteoles shorter than the flowers acute, calyx more or less hairy, teeth triangular के the length of the tube, corolla hairy without and within.
Cultivated fields and waste places, ascending to $1,000 \mathrm{ft}$. in the Highlands; fl. Aug.-Sept. - Usually a low branched plant, 1-2 ft., very variable, chiefly distinguished from M. sativa by the short calyx-teeth.-Distrib. Europe (Arctic), N. Asia, W. Asia to the Himalaya; introd. in N. America. -To the following varieties many might be added of more or less value.
VAR. 1, arven'sis proper; stem short, hairs dense reflexed, leaves smooth hairy all over, calyx very hairy. -Var. 2, nummula'ria, Schreb. (sp.); stem long, hairs few, leaves and calyx sparingly hairy.-Var. 3, agrestis, Sole (sp.); stem long hairy, leaves coarsely serrate broad often cordate wrinkled and calyx very hairy, bracts smaller upwards.-Var. 4, prácox, Sole (sp.) ; stem stout erect slightly hairy, leaves smooth sparingly hairy, bracts much smaller upwards, calyx-teeth longer. Approaches M. sative. - Var. 5, Allio'nii, Boreau (sp.) ; stem tall slightly hairy above, nearly glabrous beneath, leaves smooth thinly hairy, bracts uniform, calyx-teeth very short. -Var. 6, parietariafo'lia, Beck (sp.) ; subglabrous, stem long, leaves smooth serrated towards the tip, bracts smaller upwards, calyx-teeth short.
*** Whorls axillary, distant, none towards the ends of the branches. Calyx 2-lipped; throat closed with hairs.
7. M. Pule'gium, L. ; prostrate, leaves small shortly petioled ovate or oblong subserrate, calyx-teeth ciliate, corolla hairy without glabrous within. Penny-royal.
Pools, wet heaths, \&c., from Durham southwards, naturalized only in Scotland frequent in Ireland; fl. Aug.-Sept.-Glabrous or more or less tomentose. Stems 4-10 in., prostrate, much branched, very leafy. Leuves $\frac{1}{4}-\frac{3}{4}$ in., spreading and recurved, acute at the base. Whorls all separate; bracts foliaceous, upper sessile flowerless; bracteoles 0 , or obovate and shorter than the flowers. Culyx and pedicels pubescent or hispid.- Distrib. Europe, N. Africa, Siberia, W. Asia.-Formerly much used medicinally.

## 2. LYC'OPUS, Tournef. GIPSY-wort.

Marsh herhs. Loaves toothed or pinnatifid. Whorls axillary, dense, many-flowered ; bracts fuliaceous, bracteoles minute ; flowers small sessile.

Calyax campanulate, equal, 4-5-toothed; throat naked. Corvlla short, campanulate, equal, 1 - 5 -fid. Stamons 4 ; upper 2 imperfect, filiform, with capitate anthers or $0 ; 2$ lower fertile, distant ; anther-cells parallel. stule 2 -fid, lobes flattened. Niutlets dry, smooth, truncate, narrowed below, margins thickened.-Distrib. Temp. regions; species probably 2 with many varieties.-EtYM. 入úkos and noûs, wolf's-foot, of doubtful application.

1. L. europæ'us, L.; stem acutely 4 -angled, calyx-teeth 5 subulate.

Ditches and river-banks from Ross southwards; rarer in Scotland; common in Ireland ; fl. June-Sept.-Glabrous or slightly pubescent. Routstock creeping or stoloniferous. Stem $1-3 \mathrm{ft}$., tough. Leaies subsessile, elliptic-oblong, coarsely serrate or pinnatifid. Whor/s many ; bracts smaller upwards; flowers sessile. Corolla $\frac{1}{6}$ in., bluish-white, dotted with purple, hairy within.- Distrib. Europe, N. Africa, Siberia, W. Asia to India, N. America, Australia.

## 3. Orig'anum, Tournef. Marjoram.

Aromatic herls or undershrubs. Leaves entire or toothed. Flowers crowded, in cylindric corymbose cymes, with large coloured imbricating bracts. Calyx subcampanulate, $10-13$-nerved, 5 -toothed or 2 -lipped; upper lip, entire or 3 -toothed, lower 2 -toothed truncate or 0 . Corollat obseurely 2-lipped; upper lip notched or 2-fid; lower spreading, 3 -fid. Stamens 4, ascending, distant ; anther-cells distinct, spreading. Style-lobes acute. Nutlets dry, smooth.-Distrib. Temp. regions of the Old World; species about 20.-Etym. öpus and $\gamma$ duos, from atlecting hilly localities.

1. O. vulga're, L. ; erect, corymbosely branched, leaves broadly ovate. Dry copses and hedgebanks, \&c., from Isla and Moray southwards, rare in Scotland ; ascends to $1,300 \mathrm{ft}$. in Yorkshire; local in Irelaud ; fl. July-Sept. -More or less pubescent, bifariously on the branches. Rontatocik short, stoloniferous. Stems many, 1-3 ft., stout. Leaves $\frac{1}{2} 1 \mathrm{in}$. , shortly petioled, rhombic-ovate, lower early withering, obtusely serrate. S'pikies j-1 in., crowled, ovoid, 4 -gonous; bracts $\ddagger \mathrm{in}$., green or purple, ovate, acute, longer than the calyx. Culyx sprinkled with yellow dots, teeth short; throat closed with hairs. Corolla purplish or white. Stcmens exsorted or not. - Distrib. Europe (Arctic), N. Africa, Siberia, Dahuria, W. Asia to the Himalaya ; introd. in N. America.-Aromatic, bitter, and balsamic.

## 4. THY'mus, L. Thyme.

Small shrubs, often hoary, much branched, very aromatic. Lcaves small, quite entire ; margins often revolute. Whorls few-flowered, distant or crowded, in lax or dense spikes; bracts minute ; flowers purple, rarely white. Calyp ovoid, 10-13-nerved, 2-lipped; upper lip 3-toothed; lower 2 -fid; throat villous. Corolla-tube naked within, obscurely 2 -lipped ; upper lip straight, flattish, notehed ; lower 3 -fid. Stumens usually exserted, straight, distant, the lower longer ; anther-cells parallel or diverging. Style-lobes subequal, subulate. Nullets nearly smooth.-Distrib. Temp. regions of the Old World ; species 40.-Etym. The Greek name.

1. T. Serpyl'lum, $L$. ; prostrate, leaves green flat quite entire. Hills and-ctry grassy places ; ascends to $3,500 \mathrm{ft}$. in the Highlands ; fl. June-

Aug.-Glabrous or hairy, hairs often reflexed and in lines on the stems. Rootstock woody. Stems decumbent. Leaves $\frac{1}{8}-\frac{1}{4}$ in., shortly petioled, ovate or obovate-lanceolate, obtuse. Whorls capitate ; bracts foliaceous; pedicels very short ; flowers often 1 -sexual. Culyx purplish, teeth ciliate. Corolla $1-3$ in., rose-purple.-Distrib. Europe (Arctic), Siberia, Dahuria, W. Asia to the W. Himalaya, Greenland ; introd. in N. America.
Sub-sp. Serpyl'Lum proper; flowering-branches ascending from trailing shoots that are barren at the tip, leaves often obovate, whorls in one head, upper lip of corolla oblong.-Commonest form in mountain districts.
Sub-sp. Chame'drys, Fries (sp.); flowering- and barren-branches ascending from the crown of the rootstock, leaves usually ovate, whorls in many axillary heads, upper lip of corolla short and broad.

## 5. CALAMIN'tha, Mench.

Herbs or shrubs. Whorls dense and axillary or loose and panicled; flowers purple white or yellow. Calyx tubular, 13 -nerved, 2 -lipped, upper lip 3 -toothed, lower 2 -fid; throat naked or villous. Corolla-tube straight; throat naked, often inflated; upper lip ereet, flattish; lower sprearling, 3 -lobed. Stamens 4, ascending under the upper lip, upper sometimes imperfect ; anther-cells parallel or diverging. Style-lobes equal, or the lower larger. Nullets smooth.-Distrib. Temp. N. hemisphere; species about 40.-Eтум. калôs and $\mu i \nu \theta \alpha$, beautiful mint.

Sub-gen. 1. Calamin'tha proper. Whorls many, compound, lax, lower many-flowered; bracts minute. Calyx-tube straight. Corolla with mid-lobe of lower lip notched.

1. C. officina'lis, Moench; perennial, leaves ovate, cymes secund. Calamint.
Waste places in dry soil from Westmoreland southwards; Mid. and S. Ireland ; fl. July-Sept.-Hairy. Rootstock more or less creeping, stoloniferous. Stem 1-3 ft., erect or decumbent at the base ; branches usually long, straggling and ascending. Leaves crenate-toothed, very variable in size and depth of serratures but pretty uniform in shape, almost glabrous or downy or nearly woolly. Cymes more or less unilateral, peduncles and pedicels variable.-Distrib. Europe from Belgium southwards, N. Africa, W. Asia ; introd. in N. America.

Sub-sp. menthifólia, Host (sp.); branches long ascending, leaves $1-1 \frac{1}{2} \mathrm{in}$. crenate-serrate green below, cymes few-flowered, calyx bent on the pedicel 2 -lipped, teeth with long bristles, upper triangular, lower subulate much longer, hairs of throat included, corolla $\frac{1}{3}$ in., mid-lobe of lower lip longest. - Var. Briyg'sii, Syme ; larger, more hispid, peduncles of lower whorls equalling or exceeding the pedicel of the central flower. Devonshire.
Sub-sp. NEP'ETA, Clairv. (sp.) ; branches short erect, leaves usually $\frac{1}{2}-1 \mathrm{in}$. subentire pale beneath, cymes about 10 -flowered, calyx erect on the pedicel, teeth nearly equal, upper triangular recurved, lower subulate, hairs of throat prominent, corolla $\frac{1}{3} \mathrm{in}$., mid-lobe of lower lip broad truncate.
Sub-sp. sylvat'ica, Lromf.; branches 0 or long ascending, leaves $1-3 \mathrm{in}$. deeply crenate-serrate, cymes loose, calyx bent on the pedicel 2 -lipped ciliate, 3 upper teeth abruptly recurved, 2 lower twice as long incurved, hairs of throat concealed in the tube, corolla $\frac{3}{4}-1 \mathrm{in}$., mid-lobe of lower lip about equalling the lateral.-Chalk banks, I. of Wight.

Strb-sifi. 2. Clinopo'dium, L. (gen.). Whorls few, compound, denseflowered, surroumded by many linear bracteoles. Calyc-tube slightly curved. Corolla with mid-lobe of lower lip notched.
2. C. Clinopo'dium, Benth.; perennial, softly hairy, leaves ovate obseurely toothed. Clinopodzum vilgare, L. Wild Basil.
Copses and rocky places from Moray southwards, and in Ireland ; ascends to $1,(.00) \mathrm{ft}$. in the Highlands; fl. July-Sept.-Rootatock woody, stoloniferous. sit mi 1-3 ft., slender, Hexuous, subsimple. Leaves remote, 1-2 in., subacute. Wherls terminal and axillary, $\frac{3}{4}-1 \mathrm{in}$. diam., depressed ; bracts equalling the calyx ; pedicels slender ; flowers crowded. Culyx $\frac{1}{3}-\frac{1}{2}$ in., striate, bristly. Corolla $\frac{3}{4}-1 \mathrm{in}$., purple, hairy ; upper lip longest. - Distrib. Europe, N. Africa, N. and W. Asia to Japan and the Himalaya; wild in Canada ; introd. in the U. States.
Stb-gen. 3. A'cinos, Monch (gen.). Whorls many, simple, lower 5-6-flowered; bracteoles few, minute. Calyx-tube curved. Corolla with the mid-lobe of the lower lip almost entire.
3. C. A'cinos, Clairv.; annual or biennial, branched, leaves petioled ovate acuminate. Thymus Acinos, L. Basil Thyme.
Banks and fields, on dry soil, from Aberdeen southwards; rare and probably nowhere indigenous in Scotland ; N.E. of Ireland, very rare ; Al. July-Aug. -More or less pubescent. Stem 3-6 in., branched from the base, ascending, slender, leafy. Leares $t-\frac{1}{2}$ in., narrowed into the petiole, variable in ireadth, entire or slightly serrate. Bracts leafy; bracteoles shorter than the pedicels. Calyx bent on the pedicel; tuhe much enlarged below in fruit ; throat closed with hairs ; 3 upper teeth recurved. Corolla $\frac{1}{2}$ in., bluepurple, spotted white and darker purple.-Distrib. Europe, N. Africa.

## 5*. MELIS'SA, Toumef. Balm.

Herls, sometimes shrubby. Whorls few-flowered, axillary, secund; bracts few, subfoliaceous ; flowers white or yellowish. Calyde coriaceous, curved, subeampanulate, with 13 ribs, 5 of them very strong, 2 -lipped; upper lip flattish, 3 -toothed; lower 2 -fid. C'orolla-tube ascending, more or less recurved; throat dilated, naked ; upper lip concave, notched ; lower 3 -fid, lobes flat. Stamens 4, converging under the upper lip; anther-cells at length spreading. Style-lobes subequal, subulate. Nullets smooth.Distrib. Europe, W. Asia to the Himalaya; species 4.-Etym. $\mu \hat{\eta} \wedge \iota \sigma \sigma a$, from bees afleeting the plant.-Genus hardly differing from Calamintha.
M. officina'lis, $L$.; leaves ovate crenate-toothed, flowers white.

Naturalized in the S. of England ; f. July-Aug.-More or less hairy. Root stork short. Stems 1-2 ft., many, erect. Lewess 1-3 in., petioled, wrinkled above. Whar/s shortly stalked; bracteoles small, oblong. Culyx-teeth, :pper deltoid recurved with setaceous points; lower longer, slender, straight. Cimolla $\frac{1}{2}$ in., white or spotted with rose.-Distrib. Mid. and S. Europe, W. Asia; a garden escape in N. America.

## 6. SAL'via, L. Sage.

Herhs or shruhs. Whorls usually racemed or spiked; bracts leafy or small. Culye: tuhular or campanulate, 2 -lippeed, upper lip entire or 3 -toothed, lower 2 -fid; throat naked. C'orolla-lube naked or with a ring
of hairs or toothed processes inside ; upper lip erect, entire or notched; lower 3 -lobed, mid-lobe entire or notched, lateral spreading. Stamens 2 , filaments short, subhorizontal, jointed below the anther, connective slender, bearing at one end a perfect anther-cell, at the other a rudimentary one. Disk forming a large gland anteriorly. Style ascending, 2 -fid, lobes subulate or dilated. Nutlets 3 -quetrous, usually shining.-Distrib. All temp. and trop. regions ; species about 400.-Etym. salvo, from the healing properties of Sage.

1. S. Verbena'ca, L.; stem leafy, corolla $\frac{1}{2} \mathrm{in}$. glabrous inside: Clary.

Dry pastures and waste places from Fife southwards; rare in Scotland and Ireland ; fl. June-Sept.-Subglabrous below, glandular-hairy above. Rootstock woody. Stem 1-2 ft., erect. Leaves 2-4 in., wrinkled, radical petioled, oblong, obtuse, irregularly crenate or serrate ; upper cauline sessile, oblong or deltoid-ovate. Whorls 6 -flowered, in long bracteate spikes; bracts ovate-cordate. Calyx campanulate, upper lip with recurved edges and minute spinescent teeth, lower teeth subulate. Corolla blue-purple ; upper lip short, compressed. Connective dilated.-Disfrib. Europe from Denmark southwards, N. Africa, W. Asia. - The nutlets become mucilaginous in water; formerly used for eye complaints.
2. S. praten'sis, $L$.; stem-leaves few, corolla 1 in . tip viscid.

Dry fields, very rare, Cobham, Kent ; Middleton Stoney, Oxford ; a denizen, Wutson; fl. June-Aug.-Glandular-hairy, especially above. Habit of S. Verbenaca, but larger. Leaves wrinkled, 3-6 in.; radical oblong or ovatecordate, long-petioled, obtuse, sometimes 2 -lobed at the base, crenatures large irregular ; cauline similar or more oblong, smaller, shorter petioled. Whorls about 4 -flowered, in spikes $1-1 \frac{1}{2} \mathrm{ft}$.; bracts small, ovate-cordate, long acuminate and calyx coloured. Corolla bright blue, glabrous inside; upper lip long, compressed, much arched ; lower broad. Connective dilated. -Distrib. Europe from Belgium southwards, W. Asia.

## 7. NEP'ETA, $L$.

Herbs, erect or prostrate. Whorls axillary or terminal ; flowers blue yellow or white. Calyx tubular, 15 -ribbed, 5 -toothed, teeth equal or unequal. Corolla-tube slender below, throat dilated, naked; upper lip straight, notched or 2 -fid; lower 3 -fid, mid-lobe large. Stamens 4, ascending under the upper lip, upper pair longest ; anther-cells diverging. Style-lobes subulate. Nutlets smooth.-Distrib. Temp. Europe, N. Africa and Asia ; species about 110.-Етум. The Latin name.

Sub-gen. 1. Nep'eta proper. Whorls subterminal ; upper bracts small. Corolla-tube short ; mid-lobe of lower lip suborbicular, concave. Anthers subparallel, both cells opening by one slit.

1. N. Catária, $L$.; erect, leaves ovate-cordate inciso-serrate white and pubescent beneath, flowers white: Cat-Mint.
Banks and waste places, rare in England and Ireland; very local in Scotland; a doubtful native, Watson ; fl. July-Sept.-Hoary, pubescent. Rootstock stout. Stem $2-3 \mathrm{ft}$., hranched, very leafy. Leaves $1-3 \mathrm{in}$., deeply lobed at the base. Whorls shortly stalked, upper sessile, many and dense-flowered, in broad heads 1 in . long; bracts leafy; bracteoles longer than the short pedicels. Calyx pubescent; teeth subulate, uppfr longest. Corollu
$\frac{1}{2}$ in., dotted with purple, tube curved. Nutets minutely granulate.Distrib. Europe, Siberia, W. Asia to the Himalaya ; introd. in N. America.
Sub-gex. 2. Glecho'ma, L. (gen.). Whorls axillary; bracts all large and leaf-like. Corolla-tube long; mid-lobe of lower lip obeordate, flat. Anthers conniving, and forming a cross; cells each with a slit.
2. N. Glecho'ma, Benth.; procumbent, leaves ovate- or orbicularreniform deeply crenate green, flowers blue-purple. Glechoma hederacca, L. firound Ivy.
Hedgebanks and copses ; ascends to near 1,300 ft. in Northumberland; H1. March-June. - Perennial, more or less pubescent. Stems 6-18 in., rooting at the base, slender, branched. Leuces $\frac{2}{3}-1 \frac{1}{3} \mathrm{in}$. diam., petioles $\frac{1}{2}-2 \mathrm{in}$. Whorls 3-6-flowered; bracteoles subulate, equalling the short pedicels. Cal lu-teeth short, recurved. Corolla $\frac{1}{2}-1 \mathrm{in}$. Niutlets minutely granulate. -Distrib. Europe (Arctic), N. Asia, Japan, W. Asia ; introd. in the N. U. States. - Bitter and aromatic, formerly used for beer, occasionally for tea.
Var. 1, Glecho'ma proper; subglabrous, corolla-tube twice as long as the calyx.-VAR. 2, parciflo'ra, Benth.; subglabrous, corolla-tube equalling the calyx.-VAR. 3, hirsu'ta, Waldst. and Kit. (sp.); hispidly pubescent, corollatube twice as long as the calyx.

## 8. prunelíta, $L$. Self-heal.

Small, hairy, perennial herbs. Whorls about 6 -flowered, in dense terminal heads, surrounded by orbicular leaf-like bracts ; flowers purplish, rarely white. Calyx subeampanulate, reticulate, 2 -lipped, closed in fruit; upper lip flat, 3 -toothed; lower 2 -lobed; throat naked. Corolla-tube broad, ascending, with a short hairy basal ring inside ; upper lip erect, concave; lower spreading, lateral lobes deflexed, middle concave. Stamens 4, exserted, filaments glabrous 2 -toothed at the tip, lower tooth antheriferous; anthers conniving in pairs under the upper lip, cells diverging. Dish erect, equal. Style-lobes subulate. Nutlets oblong, smooth.-Distmib. N. and S. temp. regions; species 3.-ETYM. Doubtful.

1. P. vulga'ris, $L$.; leaves ovate-oblong, corolla not twice as long as the purplish calyx. Brunella, Tournef.
Pastures and waste places ; ascends to 2,400 ft. in Yorkshire ; fl. July-Sept.More or less hairy. Rootstock creeping. Stems 4-12 in., erect or ascending, branches often abbreviated. Leaves 1-2 in., petioled, uppermost sessile, ovate-oblong or oblong-lanceolate, entire toothed or subpinnatifid. Whor/s in cylindric spikes, 1-3 in.; bracts broadly ovate-cordate, eiliate, green with purple edges; bracteoles 0 ; pedicels very short. Calyp-teelh minute, mueronate. Corolla $\frac{1}{2}-\frac{3}{4}$ in., purple, rarely white.-Distrib. Europe (Aretic), N. Africa, temp. Asia, America, Australia.

## 9. SCUTELLA'RIA, L. SkUll-CAp.

Slender herbs, rarely shrubs. Flowers solitary or in pairs, axillary or in terminal spikes or racemes. Calyx campanulate, 2 -lipped; lips entire, closing after flowering, upper surmounted by a broad concave deciluons scale (the posterior lobe of the calyx), lower persistent. Corolla-tube long, naked inside, throat dilated ; upper lip entive or notched; lower dilated, lateral lobes free spreading, usually connate with the upper lip, rarely with
the lower. Stamens 4 ; anthers conniving in pairs, ciliate, lower 1 -celled, upper 2 -celled. Disk elongate, curved. Ovary oblique. Style with the upper lobe very short. Nutlets smooth or tubercled.-Distrib. N. temp. and subtrop. regions, abundant in America; species about 90.-Етум. soutella, from the dish-like scale on the calyx.

1. S. galeric'ulata, $L$.; leaves crenate-serrate, flowers $\frac{2}{3}$ in.

Marshy places, river-banks, \&ce, from Ross and Harris southwards, rare in Scotland ; local in Ireland ; fl. July-Sept. -Glabrous or puberulous. Rootstock creeping. Stems $6-18 \mathrm{in}$., slender, simple or branched. Leaves $\frac{1}{2}-2 \frac{1}{2} \mathrm{in}$., shortly petioled, oblong or ovate, base cordate, obtuse or subacute, crenatures rather remote. Flowers secund, pubescent, solitary ; hracts leaf-like; bracteoles minute, setaceous ; pedicels very short. Calyx-lobes short, broad. Corolla blue variegated with white inside, 3-4 times as long as the calyx; tube curved; lips short. Stumens and style included. Nutlets granulate, enclosed in the 2 -valved calyx.-Distrib. Europe (Arctic), N. Africa, N. Asia, W. Asia to N.W. India, N. America.
2. S. mínor, $L$.; leaves with 1-2 crenatures near the base, flowers $\frac{1}{3}$ in. Swampy heaths and sides of ditches, \&cc., from Dumbarton southwards, rare except in the W. counties and Ireland; ascends to $1,000 \mathrm{ft}$. in Devon; fl. July-Oct.-Habit of S. galericulata, but only 4-6 in., more slender, often much branched; leaves shorter-petioled or sessile, $\frac{1}{3} 1 \mathrm{in}$., obtuse, upper quite entire ; flowers much smaller, pale pink-purple.-Distrib. Europe from Belgium southwards, excl. Greece and Turkey, W. Asia to the N.W. Himalaya.

## 10. MEL'ITTIS, $L$. Bastard-balm.

An erect perennial herb. Whorls axillary, 2-6-flowered ; flowers large. Calyx broadly campanulate, membranons, nerved; upper lip broad, orbicular, irregularly $2-3$-lobed ; lower lip with 2 rounded lobes. Corolla-tube broad, naked inside, orbicular; lower lip broadly 3 -lobed. Stamens 4, ascending under the upper lip; anthers conniving in pairs, cells diverging. Style-lobes ovate. Nutlets smooth or reticulate.-Distrib. Europe from France southwards, excl. Greece.-Etym. Same as Melissa.

1. M. Melissophyl'ium, L.; leaves ovate or oblong crenate-serrate. M. grandiflora, Sm.

Copses, from Wales and Gloucester to Somerset, Hants, and Sussex ; fl. May-June.-Sparingly pilose. Rootstock long, creeping. Stem 1-2 ft., erect, simple or branched. Leaves subsessile or petioled, hairy on the nerves below. Bracts leaf-like; bracteoles 0 ; pedicels short, stout. Cicly.x very open, lobes all short and broad. Corolla $1-1 \frac{1}{2}$ in., tube nearly straight, mouth oblique; lips diverging, creamy white, blotehed with pink or purple.Distrib. Europe from France southwards.

## 11. marru'bium, $L$. White Horehound.

Perennial, tomentose or woolly herbs. Whorls axillary; bracts leaf-like ; flowers small. Calyx tubular, 5-10-nerved ; teeth $5-10$, subspinous, ereet or spreading. Corolla short; tube naked or with a ring of hairs inside; upper lip erect; lower spreading, 3 -fid, mid-lobe broadest. Stamens 4, included; anther-cells diverging, subconfluent. Style-lobes short, obtuse. Nutlets obtuse.-Distrib. Temp. and warm regions of the Old World; species 30.-Еtym. The old Latin name.

1. M. vulga're, $L$. ; leaves broadly ovate crenate, whorls dense-flowered. Waste places, from Fife southwards, not common, perhaps not a native ; rare in Ireland; fl. July-Nov.-Hoary,pubescence almost woolly. Rootstock short, stout. Stem $1-1 \frac{1}{2} \mathrm{ft}$., stout, branched, leafy. Leares $\frac{1}{2}-1 \frac{1}{2}$ in., cordate or cuneate at the base, nerves stout usually diverging from the broad rather long petiole, much wrinkled, leathery. Whorls of innumerable partial ones, depressed, axillary, villous. Calyx oblong ; teeth 10, short, spinous, hooked at the tip. Corolla $\frac{1}{2}$ in., white; tube slender; upper lip long, 2 -fid.Distrib. Europe, N. Africa, W. Asia to N.W. India ; introd. in N. America. -Aromatic and bitter. Much used as a cough medicine.

## 12 STA'CHYS, L. WOUNDWORT.

Herbs, rarely shrubs. Leaves crenate or serrate. Whorls 2- or moreflowered, usually in terminal racemes. Caly.x subcampanulate, 5-10nerved, 5 -toothed, teeth usually equal. Corolla-tube eylindric, with usually a ring of hairs inside, often incurved above ; throat not dilated ; upier lip erect or spreading; lower longer, spreading, 3 -lobed, mid-lobe largest, lateral often reflexed. Stamens 4, ascending, 2 lower longest; anthers conniving, cells parallel or diverging. Style-lobes nearly equal, subulate. Nutlets obtuse.-Distrib. Chiefly warm N. temp. and oriental regions; species about 160.-EtYM. $\sigma \tau d \chi u s$, from the spiked inflorescence.

Su'b-gen. 1. Sta'chys proper. Whorls in elongate interrupted spikes or racemes; lower or all the bracts foliaceous. Anther-cells diverging.

1. S. sylvat'ica, L.; perennial, hispid, cauline leaves long-petioled ovate broadly cordate coarsely serrate, whorls 6-12-flowered.
Woods and shady places, ascending to $1,500 \mathrm{ft}$. in Northumberland ; fl. July-Aug.-Feetid when bruised ; softly hispid. Rootatork creeping, stoloniferous. Stem 1-3 ft., rather slender, solid, simple or branched. Leaves 2-4 in., petiole often longer, radical withering early. Spikes $4-8$ in., hairy and glandular ; lower bracts serrate, upper lanceolate quite entire ; bracteoles minute ; perlicels short. Calyp-tecth triangular-subulate, spinescent. Corollu $\frac{3}{3}-\frac{2}{3}$ in., red-purple; tube equalling or exceeding the calyx; lower lip variegated with white.-Distrib. Europe (Aretic), Siberia, N.W. Himalaya.
2. S. palus'tris, L. ; perennial, hairy, cauline leaves shortly petioled or sessile ovate- or oblong-lanceolate, whorls 8 - 10 -flowered.
River-hanks and moist places, ascends to $1,500 \mathrm{ft}$. in Northumberland ; fl . July-Sept.-Habit, \&c. of S. sylvatica, but leaves much narrower; stem stouter and hollow ; hairs less coarse ; odour not so disagreeable, and flowers paler.-Distrib. Europe (Aretic), Siberia, Dahuria, W. Asia to the Himalaya, E. and W. N. America.
S. amluig'ua, Sm. (sp.), is a hybrid nearer sylvatica than palustris, with leaves always shortly petioled, fruit never maturing. Cultivated ground, not uncommon. Other hybrids nearer to palustris than to sylvatica are more common.
3. S. german'ica, $L$. ; biennial, shaggy with white silky hairs, cauline leaves shortly petioled ovate-oblong or lanceolate, spikes stout, whorls very dense-flowered lower remote.
Fields and roadsides on dry soil, very rare, Bedford, Norfolk, Oxford, Kent : an alien or denizen, Watson; fl. July-Aug.-Rootstock stoloniferous. Steru

1-3 ft., very stout, branched. Leaves coarsely crenate-serrate, often cordate, wrinkled under the matted hairs; radical $2-5$ in., tufted, rather long-petioled. Whorls interrupted; upper bracts lanceolate; bracteoles subulate; pedicels very short. Calyx villous; upper lip longest ; teeth triangular, spinescent. Corolla $\frac{1}{4}$ in., pale rose-purple, pubescent, lower lip spotted.-Distrib. Europe from Belgium southwards, W. Asia to N.W. India.
4. S. arven'sis, L.; annual, sparingly hairy, leaves ovate or oblong obtuse crenate, whorls 4-6-flowered, corolla very small.
Cultivated fields and waste places; rare in Scotland, local in Ireland ; a native or colonist, Watson; fl. April-Nov.-Stem branched from the base ; branches 6-18 in., weak, ascending, often rooting below. Leaves small, $\frac{1}{4} 1 \mathrm{in}$, base cordate or cuneate, upper sessile; petioles very variable. Whor/s $\frac{1}{3} \frac{3}{4} \mathrm{in}$. diam.; bracts sessile, subacute ; bracteoles 0 ; perlicels short. Calyx-teeth longer than the tube, lanceolate-subulate, spinous-tipped. Corolla equalling the calyx, $\frac{1}{3}$ in., pale pink variegated with white. - Distrib. Europe, N. Africa, Siberia, W. Asia to N.W. India; introd. in N. America.
Sub-gen. 2. Beton'ica, L. (gen.). Whorls in short dense terminal spikes; lowest bracts leafy, upper minute. Anther-cells parallel.
5. S. Beton'ica, Benth.; hairs deflexed, leaves petioled oblong-cordate obtuse deeply crenate, whorls all close or the lower only separate, calyxlobes triangular spinescent. Betonica officinalis, L. Wood Betony.
Copses, woods, roadsides, \&c. from Skye and Ross southwards, rare in Scou-
land and Ireland, ascends to $1,200 \mathrm{ft}$. in Northumberland ; fl. June-Aug.Rootstock woody. Stems 6-24 in., ascending or erect, simple or sparingly branched from the base. Leures 1-4 in., coriaceous, radical tufted on slender petioles, crenatures large rounded ; cauline few, much narrower, more toothed or serrate. Whorls in an oblong, obtuse, long-peduncled spike, 1-3 in.; bracteoles as long as the calyx, oblong-lanceolate, awned; pedicels short. Calyx-teeth as long as the tube. Corolla $\frac{3}{4}$ in., red-purple, hairy, tube exserted ; upper lip ereet, lower 3-lohed.-Distrib. Europe, N. Africa, W. Siberia.-Formerly much used medicinally.

## 13. Galeop'sis, $L$. Hemp-nettle.

Annual herbs; branches diverging. Leaves toothed. Whorls manyflowered, dense, axillary and terminal ; bracts foliaceous; flowers red orange or variegated. Calyx subcampanulate, nearly regular, 5 -nerved; teeth 5, spinescent. Corolla-tube straight, naked inside, throat dilated; upper lip ovate, arched ; lower 3 -fid, mid-lobe obeordate or 2 -fid; palate with ereet teeth at the union of the lobes. Stamens 4, exserted; anther-cells opposite, transversely 2 -valved, inner valve rounded ciliate, outer larger naked. Nutlets rounded, compressed, obscurely reticulate.-Distrib. Temp. Europe, W. Asia; species 3.-Etym. $\gamma \boldsymbol{\lambda} \boldsymbol{\lambda} \boldsymbol{\eta} \eta$ and $\delta \psi \iota s$, from the resemblance of the corolla to a wcersel's head.

1. G. Lad'anum, L. ; softly pubescent, nodes not thickened, calyxteeth not exceeding the tube, corolla red.
Cornfields and waste places, from Skye and Ross southwards, rare in Scotland; E. of Ireland, rare and local ; a colonist, Watson; fl. July-Oct.-Stem 6-18 in.; branches many, ascending. Leaces petioled. 1-2 in., ovate-oblong or linear-lanceolate, acute, servate. Whor/s few- or many-flowered; bracts sessile; bracteoles linear, spinescent; pzdicels very short. Calyx-teth
subulate-lanceolate. Corolla $\frac{3}{4}-1 \mathrm{in}$., hairy, rosy, lower lip variegated with white. -Distrib. Europe, Siberia, W. Asia; introd. in N. America.
Sub-sp. Lid'anum proper (L. Herb.) ; leaves ovate or ovate lanceulate serrate throughout, whorls all separate, tube of corolla equalling the calyx. G. intermedia, Villars.-Wheat-fields, Moray.
Sub-sp. angustifo'lia, Ehrh. (sp.); leaves narrower connate at the base interruptedly serrate or subentire, upper whorls approximate, tube of corolla much longer than the calyx.- V AR. 1, almost glabrous or minutely pubescent. Common.-Var. 2, cunes'cens, Schultz (sp.); very pubescent. Chiefly in the south.
2. G. dubia, Leers ; glandular-pubescent, nodes not thickened, calyxteeth not exceeding the tube, corolla often yellow. G. villosa, Huds.; G. veliroleu'ca, Lamk.

Sandy cornfields, rare, from Durham, York, and N. Wales to Essex ; a colonist, Wutson; fl. July-Aug.-Habit of G. Ladanum, but glandular ; leaves broader, more deeply serrate ; whorls dense, almost silky ; bracteoles much smaller ; calyx-teeth less spinescent; corolla $1-1 \ddagger \mathrm{in}$., pale yellow, ravely. white or purple.-Distrib. Europe from Denmark southwards.
3. G. Tet'rahit, L. ; hispid, nodes thickened, calyx-teeth as long as or longer than the tube, corolla yellow and purple or white.
Cornfields and waste places, ascending to $1,300 \mathrm{ft}$. in Northumberland ; a native or colonist, Wutson ; fl. July-Sept.-Usually much larger and stouter than the two preceding, with spreading and dellexed hairs. Stem $\frac{1}{2}-3 \mathrm{ft}$., stont, succulent, very hispid at the nodes. Leaves 1-4 in., rather longpetioled, ovate or ovate-lanceolate, acute or acuminate, very coarsely serrate. Whorls dense-flowered; bracts leafy; bracteoles shorter than the calyx; pedicels very short. Culyx $\frac{1}{2} \frac{3}{4} \mathrm{in}$. ; teeth very long, straight, subulate. Corolla 14 in .-Distrib. Europe (Arctic), N. Asia, W. Asia to N.W. India ; introd. in N. America.
Sub-sp. Tet'rahit proper; corolla $\frac{3}{4} \mathrm{in}$. rosy or white, tube a little exceeding the calyx, upper lip flattish longer than broad, nutlets slightly convex above on the inner face.-VAR. 1, corolla twice as long as the calyx-teeth, lower lip nearly entire flat.-VAR. 2, bif'ida, Bomn. (sp.); corolla half as long as the calyx-teeth, lower lip notched, margins at length reflexed.
Sub-sp. versic'olor, Curt. (sp.) ; corolla larger broader $1-1+\frac{1}{4} \mathrm{in}$. yellow and purple, tube much exceeding the calyx, upper lip arched as broad as long, nutlets very convex above on the inner face.

## 13*. LEONU'RUS, L. Mother-wort.

Erect herbs. Leaves lobed. Whorls axillary, dense-flowered, scattered; bracteoles subulate ; flowers small, pink or white. Calyx 5 -nerved, turbinate, truncate, with 5 subspinescent spreading teeth. Corolla-tube naked, or with an oblique ring within ; upper lip entire, ereet ; lower 3 -fid, midlobe oheordate. Stamens 4 ; anthers conniving in pairs, cells transverse. Style-lubes subulate or obtuse. Nuticts smooth, 3 -quetrous, truncate at the top.-Distrib. Temp. Europe, Asia, and America; species 10.-Etym. $\lambda \in \omega \nu$ and oùpa, lion's-tail.
L. Cabitiaca, L.; puhescent, lower leaves palmately lobed, upper ovate, bracts subtrifid, corolla-tube with a ring of hairs inside.
Hedges and waste places in England, Scotland, and Ireland, but rare and not
indigenous ; fl. July-Sept.-Rootstock stout, perennial. Stem 2-4 ft., stout, erect, angles prominent, very leafy. Leaves very close set, radical on slender long petioles, ovate or orbicular-cordate, margin lobed and toothed ; cauline $2-3 \mathrm{in}$., petioled, cuneate or obovate-oblong, lower multifid, upper 3 -fid, palmately 3 -many-nerved, lobes acute. Whorls very many; bracts large, leaf-like, petioled; bracteoles small, subulate, pungent; flowers sessile. Calyx $\frac{1}{6} \mathrm{in}$.; teeth broadly triangular. Corolla $\frac{1}{2}$ in., woolly, pale rose, upper lip nearly straight. Nutlets villous-tipped.-Distrib. Europe, Siberia, W. Asia to the Himalaya; introd. in N. America.

## 14. La'miUM, $L$. Dadinenttle.

Annual or perennial hairy herbs, decumbent at the base. Whorls manyflowered, axillary, or in leafy bracteate heads; bracteoles 0 or subulate; flowers red purple white or yellow. Calyx tubular or subcampanulate; teeth 5, equal, or the upper longer. Corolla-tube naked, or with a ring of hairs within, throat dilated; upper lip arehed; lower 3 -fid spreading, lateral lobes sometimes toothed at the base ; mid-lobe broad, base contracted. Stamens 4 ; anthers conuiving in pairs, cells diverging. Stylelobes subulate. Nutlets 3 -quetrous, truncate at the top, smooth scaly or tubercled.-Distrib. Temp. Europe, Asia, N. Africa; species 35.-Etym. $\lambda a t \mu \delta{ }^{\prime}$, from the throat-like corolla.

Section 1. Lamiop'sis. Annual (the British sp.). Corolla-tube nearly straight, naked or with a ring of hairs, not constricted below the ring; throat very wide. Anthers hairy. Nutlets with white scales.

1. L. purpu'reum, $L_{\text {. }}$; leaves petioled cordate crenate, whorls subterminal crowded, calyx slightly hairy, teeth spreading in fruit about as long as the tube.
Fields and 'waste places ; ascends to near 2,000 ft. in Northumberland ; fl. April-Oct. - Silkily hairy, or subglabrous. Stem 6-18 in., decumbent below, branched from the base, often purplish. Leaves $\frac{1}{2}-2 \mathrm{in}$., obtuse, petiole as long or longer. Bracts crowded, bases not overlapping, upper subsessile, together forming a flat-topped head. Calyx about $\frac{1}{\frac{1}{5}} \mathrm{in} . ;$ teeth triangular with spinous points. Corolla $\frac{1}{2} \frac{3}{4} \mathrm{in}$., purple, rarely white; lateral lobes generally $1-2$-toothed at the base.-Distrib. Europe, Canaries, Siberia, W. Asia ; introd. in N. America.
Sub-sp. PURPU'reum proper; corolla-tube longer than the calyx-teeth, with a ring of hairs within.-VAR. 1, leaves and bracts with shallow crenatures.Var. 2, decip'iens, Sonder ; leaves and bracts deeply crenate.
Sub-sp. Hyb'ridum, Vill. (sp.); corolla-tube shorter than the calyx, ring of hairs within very inconspicuous. L. dissectum, With.; L. incisum, Willd.
2. L. interme'dium, Fries; leaves petioled orbicular-cordate crenate, whorls subterminal crowded, calyx slightly hairy, teeth spreading in fruit much longer than the tube.
Cultivated ground in light soils in Scotland and the extreme N. of England ; N. of Ireland, rare and local ; fl. June-Sept.-Intermediate between purpureum (almost united by sub-sp. hybridum) and L. amplexicuule, of which it has the habit, overlapping upper bracts, and foliage ; often stouter and more succulent than either, and the long calyx-teeth distinguish it from both. The tube of the corolla exceeds the calyx and has a very obscure ring of hairs; lateral lobes toothed.-Distrib. Chiefly in N. and W. Europe (excl. Spain).
L. amplexicau'le, $L$.; leaves petioled orhicular deeply crenate, whorls distant, calyx densely pubescent, teeth converging in fruit about equalling the tube, corolla-tube long slender. Henbit Decednettle.
Waste sandy places; rather rare in Ireland; fl. May-Aug.-Hairy or almost glabrous. Stem $4-10 \mathrm{in}$., branched from the base. Leates small, $\frac{1}{4}-\frac{3}{7} \mathrm{in}$., lower long-petioled, almost lobulate, base rounded or cordate. Bructs sessile, broader than long, many-lobed, bases overlapping. Cimollí sometimes imperfeet, often $\frac{3}{4} \mathrm{in}$., very slender, rosy, pubescent.- Distrib. Europe, N. Africa, Siberia, W. Asia to N. W. India ; introd. in N. America.

Section 2. Lamioty'pus. Perennial. Corolla-tube curved, ascending, with a ring of hairs inside, constricted below the ring. Anthers hairy. Nutlets without seales.
4. L. al'bum, L.; leaves all petioled cordate crenate or serrate, calyxteeth narrow straight longer than the straight tube, corolla white, tube gibhous at the base below, ring of hairs oblique.
Fields and waste places, from Moray southwards, rare and local in Seotland and Ireland ; fl. May-Dec. - More or less hairy. Rootstock creeping, branched, stoloniferous. Stem 6-18 in., rooting and branched from the hase, then ereet. Leares 1-3 in., sometimes blotched with white, lower long-petioled, subacute or acuminate, rarely deeply incised. Whor/s 6-10-flowered, upper crowded, lower remote; bracts shortly petioled. C'ulyx glabrous or hairy ; teeth triangular-subulate, with long slender points. Corolla $\frac{3}{4}-1 \mathrm{in}$., throat gradually dilated; upper lip vaulted, villous; lateral lobes variable.Distrib. Europe, N. Africa, N. Asia; introd. in N. America.
L. maccla'tem, $L$. ; leaves all petioled cordate crenate or serrate, calyxteeth hroad strongly recurved as long as the oblique tube, corolla usually purple equal at the base below, ring of hairs transverse.
Waste places, copses, \&c., in England and Seotland, not indigenous; f.
June-siept.-Very closely allied to L. album, but the calyx and corolla are different ; flowers fewer, rarely white ; leaves more wrinkled, and almost always with a merlian white stripe, and the corolla-throat is suddenly dilated.
-Distrib. Europe, N. Africa, Siberia, W. Asia.
Section 3. Galeob'dolon, Huds. (gen.). Perennial. Corolla-tube curvel, ascenling, with a ring of hairs inside, constricted below the ring; upper lip stipitate. Anthers glabrous. Nutlets without scales.
5. L. Galeob'dolon, Crantz; leaves petioled ovate acuminate doublycremate or -serrate, calyx-teeth shorter than the oblique tube, corolla yellow, ring of hairs oblique. Guleobdolon luteum, Huds. Yollow Arehangel. Hedges and copses, chiefly on chalk and limestone, from Yorkshire southwards,
loeal ; E. of Ireland, rare and local ; H. May-June.-Hispid or subylahrous, hairs often reflexed. Rotstock short, stoloniferous. Stems 6-18 in.. flowering erect: barren elongate, prostrate. Leaces 1-2 in., petioles variable. Whor/s remote, 6-10-flowered; upper bracts sometimes lanceolate. Culyp-teeth mucrouate. Corella ${ }^{3}-1 \mathrm{in}$., tuhe short, gibbous at the base below ; lips long, lower spotted red-brown.-Distrib. Europe, W. Siberia.

## 15. ballo'ta, L. Black Hobemound.

Perennial, hairy or woolly herbs or undershrubs. Whorls axillary, dense-flowered; luracteoles subulate ; flowers small. Calyx tubular or funnel-
shaped, 10 -nerved ; teeth 5 -10, dilated at the base or connate into a spreading limb. Corolla-tube with a ring of hairs inside ; upper lip erect, concave ; lower as long, 3-lobed, spreading. Stamens 4, ascending under the upper lip ; anthers conniving in pairs, cells at length diverging. Stylelobes subulate. Nutlets obtuse.-Distrib. Europe, N. and S. Africa, temp. Asia; species 23.-Еtym. The Greek name.

1. B. ni'gra, $L$.; erect, hairy, calyx-teeth exceeding the corolla-tube.

Hedgebanks, \&c. from the Forth and Clyde southwards; rare and seldom indigenous in Scotland and Ireland ; fl. July-Aug.-Dull green, hoary or woolly, foetid. Ruotstock stout, short. Stem $2-3 \mathrm{ft}$., stout, erect, much branched, hairs usually reflexed. Leares 1-2 in., petioled, ovate- or orbicular-cordate, crenate or almost lobulate. Whon/s many; cymes peduncled, 3-6-flowered; bracts leaf-like, bracteoles small ; flowers sessile. Calyx $\frac{1}{3}$ in., slightly enlarged in fruit; tube cylindric, strongly ribbed; limb short, expanded ; teeth 5, very variable, nerved, spinescent. Corolla $\frac{1}{2} \frac{3}{4} \mathrm{in}$., pale red-purple ; upper lip hairy outside and in ; mid-lobe of lower obcordate. Nutlets obtusely 3 -gonous, brown, smooth, shining.--Distrib. Europe, N. Africa, W. Asia; introd. in N. America.
Var. 1, fuétidu, Lamk. (sp.); calyx-teeth deltoid mucronate or spinous-tipped. -Var. 2, rudera'lis, Swartz (sp.); calyx-teeth lanceolate tips long spinous.

## 16. teu'crium, L. Germander.

Herbs. Whorls with leafy bracts or in leafy unilateral racemes or spikes. Calys tubular or campanulate; teeth 5, equal or the upper broader and reflexed. Corollu-tube short, naked within ; limb obliquely 5 -lobed ; 2 upper lobes very small, 2 lateral larger, lowest largest, rounded or oblong, often concave. Stamens 4, protruded between the 2 upper lobes, 2 lower longest; anther-cells confluent. Style-lobes nearly equal. Nutlets subglubose, smooth reticulate or pitted, obliquely truncate at the base. Distrib. Temp. and warm regions ; species 86.-Etym. The ancient name.

Section 1. Scorodónia, Monch (gen.). Whorls 2 -flowered, in terminal branched 1 -sided racemes. Upper lip of calyx much dilated.

1. T. Scorodónia, L.; leaves all shortly petioled ovate-cordate crenate, bracts short, calyx gibbous at the base. Wood Sage.
Copses, heaths, and hedges, especially in stony soils ; ascends to $1,500 \mathrm{ft}$. in
Northumberland; fl. July-Sept.-Perennial ; finely pubescent or hairy.
Rootstock woody, stoloniferous. Stemis 8-24 in., tufted, usually ascending,
rigid. Leaves $1-1 \frac{1}{2}$ in., in distant pairs, rarely laciniate. Racemes 3-6 in.,
branched at the base ; bracts petioled, green ; bracteoles 0 ; pedicels short.
C'alyx broadly campanulate, reticulate in fruit; lobes cuspidate, 4 lower
small incurved subulate. Corolla $\frac{1}{2}$ in., ochreous. Stamens purplish. Nut.
lets subglobose, smooth.-Distrib. Europe, except Russia, N. Africa.-
Bitter, aromatic, tonic ; a substitute for hops.
Section 2. Scor'dium, Benth. Whorls 2-6-flowered; bracts leaf-like. Upper lip of calyx equal to or rather larger than the lower.
2. T. Scor'dium, $L$. ; leaves sessile oblong coarsely serrate, calyx nearlyequal at the base, teeth nearly equal. Water Germander.
Wet meadows, very rare ; Yorkshire, Norfolk, Cambridge, Devon; S. and W.
of Ireland, very local and rare ; a native? Watson ; fl. July-Aug.-Perennial, foetid, hairy woolly and glandular. Rontstock ereeping, stoloniferous. Stem 4-10 in., branched from the base, erect or prostrate, leafy. Leuries $\frac{1}{2}-1 \frac{1}{2}$ in., narrowed rounded or cordate at the base. Bructs leaf-like, sometimes auricled at the hase (T. scovdioides, Bab. not Schreber) ; bracteoles 0 : pedicels short. Culyx-teeth straight, short, triangular. Corvella $\frac{1}{2}$ in., rose-purple ; lower lip spotted. Nutlets wrinkled.-Distrib. Europe, N. Africa, Siberia, W. Asia to the N.W. Himalaya.
3. T. Bo'trys, $L . ;$ leaves all petioled triangular-ovate pinnatifid, calyx saccate at the base, teeth equal.
Chalky fields, Bookham and Betchworth, Surrey; indigenous, or a colonist,
Buker; fl. Aug.-Annual, pubescent and glandular with long hairs. Stem $4-8 \mathrm{in}$., erect, much branched from the base, leafy. Leaves $\frac{1}{3}-1 \mathrm{in} ., \mathrm{seg}$. ments 3-5 pair, linear, obtuse, lower again lobed ; nerves prominent helow.
Bracts leaf-like. Calyx large, glandular, inflated and reticulate in fruit; lobes triangular, mucronate. Corolla $\frac{2}{3}$ in., rose-purple, lower lip spotted white and red. Nutlets deeply pitted.-Distrib. Europe from Belgium southwards, excl. Greece and Turkey, N. Africa.
Section 3. Chamæ'drys, Benth. Whorls 2-6-flowered, all or the upper only in lax terminal racemes. Calyx-tecth subequal.
T. Chamédrys, L. ; leaves petioled ovate incised-crenate, bracts sessile leaf-like, calyx nearly equal at the base, teeth nearly equal.
Old walls in England, Scotland, and sandy fields in Ireland, rare; a garden escape ; fl. July-Sept.-Perennial, almost hispidly hairy. Rootstock creeping, stoloniferous. Stem 6-18 in., ascending, much branched, leafy. Lecties $\frac{1}{2}-1 \frac{1}{2}$ in., gradually narrowed into the petiole, nerves prominent beneath. Whorls about 6 -flowered, in the axils of leafy bracts, or subsecund in leafy terminal spikes; bracts exceeding the calyx, quite entire, acuminate, often purple; upper smaller; pedicels very short. Ciely, c-tecth straight, triangular, spinescent. Cornlla $\frac{3}{4} \mathrm{in}$., rosy, lower lip spotted white and red. Nutlets nearly smooth.-Distrib. Europe from Holland southwards; W. Asia.-A reputed tonic and famous old gout medicine.

## 17. A'JUGA, L. Bugle.

Annual or perennial herbs. Whorls few- or many-flowered; bracts leaf-like; flowers blue purplish or yellow. Calys. subeampanulate, 5 -fid or 5 -toothed. Corolla-tube usually with a ring of hairs within, straight or twisted ; upper lip short, notehed ; lower longer, spreading, 3 -fid, lateral lobes oblong, middle broader notched or 2 -fid. Stamens 4, ascending, protruded beyond the upper lip, 2 lower longer; anther-eells diverging, at length confluent. Style-lobes subequal. Nutlets reticulate or rugose. -Distrib. Temp. regions of the Old World, from Europe to Australia ; species 30.-Etym. doubtful.

1. A. rep'tans, $L$; almost glabrous, stoloniferous, leaves repandcrenate, whorls in a loose spike with spreading hracts, flowers blue.
Copses, woods, and pastures, ascending to $2,000 \mathrm{ft}$. in the Highlands ; ff.
May-July.-Perennial, subglabrous or pilose, with bifarious lines of hairs
on the stem. Rrwitstock short, stout ; stolons slender, leafy, tips ascending.
Flowering stem 6-12 in. Leaves, radical 2-3 in., long-petioled, narrowly
obovate, obtuse; those on the stolons small, obovate-spathulate ; cauline few, sessile, oblong, obtuse. Spike 3-8in. ; bracts subentire, obtuse, much shorter than the upper flowers, upper often purplish; whorls 6-10flowered; pedicels very short. Calyx small, teeth triangular acute ciliate. Corolla $\frac{1}{2} \frac{3}{4}$ in., rarely white or rosy, mid-lobe of lower lip broadly obcordate.-Distris. Europe.-A form without stolons (var. pseulo-alpina) has been mistaken for A. alpina. The A. alpina of Smith is the exotic A. genevensis, L.
2. A. pyramid'alis, $L$.; pilose with soft jointed hairs, leaves obscurely crenate, whorls in a compact pyramidal spike, upper bracts appressed, Howers blue. A. genevensis, var. Benth.
Mountain woods and banks of streams in the N. of Scotland, from Argyle to
Orkney and the Hebrides; W. of Ireland, Arran Isles and Burren ; fl.
May-July.-Similar to A. veptans, but stolons produced late only ; radical leaves very shortly petioled; calyx woolly with longer teeth ; lower corolla lip smaller, its mid-lobe less cordate.-Distrib. Europe.
3. A. Chamæ'pitys, Schreber; annual, villous, cauline-leaves 3-partite, flowers solitary in the axils of leaf-like bracts yellow. Ground Pine.
Chálky fields, local, from Bedford and Cambridge to Kent and Wilts; a colonist, Watson; fl. May-Sept.-Hairs long scattered. Stem 3-6 in.; branches ascending from the root, densely leafy. Leaves, radical early withering, petioled, ovate-lanceolate, entire or toothed ; cauline $1-1 \frac{1}{2}$ in., spreading, lobes narrow-linear. Whorls many, 2 -flowered; bracts many times longer than the flowers. Calyx hispid; teeth narrowly triangular. Corolla $\frac{1}{2}$ in. ; lower lip spotted with red. Nutlets large, oblong, deeply pitted.-Distrib. Europe from Belgium southwards, N. Africa, W. Asia.

## Order LVI. Verbena'cese.

Herbs, shrubs, or trees. Leaves opposite or whorled, exstipulate. Flowers 2 -sexual, cymose, irregular, bracteate. Calyx inferior, tubular, cleft or tonthed, persistent, imbricate in bud. Corolla hypogynous, tubular, usually 2 -lipped, imbricate in bud. Stamens usually 4, didynamous, inserted on the corolla-tube; anthers 2-celled. Ovary 2-4-celled; style simple, terminal, stigma simple or 2 -fid; ovules solitary or 2 collateral in each cell, erect and anatropous or ascending and $\frac{1}{2}$-anatropous. Fruit a 2or 4-celled berry, or a drupe with 2-4 1-2-celled stones, or of 4 nutlets. Seeds ascending, exalbuminous ; cotyledons foliaceous, radicle inferior.Distrib. Chiefly tropical ; genera 40 ; species 550.-Affinities. With Borraginees and Labiato.-Pnoperties. Chiefly bitter and astringent.

## 1. Verbe'na, $L$. Vervain.

Herbs or undershrubs. Stem 4-gonous. Leaves opposite or 3-nate, simple pinnatifid or 3 -partite. Flowers bracteate, in terminal spikes or racemes. Calyx tubular, 5 -ribbed, unequally 5 -toothed. Corolla salvershaped; tube straight or curved, villous within; limb oblique, 2 -lipped, 5 -ficd. Stamens 4, 2 or all perfect, included. Disk annular. Ovary 4celled ; style slender, 2-lobed, one lobe only stigmatiferous ; ovules solitary
in each cell, erect. Capsule splitting into 4 ribbed nutlets.-Distrib. Almost wholly American ; species 70.-Etym. Classical and obscure.

1. V. officina'lis, L.; leaves opposite, flowers spiked.

Dry waste ground, local, from Northumberland southwards ; absent from Scotland ; S. and Mid. of Ireland, local ; fl. July-Sept.-Peremial, hispidly puhescent. Rootstock woody. Stems 1-2 ft., rigid, branched above. Lorties oblong, pinnatitid or 3-partite, lobes acute or obtuse, upper narrower. Sipiles dense-lowered, afterwards elongating ; bracts ovate, acute, $\frac{1}{2}$ as long as the calyx, which is $\frac{1}{2}$ as long as the corolla-tube. Corolla lilac, limb $\frac{1}{6} \mathrm{in}$. diam. Vutlets truncate, granulate.-Distrib. Europe from Denmark southwards, N. Africa, W. Asia to the Caspian and Himalaya; introd. in N. America.--An object of much superstition amongst the ancients.

## Order LVII, Lentibulari'nem.

Scapigerous herbs, chiefly aquatic or marsh. Leaves radical, crowded or whorled, undivided or multifid, exstipulate. Flowers solitary racemed or corymbose, irregular, bracteate. Calyse free, persistent, 2 -labiate or 5 -partite. Corolla hypogynons, deciduous, personate or 2 -lipped, tube short ; upper lip short 2 -fid, lower entire or 3 -fid; palate convex. Stumens 2, opposite the lateral sepals, hypogynous or inserted on the corolla-tube, filaments short arching; anthers adnate, 1 -celled, transversely 2 -valved. Disk 0. Ovary free, 1-celled; style short, thick, stigma 2-lipped, upper lip short, lower dilated ; ovules many, anatropous, placenta free basal globose. Capsule 2 -valved or bursting irregularly, many-seeded. Seels minute, oblong or peltate, placenta spongy, testa striate or pitted sometimes pilose, albumen 0 ; embryo straight, with 1 or 2 small coty-ledons.-Distrib. Chiefly temp. and cold regions; genera 3; species about 130.-Affinities. With Primulucece.-Properties unimportant.
Terrestrial. Stamens on the base of the corolla-tube............1. Pinguicula.
Aquatic. Stamens on the base of the lip of the corolla.......2. Utricularia.

## 1. PINGUi'CULA, Tournef. Butterwort.

Perennial, succulent, simple herbs. Leaves rosulate, quite entire. Scopos axillary, ebracteate, 1 -flowered. Flowers yellow white or purple, inclined or drooping. Calyx unequally 5 -partite. Corolla ringent. Stamens hypogynous, filaments stout ascending ; anthers terminal. Ocary subglohose. Cupsule erect, 2-4-valved. Seeds oblong, testa rugose. Distrib. N. temp. regions, Fuegia.-Etym. pinguis, from the greasy texture.

1. P. vulga'ris, L. ; calyx-lobes ovate-oblong obtuse, corolla violet, lips very unequal, spur slender about equalling the lower lip.
Wet boyss, \&ce., rare in the S. of England, common in Scotland and Ireland; ascends to near 3,(011) ft. in the Highlands ; fl. May-July.-Glabrous, except the glandular top of the scape and calyx. Leaves 1-3 in., appressed to the ground, oblong, obtuse, succulent, margins incurved, superficial cells pellucid; petiole broad, very short. Scapes several, 4-6 in., purplish. C'alyxlubes very variable. Corvella $3_{3}-1 \mathrm{in}$.; lower lip much longer and broader than
the upper ; segments broad, obtuse ; spur straight or incurved, variable in length. Cupsule ovoid or subglobose.-Distrib. Europe (Arctic), N. Asia, E. and W. N. America.-Leaves used to curdle milk in Lapland.

Sub-sp. vulga'ris proper; calyx-lobes more ovate sometimes'subacute, corolla $\frac{2}{3}$ in., lobes of lower lip not overlapping, spur entire at the tip, capsule ovoid subacute.
Sub-sp. grandiflo'ra, Lamk. (sp.) ; larger, leaves broader, calyx-lobes more oblong rounded at the tip, corolla 1 in ., lobes of lower lip very broad overlapping, spur often 2 -fid at the tip, capsule subglobose.-Bogs, Cork and Kerry ; abundant but introduced in a bog near Penzance.-Distrib. W. of France, Alps and Pyrenees, Spain and Portugal.-Apparently a sub-species; the Irish is an extreme form; Alpine and Pyrenean intermediates are numerous.
2. P. lusitan'íca, L.; calyx-lobes suborbicular, corolla lilac, lips nearly equal, throat yellow, spur short stout conical incurved.
Bogs, in the S.W. of England, local, from Hampshire to Cornwall ; W. of Scotland and Ireland, common ; ascending to $1,500 \mathrm{ft}$. in Mayo ; fl. June-Oct.-Glabrous. Leaves $\frac{1}{3}-\frac{2}{3}$ in., oblong, shortly petioled, thin, succulent, obtuse, margins incurved. Scapes very slender. Corolla $\frac{1}{3} \mathrm{in}$.; lips nearly equal in length, lobes short broad; spur very broad, obtuse. Capsule globose.-Distrib. W. of France, Spain, Portugal.
3. P. alpi'na, L.; calyx-lobes broadly ovate obtuse, corolla white, lips unequal, throat yellow, spur very short conical.
Bogs, I. of Skye, and Rosehaugh in Ross-shire ; fl. May-June.-Similar to $P$. lusitunica, but larger, seapes shorter; corolla $\frac{1}{2}$ in., throat hairy; lower lip longer than the upper ; spur broader and more obtuse ; capsule ovoid, acute.-Distrib. Europe (Arctic) N. of the Alps, N. Asia, Himalaya Mts., Greenland, Fuegia.

## 2. UTRICULA'RIA, $L$.

Aquatic, often floating or terrestrial slender herbs. Leaves (of Brit. species) floating, multifid ; segments very slender, furnished with floating bladders. Flowers solitary spiked or racemed, naked or bracteate. Calyx 2-partite, lobes subequal. Corolla personate. Stamens inserted on the upper lip of the corolla, filaments incurved; anthers subterminal, coherent, simple or constricted in the middle. Ovary short. Capsule globose, bursting irregularly. Seels oblong or peltate, striate, pitted or covered with capitate or glochidiate hairs.-Distrib. Widely dispersed; species 120.-Етуm. utriculus, from the bladder-like floats.

1. U. vulga'ris, L.; leaves spreading pinnately multifid, bladders on the young leaves, spur conic acute half as long as the lip.
Pools and ditches, rather scarce, ascends to $1,500 \mathrm{ft}$. in the Highlands; fl . July-Aug.-Stems 6-18 in., stout, leafy. Leaves $\frac{3}{4}-1 \mathrm{in} .$, broadly ovate in outline; segments sabulate, very slender, remotely toothed; bladders $\frac{1}{8}-\frac{1}{4}$ in., shortly stalked. Scape 4-8 in., very stout, 4-8-flowered ; pedicels much longer than the calyx. Corolla $\frac{3}{3}$ in., yellow; palate prominent ; spur appressed to the under lip. Anthers cohering.-Distrib. Europe, N. Africa, Siberia, N. America.
Sub-sp. vulga'ris proper ; pedicels $2-3$ times as long as the calyẋ reflexed
after flowering, upper lip of the corolla as long as the palate, lower projecting a little, recurved.
Sub-sp. Neglece'ta, Lehm. (sp.) ; more slender, pedicels 4-6 times as long as the calyx straight and ascending after flowering, upper lip of corolla 2-3 times as long as the palate, lower forming a broad flat projection.-Essex.
2. U. interme'dia, Hayne ; leaves distichous dichotomously multifid, bladders on the leafless branches, spur conic acute half as long as the lip.
Pools and ditches, rather rare ; fl. July-Sept.-Stems slender, $4-8 \mathrm{in}$. Letecs close set, $+\frac{1}{2} \mathrm{in}$. broad, orbicular in outline; segments subulate, distantly toothed ; bladders $\frac{1}{8} \frac{1}{1} \mathrm{in}$. long, on slender stalks. Scape rather stout, 3 -4-flowered; pedicel equalling or much exceering the calyx. Corollu $\frac{1}{2}$ in., pale yellow ; upper lip twice as long as the prominent palate; lower broad, flat; spur appressed to the under lip. Anthers free.-Distrib. Europe N. of the Alps, N. Asia, N. America.
3. U. minor, $L$. ; leaves dichotomously mnltifid, bladders on the leaves, spur minute obtuse.
Pools and ditches, rare in Great Britain, commoner in W. Ireland ; fl. June -Sept.-Stems capillary, 3-10 in. Leares lax, $\frac{1}{8}-\frac{1}{4}$. broad, orbicular in outline ; segments subulate, quite entire; bladders $\frac{1}{1} \frac{i n}{}$., on slender stalks. Scapes 2-6 in., 2-6 flowered ; pedicels 2-3 times as long as the calyx. Corvlla $\frac{1}{3}$ in., pale yellow ; upper lip as long as the inconspicuous curved palate, lower lip broad. Anthers free.-Distrib. Europe (exel. Spain, Greece, and Turkey), N. Africa, Siberia, W. Asia to the Himalaya, N. America.

## Order LVIII. primula'cere.

Perennial, rarely annual herhs. Leaves all radical, or if cauline usually opposite or whorled, exstipulate. Flowers 2 -sexual, regular. Calyc inferior, superior in Samolus, 5- (rarely 4-9-) cleft. Corolla usually hypogynous ( 0 in Glaux), rotate bell- or funnel-shaped, 5- (rarely 4-9-) cleft. Stamens inserted in the corolla-tube opposite its lobes, with sometimes alternating staminodes (hypogynous in Glaux), filaments usually short; anthers bursting inwaids by slits, rarely by terminal pores. ieary 1 celled; style simple, stigma undivided; ovules many, amphitropous rarely anatropous, placenta free central. Capsule 1-celled, dehiscing by simple or 2 -fid valves or transversely. Seerls sunk in cavities of the placenta, testa thin, hilum usually ventral, albumen fleshy or horny ; embryo terete, parallel to the hilum. - Distrib. N. temp., aretic, and mountain regions, Chili and Fuegia; genera 18 ; species about 200.Affinities. With Myrsincee and Plumbaginee.-Prorerties unimportant.
Tribe 1. Primule'fe. Ovary superior. Capsule valvular. Hilum ventral. Leaves radical. Rootstock woody or fleshy. Flowers umbelled...1. Primula. Leaves radical. Rootstock tuberous. Scapes 1-flowered.......1*. C'yclumen. Leaves cauline. Calyx 5-partite. Corolla yellow................2. Lysimachia. Leaves cauline. Calyx 5-9-partite. Corolla white ................3. Trientalis. Leaves cauline. Calyx campanulate, coloured. Corolla 0...........4. Glaux. Tribe II. anagalíideef. Ovary superior. C'apsule opening transversely. Hilum ventral.
Calyx 4 -partite. Filaments glabrous 5. Centunculus.

Calyx 5-partite. Filaments villous.......................................6. Anagallis.

Tribe III. hotróniere. Ovary superior; ovules anatropous. Cápsule valvular. Hilum basal 7. Hottonia.

Tribe IV. SAmole'fe. Ovary inferior; ovules anatropous. Capsule valvular. Hilum basal. 8. Samolus.

## 1. PRI'MULA, $L$.

Scapigerous, perennial herbs. Flowers in involucrate umbels, white yellow or purple. Calyx 5-toothed or fid. Corolla funnel- or salvershaped, throat naked or with 5 swellings; lobes 5, erect or spreading. Stamens 5, included. Ovary ovoid or globose ; style filiform, stigma capitate; ovules many, amphitropous. Capsule 5 -valved at the top, manyseeded, valves simple or 2 -fid. Sceds plano-convex, peltate, testa punctate. --Distrib. Of the Order; species about 50.-Etym. primus, from flowering early.-Flowers usually dimorphic, having long styles with anthers deep in the tube, or the reverse.

## * Leaves not mealy beneath, vorinkled and toothed. Calyx-tule 5-angled.

1. P. vulga'ris, Huds.; leaves and umbels subsessile, flowers spreading or suberect, calyx-teeth acuminate, corolla pale yellow, limb flat, throat contracted with thickened folds. Primrose.
Copses, pastures, and hedgebanks, ascends to $1,600 \mathrm{ft}$. in Yorkshire ; fl. April-May.- Roonstock stout, fleshy. Leaies 3-6 in., obovate-spathulate, beneath and inflorescence covered with soft jointed hairs. Umbels so sessile that the pedicels resemble scapes, which are about as long as the leaves; bracts linear. Culyxx $\frac{1}{2}$, $\frac{3}{4}$ in., a little inflated, 5 -angled. Corolla $1-1 \frac{1}{2}$ in., rarely purplish, greenish when dry ; lobes orbicular, notched. C'apsule as long as the calyx-tube, ovoid, on prostrate pedicels.-Distrib. Europe, except the N.E.; N. Afriea.--Varies in the inflorescence being sessile ( $P$. wuutis, Jacq.) or a more or less peduncled umbel (vars. caulescens and intermedia), (if these be not hybrids, as suggested by Baker). The origin of the Polyanthus. For hybrids see $P$. veris.-Rootstock emetic.
2. P. ela'tior, Jacq. ; petioles winged, umbels peduncled, flowers horizontal or drooping, calyx-teeth acuminate, corolla pale yellow, limb concave, throat open without folds. Oxtip.
Copses and meadows in Suffolk, Cambridge, and Essex ; fl. April-May.-Intermediate between $P$. vulgaris and veris, differing from the former in the less inflated calyx, shorter pedicels, inodorous flowers, and capsule longer than the calyx-tube ; it hence resembles hybrids between $P$. veris and officinalis, but differs from these by the more villous calyx, paler flowers, and absence of folds at the mouth of the corolla.-Distrib. Europe from Gothland southwards, excl. Greece and Turkey, Siberia.
3. P. ve'ris, L.; petioles winged, umbels peluncled, flowers drooping, calyx-teeth obtuse, corolla buff-yellow funnel-shaped, limb much cupped, throat open with obscure folds. P. officinalis, Jacq. Cowslip, Paigle.
Meadows, pastures, and hedgebanks ; ascends to $1,600 \mathrm{ft}$. in Northumberland;
fl. A pril-May.-Besides the characters given above, $P$. veris differs from $l$ '. elutior in the short and often glandular pubescence of the pedicels and calyx ; shorter pedicels; odorous flowers; much smaller corolla-limb; and capsule much shorter than the calyx-tube. - Distrib. Europe, Siberia,
W. Asin, N. Africa?-Hybrids with P. vulgaris include $P$. elation of older English botanists, probably $P^{\prime}$. veris, $\beta$ elutior, L., and $P^{\prime}$. vurvicuitis, Goupil.

> ** Letces zery mealy beneath, not crinkled. Culyx-tube terete.
4. P. farino'sa, $L$.; calyx-lobes longer than its tube a little shorter than the corolla-tube, corolla-lobes lilac distant, capsule cylindric-oblong twice as long as the calyx. Bird's-eyc Primrose.
Bors and meadows on the Pentlands, and in England, from Yorkshire (ascending to 1.810 ft .) northwards ; fl. June-July.-Letees $1 \frac{1}{2}-2 \mathrm{in}$., obovate-spathulate, variable in breadth, crenulate, obtuse or subacute, glabrous above, meal below white or sulphur-coloured. Scope stout, $2-8$ in., rarely 0 . Flowers erect or spreading, crowded; bracts small, saceate at the hase; perlicels usually shorter than the calyx. Culyx-tube oblong-obovoid, mealy; lohes linear-oblong, obtuse. C'orollue $\frac{1}{3}-\frac{1}{2}$ in. diam.; lohes flat, wedge-shaped, 2 -fid; mouth yellow, contracted, with rounded folds.-Distrib. Europe (Arctic), Siberia to Mongolia, Greenland, N. U. States, Fuegia.
5. P. scot'ica, Hook.; calyx-lobes equalling its tuhe much shorter than the corolla-tube, corolla-lobes blue-purple contiguous, capsule shortly oblong scarcely exceeding the calyx.
Pastures in Orkney, Caithness, and Sutherland ; fl. June-Sept.-Perhaps only a sub-species of $P$. furinosu, but smaller; bracts less saccate; leaves broader in proportion, and calyx shorter. Syme states that the flowers of $P$. furtinose are dimorphic, and of $P$. scotica not so, for single plants seed freely, also that it has three flowering seasons. - Disthib. Lapland (Arctic), Norway, and Sweden.-Scape sometimes 0 (var. acaulis).

## 1*. CYC'LAMEN, Tournef. Sowbread.

Herhs with large 'tuberous rootstocks. Leaves all radical, petioled, broad. Scapes 1 -flowered, erect, naked, coiled spirally when fruiting. Flowers nodding, white pink or lilac. Calyx 5-partite. Corolla-tube short, throat thickened ; lobes 5, large, reflexed. Stumens 5, inserted at the base of the corolla, included; anthers cuspidate. Ovary globose; style short, stigma simple ; ovules many, amphitropous. Capsule 5 -valved, many-seeded, valves reflexed. Seeds subglobose, angled, peltate.Distrib. S. Europe, N. Africa, W. Asia; species 6-8.-Etym. кúkえos, from the spiral peduncle.
C. hederafólicm, Willd.; tuber fibrous all over, leaves and flowers autumnal. C. europœum, Sm, not L.
Hedgehanks and copses in Kent, Sussex, \&c.; a denizen, Watson; fl. Sept.

- Tulier 1-3 in. diam., turnip-shaped. Leaves appearing after the flowers, ovate-cordate, crenulate, $5-9$-angled, dark green with a whitish mottled border, often purple beneath. Supes 4-8 in. Culys--⿰ohes ovate-lanceolate, acute, Corollu-lules 1 in ., white or pink, red at the base. Fruit $\frac{1}{2} \mathrm{in}$. diam.-Distrib. of the gelius.-Root acrid and purgative.

## 2. LYSIMA'CHIA, $L$. LOOSE-STRIFE.

Erect or procumbent herbs. Leaves alternate opposite or whorled, quite entire, sometimes glandular-dotted. Flowers axillary or terminal, solitary racemed or spiked, yellow white pink or purple. Calyx 5-6-partite.

Corolla rotate ; segments 5-6, spreading or conniving. Stamens 5-6, inserted on the throat, filaments sometimes connate below. Ocary subglobose ; style filiform, persistent, stigma obtuse ; ovules many, amphitropous. Capsule subglobose, 5 -valved, many-seeded. Seeds plano-convex, peltate.-Distrib. N. temp. zone, rarer in trop. mts. and in S. Africa and Australia; species 40.-Etym. obscure.

Section 1. Lysimas'trum, Duby. Flowers yellow, axillary, solitary or in terminal panicled cymes. Corolla-lobes without alternating teeth. Stamens included. Seeds margined.

1. L. vulga'ris, L.; erect, pubescent, leaves opposite and whorled ovate-lanceolate punctate, cymes panicled, filaments connate below.
River-banks, \&c., from Mull and Aberdeen southwards, rare in Scotland; local in Ireland ; fl. July-Aug.-Rootstock creeping, stoloniferous. Stem $2-4 \mathrm{ft}$., pubescent above. Leaves 2-4 in., sessile, with black glands, glabrous or pubescent below. Cymes panicled in the upper axils; bracts linear. Calyxlobes lanceolate, ciliate, edges red. Corolla $\frac{1}{2} \mathrm{in}$., subcampanulate, deep yellow with orange dots inside ; lobes ovate, not ciliate. C'apsule globose.
Seeds 3 -gonous, rough.-Distrib. Europe (Arctic), N. Africa, N. Asia, with a very closely allied Australian representative.
2. L. nem'orum, L.; procumbent, leaves opposite shortly petioled ovate acute, peduncles slender solitary axillary 1 -flowered, sepals linearsubulate, filaments free eglandular. Yellow Pimpernel.
Copses, hedgebanks, \&c., ascending to $2,500 \mathrm{ft}$. in the Highlands ; f. May-July.-Glabrous, shining, eglandular. Stems slender, 3-12 in. Leures 1-2 in. Peilencles capillary, curved, as long as or exceeding the leaves. Corollat rotate, $\frac{1}{2} \frac{2}{3} \mathrm{in}$. diam.; lobes spreading, not ciliate. Filuments very slender, glabrous. Capsule small, globose.-Distrib. Europe, excl. Russia Greece and Turkey.
3. L. Nummula'ria, L.; prostrate, leaves opposite ovate-cordate or orbicular obtuse, peduncles axillary 1 -flowered, sepals broad, filaments connate at the base glandular. Creeping Jenny, Money-uort.
Moist shaded places in England, rare if native in Scotland and Ireland; ff. June-July.-Glabrous, shining. Stems 1-2 ft., rather stout, pendulous. Leares $\frac{3}{4}-1 \frac{1}{2}$ in., shortly petioled, dotted with sunk glands. Pedurcles stout, about equalling the leaves, solitary, rarely in pairs. Sepuls ovate-cordate, acute. Corolla $\frac{3}{4} \mathrm{in}$. diam., cup-shaped ; lobes obtuse, ciliate and glandular.
-Distrib. Europe ; a garden escape in the N. U. States.
Section 2. Naumber'gia, Moench (gen.). Flowers yellow, in dense axillary racemes. Corolla-lobes with minute alternating teeth. Stamens and slender style exserted. Seeds scarcely margined.
4. L. thyrsifio'ra, $L$.; erect, leaves opposite sessile lanceolate.

Marshes and canal banks, rare and local ; Lanark, Forfar, York, Cumberland, Nottingham, Wilts, and Chester; absent from Ireland ; H1. June-July.Glabrous or nearly so. Rootstock creeping, stoloniferous. Stem 1-3 ft., stout, simple. Leaves rarely whorled, lower small, upper 2-3 in., covered with black dots. Racemes $\frac{3}{4}-1 \frac{1}{2}$ in., from the lower axils, cylindric; peduncles
long, suberect ; pedicels $\frac{1}{6}$ in., as long as the calyx ; bracts and calyx-lobes
linear, dotted. Corolla $\frac{1}{4} \mathrm{in}$., campanulate, lobes 5-6, narrow, dotted. Filaments comnate at the very base. C'apsule ovoid.-Distrib. Europe N. of the Alps, Siberia, Dahuria, N. America.

## 3. trientális, $L$. Chickweed-Winter-green.

Erect, simple, glabrous herbs; rootstock slender creeping. Leaves in one whorl of $5-6$, with a few small alternate scales beneath the whorl. Flowers white, ebracteate, solitary on slender peduncles. C'alyx 5-9-partite. Corolla rotate, 5-9-partite. Stamens 5-9, filaments filiform. Ocary globose ; style filiform, stigma obtuse ; ovules few, amphitropous. Capsule glohose, 1-celled, few-seeded, valves 5 revolute. Seeds flattened, peltate, crowded, cohering by the membranous epidermis of the testa.-Distrib. One European and one N. American species.-Etym, doubtful.

## 1. T. europre'a, $L$.; leaves obovate or obovate-lanceolate.

Sulalpine woods, from York and Lancashire northwards, rare and local; ascends to $2,800 \mathrm{ft}$. in the Highlands; absent from Ireland; ft. June-July.Stem wiry, slender, 4-8 in., leafy at the top. Leaves $1 \frac{1}{2}-2 \frac{2}{2}$ in., shining, rigid, obtuse or acute, narrowed into short petioles. Floners erect, few. Peducheles 1-3 in., filiform. Sepals linear-subulate. Corolla $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam. ; lobes ovate, acute. C'apsule size of a pea; walves very deciduous. Seeds hexagonal, testa grey-white punctate.-Distrib. Europe (Arctic), N. of the Alps, and Italy, Siberia to Kamtschatka.

## 4. Glaux, Toumef. Sea Milkwort.

A small rather succulent glabrous herb; rootstock creeping, stoloniferous. Leaves decussate. Flowers small, axillary, sessile, white or pink. Calyx 5-partite, coloured. Corolla 0. Stamens 5, hypogynous, alternate with the calyx-lobes. Ovary subglobose ; style filiform, stigma obtuse; ovules few, amphítropous. Capsule globose, 5-valved, few-seeded. Seeds peltate--Distrib. Europe (Arctic), except Turkey, N. Asia, W. Asia to the N.W. Himalaya, N. America.-Еtym. $\gamma \lambda a u \kappa o ́ s$, of a sea-green colour.

1. G. marit'ima, $L$.; glabrous, leaves 4 -farious sessile quite entire. Muddy sea-shores and estuaries ; also in salt districts of Worcester and Stafford ; fl. June-July.-Stem 6-10 in., procumbent, rarely suberect. Leures $\frac{1}{4}-\frac{8}{4} \mathrm{in}$., linear- or obovate or onate-oblong. Flowers suberect. Culyr $\frac{1}{6} \frac{1}{4} \mathrm{in}$., campanulate, margins of the obtuse lobes searioas. Authers subexserted. C'apsule small, globose, cuspidate. Seeds plano-convex, testa rough.

## 5. centun'culus, L. Bastard Pimpernel.

Very small ammul herbs. Leuves subopposite or alternate. Flowers minute, solitary, axillary, subsessile, ebrasteate, white or pink. Culypr 4.5-partite. Corolla short, urceolate, persistent ; tube suhglobose ; limb $4-5$-partite. Stamens 4-5, on the throat of the corolla, exserted, filaments flattened. Ovary subglohose ; style filiform, stigma obtuse; ovules many, amphitropous. C'apsule globose, bursting transversely, many-seedeel. Soeds peltate.-Distrib. Europe, Asia, America ; species 3.-Etym. doubtful.

1. C. min'imus, $L$.; glabrous, leaves ovate or ovate-lanceolate.

Wet turfy and sandy places, local, from Moray southwards ; rare in Ireland;
fl. June-July. - Stem 1-3 in., branched from below. Leuces $\frac{1}{2}-\frac{1}{5}$ in., very
shortly petioled, ovate or ovate-lanceolate. Flovers numerous, white or pink. Sepals lanceolate, longer than the erect usually 4 -lobed corolla. Filuments naked. C'upsule mucronate. Seeds 3 -gonous, testa areolate. Distrib. Europe, excl. Greece and Turkey, Azores, Siberia, Andes, Brazil.

## 6. anagalílis, Tournef. Pimpernel.

Slender annual or perennial herbs. Leaves opposite, quite entire. Flowers on axillary 1 -flowered peduncles, ebracteate, red or blue rarely white. Calyx 5-partite. Corolla rotate or funnel-shaped, 5 -partite. Stamens 5, on the base of the corolla-tube ; filaments filiform villous free or connate below. Ovary globose ; style simple, stigma obtuse ; ovules many, amphitropous. Capsule globose, bursting transversely, many-seeded. Seeds plano-convex, peltate.-Distrib. Europe, temp. Asia, N. Africa, S. America; species 6-8.-Etym. The Greek name.

1. A. arven'sis, L.; annual, erect or procumbent, leaves sessile ovate or lanceolate dotted beneath, sepals almost equalling the rotate corolla. Poor Man's Weather-glass.
Fields and waste places, from Moray and Banff southwards; a colonist in Scotland, Wutson ; fl. May-Oct.-Glabrous, glandular-dotted. Stem 6-18 in., branched from the base, 4 -angled ; branches ascending. Leaves $\frac{1}{2}-1 \frac{1}{2}$ in., rarely in whorls of $3-4$, sometimes cordate, acute. Pedunctes 1-2 in., slender, erect in flower, decurved in fruit. Sepals narrow-lanceolate, acuminate. Corolla $\frac{1}{3} \frac{1}{2} \mathrm{in}$. diam., opening in clear weather, lobes often ciliate. Capsule size of a small pea. Seeds 3 -gonous.-Distrib. Europe, N. Africa, Siberia, W. Asia to the Himalaya ; introd. in America.
Var. 1, pheeric'ea, Lamk. (sp.); corolla scarlet rarely pink, or white with a purple eye (var. pallida), lobes usually glandular-ciliate.- -VAR. 2, covru'lea, Lamk. (sp.); more ereet, corolla bright blue, lobes rarely ciliate. Rare.
2. A. tenel'la, $L$.; perennial, creeping, leaves shortly petioled broadly ovate or orbicular not dotted, sepals much shorter than the funnel-shaped corolla. Bog Pimpernel.
Marshes and wet meadows, especially in the W. of Great Britain, and in Ireland; t1. July-Aug.-Glabrous, rather succulent. Stems 3-4 in., 4-angled. Leaves $\frac{1}{8}-\frac{1}{4} \mathrm{in}$., bifarious, opposite or subopposite. Peduncles 1-2 in., rather stout. Sepals linear-subulate. Corolla $\frac{1}{2}$ in. diam., rosy with dark veins. Filaments united at the base. Capsule very small. Seeds as in A. arvensis. --Distrib. Europe from Belgium southwards, except Russia, E. Siberia, N. Africa, temp. S. America?

## 7. HOTTO'NIA, $L$ Lr WATER-VIOLET.

Floating herbs. Leaves submerged, whorled, pectinate and multifid. Flowers racemose, white or lilac, pedicels whorled. Calyx 5-partite. Corolla salver-shaped; throat thickened; limb 5-partite, friaged at the hase. Stamens 5, included. Ovary globose ; style filiform, persistent, stigma obtuse ; ovules many, anatropous. Capsule 5 -valved; valves cohering at the top, many-seeded. Seeds angled, hilum basilar:-Distirib. Europe, N. America; species 2.-Etym. Pierre Hotton, an early Leyden professor of botany.

1. H. palus'tris, $L$.; sepals subacute, equalling the corolla-tube.

Ponds and marshes, local, from Durham and Westmoreland southwards to Hampshire ; Co. Down in Ireland ; fl. May-June. --Pale green, glabrous, except the slightly glandular-hairy inflorescence. Stem branched; branches leafy, $6-10 \mathrm{in}$. , radiating from the base of the scape, creeping and floating, as thick as a goosequill, succulent ; joints not inflated. Leaces 1-2 in., imperfectly whorled ; segments slender, linear, acute. Scape 1-2 ft., stout, erect. Whorls $4-8$-flowered ; pedicels $\frac{3}{-1} 1 \frac{1}{2}$ in., decurved in fruit; bracts linear. Culyx-lobes $\frac{1}{3} \mathrm{in}$., linear. Corolla $\frac{3}{4} \mathrm{in}$. diam., lilae with a yellow eye; lobes obtuse. Capsule the size of a small pea.-Distrib. Eirope, excl. Spain Greece and Turkey, W. Siberia.

## 8. SA'MOLUS, Tournef. Brook-weed.

Annual or perennial herbs. Leaves alternate or mostly radical. Flowers in terminal racemes or corymbs, white; pedicels bracteate. Culys $\frac{1}{2}$-superior, limb 5 -fid. Corolla perigynous, subcampanulate, 5 -partite. Stamens 5, on the tube or throat of the corolla, alternating with staminodes, filaments very short. Ovary subglobose ; style short, stigma obtuse or capitate ; ovules many, anatropous. Capsule $\frac{1}{2}$-inferior, ovoid, 5 -valved above the calyx-tube, many-seeded. Seeds angular, hilum basilar. Distrib. Temp. climates ; species about 10.-Etym. obscure.

1. S. Valeran'di, $L$.; leaves obovate or spathulate olituse or apiculate. Wet ground and ditches, often near the sea, from Skye and Moray southwards; fl. June-Sept.-Glabrous, rather shining. Rootstock short. Stem $\frac{1}{2}-2 \mathrm{ft}$., erect, with prostrate or ascending sometimes rooting branches from the base. Leutes 1-4 in., quite entire, radical rosulate, cauline alternate. Racemes $\frac{1}{3}-\frac{2}{3} \mathrm{in}$., erect; pedicels ascending, bract above their middle small lanceolate. Culyx-tube hemispherical ; lobes deltoid, acute. Corolla $\frac{1}{8} \mathrm{in}$. diam., lobes short, obtuse. Stamens included. Capsule $\frac{1}{4} \mathrm{in}$. diam., globose. Seeds rough.-Distrib. Temp. N. hemisphere.

## Order Lix. plumbagin'er.

Herbs, often maritime, rarely shrubs. Leaves alternate or radical, exstipulate. Floners regular, 2 -sexual ; bracteoles and bracts usually 3 . Caly,x inferior, tubular ; limb 5 -cleft, plaited, often scarious and coloured. Petels 5, hypogynous, claws long free or slightly cohering, twisted in bud, or combined into a monopetalous imbricate corolla. Stamens 5, opposite the corolla-lobes, epipetalous (hypogynous in the monopetalous genera), filaments filiform ; anther-cells bursting inwards, separate below. Geary free, 1 -celled; styles 5, rarely 3-4, distinct or cohering, stigmas capillary or linear; ovule solitary, anatropous, suspended from a basal funicle. Fruit enclosed in the calyx-tuhe, membranous, bursting irregularly or 5valved. Seed pendulous, albumen scanty floury ; emhryo straight, cotyledons flat, radicle cylindric superior.-Distrib. All regions; genera 10 ; species about 200.--Affinities. Nearest to Primulaceu, but distant. Phopertifs. Astringent, but unimportant.
Scape terminated by a bracteate head...................................1. Armeria.
Seape terminated by panicled unilateral cymes.
2. Statice.

## 1. Arme'ria, Willd. Thrift, Sea-pink.

Perennial herbs. Leures all radical, very narrow. Flowers pedicelled, fascicled in small bracteate cymes, which are collected into a dense hemispheric head; involucre tubular, scarious, reverted, sheathing the top of the scape downwards. Calyx funnel-shaped, scarious. Petals cohering at the very base, persistent and covering the utricle. Filuments inserted on the petals, bases dilated. Ovary obovoid; stigmas capillary, papillose. Utricle with 5 hard bosses at the top, dehiscing tiansversely or irregularly below.-Distrib. Alpine, Aretic and maritime N. temp. regions, Chili; species 30.-Etim. The monkish Latin Flos Armerice, applied to a Pink.

1. A. vulga'ris, Willd.; pubescent or ciliate, leaves linear usually 1-nerved. A. maritima and alpina, Willd.; A. pubescens, Link; $A$. pubigera, $\boldsymbol{\beta}$ scotica, Boissier ; A. duriuscula, Bab. ; Statice Armeria, L.
Rocky and stony sea-shores and on lofty mountains, ascending to $3,800 \mathrm{ft}$. in the Highlands ; f. April-Oct.-Rootstock woody, branched. Leaves densely fascicled, 1-6 in., ${ }_{2}^{2} \sigma$ 施 broad, obtuse or acute, covered with impressed points on both surfaces. Scape 3-12 in., hairs spreading or reflexed; heads $\frac{1}{2}-1 \mathrm{in}$. diam. ; involucral (reverted) bract $\frac{1}{2}-1 \mathrm{in}$., lacerate ; outer bracts shorter than the head, ovate, acute or produced into long brown or green points ; inner oblong, obtuse, scarious; pedicel $\frac{1}{\frac{1}{2}-\frac{1}{3}}$ in., equalling the calyx. Calyx decurrent on the pedicel, with 5 pubescent ribs, lobes cuspidate. Petals $\frac{1}{3} \mathrm{in}$., rose-pink or white, limb obovate. Utricle exceeding the calyx-tube.-Distrib. Europe (Arctic), Asia, N. America, Chili.
Var. planifo'liu, Syme; leaves broader, flat above, sometimes 3-nerved.
2. A. plantagin'ea, Willd.; glabrous, leaves narrow-lanceolate usually 3-5-nerved, calyx-lobes awned.
Sandy banks, \&c., St. Brelade's Bay and on the Quenvais, Jersey ; f. June-Aug.-More rigid, stouter and larger than $A$. vulgaris; leaves $\frac{10}{1-\frac{1}{4}} \mathrm{in}$. broad, narrowed into long points, margins cartilaginous and undulate when dry ; scapes taller ; reverted involucral bracts longer and less deeply cut; outer bracts with usually a long herbaceous point exceeding the head; flowers darker, on shorter pedicels.-Distrib. Mid. and S. Europe.--Syme describes a probable hybrid between this and $A$. vulgaris, as growing with them at St. Brelade's Bay.

## 2. STAT'ice, L. Sea-lavender.

Perennial herbs. Leaves all radical. Flowers shortly pedicelled, in 1- or more-flowered 3-bracteate spikelets, which are alternately distichously or secundly arranged in branched panicles. Calyx obeonic ; limb scarious, 5 -lobed. Petals free or united at the very base. Filaments inserted on the petals. Ovary obovoid or oblong; styles free or counate at the base, stigmas capillary, papillose. Fruit as in Armeria.-Distrib. Chiefly saline districts and shores of temp. seas, most common in W. Asia; species 50-60.-Етум. The Greek name for some astringent herb.

> * Leares pinnately-veined. Calyx-lobes with intermediate teeth.

1. S. Limo'nium, L.; leaves usually long-petioled 1 -ribbed, scape branched above, branches nearly all flowering.
Muddy shores, from Holy Is. on the E. and Wigton on the W. southwards; and in Ireland ; fl. July-Nov.-Glabrous. Rootstock stout, woody, creeping,
branched. Leaves 2-4 in., oblong- or obovate-lanceolate, variable in breadth, often mucronate, petiole usually slender. Scupes many, 6-18 in., angular, corymbosely branched. Spikelets $2-3$-flowered, $\frac{1}{3}$ in., alternate, erect, secund: outer bract herbaceous margins scarious, intermediate scarious, inner scarious and green at the back. Calyx purplish-green; lobes triangular-ovate, often jagged, much enlarged after flowering. Corolla $\frac{1}{3}$ in., blue-purple.Distrib. Europe, N. Africa, N. America.
Sub-sp. Limo'nium proper; inner bract about twice as long as the interme-diate.-Absent from Ireland.-Var. 1, Be'hen, Drejer (sp.) ; spikelets on corymbose compact or spreading or recurved branches.-VAR. 2, seroti'na, Gren. and Godr. (sp.); spikelets in pyramidal panicles with flexuous spreading branches. S. coast of England.
Sub-sp. BaHu'siensis, Fries (sp.) ; spikelets lax on distant erect or incurved branches, inner bract half as long as the intermediate. S. variflora, Drejer.

> ** Leaves 1-3-nerved. Calyx-lobes without intermediate teeth.
2. S. auriculæfo'lia, Vahl; leaves shortly petioled 3 -nerved at the base, scape branched from about the middle, branches nearly all flowering, calyx-lobes obtuse.-S. spathutata, Hook. ; S. binervosa, G. E. Sm.
Sea-shores from Lincoln on the E. and Galloway on the W. southwards; common in Ireland ; fl. July-Aug.-Glabrous. Rootstock short, stout, branched. Leures 1-4 in., often mucronate. Scapes 4-10 in., paniculately branched; spikelets unilateral, often imbricate ; bracts often coloured, inner twice as long as the intermediate; flowers as in S. Limonium. Calyx-limb white. Corolla blue-purple.-Distrib. Coasts of France, Spain, and the Medi-terranean.-Boissier (who has examined Vahl's plant) refers this (in Herb. Hook.) to auriculafolia, and in DC. Prodr. he refers the latter to his oxylepis.
Var. 1, occidenta'lis, Lloyd (sp.); leaves obovate-lanceolate, branches of panicle ascending, lower sometimes flowerless, spikelets slender erect or ascending. -Var. 2, intermédia, Syme; leaves obovate-lanceolate, branches of panicle ascending usually all flowering, spikelets stout spreading or ascending.Var. 3, Dodar'tii, Gir. ; leaves spathulate, branches of panicle short spreading often in pairs all flowering, spikelets crowded stout spreading.
3. S. reticula'ta, L.; leaves shortly petioled 1-ribbed, scape branched from near the base, branches flexuous most of them flowerless, calyx-lobes mucronate. S. bellidifolia, Gonan ; S. caspia, Willd.
Salt marshes of the Wash (Norfolk, Cambridge, Lincoln) ; fl. July-Aug.Glabrous, exeept the scaberulous panicle. Rootstock much branched. Letwes $\frac{3}{4}-1 \frac{1}{2}$ in., few, obtuse. Scape 4-8 in., rather slender, excessively branched; branches spreading, recurved; spikelets unilateral, usually fascicled at the ends of the branchlets, bracts with broad scarious margins, inner $\frac{1}{3}$ longer than the intermediate ; flowers much smaller than in S. Limomium, $\frac{1}{2}$ in., frale lilac.-Distrib. Coasts of France, the Mediterranean and Black Seas, E. Asia.-This I take to be the Limoninm reticalutum of Ray and Boceoni, who art Limæeus' principal authorities for S. reticuluta.

## Division III. APET'ALE.

## Order LX. POLYGONE'FR.

Herbs rarely shrubby. Leaves alternate, simple, quite entire or serrulate ; margins revolute in bud ; petiole dilated; stipule sheathing, scarious. Flowers usually 2 -sexual, pedicels jointed. Sepals 3-6, petaloid or herbaceous, free or connate, persistent, imbricate in bud. Stamens 5-8, rarely more or less, perigynous or hypogynous, opposite the sepals; anthers 2 -celled, bursting outwards or inwards. Disk glandular annular or 0 . Ovary free, ovoid, 3 -gonous or compressed ; styles $1-3$, stigmas capitate or penicillate ; ovule 1, basilar, orthotropठus. Fruit indehiscent, hard, usually enveloped in the perianth. Seed erect, testa membranous, albumen floury ; embryo straight and axile, or lateral and curved, cotyledons various, radicle superior.-Distrib. Chiefly temp. regions; genera 33 ; species about 500.-Affinities. With Amaranthacees and Cheno-podiece.-Properties. Root often astringent or purgative; some yield oxalic and malic acids ; the leaves or seeds of others are alimentary.
Sepals 5, subequal. Fruit compressed or 3 -gonous, wingless...1. Polygonum.
Sepals 6, 3 inner much larger. Fruit 3-gonous........................2. Rumex.
Sepals 4, 2 inner larger. Fruit winged....................................3. Oxyria.

## 1. POLYG'ONUM, $L$.

Herbs. Leaves alternate ; stipules tubular. Flowers 2 -sexual, in panicled racemed or spiked clusters; bracts ochreate. Sepals 5, 3 outer sometimes enlarging in fruit. Disk usually glandular. Stamens 5-8; anthers versatile. Ovary compressed or 3 -gonous; styles $2-3$, stigmas capitate. Fruit 3 -quetrous or compressed. Embryo axile or lateral. -Distrib. All climates ; species 150.-Еtym. mo入ús and $\gamma \delta \boldsymbol{\sigma} v$, from the many nodes.

Section 1. Bistorta, Tournef. Rootstock perennial. Stem simple, erect. Stipules truncate. Racemes solitary, spike-like; pedicels jointed at the top. Stamens 8. Fruit 3 -quetrous; embryo lateral, cotyledons thin flat.

1. P. Bistor'ta, L.; leaves obtuse or cordate at the base, petiole winged, raceme dense cylindric. Bistort, Snake-root.
Woods and wet meadows, from Ross and Skye southwards, but not common, and often introduced; ascends to $1,000 \mathrm{ft}$. in Northumberland; very rare and probably not native in Ireland; fl. June-Sept.-Glabrous, except the leaf-nerves beneath. Rootstock woody, twisted, creeping; roots tuberous. Stems 1-2 ft., strict, slender. Leaves, radical 3-6 in., oblong-ovate, obtuse, waved, glaucous beneath ; petioles 6-12 in., broadly winged above ; cauline subsessile, broader at the base; stipules $\frac{1}{2}-3 \mathrm{in}$. Spike $1 \frac{1}{2}-2 \mathrm{in}$. ; bracts cuspidate. Sepals $\frac{1}{6}$ in., pink. Stumens exserted. Fruit brown, shining. -Distrib. Europe (Aretic), N. Asia, W. Asia to the Himalaya.-Root astringent and starchy ; used as food in famine-times, and formerly medicinally.
2. P. vivip'arum, $L$. ; leaves narrowed at the base, petiole not wingerl, raceme spike-like bulbiferous below.
Mountain pastures and wet alpine rocks ; ascending to $4,000 \mathrm{ft}$. in Scotland; N.W. of Ireland, very rare ; fl. June-Aug.-Glabrous. Rootstock slender. Stem 4-16 in., slender. Leaves $1-2 \frac{1}{2}$ in., $\frac{1}{6}-\frac{1}{3}$ in. broad, radical narrow linearoblong, petioles as long or shorter, subacute, glancous beneath, margins revolute ; cauline few, shorter petioled; stipules $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$. Spikies $1-3 \mathrm{in}$., slender, ohtuse. Floncers whitish or pink, as in P. Bistorta, hut rather smaller; bulbils purple. Fruit rarely ripening.-Distrib. Alps of N. temp. and high Arctic regions.
Section 2. Persicária, Meissn. Annual, rarely perennial. Stipules truncate, entire. Racemes spike-like, solitary in pairs or panicled ; pedicels jointed at the top. Stamens 4-8. Fruit compressed or 3-quetrous; embryo lateral, cotyledons thin, flat.

* Spikes short, usually dense, not or rarely intermupted, not leafy at the base.

3. P. amphib'ium, L. ; perennial, creeping or floating, spikes dense, peduncles hairy, sepals eglandular, stamens 5 , styles 2 united half-way, fruit ovoid, faces convex.
Damp and watery places ; fl. July-Aug.-Rootstock creeping, slender, woody, branched. Stem very variable in length and height. Leaces oblong linearoblong or lanceolate, obtuse or acute, serrulate or ciliate, eglandular, petioled or not; stipules large, appressed, mouth entire. Spikes $1-3, \frac{1}{2}-2 \mathrm{in}$.; peduncles stout, hairy ; pedicels short; bracts obtuse acute or cuspidate. Sepals $\frac{2}{6}$ in., not nerved, pale or bright rose-red, much longer than the shining fruit.-Distrib. N. temp. and Aretic regions.
VAr. 1, aquat'icum; leaves floating long petioled, like those of Potamogeton natans, and stipules glahrous.-VAR. 2, terrestre ; terrestrial, leaves shortly petioled or sessile longer and narrower, and stipules scabrid or hispid.
4. P. lapathifo'lium, L. ; annual, spikes subeylindric, peduncle rough sepals glandular, stamens 6 , styles 2 free, fruit orbicular, faces concave.
Fields and waste places : ascends to near $1,000 \mathrm{ft}$. in Yorkshire ; fl. July-Aug. -Stem 1-4 ft., decumbent and rooting below, much hranched; nodes stout, swollen. Leaves 4-6 in., shortly petioled, ovate- or oblong-lanceolate, acuminate, ciliate, glabrous puhescent scaberulous or cottony above and below, sometimes glancous below, or with a black blotch above, punctate and sparingly glandular ; stipules loose, often ciliate. Spikes $1-3, \frac{3}{3}-1 \frac{1}{2} \mathrm{in}$., often racemed or panicled, obtuse, stont ; bracts broad. ohtuse or cuspidate. Smuls nerved. equalling the obtuse dark fruit.-Distrib. Europe, N. Africa, Siheria, Dahuria. W. Asia to India; introd, in America.
VAR. 1, laputhifo'lium proper; upper stipules ohliquely truncate ciliate, lower naked, spikes dense remote when young, sepals greenish-white.-VAr. 2, nodo'sum, Pers. (sp.) ; stipules all ciliate, upper strongly, spikes dromping crowded when young, sepals pink, fruit smaller. P. laxum, Reich. Rare.
5. P. Persica'ria, L. ; annual, spikes usually short dense, peduncle glabrons sepals nearly eglandular, stamens 6 , styles 2-3 united half-way, fruit plano-convex or 3 -gonous. Persicaria.
Waste moist places, fields, \&ec. ; ascending to $1,200 \mathrm{ft}$. in the N. of England; f. Jul--Oet.-Stem 6-18 in., hranched, erect or ascending, nodes swollen. Leures subsessile, ovate or lanceolate, subacute, ciliolate, often with a black
blotch, pubescent and punctate below, eglandular ; stipules copiously ciliate. Spikes $\frac{1}{2}-1 \frac{1}{2}$ in., stout, with sometimes a leaf at the base, erect or suberect, peduncled, lateral sessile. Sepals red or white, equalling the fruit.Distrib. Europe (Aretic), N. Africa, Siberia, Dahuria, W. Asia to India. ** Spikes long, lax, slender, interrupted and leafy below.
6. P. mi'te, Schrank; annual, suberect, spikes slender erect, sepals eglandular, stamens 5-6, styles $2-3$ united half-way, fruit plano-convex or 3 -gonous as long as the sepals.
Wet places, from York southwards, local ; fl. Aug.-Sept.-Stems 1-2 ft., erect, decumbent at the rooting base, branched, slender. Leaves 2-4 in., shortly petioled, lanceolate or elliptic-lanceolate, subacute, ciliolate, eglandular; stipules loose, strongly cilate. Spikes $\frac{1}{2}-3$ in., solitary, lax. Sepals white or pink, nerves faint. Fruit black, rather narrow.-DISTRIB. Europe, except Spain Greece and Turkey.
7. P. Hydrop'iper, $L$.; annual, suberect, spikes very slender tips drooping, sepals with few very large glands, stamens 6 (rarely 8), styles 2-3 free, fruit plano-convex or 3 -gonous as long as the sepals. Water-pepper. Watery places, from Skye southwards, and in Ireland ; ascending to $1,300 \mathrm{ft}$. in the Lake district ; fl. Aug.-Sept.-Ntem 1-3 ft., creeping and rooting at the base, much branched. Leaves 2-4 in., shortly petioled, lanceolate or elliptic-lanceolate, subacute, ciliolate, minutely glandular below; stipules short, inflated, ciliate or not. Spikes 3-8 in., curved, lax. Sepals green and rose-coloured. Fruit black, punctulate.-Distrib. N. temp. hemi-sphere.-Very acrid, and a reputed diuretic.
8. P. mi'nus, Huds.; annual, spikes very slender straight, sepals usually 5 with minute glands at the base only, styles 2-3 united half-way, fruit plano-convex or 3 -gonous as long as the sepals.
Marshy places, local in England, Dumfriesshire only in Scotland ; rare in Ireland; tl. Aug.-Sept.-Stem 6-24 in., usually very slender, much branched, erect or ascending. Leaves $1-3 \mathrm{in}$., narrow-lanceolate, ciliolate, eglandular ; stipules not inflated, short, ciliate. Spikes 1-3 in., solitary or panicled, usually on slender peduncles. Sepals $\frac{1}{10} \frac{1}{8}$ in., very small. Fruit pitchy-black, shining, acute.-Distrib. Europe, Siberia, W. Asia to India.
Section 3. Aviculária, Meissn. Annual or biennial. Leaves narrow; stipules silvery, at length lacerate. Flowers axillary, solitary or fascicled; pedicels jointed at the top. Stamens usually 8. Styles usually 3. Fruit 3-quetrous ; embryo lateral, cotyledons thin flat.
9. P. Avicula're, $L$.; prostrate, nerves of leaves obscure beneath, of the stipules few simple, sepals enclosing the fruit. Knotgrass.
Fields, waste places, \&c.; ascending to $1,800 \mathrm{ft}$. in Northumberland ; fl. May-Oct. - Annual, glabrous, eglandular, branched from the base ; branches $\frac{1}{2}-3 \mathrm{ft}$., straggling, grooved, angular above, leafing and flowering throughout. Leaves $\frac{1}{2} 1 \frac{1}{2}$ in., $\frac{1}{1-\frac{1}{-1}} \mathrm{in}$. broad, sessile or shortly petioled,
linear-lanceolate or -oblong, narrowed at both ends, rarely broadly ellip-
tic or almost filiform, acute or obtuse, margins flat or recurved; stipules
$\frac{1}{8}-\frac{1}{4} \mathrm{in}$., white, red at the base, lacerate to the middle. Flowers $\frac{1}{10}-\frac{1}{8} \mathrm{in}$. ,
white, pink, crimson, or green, clustered in the axils of most of the leaves.
Fruit brown, minutely striate and punctate. - Distrib. Lurope (Arctic), N.
and W. Asia ; introd. in N. America.-A most variable plant.

Tiar. 1, aulga'tum; leaves rather thin, fruit dull not exceeding the sepals.Vab. 2, littora'le, Link. (sp.); leaves rather fleshy, fruit more shining slightly exceeding the sepals. Littoral. The passage to $P$. maritimum.
10. P. marit'imum, L.; prostrate, nerves of the leaves reticulate bemeath, of the stipules few or many, sepals shorter than the fruit.
Sea-shores, from Forfar and the Clyde southwards ; fl. July-Sept.-Very similar to $P^{\prime}$. axiculare, but perennial, much stouter, more rigid and woody, colour darker when dry ; leaves thicker. margins recurved, often glaucous below ; stipules larger more scarious and nerved; flowers and fruit much larger.-Distrib. France, Spain, the Mediterranean, W. Asia, N. America.
Sub-sp. Marit'inum proper; leaves usually spreading fleshy glaucous beneath, margins revolute, stipules with many often-forked nerves, sepals broader.Channel Is., Hampshire (probably extinct).
Sub-sp. Ra'II, Bab. (sp.) ; upper leaves usually erect not fleshy or glaucous beneath, margins flat, stipules with fow simple nerves. P. Roberti, Loisel. in part.-Habit and foliage of $P$. aviculare, fruit of $P$. maritımum.
Section 4. Tinia'ria, Meissn. Annual (the British species), usually twining. Leaves cordate or sagittate; stipules truncate, mouth entire. Flowers in racemose clusters. Sepuls enlarging. Stamens 8. Styles 3, united. Fruit 3 -quetrous; embryo lateral, cotyledons narrow, flat.
11. P. Convolvulus, $L$. ; leaves cordate-sagittate, 3 outer sepals obtusely keeled ravely winged, pelicels short jointed above the middle, fruit dull striate gramulate. Black Bindweed.
Fields and waste places, ascending to upwards of $1,000 \mathrm{ft}$. in the Highlands; fl. July-Sept.-Root fibrous. Stem 1-4 ft., angular, twining, climbing or prostrate, slender, puberulous at the angles. Leaves $1 \frac{1}{2}-4 \mathrm{in}$., petioles shorter slender, gradually acuminate, lateral angles obtuse or acute, eglandular, puberulous beneath; stipules short. Rucemes erect, terminal and axillary, slender, pedicels recurved. Sepals 5, obtuse, green, margins white, 3 outer rough at the back, at length 1 in . and covering the fruit.Distiab. N. temp. and Aretic recions of the Old World; introd. in the New.
Var. 1, Concoleulus proper; elusters 4-6-flowered, outer sepals obtusely keeled in fruit.-Var. 2, psendeodumeto'rem, Wats.; clusters 5-10-flowered, flowers fewer, outer sepals broadly winger? in fruit.
12. P. dumeto'rum, L.; leaves cordate-sagittate, 3 outer sepals with broad membranous wings, pedicels very slender jointed below the middle, fruit smooth highly polished.
Herlges and thickets in the S. counties of England, from Monmouth to Herts southwards, rare, soon disappearing; fl. July-Aug.--Habit of $P$. Concelvulus, but pedicels capillary (often $\ddagger$ in.) and seed polished. The stems are described as terete, hut I find them as much anyled as in P. Concoloulus.Distrib. Europe, Siberia, W. Asia to N.W. India.

## 2. RUMEX, $L$. Dock.

Herbs. Rootstock stout, tapering into the root; biennial or perennial. Stems usually grooved. Leaves alternate; stipules tubular. Fluwers 1-2sexual, in panieled or racemed whorls. Sopuls 6, 3 inner enlarging. Stumens 6 ; anthers basifixed, erect. Ovary 3 -quetrons; styles 3 , filiform, stigmas penicillate. Fruit 3 -quetrous. Embryo lateral.-Distrib. All temp. climates; species about 50.-Etym. The old Latin name.

Section 1. Lap'athum, Meissn. Leaves not hastate. Flowers 2 -sexual (moncecious in $R$. alpinus). Inner sepals coriaceous in fruit.

* Inner fruiting sepals strongly toothed.

1. R. obtusifo'lius, L.; radical leaves oblong-ovate cordate obtuse, panicle leafy below, inner fruiting sepals elongate triangular obtuse shortly strongly toothed at the base, upper with an ovoid tubercle.
Fields, waste grounds, \&c.; ascends to $1,600 \mathrm{ft}$. in N. of England ; f. Aug.-
Sept.--Perennial, 2-3 ft., stem stout and leaves beneath puberulous. Leuces
6 -12 in., subacute or obtuse, margin crenulate waved, upper oblong-lanceo-
late; petiole rather slender. Panicle narrow ; pedicels $\frac{1}{2}$-twice as long as the reticulate fruiting sepals, $\frac{1}{5} \ddagger \mathrm{in}$. ; tubercle red. - Distrib. Europe, N. Africa, Siberia, W. Asia to N.W. India ; introd. in N. America.
2. R. acu'tus, $L$.; radical leaves linear or oblong-lanceolate waved, panicle leafy below, inner fruiting sepals triangular or cordate with short broad teeth near the top, upper with an ovoid or lanceolate tubercle. $R$. pratensis, Mert. and Koch.
Roadsides and waste places from Aberdeen southwards ; ascending to 1,200 ft.
in N. of England; fl. June-July.-Similar to R. olltusifoliess, but leaves narrower, and fruiting inner sepals much broader, with more and shorter teeth.-Syme, following Koch, is disposed to regard this as a hybrid between R. crispus and obtusifolius. R. conspersus, Hartm., which has more crisped leaves, otherwise agrees with this; it was found in Kinross-shire by Dr. Walker Arnott, who suspected it to be a hybrid between $R$. whitusifolius and aque-ticus.-Distrib. Europe from the Alps northwards, Spain.
3. R. pul'cher, L.; leaves oblong-cordate or fiddle-shaped obtuse, upper acute, panicle leafy to the top, inner fruiting sepals oblong deeply-toothed to above the middle, tubercle oblong often muricate. Fiddle Dock.
Roadsides and waste places in dry soil from Notts and Lincoln southwards ; fl. June-Oct.-Biennial or perennial, glabrous or sparingly pubescent. Stem 6-24 in., flexuous ; branches slender, spreading, tips often decurved. Lewres 3-6 in., soon withering, always contracted above the base, crenulate; petiole slender. Punicle with spreading branches and remote whorls; pedicels stout, shorter than the fruiting sepals, jointed below the middle. Fruiting sepals $\frac{1}{3} \mathrm{in}$., pale, obtuse truncate or cuneate at the base, deeply pitted and reticulate ; teeth short, straight. Fruit $\frac{1}{18}$ in.-Distrib. Europe from Belgium southwards, N. Afriea, W. Asia.
4. R. marit'imus, L.; leaves linear- or oblong-lanceolate, panicle
leafy to the top, inner fruiting sepals triangular or rhomboid acuminate, teeth 2-4 very long, tubercle linear-oblong very tumid. Golden Dock.
Marshes, \&c. rare, from Durham southwards; Co. Dublin in Ireland; fl. July-Aug.-Biennial, puberulous, yellow-green. Stem 1-2 ft.; branches ascending. Leaves 3-10 in., acute obtuse or cuneate at the base, shortly petioled, margins slightly waved. P'anicle with spreading densely flowering branches, whorls often confluent ; pedicels jointed close to the base, very variable in length, rarely twice as long as the fruiting sepals, which are reticulate, $\frac{1}{-\frac{1}{8}}$ in., orange-yellow, spines as long; tubercle often almost concealing the sepal. Fruit small, pale chesnut.-Distrib. Europe, Siberia, Dahuria, W. Asia to N.W. India, N. America.
Sub-sp. MARIT'imuS proper; whorls confluent, inner fruiting sepals triangular, teeth often longer than the sepal.

Sub-sp. PALUs'TRIS, Sim. (sp.); whorls laxer usually distinct fewer-flowered, inner fruit-bearing sepals oblong-triangular or rhomboid, teeth shorter usually fewer.
** Inner sepals quite entire or minutely toothed.

## + One or all the inner sepuls with a prominent tubercle on the millvib.

5. R. cris'pus, L.; leaves lanceolate or oblong-lanceolate subacute much waved and crisped, panicle leafy below, inner fruiting sepals broadly ovate or cordate obtuse subentire, upper with a broad smooth tubercle.
Roadsides and waste places ; ascends to near 2,000 ft. in Northumberland ; fl. June-Oct.-Perennial, glabrous or puberulous. Stem 1-3 ft., branched. Lecues 6-10 in., obtuse rounded or aoute at the base ; petiole moderate. Panicle with erect branches; whorls crowded; pedicels jointed at the base, twice as long as the fruiting sepals or shorter. Fruiting sepels $\frac{1}{8}-\frac{1}{4} \mathrm{in}$., green or reddish, reticulate; inner entire or crenulate ; tubercle small, smooth. Fruit brown.-Distrib. Europe, N. Africa, temp. Asia to Japan ; introd. in N. America.
6. R. sanguin'eus, $L$.; leaves oblong-lanceolate fiddle-shaped sparingly waved, panicle leafy at the base, inuer fruiting sepals oblong olituse rounded at the base entire, upper with a large smooth tubercle.
Roadsides and hedges from Isla and Elgin southwards ; ascending to $1,200 \mathrm{ft}$. in Yorkshire ; fl. July-Aug. - Perennial, glabrous. Stem $1-4 \mathrm{ft}$., slender, simple or sparingly branched. Leaves $6-10 \mathrm{in}$. , usually cordate at the hase and contracted above it, margin slightly waved ; petiole shorter. I'unicle lax, usually leafless; whorls distant, many-flowered ; pedicels usually equalling the fruiting sepals, rarely twice as long, jointed at the base. Fruitiny sepuls oblong or oblong-lanceolate; tubercle on the outer larger, subglobose, on the others small or 0. Fruit brown, shining.-Distrib. Europe, W. Asia ; introd. in N. America.

VAR. 1, sengquin'ens proper ; stem and veins of leaves blood-red. Rare, often naturalized.-Var. 2, vur'idis, Sibth. (sp.) ; stem and veins of leaves green or red in autumn only. R. nemorosus, schrader.
7. R. conglom'eratus, Murray; leaves oblong-lanceolate rounded or cordate at the base, panicle leafy almost to the top, inner fruiting sepals linear-oblong subacute rounded at the base quite entire, all with oblong tubereles. R. acutus, Sm. and L. Herb.
Wet meadows and waste places ; fl. June-Oct.-Closely allied to R. sanguineus, differing in the leaves never contracted above the base, pedicels jointed helow the middle, longer tubercles, and in the characters given above.Distrib. Europe, N. Africa, W. Asia, introd. in N. America.
8. R. Hydrolap'athum, Huds.; leaves broadly oblong-lanceolate, panicle almost leafless, inner fruiting sepals deltoid-ovate acute or obtuse quite entire or faintly toothed, all with oblong tubercles.
Ditches and river-sides from Isla southwards; common in England, rare in Seotland and Ireland; fl. July-Aug.-Perennial, glabrous. Stem 3-6 ft., erect, branched. Lentes 1-2 ft., acute, rounded cordate or acute at the base, margins Hat crenulate ; petiole $6-10 \mathrm{in}$., flat above, not winged. Punicle very large; whorls rather crowded; fruiting pedicels as long or twice as long as the sepals, jointed towards the base. Fruitiny sepals $\frac{1}{-1} \mathrm{i}$ in., reticulate, truncate or cuneate at the hase. Fruit pale chesnut. -Distrib. Europe.-The largest British species. Root astringent.

## + Fruiting sepals without tubercles on the midrib.

9. R. aquat'icus, $L$.; lower leaves oblong-lanceolate crisped and waved, panicle leafy at the base only, inner fruiting sepals cordate waved membranous reticulate. R. domesticus, Hartman ; R. longifolius, DC.
Fields, meadows, and ditches, from Yorkshire and Westmoreland northwards; ascending to $1,600 \mathrm{ft}$. in the Highlands ; absent from Ireland ; fl. July-Aug. -Perennial, glabrous. Stem $1-3 \mathrm{ft}$., very stout. Leaves as in R. crispus, but broader, 3-4 in. across. Punicles with erect branches ; whorls confluent; pedicels usually the length of the sepals, jointed below the middle. Fruiting sepals $\frac{1}{4}-\frac{1}{3}$ in. diam., obtuse, green, strongly reticulate ; midrib slightly thickened. Fruit broad, small, pale brown.-Distrib. Scandinavia (Arctic), France, Germany, N. Asia, W. Asia to the Himalaya, N. America.
R. alpi'nus, $L$.; leaves broadly ovate-cordate obtuse, panicle leafy at the base only, inner fruiting sepals triangular-ovate obtuse faintly reticulate. Monk's Rhubarb.
Roadsides, near cottages, \&c. N. of England and Scotland, rare and naturalized only ; fl. July-Aug.-Perennial, puberulous with cellular hairs. Rootstock very stout. Stem $2-4 \mathrm{ft}$., stout. Leaves 6-24in., not so broad, margins waved; petiole long, stout. Panicle with very many erect branches ; whorls very many, not confluent, flowers monœeious, pedicels jointed below the middle, usually twice as long as the fruiting sepals, which are $\frac{1}{6} \frac{1}{4} \mathrm{in}$. Fruit grey.-Distrib. N. and Alpine districts of S. Europe, excluding Russia.-Root formerly used medicinally, and leaves as a potherb.
Section 2. Aceto'sa, Tournef. Leaves hastate or sagittate. Flowers monœecions or diœcious.
10. R. Aceto'sa, L.; diœecious, lower leaves sagittate, upper sessile, outer fruiting sepals reflexed, inner enlarged orbicular quite entire scarious tubercled at the base. Sorrel.
Meadows and pastures, ascending to $4,000 \mathrm{ft}$. ; fl. May-Aug.-Perennial, glabrous, acid, rather succulent. Rootstock tufted, slender. Stem $1-2 \mathrm{ft}$., simple, slender. Leaves, radical 3-6 in., very long-petioled, basal sinus rounded or angled, glaucous beneath; stipules brown. Panicle with erect branches, leafless ; male whorls densely 4-8-flowered; pedicels jointed below the middle. Sepals of male fl. herbaceous, margins white or pink, scarious ; of female $\frac{1}{3} \mathrm{in}$. in fruit, pink or crimson. Fruit brown, shining.Distrib. N. temp. and Arctic zones.-Leaves used as a salad and potherb; abounds in binoxalate of potash.
11. R. Acetosel'la, L.; diœcious, lower leaves hastate, uppermost sessile, outer fruiting sepals appressed, inner hardly enlarged oblong. orate obtuse entire herbaceous, midrib thickened at the base. Sheep's Sorrel.
Dry pastures, \&c., ascending to 2,500 ft. in Yorkshire ; fl. May-Aug. Perennial, acid, glabrous, often bright red in autumn. Rootstock creeping, much branched. Stems 3-20 in., often many and tufted, decumbent at the base, slender. Leuves $\frac{1}{2}-2 \mathrm{in}$., long-petioled, variable in breadth, often 3 lobed ; stipules silvery, torn. Panicle leafless, branches erect ; male flowers largest, pedicels as long as the fruiting sepals, jointed at the top, very variable in length. Fruiting sepals it in., closely investing the yellowbrown fruit.-Distrib. N. temp. and Arctic zones ; introd. into the S.

## 3. oxy'ria, Hill. Mountain Sorrel.

Characters of Rumex, but sepals 4 ; anthers versatile; ovary compressed ; stigmas 2 ; fruit lenticular, broadly winged, and embryo axile.Distrib. Aretic regions and Alps of the N. temp. zone; species 1.Etym. $\delta \xi \underline{v}$ s, from the acidity of the leaves.

1. O. renifor'mis, Hook.; leaves ovate-cordate or reniform.

Mountain rocks and streams, Wales, Yorkshire, and northwards; ascending to near $4,000 \mathrm{ft}$. in the Highlands ; S.W. of Ireland, rare ; fl. July-Aug.Peremnial, glabrous, rather fleshy, acid. Rootstock branched, tufted. Stem 6-18 in., stout, subsimple. Leares, radical many, $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. broad, long-petiolerl. rounded or retuse, rarely 3-lobed or subhastate; cauline solitary. Panirle slender, leafless, lax-flowered; pedicels slender, jointed at the middle, thickened at the top. Outer sepuls spreading or reflexed; inner $\frac{1}{1}$ in., spathulate, $3-5$-nerved. Fruit $\frac{1}{6} \mathrm{in}$. diam.; wing orbicular-cordate, membranous, veined, top notched.-An excellent potherb and antiscorbutic.

## Order LXI. Amarantha'cerz.

Herbs or shrubs. Leaves opposite or alternate, simple, usually quite entire, exstipulate. Flowers small, 1-2-sexual ; bract persistent, bracteoles 2 deciduous. Sepuls $3-5$, subequal, scarious, persistent, imbrieate in bud. Petuls 0. Stamens 3-5, hypogynous, opposite the sepals, staminodes 3-5 or 0, filaments free or connate, filiform or dilated ; anthers 1-2-celled, fixed by the back. Ovary free, 1 -celled, compressed; style 0 or simple, stigmas 1-3 filiform or capitate ; ovules 1 or more, basal, campylotropous. Fruit usually a membranous utricle. Seeds vertical, reniform, testa crustaceous shining, albumen floury ; embryo annular or curvel, radicle next the hilum.-Distrib. Tropies, rarely in temp. regions; genera 45 ; species about 400.-Affinities. With Chenopodiaceex and Paronychicer.-Properties. Unimportant.

## 1*. AMARAN'THUS, L.

Herbs. Leaves alternate, apiculate. Flowers monœcious or polygamons, usually in cymose clusters. Sepals $3-5$, equal, erect. Stumens 35 , filaments free; staminodes 0 ; anthers 2 -celled. Style 0 , stigmas $2-3$ subulate. Utricle ovoid. Embryo annular.-Distrib. Tropical or subtropical; species about 12.--Etym. á $\alpha^{\prime} p a \nu \theta o s$, unfouding, from the persistent perianths.
A. Bli'tum, L.; leaves ovate or obovate, flowers 3 -merous.

Cultivated ground in the W. of London, \&c., not even naturalized; fl. July-Ang.-Annual, glabrous. Stem 1-2 ft ., decumbent, branched, angular. Leaces 1-3 in., long-petioled, dark green, tip rounded. Flowers minute; clusters axillary and in interrupted cymes. Sepals oblong, mucronate, exceeding the bracts, shorter than the utricle.-Distrib. Warm climates.

## Order LNil. chenopodiacerz.

Herbs or shrubs. Leaves simple, alternate, exstipulate. Flourers 1-2-sexual, small, regular, often dimorphic ; bracts 1-3 or 0 . Culy.e inferior, of $3-5$ free or connate sepals, imbricate in bud. Petuls 0. Stamens usually E, opposite the sepals, perigynous or hypegynous;
anthers 2-celled. Orary ovoid globose or depressed, 1-celled ; stigmas 2-4; ovule solitary, basal or lateral, amphitropous. Fruit usually a utricle, enclosed in the often enlarged or fleshy calyx. Sced horizontal or vertical, testa crustaceous, inner coat membranous, albumen floury, rarely fl shy or 0 ; embryo curved annular or spiral. -Distrib. All climates; genera 70 ; species about 450.-Affinities. With Amaranthacece, C'aryophyllea, and Paronychiea.-Properties. Chiefly known as potherbs.
Tribe I. Stem leafy. Allowmen copious, floury; embryo annular.
Flowers 2 -sexual. Disk fleshy. Utricle thick and hard above ......1. Beta.
Flowers 2 -sexual. Disk fleshy. Utricle thick and hard above ......1. Beta.
Flowers 1 -sexual, male 3-5-female 2 -sepalous.........................3. Atriplex.
Tribe II. Stem leafless, jointed. Albumen scanty ; embryo conduplicate.
Flowers 2-sexual
4. Salicornia.

Tribe III. Stem leafy. Albumen seanty, fleshy ; embryo spiral.
Sepals 4-5, not winged at the back.
5. Suæda.

Sepals 4-5, transversely winged in fruit
6. Salsola.

## 1. Be'ta, L. Beet.

Herbs. Leaves almost entire. Flowers 2-sexual, in axillary spiked or cymose fascicles, cohering in fruit by the enlarged bases of the sepals. Calyx urceolate, base indurate in fruit. Stamens 5, perigynous, filaments subulate. Disk fleshy, annular. Ovary sunk in the disk, depressed; style short, stigmas 2-4 subulate. Fruit adnate to the disk and calyx-base. Seed horizontal, testa thin, albumen floury ; embryo annular.-Distrib. N. temp. Europe and Asia; species 9.-Etym. Uncertain.

1. B. marit'ima, $L$.; decumbent, clusters of flowers spiked.

Muddy, \&c. sea-shores, from the Forth southwards, and in Ireland; fl.
June-Oct.-Glabrous, perennial. Rootstock branched, tapering into a fleshy
root. Stems many, 1-2 ft., branched, angular, striped, tips ascending.
Leaves 2-4 in., fleshy, shining, lower rhomboid-ovoid, acute ; upper lanceo-
late ; petiole broad. Spikes 3-6 in., slender, panicled, clusters 2-3-flowered, sessile ; bracts linear-lanceolate, acute, lower $\frac{1}{2}-1 \mathrm{in}$. ; flowers $\frac{1}{6} \mathrm{in}$. diam., green. Sepals incurved, obtuse, keel entire, edges scarious. - Distrib. Europe from Denmark southwards, N. Africa, W. Asia to India. - Probably the origin of the Beet and.Mangold Wurzel. An excellent spinach.
2. CHENOPO'DIUM, Tournef. Goose-foot.

Erect or prostrate, very variable herbs, usually littoral or on made soil. Stem angled, striped white or red and green. Leaves entire lobed or toothed. Flowers minute, 2-sexual, ebracteolate; clusters axillary, or in simple or panicled cymes. Sepals 3-5. Stamens 2-5, perigynous, filaments subulate. Disk 0. Ovary free, depressed or compressed; styles 2-3. Utricle membranous, often enclosed by the calyx. Seed horizontal or vertical, testa crustaceous, albumen floury; embryo annular.-Distrib. All climates; species about 50.-ETYM. $\chi \hat{\eta} \nu$ and $\pi$ oûs, goose-foot.

Section 1. Annual. Flowers 5 -merous. Styles short. Seeds horizontal. * Leaves quite entire.

1. C. Vulva'ria, L.; mealy, diffuse, leaves deltoid-ovate, sepals not keeled covering the utricle. C. olidum, Curtis.

Roadsides and waste places, from Edinburgh southwards; rare in Scotland; S. and E. of Ireland (perhaps extinct) ; fl. Aug.-Oct.-Annual, feetid. Brunches 6-18 in., opposite, divaricate. Leaves $\frac{1}{2}-1 \mathrm{in}$., greasy to the touch, acute, grey-green ; petioles as long or shorter. S'pikes small, $\frac{1}{4} \frac{1}{2}$ in., dense, axillary and terminal. Seeds black, punctulate.-Distrib. Europe from Deumark southwards, N. Africa.-Odour of stale salt fish.
2. C. polysper'mum, L.; glabrous, erect or ascending, leaves ovate, sepals not keeled shorter than the utricle.
Cultivated ground, manure-heaps, \&c. from Lancashire and Durham southwards ; Ireland, very rare and introduced only ; fi. Aug.-Oct. - Annual. Stem 6-18 in.; branches many, spreading, leafy. Leaces $\frac{1}{2}-1 \frac{1}{2}$ in., shortly petioled, membranous. C'ymes $\frac{1}{2}-1 \mathrm{in}$., axillary and terminal, simple or panieled; branches very slender, spreading ; flowers very minute. Seeds minute, dark brown, rough.-Distrib. Europe, N. Asia ; introd. in N. America.
Vik. 1, acutifólium, Sm. (sp.); stem ascending, leaves acute, eymes nearly simple leafy.-Var. 2, cymo'sum, Moq. Tand.; stems decumbent, leaves more obtuse, cymes dichotomous leafless. Var. obtusifolium, Syme.

## ** Leaves more or less toothed or lobed.

3. C. al'bum, L.; erect, more or less mealy, leaves subentire or irregularly toothed, upper oblong entire, sepals keeled covering the utricle narrowly scarious or all green, seed obtusely keeled or not.
Waste places, especially in cultivated ground, ascending to near $1,000 \mathrm{ft}$. in Yorkshire ; H1. July-Sept.-Very variable. Stem 1-3 ft.; branches erect or ascending. Leuves $1-3$ in., rhombic deltoid-ovate or oblong, tip acute obtuse or rounded, base cuneate often 3 -nerved ; petiole usually long and slender. spikes terminal and axillary, simple or panicled, leafy below. Seed almost black.-DISTRIb. Europe (Arctic), temp. Asia; introd. in N. America.
Sub-sp. AL'BLM proper ; leaves rhombic or deltoid-ovate hardly hastate, seed obtusely keeled.-Var. 1, can'dicuns, Lamk. (sp.) ; leaves usually much toothed mealy, spikes simple shorter than the leaves in a slender terminal panicle, calyx very mealy.-Var. 2, vir'ide, L. (sp.) ; leaves almost entire sparingly or hardly mealy, spikes lax axillary subcorymbose, branches recurved, calyx almost glabrous.-VAR. 3, paga'nmen, Reich. (sp.); lower leaves oltusely serrate glabrous or sparingly mealy below only, spikes lax erect axillary simple or in terminal panicles, calyx sparingly mealy. Var. virens, Lond. Cat.
Sub-sp. FicifóliUm, Sm. (sp.) ; flaceid, leaves more oblong-hastate with broader obtuse spreading basal lobes, often contracted above them, spikes lax ascending panieled, seed not keeled.-From Northumberland southwards, Dublin and Belfast, rare.-Unlike any of the varieties of album proper; always easily recognized ; it should perhaps be regarded as a species, but its distinctive characters are hardly to be conveyed by words.
4. C. ur'bicum, $L$.; erect, sparingly mealy, leaves triangular acute deeply toothed or subentire, spikes erect leafless simple axillary, or in a terminal erect panicle which is leafy below, sepals not keeled nor covering the utricle broadly scarious, seed large punctulate not keeled.
Waste places, from Chester and York southwards ; not indigenous in Scotland; very rare in Ireland ; fl. Sept.-Oct.-Stem 6-36 in., stout, sparingly branched.
Leaces 1-3 in., often as broad as long ; petiole usually shorter, winged above ; lateral nerves spreading. Sipikes $4-2$ in., rather dense-flowered.-Distrib. Europe, Canaries, Siberia, W. Asia ; introd. in N. America.

Var. 1, deltoi'deum, Lamk. (sp.) ; leaves deltoid shortly toothed or subentire, spikes erect longer than the leaves, panicle leafless above.-Var. 2, intermedium, Mert. and Koch (sp.) ; leaves rhombic-triangular deeply sinuatetoothed, spikes shorter than the leaves, panicle leafy almost to the top.
5. C. hyb'ridum, L. ; erect, almost glabrous, leaves large long-acuminate with 2-4 broad lobes on each side, spikes in lax axillary almost leafless corymbs, sepals obtusely keeled not covering the utricle broadly scarious, seed large opaque coarsely pitted not keeled.
Fields and waste places, from Northumberland to Dorset and Kent, local; rarer and not wild in Scotland and Ireland ; a native? Watson; fl. Aug.-Sept.Odour heavy. Stem 1-3 ft., stout, branched. Leaves 3-5 in., almost shining, broadly ovate, pale green, membranous, $3-5$-nerved near the usually cordate base. Clusters of flowers rather large.- Distrib. Europe, N. Africa, Siberia, W. Asia to N.W. India ; introd. in N. America.
6. C. mura'1e, L.; nearly glabrous, leaves bright green rhombic- or deltoid-ovate acute entire at the cuneate base, upper narrower serrate, spikes short densely panicled, sepals slightly keeled almost covering the utricle, narrowly scarious, seed sharply keeled.
Waste places near houses, rare in England ; a doubtful native of Scotland ; S. and E. of Ireland, very rare ; fl. Aug.-Sept.-Rather foetid. Stem 6-18 in., erect or ascending; branches decumbent. Leaves $\frac{3}{4}-3 \mathrm{in}$. broad, rather shining, teeth sharp; petiole shorter than the blade. Spikes $\frac{1}{2} \frac{3}{4} \mathrm{in}$. Need rather opaque, punctate.-Distrib. Europe, N. Africa, W. Asia to N.W. India; introd. in N. America.

Section 2. Annual. Lateral flowers of each cluster usually 2-4merous, seeds vertical ; terminal 5 -merous, seed horizoutal or vertical. Style short.
7. C. ru'brum, L. ; glabrous, shining, leaves deltoid or rhombic-ovate, spikes leafy panicled, sepals not keeled covering the utricle narrowly scarious, seeds mostly vertical minute brown shining obscurely keeled.
Waste places, ditches, salt marshes, \&c. from the Forth and Clyde southwards;
S. and E. of Ireland, very rare ; fl. Aug.-Sept.-Stem 1-3 ft., erect or ascending. Leaves excessively variable, entire irregularly toothed or serrate, obtuse or acute, 3 -nerved at the base. Spikes very short, in terminal and axillary panicles.-Distrib. Europe, Siberia, W. Asia.
Sub-sp. RU'brum proper ; leaves sinuate-serrate not fleshy, panicle leafy to the top, spikes short compact dense-flowered often almost capitate.-V Ar. 1 , stem stout, leaves deltoid much serrate, panicles dense-flowered.-VAR.
2, pseuto-botryo'des, Wats.; smaller, often reddish, stem slender, leaves
rhomboid almost entire, panicles much reduced. C. botryodes, Bab. not Sm.
Sub-sp. botryo'des, $S m$. (sp.); leaves subentire, fleshy, paniele leafless above.
8. C. glau'cum, L. ; prostrate, leaves mealy beneath oblong or ovateoblong sinuate-lobed, spikes short dense leafless, sepals keeled nearly covering the utricle narrowly scarious, seeds shining red-brown not keeled.
Waste ground, in the S. of England, not indigenous in the N. or in Scotland; absent from Ireland; native? Watson; fl. Aug.-Sept. - Stem 6-18 in., usually spreading, widely branched, shining, glabrous. Leaves $\frac{1}{2}-1 \mathrm{in}$., white
below, tip obtuse or rounded, base cuneate. Spikes $\frac{1}{4}-1 \mathrm{in}$., simple or compound, terminal and axillary. Seeds variable, very small, the horizontal largest. - Distrib. Europe, Canaries, Siberia, W. Asia to the Himalaya, N. America, S. Chili, New Zealand, Australia.

Section 3. Perenuial, glabrous or nearly so. Flowers all 5 -merous, or lateral $2-3$-androus. Seeds nearly all vertical. Styles $2-5$, very long.
9. C. Bo'nus-Henri'cus, L.; leaves triangular-hastate subacute, spikes mostly in a compound leafless panicle, sepals not keeled toothed at the tip, broadly scarious, seeds large tumid black not keeled. All-good.
Waste places, often near houses, from Ross southwards ; ascends to $1,200 \mathrm{ft}$. in the N. of England; common in Ireland; a native? Watson; fl. May-Aug.-Rootstock stout, fleshy, branched. Stem stout, erect or ascending, $1-3 \mathrm{ft}$., papillose. Leaves 2-4 in., succulent, papillose beneath, variable in shape, entire or sparingly sinuate-toothed, petiole of lower long, basal lobes often large acute and spreading. Spikes 1-2 in., dense-flowered. Sepuls shorter than the utricle. Stamens 2-5, rarely 0. Seed punctulate.-Distrib. Europe, Siberia ; introd. in N. America. - Cultivated as a pot-herb in Lincolnshire, and called "Mercury."

## 3. A'TRIPLEX, Tournef. Orache.

Herbs or shrubs, mealy or scaly. Leaves alternate or opposite, petioled, often hastate, entire or sinuate-toothed. Flowers small, 1 -sexual, ebracteate ; clusters usually in branched cymes.-Male. Sepals 3-5. Stamens 3-5, bypogynous, filaments filiform. Ovary rudimentary.-Female. Sepals 2, free or connate. Stamens 0. Styles 2, filiform, connate at the base. Utricle compressed, enclosed in the enlarged calyx. Seed compressen, vertical or horizontal, albumen floury ; embryo annular.-Distrib. Shores and waste places ; species 50-60.-Etym. The old Latin name.
Sub-gen. 1. A'triplex proper. Annuals. Flowers monœcious; sepals of female united below. Pericarp not adherent to the sepals. Testa crustaceous. Radicle basal or sublateral.

1. A. pat'ula, L. ; mealy, stem erect or ascending striped, branches spreading, leaves deltoid hastate or rhombic, floral usually broad, sepals rhombic or deltoid usually toothed and tubereled not or rarely hardened.
Waste places, manure-heaps, \&c. ; fl. June-Oct.-Very variable, $6 \mathrm{in} .-3 \mathrm{ft}$., rarely prostrate, less mealy than A. luciniata. Female رt. mostly mixed with the males, but a few axillary ones occur separately. Fruiting sepuls usually $\frac{1}{-}-\frac{1}{6} \mathrm{in}$. diam. except in sub-sp. Bubingtonit, excessively variable in form, length of free portion, toothing and sculpture ; base hastate truncate or deltoid. Seeds usually of two forms, largest $\mathrm{i}^{2}-\frac{1}{6} \mathrm{in}$. diam., dark brown, much compressed : smallest $\frac{1}{n}-\frac{1}{1}$, smooth and shining.-Distrib. Most cool (Aretic) parts of the globe, native or naturalized.
Sub-sp. PAT'ULA proper; erect or decumbent, deep preen, sparingly mealy, lower leaves opposite rhombic or rhombic-hastate with ascending cusps acute entire or serrate, spikes dense simple leafy below, sepals united at the hase only deltoid, seeds all vertical.- Common, extending to India; ascends to $1,000 \mathrm{ft}$. in the N. of England.-- Var. 1, auyustifo'liu, Sm. (sp.); stem weak procumbent, branches divaricate, leaves subentire, spikes long lax panicled, sepals usually smooth.-VAR. 2, erec'tu, Huds. (sp.) ; stem erect or ascending,
lower leaves deltoid serrate, panicle lax, spikes short dense, sepals denticulate usually muricate on the back.
Sub-sp. hasta'Ta, $L$. (sp.); erect or decumbent, dark green, mealy, lower leaves opposite hastate-deltoid with horizontal cusps subacute entire or toothed, spikes simple or panicled interrupted leafy at the base, sepals deltoid united at the base only, seeds dimorphic, larger brown rough, smaller black smooth.-Common, extending to India ; ascends to $1,300 \mathrm{ft}$. in N. of England.-VAR. 1, hasta'ta, Huds. (sp.) ; upper leaves not hastate, spikes lax, terminal of panicle long, sepals rhombic much longer than the utricle, most of the seeds large. A. patula, Sm. ; Smith' ii, Syme.-Var. 2, deltoi'dea, Bab. (sp.) ; upper leaves usually hastate, spikes dense, terminal of the panicle short, sepals truncate but little longer than the utricle, seeds mostly small. A. prostrata, Bab.
Sub-sp. Babingto'niI, Woods (sp.) ; usually pale and very mealy, prostrate, branches spreading ascending, leaves mostly opposite deltoid or rhombicovate entire or sinuate-toothed, upper usually similar, clusters of flowers remote, spikes simple lax leafy, sepals connate at the often hardened base or united nearly to the middle, seeds all vertical large pale rather rough.-Sea-shores, abundant.-Very variable ; as green as sub-sp. hustata, almost as white as $A$. laciniata, from which the striped stems and neither swollen nor much hardened base of the sepals distinguish it.
2. A. littora'lis, L. ; mealy, stem erect striped, branches ascending, leaves linear- or elliptic-oblong usually quite entire upper very narrow, sepals rhombic or deltoid toothed tubercled not hardened.
Salt and brackish marshes, banks, \&c. from W. Perth and Fife to Dorset and Kont ; rather rare in Ireland ; fl. July-Sept.-Best distinguished from A. putula by the narrower usually quite entire leaves, which are never hastate and hardly ever rhombic. Clusters of flowers in slender terminal spikes. Seeds nearly smooth, shining, all vertical.-Distrib. Of A. patulu.
Var. 1, littora'lis proper; leaves quite entire or faintly toothed, tips of the fruiting sepals often recurved.-VAR. 2, mari'nu, L. (sp.); leaves serrate or lobed, tips of fruiting sepals appressed. A. serrata, Huds.
3. A. lacinia'ta, $L$. ; clothed with persistent silvery scales, stem not striped reddish, lower leaves opposite rhombic-ovate, upper similar or hastate, floral sessile, sepals cuneate at the swollen hardened base. $A$. arenaria, Woods, not Nuttall ; A. rosea, L. ?
Sandy sea-coasts from the Clyde on the W. and Yorkshire on the E., southwards; fl. July-Oct.-Silvery-white ali over. Stem angled, branched from the base; branches $4-10 \mathrm{in}$., diffuse, stout or slender. Leaves $1-1 \frac{1}{2}$ in., petioles short, acute or obtuse, base cuneate, subentire or irregularly acutely or obtusely lobed toothed or serrate. Clusters of male flovers in short dense subpanicled spikes, of female axillary with a few males intermixed. Fruiting sepals $\frac{1}{5} \frac{1}{2} \mathrm{in}$. diams, united to the middle, often broader than long, rhombic, acute or acuminate, entire lobed or toothed; disk often prominently veined or wrinkled, rarely tubercled. Seed large, $\frac{1}{6} \mathrm{in}$. diam., much compressed, rough, red-brown.-Distrib. W. Europe from Norway to France.-This is the plant of Linn. Herb., and is no doubt that intended in the Sp. Plant. though described as erect. Linnæus included with it the very similar N. American A. arenariu, Nutt. (not Woods), which differs in habit and the seed. As Nuttall's name of arenaria must be retained, I adopt the Linnean of laciniata for this.

Sub-gen. 2. Obi'one, Gartn. (gen.). Annual or peremial. Flowers moncecious or dicecious. Pericarp adherent to the cup-shaped perianth. Testa coriaceous or crustaceous ; radicle superior. Halimus, Wallroth.
4. A. portulacoi'des, $L$.; shrubby, mealy, leaves obovate- or spathu-late-lanceolate quite entire, perianth sessile compressed 2-4-lobed.
Muddy maritime cliffs and marshes, from Wigton and Northumberland south-
wards ; S. and E. of Ireland, very rare ; fl. Aug.-Oct.-Covered with minute persistent greyish-white scales. Rootstock woody, branched. Stem 1-3 ft., woody below, flexuous, decumbent; branches 12-18 in., erect. Leaves $1-3$ in., mostly opposite, rounded at the tip, narrowed into the petiole, upper linear. Spikes in terminal interrupted panicles, leafy below. Fruiting perianth $\frac{1}{5}-\frac{1}{6}$ in., cupular, lobes rounded, unequal. Seed chesnut, rough.-Distrib. Erope from Denmark southwards, N. Africa, W. Asia.
5. A. peduncula'ta, L.; herbaceous, mealy, leaves narrowly obovateoblong quite entire, perianth pedicelled, lobes 2 recurved.
Muddy maritime marshes, rare, from Lincoln to Kent ; fl. Aug.-Oct.-Annual, mealy like A. portulacoides. Stem 3-8 in., flexuous, slender, terete, simple or sparingly branched. Leaves $\frac{1}{2}-1 \frac{1}{2}$ in., rounded at the tip, shortly petioled. Spikes terminal and reduced to axillary fascicles ; flowers subsessile, one or few fruiting in each fascicle, when the pedicel elongates to $\frac{1}{3}-\frac{1}{2}$ in., and is very spreading. Fruiting perianth $\frac{1}{4} \mathrm{in}$. diam., campanulate with 2 lateral lobes and 2 intervening small teeth. Seed as in A. portulucoids.s. --Distrib. Baltic from Gothland southwards, shores of France, Russia, and Siberia.

## 4. Salicor'niA, Tournef. Marsh Samphire.

Annual or perennial leafless herbs. Stems cylindric, very succulent, jointed; branches opposite. Flowers 2 -sexual, minute, 3 together sunk in pits of the axis at the base of the internodes. Perianth turbinate, compressed, fleshy, 3-4-lobed or truncate, mouth contracted. Stamens 1-2, perigynous. Styles 2. Utricle compressed, included in the swollen perianth. Seed vertical, testa membranous hairy, alhumen seanty fleshy or 0 ; embryo conduplicate green, radicle inferior incumbent, cotyledous $\frac{1}{2}$-terete thick.-Distrib. Salt districts, chiefly in temp. regions ; species 5-6.-ETYM. sal and cornu, from the horn-like branches.

1. S. herba'cea, $L$.; root annual slender, stem ascending, brauches more or less fusiform, all flowering.
Salt marshes ; fl. Aug.-Sept.-Stem 6-18 in., $\frac{1-\frac{1}{3}}{3}$ in. diam. at the thickest part, which is above the base ; internodes $\frac{1}{2}$ in., usually contracted above and below, 2 -lobed at the top when dry, lower woody slender, upper fleshy slightly compressed; branches spreading or ascending ; flowering internodes in short spikes. Flower-beuring cavities 2 at each node, opposite. Stumens inserted at various heights, if 2 successively protruded. Stules exserted. Fruiting perianth narrowly winged at the top. Seeds ovoid or oblong, greenish, covered with curled hairs.-Distrib. Europe, N. Africa, N. Asia, W. Asia to India, N. America - Formerly burnt for Barilla, and sometimes pickled.
VAR. 1, herla'cea proper; green, glaucous, ascending, branches suberect, spikes many-flowered.-VAr. 2, mocum'lens, Sm . (sp.); red, decumbent, branches cruciate, spikes few-flowered.-V AR. 3 , ramosis'sima, Woods; grass-
green, erect, much-branched, spikes few-flowered. Haling Island.-VAR. 4, pusil'h, Woods ; very small, spikes about $\frac{1}{4} \mathrm{in}$. few-flowered.
2. S. radi'cans, Sm.; rootstock perennial woody creeping sending up herbaceous terete barren and flowering branches.
Salt marshes, from Norfolk southwards to Dorset ; fl. Sept.-Oct.-Much more branched and tufted than $S$. herbucea, colour browner, but perhaps only a sub-species. Stems $\frac{1}{2}-2 \mathrm{ft}$., $\frac{1}{2} \mathrm{in}$. diam.; spikes thicker and more obtuse. -Distrib. W. Europe from Denmark southwards. - Erroneously referred to Arthrocnemaun fruticosum by Moquin Tandon (in DC. Prodr.).
Imperfectly known species are S. lignosa, Woods (Woods and Kippist, Linn. Proceedings, 1851, p. 111), with the growth, \&c. of S. radicuns, but stem shorter thicker more woody below ; and S. megastachya, Woods, with tubercled hairless seeds, which is possibly an Arthrocnemum.

## 5. SU届'DA, Forsc. Seablite.

Saline herbs or shrubs. Leaves fleshy, alternate, terete or $\frac{1}{2}$-terete. Flowers 1-2-sexual, small, green, axillary, minutely 3 -bracteolate. Calyze 5 -partite ; segments obtuse, not keeled or winged. Stamens 5, hypogynous. Styles 3-5, compressed. Utricle enclosed in the fleshy or dry calyx. Seed horizontal or vertical, testa crustaceous, inner coat thin, albumen 0 or fleshy and scanty ; embryo in a flat spiral, radicle inferior.Distrib. Salt marshes and shores ; species about 33.-Etym. unknown.

1. S. marit'ima, Dumort.; stem annual procumbent or ascending branched, leaves subacute tapering at the base, styles 2, seed horizontal. Schoberia, C. A. Meyer ; Chenopodina, Moq. Tand.
Salt marshes ; fl. July-Oct.-Glabrous, glaucous, reddish in winter. Stem usually branching from the base; branches $3-24 \mathrm{in}$., straggling, slender. Leaves $\frac{1}{-1} \mathrm{in}$. or more. Flovers 3-5 together, rarely solitary, subsessile. Seed shining, striate, brownish-black, beaked.-Distrib. Europe (Arctic), N. Africa, Siberia, W. Asia to India, N. America.
2. S. frutico'sa, Forsk.; stem perennial woody, leaves rounded at the base and tip, styles 3, seed vertical. Schoberia, C. A. Meyer.
Sandy and pebbly beaches, rare and local from Norfolk southwards to Dorset ; fl. July-Oct.-Glabrous, rather glancous. Stem 1-3 ft., $\frac{1}{2} \mathrm{in}$. diam. at the base ; branches erect or ascending. Leaves $\frac{\downarrow}{-\frac{2}{3}}$ in., crowded, fleshy, dotted with white. Flowers solitary or 2-3 together, subsessile. Deed shining, black.-Distrib. Europe from Spain eastwards, N. Africa, W. Asia to India. -Formerly burnt for Barilla in S. Europe.

## 6. SAL'SOLA, L. Saltwort.

Herbs or shrubs. Leaves alternate or opposite, sessile, subcylindric or subulate, fleshy rigid or spinescent. Flowers small, axillary, sessile, 2 -sexual, 2 -bracteate. Sepals 5, rarely 4, with a broad transverse dorsal wing that forms after flowering. Stamens 5, rarely 3, hypogynous ; filaments linear free or connate below. Ovary subglobose ; style elongate, stigmas 2-3 compressed or subulate. Utricle depressed, enclosed in the stellately 5 -winged much enlarged calyx. Seed horizontal, testa membranous, albumeu 0 ; embryo in a conical helix.-Distrib. Saline districts in temp. regions ; species about 30.-ETYM. sal, from yielding alkalies.

1. S. Ka'il, L. ; herbaceous, rigid, leaves spinous-pointed.

Sandy sea-shores from Argyle and Moray southwards, and in Ireland ; fi. July-Aug.-Annual, pubescent or scabrid, glaucous. Stem 6-18 in., erect or procumbent, striped ; branches many, spreading, flexuous. Leutes $\frac{1}{2}-1 \frac{1}{4}$ in.. spreading and recurved, fleshy, ovate-subulate, $\frac{1}{2}$-amplexicaul. F/urers 1-3; bracts spinescent. Wiugs of fruiting perianth very variable, broad or narrow, searious, often rose-coloured. Seed brown, adherent to the pericarp. -Distrib. Europe, N. and S. Africa, Siberia, W. Asia to India, N. and S. Amerien, Australia.-Formerly burnt for Barilla.

## Order LXIII. THYMELE'尼.

Shrubs or trees, rarely herbs; juice acrid; iuner bark tenacious. Leures alternate or opposite, quite entire, exstipulate. Flowers 2 -sexual (rarely polyyamous), solitary fascicled cymose or capitate. Cutys inferior, throat naked or bearing seales glands or staminodes ; lohes 4-5, imbrivate in hud. Corollu 0. Stemens 2, 4, 8, or 10, adnate in 1-2 series to and includenl within the calyx-tube, when equalling its lobes alternate with them: anthers 2 -celled. Disk 0 or of 4-8 hypugynous stales or glands. Ovary free, 1 - rarely 2 -celled; style terminal or lateral, stigma capitate; ovules 1-3, pendulons, anatropous. Fruit a drupe or berry (rarely capsular). Soul pendulous, testa thin or crustaceous, albumen seanty or $\theta$; embryo straight, cotyledons plano-convex, radicle short superior.-Distrib. Temp, and trop. regions ; genera 40 ; species about 300.-Affinities. With Eloagnce, Proteucew, and Santalacese.-Properties acrid.

## 1. DAPH'NE, $L$.

Shrubs, rarely tall. Leaves usually alternate and persistent. Flourers odorons. Culyx tubular; lobes 4, spreading; throat naked. Stomens 8, subsessile, 2 -seriate; anthers fixed by the back. Style sulbterminal, short or 0. Fruit coriaceons or fleshy. Testa crustaceons.-Distinib. Eirope, N. Africa, temp. Asia ; species abont 30.-Etym. doubtful.

1. D. Laure'ola, $L$.; leaves evergreen, flowers fascicled in the upper leaf-axils green glahrous. Spurge Laurel.
Copses and hedgehanks in st:ff soils, from York and Durham southwards; not native in Scotland or Ireland ; f. Jan.-A pril.-Shrub 1-3 ft., leafless below, branches few. Leares $2-5 \mathrm{in}$. , very coriaceous, obovate-lanceolate, acute, subsiessile. Cymmes fow-flowered; bracts oblong, deciduous; flowers $\frac{1}{2}$ in., inclined, males and 2 -sexual intermixed. Ciulyx-lolies $\frac{1}{2}$ the lengrt of the tuhe. Irupe $\frac{1}{2}$ in., ovoid, black.-Distrib. Europe from Belgium sonthwards, excl. Russia, N. Africa, W. Asia.-Berry very poisonous.
2. D. Mezereum, $L$. ; leaves deciduous, flowers appearing before the leaves clustered on the branches pink silky. Mczcreon.
Copses and woods, perhaps native in the S.; an alien or denizen, Wicteon; fi. Feh.-A pril.--Shrub 2-4 ft.; branches few, erect. Leaves 2-3 in., obovateor spathulate-lanceolate, acute, membranous, petioled. Flowers usually in threes, subsessile in the axils of the last year's leaves, very fragrant, rarely white ; bracts small. Culy $x \frac{1}{3} \mathrm{in}$. diam., tube as long as the lobes. Berry
$\frac{1}{2}$ in., bright red, ovoid. -Distrib. Europe (Arctic), Siberia.-Acrid and poisonous ; leaves used as a vesicant ; berries cathartic.

## Order LXIV. Elefeag'nere.

Shrubs or trees, with copious silvery or brown scales; buds naked. Leares alternate or opposite, quite entire, exstipulate. Flowers small, regular, 1-2-sexual, axillary, fascicled or cymose, white or yellow. Calyx in the 2-sexual and female f. tubular, 2-6 cleft, lobes imbricate or valvate in bud; in male fl. of 2 or 4 sepals free or connate below. Corolla 0. Disk 0, or lining the calyx-tube, often thickened round the style. Stamens adnate to the calyx-tube, in the male fl. twice as many as the lobes, in the 2 -sexual as many as and opposite the lobes; anthers fixed by the back or base. Ovary free, sessile, enclosed in the thickened calyx-base, 1eelled; style filiform, stigma lateral ; ovule 1, basal, erect, anatropous. Fruit indehiscent, enclosed in the calyx-tube. Seed ascending, testa thick or thin, albumen 0 or scanty ; embryo straight axile, cotyledons thick, radicle inferior.-Distrib. N. temp. and trop. zones; genera 4 ; species 20.-Affinities. With Thymelec.-Properties unimportant.

## 1. hippoph'Ae, $L$. Sea Buckthorn.

A shining silvery willow-like dicecious shrub. Leaves alternate. Male fl. in axillary clusters. Sepals 2. Stamens 4. Fem. fl. solitary. Calyx tubular, minutely 2 -lobed. Fruit a membranous utricle enclosed in the succulent calyx-tube. Seed oblong, grooved on one side, testa crustaceous shining, albumen a thin fleshy layer; embryp amygdaloid.-Distrib. Europe, N. and Central Asia to the Himalaya.-Etym. doubtful.

1. H. rhamnoi'des, $L$.; leaves obovate or linear-oblong, petiole short. Sandy sea-shores, not common ; indigenous in the S., naturalized as far N. as

Isla and Fife ; absent from Ireland.-Shrub 1-8 ft.; branches slender and subpendulous, or short and spinescent. Leares $\frac{1}{4}-2 \mathrm{in}$., dull green above, silvery beneath. Floxcers on the old wood; male minute; sepals broadly oblong; filaments short; anthers yellow. Fruit $\frac{1}{3} \mathrm{in}$. diam., globose or oblong, orange-yellow.-The description of the fruit I owe to Dr. Dickson.

## Order LXV. Lorantha'cere.

Evergreen parasitic shrubs. Stem often jointed. Leaves usually opposite, coriaceous, exstipulate. Flowers 1-2-sexual ; inflorescence various. Sepals thick, 4, 6, or 8, superior, free or united into a tubular calyx, lobes valvate in bud. Corolla 0. Stamens, one adnate to each calyx-lobe, filaments various or 0 ; anther 2 -celled, opening by slits, or many-relled and opening by as many pores. Disk annular, epigynous or 0. Ovary. inferior, 1 -celled ; style simple or 0 , stigma simple; ovule 1 , reduced to a nucleus or to an embryo sac, basal, erect, orthotropous, aduate to the walls of the ovary. Berry 1 -seedel. Seed ereet, testa thin, albumen copious fleshy; embryos 1 or more, cotyledons thin or plano-convex, radicle
superior.-Distrib. Chiefly trop. but many temp.; genera 13 ; species about 450. - Affinitins. Very near Santalacce. - Plioperties unimportant.

## 1. Vis Cum, L. Mistletoe.

Leaves opposite whorled or 0. Flowers 1-sexual, small, green, spiked or clustered in the forks or internodes of the branches. Sopuls 4 , triangular. Anthers sessile, cells many, opening by pores. Stigma sessile.-Distrib. of the Order ; species about 100 ?-ETYM. i $\xi$ oss, or $\beta \iota \sigma \kappa$ ós of the Greeks.

1. V. al'bum, $L$.; leaves obovate-lanceolate obtuse 5-7-nerved.

On various trees, most rare on the oak, from York and Denhigh southwards ; not native in Scotland or Ireland; f. March-May.-Shrub 1-4 ft., yellowgreen, glabrous; branches terete, dichotomous, knotted. Letces 1-3 in., opposite or in whorls of 3 . Flowers in threes, inconspicuous, green, 2. bracteate. Berry white, nearly $\frac{1 n}{}$. diam., ovoid or globose, viscid. Eimbiryos $1-3$, green; when 2 , often united by the cotyledons.-Dis'rrib. Europe, N.Asia.

## Order LXVI. santalácers.

Herbs, shrubs, or trees, usually parasitic on roots. Leaves mostly alternate, quite entire, exstipulate. Flowers 1-2-sexual, small or minute, solitary or cymose, 2 -bracteolate. C'alyx inferior or becoming adherent to the ovary ; lobes $3-5$, valvate in bud, often with a tuft of hairs on their face. Stamens opposite and adnate to the calyx-lobes, filaments short ; anthers fixed by the base or baek. Disk epigynous, often dilated and lobed. Ovary 1 -celled; style short, stigmas $1-5$; ovules $2-5$, reducel to a naked pendulous nucleus, placenta basal erect. Fruit indehiscent, 1 -celled, 1 -seeded. Seed adhering to the placenta, and often to the pericarp, albumen fleshy ; embryo straight axile, cotyledons plano-convex, radicle superior.-Distrib. All regions ; genera 20 ; species 200. -Affinities. With Lorantheces, Olacinec, and Cornee.-Properties. Unimportant, except the fragrant wood of Santalum.

## 1. the'sium, $L$. Bastard Toad-flax.

Slender, herbaceous, peremial root-parasites. Leaves alternate, narrow, decnrrent 1-3-nerved. Flowers minute, green, solitary and axillary or in 2 -chotomous cymes, 2 -sexual. Culyx-tube short or long, limb, 5 - rarely 4 lobed, persistent ; lobes with a tuft of hairs on the face. Ovary inferior; style short, stigma capitate; ovules 3. Fruit ribbed.-Distrib. Temp. Europe, Asia, N. and S. Africa, S. America ; sprecies about 60.-Еtym. Obscure.

1. T. linophyl'fum, L.; stems diffuse, leaves 1 -nerved, pedicels scabrid. T. humifiusum, DC.; T. dicaricutum, var. anglicum, A.DC.

Dry chalky pattures, from Norfolk and Gloucestershire southwards ; f. May-July:-Routstock woody, yellow ; roots fibrous, attacherd to those of various plants. Stems many, 6-18 in., leafy, prostrate. Lewess $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$., linearlanceolate, acute or obtuse. Florers of in. diam., racemed or fascicled, pedncelled, white inside. Culyp fumnel-shaped, lohes incurved in fruit, toothed. Frwit $\frac{1}{\frac{1}{8}}$ in., green, ovid, contracted into the short stout pedicel.
-Disthib. Europe from Belgium soathwards, N. Africa, W. Asia.

## Order LXVII. ARISTOLO'CHIERE.

Herbs or shrubs, often climbing. Leaves alternate, entire or lobed, exstipulate. Flowers 2 -sexual, solitary spiked or racemed, regular or irregular. Culyx superior, tubular, campanulate or trumpet-shaped; limb 3-lobed or lipped, valvate in bud. Stamens 6 or 12, rarely 5, epigynous, filaments short or 0 ; anthers free or adnate to the style, cells 2 bursting outwards or inwards. Ovary 4-6-celled ; styles 6, inner surface stigmatic ; ovules very many, anatropous, 2 -seriate in the inner angles of the cells. Fruit a 4-6-valved septicidal capsule, or a berry. Seeds horizontal flattened or boat-shaped, raphe thickened, albumen copious fleshy or horny; embryo minute basilar, cotyledons short, radicle usually next the hilum.Distrib. Chiefly trop.; genera 5 ; species 180.-Affinities. With Nepenthacere and Rafjlesiacere.-Properties. Bitter, acrid, sometimes aromatic.

Calyx campanulate, regularly 3 -cleft. Stamens 12 ...................1. Asarum.
Calyx tubular, mouth oblique. Stamens 6.......................1*. Aristolochia.

## 1. as'arum, Tournef. Asarabacea.

Perennial herbs. Rootstock stout, branched, woody. Leaves radical. Flower solitary, peduncled, terminal, lurid purple. Calyz campanulate, regular, persistent, 3 -lobed. Stamens 12, epigynous ; anthers 2 -celled, hursting outwards; connective produced. Ovary inferior or $\frac{1}{2}$-inferior, 6 -celled; styles 6, tubular, grooved or 2 -fid. Capsule coriaceous, bursting irregularly. Seeds hoat-shaped, wrinkled on the convex face, with a median winged or fleshy raphe on the other.-Distrib. Europe, N. Asia, Himalaya, N. America ; species 10.-Etym. doubtful.

1. A. europæ'um, $L$.; pubescent, leaves evergreen reniform.

Copses in Wilts, Yorkshire, Westmoreland, \&e.; a denizen, Watson ; fl. May.-Rootstock creeping, fleshy ; branches and stems short, sending up annually a pair of leaves and 2 large scales. Leares 2-3 in. diam., dark green, petiole 3-5 in. Scapes from between the leaves, very short, woolly. Calyx $\frac{1}{2}$ in., greenish-purple outside. Filuments subulate, alternate longer; connective with a long subulate tip. Styles recurved, their stigmatic tips projecting between the anthers. Fruit globose.-Distrib. Burope from Belgium southwards, W. Siberia. - Root cathartic, emetic, and sternutatory.

## 1*. ARISTOLO'CHIA, Tournef. Birthwort.

Shrubs or perennial herbs, often twining. Leaves cauline ; petioles with dilated bases, having in their axils solitary or racemose flowers and often the stipule-like leaf of an undeveloped bud. Calyx coloured, tuhe inflated at the base, then contracted, hairy inside; limb dilated, ohliquely 1-2-lipped. Anthers 6, rarely 5 or more, adnate in a whorl to the very stnut short 6 -lobed style. Capsule septicidally 6 -valved. -Distrib. Chiefly trop.; species 160.-Etym. The old Greek name.
A. Clemati'tis, L.; glabrous, flowers clustered, lip narrow acute.

Ruins, \&c., from York southwards, rare and not indigenous ; fl. June-Sept.
Rootstock creeping, woorly. Stems many, erect, simple, angled. Leaves
$3-6 \mathrm{in}$. diam., broadly cordate, obtuse, apiculate, reticulate, glaucous
beneath; auricles rounded, incurved, almost enclosing the deep sinus.
Flowers 4-8 in a cluster ; pedicels very short. Ovary fusiform. C'alyx I in.,
yellow ; tube slender, globose at the base, curved ; lip $\frac{1}{2}$ in., oblong or ovate ; throat dilated. C'apsule $\frac{3}{4}-1 \mathrm{in}$., pyriform, obtuse ; peduncle decurved. Neels suborbicular, much compressed, granulate, deeply exeavated on the ventral face.-Distrib. Europe from Denmark southwards, W. Asia.

## Order LXVIII. EUPHORBIA'CERE.

Herbs, shrubs, or trees, juice often milky. Leaves usually alternate, simple, often stipulate. Flowers small or minute, usually 1 -sexual, bracteate or involucrate. Calyx 0, or sepals 2 or more. Pectels 0 (in lisitish genera). Male. Stumens 1 or more ; anthers didymous. Gewry rudimentary or 0.-Female. Ovary 2 -3-lobed, 2-3-celled; styles 2-3, stigmas entire or lobed. Ovules 1-2, collateral, pendulons from the top of each cell, funicle dilated over the micropyle. Coapsule 2 -3-lobeed and -celled, cells 1-2 seeded. Seeds pendulous, testa ustally crustaceots, fumicle often swollen at the tor (seels carmenatate), allumen copions tleshy ; embryo axile, radicle superior.-Distribs. All climates execpit Arctic ; genera 180; species about 3,000.-Affinities. Close with Multence and Lrtiecoe.-P'roperties. Usually aerid, but too mumerots to spreeity.The above diagnusis includes the British genera of this vast Order, to ennmerate all the characters of which would exceed the limits of this Floma.
SUb-order I. Euphor'bieæ. Ovules $1-2$ in each cell ; raphe ventral. Cup. sule septicidal ; valves elastically breaking away from the seed-bearing axis.
Tribe I. EUPHOR'BI 居. Herbs or shrubs ; juice milky. Stomens many, collected into a calyx-like involucre (perianth of some). P'istil soltary, pedicelled, 3 -lobed, 3 -celled........................................1. Euphortha.
Tribe 1I. ACAL'YPHEes. Herhs or shrubs, juice not milky. Flume, not in calyx-like involucres; male with 3 valvate seprals; fema'e a 2-3-celled ovary ....................................................2. Mereuratis.
Sub-order II. Buxe'æ. Ocules 2 in each cell; raphe dorsal. Ciepsule loculicidal.
3. Buxus.

## 1. EUPHOR'BIA, $L$. Spurge.

Herbs (the British species). Inflorescence of many male and one female flower in a 4-5-lohed involucre (perianth of some); lobes with thick glands at the simuses. -Mane fl. a pedicelled stamen ; anther didymous.-Fiamai.e ft. Uvary on a lengthening pedicel, inclined or pendulous; stigmas 2 -lid. Ciapsule 8 -lobed, 3 -valved, valves with a coriaceous exocarp separable from a hard 2 -valved endocarp.-Disfub. of the Order; speecies 700.Etym. The old Greek name.
Section 1. Lernes exstipulate. Branches (or stem, if simple) terminated by umbels of forked branchlets (rays) subtended by a whorl of leaves ; rays 2 -lvacteate at the forks.

* Leaves alternate. limbels 5. raruly 3-4-rayed. Glands of involucre transversely oblong reniform or orbicular, not cuspidate.

1. E. Helioscópia, L. ; aunual, glabrous, rarely pilose, leaves obovate serrate above the middle, upper bracts broadly ovate-cordate, capsule smooth, seeds deeply pitted. Sun Spurge.

Fields and waste places, ascending to $1,000 \mathrm{ft}$. in the Highlands ; fl. June-Oct. -Subglaucous. Stem 6-18 in., simple or 3-fid below. Leaves 1-2 in., narrowly obovate, sometimes cuneate, subpetioled, rounded at the top, membranous; lower smaller. Involucral glands orbicular, yellow. C'apsule $\frac{1}{6}$ in., Seeds brown.-Distrib. Europe, N. Africa, N. Asia, W. Asia to India, introd. in N. America.
2. E. platyphyl'los, $L$.; annual, glabrous or pilose, leaves linearoblong or obovate-lanceolate acute serrulate above the middle, bracts cordate, capsule warted, seeds smooth.
Fields and waste places, rare, from Yorkshire southwards ; f. July-Oct.--Stem $\frac{1}{2}-3 \mathrm{ft}$., usually simple, stout, erect ; branches numerous, alteruate, slender, ascending. Leaves $\frac{1}{2}-1 \frac{1}{2}$ in., sessile, spreading or reflexed. Bructs short, broad, apiculate. Involucral glands suborbicular.--Distrib. Europe from Belgium southwards, N. Africa, W. Asia; introd. in N. America.
Sub-sil. Platyphyl'los proper; bracts $\frac{1}{3} \frac{-3}{4} \mathrm{in}$., capsule $\frac{1}{6} \mathrm{in}$. long, warts hemispherical, seeds olive-brown.
Sub-sp. stric'ta, L. (sp.); bracts $\frac{1}{4}-\frac{1}{3}$ in., capsule $\frac{1}{2}$ in., warts eonical, seeds oblong smaller red-brown.--Woods on limestone in Gloster and Monmouth.
3. E. hiber'na, L.; perennial, pubescent, leaves elliptic- or lanceolateoblong quite entire, upper cordate, bracts ovate-cordate, capsule furrowed and warted, seeds smooth.
Copses and hedges, Linton in N. Devon ; S.W. of Ireland, rare ; fl. May-June.-Rootstock stout. Ntems 1-2 ft., several, subsimple, leafy. Leaves 2-4 in., $1-1 \frac{1}{2}$ in. broad, sessile, obtuse or notched at the tip, thin. Bructs broad, upper rounded at the base. Involucral glands renitorm. Capsele $\frac{1}{1}$ in., subglobose, valves not keeled, warts cylindric. Seeds broad, pale brown.-Distrib. France, Switzerland, Italy.-Used in Ireland to poison fish.
4. E. pilo'sa, $L$.; perennial, pubescent or pilose, leaves linear-oblong obtuse serrulate, uper not cordate, bracts broadly ovate glabreus, capsule glandular, seeds smooth. E. palustris, Forst. not L.
Copses and hedges ; Prior's Bank, Bath; Westmeston, Sussex ; fl. May-June.
-Routstock stout. Stems 1-3 ft., stout, leafy, much branched above. Leuves 2-5 in., obtuse, narrowed at the base, lower obscurely petioled, upper sessile. Bracts short, often orbicular. Incolucre large; glands large, oblong, purple. C'upsule $\frac{1}{5} \mathrm{in}$., glands prominent, with pencils of hairs. Needs broad, brown. -Distrib. Europe from S. France and Germany southwards, W. Siberia.-Boissier refers this, the "English Botany" plant (t. 2i87), to E. pulustris, L., which he places amongst "species annuæ," yet describes the rootstock as thick; he further describes the warts of the capsule as oblong-cylindric, which is not the case in the figure, nor in British specimens which best agree with Linnæus' description of pilosa.
E. coralloi'des, L. ; perennial, villous, leaves linear-oblong obtuse serrulate, upper not cordate, bracts ovate or ovate-lanceolate pubescent, capsule quite smonth villous eglandular, seeds smooth.
Hedges, Slinfold Parsonage, Sussex ; naturalized ; fl. May-June.-According to Syme, best distinguished from E. pilosa, to which it is extremely near, by the smaller rootstock ; reddish less branched stem ; more regular and open umbel; softer pubescence; pubescent upper bracts, and quite smooth capsule. -Distrib. N. Sicily and Naples.
** Leaves alternate. Umbels 3-or many-rayed. Glands of incolucre reniform or lunate with cuspidate tips.

+ Bracts connate at the base.

5. 2. amygdaloi'des, $L$.; perennial, hairy, leaves obovate-lanceolate quite entire, capsules glabrous minutely dotted, seeds smooth grey.
Woods, copses, \&c. from Northumberland and Yorkshire southwards, local ; Bandon in Ireland ; fl. March-May.-Rootstork woody. Stems 6-12 in., erect, very stout, leafy, barren the first year, elongating the following to 2 ft ., then throwing out slender branches. Leaves 2-3 in., obtuse or acute, lower petioled, upper sessile often oblong. Rays 5-10; bracts connate into an orhicular limb $\frac{3}{4}-1 \mathrm{in}$. diam., yellow. Incolucres broad, pedicels slender, cusps of glands converging. C'upsule with rounded valves. Seed subglobose, acute.-Distrib. Europe from Holland southwards, W. Siberia, W. Asia.

+ Bracts free at the base. All glabrous.

6. E. Pep'lus, $L$.; annual, leaves orbicular-obovate quite entire, bracts ovate, capsules small, valves keeled, seeds pitted whitish.
Gardens, fields, and waste places, ascending to $1,000 \mathrm{ft}$. in the Highlands ; a native or colonist, Watson ; H. July-Nov.-Stems 6-10 in., simple or 3-chotomous at the lase. Lewves $\frac{1}{2}-\frac{3}{4}$ in., sessile or with short slender petioles, thin. Recys 3, repeatedly forked. Invelueres small; cusps of glands slender, curved. Capsule-calces with 2 keels on the back. Seeds 3 -honous, deeply pitted and keeled on the back, with 2 facial furrows.-Distrib. Europe, N. Africa, Siberia, W. Asia to N.W. India ; introd. in N. America.
7. E. exig'ua, L.; annual, leaves linear-lanceolate quite entire obtuse or acute, bracts corlate at the base, capsules rough on the back of the valves, seeds pale deeply pitted.
Fields, \&c. from Banff and Forfar southwards, local in Ireland ; a colonist, Wutson; fl. July-Oct.-Very variable. Stems usually excessively branched from the base ; branches 6-15 in., erect and strict, or prostrate curved and ascending. Leuves -1 in ., very variable, broadest above or below the middle, sometimes trincate and apiculate. Ruy/s $3-5$, often forked; bracts often toothed at the base. Involucres small, subsessile; tips of glands obtuse. Cupsuley small. Seeds obtusely 3-gonous, keeled, grey.-Distrib. Europe, N. Africa, W. Siberia, W. Asia to N. W. India.
8. E. portland ica, $L$. ; perennial, leaves coriaceons obovate or oblongobovate quite entire, hracts deltoid- or reniform-cordate, capsules slightly rough on the back of the valves, seeds opaque brown pitted.
Sea-shores, from Wigton to the I. of Wight, rare ; N. S. and E. of Ireland ;
f. May-Aug.-Rontstork cylindric, woolly, tortuous. Stems 6-18 in., very many, tufted, erect or ascending, naked and scarred below, branched, leafy above. Lewees $\frac{1}{3}-\frac{2}{2}$ in., spreading, acute or apiculate. Rays $3-5$; bracts $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. diam., broader than long, often keeled and cuspidate. Capsule-valers faintly keeled, granulate. Seed with shallow pits, cuticle brown, caruncle large.--Disthib. Coasts of France and Spain.
9. E. Para'lias, $L$. ; perennial, leaves imbricate coriacenus quite entire, lower linear-obovate or -oblong, upper ovate, bracts broadly cordate, capsules leathery wrinkled, seeds minutely dotted whitish.
Sandy shores, from Cumberland and Suffolk southwards ; rare and local in

Ireland ; f. July-Oct.-Bushy, glaucous, often reddish. Rootstock woody. stems 6-18 in., many, stout, erect or ascending, naked and tubercled below. Leaves $\frac{1}{2}-1$ in., very thick, sessile, obtuse, concave above, nerveless, margins incurved when dry. Rays 5-8, short and stout, ferked once or twice; bracts variable, $\frac{1-3}{4-\frac{3}{4}} \mathrm{in}$. diam., sometimes broader than long. Incolucres sessile or pericelled, cusps of glands short. Capsules deeply lobed, valves very rugose, with a dorsal furrow. Seed ovoid, caruncle minute.-Distrib. Europe from Belgium southwards, exel. Greece and Turkey.
E. E'scla, L.; perennial, leaves linear or oblong-laneeolate, bracts broadly cordate mucronate, capsule granulate, seeds smooth ovoid brown.
Woods and fields, introduced near Forfar, Edinburgh, and Alnwick; fl. July.
-Rootstock creeping. Stem 1-2 ft., erect, slender, naked below, simple or with leafy flowerless lateral branches. Leaves $1-1 \frac{1}{2}$ in., sessile, spreadiny, acute or obtuse, sometimes denticulate, thin, 1-nerved. Rays 10-20, long, slender, forked only at the tips ; bracts $\frac{1}{2}-\frac{3}{4} \mathrm{in}$. diam., reniform-cordate, acute or obtuse. Involucres small, long-pedicelled ; glands with short straight cusps. Capsule small, valves rugose and with a dorsal furrow. Needs quite smooth, caruncle small.-Distrib. Europe, Persia, Mid. and N. Asia ; introd. in N. America.
E. Cyparis'sias, L.; perennial, leaves narrow-linear quite entire, bracts cordate obtuse, capsule granulate, seeds smooth globose pale.
Woods and plantations, introduced from Cumberland southwards ; fl. June-July.-Habit of E. Esula, but rather glaucous; rootstock creeping and stoloniferous ; more leafy ; leaves narrower ; bracts smaller, and seeds almost white.-Distrib. Europe, excl. Turkey ; introd. in N. Ameriea.
*** Leaves opposite. Umbels 3-4-rayed. Glands of inrolucre lunate, cuspidate. E. Lath'yris, $L$. ; biennial, leaves decussate linear-oblong broader at the base obtuse, bracts cordate at the base, capsule smooth, seeds ridged and wrinkled dusky brown.
Conses and woods, naturalized in England and Scotland ; an alien, Watson ; fl. June-July.-Glabrous, glaucous. Stem stout, erect, short, leafy the first year, during the next elongating to $3-4 \mathrm{ft}$., and flowering. Leaves $2-8 \mathrm{in}$., sessile, spreading, 1-nerved, tips rounded, apiculate. Rays stout, unequal, irregularly forked; bracts $1-3 \mathrm{in}$., ovate-lanceolate, acute. Incolucres large, sessile, cusps of glands suberect. C'apsule $\frac{1}{3} \mathrm{in}$. diam. Seed $\frac{1}{6} \mathrm{in}$., broadly oblong, obliquely truncate, caruncle large.-Distrib. Europe S. of the Alps; introd. in N. America.
Section 2. Stems prostrate, dichotomously branched. Leaves opposite, stipulate. Involucres axillary or in the forks, solitary.
10. E. Pep'lis, $L$.; annual, glabrous, leaves dimidiate-cordate subentire. Sandy shores, I. of Wight west to Cardigan, very rare and uncertain in appearance ; Waterford in Ireland ; Channel Is.; fl. July-Sept.-Proeumbent, glaucous, purplish. Stems many, 6-12 in., spreading from the root. Leaces $\frac{1}{2}$ in., coriaceous, shortly petioled, obtuse or retuse, base on one side produced outwards and downwards into a rounded auricle, on the other obliquely eut off ; stipules ovate, 2 -fid. Involucres shortly pedicelled, glands oblong. Capsule $\frac{1}{5}$ in., valves smooth, keeled, glabrous. Seeds white, not caruncled.-Distrib. Shores of Atlantic and Mediterranean from France southwards ; salt tracts of W. Siberia, W. Asia.

## 2. Mercuria'lis, Toumef. Dog's Mmectry.

Erect herbs. Leares opposite, petioled, serrate, stipulate. Flomerrs mon- di-cecions, minute ; males in interrupted axillary spikes ; females chnsterel, spiked or racemose. Sepals 3, valvate. Disk in the female of 2 elongate glands, alternating with the carpels. Stamens $8-20$, on a central disk, filaments slender erect; anther-cells pendulous from a sulglobose conneetive, bursting outwards. Ovary 2 -celled, styles long, simple, subulate; ovule solitary, pendulous. Capsule didymous, outer coat separating from the cartilaginous 2 -valved imer. Sheds pitted or wrinkled, funicle thickened; cotyledons broat.-Distrib. Europe, N. Africa, temp. Asia to Japan ; species 6.-Etys. unknown.

1. M. peren'nis, L.; perennial, pilose, diœcious, stem simple.

Who ls and shady places, ascending to $1,700 \mathrm{ft}$. in the Highlands ; f. March-April.-Rowdstock slender, ereeping. Stem 6-18 in., solitary, erect, terininal. Leutrs larger upwards, upper 2-3 in., shortly petioled, ovate or elliptic-lanceolate, crenate-serrate, green, often blue when dry; stipules minute. Mule sprikes very slender, long-peduneled, flowers perlicelled. Nepuls acute. Female spikes or racemes shorter, 1-3-Howered ; styles long, recurved, stigmatic all over the front. C'apsule $\frac{1}{3} \mathrm{in}$. diam., hispid. Needs gray, cuticle white.-DISTRIB. Europe, N. Africa.-M. ovata, Sternb. and Hoppe, with broader subsessile leaves, is hardly a variety.

## 2. M. an'nua, $L$. ; annual, nearly glabrous, stem branched.

Fields, gardens, \&c. from Fife and Perth southwards; rare in Ireland; a colonist? Wutson; fl. July-Oct.-Diœecious or monœecious (M. amligua, L. fil.). Ntem 6-18 in. Leaves membranous, shortly petioled, ovate or lanceolate, narrowest in the female, acute, rounded or cordate at the base. shining, crenate-serrate, ciliate. Male flozer clustered in peduncled axillary spikes; female in axillary clusters with sometimes males intermixed ; styles diverging, stigmatic on the sides in front. Ciapsule small, tubercled, hispid. Neals brown, reticulate.-Distrib. Europe, N. Afriea, W. Asia.-Leaves boiled and eaten as a pot-herb.

## 3. BUX'US, Tournef. Box.

Evergreen shrubs. Leaves alternate, exstipulate. Flowers moncecious, in axillary fascicles or spikes, green, 4 -bracteolate, uppermost female. -Male. Sepals 4, 2 outer imbricate in bud. Stamens 4, hypogynous, oprosite the sepals, filaments stout fleshy ; anthers 2 -celled, bursting inwards. Ovary rudimentary. - Female. Sepals 4-12, often imbricate in threes. Orary free, 3-celled, top 3-lohed between the styles; styles 3, excentric, spreading, persistent, grooved and stigmatic on the inner face; ovules suspendenl in pairs in each cell, anatropous, raphe dorsal. Capsule coriaceous, 3 -celled, loculicidally 3 -valved; cells 1 - 2 -seeded. Seeds pendulous, testa crustaceous shining thickened at the base, albumen fleshy; embryo axile, curved, radicle superior.-Distrib. Europe, Africa, Madagascar, Asia, W. Indies: species 17.-ETYM. $\pi 0^{\prime} \xi$ os of the Greeks.

1. B. sempervi'rens, $L$.; leaves oblong, flowers sessile.

Chalk hills of Kent, Surrey, Bucks, and Gloncester ; indigenous in Surrey ; a denizen, Wetson; A. April-May. -A shrub or small tree, 8-12 ft.; branches erect or drouping, young pubescent, wood close-grained. Leaves $\frac{1}{2}-1 \mathrm{in}$.,
obtuse or retuse. Spikes small ; bracts and sepals obtuse ; flowers whitish, very crowded. Stamens much exserted ; anthers didymous. Ovary globose. Cupsule $\frac{1}{2}$ in., ovoid, 3 -horned, wrinkled. Seeds black.-Distrib. Europe from Belgium southwards, N. Africa, N. Asia to Japan, W. Asia to W. Himalaya. --bitter and poisonous; wood used for engraving upon.

## Order LXIX. CERATOPHYLILERE.

A submerged, branched, slender, fragile herb; stems cylindric. Leaves whorled, sessile, exstipulate, 2 -chotomously cut into linear-toothed lobes. F'lowers solitary, axiliary, minute, monœcious, enclosed in a 8-12-partite persistent involucre with subulate lobes. Perienth 0.-Male. Anthers many, crowded, sessile, oblong, cells linear, sunk in a fleshy 2 -cuspidate comnective, bursting irregularly. - Female. Ovary oblong, 1-celled; style terminal, subulate, persistent, stigma unilateral papillose; ovule 1 , pendulous from the top of the cell, orthotropous. Fruit coriaceous, indehiscent, tubercled winged or spurrel at the base. Seed pendulous, testa membranous, hilum thickened, albumen 0 ; cotyledons 2 -fid ovoid thick, phumule large many-leaved, radicle very short.--Disthib. Europe, Asia, Africa, N. America (Aretic).-Affinities altogether doubtful. - l'roperties unknown.-Etym. кépas and фúл入ov, from the horn-like leaf-lobes.

## 1. Ceratophyl'lumi, $L$. Hornwort.

1. C. demer'sum, L.; leaves remotely serrate.

Ponds and ditches, from Forfarshire southwards, and in Ireland ; fl. July-Sept.-Stems $8 \mathrm{in} .-3 \mathrm{ft}$., densely leafy. Leaves 1 in. , segments spreading, subulate, dark green. F'lowers found in shallow water only, very inconspicuous. Fruit $\frac{1}{4} \mathrm{in}$., tipped with the slender curved style, very variable.
Sub-sp. Demer'sum proper; fruit smooth, spurs 2 subulate. C. apiculatum, Cham.
Sub-sp. submer'sum, L. (sp.) ; fruit not spurred, covered when mature with cylindric projections.-S.E. of England, rare.

## Order LXX. urticere.

Herbs, shrubs, or trees ; juice watery. Leaves opposite or alternate, stipulate or not. Flowers 1 -sexual, small, green.-Male. Calyx 4-5partite, concave. Stumens 4-5, opposite the sepals, filaments transversely furrowed, inflexed in bud, springing up elastically; anthers fixed at the baek, bursting inwards. Uvary rudimentary.-Female. Calyx tubular or 3-5-cleft. Staminodes 3-5 or 0 . Ovary sessile, ovoid, 1-celled; style simple or 0 , terminal or lateral, stigma lateral or terminal glandular or penicillate ; ovule basal, erect, orthotropous. Fruit minute, dry or fleshy, indehiscent, free or adhering to the calyx. Seed erect, testa thin, albumen tleshy usually scanty; embryo axile, straight, cotyledons plano-convex, radicle superior.-Distrib. All climates; genera 43 ; species 500.Affinities. With Ulmacea, Cannabineos, Malvaceu, and Euphorbiacea.Properties. The inner bark affords valuable fibre.
Leaves opposite, with stinging hairs.......................................1. Urtica.
Leaves alsernate, with simple hairs.....................................2. Parietaria.

## 1. URti'ca, Tournef. Nettle.

Herbs, rarely shrubby, with stinging hairs and tenacious inner hark. Leaves opposite; stipules lateral. Flowers mon- di-eceious in bracteate clusters, ebracteolate. -Male. Pedicel jointed. Calyx 4-partite, persistent; lobes concave, imbricate in bud. stamens 4; anthers reniform. -Female. Calyx 4 -partite, segments unequal, flat. Stigma subsessile, penicillate. Fruit compressed.-Distrib. Temp. and trop. regions; species 37.-Etym. uro, from the burning pain of its stings.

1. U. u'rens, L.; annual, glabrous except for the stinging hairs, leaves ovate-oblong coarsely serrate, panicles 2 -sexual.
Fields and waste places ; ascending to $1,600 \mathrm{ft}$. in Northumberland ; fl. Jume-
Supt.-Stem 1-2 ft., erect, branched. Leares 1-2 in., petioled ; teeth few.
terminal oblong ; stipules 2 on each side. Spikes $\frac{1}{4}-1 \mathrm{in}$., in pairs. F/werens
few in a cluster; pedicels long or short. - Distirib. Euroje (Arctic), N.
Africa, Siberia, W. Asia to the Himalaya; introd. in N. America.
2. U. dioi'ca, L.: perennial, pubescent, leaves ovate-cordate or lanceolate deeply serrate, panicles usually 1 -sexual.
Hedgebanks, \&c., ascending to $2,500 \mathrm{ft}$. in the Highlands; fl. June-Sept. -Rootstock creeping, stoloniferous. Stem 2-4 ft., simple or branched. Leaves 2-4 in., petioles long or short, nerves impressed ; stipules 2 on each side, linear-oblong. Panirles 1-3 in., in pairs, males lax-females denseflowered, recurved. - Distrib. N. temp. regions (Aretic), S. Africa, Andes, Australia.-The young leaves are a good pot-herb, and yield a green dye.
3. U. pilulif'era, L.; annual, glabrous except for the stinging hairs, leaves ovate or cordate entire or toothed, female flowers capitate.
Waste places in England, chiefly near the sea, hut rarely establisherl; an alien, Wutson; fl. June-Aug.-Stem 1-2 ft., simple or branched. Lences 1-3 in., long-petioled; stipules two on each side, ovate. Male spikites, panicled, peduncles very slender elongate. Female heculs $\frac{1}{3} \mathrm{im}$. diam.; peduncles $\frac{1}{2}$ in., stout ; calyx very large. Floners of hoth sexes much larger than in the precerling species.-Distrib. Europe, N. Africa, W. Asia; introd. in N. America.-The most virulent British nettle.
Var. 1, pilulif'era proper; leaves deeply serrate.-Var. 2, Dodar'tii, L. (sp.) ; leaves entire or nearly so.

## 2. PARIETA'riA, Tournef. Pellitory.

Herbs, rarely shrubs. Leaves alternate, quite entire, exstipulate. Flover's clustered or cymose, polygamous, 1-3-bracteate. Calyx of male 4 -partite, valvate in hud; of female tubular 4 -fid. Stamens 4. Style long or short, stigna papillose. Fruit included in the enlarged calyx. -Drstrib. Temp, and trop. regions species 8.-Etym. paries, from growing on walls.

1. P. officina'lis, L.; leaves triple-nerved. P. diffiuse, Koch.

Old walls and hedgebanks, \&e., from Forfar southwards ; fl. June-Oct.-Perennial, pubescent with curled hairs. Rootstock short, woody. Siem.s. 1-2 ft., tufted, erect (var. erecta, Lond. Cat. not Koch), or decumbent ( $P$. fallur., Gren. and Godr.), terete ; branches slender, leafy. Lettess $\frac{1}{2}-4 \mathrm{in}$. ., elliptic-lanceolate or ovate, obtuse or acute, petiole slender. Flowers in
axillary clusters, mostly 2 -sexual, in a 3 -6-lobed few-flowered involucre. C'ulyx elongate and tubular after flowering.-Distrib. Europe, N. Africa, W. Asia.

## Order LXXI. Cannabi'nere.

Annual or perennial, erect or twining herbs; juice watery. Leaves opprosite, or the upper alteruate, simple or compound, stipulate, often glandular. Flowers minute, diœecious.-Male racemed or panicled. Sepals 5 , free, imbricate in bud. Stamens 5, adnate to the base of the sepals ; anthers oblong, basifixed, dehiscing in front.-Female in cones or fascicled, bracteate and bracteolate. Sepal 1, membranous, bract-like. Ocary free, compressed ; styles 2, subulate, stigmatic all over; ovule 1, pendulous, campylotropous, micropyle superior. Fruit dry, indehiscent, enclosed in the sepal. Seed pendulous, testa coriaceous, inner coat thin, albumen 0 ; embryo coiled or curved, radicle superior.-Distrib. N. temp. and trop. regions ; genera 2; species 3.-Affinities. With Urticed.-Properties. Bitter, aromatic, narcotic ; fibre tenacious.

## 1. hu'mulus, $L$. Hop.

Twining, perennial. Leaves lobed; stipules connate.-Male fl. in lax panicles.- Female in pairs in the bracts of the catkin. Stamens erect; anthers dehiseing by subterminal slits. Embryo a flat spiral.-Distrib. N. temp. regions; species 2.-ЕтуM. doubtful.

1. H. Lu'pulus, $L$. ; bracts of catkins much enlarged scarious.

Hedges and copses from York southwards ; introd. in Scotland, where it ascends to $1,000 \mathrm{ft}$. in the Highlands ; rare and not indigenous in Ireland ; fl. July-Aug.-Rootstock stout, branched. Stems tall, scabrid, almost prickly, very tough; branchlets glabrate. Leaves $3-4 \mathrm{in}$. diam., cordate, petioled, uppermost ovate, the rest palmately 3 - 5 -lobed to the middle; lobes ovate, acutely toothed. Male $\boldsymbol{\pi}$. $\frac{1}{4} \mathrm{in}$. diam., in panicles 3-5 in. ; female in catkins $\frac{1}{2} \mathrm{in}$. diam., on curved peduncles $\frac{1}{2} 1 \mathrm{in}$.; stigmas purple. Fruiting cuthin $1 \frac{1}{2}$ in., broadly ovoid or subglobose, yellow ; scales orbicular, covered with resinous glands at the base, as are the bracteoles and fruit. - Distrib. Temp. Europe, Asia, N. America.-Catkins used in brewing; the young blanched foliage is a good pot-herb.

## Order LXXII. ulma'ces.

Trees or shrubs; juice watery. Leaves alteruate, simple, distichous, oblique, seabrid; stipules caducous. Flowers 2-sexual, fascieled, lateral. Calyx campanulate, 4-5- or 8-9-fid, imbricate in bud, persistent. Stamens 4-5 or 8-9, adnate to the calyx-tube; anthers fixed by the back, bursting outwards. Ovary free, $1-2$-celled ; styles 2, subulate, stigmatic on the inner face ; ovule 1 in each cell, pendulous, anatropous. Fruit dry, 1 -seeded, winged or not. Seed pendulous, testa thin, albumen 0 ; embryo straight, cotyledons large flat or folded, radicle superior.-Distrib. N. temp. zone; genera 3-4; species about 18.-Affinities. With Urticece. -Properties. Bitter, mucilaginous, astringent.

## 1. UL'mus, L. Elm.

Ovary 2-celled. Sumara winged all round. Cotyledons flat.-Distrib. Of the Order ; species about 13.-Etym. The Latin name.

1. U. monta'na, Sin.; seed in the centre of the oblong or suborbicular samara. U. campestris, L. herb.; U. stricta and glabra, Lindl. U. mujor, Sm. Scotch, Wych, or Mountain Elm.
Woods, indigenous in the N. of England and Scotland, and perhaps in
N.E. Ireland ; naturalized elsewhere ; ascends to $1,300 \mathrm{ft}$. in Yorkshire ;
fl. March-April. - A large tree, $80-120 \mathrm{ft}$., trunk attaining 50 ft . in girth;
branches long, spreading, weeping or horizontal, bark corky or not ; twigs
pubescent. Rioot sending up suckers, chiefly when cut. Leawes $3-6$ in.,
often 3 in . diam., ovate-oblong, cuspidate, doubly and trebly serrate,
unequally rounded or cordate at the base. Calyx $\frac{1}{4} \mathrm{in}$., ciliate, lobes obtuse.
Stamens 4-6; anthers purple. Samara $\frac{1}{3}-1 \frac{1}{4}$ in.. very variable in breadth
and the depth of the notch.-Distrib. Europe, Siberia.
U. campes'tris, Sm.; seed above the centre of the obovate or oblong sanara. U. suberosa, Ehr.; U.minor and glabra, Miller; U. curpinifolia, Lindl. Common Elm.
Woods and hedgerows, rarer in Scotland ; ascends to $1,000 \mathrm{ft}$. in Yorkshire : a denizen, W'atson; fl. March-May.-A very large tree, 125 ft ., trunk $410-50 \mathrm{ft}$. in girth; bark rugged. Rout sending up abundant suckers. Brancluss spreading, but not so horizontally as in $U$. montena; twigs less downy, often eorky. Leazes smaller, 2-3 in., less cuspidate, often narrow at the base. ('ulyx smaller. stamens often 4. Samera $\frac{1}{2}$ in. usually obovate. Seed not ripening in Eny-land.-Distrib. Mid. and S. Europe, N. Africa, Siberia. - An extremely variable tree. Many vars. of this and the preceding are describel, but is the absence of authentically named trees are little deserving of attention.

## Order LXXIII. SALICI'Nefe.

Trees or shrubs. Leaves alternate, simple, deciduous, stipulate. Flowers diecious, in catkins which usually precede the leaves. Periunth 1 . Disk annular urceolate or glandular.-Male. Stamens 1 or more, inserted under the disk, filaments free or connate; anthers basifixed, bursting inwards. -Female. Ovary sessile or pedicelled, 1-celled; styles 2, short, stigmas 2 eutire or 2-4-lobed ; ovules many, on 2 parietal placentas, ascenting, anatropous, raphe dorsal. Capsule 1 -celled, loculicidal; valves 2, rolling back, many-seeded. Secels minute, testa membranous, funiclshort, with a pencil of silky hairs that conceals the seed, albumen 0 ; embryo straight, cotyledons plano-convex, radicle inferior. - Distris. Aretic and N. temp. zones, rare in the tropics and S.; absent from Australia, and the Pacific; genera 2; species 180.-Affinities. Very obscure.-Properties. Bitter, astringent, febrifuge, aromatic.

Leaves broad. Catkins drooping, seales cut

1. Populus.

Leaves usually narrow. Catkins erect, scales entire. 2. Salix.

## 1. POP'ULUS, Tourncf. Poplar.

Catkins drooping; scales crenate lobed or cut. Disk oblique, cupular. Stamens 4-30, filaments free. Stigmas slender, 2-4-cleft.-Distrib. N. temp. regions; species 18.-Etym. The Latin name.

Section 1. Leu'ce. Young shocts pubescent. Fruiting cablinis dense; scales ciliate. Stamens 4-12. Stiginas with 2-4 linear lubes.

1. P. al'ba, L.; buuds not viscid, leaves of shoots more or less lobel, of branches broadly ovate-cordate sinuate-lobed white and cottony beneath.
Moist woods, river-banks, \&c. ; fl. March-April.-A large tree, $60-100 \mathrm{ft} . ;$ bark grey, smootb; wood white; branches spreading, buds cottony; suckers many, with large deltoid-ovate lobed and toothed leaves 2-4 in: diam. Leuces on the branches 1-3 in., glabrous in age ; petioles very long, slender, compressed. Catkins 2-4 in., cylindric ; female shorter. Stamens 6-10; anthers purple. Capsules $\frac{1}{4}$ in., narrow ovoid.-Distrib. Europe from Gothland southwards, N. Africa, N. Asia, W. Asia to the N.W. Himalaya.-Wood light, useful, does not burn easily.
Sub-sp. aL'ba proper; leaves of the suckers lobed, of the branches white and cottony beneath. White Poplur, Abele.-A doubtful native, cultivated as far N. as Forfar, but does not flower in Scotland?
Sub-sp. canes'cens, Sim. (sp.); leaves of the suckers angled and toothed, of the branches hoary beneath or glabrous. Grey Poplat:-Indigenous in the S.E. of England. - Wood said to be superior to that of $P$. allu proper.
2. P. trem'ula, $L$.; buds not viscid, leaves of shoots cordate acute entire, of branches suborbicular-ovate sinuate-serrate with incurved teeth glabrous or silky beneath. Aspen.
Copses, \&ce., indigenous, but more often planted ; ascends to $1,600 \mathrm{ft}$. in Yorkshire ; fl. March-April.-Erect, 40-80 ft., short-lived. Bark grey, wood white; suckers many, pubescent; branches spreading; buds pubescent. Leaves 1-4 in., versatile, old obtuse, young acute, cottony beneath; petiole very long, slender, glabrous, compressed. Cutkins 2-3 in., cylindric; scales laciniate. - Distrib. Europe (Arctic), N. Africa, N. Asia. - Wood indifferent.

Section 2. Aigeíros. Young shoots glabrous. Fruiting catkins lax ; scales subglabrous. Stamens $8-30$. Stigmas 2-fid, short, cuneate.
P. nígra, L.; buds viscid, leaves rhombic deltoid or suborbicular finely crenate-serrate at length glabrous. Black Poplar.
Moist places, river-banks, \&e. ; not indigenous ; fl. April.-Erect, 50-60 ft., of very rapid growth and short duration. Bark grey; wood soft, white; branches spreading, buds glabrous. Leaves 1-4 in., angles rounded, acuminate, young silky beneath and ciliate; petiole slender, compressed. Male catkin 2-3 in., cylindric ; female shorter, ascending, peduncle curved in fruit ; scales shortly cut. Stamens $12-20$; anthers purple. Cilysules $\frac{1}{4} \mathrm{in}$., ovoid, pedicelled, recurved.-Distrib. Europe, N. Asia. Wood light, much used for carving, charcoal, \&c.; bark for tanning.

## 2. SA'LIX, Tournef. Willow.

Trees or shrubs. Leaves quite entire or serrate ; stipules persistent or deciduous. Stamens 2 or more, filaments free or connate. Catkins erect; scales entire. Stigmas entire or 2 -fid.-Distrib. of the Orker; species 160. -Etym. The Latin name.-For the species of this troublesome genus I have followed Andersson, and for the vars., Syme.

Section 1. Catkins on short peluncles that bear fully developed leaves; scales pale, persistent or deciduous. Filaments hairy below, all free. Capsule glabrous in the British species.

* Stamens 3 or more, free. Petiole glandular at the tip. Capsule pedicelled.

1. S. trian'dra, $L$.; leaves linear- or oblong-lanceolate acuminate glan-dular-serrate glabrous paler or glaucous beneath, disk of the male flower 2-glandular, stamens 3. Almmd-loceved or French Willow.
River-banks and osier-grounds from Perth southwards, and in Ireland, often planted ; fl. April-June.-A tree, 20 ft ., bark flaking. Leaties $2-4 \mathrm{in}$.; stipules large, $\frac{b}{2}$-cordate. Cuthins $1-2 \mathrm{in}$. , appearing with the leaves, slender, female narrower ; scales nearly glabrous. Capsule small, pedicelled, glabrous ; style thick, short.-Distrib. Europe (Aretic), N. Asia.
VAR. 1, trian'dre proper; twigs terete, leaves more linear narrow glaucous beneath.-Var. 2, 11 offimannia'na, Sm. (sp.); twigs terete, leaves broader at the base green beneath.-Var. 3, cmyydulina, L. (sp.) ; twigs furrowed, leaves rounded at the broad base glaucous beneath. -S . contorta, Crowe, is another variety cultivated in Sussex.
S. lanceola'ta, Sm. distinguished from S. triandra by its shaggy seales and distinctly developed style, appears to me a good species (Buker).
This is one of the common willows cultivated for basket-work. It is not indigenous, whether it be a good species, or, as Andersson supposes, a smoothfruited hybrid between triandra and alloa, or viminalis.
2. S. pentan'dra, L.; leaves elliptic or ovate- or obovate-lanceolate acuminate glandular-serrulate viscid shining paler beneath, disk of male and female flower 2-glandular, stamens 5 (4-12). Bay-leaved Willow.
River-hanks and wet places, from Argyle and Moray southwards ; ascends to $1,300 \mathrm{ft}$. in Northumberland; rare in Ircland; fl. May-June.- A glabrous shrub, 6-8 ft., or tree, 20 ft .; bark brown. Leaves 1-4 in., fragrant, reticulate below; stipules ovate oblong or 0 . C'uthins, male 1-2 in., erect then pendulous, scales oblong; female shorter. Capsule pedicelled, glabrous; style short.-Distrib. Europe (Aretic), exel. Greece and Turkey, W. and N. Asia. - The latest-flowering willow.-S. cuspiduta, Schultz (Meyreriana, Willd.), found in Shropshire, is probably a hybrid between pentuntre and fragilis.
** Stamens 2, rarely more, free. Petiole glandular or not at the top.
3. $\mathbf{\text { S. frag'ilis, }}$ L.; leaves lanceolate long-acuminate glabrous glandularserrate pale or glaucous beneath, young pilose, stipules $\frac{1}{2}$-cordate deciduous, capsule pedicelled. C'rack Willurw, Withy.
Marshy ground, from Mid. Scotland southwards ; ascends to $1,300 \mathrm{ft}$. in Northumberland; not a native of Ireland; fl. April-May.-A large tree, $80-90 \mathrm{ft}$., trunk sometimes 20 ft . in girth; branches spreading obliquely from the trunk; twigs very fragile at the junction, smooth, polished. Lauces 3-6 in., petiole often glandular at the top. Cuthines usually spreading, appearing with the leaves, stout ; male 1-2 in., female slender, often longer; scales linear-linceolate ; disk 2-crlandular; stamens 2, rarely 3-5. Ciapsule glabrous; style short.-Distrib. Europe, Siberia, W. Asia; introu, in America.-Andersson doubts this being indigenous, except in S.W. Asia.
Var. 1, frag'ilis proper; twigs yellow-brown, leaves elliptic-lanceolate.-Var. 2, decip'iens, Hoffm. (sp.) ; twigs orange or crimson, leaves smaller.
S. Russellia'na, Sm. (Bedford Willone), a tree 50 ft , trunk 12 ft . in girth, is considered a hybrid between fragilis and alla, and referred to $S$. vividis, Fries. Mr. Baker, however, regards it as not even a var. of S. fragilis; and considers Fries' S. viridis to be different, and not a British plant.
4. S. al'ba, $L_{\text {. }}$; leaves narrowly lanceolate long-acuminate silky on both sides (except when old) glandular-serrate, stipules ovate-lanceolate deciduous, capsule subsessile. White Willow.
Marshy ground, from Sutherland southwards; a doubtful native of Ireland ; fi. May.-A large tree, 80 ft ., trunk 20 ft . in girth; bark fissured; twigs not fragile at the forks, silky. Leaves 2-4 in., glabrous when old, petiole eglandular. Catkins appearing with the leaves, slender, lax, erect, scales linear. Filaments hairy below the middle. Capsule glabrous, style very short.--Distrib. Europe, N. Africa, Siberia, W. Asia to N.W. India.Timber most useful for carpentry and fuel ; bark used for tanning.
Var. 1, al'ba proper ; twigs olive, old leaves silky on both surfaces.-VAR. 2, corru'lea, Sm. (sp.); twigs olive, old leaves glabrous, glaucous beneath.--Var. 3 , vitelli'na, L. (sp.) ; twigs yellow or reddish, old leaves glabrous above, scales of catkins longer. Golden Willow.
Section 2. Catkins on leafy or bracteate peduncles; scales persistent, discoloured at the tip (except S. reticulata). Stamens 2, filaments glabrous free. Disk 1-glandular. C'apsule tomentose or silky, rarely glabrous.

$$
\text { * Capsule with a slender pedicel; style very short or } 0 \text {. }
$$

5. s. Capre'a, $L$.; leaves elliptic or oblong-obovate or -lanceolate acute or acuminate crenate reticulate on both surfaces tomentose below, stipules $\frac{1}{4}$-reniform, catkins silky, male ovoid-oblong, female elongate at length nodding, scales pilose, tip black. Common Sallow, Goat-willow.
Copses, pastures, \&c.., by streams, from Inverness southwards; ascending to $2,000 \mathrm{ft}$. in the Highlands; fl. April-May.-A silvery tree or large shrub. Leaves 2-4 in., dark green above, cuspidate, margins narrowly recurved. Catkins short, preceding the leaves, sessile, bracteate ; male $1 \mathrm{in} .$, very stout, female lengthening to 3 in . Filaments glabrous. Capsule $\frac{1}{2} \mathrm{in}$., silky ; pedicel very slender.-Distrib. Europe, N. Asia, W. Asia to the Himalaya. -The earliest flowering British willow. The twigs with catkins gathered at Easter, are called Palm-branches. Andersson points out the impossibility of distinguishing this from S. cinerea, L.
Sub-sp. Capre'a proper; buds and twigs glabrous or puberulous, leaves usually broad glabrous and dull green above.-Var. 1, leaves undulate crenate-serrate, stipules long.-Var. 2, leaves almost entire, stipules 0 . A small bush, not uncommon in Highland gullies.
Sub-sp. CINE' REA, L. (sp.) ; buds and twigs tomentose, leaves smaller narrower from elliptic-oblong to oblanceolate undulate at the margins pubescent above, male catkins less stout opening later, anthers paler yellow, capsule smaller (filaments pilose at the base, Syme).-VAR. 1, cine'rea proper; leaves oblong-lanceolate glaucous, hairs beneath often red-brown, stipules large. -VAR. 2, aquat ica, Sm . (sp.) ; leaves more obovate glaucous, hairs beneath white, stipules large.-VAR. 3 , oleifo'lia, Sm . (sp.); leaves narrow rigid glaucous, hairs beneath red-brown, stipules small.-Andersson correctly refers the S. cine'rea of Smith in Eng. Bot. (t. 1897) to this; but also quotes that plate and name under daphnei'des, Vill., a very different plant.
6. s. auri'ta, $L$.; leaves obovate-oblong rarely oblanceolate crenate
much wrinkled pubescent and reticulate heneath, stipules reniform, catkins short dense-flowered, male ovoid, female cylindrie.
Moist copses, heaths, \&c. ; ascending to $2,000 \mathrm{ft}$. in the Highlands : fl. April-May.-A small bush, 2-4 ft., with straggling branches; probably a form of S. Caprea, being so closely allied to sub-sp. cinerea that it is chiefly distinguishable by its smaller size, reddish twigs, leaves rarely 2 in., very much wrinkled, young reddish and crisped, often petioled, large stipules, shorter catkins, $\frac{1}{2} \frac{3}{2}$ in., and narrower more tomentose capsule.-Distrib. Europe, Siberia, W. Asia.
7. S. re'pens, $L$. ; leaves small oblong- or linear-lanceolate obtuse or acute, margin recurved entire or serrulate shining and reticulate above, silky or glaucous beneath, stipules 0 or lanceolate, catkins cylindric-oblong, seales spathulate, anthers at length black. S. foetidn, Sm.
Heaths, commons, \&cc. from Argyle and Aberdeen southwards; ascending to $2,500 \mathrm{ft}$. in the Highlands; H. April-May.-A small, straggling bush; branches slender, elongate, erect or decumbent; buds silky. Leutees excessively variable, $\frac{1}{2}-1 \frac{1}{2}$ in., young always silvery silky. Catkins preceding or appearing with the leaves, erect, short, sessile, rarely on lengthening leafy peduncles $\frac{1}{2}-1$ in., bracts leafy ; scales yellow-green or purple, silky, always dark at the tip; anthers yellow till tho pollen is shed. Capsule pedicelled, glabrous or silky.-Distrib. Europe, Siberia-The following are the chief British forms.
Var. 1, repens proper; stems decumbent below, flowering branches erect or ascending, leaves appearing with the flowers elliptic-oblong quite entire silky beneath tip straight, stipules 0 , capsule glahrous.-VAr. 2, fus'ca, L. (sp.); stem suberect, branches spreading, leaves elliptic-oblong faintly serrate tip straight ; the rest as in var. 1.-VAR. 3, prostru'ta, Sm. (sp.) ; prostrate, branches many slender, leaves appearing after the flowers faintly serrate puberulous above glaucous and silky beneath, stipules minute or 0 , eapsule silky.-Var. 4, ascen'dens, Sm. (sp.) ; stem decumbent, branches ascending, leaves as in var. 3 but appearing with the flowers more silky beneath and tips recurved, stipules ovate or lanceolate or 0 , capsule silky at length glabrous. -Var. 5. parvifólia, Sm. (sp.) ; stem as in var. 3, leaves and capsules as in var. 4, stipules small ovate or $0 .-\mathrm{VAR} .6$, argen'tea, Sm. (sp.) ; stem and simple slender branches erect, leaves appearing with the flowers elliptic-ovate quite entire densely silky and silvery especially beneath, tip recurved. capsule silky. A large form, growing in sandy places.-Var. 7, rosmarinịtólia, L. (sp.) ; leaves 2-3 in., linear or linear-lanceolate faintly glandular-serrate or entire glabrous or silky beneath, stipules ovate or lanceolate, eatkins short sessile dense, scales black, capsule tomentose. Said to have been found in the last century by Sherard in bogs in Scotland.
S. amhig'uu, Ehr. (S. incuba'cea, L. ; S. re'pens, var. incuba'cea, Syme), is a hybrid between S. auritta and S. re'pens (Andersson), remarkable for the reticulate leaves with recurved margins and large stipules.-S. spathula'ta, Willd., is referred by Andersson to a hairy form of this.
** Capsule wuth a slender pedicel; style distinct.
8. S. ni'gricans, Sm.; leaves thin ovate-oblong cordate or lanceolate subacute reticulate ahove, stipules 0 or $\frac{1}{2}$-cordate, catkins sessile or on short leafy peduncles ovoid or cylindric, seales linear-oblong pilose.
Rocks and banks of streams. from Aberdeen southwards to Norfolk and Hereford; ascends to 2,300 ft. in the Highlands ; rare in Ireland ; fl. May-June.
-A procumbent shrub or tree, 10 ft . Leaves entire or serrate, black when dry. Catkins $\frac{1}{2}-1 \mathrm{in}$., appearing before or after the leaves, scales acute or obtuse ; filaments hairy at the base. Capsule narrowly conical, glabrous or tomentose ; pedicel and styles slender. -Distrib. N. and Alps of Mid. Europe. Andersson describes this as the most variable of the genus. It is perhaps a form of S. phylicifolia, which presents a parallel series of variations. Syme sums up its differences as consisting in the thinner more reticulate darker leaves, more or less glaucous beneath, blackening more when dry, and more permanently hairy; more pubescent twigs; large stipules; more glabrous capsule; shorter style and longer pedicel.
Mr. Baker's experience of the general habit of the two is:-phylicifolia, twigs bright chesnut, rarely hairy; leaves firmer brighter coloured above glaucous (very rarely not) quite glabrous beneath; stipules of the leaf-shoots smaller and more deciduous ; whole plant drying without turning black:-nigricans, twigs much shorter, dull-coloured, pubescent (like cinerea); leaves softer usually grey-pubescent and much less if at all glaucous below ; stipules of barren shoots larger, more persistent ; style and pedicel the same in both, and ovary similarly variable in silkiness; plant turning black when dried. Both, when growing with Caprea and cinerea, flower a little later (through May into June), and are mostly plants of subalpine valleys.
The erect varieties with broad leaves 1-4 in., more or less glaucous beneath, and silky capsules are :-True nigricans; cotinifolia, Sm.; and Fonsteriana, $\mathrm{Sm} .-S$. rupestris, $S \mathrm{~m}$. , is a trailing variety with small broad leaves.S. Andersoniuna, Sm.; damascena, Forbes, and petraa, G. Anders., are erect shrubs with glabrous capsules.- $S$. hirta, Sm., is a subarborescent form (male only) with silky twigs and leaves densely pubescert beneath.-S. floribunda, Forbes (tenuifolia, Sm.; bicolor, Hook.), is a doubtful plant.
9. S. phylicifo'lia, $L$.; leaves ovate-oblong or elliptic-lanceolate quite glabrous shining above glaucous beneath, stipules 0 or very small, catkins sessile bracteate, scales linear-oblong black acute. Tea-leaved Willow.
Rocks and mountain streams, from Cheshire and Lancashire northwards; ascending to $2,000 \mathrm{ft}$. in the Highlands; abundant in Yorkshire and the Breadalbane range; rare in Ireland; fl. April-May. - A very handsome large bush or small tree ( 10 ft .). When fully developed, conspicuous from its spreading shining chesnut or reddish branches, and glistening green and glaucous foliage ; it resembles $S$. nigricans so closely in the size and all characters, that the varieties of each are often undistinguishable. Andersson thus sums up their differences: Leaves of phylicifolia less unequal, thicker, blacken less in drying, and have no minute white dots ; capsule larger, with longer beaks : he adds that it is the earliest flowerer of the genus (in England $S$. Caprea flowers first) ; Syme, on the other hand, says it is amongst the latest !-DIstrib. Almost the same as S. nigricans.
The British forms described as species are, 1st, the erect with silky capsules, S. Davalliana, Sm.; Weigeliana, Willd. (Wulfeniana, Sm.); nitens, G. Anders.; Cioweana, Sm.; Dicksoniana, Sm. (myrtilloides, Sm. not L.) ; and tenuior, Borr. - 2d, erect with glabrous or nearly glabrous capsules, laxiflora, G. Anders.; propinqua, Borr.; tetrapla, Walker; Borreriana, Sm.; philly. reafolia, Borr.; tenuifolia, Borr.- $3 d$, a more or less decumbent rooting form, with silky capsules, S. radicans, Sm. (phylicifolia, Sm.).
S. laurina, Sm. (laxiflora, Borr.; bicolor, Sm.), a small handsome tree, $20-30 \mathrm{ft}$., found in various parts of England and Ireland, is, according to Andersson, prokably a hybrid between S. phylicifolia and Caprea.

## *** Capsule with a short pedicel or 0 . Style slender.

S. daphnot'des, Vill.; arboreous, buds large, leaves narrow oblong or linear-lanceolate acuminate acutely serrate shining ahove glaucous beneath, stipules $\frac{1}{2}$-cordate acute, catkins stout sessile, scales black acute very villous, capsules glabrous. S. acutifolia, Willd. Violet Willow.
Great Ayton, Yorkshire, not indigenous ; fl. April.-A small tree, $10-12 \mathrm{ft}$., twigs violet. Leaves 3-6 in., very acuminate, with persistent glaucous ;bloom. Catkins clothed with silky hairs, appearing before the leaves; scales black-pointed ; anthers yellow.-DISTRIB. S. Scandinavia across Europe and Asia to the Amur.
10. S. vixeina'lis, $L$.; leaves linear-lanceolate acuminate reticulate above silvery silky beneath, margin revolute quite entire, stipules linearlanceolate, catkins sessile, bracts small or 0, capsules tomentose. Osier.
Wet places and osier beds, from Elgin and Harris southwards; Ireland, doubtfully native ; fl. April-June.-A shrub or small tree, 30 ft .; branches long, straight, young silky, old polished, leafy. Leaves 4-10 in., narrowed into the petiole, margins waved. Catkins $\frac{3}{4}-1$ in., opening long before the leaves, golden-yellow ; scales oblong, brown; disk a slender gland. Capsule shortly pedicelled, base broad, white ; stigmas rarely 2 -fid.-DIsTRIB. Russia, N. Asia, Soongaria ; cult. throughout Europe ; introd. in N. America.
S. stipula'ris, Nim., is a supposed hybrid, probably between viminalis and Caprea or cinerea, cultivated in Essex and Suffolk; it has broader more undulating leaves, large stipules, and a shortly pedicelled capsule. - In Britain this and Smithiana shade off into viminalis, and keep quite distinct from cinerea (Baker)
S. Smithia'na, Willd. (S. mollissinea, Sm.); this Andersson regards as an undoubted and excessively variable hybrid between viminalis and Caprea; it is very common in osier-grounds of England and Ireland, and found in Scotland ; the leaves are not so silvery beneath, usually dull and hoary; eapsule long pedicelled.-S. acurainata, Sm., and S. ferruginea, G. Anders. (S. holosericea, Borr., S. rugosa, Leefe), are varieties.
11. S. lana'ta, L.; leaves broadly ovate or oblong-lanceolate acute woolly entire cottony beneath with raised reticulate veins, stipules large $\frac{1}{1}$-cordate glandular-serrate, catkins terminal sessile, scales obtuse clothed with long golden hairs, capsules glabrous.
Alpine cliffs and rocky rills, very rare ; Clova Mts., Glen Callater, and Maol Cuachlan in the Breadalhane Mts.; ascends to 2,700 ft., fl. May-June.-A small shrub, $2-3 \mathrm{ft}$., with tortuous branches and tomentose twigs; buds large, black, hirsute, Leaves 1-3 in., coriaccous, petioles very short. Catkins appearing with the leaves, crowded, stout, sometimes ashy white as in S. Lapponum, especially in age ; male l-2 in., female $2-4 \mathrm{in} . ;$ scales black, oblong. Stamens glabrous. Capsule shortly pedicelled; style very slender, stigmas filiform, notched or 2-fid.-Distrib. Arctic and Alpine Scandinavia, Aretic Asia, Altai Mts., Greenland.
12. S. Lappo'zum, L.; dwarf, leaves elliptic or obovate-lanceolate acuminate reticulate silky and villous above cottony beneath with straight raised veins, margins recurved, stipules 0 or small, catkins subsessile hracteate, scales acute clothed with long white hairs, capsules tomentose. Wet alpine rocks in Scotland ; ascending to 2,700 ft. from Edinburgh north-
wards ; fl. June-July.-Shrubby, 2-3 ft., erect or decumbent; branches stout, brown, buds woolly. Leaves 1-2 in., very variable, quite entire or sinuate-serrate, dull green above ; petioles rather long, dilated at the base. Catkins preceding the leaves; male ovoid, scales black, anthers yellow; female longer, 1-3 in. Capsule conical, subsessile; style very long, stigmas filiform, cleft.-Distrib. Mts. of France and N: Italy, Scandinavia to the Arctic circle, Siberia, N. America.-The Edinburgh specimens seen by me are flowerless; this locality is anomalous for so alpine a plant.
The following varieties differ by very slight and iffconstant characters: S. arenária, Sm. (sp. and L. in part); leaves downy above woolly beneath, style equalling the capsule. S. Stuartia'na, Sm . (sp.); leaves woolly above silky and cottony beneath, style equalling the capsule. S. glau'ca, Sm . (sp. not L.) ; leaves snow-white and woolly beneath, style much shorter than the capsule. (I should doubt this being the same species.)
13. S. Myrsini'tes, L.; dwarf, leaves small rigid ovate obovate or lanceolate shining and reticulate on both surfaces glandular-serrate, stipules 0 or lanceolate, catkins on leafy peduncles, scales spathulate blackish, capsules pilose. S. retusa, Dickson (Andersson).
Moist rocks and rivulets in Braemar, Breadalbane and Clova Mts., ascending to $2,700 \mathrm{ft}$. ; fl. June-July.-A small rigid suberect or creeping shrub, young parts clothed with silky deciduous hairs. Leaves usually $\frac{1}{2} 1 \mathrm{in}$., very variable, dark green and glossy ; petioles very short; stipules ovatelanceolate, serrate. Catkins $\frac{1}{2}-1 \mathrm{in}$., appearing with or after the leaves, on stout peduncles often as long, oblong, male ovoid ; seales pilose, disk large; anthers at length black. Capsule pilose or pubescent, distinctly pedicelled; style long, stigmas thick.-Distrib. Alps of Scandinavia (Arctic), Austria, Germany and France, Siberia, N. America.-The following British varieties are enumerated.-VAR. 1, procum'bens, Forbes (sp.), (S. lavis, Hook.); leaves broad subacute faintly serrate.--VAR. 2, arbutifo' lia, Syme; leaves narrow acute or acuminate very faintly serrate.-VAR. 3, serra'ta, Syme; leaves ovate acute serrate.
S. Graha'mi, Borr. MS. (Baker in Seem. Jour. Bot. 1867, 157, t. 66), is a plant only known from female specimens cultivated in the Edinburgh Bot. garden said to have been brought by Prof. Graham from Frouvyn in Sutherland (Baker and Syme are mistaken in supposing that any of Borrer's specimens are indigenous.) It appears to me to be a form of S. Myrsinites, with smaller catkins, paler scales, and a perfectly glabrous capsule with a rather long very silky pedicel ; and not at all allied to S. polaris or herbacea. Syme suspects it to be a hybrid between herbacea and nigricans or phylicifolia. The Engl. Bot. figures of the ovary and scale are very incorrect.
14. S. Arbus'cula, L.; leaves ovate-lanceolate or obovate acuminate serrulate shining above pale or glaucous beneath, catkins lateral on bracteate peduncles, scales obtuse hirsute, capsules sessile tomentose.
Rocks on the Mts. of Argyle, Perth, Forfar, and Aberdeen, ascending to $2,400 \mathrm{ft}$.; also in S. Scotland (Syme); unknown in Ireland; fl. June-July. -A small, rigid, decumbent, rooting shrub; twigs yellow, pubescent, then brown. Leaves $\frac{1}{2}-1 \frac{1}{2}$ in., very variable, at first silky beneath. Catkins $\frac{1}{3}-1 \mathrm{in}$., females often long-peduncled ; scales obovate or rounded, reddish, very pubescent. Capsules conical, reddish, base embraced by the scale; style long, deeply cleft, stigmas thick notched.-Distrib. Alps of Mid. and
N. Europe to the Arctic circle, Siberia, Dahuria, Soongaria, Greenland.Intermediate between S. phylicifolia and Myrsinites.
The British forms are : S. carina'la, Sm.; suberect, leaves folded and recurved. -S. prunifólia, Sm.; decumbent or ascending, leaves flat.-S. veuulo'sa, Sm.; decumbent, leaves reticulate on both surfaces. - S. vacciniifólia, Walker (livida, Sm. not Wahl) ; decumbent, leaves silky beneath.
**** Capsule sessile or subsessile. Style short or 0 .
15. 8. herba'cea; L.; very dwarf, stems buried, leaves oblong or orbicular obtuse or retuse shining reticulate serrate, catkins on 2-leaved peduncles oblong few-flowered, scales concave glabrous or pubescent.
Tops of the loftiest Welsh and N. English Mts., common on the Scotch Alps, ascending to $4,300 \mathrm{ft}$. ; local in Ireland; fl. June.-A very small straurgling shrub; stem and branches spreading horizontally under the turf, sending up short flowering few-leaved twigs; bud-scales persistent, brown. Leaves $\frac{1}{4} \frac{1}{2}$ in., shortly petioled, curled; stipules minute ovate or 0 . Catkius $\frac{1}{6}-\frac{1}{4} \mathrm{in}$., flowering after the leaves, 4-10-flowered, subterminal, shortly peduncled; scales obovate, obtuse; anthers yellow-brown or purple. Cupsule rarely pubescent, subsessile; style rather short.-Distrib. Arctic and Alpine Europe, Siberia, Dahuria, N. America.-The smallest British shrub.
16. S. reticula'ta, L. ; dwarf, depressed, stems buried, leaves orbicularoblong or obovate strongly reticulate on both surfaces green above glaucous beneath, catkins on very long leafy peduncles, style very short.
Lofty Mts, of Breadalbane, Clova, Braemar, and Sutherland; ascending to $3,200 \mathrm{ft} . ; \mathrm{fl}$. July-Aug.-Stem 1-2 ft., procumbent, short, woody ; branches tortuous, sparingly leafy. Leaves sometimes cuneate, obtuse or retuse, margin entire or waved, young pilose, older glabrous and rugose above, usually hoary beneath, stipules 0 . Catkins $\frac{1}{2}-1$ in., subterminal, flowering after the leaves, many-flowered, oblong; scales obovate, purplish or yellow, of one colour ; anthers purplish ; disk a laciniate cup. C'apsule sessile, hoary, obtuse ; stigmas notched.-Distrib. As S. herbacea, reaching the limits of Arctic vegetation.

Section 3. Syman'dree, Anderss. Catkins appearing before the leaves, on short bracteate or leafy peduncles; seales tipped with dark colour. Stamens 2, filaments more or less combined.
17. s. purpu'rea, $L$.; shrubby, leaves often opposite thin linearlanceolate serrulate glabrous, stipules $\frac{1}{2}$-ovate or 0 , catkins subsessile, seales small, capsule subsessile, style very short. Purple Osier.
River-banks and osier-beds, from Perth and Isla southwards ; doubtfully indigenous in Ireland ; fl. March-A pril.-An erect or decumbent shrub, 5 -10 ft.; twigs slender, tough ; bark red or purple. Leaves 3-6 in., sparingly hairy when young, shortly petioled, broadest about or beyond the middle, glaucous but most so beneath, black in drying. (atkins $\frac{3}{4}-1 \frac{1}{2}$ in., opposite or alternate, erect, then spreading or recurved, cylindric ; scales purple-black above, hairy or woolly; filaments hairy at the base ; anthers red, then black. Capsule broadly ovoid, obtuse ; stigmas entire or cleft.-Distrib. Europe, N. Africa, Siberia, W. Asia to India; introd. in N. America.Bark very hitter; used for basket-making, but not so commonly as $\mathbb{S}$. viminalis.-The best-marked British varieties are 1, Wooluariu'na, Borr. (sp.,) and ramulo'sa, Borr.; erect, branches yellowish, stigmas notched.

2, Lambertia'na, Sm. (sp.); erect, leaves broader above, branches purplish glaucous, stigmas subsessile short thick.
S. ru'bra, Huds., a common osier-bed shrub, often becoming a tree 10 ft . high, is a hybrid between purpurea and viminalis, with the leaves silky beneath, filaments usually more or less free, and style longer; it is a very variabie plant, and includes: 1, rubra proper; filaments connate at the base only; 2, S. Forbyana, Sm. (sp.), filaments united to the top ; 3, S. Melix, L. (sp.), leaves often subopposite filaments united to the top: (bears fascicles of diseased leaves, owing to the puncture of a Cynips, hence called Rose Willor.)
S. Donianu, Sm. (sp.), a native of dry places in Mid. and S. Germany, described by Andersson as exactly intermediate between repens and purpurea, was stated by the late G. Don to be a native of Forfarshire, no doubt erroneously; it may be known from purpurea by its yellow anthers, pedicelled capsule, and filaments more or less connate at the base only.

## Order LXXIV. CUPULIF'ERIE.

Trees or shrubs. Leaves alternate, stipulate.-Male fl. solitary or crowded, or in catkins, bracteate or not. Sepals 5 or more, unequal or 0 . Stamens 5-20, adnate to the base of the sepals or of a concave bract; filaments slender, free or connate; anthers fixed by the back, 2-celled, bursting inwards.-Female fl. sessile in an involucre formed of free or connate bracts. Calyx adnate to the ovary, about 6-toothed. Ovary inferior, more or less completely 2-3- (rarely more) celled ; styles 2-3, stigmatose above; ovules 1 or 2 collateral, erect or pendulous, anatropous. Fruit (a glans) indehiscent, coriaceous or bony, 1- rarely 2 -seeded, seated on or enclosed in the hardened or accrescent bracts (cupule). Seed large, testa thin often alherent to the pericarp, albumen 0 ; cotyledons thick, Heshy or farinaceous, often grooved or folded ; radicle short, superior.-Distrib. N. hemisphere, from N. Africa, N. India, the Malay Is. and Darien northwards, Mts. of S. Australia, New Zealand, and Chili ; genera 12 ; species about 260. Affinities. With Juglandece and Betulacee.-Properties. Yield tannin, many good woods, and esculent embryos.
Sub-order I. Quexci'neæ. Male fl. Sepals 4-10. Filaments simple; an-ther-cells connate. Female fl. 1-3 in an involucre of many bracteoles which enlarges in fruit. Ovary $3-7$-celled; ovules 2 in each cell, with 2 integuments. Fruit seated in a cupule.
Male catkins slender. Styles 3, short 1. Quercus.

Male catkins globose. Styles 3, filiform.................... ................2. Fagus.
Sub-order II. Coryle'æ. Male fl. Perianth 0. Stamens included between 2 bracteoles, filaments often 2 -fid ; anther-cells separate, hairy at the tip. Frmale fl. in pairs; bracteoles 2, enlarging in fruit. Ovary imperfectly 2-celled; ovules 2, pendulous from one placenta only, with two integuments. Fruit enclosed in the coriaceous bracts.
Female catkin minute, of few brown scales 3. Corylus.

Female catkin large, of many leafy scales.
4. Carpinus.

## 1. QUER'CUS, Tournef. OAK.

Trees; buds scaly ; hairs often stellate. Leaves evergreen or deciduous; stipules deciduous.-Male fl. in catkins, with usually a caducous bract at
the base. Calyx 6-7-lobed. Stamens indefinite ( 10 in the British sp.), filaments slender exserted.-Female fl. solitary. Culyx 3-8-lohed. Oeary 3 -celled; styles 3. Fruit more or less ovoid, terete, 1 -seeded ; cupule of imbricating scales. Seed with the remains of the septa and undeveloped ovules attached to its upper or lower part ; cotyledons included in the pericarp in germination.-Distrib. Of the Order, excl. the S. hemisphere; species about 250. -Етym. The Latin name.

1. Q. Ro'bur, L.; leaves deciduous oblong-obovate sinuate-lobed.

Woods, \&c.; once the chief forest tree of England ; ascends to $1,350 \mathrm{ft}$. in the Highlands; fl. April-May.-Trunk 60 to $100 \mathrm{ft} ., 70 \mathrm{ft}$. in girth (Cowthorpe oak,
Yorkshire) ; bark rugged ; branches tortuous. Leaves 3-6 in., sessile or shortly petioled, narrowed rounded or cordate at the base, young pubescent beneath, plaited in bud. Cutkins 1-3 in., appearing with the leaves, pendulous ; bracts linear ; flowers small in distant clusters ; sepals pilose. Acorns ${ }^{3}-1$ in., 2-3 together ; cupule with many appressed triangular olituse imbricating scales.-DIstrib. Europe, W. Asia from the Atlas, Taurus, and Syria, almost to the Aretic circle.
Var. 1, sessil'ittora, Sm. (sp.) ; leaves petioled, peduncles very short.-VAR. 2, peduniculata, Ehr. (sp.); leaves sessile, peduncles long.

## 2. FA'GUS, Tournef. Brech.

Trees. Leaves deciduous or evergreen ; stipules caducous.-Mates fl. longpeduncled. Sepals 5-7. Stamens 8-16, filaments slender, exserted; anthers oblong.-Female fl. 1-3; involucre of 4 bracts. Calyx 6 -toothed. Ovary 3-gonous, 3 -celled; styles 3, linear; ovules 2 in each cell, pendulous from the top. Fruits usually 3 together, 1-rarely 2-3-seeded, compressed 3-gonous or 2-3-winged, enclosed in a hardened or coriaceons 4 -lobed scaly involucre. Seed pendulous, crowned with the undevelopesi ovules ; cotyledons plaited, leafy after germination-Distrib. Temp. Furope, N. Asia (exel the Himalaya), N. and S. America, S. Australia, New Zealand ; species 15.-Eтym. from $\phi$ d $\gamma \omega$, from the catable seeds.

1. F. sylvat'ica, $L$.; leaves deciduous oblong-ovate obscurely toothed. Woods, especially on chalk and limestone, from Cheshire southwards ; planted in. Scotland and Ireland, and up to $1,200 \mathrm{ft}$. in Yorkshire ; fl. April-May.Truack 118 ft . (King's beech, Ashridge), and 29 ft . girth (Bieton, Devon); head 352 ft . diam. (Knowle beech) ; bark smooth, white ; branches horizontal ; huds acute. Leuves $2-3 \mathrm{in}$., shortly petioled, acuminate, silky when young; plaited parallel to the nerves in bud; stipules searious. i/cule $\%$. capitate, pendulons ; peduncle $1-2 \mathrm{in}$; anthers yellow; female on shorter peluncles. C'upule $\frac{3}{3} \mathrm{in}$., 4 -cleft, segments bristly. Fruit 8 -quetrous, smooth. -Distrib. A triangular area between Norway, Asia Minor, and Spain ; Japan. - Wood used for tools, carpentry, and fuel ; fruit yields oil.

## 3. Coryl'us, Tournef. Hazel.

Shrubs or small trees. Leuves deciduous in bud. Male sprikes slender, peudulous. Bructs cuneate, with 2 bracteoles above their inner lase. Perianth 0 . Stemens 4 with 2 -celled, or 8 with 1 -celled anthers, filaments short. Female fl. in pairs in each bract; bracteoles 2. Fruit woody, 1 -eelled, 1 -seeded, enclosed in the greatly enlarged coriaceous more or less cut bract aud bracteoles. Cotyledons included in the nut in germina-
tion.-Distrib. Temp. N. hemisphere ; species 7.-Еtym. кópus, from the cap-like form of the involucre.

1. C. Avella'na, $L$.; leaves orbicular-cordate doubly serrate cuspidate. Copses and hedges, ascending to nearly $1,900 \mathrm{ft}$. in the Highlands ; fl. Feb.March. -A glandular, hispid and pubescent shrub; rarely a tree 30 ft ., with trunk 3 ft . girth at the ground (Eastwell Park, Kent). Leares 2-4 in., distichous, unequal at the base, plaited parallel to the midrib in bud ; petiole short; stipules oblong, obtuse. Male catkins 1-2 in., 2-4 in a raceme, pendulous, bracts cuneate ; female minute, subglobose, sessile. Fruit ${ }^{2} \frac{1}{2} \frac{-3}{4}$ in., clustered, woodv; involucre palmately lobed and cut, unarmed.-DIsTRIB. Europe, N. Africa, Siberia, Dahuria.-Wood very elastic. Nuts yield aburdance of bland oil.

## 4. Carpi'nus, Tournef. Hornbeam.

Trees. Leaves deciduous.-Male. Spikes lateral ; bracts ovate, acute. Stamens 6-12 in the axil of the bract, filaments slender; anther-cells separate, tips pilose.-Female fl. Spikes terminal ; bract 2 -flowered, deciduous; flowers each in a lobed bracteole which enlarges after flowering. Fruit almost woody, nerved, 1-celled, 1-seeded, enclosed in the leafy lobed bracteole.-Distrib. N. temp. zone; species 4.-Etym. The Latin name.

1. C. Bet'ulus, $L$.; leaves elliptic-ovate doubly serrate pilose beneath, female bracts 3 -lobed 3 -nerved mid-lobe much the longest.
S. counties of Ergland, indigenous ; planted N. of them and in Ireland ; fl. May.-A small uree, but sometimes 70 ft ., with the trunk (usually flattened) 10 ft . in girth; bark smooth, light-grey ; wood close, white, heavy. Leaves 2-3 in., subdistichous, acute or acuminate, shortly petioled, plaited parallel to the nerves in bud; stipules large, linear-oblong. Mule cutkins 1-2 in., pendulous; bracts ovate-lanceolate, acute. Female 2-4 in., pendulous in fruit, cylindric ; bracts 1-1 $\frac{1}{2}$ in., entire or toothed. Fruit $\frac{1}{4}$ in., green, 7-11-nerved.-Distrib. Europe from Gothland southwards, W. Asia.-Wood the best fuel, very tough and difficult to work.

## Order LXXV. Betula'ces.

Trees or shrubs. Leaves alternate, deciduous, stipulate. Flowers small, monocious, 1-3 together in the axils of the scales of a terete or globose catkin.-Male. Scale peltate, 2 -bracteolate. Sepals 1 or more. Stamens usually one opposite each sepal, filament short simple or 2 -fid ; anthers basifixed, glabrous, cells connate or separate.-Female. Scales sessile, entire or 3-4-lobed, persistent or deciduons. Perianth 0. Ovary compressed, 2-celled, stigmas 2 filiform; ovules solitary in each cell, pendulous from the septum, anatropous. Fruit not enclosed in the bracts, small, dry, indehiscent, 1-2-celled, cells 1 -seeded. Secd pendulous, testa thin adherent to the pericarp, albumen 0 ; embryo straight, radicle superior, cotyledons flat, leafy in germination. - Distrib. N. temp. regions, S. America; genera 2; species 35.-Affinities. With Cupuliferee and Myricacea. Properties. Bark yields tannin and oil, \&c.

Scales of female catkin thin, deciduous 1. Betula.

Scales of female catkin woody, persistent. 2. Alnus.

## 1. Bet'ula, Tournef. Birch.

Trees or shrubs. - Male catkin. Scules peltate, with 2 bracts, and 3 flowers. Sepals 1-4. Stamens 2, filaments forked, separating the anther-cells.-Female. Bracts imbricate, usually 3 -lohed, $2-3$-flowered : bracteoles 0 . Fruit lenticular, winged or margined.-Distrib. N. temp. and Aretic regions ; species ahout 25.-Etym. The Latin name.

1. B. al'ba, $L$. ; a tree, leaves long-petioled deltoid rhomboid or ovate acute doubly serrate, fruit broatly winged.
Woods and copses, especially in mountain districts ; ascending to $2,500 \mathrm{ft}$. in the Highlands ; fl. April-May.-A short-lived tree, $40-50$ rarely 80 ft., trunk 8-10 in. diam.; hark flaking, silvery white ; wood whitish ; branches often weeping (B. permiula, Wahlb.). Leaers 1-3 in., sometimes pubescent, rather coriaceous, resinous or glandular when young; petiole slender; stipules broad. Mule cutkius $\frac{1}{2} 2 \mathrm{in}$., pendulous ; sepal 1 ; female solitary shorter, suberect. Scales of fruit cuneate, brown, 3 -lobed to the middile. Fruit orbicular, wing notched. - Distrib. Europe (Aretic), N. Asia, N. America (a variety).- Bark used in tauning, and yields a fragrant oil ; juice sugary in spring, and a wine is made from it ; wood durable.
Sub-sp. verruco'si, Eler. (sp.); leaves truncate at the base, lateral lobes of fruiting bracts spreading.
Sub-sp. (clutino'sa, Fries (sp.); sometimos bushy, leaves rhomboid-ovate, lateral lobes of fruiting, bracts erect.-VAR. 1, denuda'ta; leaves glabrous resinous.-Var. 2, pubes'cens, leaves and twigs pubescent.
2. B. na'na, $L$.; bushy, leaves short-petioled orbicular-crenate, fruit very narrowly winged.
Mts. of Scotland, but not general ; ascending to 2,700 ft.; fl. Mav.-Bush $1-3 \mathrm{ft}$. Leaves $\frac{1}{4} \frac{1}{2} \mathrm{in}$., glabrous, dark green. Catkins $\frac{1}{4}$ the size of those of B. alba. Bracts of fruiting catkins broadly oheuneate, with 3 rounded lobes.- Distrib. Arctic and Alpine Europe (excl. Spain, Greece, and Turkey), N. Asia, N. America.

## 2. Al'NUS, Tournef. Alder.

Trees or shrubs.-Male catrin. Scules peltate, 3 -flowered. Sepals and stumens $3-5$; anthers 2-celled.-Female broadly ovoid; seales fleshy, $2-3$-flowered, each with $2-3$ bracteoles or sepals adnate to the brant. Fruiting cathin woody ; fruit compressed, winged or not, 1 -celled, 1 -seeded. - Distrib. Europe, Asia from the Himalaya northwards, N. America, Andes, Chili ; species 14.-Etym. The Latin name.

1. A. glutino'sa, L.; leaves obovate- or orbicular-cuneate green on hoth sides, female catkins racemose.
River-hanks, marshes, \&c.; ascending to $1,600 \mathrm{ft}$. in the Highlands ; f. MarchA pril.-A hush or tree, $20-40$, very rarely 70 ft .; trunk 1-2 ft. diam.; hark black; woord white when alive, red when cut, then pale pink. Leawes $2-4$ in., shortly petioled, glutinous and hairy when young, sinuate and serrulate; stipules ovate. Cuthins appearing before the leaves; male 2-4 in., bracts orbicular, red ; female $\frac{1}{2}-1 \mathrm{in}$., terminal, racemose, obtuse ; bracts red-brown, woody. Fruit in in., pale, hardly winged.-Distrib. Europe, N. Africa, W. and N. Asia to Japan.-Wood soft, durable.

## Order LXXVI. myRICA'cests.

Shrubs or trees, often with a glandular wax-secreting pubescence ; buds scaly. Leaves alternate, simple, exstipulate (with one exception). Catkins axillary, simple or compound, 2 -sexual with male flowers below, or 1 sexual. Flowers bracteate or not. Perianth 0.-Male. Stamens 2-16, filaments free or connate ; anthers hasifixed, dehiscing outwards.-Female. Ovary sessile, 1-celled; styles 2, lateral, filiform, stigmatic all over; ovule 1, sessile, basal, orthotropous. Fruit a papillose drupe with a 1 -seeded stone, sometimes 2 -winged from being adnate to the enlarged bracteoles. Seed erect, testa thin, albumen 0 ; cotyledons fleshy planoconvex, radicle superior.-Distrib. N. temp. zone, trop. Asia, S. Africa, N. America; genus 1; species 30.-Affinitiss. Close with Juglandea.Properties. Yield wax, resin, benzoic acid, and tamin.

## 1. MYR'ICA, $L$. Sweet-gale, Bog-myrtle.

Character of the Order.-Етym. The Greek name.

1. M. Ga'le, L.; leaves narrowly cuneate-obovate or -lanceolate serrate towards the tip, stamens ebracteolate, ovary 2 -bracteolate.
Bogs and moors; ascending to $1,800 \mathrm{ft}$. in the Highlands; fl. May-July.Shrub 2-3 ft., twiggy, suberect, resinous, fragrant. Leures $2-3 \mathrm{in}$., rarely quite entire, obtuse or acute, very shortly petioled, often pubescent beneath. Cutkins flowering bafore the leaves appoar; male $\frac{1}{2}-1 \mathrm{in}$., racemose, crowded, erect ; scales broadly ovate, concave, anthers red; female $\frac{1}{4} \mathrm{in}$., styles red. Inrope minute, lenticular, adnate to the persistent bracts.- Distrib. Europe, excopt Italy Greece and Turkey, N. Asia, N. America.-Much used in cottage-practice and for tea-making.

## Order LiXXVII. CONIF'ER屋.

Trees or shrubs; wood without medullary rays or vascular tissue proper ; wood-cells studded with disks. Lcaves nsually alternate, rigid, linear or subulate, solitary, or fascicled in membranous sheaths. Flowers monœcious or diœecious, males in deciduous catkins ; females in cones ; perianth 0 .-Male of many 1-or more-celled anthers seated on the scales of the eatkin, filaments 0 or connate. - Female 1 or more sessile naked orthotropous or anatropous ovules (earpels of some) seated on an open carpellary leaf (bract of some), which is adnate to the scale of the cone. Seeds often winged, testa thin or thick, albumen densely fleshy; embryo axile, straight, cotyledons 2 or more, radicle terete often attached to a crumpled thread (suspensor).-Distrib. Especially cold regions; very rare in trop. Africa and America; genera 33 ; species about 300.--Affinities. With Cycaiere and Gnetaccos.-Propertifs. Yield terebinthine, succinie acid, pitch, tar, turpentine, valuable woods, and a few edible seeds.
'Tr:be I. Abieti'nese. Flowers monocious. Cones usually large, conical ; scales more or less woody. Pollen curved.
Cone woody, seales persistent

1. Pinus.

T'ribe [I. CUPRESSI'Nefe. Flowers mon-di-œecious. Cones usually globose or short, scales wondy or fleshy, persistent. Pollen globose.
Cone fleshy, globose ; scales connate.
2. Juniperus.

Tribe III. TAXI'NEfe. Flowers diœeious. Cones much reduced; scales small, thin or coriaceous, the upper with 1 ovule. Seed hard, with a fleshy coat, or seated in a fleshy cup. Pollen globose.
Soed solitary, seated in a fleshy cup

## 1. Pi'nus, $L$. Pine, Fir.

Trees ; branches more or less whorled. Leaves evergreen, in clusters of 2,3, or 5.-Male catkin with membranous scales. Anther 1,2 -celled.Female cone usually ripening in the second year; scales woody. Ovules 2 , inverted, alnate to the bract; cotyledons 3 or more, linear; radicle inferior.-Distrib. N. hemisphere, from Mexico and Borneo to the Aretic circle ; species about 110.-Етум. The classical name.

1. P. sylves'tris, $L$.; leaves in pairs, cones ovoid, young recurved, seeds winged. Scotch Fir.
Highlands, ascends to $2,200 \mathrm{ft}$., rare in a native state ; formerly native over many parts of Britain ; fl. May-June.-A tree, $50-100 \mathrm{ft}$., trunk attaining 12 ft . girth; wood red or white ; bark red-brown, rough. Leatees $2-3 \mathrm{in}$., acicular, acute, grooved above, convex and glaucous beneath, minutely serrulate, sheath fimbriate. Male cathius $\frac{1}{4} \mathrm{in}$., spiked, yellow ; connective produced. Female cones 1-2 in., 1-3 together, acute ; scales few, ends rhomboid with a transverse keel and deciduous point. Seed $\frac{1}{2}$ in., wing cuneate, much exceeding the nucleus.-Distrib. Plains of N. and Mts. of S. Europe, Siberia, Dahuria. - Yields tar, piteh, rosin, turpentine, and deals.

## 2. JUNIP'ERUS, $L$. Juniper.

Trees or bushes ; heart-wood red. Leaves opposite or whorled in threes, all subulate, or on the young shoots subulate, on the old scale-like and appressed. Flowers mon-di-tecious.-Male catkins globose. Anther 1, 3-6-celled. -Female cone (a galbulus) ripening the $2 d$ year, small, globose, of 4-6 decussate or whorled scales, which are fleshy in fruit, the upper and lower flowerless. Ovules 1-2, ereet. Seeds 1-8, free or connate, small, testa bony; cotyledons 2-4, oblong; radicle superior.-Distrib. Temp. and cold N. hemisphere ; species 27.-Etym. The classical name.

1. J. commu'nis, L.; leaves in threes subulate pungent jointed on the branch glaucous above, margins and midrib thickened.
Open hill-sides, ascending to $2,400 \mathrm{ft}$., and var. nana to $2,700 \mathrm{ft}$. in the Highlands ; fl. May-June.-Shrubby, $1-5 \mathrm{ft}$., rarely subarboreous ( $10-20 \mathrm{ft}$. ); trunk attaining 5 ft . in girth. Bark Haking, fihrous, red-brown. Lewes $\frac{1}{2}-1 \mathrm{in}$., crowderl, lower shorter, oblong-lanceolate, concave. Come $-\frac{1}{3} \mathrm{in}$. diam., very fleshy, blue-black, glaucous, with scarious empty scales at its bases.-Distrib. From the Atlas, Taurus, Himalaya, Japan, and Rocky Mts. to the Arctic regions.-A powerful diuretic.
VAR. 1, commu'nis proper; leaves spreading straight subulate.-VAR. 2, na'na, Willd. (sp.); leaves shorter broader imbricate incurved.

## 3. TAX'US, Tournef. Yew.

A tree or shrub; wond very tough, heart-wood red ; wood-cells with a spiral line inside. Leaves linear, 2 -farious, decurrent ; petiole very short, with a half twist. Flowers usually divecious.-Male catkin axillary,
very small, of several imbricate scarious empty scales, and one peltate $3-8$-celled anther.-Female cone of a few minute scales, and 1 terminal erect ovule seated on a fleshy disk, which enlarges into a red fleshy cup containing the seed. Seed ovoid, subcompressed, testa bony ; cotyledons 2, short, radicle superior.-Distrib. N. temp. regions from the Atlas, Taurus, Himalaya and Mexico to the Arctic circle.-Etym. $\tau \delta \xi \% \nu$, from the wood being used in making bows.

1. T. bacca'ta, L.; leaves linear more or less falcate acute.

Rocky glens, hill-sides and woods, from Aberdeen and Argyle southwards; ascending to $1,500 \mathrm{ft}$. in Northumberland ; rare in a native state ; fl. March. -Trunk 15-50 ft. in England, much loftier in India; sometimes 27 ft. in girth (Hounslow), channelled; bark thin, flaking; branches spreading. Leaves $\frac{1}{3}-1 \frac{1}{2}$ in., coriaceous, shining above, paler beneath. Male catkins $\frac{1}{4}$ in., yellow ; female minute ; seales green. Frust $\frac{1}{3}$ in. ; cup red, mucilaginous; seed olive-green, punctulate.-DISTRIB. Of the genus.-I believe the 6 supposed species of this genus to be forms of one. T. fastigia'ta, Lindl. (Irish or Florence-court yew), is a fastigiate variety.

## Class II. MONOCOTYLEDONS.

## Division I. PETALOI'DEE.

## ORDER I. HYDROCHAR'IDEFE.

Aquatic herbs. Leaves aërial floating or submerged, opposite or whorled, convolute in bud. Flowers usually diœecious, buds enclosed in one or more spathaceous bracts.-Male. Perianth of 6 segments in 2 series (rarely 0 ), 3 inner often petaloid, imbricate or valvate in bud. Stamens on the base of the segments, 3 and opposite the sepals, or more and in 2 or more series, filaments free or connate below ; anthers adnate. Ovary rudimen-tary.-Frmale. Perianth superior, 6-partite. Staminodes various, sometimes antheriferous. Ovary 1- or 3-6-celled; styles 3 or 6 , 2 -fid, free or connate below, stigmas decurrent; ovules many, ascending. Fruit usually baccate, submerged, 1-6-celled. Seeds many or few, ou pulpy projecting placentas, testa firm, albumen 0 ; embryo straight, plumule lateral, radiele next the hilum.-Distrib. All climates; genera 10 ; species about 20.-Affinities. With Alismacere.-Properties unimportant.

Leaves orbicular floating.

1. Hydrocharis.

Leaves ensiform serrate submerged 2. Stratiotes.

Leaves linear opposite or whorled, submerged 2*. Anacharis.

## 1. HYDRO'ChARIS, $L$. Frog-bit.

A floating herb. Leaves orbicular, quite entire.-Male fl. 2-3, subumbelled ; spathe peduncled, 2-leaved. Sepals 3, herbaceous. Petals 3,
white, membranous. Stamens 12, 3-6 without anthers, filaments connate below, forked, fleshy; anthers basifixed, cells separate, both on one fork. Rudimentary ovaries 3.-Female solitary, long-peduncled; spathe 1, radical. Sepals of the male. Pitals with a fleshy gland at the base. Staminodes 6, filiform, in pairs opposite the sepals. Ovary ovoid, 6-celled ; styles 6, short, connate at the base ; ovules many, inserted on the septa, orthotropous. Fruit fleshy, indehiscent. Seeds few, ovoid, immersed in mucus, testa lax papillose; embryo ovoid.-Distrib. Europe except Turkey, Siberia.- Etym. viswp, water, and $\chi$ dpts, elegance.

1. H. Morsus-Ra'næ, $L$. ; leaves orbicular-reniform, flowers white.

Ponds and ditches, from Northumberland southwards; rare and local in Ireland ; ft. July-Aug.--Stoloniferous, roots fibrous and bulbiferous. Leaves 1-1 12 in . diam., deep green above, reddish below. Flowers erect, $\frac{3}{4}-1 \mathrm{in}$. diam.; sepals small, oblong; petals broadly obovate, crumpled. Fruit I have not seen. -The cells of the testa swell in water and emit a spiral thread.

## 2. Stratio'tes, L. Water Soldier.

A stoloniferous submerged herb. Leaves all radical. Flowers subdicecions, submerged in bud, emersed when open. Inflorescence and perianth of Hydrocharis, but female flower sessile on a 2 -spathed peduncle.-Male fl. Stumens many, 12 antheriferous, the rest subulate ; anthers linear.Female. Staminodes many, a few antheriferous. Ovary compressed with a narrow neck, and fruit as in Hydrocharis; ovules anatropous.-Distrib.
 from the sword-like foliage.

1. S. aloídes, $L$.; leaves tapering spinous-serrate.

Ponds and ditches in the E. of England from York to Suffolk, and in Lancashire and Cheshire ; naturalized in E. Scotland and Ireland; fl. June-Aug. -Leares 6-18 in., spreading, hase $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. diam., rigid, brittle, deep green, many-nerved. Peduncles axillary, short, stout. Florers $1 \frac{1}{2}$ in. diam. Fruat decurved at right angles to the peduncle, flagon-shaped, 6-gonous, green ; carpels separating, full of mucus. Seeds with a mucous coat.

## 2*. AN A'CHARIS, Rich. Water-thyme.

Stem slender, submerged, elongate, branched. Leaves in whorls of 3 (rarely 4), lower opposite. Flowers subdiœecious, axillary, solitary, sessile ; spathe tubular, slender, 2 -lipped. Scpuls and petals 3 each, small, green. -Male. Stamens 3-9, filaments short or 0; anthers oblong.-Female. Tube of perianth long, slender. Staminodes 3 or 6, sometimes antheriferous. Ovary 1-celled; style slender, adnate to the perianth-tube, stigmas 3 ; ovules orthotropous, few, placentas 3 parietal. Berry oblong, 1 -celled, few-seeded.-Distmib. Temp. and trop. climates; species 2.-Etym. äva, without, and $\chi$ ápıs, elegance.
A. canaden'sis, Planch.; leaves linear- or lanceolate-oblong serrulate. A. Alsinastrum, Bab.; A. Nuttellii, Planch.; Udora, Nutt.

Ponds, ditches, and streams, abundant, introduced from America into County
Down ahout 1836, and into England about 1841, rapidly spreading ; fl. May
-Oct. Dark green, pellucid. Stem 1-4 ft., very brittle, terete, rooting at the
nodes. Leaves $\frac{1}{4} \frac{1}{2}$ in., sessile, acute, margined. Flowers resting on the surface of the water, $\frac{\pi}{5} \mathrm{in}$. diam., greenish-purple, tube of female 4-8 in., capillary. Sepals boat-shaped. Petals recurved. Stigmas long, terete, notched. Male not hitherto found in England.-Distrib. N. America.

## Order II. orchid'ere.

Terrestrial herbs, roots fascicled or tuberous (many exotics are epiphytes, with pseudo-bulbs). Leaves sheathing at the base, or scales. Flowers solitary, spiked, racemed or panicled. Perianth superior, irregular, of 6 coloured segments ; 3 outer (sepals) nearly similar; 3 inner lateral (petals) like the sepals; lower inner (lip) dissimilar, usually larger, often spurred. Stamens confluent with the style into an unsymmetrical column ; anther 1 opposite the lip (in Cypripedium 2 opposite the petals), 2 -celled, persistent or deeiduous; pollen in 2, 4, or 8 pyriform pedicelled masses (pollinia), pedicels (coudicles) terminating in a gland; glands exposed or in 1 or 2 pouches. Dvary usually long and twisted, 3-gonous, 1-celled; style often terminating in a beak (rostellum) at the base of the anther, stigma a viscid surface (of three confluent stigmas) facing the lip, beneath the rostellum, rarely 2 -lobed; ovules very many, anatropous, placentas 3 parietal. Capsule 3 -valved, valves separating from 3 septa. Seeds innumerable, very minute, fusiform, testa very lax reticulate, albumen 0 ; embryo fleshy.-Distrib. All climates and situations but maritime and aquatic; genera 400 ; species 3,000 .-Affinities. With Iridece.-Properties. A few are aromatic (Vanilla): the tubers of Orchis are nutritive, and yield starch and salep.
Tribe I. oph'rydere. Anther 1, confluent with the face of the style; cells 2 , bursting vertically ; pollen-masses 2 , free or united by their glands, of many grains united by an elastic web.

> * Lip spurred. Stigma a depressed surface.

Pollen-glands free or connate, in one pouch.

1. Orchis.

Pollen-glands free, exposed. Flowers purple 2. Gymnadenia.

Pollen-glands free, exposed. Flowers white or green.............3. Habenaria.
${ }^{* *}$ Spur very short, stigma of two oblong lobes...............................4. Neotinea. *** Spur none.

Tribe II. Arethu'sere. Anther a deciduous 2 -celled cap, crowning the column; pollen-masses 2 , free or united by their glands, of free grains, hence powdery..
8. Epipogium.

Tribl III. neot'tidere. Anther a deciduous 2-celled cap hinged to the top or back of the column ; pollen-masses 2 or 4, grains waxy or powdery united by an elastic web.
Lateral sepals and petals spreading, tips incurved.

* Upper lobe of lip concave, lower entire.

Flowers racemed drooping; ovary straight.
9. Epipactis.

Flowers spiked, suberect ; ovary twisted 10. Cephalanthera.
** Upper lobe of lip flat, lower 2-lobed.......................................11. Listera.
Lateral sepals and petals ascending.
Lip ardnate to the base of the column, not saccate................ 12 Spiranthes.
Lip free from the base of the column, saccate.....................13. Goodyera.
Tribe IV. Malax'ideeze. Anther a 2 -celled cap, hinged to the back, front, or top of the column ; pollen-masses 4, waxy.
Leafy. Lip superior. Column short....................................14. Malaxis.
Leafy. Lip inferior or superior. Column slender..................15. Liparis.
Leafless. Lip inferior..................................................16. Corallorhiza.
Tribe V. CYPRI'PEDIEAE. Anthers 2, lateral,...........17. Cypripedium.

## 1. OR'CHIS, $L$.

Tubers globose ovoid or palmate. Leaves chiefly radical, sheathing. Flowers spiked. Sepals and petals ascending, comnivent or the lateral sepals spreading. Lip spurred, decurved. Anther confluent with the column, cells diverging at the base ; pollen-glands in a common pouch ; rostelluin projecting between the ponches.-Distrib. Europe, N. Asia, W. Asia to the W. Himalaya, rare in N. America; species about 70. -Etym. The old Greek name.

Sub-gen. 1. Or'chis proper. Lobes of lip not spirally coiled. Pollenglands not connate.
-Lateral sepals spreading or reflexed.

1. O. mas'cula, L.; tubers ovoid, leaves usually spotted, spike lax, bracts 1-nerved coloured, lip 3-lobed longer than the ovary. Purple Orchis. Copses and pastures ; ascending to $1,500 \mathrm{ft}$. in the Lake district ; fl. AprilJune. -Stem 6-18 in. Leuves narrow-oblong, obtuse, spots purple-black. Bracts equalling the ovary. Flower red-purple, rarely white; sepals $\frac{1}{2}$ in., acute or obtuse; lip as broad as long, margins recurved, spotted with purple, mid-lobe longest crenate, tip notched ; spur stout, ohtuse, variable in direction.-Distrib. Europe, N. Africa, W. Siberia-Yields salep.
2. O. laxifio'ra, Lamk.; tubers globose, leaves lanceolate, spike lax, bracts $3-5$-nerved coloured, lip $2-3$-lobed, spur $\frac{1}{2}$ as long as the ovary.
Wet meadows, Jersey and Guernsey ; fl. May-June.-Stem 1-3 ft., grooved. Leates cauline and radical, acuminate, not spotted. Bructs as long as the slender ovary. F'lowers 1 in . from upper sepal to tip of lip, bright redpurple ; sepals and petals ohtuse ; lip as broad as long. sides reflexed, spotted, lateral lobes very large, crenulate, longer than the middle one, which is sometimes wanting; spur stout, obtuse, variable in direction.Distrib. Europe from Belgium to Portugal and eastwards.
3. O. latifo'lis, L.; tubers paimate, leaves usually spotted, spike dense, bracts 3 -nerved green, lip obseurely 3 -lobel, spur usually shorter than the ovary. O. palmata, Syme. Mursh Orchis.
Moist meadows, \&c. ; ascending to near $1,600 \mathrm{ft}$. in Northumherland ; fl. June-July.-Ntem 1-3 ft., usually tubular, leafy upwards. Leneves ohlong or lanceolate. Bracts mostly exceeding the thowers. Florers $\frac{z}{3} \mathrm{in}$. from upper sepal to tip of lip, dull purple ; scpals and petals obtuse or acute ; lip spotted with purple, margins recurved, mid-lobe narrowest; spur nearly straight or decurved.-Distrib. Europe, N. Africa ? N. Asia, Himalaya.

Sub-sp. latifo'lia proper; leaves oblong flat at the tip, flowers smaller darker coloured, lip spotted.
Sub-sp. incarnáta, $L$. (sp.) ; leaves lanceolate acute unspotted, tip concave, base broader.
4. O. macula'ta, $L$. ; tubers palmate, leaves spotted, spikes oblongpyramidal dense, bracts 3 -nerved green, lip deeply 3 -lobed, spur equalling the ovary or șhorter. Spotted Orchis.
Moist places, ascending to $3,000 \mathrm{ft}$. in the Highlands ; fl. May-July.-Stem 6-18 in., slender, leafy upwards. Leaves narrow, oblong-lanceolate, acute or obtuse. Bracts subulate, about equalling the ovary. Floxers $\frac{1}{2}$ in. from the upper sepal to the tip of the lip, very pale purple, spotted, rarely white ; lip as broad as long, margins recurved, mid-lobe narrower and about as long as the lateral, which are toothed ; spur straight.--DIsTRIB. Europe (Arctic), Siberia, Dahuria, W. Asia.
** Lateral sepals arching and forming a hood vith the dorsal and the petals.
5. O. Morio, $L$.; tubers glohose, spike lax, bracts 1-nerved coloured, lip 3 -lobed, spur ascending equalling the ovary. Green-winged Orchis.
Meadows, \&e. from Northumberland southwards ; E. and Mid. Ireland; fl. May-June. - Stem 6-12 in. Leaves rather small and narrow, unspotted. Bructs about equalling the ovary. Flowers $\frac{2}{3} \mathrm{in}$. from upper sepal to tip of lip, dingy purple ; sepals obtuse, veins green; lip spotted, lateral lobes broad crenate, middle about as long; spur nearly straight, obtuse. Distrib. Europe, Siberia, W. Asia.
6. O. ustula'ta, $L$.; short, tubers ovoid, spike dense, bracts 1-nerved green, sepals and petals very dark white-spotted, lip 3 -labed, spur $\frac{1}{4}$ as long as the ovary. Dark-winged or Dwarf Orehis.
Dry pastures, from Durham southwards, local ; absent from Ireland ; fl. May-June.-Ntem 3-10 in. Leares narrow-oblong, acute, unspotted. Bracts variable, scarious. Flowers $\frac{1}{3} \mathrm{in}$. from sepal to tip of lip, eventually white; sepals and petals dark-purple and green; lip with raised purple spots, lateral and segments of 2 -fid mid-lobe nearly equal ; spur decurved obtuse. -Distrib. Europe from Gothland southwards, W. Siberia.
7. O. purpu'rea, Huds.; tall stout, tubers ovoid, spike dense, bracts 1-nerved, sepals obtuse green and purple, lip 3 -lobed, lateral lobes narrow, mid-lobe obcordate crenulate, segments broad flat crenulate, spur $\frac{1}{2}$ as long as the ovary. O. militaris, Sm. ; O. fusea, Jacq.
Downs and copses in chalk soils, Kent and Surrey ; fl. May.-Stem 1-3 ft., stout. Leaves oblong, 3-5 in., obtuse. Spikes usually large, many-flowered. Flowers $\frac{3}{4} \mathrm{in}$. from tip of lip to top of upper sepal ; sepals and petals hardly acute, green and purple outside, paler inside, spotted; lip pale rosy, spotted with purple, with a notch in the sinus of the mid-lobe. Spur decurved.Distrib. Europe from Holland southwards.
8. O. milita'ris, L.; tubers ovoid, spike oblong dense, bracts 1 -nerved, sepals acuminate and petals pale purple or white, lip 3-lobed, lateral lobes narrow, middle 2 -fid with narrow upcurved segments and a tooth in the sinus, spur $\frac{1}{9}$ as long as the ovary.
Woods and chalk downs, Oxford and Berkshire to Sussex and Kent ; fl. MayJune. - Stem 1-1 $\frac{1}{2} \mathrm{ft}$. Leaves large, oblong, obtuse, concave, unspotted.
Bracts very short. Flowers about 1 in . from dorsal sepal to tip of lip, bright
or pale purple ; lip pale, dotted with raised rough points, lateral lobes linear, segments of mid-lohe rather broader; spur decurved, obtuse.-Distrib. Europe from Gothland southwards, N. Africa ? Siberia, Dahuria.
Sub-sp. Milita'ris proper; outer sepals pale-purple, lip pale purple, lateral lobes narrow veined, middle deeply 2 -fid with lobes rather broader than the lateral.-Berks, Oxford, Bucks.
Sub-sp. Sim'IA, Lamk. (sp.) ; outer sepals white, lip white, lobes crimson narrow, middle deeply 2 -fid with lobes as long and narrow as the lateral.Oxford. O. tephrosanthos, Vill.
Sub-gen. 2. Anacam'ptis, Rich. (gen.). Lip ascending, lobes broad, not spirally coiled; spur very long. Pollen-glands connate.
9. O. pyramida'lis, L.; tubers globose, leaves acuminate, spike pyra-midal, bracts 1-3-nerved coloured, lateral sepals spreading, lip 3-lobed 2 tubercled at the base, spur longer than the ovary.
Pastures, \&c., from Wigton and Northumberland southwards; Mid. Ireland ; fl. June-Aug.-Stem 6-24 in., slender. Leates chiefly radical, lanceolate. Spike pyramidal, then oblong. Bracts as long as the ovary. Flowers rosy rarely white ; sepals and petals obtuse ; lip broader than long, lohes subentire, variable in shape and relative size.-Distrib. Europe from the Baltic southwards, N. Africa. - Scent of flowers peculiar.
Sub-gen. 3. Himantoglos'sum, Rich. (gen.). Lobes of lip very long, spirally coiled in bud; spur very short. Pollen-glands connate.
10. O. hirci'na, L.; tubers ovoid, stem tall, spike long, bracts very long ribbed green, lateral sepals conniving, mid-lobe of lip strap-shaped, spur much shorter than the ovary. Lizard Orchis.
Copses in Suffolk and Kent, extremely rare ; fl. July-Aug.-Stem 1-3 ft. Leaves chiefly radical, oblong, obtuse. Spike 6-17 in. Bracts 1-2 in., much exceeding the flowers. Flovers large ; sepals and petals forming a green hood $\frac{1}{3} \mathrm{in}$. long ; lip $1 \frac{1}{2} \mathrm{in}$., white, purple-spotted at the base, lateral lobes slender, mid-lobe about 1 in . by $\frac{1}{8}$ broad, green.-Distrib. Europe from Belgium southwards, N. Africa.-Scent detestable, hircine.

## 2. GYMNADE'NIA, $B r$.

Characters of Orchis, but the free glands of the pollen-masses contiguous, exposed, not contained in pouches. - Distrib. Mountain districts of

1. G. Conop'sea, $B r$.; tubers palmate, flowers purple, lateral sepals spreading, lip obtusely 3 -lobed, spur slender. Fragrant Orchis.
Dry pastures ; ascending to $2,000 \mathrm{ft}$. in the Highlands ; fl. June-Aug.-Stem $6-18 \mathrm{in}$. Leaves oblong-lanceolate, keeled, acute. Spikes dense- or lax, narrow. Bract as long as the ovary, green, 3-nerved. Flomers bright rose-red or purple, broader than long, $\frac{1}{3}$ in. diam.; sepals and petals obtuse ; lip broad, lobes 3, subequal, rounded entire; spur very slender, flexuous. -Distrib. Europe (Arctie), Siberia, Dahuria, W. Asia.-Very fragrant.

## 3. HABENAR'IA, Br .

Tubers 2, if more narrow and fascicled. Habit of Orchis, but glands of pollen-masses free, distant, exposed.-Distrib. Temp. and subtrop. regions of the N. hemisphere ; species nearly 100.-Etym. Doubtful.

1. H. bifo'lia, $B r$.; leaves 2, flowers whitish, sepals spreading, lip linear-oblong entire, spur twice as long as the ovary. Butterfly Orchis.
Wet meadows, heaths ; ascending to $1,500 \mathrm{ft}$. in the N. of England ; fl. June-Aug.-Tubers 2, ovoid. Stem 6-18 in. Leaves rarely 3, lower 3-6 in., ovate or oblong, obtuse, narrowed at the base, upper small, lanceolate. Spikes 4-6 in., lax-flowered ; bracts equalling or exceeding the ovary, green. Flowers 1 in . from upper sepal to tip of lip, tinged with green or yellow; sepals subacute, dorsal broad, lateral large; petals small; lip obtuse. Column without a rostellum.-Distrib. Europe, N. Asia (Aretic).-Very fragrant. The following sub-species are, according to Darwin, very distinct, and require different species of moth to fertilize them. They vary in the position and distances of their anther-cells, and intermediates occur.
Sub-sp. BIFo'liA proper ; lateral sepals narrow, spur slender spreading, anthercells parallel, caudicle short, glands oblong; fl. June-July.
Sub-sp. chloran'tha, Bab. (sp.); flowers usually larger greener, lateral sepals broader, spur stout decurved more clavate, anther-cells more distant diverg ing, caudicles longer, glands orbicular ; fl. July-Aug.
2. H. vir'idis, $B r$.; leaves several, flowers green, sepals conniving, lip linear-oblong 2 -fid, spur very short. Frog Orchis.
Hilly meadows, especially northwards, local ; ascending to $2,500 \mathrm{ft}$. in the Highlands; f. June-Aug.-Tubers ovoid, often lobed. Stem 3-12 in. Leaves narrow-oblong, obtuse, smaller upwards. Spike lax; bracts green exceeding the ovaries. Flowers $\frac{1}{3}-\frac{1}{2}$ in. ; hood hemispheric, petals and sepals striped with dark red; lip paler, browner. Anther-cells diverging, rostellum 0.Distrib. Europe (Arctic), Siberia, Dahuria, N. America.
3. H. al'bida, $B r$.; tubers fascicled, flowers white, lateral sepals conniving, lip acutely 3 -lobed, spur very short. Gymnadenia, Rich.
Hilly pastures, from Sussex and Cardigan northwards ; ascending to near $1,900 \mathrm{ft}$. in the Highlands; W. and N. of Ireland ; fl. June-Aug.-Stem 6-12 in. Leaves small, obtuse, upper acute. Spike narrow, dense ; bracts green, equalling the ovary. Flozers $\frac{1}{6}$ in., subsecund; ovary short; sepals and petals obtuse; lip small, projecting; lobes triangular.-Distrib. Europe except Turkey, W. Siberia, Greenland.--Sweet-scented.

## 4. NEOTI'NEA, Reich. fil.

An inconspicuous herb. Tubers ovoid. Flowers small. Lateral sepals and petals forming a hood. Lip 3-lobed; spur minute. Anther-cells parallel ; pollen-masses 4, glands free, naked, concealed behind the broad recurved rostellum. Stigmas 2, diverging, linear-oblong or reniform.Distrib. France, S. Europe, N. Africa, Asia Minor.-Etym. Originally Tinea, with neo added to distinguish it from the genus of moths.

1. N. intac'ta, Reich. fil.; leaves oblong often spotted. Tinea, Bivoni. Limestone pastures, Galway ; fl. June.-Habit of Gymnadenia albida, but smaller, 4-10 in. Spike dense-flowered, sometimes twisted ; bracts shorter than the ovary, 1-nerved. Flowers $\frac{1}{6}$ in., pink or purplish; sepals darker; petals acute ; lip projecting, lateral lobes short linear, middle entire or lobed, -I copy Reichenbach's description of the column, anthers, \&c.

## 5. ac'eras, Br. Man Orchis.

Tubers ovoid. Sepals and petals connivent and forming a hood. Lip elongate, 4 -lobed; spur 0 . Anther confluent with the column; cells A. 42
parallel ; pollen-masses 2, glands connate in one pouch. Stigma depressed ; rostellum ohsolete.-Distrib. Europe, N. Asia, and Himalaya; species 3-4.-Етум. й, privative, and кє́pas, spur.

1. A. anthropoph'ora, Br .; perianth green, lobes of lip linear.

Pastures and copses in chalky soil in S.E. of England, from Lincoln to Kent and Sussex, scarce ; fl. June-July.-Stem 8-16 in. Leaves oblong-lanceolate, lower obtuse, upper acute. Spike lax-flowered, narrow; bracts small. Flover $\frac{2}{3} \frac{3}{4} \mathrm{in}$.; sepals and petals often edged with rod; lip perpendicular, yellow, edges red, narrow, with 2 lateral and 2 terminal lohes, all similar and linear.-Distrib. Europe from Belgium southwards, N. Africa.

## 6. hermin'ium, $B r$. Musk Orchis.

Tubers ovoid. Leaves 2 or few. Perianth-segments incurved. Lip 3lobed; spur 0. Column with short lateral arms. Anther confluent with the column, cells diverging below; pollen-masses 2, subsessile, glands large, exposed. Stigma discoid; rostellum 0.-Distrib. Europe, temp. Asia; species 4.-Етчm. $\dot{\varepsilon} \rho \mu i v$, the foot of a bed-post, from the shape of the tubers.

1. H. Monor'chis, $B r$.; flowers minute, subsecund, green.

Chalky downs, S.E. of England, from Norfolk, Cambridge, and Gloucester,
to Dorset and Kent; fl. June-July.-Tubers at the end of fleshy fibres.
Stem 4-10 in., slender. Leaves, radical 2, narrow-oblong, acute ; cauline
solitary. Spike slender, rather lax; bract green, as long as the ovary,
Flozerrs $\frac{1}{\frac{1}{2}} \mathrm{in}$. ; sepals broad ; petals narrower, longer, obscurely lobed at the
side ; lip narrow, 3 -lobed, base saccate, mid-lobe entire narrow.-Distrib.
Europe (Arctic) except Spain, Siberia, Himalaya.-Odour of musk.

## 7. O'PHRYS, $L$.

Tubers ovoid. Perianth spreading. Petals small. Lip perpendicular, usually convex, velvety; spur 0 . Anther capping the column, arched forwards, often beaked, cells parallel ; pollen-masses 2, glands in separate pouches. Stigma a depressed disk; rostellum 0. Ovary not twisted.Distrib. Europe, N. Africa, W. Asia; species about 30.-Etym. ठфpús, an eyebrow, from the markings of the lip.

1. O. apif'era, Huds.; sepals pink or white inside, lip broad convex 3-lobed, with a terminal appendage, anther-heak hooked. Boe. Orchis.
Copses and fields in chalk and limestone districts, from Durham and Lancaster to Sussex and Kent; ascending to $1,000 \mathrm{ft}$. in W. of England ; S. and Mid. Ireland on limestone and sandhills ; fl. June-July.-Stem 6-18 in. Leaves short, ohlong. Spite 3-6-flowered ; bracts large, leafy. Flowers 1-1 $\frac{1}{4} \mathrm{in}$.; sepals ovate ; petals small, downy, linear-oblong, obtuse ; lip brown-purple, lateral lobes tuhereled at the base, disk spotted with orange yellow.Distrib. Europe from Belgium southwards, N. Africa.
Sul-sp. aPIF'ERA proper ; petals linear, lip equalling the sepals deeply 3-lobed, appendage recurved.
Sub-sp. arach'vites, Willd. (sp.) ; petals subdeltoid-ovate, lip longer than the sepals, appendage straight or incurved.-Chalk downs, Folkestone.
2. O. aranif'era, Huds.; sepals yellow-green inside, petals oblong, lip brond convex without an appemdage, anther beaked. Spider Orchis.
Copses and downs in chalk and limestone, from Northampton and Suffolk to

Dorset and Kent; fl. April-May.-Habit of O. apifera. Lip brown with various glabrous markings.-Distrib. Europe from France southwards.
Var. 1, arunif'era proper; petals almost glabrous, lip usually lobed at the margin.-Var. 2, fucif'eru, Smith (sp.) ; petals downy within, lip rarely lobed, its tubercles less prominent.
3. o. muscif'era, Huds.; sepals yellow-green, petals narrow linear, lip longer than broad narrow nearly flat, anther not beaked. Fly Orchis. Copses and downs on chalk and limestone, from Durham and Westmoreland southwards; Mid. Irtland, very rare ; fl. May-July.-Stem slender, 10-18 in.
 brown ; lip with a blue patch, sometimes edged with yellow, lateral lobes reflexed, terminal 2 -fid.-Distrib. Europe from Norway southwards.

## 8. EPIPO'GIUM, Gmelin.

A leafless root-parasite. Rootstock of fleshy branched fibres. Flowers racemed. Sepals and petals rather spreading. Lip superior, ovate, 3 -lobed, disk with rows of glands ; spur short, stout. Anther terminal, deciduous; pollen-masses 2, in cavities of the cylindric column, stalked, glands connate. Stigma prominent, horseshoe-like ; rostellum 0. Ovary not twisted. -Distrib. Europe N. of the Alps, N. Asia, Himalaya.-Etym. '̇ $\pi$ ! and $\pi \omega \quad{ }^{\omega} \omega \nu$, from the lip being uppermost.

1. 玉. Gmelíni, Rich.; flowers pale yellow. E. aphyllum, Sw.

Amougst decayed leaves, Tedstone in Delamere Forest, Hereford, only once found ; fl. Aug.-Stem 4-8 in., tumid above the base, pale yellow-brown, with 1 or 2 appressed sheaths. Bracts as long as the pedicels. F'oxers 2-6, shortly pedicelled, $1 \mathrm{in} . ;$ ovary broad, short; sepals and petals narrowlanceolate, subequal, margins involute; lip recurved, lateral lobes small, middle whitish with red glands ; spur obtuse.

## 9. epipactis, Rich. Helleborine.

Rootstock creeping. Stem leafy. Flowers racemed, ovary straight, pedicel twisted. Sepals and petals conniving or spreading. Lip much contracted in the middle, basal lobe concave, terminal entire with 2 basal tubercles. Anther sessile, hinged on the top of the column; pollen-masses 2, powdery, glands connate. Stigma prominent ; rostellum short, erect. Capsule pendulous.-.. Distrib. Europe, N. Asia, Himalaya ; species 8.Etym. The classical name for this or another plant.

1. E. latifo'lia, $S w$.; leaves rotundate ovate or oblong, bracts mostly exceeding the flowers, upper lobe of lip with rounded margins, lower broadly ovate acute or apiculate rarely entire, ovary broadly pyrifurm.
Woods; fl. July-Aug.-Stem 1-3 ft., pubescent above. Leaves variable, ribbed. Raceme many-flowered, bracts green. Flowers subsecund, $\frac{1}{2}-\frac{2}{3} \mathrm{in}$. diam., green, variously marked with yellow-white or purple; sepals broadly ovate; petals ovate-lanceolate; lip variable in form and colour, as long as the sepals or shorter, lower lobe with thickened ridges on the disk.-Distrib. Europe (Arctic), N. Africa, Siberia, Himalaya.-I am indebted to Mr. Britten for the synonymy of the following sub-species.
Sub-sp. latifo'lia proper (sp.) ; leaves broadly oblong, raceme lax, flowers greenish-yellow spotted brown inside, sepals ovate-lanceolate spreading as long as the ovary, lower lobe of lip subdeltoid, ridges plaited and rugose.
E. viridiflora, Hoffm.; E. purpurata, Sm. ; E. Helleborine, var. varians, Crantz; E. mediu, Bab.-Flowers earlier than viridans.
Sub-sp. vir'idans; leaves broadly ovate, racemes dense, flowers greenish-white rosy inside, sepals incurved shorter than the ovary, lower lobe of lip suborbicular, ridges smooth. E. Helleborine, var. viriduns, Crantz.
Sub-sp. rubigino'sa, Koch (sp.) ; leaves ovate-lanceolate, raceme lax, flowers small dingy red-purple, sepals incurved shorter than the ovary, lower

- lobe of lip broader than long, ridges plaited and rugose. E. ovelis, Bab.; E. media, Fries; E. Helleborine, var. rubiginosa, Crantz.-Limestone, local, from Hereford northwards, and in Ireland ; ascends to $1,200 \mathrm{ft}$. in Yorkshire.

2. E. palus'tris, $L$.; leaves lanceolate, bracts mostly short, upper lobe of lip angular lower obtuse crenate, ovary very narrow-pyriform.
Marshy places, from Fife southwards to Devon and Kent; rare in Scotland and Ireland ; fl. July.-Stem 8-18 in., slender, wiry, pubescent above. Leaves acute, upper acuminate. Flowers few, $\frac{1}{3}-\frac{2}{3}$ in. broad; sepals and petals ovate, subacute, green striped with purple ; lip white, streaked with red, lower lobe tubercled towards the base.-Distrib. Europe, Siberia.

## 10. CEPHALAN'ThERA, Richard.

Rootstock creeping. Stems leafy. Leaves subdistichous. Spikes fewflowered; ovary twisted. Flowers suberect, sepals and petals incurved. Lip decurved, constricted in the middle, upper lobe saceate, lower not tubercled, crested on the disk. Anther hinged on the contracted top of the column ; pollen-masses 2, powdery, glands connate. Stigma prominent; rostellum 0. Capsule erect.-Distrib. Europe, N. Asia, Himalaya; species 4.-ETYм. кєфа入প and $\check{\alpha} \nu \theta \eta \rho$, from the position of the anther.

1. C. grandiflo ra, Bab.; leaves ovate-oblong, lower bracts large much exceeding the almost glabrous ovary, flowers white. White Helleborine.
Woods and copses chiefly in chalky districts, from Cumberland to Dorset and
Kent, rare ; absent from Ireland; fl. May-June. -Stems tufted, 1-2 ft. Leaxes
3-6 in., upper narrower. Florers $\frac{2}{3}$ in., distant, suberect, cream-white ; sepals and petals ovate-oblong, obtuse ; lower lobe of lip orbicular, erect, yellow.-Distrib. Europe from Denmark southwards.
2. C. ensifo'lia, Rich.; leaves ovate or lanceolate, bracts of upper flowers much smaller than the almost glabrous ovaries, flowers white.
Woods and copses from Skye and Perth to Hants and Kent, local ; rare in Ireland; fl. May-June.--Stems $1-2 \mathrm{ft}$., subsolitary, slender. U ${ }_{l}$ per bracts minute. Leaves usually longer than in C. grandiftora, flowers whiter and narrower, sepals more acute.-Distrib. Europe, W. Siberia, W. Asia.
3. C. ru'bra, Rich.; leaves lanceolate, bracts exceeding the glandular pubescent ovaries, flowers rose-purple. Red Helleborine.
Woods and copses in chalky districts, Gloucester and Somerset, very rare;
fl. June-July.-Stem 6-18 in., slender. Flowers few or many ; sepals and petals acuminate; lip white, lower lobe ovate-lanceolate. Column slender.

- Distrib. Europe from Gothland southwards, W. Siberia.

## 11. LISTERA, Br .

Root of fleshy fibres. Leaves 2, subopposite, or 0. Flowers racemed, green or brown. Sepuls and petals spreading and incurved. Lip dellexed,

2 -fid; spur 0. Anther hinged on to the back of the column, 2-celled; pollen-masses 2, powdery, glands connate. Stigme prominent; rostellum tongue-shaped.-Distrib. N. temp. and cold regions; species 6.-Etym. Dr. Martin Lister, a British naturalist.

Sub-gen. 1. Liste'ra proper.-Stem 2- rarely 3 -leaved. Lip linear, with 2 straight nearly parallel terminal lobes.

1. L. ova'ta, $L . ;$ stem tall terete pubescent above, leaves broadly elliptic, lip 2 -fid without lateral lobes. Tway-blade.
Woods and pastures, ascending to near $1,900 \mathrm{ft}$. in N. of England ; fl. May-July.-Stem 1-2 ft., solitary, stout. Leaves 3-8 in., ribbed. Raceme elongate; bracts minute. Flowers $\frac{1}{2}$ in.; sepals deep green, ovate, subacute; petals yellow-green; lip the same, slightly saccate at the base, apiculate between the terminal lobes. -Distrib. Europe (Aretic), Siberia.
2. L. corda'ta, Br.; small, glabrous, stem angled fragile, leaves ovatecordate, lip 2 -fid and with 2 basal linear lobes. Lesser Tway-blade.
Mountain woods and moors, especially under heather, from Hampshire and N.
Devon northwards, ascending to 2,700 ft. in the Highlands; rare in Ireland;
f. July-Sept.-Stem 4-8 in., brownish-green. Leaves $\frac{1}{2}-1 \mathrm{in}$., sessile, mem-
branous, acute. Raceme lax, few-flowered; bracts minute. Flowers $\frac{1}{6} \mathrm{in}$.;
sepals and petals olive-brown, obtuse ; lip dirty yellow-green, terminal lobes
linear. -Distrib. Arctic and Alpine Europe, N. Asia, N. America.
Sub-gen. 2. Neot'tia, L. (gen.). A brown leafless root-parasite. Stem with sheathing scales. Lip concave at the base, terminal lobes divaricate.
3. L. Nidus-a'vis, L.; raceme lax-flowered. Bird's-nest Orchis.

Dark woods, especially beech, from Forfar and Argyle southwards; E. and N.E. only of Ireland ; fl. June-July.-Root a mass of succulent, stout, interlaced fibres. Stem robust, $1-\frac{1}{2} \mathrm{ft}$., dirty-brown. Flowers $\frac{1}{3}$ in., grey-
brown, bracts short.--Distrib. Europe, W. Siberia.

## 12. SPIRAN'thes, Rich. Lady's-tresses.

Root of tubers or stout fibres. Stem leafy. Spike of small flowers in 1-3 spirally-twisted rows. Sepals and petals similar, suberect; sepals gibbous at the base; upper adnate to the petals, forming a tube round the lip. Lip embracing and adnate to the base of the column, tip entire, disk 2 -tubercled. Anther hinged on to the back of the column, 2 -celled; pollen-masses 4, powdery, sessile on one linear gland. Stigma discoid; rostellum beaked, finally 2 -fid. - Distrib. trop. and temp. regions; species 46. -Etym. $\sigma \pi \epsilon i \bar{\rho} a$ and ${ }^{2} \nu \theta o s$, from the twisted inflorescence.

1. S. autumna'lis, Rich.; tubers 2-3 ovoid, flowering-stem sheathed distinct from the root-leaves, spike slender, flowers many in 1 series.
Dry pastures from Westmoreland and York southwards; S. and Mid. Ireland;
fl. Aug.-Sept.-Stem 4-8 in., slender, upper part and inflorescence pubescent.
Levees 1 in ., in lateral rosettes, ovate, acute, appearing after the flowers.
Flourers sheathed by the cucullate cuspidate bracts. Perianth $\frac{1}{6}$ in., white;
lip channelled at the base, tip exserted, crenate.-Distrib. Europe from
Denmark southwards, N. Africa.-Flowers fragrant.
2. S. æstiva'lis, Rich.; tubers several cylindric, radical leaves on the flowering stem linear, spike slender many-flowered, flowers in 1 series.

Bogs; New Forest, Wyre Forest Worcester, Jersey and Guernsey ; fl. JulyAug. -Stem 6-18 in., glabrous. Leaves 2-6 in., narrowed below. Spike slightly pubescent. Flow's's and bracts as in S. autumnalis, but rather larger.-Distrib. W. Europe from Belgium southwards, N. Africa.
3. S. Romanzoviana, Cham.; tubers several cylindric, radical leaves on the flowering stem narrow obovate-lanceolate, spike stout, flowers in 3 series. S. cernua, Hook. not Rich.; S. gemmipara, Lindl.
Meadows, Bantry Bay, Co. Cork ; fl. Aug.-Sept.-Stem 6-10 in., stout, glabrous, leafy throughout. Leuves, lowest 3-6 in. Spike 2-3 in., glandularpubescent; bracts sheathing the base of the ovary, subulate-lanceolate. Hlozers white, much larger and broader than in the preceding species; lip tongue-shaped, contracted below the crenate recurved tip, tubercles at the base smooth and shining.-Distrib. N. Ameriea, New York to the Pacific.-Gray correctly refers S. gemmipara to Romanzoviana. S. cernua, to which I once referred this, is also common in the U. States, and had till quite lately been confounded with it by American botanists.

## 13. GOODYE'RA, Br .

Rootstock creeping. Leaves usually ovate and petioled. Flowers small, spiked, in spiral series. Upper sepal and petals ascending, free or connate; lateral sepals deflexed, embracing the base of the lip. Lip decurved, entire, hase saccate. Anther hinged on to the back of the column, 2-celled; pollen-masses of loosely cohering grains, sessile on one oblong gland. Stigma discoid; rostellum beaked, finally 2 -fid.-Distrib. N. temip. regions; species 16.-Etym. John Goodyer, an English botanist.

1. G. re'pens, $B r$.; leaves ovate acute, nerves reticulate.

Fir woods in E. Scotland, from Berwick and Roxburgh to Ross, local and rare ; fl. July-Aug. - Rootstock slender, matted, widely creeping. Stem 4-8 in., slender, and inflorescence glandular-pubescent. Leuves $\frac{1}{2}-1 \mathrm{in}$., acute, dark green, pubescent beneath. Spike slender; bracts subulatelanceolate, longer than the ovary. F'loucrs cresm-white ; perianth $\frac{1}{4} \mathrm{in} .-$ Distrib. Mid. and N. Europe (Aretic), Siberia, Himalaya, N. America.

## 14. MALAX'IS, $L$.

A small green subsucculent herb. Leaves few, broad, short. Flowers minute, racemose, green. Sepals and very small petals spreading. Lip superior, minute, entire, concave. Anther hinged on to the top of the minute column, persistent; pollen-masses 4, waxy, attached to one gland. Stigma depressed ; rostellum minute. - Distrib. Europe (Arctic) N. of

## 1. M. paludo'sa, Sw.; leaves ohovate obtuse. Bog Orchis.

Sphagnum swamps and bogs, from Dorset and Sussex northwards, searce and easily overlooked ; ascending to $1,500 \mathrm{ft}$. in the N. of England ; rare and local in Ireland; fl. July-Sept.--Stem 1-4 in., swollen and sheathed with white scales at the base, forming a new plant at the side of the old, angled above. Leaves few, fringed with cellular bulbils that develop new plants.
Raceme elongate, many-flowered; braets minute; pedicel twisted. Flowers $\frac{1}{6}$ in., yellow-green ; sepals ovate; petals linear-oblong, recurved; lip about equalling the petals, erect, acute, embracing the column at its base.

## 15. LI'PARIS, Rich.

Habit of Malaxis, but usually 2 -leaved. Sepals and petals spreading, linear. Lip inferior or superior, broader than the sepals, entire. Anther terminal on the slender column, deciduous, pollen-masses 4, waxy, glands evanescent. Stigma small, depressed ; rostellum minute-Distrib. Temp. and trop. regions ; species 33 .-Erym. $\lambda_{\imath} \pi \alpha \rho 6$ s, from its greasy texture.

1. L. Loese'lii, Rich.; leaves elliptic-lanceolate acute keeled petioled, lip oblong-obovate mucronate. Sturinia, Reich. Fen Orchis.
Spongy bogs in Norfolk, Suffolk, Huntingdon, and Cambridge ; fl. July. -Stem $4-8$ in., swollen and sheathed with white seales at the base, 3 -gonous and leafless above. Leares 1-3 in. Flowers few, $\frac{1}{2}$ in., ascending, pale yellowgreen ; bracts mostly small.-Distrib. Europe N. of the Alps.

## 16. Corallorhíza, Haller. Coral-root.

Leafless. Root of branched, fleshy, interlaced fibres. Stem with sheathing scales. Flowers few, small, subracemose. Upper sepal and petals connivent, lateral sepals spreading Lip deflexed, short, lateral lobes small; spur minute, adnate to the ovary. Anther terminal on the short column, deciduous, 2 -celled ; pollen-masses 4, subglobose, granular, free. Stigma discoid; rostellum inconspicuous.-Distrib. N. temp. regions; speeies 10. - Етуm. корáл入ıò and piľa, coral root.

1. C. inna'ta, $B r$.; sepals linear-lanceolate, lip oblong.

Boggy or sandy woods and copses in Scotland, from Moray and Ross to Ayr and Berwick, rare ; fl. July-Aug.-Stem 6-10 in., slender; sheaths lax, redbrown. Raceme 4-8 flowered, pedicels very short ; bracts minute. Flowers horizontal ; perianth $\frac{1}{4} \mathrm{in} . ;$ sepals ovate-lanceolate, olive-green, lateral deflexed and petals narrower; lip whitish with small purple tubercles.Distrib. Arctic, N. and Mid. Europe, Siberia, Daburia, N. Àmerica.

## 17. CYPRIPE'DIUM, L. Lady's Slipper.

Rootstock creeping. Stem leafy or leafless. Sepals and petals spreading. Lip large, inflated. Column curved over and nearly closing the small orifice of the lip, bearing a terminal dilated lobe (deformed stamen), on each side of the base of which is a short antheriferous arm, and below it a discoid pedicelled stigma. Anthers 2, partially 2 -celled ; pollen viscid, granular; rostellum 0. Ovary straight.-Distrib. Trop. and temp. regions; species 50. -Еtym. Kú $\pi p i s$ and $\pi o ́ \delta i o v, ~ V e n u s ' ~ s l i p p e r . ~$

1. C. Calce'olus, $L$.; bracts foliaceous, lip obovoid.

Woods in limestone districts, Westmoreland, Durham and York, nearly extinct ; fl. May.-Pubescent. Stem 6-18 in. Leaves oblong, acuminate, ribbed. Flowers 1-2; bracts foliaceous; sepals red-brown, upper 1-1 $\frac{1}{2}$ in., erect, ovate-lanceolate, acuminate ; lateral narrower, usually connate, and placed under the lip ; petals $1 \frac{1}{2}$ in., linear ; lip as long, pale yellow, obovoid, with a rounded upturned end. - Distrib. Europe (Arctic), exel. Spain Peninsular Italy and Turkey, N. Asia, Himalaya.

## Order III. I'ridere.

Perennial herbs; rootstock tuberous, bulbous, or creeping, or a corm. Leaves often equitant and ensiform. Flowers regular or not, enclosed in 2 spathaceous bracts. Periunth superior, petaloid, of 6 imbricate segments in 2 series, often twisted and persistent after flowering. Stemens 3, epigynous or inserted on the outer perianth-segments; anthers usually narrow, bursting outwards. Ovary 3 -celled ; style simple, stigmas 3 often dilated simple or divided; ovules very many, anatropous, in the inner angles of the cells. Capsule 3 -gonous, 3 -celled, loculicidally 3 -valved. Seeds many, testa coriaceous or thin, raphe separable, albumen horny or fleshy ; embryo terete, short, cylindric.-Distrib. Chiefly extra-tropical ; genera about 50, and species 500.-AFFinities. With Amaryllideae and Orchidex.-Properties. Purgative and diuretic.
Segments of perianth nearly equal.
Perianth-tube short. Stigmas 3, 2-partite.

1. Trichonema.

Perianth-tube short. Stigmas 3, entire...........................1*. Sisyrinchium.
Perianth-tube long. Stigmas 3, cleft
2. Crocus.

Segments of perianth unequal.
Perianth regular
3. Iris.

Perianth irregular and oblique
4. Gladiolus.

## 1. TRICHONE'MA, Ker.

Corm sheathed. Leaves radical, slender, linear. Scape simple or branched. Perianth regular; tube very short; segments equal, suberect, tips recurved. Stamens on the throat of the perianth, filaments free, hairy; anthers basifixed. Ovary short, 3 -gonous; stigmas linear 2 -cleft. C'ipsule oveid, 3 -lobed. Seeds subglobose, testa coriaceous.-Distrib. Chielly S. Africa; species 21.-Etym. $\theta p i \chi$ and $\nu \bar{\eta} u a$, from the hairy filaments.

1. T. Colum'næ, Reich.; leaves wiry. T. Bulbocodium, Sm. not L. Sandy pastures, Dawlish, Jersey, Guernsey ; fl. March-May.-Corm size of a pea, ovoid; sheaths brown, shining. Learess 2-4 in., recurved, subeylindric, grooved above. Srape very short, 1-3-flowered; spathe longer than the perianth-tube; pedicels curved in fruit. Perianth-segments $\frac{1}{2}$ in., subacute, greenish outside, whitish inside with purple veins and yellow base. Cupsule small.-Distrib. W. Europe from France southwards, Mediterranean shores.

## 1*. SIS YRIN Chil'M, L. Blue-Eyed Grass.

Root of rigid fibres. Leaves radical, linear, equitant. Scape usually 2-edged. Flowers umbellate. Perianth regular, tube very short; sergments equal, spreading or suberect. Stumens on the throat of the perianth, free or comnate at the base; anthers basifixed. Ocary short, 3 -gonous; style short, stigmas 3 filiforn involute. Capsule sulgglobese, coriaceous. Secds subglobose or angled, testa hard.-Distrib. N. and S. America; species 42.-ETYM. Obseure.
S. bermidia'sem, $L$. ; bracts subequal. S. anceps, Bab. not Lamk. Bogs, Woodford in Galway ; fl. July-Aug.- Leaves $3-5$ in., $\frac{1}{6}$ in. broad, ensiform. Saupe 6-18 in., Hattened, wing narrow. Bracts shorter than the 1-4 flowers, which are $\frac{3}{3} \mathrm{in}$. diam. P'eriunth-serymonts blue inside, obcordate, retuse, mucronate.-Distrib. Aretic and temp. N. America, Bermudas.

## 2. CRO'CUS, $L$.

Corm with sheathing fibrous coats. Stem 0. Leaves radical, surrounded by scarious sheaths, narrow-linear, channelled, white beneath, margins recurved. Flowers solitary or fascicled, almost sessile. Perianth large, tube very long; segments equal, narrow-oblong, oncave. Stamens on the bases of the outer segments, filaments free; anthers basifixed. Ovary subterranean, hidden amongst the leaf-bases, ovoid, colourless ; style filiform, stigmas 3 cuneate dilated or laciniate. Capsule on a long thin pedicel, fusiform. Seeds globose, testa thick.-Distrib. Europe, N. Africa, N. and W. Asia; species 28.-Еtym. The old Greek name.

1. C. nudifo'rus, $L$.; flowers solitary autumnal, stigmas multifid.

Meadows, Lancaster, Derby, Notts, Warwick, Stafford, \&c.; a denizen or native, Wutson ; fl. Sept.-Oct.-Corm subglobose, clothed with rich brown coats of parallel fibres. Leaves vernal. Perianth lobes 2 in., bright purple. Anthers pale orange-yellow. Stigmas orange, their segments truncate and crenate. Seeds as in C. vernus.-Distrib. France and Spain.
C. ver'nus, $L$. ; flowers few vernal, stigmas toathed. Purple Crocus.

Naturalized in meadows at Nottingham, Hornsey, Middlesex, and elsewhere in England and Ireland; fl. March-April.-Corm broad, depressed ; sheaths of reticulate fibres, much torn, dirty brown. Perianth lobes 1-2 in., purple or white. Anthers pale bright-yellow. Stigmas deep-orange. Capsule $\frac{1}{2}-\frac{3}{4}$ in. Seeds reddish, small.-Distrib. Mid. and S. Europe.

## 3. I'RIS, $L$.

Rootstock tuberous or creeping. Leaves chiefly radical, equitant, ensiform. Scape compressed; spathes terminal with scarious borders. Perianth-tube short, rarely long; sepals large, stipitate, reflexed, stipes channelled; petals smaller, suberect, stipitate, margins of stipes involute. Stamens inserted on the base of the sepals, filaments free; anthers basifixed. Ovary 3 -gonous; style stout, stigmas 3 very broad petaloid arching over the stamens 2 -fid and with a transverse lamella, stigmatic surface a point below the lamella. Capsule coriaceous, 3 -gonous, 3 -ribbed. Sceds many, flat or globose, testa coriaceous hard or thick.-Distrib. N. temp. regions; species 48.-Etym. The Greek name, from the hues of the flower.

1. I. Pseud-ac'orus, $L$.; flowers bright yellow, petals $\frac{8}{4}$ shorter than the sepals. Yellow Flag.
River-banks, ditches, \&c.; fl. May-Aug.-Rootstock creeping, stout. Leaves
$2-4 \mathrm{ft}$., $\frac{1}{2}-1 \mathrm{in}$. broad. Scape $2-4 \mathrm{ft}$., leafy, often branched at the top;
pedicels about as long as the ovary ; spathes 2 in., acute or obtuse. Flower's
3-4 in. diam., tube cylindric, variable in colour and form of the segments;
sepals often purple-veined, with an orange spot near the base; petals
spathulate. Stigmas yellow. Seeds much vertically compressed, faces flat,
testa hard.-Distrib. Lurope, N. Africa, Siberia.-Rootstock acrid.
2. I. foetidissima, $L$.; flowers yellow or purple, petals $\frac{1}{4}$ shorter than the sepals. Foetid Iris, Roast-beef plant.
Copses and hedgebanks, chiefly on limestone and chalk, from Durham southwards; naturalized only inScotland; rare in Ireland ; fl. May-July.- Rootstock stout, creeping. Leaves much as in I. Pseud-acorus, darker green and more flaccid. Scape 1-2 ft., leafy; pedicels longer than the ovary; spathes 3-4 in.,
acuminate. Florers 3 in. dinm.; sepals obovate-lanceolate, bluc-purple, rarely yellow; petals and stigmas spathulate, yellow. C'upsule $2-3$ in., clavate. Seeds globose, testa Heshy orange-red.-Distrib. France, Spain, Austria, Italy, Turkey, N. Africa.

## 4. GLADI'OLUS, $L$.

Corms with reticulate fibrous coats. Leaves equitant, ensiform. Scape tall. Flowers usually secund, showy, spiked, inclined or horizontal. Perianth irregular, sub-2-labiate ; tube short, curved, segınents ohovate. stamens ascending, on the perianth tube; anthers linear, versatile. Ovary ovoid; style filiform, stigmas 3 broad undivided. Capsule coriaceous. Needs compressed, winged, or globose with a fleshy testa.-Distrib. Europe, W. Asia, chiefly S. African.-Etym. gludiolus, a little sword.

1. G. commu'nis, L.; var. illyricus, Koch (sp.) ; leaves glaucous, spathes subequal, perianth campanulate. G. imbricatus, Bab. not Reich. Open grounds, New Forest and I. of Wight, rare ; f. June-July.-Corm size of a hazel-nut, with many bulbils at its base. Leaves 6-10 in., $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. diam., glaveous, acuminate. Scape 2-3 ft., leafy. Spike $4-8$-flowered; spathes subequal, lanceolate, acuminate. Perianth 1-1 $\frac{1}{2}$ in., curvel, crimson-purple: 3 upper segments spathulate ; 3 lower more obovate, paler with strong redpurple veins. Stigmas spathulate, margins involute after flowering. Cupsule $\frac{1}{2}$ in., clavate. Seeds narrowly winged.-Distrib. Europe, not N. or W. of the Loire and Rhine, N. Africa.-The var. illyricus differs from communis in the more slender fibres of the corm sheath; broader stigmas not papillose on the margin throughout their length ; and narrower wing of the seed.

## Order IV. AmARYL'LIDERE.

Root bulbous. Leaves radical. Scape naked. Flowers bracteate. Perianth superior, coloured, of 6 lobes or segments in 2 series, with sometimes a crown at the mouth of the tube, regular or irregular. Stamens 6 , on the perianth-tube or bases of the segments (rarely epigrnous), filaments free or connate ; anthers versatile, linear or oblong, bursting inwards or by terminal pores. Ovary ovoid or globose, 3-celled ; style filiform or columnar, stigmas 1 or 3 ; ovules many, in 2 series, in the iuner angles of the cells, anatropous. Fruit usually capsular, rarely fleshy, 3 -celled, loculicidally 3 -valved, cells 1 - or more-seeded. Seeds turgid or compressed, testa various, albumen fleshy; embryo straight, axile, terete.-Distiab. Temp. and trop. ; genera about 70 ; species 400 . - Affinities. Close with Iridece, and Liliacher.-Propkrties. Emetic, narentic and poisonous. Agave yields textiles, and a fermentable liquor (pulque).

Mouth of perianth with a circular crown.

1. Narcissus.

Crown 0. Outer perianth-segments largest.
2. Galanthus.

Crown 0. Perianth-segments equal
3. Leucojum.

## 1. NARCIS'SUS, $L$.

Scape compressed. Leaves narrow, linear. Flowers with a membranous spathe, solitary or umbellate, large, white or yellow, drooping or inclined. Perianth tubular below; segments spreading, mouth surmounted with s circular crown. Stamens inserted in the tube, included within the
crown, filaments free or adnate to the tube ; anthers versatile. Ovary 3 -gonous ; style filiform, stigma obtuse. Capsute coriaceous. Seeds globose, testa smooth, rough when dry.-Distrib. Europe, N. and W. Asia ; species about 30.-Etym. Mythological.

1. N. Pseudo-narcis'sus, L.; leaves nearly flat, flower solitary yellow campanulate, crown campanulate as long as the perianth-segments, margin crisped obscurely 6 -lobed. Daffodil, Lent Lily.
Copses and moist woods throughout England, local ; naturalized in Scotland and Ireland; fl. March-April.-Bulb 1 in., outer seales membranous. Leaves glaucous, obtuse. Scape 6-10 in. Flover primrose-yellow, 2 in.; pedicel short. Perianth-lobes acute. Capsule turbinate.-Distrib. Europe from Gothland southwards.
Var. 1, Pseudn-narcis'sus proper ; leaves slightly glaucous, perianth-segments oblong-lanceolats pale yellow, crown bright yellow with 6 rectangular lobes. - Var. 2, Bromfield'ii, Syme ; leaves very glaucous, perianth segments broader bright yellow, crown with 6 rounded lobes. The cultivated form.
N. biflo'rus, L. ; leaves keeled, flowers 1-3 yellow salver-shaped, crown short concave membranous.
Naturalized in England, Scotland, and Ireland, in copses and woods; fl. April-May.-Bulb 1-1 $\frac{1}{2}$ in., outer scales membranous. Leaves very long, $10-18 \mathrm{in}$, hardly glaucous, obtuse. Scape as long, acutely 2 -edged. Perianth $1 \frac{1}{2} \mathrm{in}$. diam., white or pale straw-coloured, pedicel slender; tube 1 in ., slender; segments broadly ovate, obtuse ; crown pale yellow.-Distrib. France, Tyrol, Italy, N. Africa ?

## 2. GALAN THUS, $L$. SNowdrop.

Flowers solitary, pendulous, white ; spathe membranous. Leaves 2, linear. Scape compressed. Perianth campanulate; sepals spreading; petals small, ereet, notched. Stamens 6, epigynous ; anthers pointed, connivent, pores 2 terminal. Ovary ovoid; style subulate, stigma simple. Capsule ovoid, herhaceous. Seeds few, subglobose, testa soft white.-Disтвib. Europe; species 2.-Etym. $\gamma \dot{\alpha} \lambda \alpha$, mill, and ằ $\theta$ os, flower.

1. G. niva'lis, L.; leaves glaucous keeled.

Meadows and copses, frequently naturalized in England and Scotland, hardly in Ireland, possibly wild in Hereford and Denbigh ; fl. Jan.-March.--Bulb $\frac{1}{2} \mathrm{in}$., ovoid. Leaves 6-10 in., obtuse. Scape longer, prostrate in fruit; spathe 2-fil, 2-nerved ; pedicel slender. Flower 1 in .; sepals obovate, concave ; petals white, with a double green spot below the tip.-DIsTRIB. Europe from Holland southwards, W. Asia.

## 3. LeUCOJ'UM, $L$. SNow-flake.

Characters of Galanthus, but leaves numerous; spathes 2, free or connate, 1-6-flowered; sepals and potals subequal ; anthers obtuse, opeuing by slits; style clavate ; testal crustaceous or fleshy.-Distrib. Chiefly European; species 9.-Etym. $\lambda$ eve's, white, and Yov, a violet.

1. L. æsti'vum, L. ; leaves hibernal, flowers æstival, scape $2-6$-fid.

Wet meadows, from Oxford and Suffolk to Kent and Devon; apparently wild
by the Tham from Reading to the Isle of Dogs ; a denizen, Wutson ;
fl. May.-Bulb 1 in . Leaves 12-18 in., obtuse, subglaucous. Scape as long,
prostrate in fruit, 2 -edged; tip of spathe entire, green. Florers drooping, buds ereet. Sepals $\frac{3}{4}$ in., ovate, white, tips green. Fruit turbinate. Needs not caruncled.-Distrib. Europe from Denmark southwards.
2. L. ver'num, $L$.; leaves and flowers vernal, scape 1-2-flowered.

Copses near a farm-house, Bicester; hedgerows, Bridport, Dorset; an alien or denizen, Watson; fl. March-April.-Much smaller than L. asticum; leaves subdistichous; scape less winged; spathe 2-fid at the tip ; flowers about as large ; ovaries more globose; seeds caruncled.-Distrib. Europe from France southwards and eastwards.

## ORDER V. DIOSCORE'居.

Rootstock often tuberous. Stem twining to the left, leafy. Leaves alternate, veins reticulate. Flowers inconspicuous, 1 -sexual, in axillary panicles or racemes. Perianth herbaceous, superior in the female flower; segments 6, in two series, regular, persistent. Stamens, 6 inserted on the perianth-segments, free ; anthers bursting inwards. Ovary 3 -celled ; styles 3 , short, stigma entire or lobed; ovules 2, collateral or superposed, anatropous. Frruit 3 -angled, 3 -celled, indehiscent or loculicidally 3 -valverl, rarely a berry or 1 -celled. Seeds winged, compressed or globose, albumen dense ; embryo small. - Distrib. Chiefly trop.; genera 6 ; species about 100.-Affinities. With Smiluccer.-Propertifs. The acrid and poisonous yam tubers are nutritious when cultivated or boiled.

## 1. TA MUS, $L$. Black-Bryony.

Perianth campanulate. Stigmas 2 -lobed. Berry imperfectly 3 -celled, few-seeded. Seeds globose.-Distrib. Europe, Mediterranean; species 1-2.-Etym. Doubtful.

1. T. commu'nis, $L$.; leaves ovate-cordate acuminate.

Copses and hedges throughout England ; most abundant in the south ; absent
from Ireland; fl. May-June.-Rootstock ovoid, black, fleshy, subterranean.
Stem many feet long, very slender, angular, branched. Leuces 2-3 in., lougpetioled, obscurely laterally lobed, 5 - $\overline{-}$-nerve, tip setaceous ; stipules reHexed. Florers $\frac{1}{6} \mathrm{in}$. diam.; males solitary or fascicled on slender racemes which are branched at the base ; female racemes 1 in ., shorter, recurved, few-flowered; bracts minute. Berry $\frac{1}{2}$ in., oblong, red.-Distrib. Europe from Belgium southwards, N. Africa, W. Asia.

## Order VI. ahismacerz.

Marsh or aquatic ssapigerons herbs. Leaves chiefly radical, base sheathing, erect or floating. Flowers usually 2 -sexual, not on a spadix, spathe 0 . Perianth inferior, of 6 (rarely 4) segments in 2 series, outer or all herhaceons. Strmens 6-9 or more, hypogynons, filainents free ; anthers oblong. Ovary of 3,6, or more carpels, tree or slightly connate ; styles short or 0 , stigma terminal simple or feathery ; ovules 1 or more in each cell, anatropous or campylotropous. Fruit of 3 or more indehiscent coriaceous carpels or dehiscent follicles. Seeds 1 or more in each carpel, testa coriaceous or membranous, albumen 0 ; embryo with a large radiele
next the hilum.-Distrib. All climates ; genera 10 ; species about 50.Affinities. With Naiadece.-Properties unimportant.
Tribe I. Alis'mese. Leaf-blade flat. Petals large, fugacious. Stamens 6 or more. Oveles 1-3, campylotropous. Embryo sharply curved.
Flowers 2 -sexual, hexandrous. Carpels free ........................... 1. Alisma. Flowers hexandrous. Carpels connate, spreading ............2. Actinocarpus. Flowers 1 -sexual, polyandrous. Carpels free ........................3. Sagittaria.
Tribe II. JUNCAGI'NERE. Leaves linear or filiform. Petals small, green. Stamens 6. Ovules 1-3, anatropous. Embryo straight.
Anthers short. Carpels united till mature.
4. Triglochin.
Anthers long. Carpels free.
5. Scheuchzeria.

Trie III. Bu'tomeat. Leaves 3 -quetrous. Petals and sepals similar, pink. Ovules many, anatropous. Embryo straight..............6. Butomus.

## 1. ALIS'MA, $L$.

Roots fibrous. Leaves erect or floating. Inflorescence umbelled or panicled, branches whorled, bracteate. Sepals herbaceous. Petals deciduous, membranous, involute in bud. Stamens 6, filaments filiform ; anthers versatile, dehiscence inwards. Carpels many, free ; style ventral or terminal, short, stigma simple ; ovules solitary, erect, campylotropous. Achenes turgid or compressed, ribbed, keeled or grooved, dehiscing or not. Seed erect, testa very thin ; embryo hooked.-Distrib. Temp. and trop.; species 20.-Etym. Doubtful.

1. A. Planta'go, $L_{L .}$; leaves erect, flowers panicled, carpels in one whorl laterally compressed, styles ventral. Water Plantain.
Ditches and edges of rivers, \&c. from Ross southwards; rare in the N. of Scotland ; fl. June-Aug.-Base of stem swollen, fleshy. Leares 6-8 in., petioled, ovate-lanceolate, acute obtuse or subcordate at the base, 5-7ribbed, young submerged or floating. Scape 1-3 ft. ; pedicels $1-1 \frac{1}{2} \mathrm{in}$. Flowers $\frac{1}{3}$ in. diam. Petals pink or rose, claw yellow. Carpels 20-30.Distrib. Aretic and N. temp. regions, Himalaya, Australia.-Juice acrid.
Var. 1, Planta'go proper ; leaves subcordate, sepals oblong, styles twice as long as the ovary.-VAR. 2, lanceola'tum, With. (sp.); leaves lanceolate, sepals ovate, styles as long as the ovary.
2. A. ranunculoi'des, $L$.; leaves erect linear-lanceolate, flowers umbelled or whorled, carpels capitate 4-5-ribbed turgid, styles terminal.
Bogs and ditches, from Ross southwards; fl. May-Sept.-Tufted. Leaves petioled, blade 2-3 in., 3-ribbed; the first developed submerged, pellucid, sometimes floating. Scape 6-18 in.; pedicel 1-3 in. Flowers as in 4 . Plantugo. Ripe carpels ovoid, apiculate.-Distrib. Europe from Gothland southwards except Turkey, N. Africa.
Var. 1, ranunculoi'des proper; erect or suberect.-VAR. 2, répens, Davies (sp.) ; scape procumbent geniculate rooting. Lakes, N. Wales and Ireland.
3. A. na'tans, L.; radical leaves submerged, cauline floating, flowers few, carpels capitate turgid many-ribhed, styles terminal.
Lakes, very rare, N. and W. of England, from York to Hereford and Wales ; near Stranraer in Scotland ; W. of Ireland, rare and local ; fl. July-Aug.-Radical leaves 2-8 in., submerged, subulate-lanceolate, pellucid. stem floating and rooting, giving off long-petioled, oblong, floating leaves,
$\frac{1}{2}-1 \mathrm{in}$., and $2-5$ slender erect 1 -flowered peduncles, $2-3 \mathrm{in}$., the uppermost umbellate. Flowers $\frac{1}{2}$ in. diam., white, claw of petals yellow. Ripe carpels beaked.-Distrib. Europe N. of the Alps and Spain.

## 2. actinocar'pus, Br. Star-fruit.

Habit and inflorescence of Alisma, but carpels 6-8, connate at the base, spreading horizontally, 2-ovuled. Fruit of as many stellately spreading 1-2-seeded long-lieaked carpels. Seeds, lower erect, upper horizontal, testa membranous rugose; embryo hooked. - Distrib. Eurone, California, Australia; species 3.-Etym. dıктiv and кapтós, from the rayed fruit.

1. A. Damasónium, $B r$.; leaves narrow oblong $3-5$-nerved, base cordate. Damasonium stellatum, Pers.
Gravelly ditches and pools, rare ; southern counties from Salop and Suffolk
to Sussex and Hants; fl. May-July.-Leares many, 2 in., obtuse, floating or emersed; petioles stout, 2-5 in. Scape 4-6 in., stout, with usually 2 whorls of flowers ; pedicels 1 in . Flowers $t \mathrm{in}$. diam.; petals caducous. Fruit ${ }^{\circ}$ in. diam., carpels dehiscing ventrally. - Distrib. France, Spain, Italy, Dalmatia, Mid. Russia, N. Africa.

## 3. SAGITTA'RIA, $L$.

Habit and inflorescence of Alisma, but flowers usually 1 -sexual ; stamens numerous ; anthers basifixed, dehiscence lateral.-Distrib. Temp. and trop.; species about 15.-Etym. sagitta, an arrow.

1. S. sagittifo'lia, L.; leaves hastate obtuse or acute. Arrow-head. Ditches, canals, \&cc. from Durham to Kent and Devon ; naturalized in Scotland, rare and local in Ireland; fl. July-Sept.-Stem swollen at the base, stoloniferous. Leaves 2-8 in., erect, lobes long, more or less diverging, acuminate, the first developed submerged, pellucid, linear ; petiole 8-18 in., stout, 3 -gonous. Scape 6-18 in., with 3-5 distant whorls of 3-5 flowers each ; bracts short, obtuse, membranous; lower whorls female, pedicel short; upper male with longer pedicels. Flowers $\frac{1}{2} \mathrm{in}$. diam., males larger. Petals white, caducous, claw purple. Anthers purple. Achenes numerous, much compressed laterally, broadly obliquely ohovate, apiculate, wings broad thick, cell small. Seed as in Alisma.-Distrib. Europe (Arctic), N. Asia, N.W. India.

## 4. TRIG'LOCHIN, $L$. ARROW-GRASS.

Root fibrous. Leaves erect, very narrow, flat or $\frac{1}{2}$-terete. Flowers racemed, small, green, ebracteate. Perianth-segments 6, all similar, cucullate, subequal, deciduous. Stamens 6 , on the base of the perianthsegments, filaments very short; anthers broad, bursting outwards. Ovary 6 -celled ; stigmas 3 or 6 , feathery ; ovules one in each cell or the alternate cells empty, anatropous. Fruit of 3-6 1 -sceded coriaceons carpels, separating from a central axis and dehiscing in front. Seeds erect, terete, testa coriaceous.-Distrib. Temp. regions, many Australian ; species about 10. -Etym. $\tau \rho \in i$ and $\gamma \lambda \times \chi i \nu$, from the 3 pointed carpels.

1. T. palus'tre, L.; leaves filiform, $\frac{1}{2}$-terete throughout, fruit clavate, carpels 3 slender long attached to the receptacle by a point.
Marshes and wet meadows; ascends to $2,000 \mathrm{ft}$. in the Highlands ; fl. June-Aug.-Stem slightly swollen at the base, stoloniferous. Leaves 2-12 in.,
flaceid, faintly grooved on the upper surface. Scape slender, taller. Raceme elongating after flowering, pedicels short. Perianth purple-edged. Anethers purple. Fruit appressed to the scape. Carpels terete at the back, narrowed below, at length falling away from a 3 -quetrous axis.-Distrib. Europe (Aretic), except Turkey, N. Africa, N. Asta, N.W. India, N. America.
2. T. marit'imum, L.; stems tufted thickened at the base, leaves slightly flattened at the tip, fruit oblong of 6 separable carpels.
Salt marshes; fl. May-Sept.-Larger and stouter than T. palustre; scape curved ; raceme longer, not dense-flowered nor much elongating in fruit; Howers larger; fruit not appressed to the scape, and carpels grooved at the back.-DIsTrib. Coasts of Europe (Arctic), except Turkey, N. Africa, salt districts of N. and Central Asia, N. America.

## 5. SCHEUCH'ZERIA, $L$.

A small marsh herb. Rootstock creeping. Leaves erect, slender. Scape leafy; flowers racemose, bracteate. Perianth-segments 6, herbaceous, reflexed, connate at the base, persistent. Stamens 6, hypogynous, filaments short; anthers long, narrow, adnate to the filament, dehiscing outwards. Ovary of 3 carpels connate at the base, stigma sessile; ovules $2-3$ in each carpel, basilar, anatropous. Fruit of $2-3$ inflated spreading follicles. Seeds 1-2, erect, ovoid, testa coriaceous. -Distrib. Europe N. of the Alps (Arctic), N. Asia, Rocky Mts.-Etym. Two Schewchzers, Swiss botanists.

1. S. palus'tris, $L$.; leaves $\frac{1}{2}$-terete, sheaths turgid.

Marshes, rare, Salop, Notts, Chester, York, Perth; absent from Ireland;
fl. July.-Rootstock long, slender, clothed with old leaf-sheaths. Leaves
6-10 in., with dilated brown sheaths and a gland at the tip. Seape stout, curved. Raceme lax, few-flowered; pedicels much lengthened in fruit. Periuntl-segments linear-oblong. Ripe carpels large for the plant.

## 6. Bu'tomus, L. Flowering Rush.

A tall marsh herb. Rootstock creeping. Leaves slender, erect. Scape naked. Flowers in a bracteate umbel. Perianth-seyments 6, oblong, spreading, subequal, all coloured. Stamens 9, hypogynous, 6 in pairs opposite the outer segments, 3 opposite the inner, filaments subulate; anthers basifixed, oblong, dehiscence inwards. Carpcls 6, beaked, connate below; styles short, stigmas sessile; ovules covering the walls of the carpel, anatropous, ascending. Follicles 6, beaked, coriaceous, turgid. Seeds many, minute, ascending, testa thin furrowed ; embryo straight. -Distrib. Europe, Siberia, Dahuria, W. Asia to N.W. India.-Etym. Obscure.

1. B. umbella'tus, $L$.; leaves long slender 3 -quetrous, scape terete. Ditches and river-sides from Cumberland and Durham southwards; naturalized in scotland ; rare in Ireland; fi. June-July.-Rootstock stout. Leaces 3-4 ft., base sheathing, twisted. Flonvers many, 1 in . diam., rose-red ; pedicels $\frac{1}{2} \mathrm{in}$., lengthening in fruit to $2-4 \mathrm{in}$. Anthers and carpels red.

## Order VII. na'tadere.

Submerged fresh- or salt-water plants. Rootstock usually creeping. Stems elongate (rarely 0), jointed, branched, slender. Leaves often floating,
alternate or distichous, rarely opposite, sheathing at the hase, stipules 0 or sheathing and inserted within the petiole sheath. F/owers inconspicuous, 1-2-sexual, green. Perianth 0, or cup-shaped, or of 3-4 inferior valvate green sepals. Stamens hypogynous; anthers 1-2-celled. Ovary of 1-4 carpels; style 1, stigma various; ovules 1 in each carpel, rarely more, erect or pendulous. Fruit of one or more utricles achenes or drupes. Sesd solitary, testa membranous, albumen 0 ; embryo straight or curved, radicle very large.-Distrib. All climates; genera ahout 20 ; species 100 ?-Affinities. With Alismacece.-Properties. Unimportant.
Tribe I. potame'ze. Spathe 0. Flowers in spikes or clusters, solitary, 1-2 sexual. Stigma subcapitate or shortly decurrent. Embryo curved.
Flowers 2-sexual ; sepals and stamens 4 each....................1. Potamogeton.
Flowers 2 -sexual ; perianth 0 ; stamens 4.
2. Rurpia.

Flowers 1-sexual ; perianth cup-shaped; stamen 1..............3. Zannichellia.
Tbibe II. NA'tADEfe proper. Floucers solitary, axillary, or on a spadix, 1 -sexual, spathe 2 -valved. Stigmas 1-3, slender. Emiryo straight.

> Flowers sessile on a flat linear spadix
> 4. Zostera.
> Flowers axillary.
> 5. Naias.

## 1. POTAMOGE'TON, $L$.

Aquatic herbs. Leaves submerged and translucent, or floating and opaque, ilternate or opposite; stipules connate, membranous or 0 . Flowers 2 -sexual, in axillary or terminal spikes, spathe basal simple. Perianthseyments 4, small, herbaceous, clawed, persistent, valvate in bud. Stamens 4 ; anthers subsessile on the claw of the segments, 2-celled, dehiscence outwards. Ovary of 4 (rarely 1) free sessile carpels, stigma subsessile ; ovule 1 in each carpel, ascending, campylotropous. Drupes 4 (rarely 1), small, green. Seed curved round a lateral process from the cell, testa membranous; embryo hooked or annular, radicular end large pointing downwards, plumule enclosed in the cotyledons.-Distrib. Temp. regions, more rare in trop.; species about 50 .-Еtym. пота $\mu \mathbf{\delta}$, a river, and yeircov, a neighbour.

Section 1. Leuves alternate, or the upper opposite, oblong olovate or lanceolate, not truly linear, margins involute in bud; stipules free.

> *Floweving stem rithout barren branches below; upper leaxes oblong Houting, loner (rarely all) sulmerged; peduncles axillary many-and dense-flowered.

1. P. na'tans, $L$.; submerged leaves 0 or linear or lanceolate, floating broader many-nerved, petiole usually slender, peduncle not enlarged upwards, stipules large not winged, dry drupe obovoid.
Ponds, lakes, and ditches ; fl. July-Sept.-Stem terete. Floating leares 2-6 in., oblong-ovate ohovate or lanceolate, obtuse or acute at the base, olive-green, submerged paler ; stipules 1-4 in. Peduncles very variable in stoutness and length. Irripe (dry) with the ventral margin convex, dorsal $\frac{1}{2}$-circular, keeled below ; beak short.-Distrib. Almost ubiquitous.
Sub-sp. NA'TANs proper; floating leaves coriaceous, blade decurrent along the petiole, submerged linear coriaceous, stipules large, peduncles stout, flowers large dense, dried drupe $\frac{1}{8} \mathrm{in}$. green.-Common at low elevations.
Sub-sp. Polygonifo'Lits, Pourvet (sp.); leaves smaller, lower submerged linear
or obovate-lanceolate membranous rarely suberect and emersed, upper floating (var. tuitans) or erect, stipules large, peduncles slender, spike and flowers smaller, dried drupe is in. red. $P$. oblongus, Viviani.-Lakes and pools, especially on heaths ; ascends to near $1,600 \mathrm{ft}$. in the Lake District.
Sub-sp. plantagin'eus, lucros; leaves all more membranous ovate or oblong obtuse or cordate at the base, stipules shorter, peduncle more slender, dried drupe 友 in. green.-Local. $_{\text {in }}$
Sub-sp. Kır'кі, S'yme; lower leaves very narrow linear-lanceolate, upper sometimes submerged long-petioled oblong-lanceolate, stipules very long. $P$. sparganiífolius, Bab. not Læst.-Ma'am, Co. Galway.
2. P. rufes'cens, Schrad.; leaves translucent, lower submerged linearlanceolate many-nerved, upper floating or erect rarely subinerged broader subcoriaceous, petiole short, stipules large, peduncle stout not enlarged upwards, dry drupe ovoid acuminate. $P$. Aluitans, Sm, not Schrad.
Ponds, canals, and ditches from Isla and Caithness southwards ; ascends to $1,500 \mathrm{ft}$. in the N. of England ; fl. 'July-Sept. - Stems terete, ${ }^{1} \mathbf{- 4} \mathrm{ft}$. Leaves reddish, not toothed, upper 2-5 in., obovate or oblong-lanceolate, obtuse ; lower sessile. Stipules not winged, obtuse, very variable. Peduncle 2-5 in.; spike stout. Drupe (dry) red, ventral margin convex, dorsal $\frac{1}{2}$-circular keeled. - Distrib. Europe (Arctic), Siberia, Dahuria, N.W. India, N. America. The acuminate fruit is a good character for this species.
** Flowering stem with copious barren branches below; upper leaves floating,
broader than the submerged lower; psduncles axillary and terminal, many-
and dense-flowered.
3. P. heterophyl'ius, Schreb.; stem slender, submerged leaves linearlanceolate, stipules small, peduncles stout thickened upwards.
Pools, lakes, \&cc., rather local, from Kent and Dorset northwards ; absent from Ireland ; fl. July-Sept. - Stem terete, 2-4 ft., green or reddish. Leaves, submerged 1-3 in., sessile, flaccid, acuminate or euspidate; floating 0 , or similar, or oblong petioled and coriaceous. Peduncles axillary and terminal. lrupe (dry) $\frac{1}{\frac{1}{2}}$ in., ventral margin nearly straight produced into a short beak, dorsal $\frac{1}{2}$-circular 3-keeled.-DIsTrib. Europe (Arctic).
Sub-sp. heterophyl'lus proper; leaves not amplexicaul almost flat, upper opposite coriaceous floating. P. gramineus, Fries and Koch.
Sub-sp. ni'tens, Weber; (sp.) branches many rooting from the upper axils, leaves alternate all submerged recurved undulate, peduncles less thickened upwards, dried drupe smaller.-Bute, Perth, Elgin, Nairm, and Ireland, very rare. Foreign specimens (authentically named) approach $P$. perfoliatus.
Sub-sp. ? Lonchi'tis, Tuckerman (sp.); leaves more linear, usually all submerged $\frac{1}{2}$-amplexicaul straight $7-9$-ribbed, upper long-petioled, peduncles slightly thickened upwards (drupe obliquely obovate, unknown in Britain, hence the identification is doubtful). P. salicifolius, Wolfg. ?-River Boyne.
4. P. lanceola'tus, Sm.; stem filiform fragile, leaves sessile straight linear- or oblong-lanceolate obtuse, upper opposite sometimes floating jetioled, stipules slender acuminate, peduncles short not thickened upwards.
River Lligwey in Anglesea ; fl. July-Ang. - Similar to slender forms of $P$. heterophyllus, but the leaves are darker green, very obtuse, usually narrower, and the axillary spike is very short ovoid. Fruit unknown, though the plant was discovered in 1808.-Syme doubtfully refers the $P$. nigrescens of Fries' Mantissa to this. Fries' Herb. Normale plant is quite different.
5. P. lu'cens, L.; stem stont, leaves large all translucent sulsessile linear- or oblong-lanceolate undulate serrulate, upper opposite often iloating, stipules large long 2 -winged, peduncles robust thickened upwards.
Lakes, ponds, and streams from Aberdeen and Argyle to Devon and Kent ; fl. July-Sept.-The largest British species, very lucid and glistening. pale green. Stem $3-5 \mathrm{ft}$. Leaves $4-10 \mathrm{in}$., chiefly submerged, very variable, many-nerved, most serrulate towards the long or short tip; upper rarely floating, broader. Peduncles very variable in length; spike stont, usually dense-flowered. Drupes (dry) in in., convex on both faces, heak obtuse. Distrib. Europe, N. Africa, Siberia, Dahuria, N.W. India, N. America.The following varieties are not constantly distinguishable.
Var. 1, le'cens proper ; leaves shortly petioled strongly serrulate apieulate or mucronate, peduncles not twice as loug as the spike.--Var. 2. ucmmincitus, Schum. (sp.) ; leaves shortly petioled narrow acuminate, peduncle more than twice as long as the spike.-Var. 3, decipiciens, Nolte (sp.); leaves sessile cuspidate serrulate at the tip, stipules shorter scarcely winged, peduncles not twice as long as the spike. In a canal at Bath.
P. longifo'lius, Gay, is referred by Gren. and Godr. rightly to $P$. luceme, and is no doubt its var. acuminatus. The Lough Corrib plant, referred by Babington to Gay's longifolius, has much narrower not serrulate leaves, and small seattered flowers; only one specimen is known.
*** Flowering stem with burven branches below ; leaves $\frac{1}{2}$ or wholl!! amploxicuenl, all submeryed, uniform, oblong or ocate-oblony, upper opposite.
6. P. prælongus, Wulf.; stem stout, leaves usially concave at the tip $\frac{1}{2}$-amplexicaul ohtuse 3 -nerved, stipules large obtuse not wingerl, peduncles long stout, spike stout, dry drupe sharply keeled.
Lakes and deep rivers, chiefly on the East from Nairn to Berks and Surrey ; very rare in Irelend ; fl. June-July.-Almost as large as $P$. lucens and much like it in habit, but barren branches few. Stem terete. Lecuws 3-9 in., 1-14 in. hroad, linear-oblong, mid-rib dilated, its vascular bundles remote appearing like a band of parallel fibres, upper opposite. I'edumels usnally longer than the leaves, hardly thickened upwards. spip usually dense-flowered. Drupe (dry) much as in $P$. lucens, but more sharply keeled.-Distrib. Europe (Arctic), Himalaya, America.
7. P. perfolia'tus, L. ; stem stout, leaves ovate-cordate amplexicaul obtuse quite entire $5-7$-nerved, tip flat, stipules small subacute disappearing early, peduncles short stout, spike dense-flowered.
Ponds, lakes, and streams ; ascending to $1,200 \mathrm{ft}$. in Yorkshire ; fl. July-Sept. -..stem terete branches dichotomous. Leaces 1-2 in., upper opposite, translucent. Peduncles terminal in the forks, axillary, not thickened upwards. Nepals long clawed. Imipe (dry) in in., compressed, hardly keeled, heak short.-Distrib. Europe (Arctic), N. Africa, N.W. India, America.
8. P. cris'pus, L.; stem slemder, leaves distichous $\frac{1}{2}$-amplexicaul ohlong aeute or obtuse crisped serrulate 3 -nerved, stipules small ohtuse disuppearing carly, peduncles tapering uiwards curved, flowers few small.
Ponds, ditches, \&ce. from Elgin and Isla to Devon and Kent ; fl. July-Aug.-Stom dichotomously branched, compressed. Lawes $11-3 \mathrm{in}$. close-set spreading or recurved. Peduncles stont or slender, laxly 6-8-flowered. Inupe (diry) $\frac{1}{6}$ in., obliquely ovoid, acuminate, compressed, beak long. -DIstrib. Europe, Siberia, India.

Section 2. Leaves all opposite, margins involute in bud ; stipules 0 .
9. P. den'sus, L.; stem slender, leaves subopposite distichous ovatecordate 3-5-nerved, peduncles very short, spikes few-flowered.
Ponds and streams, from the Forth and Clyde to Devon and Kent ; ascending to $1,000 \mathrm{ft}$. in the Lake District ; very local in Scotland and Ireland ; fl. July -Sept.-Branches dichotomous. Leuces $\frac{1}{2}-1$ in., close-set, recurved, acute or acuminate, keeled, serrulate, translucent, apparently opposite, the nodes of the pairs being confluent, but their bases overlap. Peduncles rarely longer than the leaves, laxly 3 - 6 -flowered. Drupes (dry) oblique, almost orbicular, compressed, sharply keeled, beak recurved.-Distrib. Europe from Denmark southwards, N. Africa.

Section 3. Leaves alternate, or the upper opposite, all similar, linearlignlate, not broader in the middle, margins flat in bud; stipules free.
10. P. compres'sus, L.; stem compressed winged, leaves $\frac{1}{2}$-amplexicaul acuminate $3-5$-nervel, stipules large acuminate, peduncles longer thau the spikes. P. zosterafolius, Schum. ; P. cuspidatus, Sm.
Lakes, ditches, \&c. rare, from Forfar and Perth southwards ; Co. Down in Ireland; fl. July-Aug. -Ntem $\frac{1}{8}-\frac{1}{4} \mathrm{in}$. broad, internodes long, nodes constricted. Leuves 2-8 in., $\frac{1}{6} \frac{1}{4} \mathrm{in}$. broad, dark green, with 3 strong and many slender nerves. S'pikie slender, interruptedly many-flowered. Floxers small. Drupe (dry) $\frac{1}{6}$ in., subroniform, compressed, obtusely kecled ; beak short, stout, re-curved.-Distrib. Europe, N. America.-I follow Fries and Tuckerman in referring this to $P^{\prime}$. compressus, L., though not the plant of Linn. Herl.
Sub-sp. Compres'sus proper; stem broad stout, leaves $4-8 \mathrm{in}$. often $\frac{1}{4} \mathrm{in}$. broad, peduncles $2-3 \mathrm{in}$. many-flowered, drupe $\frac{1}{8}$ in. slightly gibbous at the hase.--Perth, Forfar, Surrey, and Co. Down in Ireland.
Sub-sp. AcUTIFo'lius, Link (sp.); smaller, more slender, less branched, leaves 2-4 in. $\frac{1}{8}-\frac{1}{6} \mathrm{in}$. broad more acute, peduncles and spike very short few, flowered, drupe $\frac{1}{8} \mathrm{in}$. more curved toothed towards the base, beak longer.Norfolk and Lincoln to Surrey and Dorset, rare ; absent from Ireland.
11. P. obtusifo'lius, Mert. and Koch; stemi slender compressed 4fronous much branched, leaves sessile $2-3$-nerved subacute or obtuse, stipules very ohtuse, peduncles very short longer than the spike, drupe (dry) shortly beaked. P. gramineus, Sm. not L.
Ponds and ditches, rare, from Lanark and Kincardine to Devon and Kent; local and rare in Ireland; H. July-Aug.-Stem flexuous, not winged. Leaves $2-6 \mathrm{in}$., $\frac{1}{8}-\frac{1}{6}$ in. broad, dark green, rather opaque, with no nerves between the 3 principal ; stipules $\frac{1}{2} \mathrm{in}$., tip broad. Peduncles much shorter than the leaves, termmal in the forks, equalling or exceeding the densely few-flowered spiike. Drupe (dry) compressed, broadly obliquely ovoid, keeled; beak straight. In a specimen from Chilsworth (Herb. Borver) the lateral nerves are absent or very obscure.-Distrib. Europe, W. Siberia, N. America.
12. P. pusil'lus, L. ; stem filiform slightly compressed, leaves $\frac{1}{2}$-am1/lexicaul narrow linear 1-3-nerved acute, stipules small acnte, peduncles terminal in the forks slender, spike few-flowered.
liivers, ponls, and ditches, ascending to $1,000 \mathrm{ft}$. in the Highlands ; fl. JulyAug. - Stome often much branched. Leewes $\frac{1}{2}-2 \mathrm{in}$., $\frac{1}{2}-\frac{1}{1} \frac{\mathrm{in}}{}$. broad, rarely acuminate, rather opaque green. Peduncles usually much longer than the spike. Spike of 6-10 minute flowers. Lrupe (dry) small, turgid, obliquely
ovoid, obscurely keeled ; beak subterminal, stout.-Distrib. Europe (Arctic), N. Africa, Siberia, N. America.

Var. 1, pusil'lus proper; leaves acute 3-nerved.-Var. 2, tenuis'simus, Fries (sp.); smaller, leaves acuminate $1-3$-nerved more spreading. $P$. grucilis, Bab. not Fries.-Var. 3, mucrona'tus, Schrad.; stem more compressed, leaves broader 3-nerved. $P$. compressus, Sm . Seems intermediate between $P$. pusillus and obtusifolius.
13. P. trichoi'des, Cham.; stem capillary repeatedly branched, leaves $\frac{1}{8}$-amplexicaul setaceous 1 -nerved, stipules acute, peduncles filiform much longer than the few-flowered spike, drupe solitary shortly beaked.
Muddy ponds and ditches in Norfolk ; fl. July-Aug.-Stem dichotomously and divaricatingly branched. Leaves $1-2 \mathrm{in}$., dark green, rigid, spreading, acuminate ; stipules slender. Peduncles curved, longer than the leaves. Flocers 3-6, very minute. Drupe (dry) Ars in., compressed, obliquely ovoid, more or less tubercled on the dorsal face.-Distrib. Europe from Belgium southwards and eastwards to Austria, Italy, and Russia, N. America.
Section 4. Leaves all similar, submerged, truly linear, margins flat in bud ; stipules adnate to their bases and forming a sheath with them.
14. P. pectinatus, L.; stem filiform, branches dense distichous, leaves very long linear or filiform acuminate $1-3$-ribbed, peduncles usually long filiform, flowers few remote, drupes shortly beaked.
Ditches, canals, \&c., fresh and brackish ; fl. June-July.-Root a small tuber. Stems repeatedly branched, forming dense masses. Leaves $3-8 \mathrm{in}$., $\frac{1}{3} \frac{1}{6} \mathrm{in}$. broad, lower sometimes 3-5-nerved, sheathing portion often $1-1 \frac{1}{2} \mathrm{in}$., tips of the stipules free. Peduncles not thickened upwards. Flowers in interrupted whorls. Drupes very large for the plant, $\frac{1}{6}$ in., dimidiate-obovoid, turgid; ventral margin slightly convex; dorsal obscurely keeled.-DIsTRIB. Europe (Arctic), N. Africa, Siberia, India, N. America.
Sub-sp. Pectina'tus proper; upper leaves setaceous 1 -nerved channelled (composed of 2 parallel tubes) lower flat 3 -ribbed, lateral keels of drupe conspicuous.-P. mari'nus, Huds., is a var. with stems naked below. Common in brackish and fresh water.
Sub-sp. flabella'tus, Bab. (sp.); leaves flat 3-5-nerved, lateral keels of drupe obscure. P. zostera'ceus, Bab. not Fries.-England and Ireland.
Sub-sp. filifor'mis, Pers. (sp.); leaves all setaceous 1 -nerved channelled, drupe smaller not keeled. P. marinus, Linn. Herb.-Scotland and Ireland.

## 2. RUP'PIA, $L$.

Slender brackish-water herbs. Leaves submerged, filiform; stipules sheathing. Flowers minute, 2-sexual, usually 2 on a short filiform peduncle (female greatly lengthening), arising from the spathaceous leafsheaths. Perianth 0. Stamens 4, filaments short broad ; anthers attached by the back ; cells reniform distant, dehiscence vertical ; pollen a curved tube with 1 median and 2 terminal nuelei. Ovary of 4 sessile carpels, stigma sessile peltate ; ovules 1 in each carpel, pendulous. Drupes longpedicelled, ovoid, carried up on the greatly lengthened usually spirally coiled peduncle. Seed pendulous, testa thin ; radicle large ovoid, cotyledon small hooked subterminal.-Distrib. Temp. and trop. regions; species 1 or more.-Етум. H. B. Ruppius, a botanical author.

1. R. marit'ima, $L$.; leaves opposite and alternate.

Brackish ditches, \&c. in England and Ireland, chiefly in the E. of Scotland; f. July-Sept.-Habit of Potannogeton pectinatus. Stem filiform, much branched, 2 ft . and upwards. Leaves $1-3 \mathrm{in}$.; stipules adherent and forming the leaf-sheath. Peduncle short and straight in flower, then lengthening to 5-6 in. Drupe $\frac{1}{8}-\frac{1}{6}$ in., green, beaked, pedicels 1-2 in.-Distrib. All shores, temp. and trop.
Sub-sp. Marit'ima proper ; sheaths inflated, fruiting peduncles spirally coiled, anther-cells oblong, drupe nearly straight, beak short. R. spira'lis, Hartm. -Yorkshire to Somerset ; rare in Ireland.
Sub-sp. Rostella'ta, Koch (sp.); sheaths appressed, fruiting peduncles short flexuous, anther-cells subglobose, drupe gibbous, beak longer.Common ; flowers earlier.

## 3. zannichelília, L. Horned Pond-weed.

Slender water-plants. Leaves submerged, usually opposite, linear; stipules adherent to the sheathing leaf-base. Flowers minute, 1- or 2sexual, solitary or in pairs, sunk in the leaf-sheath. Perianth 0. Stamen 1 ; anther 2 -celled, sagittate, cells adnate to the slender filament, dehiscence lateral, connective excurrent ; pollen globose. Ovary of 4-6 carpels in a short sheath; styles long or short, stigma peltate persistent; ovule pendulous, anatropous. Achenes 4-5, sessile or pedicelled, oblong, curved. Seed pendulous, testa membranous; radicle large, clavate; cotyledon slender, twice folded.-Distrib. Temp. and trop.; species 1 or several.Etym. Zannichelli, a Venetian botanist.

1. Z. palus'tris, L.; achenes curved, keel tubereled.

Fresh and brackish ditches and pools; fl. May-Aug.-Annual. Stem 3-6 in., filiform or setaceous; branches divaricate. Leuves 1-3 in., opposite, subwhorled, often capillary. Flowers sessile or shortly pedicelled. Achenes narrow, ventral surface concave, dorsal convex.-Distrib. Europe, N. Africa, Siberia, India.
Sub-sp. Palus'tris proper; ripe carpels subsessile spreading, dorsal face shortly winged and tubercled, style stout. Z. major, Hartm.
Sub-sp. pedicella'ta, Fries (sp.); ripe carpels stipitate longer and narrower, dorsal face winged and tubercled, style long slender.

## 4. Zoste'ra, L. Grasswrack.

Grass-like marine plants; rootstocks matted, creeping. Stem compressed. Leaves distichous, sheathing, long, liuear ; stipules adherent to the sheathing leaf-base. Flowers in 2 parallel series of alternating anthers and ovaries on one surface of a linear membranous spadix, which is enclosed in the sheath of a pedicelled leaf-like spathe. Perianth 0. Anthers sessile, 1-celled, dehiscence longitudinal ; pollen of simple slender cells. Carpel 1, ovoid, fixed laterally ; style subulate, persistent, stigmas 2 capillary exserted from the spathe, deciduous; ovule pendulous from the point of attachment, orthotropous. Fruit membranous, dehiscing vertically. Seed ovoid, testa tough; embryo large, ovoid, with a small uncinate subulate plumule in a lateral fissure.-Distrib. Various coasts; species 2.-Етум. ऽwotv́p, a riband.

1. Z. marina, $L$. ; spathe dilated above the peduncle, its blade long, spadix many-flowered margin entire.
Muddy and sandy estuaries near low-water mark ; fl. July-Sept.-Rootstock slender, rather fleshy. Leaves $1-3 \mathrm{ft}$., $\frac{1}{8}-\frac{1}{3} \mathrm{in}$. broad, obtuse, bright green, opaque, 1-7 nerved. Spathe, including the leafy portion, 6-10 in., varying in breadth as the foliage does. Spadix 1-3 in. Flowers green, usually in series of 2 anthers (perhaps one 2-celled anther) and an ovary. Fruit $\frac{1}{4} \mathrm{in}$. furrowed. - Distrib. Most temp. coasts (Arctic).
Var. 1, mari'ua proper; leaves $\frac{1}{4}-\frac{1}{3} \mathrm{in}$. broad 3-7-ribbed.-Var. 2, ungustifo'lia, Syme ; leaves $\frac{1}{8}-\frac{1}{4} \mathrm{in}$. broad $1-3$-nerved.
2. z. na'na, Roth ; spathe dilated above the peduncle, its blade short, spadix few-flowered, margin with inflexed membranous appendages.
Estuaries, rare, from Forfar and Argyle to Sussex and Dorset; Dublin Bay ; fl. July-Sept.-Similar to Z. marina, var. angustifolia, but leaves not mure than 6 in . by $\frac{1}{8}-\frac{1}{6}$ broad, 1-3 nerved; fruit shorter and very obscurely striate. -Distrib. Atlantic coast of Europe, N. Africa.

## 5. NA'IAS, $L$.

Very slender fresh-water herbs. Leaves submerged, linear, opposite fascicled or whorled; stipules adnate to the leaf-base. Flowers 1 -sexual, solitary or crowded on short branchlets.-Mace. Spathe membranous, tubular, toothed. Stamen 1, filament at length elongating ; anther subsessile, 4-celled ; pollen large, globose.-Female naked. Carpel 1, ovoid, sessile; style short, stigmas 2-4 persistent subulate; ovule basal, erect, anatropous. Drupe small, epicarp thin, separable. Seed ovoid, testa thin; embryo ovoid, oblong, radicular end largest.-Distrib. Various climates; species 8.-ETYM. vulas, a water-nymph.

1. N. flex'ilis, Rostkov.; leaves opposite or 3 in a whorl.

Lakes near Roundstone, Connemara; female plant only ; f. Aug.-Sept.Stem filiform, branched, brittle. Leaves $\frac{1}{2}-1 \mathrm{in}$., very slender, linear, quite entire or remotely serrulate ; sheaths ciliate. Flowrers monœecions, $2-3$ or solitary. Drupe $\frac{1}{\frac{1}{8}}$ in.-Distrib. Europe, Asia, America.

## Order ViIl. hiliaceez.

Root bulbous or fibrous, or rootstock creeping. Stem rarely shrubhy or arborescent. Flowers 2-rarely 1 -sexual. Perianth herbaceous, petaloid, inferior ; segments 6 in 2 series, rarely 4,8 , or 10 , free or connate, imbricate (rarely valvate) in bud. Stamens 6 ( 3 in Ruscus) hypugynous or inserted on the perianth, filaments long or short; anthers ohlong or linear. Ovary 3 -celled; styles 1 or 3 , rarely 0 , stigma simple or 3 lobed; ovules 2 or more in the inner angle of each cell, anatropous. Fruit a 3-rarely 1-2-celled capsule or berry. Seeds 1 or more in each cell, albumen horny or fleshy; embryo small, often minute, terete, radicle mext to or distant from the hilum,-Distr'b. . 111 climates; genera abou: 170 ; species ahout 1,500.-Affinities. With Juncere.-Properties various.

## Series 1. Rootstock creeping. Fruit a berry.

Tribe I. TRillide'fe. Stem with 1-2 whorls of reticulate-veined leaves. F'lorers not jointed on the pedicel. Styles free. Testa coriaceous or fleshy. Radicle next the hilum.

1. Paris.

Tribe II. Asparagi'nefe. Pedicel jointed. Styles combined or stigma sessile. Testa various. Radicle far from the hilum.

> * Stem lranclied. Flovers often 1-sexual.

Flowers axillary, pedicels jointed in the middle.
Flowers on the surface of a leaf-like branch
** Stem simple. Flovers 2 -sexual.
Scape leafless. Flowers racemose, subglobose
4. Convallaria.

Stem leafy. Perianth tubular, 6-cleft............................5. Polygonatum.
Stem 2 -leaved. Perianth-segments 4
6. Smilacina.

Series 2. Root of thick fleshy fibres. Fruit capsular, loculicidal.
Tribe III. ANTheri'cefe. Flowers jointed on the pedicel. Style simple. Testa black, brittle. Raulicle next the hilum.
7. Simethis.

Series 3. Root bulbous. Flozers not jointed on the pedicel. Fruit capsular.
Tribe IV. Lilie'压. Styles combined or stigma sessile. Capsule loculicidal. Testu various, Radicle next the hilum.

* Scape leafless. Flowers usually bracteate. Floncers racemose or sulracemose.
Perianth-segments free, blue or pink

8. Scilla.

Perianth globose, 6 -toothed
9. Museari.

Perianth-segments free, white.
Flowers umbelled, capitate or corymbose.
Bracts of 1-2 large membranous spathes.
11. Allium.

Bracts of 1-2 linear green leaves 12. Gagea.
** Stem leafy. Flowers usually ebracteate, segments free.
Flower subsolitary, small, white. Nectary transverse .............13. Lloydia.
Flower large drooping. Nectary oblong.............................14. Fritillaria.
Flower solitary, large. Nectary 0. Stigma sessile .................14*. Tulipa.
Flowers many, large. Nectary 0. Style long......................14**. Litium.
Tribe V. ColCHiCE'尼. Styles free. Capsule septicidal. Testa various. Rudicle distant from the hilum......................................15. Colchicum. Series 4. Rootstock creeping. Fruit capsular.
Tribr VI. Vera'treet. Styles free. Cupsule septicidal. Testa thin, sometimes lax at each end. Radicle next the hilum..........16. Tofieldia.
T'ribe ViI. narthe'cieze. Style very short. Capsule loculicidal. Testa produced and filiform. Rudicle next the hilum............17. Narthecium.

## 1. Par'is, L. Herb Paris.

Rootstrck stout. Stem simple, with 1 whorl of usually 3-9 leaves. Srpals 3-5, lanceolate. Petuls as many, filiform. Shamens 6-12, hypogynous ; aathers adnate, cells narrow ; connective sometimes produced. Ocary subglobose, 4-6-lobed and -celled; styles 4-6, free, stigmas decurrent; cells 4- or more-ovuled. Berry indehiscent or 4-6-valved. Secds few or many, testa coriaceous or fleshy, albumen horny; embryo terete, radicle next the hilum.-Distrib. Europe, N. Asia, Himalaya; species 2-3.Etym. par, equal, from the 4-nary parts of $P$. quadrifolia.

1. P. quadrifo'lia, $L$.; leaves ovate-oblong or obovate.

Woods from Renfrew and Moray southwards, local ; absent from Ireland ; f. May-June. - Glabrous. Rootstock white, creeping. Stem 6-12 in., terete, leafy at the top, sheath basal. Leaves 4 (rarely 3-8), 3-5 in., acute, 3-5nerved. Flower $1 \frac{1}{4}-1 \frac{3}{4} \mathrm{in}$. diam., solitary; peduncle $\frac{1}{2}-3 \mathrm{in}$., erect. Sepals green, acuminate. Petals as long, yellow. Connective much produced. Berry 4-6-celled, black, bursting irregularly. Seeds black, testa coria-ceous.-Distrib. Europe (Arctic), Siberia, W. Asia.-Rootstock purgative.

## 2. Aspar'agus, $L$. Asparagus.

Rootstock stout, creeping. Stem slender, branched, terete or angled (sometimes spiny and climbing). Leaves minute scales, bearing in their axils fascicles of needle-like branches (cladodes). Flonvers small, 1-2sexual, pendulous, axillary; pedicel jointed. Perianth campanulate, segments connate at the base. Stamens on the base of the segments; anthers oblong. Ovary 3 -gonous; styles combined, stigmas 3 ; cells several-ovuled. Berry globose. Seeds 3-6, testa black brittle ; embryo dorsal, clavate, radicle far from the hilum.-Distrib. Temp. and trop. Asia, Africa; species 60-70.-Етум. The old Greek name.

## 1. A. officina'lis, $L$.; stems erect terete flexuous, branches slender.

Coasts of England, from Anglesea and Suffolk southwards, rare and local ; naturalized only in Scotland ; S.E. of Ireland ; fl. June-Aug.-Stem 1-2 ft., annual; young shoots scaly below, seales triangular. Cladodes $\frac{1}{4} \frac{-1}{2} \mathrm{in}$. Flowers 1-2, $\frac{1}{4}$ in., axillary, dirty white, or yellow with red veins; pedicel as long, jointed at the middle. Berry $\frac{1}{4}$ in. diam., red.-Distrib. Europe, N. Africa, Siberia ; introd. in N. America.-Diuretic. The origin of the garden Asparagus, cultivated since the Roman period.

## 3. RUs'Cus, L. Butcher's Broom.

Shrubby, evergreen, subdiœcious. Rootstock stout, creeping. Leaves minute scales, bearing in the axils leaf-like branches (cladodes). Flowers minute, often on the face of the cladode. Perianth herbaceous, persistent; segments 6, spreading, inner smaller, all partially valvate in bud. Stamens 3, filaments connate in a short stout column; anthers sessile, cells diverging below. Ovary enclosed in a fleshy cup (staminal) 3-celled; style short, stigma discoid; ovules few. Berry usually 1 -celled. Seed 1, globose, or 2, plano-convex; testa thin, adherent, albumen horny ; embryo minute, lateral, radicle far from the hilum.1) istrib. Temp. Europe, W. Asia, N. Africa; species 4-5.-Etym. Obscure.

1. R. aculea'tus, $L$.; cladodes ovate rigid spinescent.

Copses and woods, from Suffolk and Glamorgan southwards, rare ; naturalized in Scotland and Ireland ; fl. Feb.-April.-Stems 10-24 in., tufted, branched, erect, stout, angled, shoots scaly when young. Cladodes $\frac{1}{2}-1 \frac{1}{2} \mathrm{in}$., twisted at the base. F'oucers 1-2, $\frac{1}{\frac{1}{8}} \mathrm{in}$. diam., bracteate and bracteolate, males on narrower cladodes, very shortly pedicelled. Berry $\frac{1}{3}$ in. diam., bright red.
-Distrib. Europe from Belgium southwards, N. Africa, W. Asia.

## 4. Convalla'ria, $L$. Lily of tife Valley.

A stemless herb. Rootstock creeping. Leaves 2-3, sheathed at the base. Scape slender; flowers racemose. Perianth shortly campanulate, segments connate, tips free recurved. Stamens on the base of the perianth, included; anthers subsagittate. Ovary ovoid, terete; style simple, stigma 3 -gonous ; cells 2 -ovuled. Berry globose. Seeds 2-3, subglobose, testa thin white adherent, albumen horny; embryo dorsal, radicle far from the hilum.-Distrib. Europe, N. Asia.-Etym. convallis, a valley.

1. C. maja'lis, $L$.; leaves ovate-lanceolate petioled.

Woods from Moray to Kent and Somerset ; ascending to $1,000 \mathrm{ft}$. in the N . of
England; naturalized in Scotland and Ireland; fl. May-June.-Leuves
6-8 in.; petiole long, slender, sheathing. Scape 6-10 in., angular ; bracts membranous ; raceme 6-12-flowered ; pedicels curved. Flowers $\frac{1}{3} \frac{\mathrm{in} \text {. diam., }}{\text { d }}$ white, drooping, almost globose. Berry red.

## 5. POLYGONA'TUM, Tournef.

Rootstock creeping. Stem leafy. Leaves alternate opposite or whorled. Flowers axillary, solitary or racemed, pendulous, white green or purplish, ebracteate. Perianth tubular-campanulate, mouth 6 -cleft, outer lobes subvalvate with replicate edges. Stamens on the middle of the tube, included. Ovary and fruit of Convallaria.-Distrib. Europe, N. Asia, Himalaya, N. America; species about 20. - Etym. aodús and yóvv, alluding to the many nodes (knees).

1. P. verticilla'tum, All.; stem angled, leaves whorled narrow-lanceolate, filaments papillose.
Wooded banks and glens, Bellingham Northumberland ; Athol, Rattray and
Dunkeld in Perthshire ; fl. June-July.-Stem 2-3 ft. Leaves 3-5 in., sessile,
3-6 in a whorl (rarely 1 or 2), flaccid, margins and veins beneath ciliolate.
Peduncles $\frac{+-3}{4}$ in., 1-3-flowered. Perianth $\dagger$ in., greenish, contracted in the middle. Berry in. diam.-Distrib. Europe (Arctic), Siberia, Himalaya.
2. P. multiflo'rum, All.; stem terete, leaves alternate subbifarious or secund oblong $\frac{1}{2}$-amplexicaul, filaments pubescent. Solomon's Seal.
Woods, from York to Kent and Devon ; rare and often naturalized, as in
Scotland and Ireland ; fl. May-June.-Stem 2-3 ft., naked below, arched.
Leaves 3-5 in., very shortly petioled, acute or obtuse. Peduncles 2-5.
flowered. Perianth $\frac{2}{3}$ in., greenish-white, constricted in the middle. Berry
$\frac{1}{3}$ in. diam., blue-black.-Distrib. Europe, Siberia, Dahuria.
3. P. officina'1e, All.; stem angled, leaves alternate oblong subbifarious $\frac{1}{2}$-amplexicaul, filaments glabrous.
Wooded limestone cliffs, from the Border to Somerset and Wilts ; rare and local ; absent from Ireland and Scotland; fl. May-June.-Stem. 6-12 in., arched. Leaves 3-4 in., subacute. Peduncles 1-3-flowered. Perianth 1 in., greenish-white, tubular, constricted at the base. Berry $\frac{1}{\text { in }}$. diam., blue-black.-Distrib. Europe, Siberia, Dahuria.

## 6. SMILACI'NA, Desf.

Rootstock slender, creeping. Stem erect, leafy. Leaves alternate. Flowers white, terminal, racemed. Perianth of 4 free segments in 1 series,
or 6 in 2 series, deciduous. Stamens 4 or 6 , on the bases of the perianthseginents. Ovary 2-8-celled; style short, simple, stigma obscurely 2-3lobed; cells 1-2-ovuled. Berry and seeds as in Concullaria.-Distrib. N. temp. zone ; species about 10.-Etys. Diminutive of Smilax.
' 1. S. bifo'lia, Kcr; leaves cordate acute. Maianthemum, Desf.
Woods, very rare, wild at Hackness, Yorkshire, and probably in Lancashire and Bodforishire ; fl. May-June.-Glabro is or pubeseont. Stem 4-8 in., flexuous. Rudical leaves $1 \frac{1}{2}-2 \frac{1}{2}$ in., base deeply 2 -lobed, many-nerverl, longpetiolel; cauline 2-3, short-petioled or upver sessile. Ruceme 1-2 in., 8-10-Howered; pedicels slender, solitary or 2-3; bracts minute. Florers. $\frac{1}{3} \mathrm{in}$. diam., 4 -merous, suberect, fragrant. Bervy $\frac{1}{4} \mathrm{in}$. diam., apiculate, white, dotted.-Distrib. Europe (Aretic), excl. Turkey, N. Asia, N. America.

## 7. SIMETHIS, Kuith.

A slender herb. Root of fascicled fibres. Leraves radical, grassy. Scripe panicled, bracteate. Flowers jointed on the pedicel. Periunth spreading, deciduous; segments 6, almost free. Stamens 6 on the base of the perianth-segments, filanents woolly below ; anthers oblong. Ocary subglobose, 3 -eelled; style slender, stigma a point ; ovnles 2 in each cell, superposed. C'apsule 3 -celled. Seeds 6, subglohose, arillate, testa hlack crustaceous shining; embryo long, radiele towards the hilum.-Distists. S.W. France, Spain, Corsica and Sardinia, N. Africa.-Etrm. Classical.

1. s. bi'color, Kunth; leaves linear acuminate. S. planifolia, Wools. Fir woods, Bournemouth ; Derrynane, Ireland ; an alien or denizen, Wutson: fl. June.-Ruot-ribres stout. Leaves 6-18 in., 直in. diam., recurved, surrounded at the hase with torn fibruus brown sheaths, flat or concave. Scope as long, dichotomously branched; bract; slender; pedicels rigid, sleader. Flourers ${ }^{3}$ in. diam., corymbose; serments oblong, obtuse, coneave, purple on the back, white inside. Capsule obtusely angled, $\frac{4}{4} \mathrm{in}$. diam.

## 8. SCIL'LA, $L$. Squill.

Bulb coatel. Lerves radical, linear. Flowers usually racemose, blue, rarely purple or white. Perianth deciluous; segments 6, spreading or conniving, free or nearly so ; nectary 0 . Stamens 6 , on the base of the perianth-segments or above it, filaments subulate ; anthers oblong. Ovary ovoid; style filiform, stigma minute; ovules 4 or more in each cell. Cupsule 3 -anglel, loculicidally 3 -valver. Socds many, testa black, alhumen fleshy; embryo terete, radiele uext the hilum.-Distmb. Chielly Europe and W. Asia ; species about 60.-Erym. Classical.

Section 1. Periunth-segments free, sprealing; stamens inserted on their lases ; anthers purple. Seeds angular.

1. S. ver'na, Huds.; leaves vernal preceding the subcorymbose flowers, bracis as long as the pedicels or longer.
Rocky pastures on the coast, very local, from Cornwall to Shetland ; E. and
N.E. of lreland, very rare ; fl. April-May.-Bulb as large as a hazel-
nut. Leatess 3-10 in., 古 $\frac{1}{6} \mathrm{in}$. broad, recurved, concave. Ncappes 1-2, shorter than the leaves. Flowers $\frac{1}{2} \mathrm{in}$. diam., bright-blue, fragrant; lower pedicels
$\frac{1}{2} \mathrm{in}$. Capsules $\frac{1}{6} \mathrm{in}$. diam.-Distrib. Coasts of France and Spain.
2. S. autumna'lis, L.; leaves autumnal narrow succeeding the shortly racemose flowers, bracts 0 .
Eocks and pastures from Gloucester and Cornwall to Kent, Channel Is. ; H1. July-Sept.-Bull ${ }_{3}^{3}-1 \frac{1}{2}$ in. diam. Leuces 3-6 in., $\frac{1}{2}$-terete, grooved above. Nocupes several, equalling the leaves. Florers $\frac{1}{2}$ in. diam., reddish purple ; pedicels ascending or spreading. Capsule small.--Distrib. W. Europe from France and Belgium southwards, N. Africa.
Section 2. Perianth campanulate, segments connate at the base; stamens below their middle; anthers yellow. Seeds sulglobose.
3. S. nu'tans, Sin.; leaves and flowers vernal, bracts in pairs. Agraphis, Link ; Hyacinthus nonscriptus, L. Bluebell, Wild Hyacinth.
Woods, banks, ¿c., from. Ross southwards; ascends to $1,500 \mathrm{ft}$. in the Lake
District ; fl. April-June.- Bulb $\frac{3}{4}-1 \mathrm{in}$. diam. Leazes $10-18$ in., $\frac{1}{2} \mathrm{in}$. broad, subacute, concave. Scope solitary, tall, stout. Raceme 6-12-flowered; bracts linear, membranous. Flowers 1 in., blue-purple white or pink, drooping ; perlicels short, curved, erect in bud and fruit. Ciupsule subglotose.Distrib. W. Europe from Belgium southwards and east to Illyria.

## 9. MUS'Cari, Tourn. Grape Hyacinth.

Perianth globose, mouth 6 -fid. Stamens on the middle of the tube. included, filaments very short; anthers short. Ovary ovoid, deeply $\because$-lobed; style short, stigma simple; cells few-ovuled. C'apsule 3 quetrous, loculicidally 3 -vaived. Seeds 6 or fewer, as in Scilla.-Distrib. Europe, W. Asia ; species 15-20.-Etym. From the musky scent.

1. M. racemo'sum, Miller; leaves slender prostrate flexuous.

Sandy pastures, Packenham and Cavenham, Suffolk; Hinton, Cambridge ; a denizen, Wratson; H. May.-Bulb small, with bulbils at the base. Leucts 6-10 in., $\frac{1}{2}$-terete, grooved above. Scupe short. Racenve short, cylindrac many-flowered; rachis dilating after flowering ; pedicels slender, lengthening in fruit ; bracts minute. Flowers $\frac{1}{6}$ in. diam., dark blue, upper imperfect. Ciupsule $\frac{1}{6}$ in.-Distrib. Europe from Belgium southwards, N. Africa.

## 10. ORNITHO'GALUM, $L$.

Bulb coated. Leaves all radical, linear. Flowers racemose or corymhose, white. Perianth spreading, persistent; segments 6 , free, with a basal nectariferous gland. Stumens 6, hypogynous, filaments flattened; anthers versatile, linear-oblong. Ovary 3 -quetrous, with 3 glands on the top ; style 3 -gonous, stigma obtuse ; cells many-ovuled. C'apsule grooved, loculicidally 3 -valved. Seeds terete or angled, testa black, rough when dry; embryo cylindric, radicle next the hilum.-Distrib. Europe, N. and W. Asia, N. Africa ; species 50-60.-Etym. The classical name

1. O. pyrena'icum, L.; raceme cylindric many-flowered, pedicels spreading, filaments much dilated to above the middle.
Woods and copses, local, somerset, Wilts, Gloucester, Bedford, Sussex ; fl. JuneJuly. - Bull, 2 in., ovoid. Leares $1-2$-flowered, $\frac{1}{4} \frac{1}{2} \mathrm{in}$. diam., vernal, concave, glaucous, withered at the flowering season. Scupe tall, stout. Raceme 4-ธ in., very many-flowered; bracts subulate. Perianth 1 in . diam.; segments narrow-oblong, greeu, margins white inside. C'apsule $\frac{1}{3}$ in.-

Distrib. Europe from Belgium southwards.-Young shoots eaten, sold at Bath, and called French Asparagus.
O. umbella'tum, L.; corymbs 6-10-flowered, pedicels slender suberect, filaments broadly subulate. Star of Bethlehem.
Copses, meadows, \&c., naturalized ; fl. May-June.-Bulb 1 in., with many bulbils. Leaves $6-8 \mathrm{in} ., \frac{1}{4} \mathrm{in}$. broad, concave, green with a white stripe.
Scape tall ; rachis of corymb elongate after flowering; bracts very long.
Periunth $1-1 \frac{1}{2} \mathrm{in}$. diam. ; segments linear-oblong, white with a dorsal green midrib. Capsule obovoid.-DIstrib. Europe from Sweden southwards.
O. nu'tans, $L$.; racemes few-flowered drooping, filaments broadly dilated upwards 3 -fid.
Copses, \&c., Midland and E. counties from Yorkshire and Durham to Hereford, naturalized; fl. April-May.-Bull 2 in . Leures $1-2 \mathrm{ft}$., $\frac{1}{4}-\frac{1}{3} \mathrm{in}$. broad, concave, glaucous with a white stripe. Ncape as long; bracts long, slender; pedicels curved, $\frac{1}{4}-\frac{1}{3} \mathrm{in}$. Periunth $1-1 \frac{1}{2} \mathrm{in}$. broad; segments lanceolate, white with a dorsal green midrib. Capsule pendulous, broadly ovoid, green, fleshy.-Distrib. Europe from Sweden southwards.

## 11. AL'LIUM, $L$.

Fœetid, pungent herbs. Bulb coated. Leaves radical, flat or terete. Flowers capitate or umbelled; spathes 1-2, membranous. Periunthsegments 6, free, spreading or cempanulate. Stamens 6, hypogynons or on the base of the segments, filaments free or connate below ; anthers oblong. Ovary 3 -gonous, style filiform, simple or 3 -cleft, stigmas simple; ovules few in each cell. C'apsule membranous, top depressed, 3 -lobed, loculicidally 3 -valved. Seeds 1-2 at the base of each cell, turgid or compressed, testa black ; embryo curved, excentric, radicle next the hilum. Distrib. N. temp. regions; species 150 . -Etym. The Latin name for Garlic.

Section 1. Por'rum. Leaves sheathing the seape to the middle. Perianth-segments erect. Three outer filaments broader, tips 3 -fid; lateral cusps subulate, about as long as the antheriferous.

## * Leaves fistular.

1. A. vinea'le, $L$.; leaves flattened or grooved above, spathe solitary short with a long beak, head globose usually bulbiferous. Crow Garlic.
Pastures and waste dry places, from Lanark and Aberdeen southwards, not frequent ; S. and E. of Ireland ; fl. June.-Bulb small. Leuves 8-24 in., strict. Scape longer, cylindric. Flowers हf in., green or pink ; pedicels slender, thick at the tip. Filaments exposed. Bulbils in., green or purplish.- Distirib. Europe, Canaries ; introd. in N. America.
Var. 1, vinea'le proper; heads with flowers and bulbils, perianth-segments olive, midrib pink. Sandhills, rare.-Var. 2, capsulif"erum, Syme; bulbils 0 , perianth-segments pink. Jersey.-VAr. 3, compac'tum, Thuill. (sp.); heads 1 or 2 together, all of bulbils. The common form.
2. A. sphæroceph'alum, $L$.; leaves terete or flattened or grooved above, spathes 2 shortly beaked, head globose dense-flowered.
St. Vincent's Rocks, Bristol ; St. Aubyn's Bay, Jersey ; fl. June-Aug.-Habit of $A$. vineale, but ribs of leaf rough when young, and heads dense, globose, red-purple, without bulbils.-Distrib. Europe from Belgium southwards.

## ** Leaves not fistular, glaucous.

3. A. Scorodop'rasum, $L$.; leaves flat keeled, edges scabrid, sheaths 2 -edged, spathes 2 shortly beaked, heads bulbiferous, stamens not exserted. A. arenarium, Sm. Sand Leek.

Dry pastures and copses, rare, York and Lancaster, to Kirkcudbright, Berwick, Fife and Forfar; fl. May-Aug.-Bulb ovoid, with small stalked bulbils. Leaves $6-8 \mathrm{in}$. $\frac{1}{3}-\frac{2}{3} \mathrm{in}$. broad. Scupe siender. Head lax-flowered ; bulbils purple ; pericels slender. Perianth $\frac{1}{3}$ in., segments red-purple, margins white, keel of outer scabrid.-Distrib. Europe, except Spain.
4. A. Ampelop'rasum, L.; leaves distichous folded, edges scabrid, sheaths cylindric, spathe 1 with a compressed long beak, head often bulbiferous, anthers exserted. Wild Leek.
Rocky banks. \&c., England, naturalized only ; wild in W. Ireland ; fl. July-Aug.-Bulbs large, with often stalked bulbils. Leaves $1-2 \mathrm{ft} ., 1-1 \frac{1}{2} \mathrm{in}$. broad. Scape 3-6 fu., very stont. Heads globose, 3-4 in. diam., very many-flowered, pedicels unequal. Perianth $\frac{1}{3} \mathrm{in}$., white or greenish.-Distrib. Switzerland', Europe S. of the Alps, W. Asia.
Var. 1, Ampelop'rasum proper; head compact, bulbils 0. Steep Holmes in the Severn.-Var. 2, bulbif'erum, Syme ; head compact, bulbils few. Guern-sey.-Var. 3, Balningto'nii, Borrer (sp.) ; flowers few, bulbils very many, pedicels sometimes proliferous. A. Hulleri, Bab. Dorset and Cornwall, doubtfully wild ; Roundstone and Great Arran Is., Ireland.
Section 2. Codono'prasum. Perianth-segments erect or spreading. Filaments all simple or obscurely 3 -fid.
5. A. Schoeno'prasum, L. ; leaves fistular, heads dense-flowered, bulbils 0 , spathes 2 shortly beaked, stamens included. Chives.
Rocky pastures, very rare, N. of England and Cornwall ; absent from Ireland; a native? Watson; fl. June-July.-Bulbs narrow, small, tufted on short rootstocks. Leaves 4-10 in., few, terete or grooved above. Scapes 6-14 in., stout or slender, hollow. Perianth $\frac{1}{3}-\frac{1}{2}$ in., campanulate, pale purple; pedicels short, bulbils 0 . Stamens connate at the very base. Capsule globose, small.-Distrib. Mid. Europe, N. Asia, Himalaya, N. America.
Var. 1, Schoeno' prasum proper; leaves straight, ribs smooth or scaberulous, perianth-segments gradually acuminate. N. of England.-Var. 2, sibiricum, L. (sp.) ; larger, leaves recurved, ribs more scabrid, perianth-segments abruptly acuminate. A. arenarium, Sm. in Eng. Bot. Kynance Cove.
6. A. olera'ceum, $L$.; leaves nearly flat or $\frac{1}{2}$-terete sheathing the cylindric scape to the middle, heads lax-flowered bulbiferous, spathes 2 , beaks slender unequal, stamens equalling the perianth. Field Gurlic.
Borders of fields, \&c., rare, from Fife and Forfar to Devon and Kent; absen from Ireland; fl. July.-Bulbs small. Leaves very slender, variable in breadth and thickness, flat towards the tip, with many striæ, ribs rough. Scapes 10-18 in., very slender. Heads lax-flowered; pedicels flexuous, spreading ; spathes 2-4 in. Perianth campanulate, segments obtuse, pale olive-green pink or brownish. Stamens included, filaments shortly connate, subulate.-Distrib. Europe, W. Siberia, Himalaya.
Var. 1, olera'ceum proper ; leaves narrow $\frac{1}{2}$-terete subfistular grooved above. Devon, Somerset, Gloucester.-VAR. 2, complana'tum, Fries (Boreau, 3p.);

Jeaves broader linear almost solid nearly flat. A. carinutum, Sm. not L. Yorkshire and Northumberland.
7. A. carina'tum, L.; leaves linear chamelled sheathing the eylindric seape to the middle, heads lmbliferous, spathes 2 , beaks long slender very unerfual, stamens at length twice as long as the perianth.
Near Newark ; fl. Aug.-Very similar to A. olevuceam, hut at once distinguished by the long filaments. Leceres flat towards the tip, with 3-5 stris. Flowers bright rose-pink.-Distrib. Europe, except Spain.
8. A. trique'trum, $L$.; leaves linear sharply keeled sheathing the hase of the triquetrous scape, heads lax-flowered, bulhils 0, spathes 2 lanceulate. Herlgebanks and meadows, Guernsey ; fl. April-June.- Bullis ovoid, rather small. Lelless 5-7 in., $\frac{1}{-\frac{1}{3}} \mathrm{in}$. broad, recurved or revolute. Nenpes $10-1 \mathrm{in}$ in., rather stout, bending over in fruit. Flowess secund. Mropins or inclined; perianth $\frac{z}{3}$ in., white, campannlate ; segments linear-oblong : pelicels curved, clavate at the tip. N'tumens short, free, melnded. filan ents slender. Nitigmus 3, distinct, filiform.-Distrib. S. of France, Spain, Italy.
9. A. ursinum, L.; leaves ovate-lanceolate sheathing the base of the 3-gonous scape, spathes 2 ovate acuminate. Ramsons.
cods, hedgebanks, \&c. from Skye and Ross southwards; ascending to $1,200 \mathrm{ft}$. m York-hire ; A. April-June.- Bullss narrow, compressed, on a short rootstock, outer coat filirons. Leazes $4-8 \mathrm{in}$., vernal, acuminate ; petioles 2-4 in. Scupe 6-18 in. Umbel regular, flat-topped; spathes 1 in .; pedicels strict. $1 \frac{1}{2}$ 2 in . ; bulbils 0 . Periunth white; segments spreading. lanceolate, acute. stamens on the base of and shorter than the segments, filaments free slender. Stigma minute. Capsule turbinate.-Distrib. Europe, N. Asia.

## 12. GA'GEA, Salisb.

Bulb coated; coats few coriaceous. Leures radical, linear. Scape with leafy bracts. Floncers yellow, corymbose or umbellate; perianth-segments persistent, free, spreading from an erect base, nectary 0 . Stamens on the base of the segments, filaments flattened subulate ; anthers linear, hasifixel. Orary 3 -gonous or 8 -quetrous; style 3-gonous, stigma obituse; cells many-ovuled. Capsule membranous, loculicidally 3 -valved. Seeds many, sulgglohose, pendulous, raphe thick, testa soft yellow; embryo cylindric, rallicle next the hilum.-Distrib. Europe, N. Asia; species 20.-Етум. Sir Thomas Guye, a British botanist.

1. G. Iu'tea, Ker ; radical leaf solitary ribbed, sheath slender, bracts 1-3. Yellow Star of Bethlehem.
Copses and pastures on the E. from Perth and Moray to Dorset, local and rare ; atisent from Ireland; fl. March-May.-Bulb small, sulglobose, with bulbils at the base. liudical leut linear, 6-18 in., $\frac{1}{2}-\frac{3}{3}$ in. broad. Sictpe short ; bracts 1-3, 2 sometimes opposite ; pedicels $1-2 \mathrm{in}$. I'eriunth $\frac{1}{2}-\frac{3}{4} \mathrm{in}$., opens in forenoon only ; segment- linear-oblong, ohtuse inner narrow west, yellow thin, green on the back.-Distrib. Europe. N. Asia, Himalaya.

## 13. LLOY'DIA, Sulisb.

A small slender herb. Bulb minute, thickly scaly. Ieaves filiform. Stem leafy, slender, 1-2-flowered. Flowers erect ; perianth-segments per-
sistent, free, spreading, equal, yellow or white, with a transverse nectariferous cavity. Stamens 6 , on the base of the segments, filaments filiform ; anthers oblong, basifixed. Ovary 3-gonous; style filiform, stigma obtuse ; cells many-ovuled. Capsule 3 -quetrous, loculicidally 3 -valved at the top. Seeds many, horizontal, 3 -quetrous, testa black rugose; embryo minute, next the hilum.-Distrib. Switzerland, Austria, France, Caucasus, Siberia, Himalaya, N. America.-Etym. Edward Lloyd, an antiquary of last century, who discovered it in Wales.

1. L. seroti'na, Reich.; leaves 3-gonous incurved.

Rocky ledges of the Snowdon range, very rare ; fl. June. -Sheaths of bulb very many and loose. Leaves 6-10 in., cauline shorter. Stem 2-8 in., terete. Pericnth-segments $\frac{1}{2}$ in., white (in England), obovate-oblong, veined with purple. Seeds red-brown till quite ripe.-Flowers in the Himalaya vary from white to primrose-yellow or deeper.

## 14. FRITILLA'RIA, $L$.

Bulbs often clustered; scales few, thick. Stem leafy, 1- or moreflowered. Leaves sessile, not sheathing. Flower drooping; perianth campanulate; segments free, caducous, tips not recurved, nectariferous gland basal. Stamens on the very base of the segments, filaments subulate; anthers oblong or linear, fixed above the base in front. Ovary long, 3gonous; style 3 -grooved, stigmas 3 -glandular on the inner surface; cells many-ovuled. Capsule erect, oblong, 3 -gonous, loculicidally 3 -valved above, margins of valves ciliate. Seeds many, 2 -seriate, horizontal, vertically compressed, margined or winged, testa spongy pale ; embryo terete, radicle next the hilum.-Distrib. N. temp. regions; species 30.-Etym. fritillus, a dice-box, from the chequered petals.

1. F. Melea'gris, L.; leaves linear flat subacute. Snake's Head.

Moist meadows, rare, from Norfolk and Bedford to Sussex and Hants; a denizen, Wutson; fl. May.-Bulb small, of 2-3 turgid seales. Leuves 6-8 in., $\frac{1}{4}-\frac{1}{3} \mathrm{in}$. broad, cauline few, short. Stem 10-18 in. Flower solitary, rarely 2 , $1 \frac{1}{2}$ in., segments narrow-oblong, tesselated with dull purple, rarely almost colourless; mectary narrow. Anthers $\frac{1}{2}$ in., yellow. Seeds close-packed. Distrib. Europe to W. Asia.

## 14*. TU'LIPA, L.

Bulb of few thick convolute scales. Leaves radical and cauline, lower sheathing. Flowers usually solitary, erect or inclined; perianth campanulate, segments free, tips recurved, nectary 0 . Stamens hypogynous, filaments short subulate glabrous or hairy below; anthers fixed by the base, mobile, linear, bursting inwards. Ovary 3-gonous; stigma sessile with 3 radiating lobes; cells many-ovuled. Capsule erect, coriaceous, and seeds as in Fritillaria.-Distrib. Europe, and N. and W. Asia; species 20.-Etym. Tulipan, a turban, in Persian.
T. sylves'tris, L.; perianth-segments elliptic-lanceolate. Wild Tulip. Chalk pits, \&ce possibly wild in Norfolk and Suffolk ; naturalized in pastures and copses elsewhere ; fl. April-May.-Bulb small, ovoid, stoloniferous; scales chesnut-brown. Leaves few, 6-10 in., linear, $\frac{1}{2}-1 \mathrm{in}$. broad, glancous.

Stem 1-2 ft., terete, flexuous. Flowers 2 in ., fragrant. bright yellow; seg. ments elliptic-lanceolate. Filaments woolly at the base. Capsule 1 in ., - acute above and below.-Distrib. Europe.

## 14**. LIL'IUM, L.

Bulb of many imbricate fleshy scales. Leaves all cauline, not sheathing, alternate or whorled. Flowers few or many, large, solitary, erect or drooping; perianth-segments free, caducous, erect below, recurved or revolute above; nectary median, elongate. Stamiens hypogynous or on the base of the segments, filaments subulate; anthers fixed above the base in front, versatile, bursting inwards. Ovary 6 -grooved; style terete, stigma obtuse ; cells many-ovuled. Capsule erect and seeds as in Fritil-laria.-Distrib. Temp. N. regions; species 40.-Etym. Unknown.
L. Mar'tagon, L.; leaves petioled obovate-lanceolate whorled, upper linear, flowers erect racemose. Purple Martagon Lily.
Copses, naturalized near Mickleham, Surrey ; fl. Aug.-Sept. - Bulb large, scales white. Stem 2-3 ft., terete. Leaves 3-8 in., chiefly in a few whorls of 6-8, subacute. Flowers $\frac{1}{2} \frac{\mathrm{in}}{} \mathrm{in}$ diam., drooping; hracts $\frac{1}{2}-1 \mathrm{in}$., green, linear-lanceolate ; pedicels 1-5 in., stout, curved ; perianth-segments oblong, revolute beyond the middle, pale purple or white, with dark raised papillæ; nectary with thick raised borders. Anthers red-brown. Capsule 1 in .-Distrib. Europe from Mid. France southwards and eastwards.

## 15. Col'chicum, L. Meadow Saffron.

Corm coated. Leaves all radical, usually vernal. Bracts spathaceous. Flowers autumnal, solitary or fascicled, subsessile on the top of the corm, erect, crocus-like; perianth-tube very long, slender, limb campanulate; segments 6, oblong, in 2 series. Stamens on the mouth of the perianth, included, filaments filiform ; anthers oblong, fixed above the base in front, bursting inwards, afterwards resupinate. Ovary deeply 3 -grooved; styles 3 , wholly free, filiform, tips recurved, stignas decurrent on their inner faces; cells few- or many-ovuled. Capsule membranous, 3 -grooved to the axis, septicidally 3 -valved at the top. Seeds suhglobose, testa rugose, ${ }^{-}$funicle fleshy ; embryo minute, excentric, remote from the hilum.Distrib. Europe, N. and E. Asia; species 20.-Etym. Classical.

1. C. antumna'le, $L$.; leaves lanceolate, sheaths stout long large.

Meadows, from Westmoreland and Durham to Dorset and Surrey, rare and local, naturalized in Scotland; S. and Mid. Ireland; fl. Aug.-Oct.-Corm large, oblique, compressed ; seales shining, chesnut. Leuves flat, 6-10 in., nerves close-set. Flowers appearing in succession; ovary subterranean; perianth-tube $2-6 \mathrm{in}$. ; limb $1 \frac{1}{2} \mathrm{in}$., pale purple. Anthers $\frac{1}{2} \mathrm{in}$., yellow. Capsule $1-2 \frac{1}{2} \mathrm{in}$., shortly peduncled, ellipsoid, acute at both ends. Seeds many, small, pale brown.--Distrib. Europe from Denmark southwards.--
Yields the famous drug. Flowers when vernal greenish and imperfect.

## 16. TOFIEL'DIA, Hudson.

Rootstock shortly creeping. Leaves radical, equitant, ensiform. Scape slender. Flowers racemed, small, green; bracteoles 3, minute connate;
perianth-segments persistent, spreading, free. Stamens 6, on the base of the segments, filaments filiform ; anthers short, fixed by the back, dehiscence inwards. Ovary ovoid, 3-gonous ; styles 3, conic, persistent, stigmas obtuse ; cells many-ovuled. Follicles 3, almost free, membranous, oblong, acute. Seeds many, minute, marginal on the valves, cymbiform, testa thin, sometimes produced at each end ; embryo minute, next the hilum.-Distrib. Alps of Europe, temp. Asia and N. America; species 10.-Etym. Tofield, a Yorkshire botanist.

1. T. palus'tris, Huds.; bracteoles scarious. T. borealis, Wahl.

Mountain rills and bogs, ascending to 2,400 ft. in the Highlands; Teesdale in
England, absent from Ireland; fl. July-Aug.-Leaves tufted, 2-3 in., 3-5nerved. Scape 4-8 in., naked or 1-2-leaved, slender, terete. Raceme denseflowered, $\frac{1}{2}-1 \mathrm{in}$.; pedicels short, bracteolate at the base. Flowers $\frac{1}{8} \mathrm{in}$. diam., pale-green; segments linear-oblong, obtuse. Capsule $\frac{1}{6} \mathrm{in}$. diam., subglobose.-Distrib. Arctic and Alpine Europe, Asia, N. America.

## 17. narthe'cium, Hudson. Bog Asphodel.

A rigid herb with the habit and leaves of Tofieldia. Flowers racemose, golden-yellow, pedicel 1-bracteate ; perianth-segments subequal, spreading, persistent, erect in fruit. Stamens 6, hypogynous, 3 on the base of the segments, filaments subulate, villous; anthers linear, fixed by the back, bursting inwards. Ovary narrow-ovoid, 3-gonous, narrowed into the short style, stigma obtuse; cells many-ovuled. Capsule 3-gonous, narrow, pointed, loculicidally 3 -valved above. Seeds many, narrow-oblong, terete, membranous, testa filiform at each end, attached to the inner basal axis of the cell by a bair-like pedicel ; embryo most minute, next the hilum.Distrib. Europe N. of the Alps and Pyrenees, N. Asia, N. America.Etym. vap日禾кор, a rod.

1. N. ossif'ragum, Huds. ; perianth-segments linear-oblong.

Bogs, ascending to near $3,200 \mathrm{ft}$. in the Highlands; fl. July-Aug.-Rootstock wiry, long, slender. Leaves 6-12 in., rigid, strongly ribbed, acuminate. Stem leafless or with 1-2 short $\frac{1}{2}$-amplexicaul leaves. Raceme 2-4 in. ; bracts subulate ; pedicels sometimes bracteolate. Floxers $\frac{1}{2}$ in. diam. ; segments linear-oblong, ribbed and green on the back. Filaments white; anthers deep-orange. Capsule red, longer than the perianth.

## Order IX. JUN'CEIE.

Perennial, rarely annual herbs. Rootstock usually creeping, scaly. Stems rrect, usually simple, sometimes septate within, pith often thick, continuous or interruited. Leaves slender, flat, or like the stem, or reduced to sheathing scales. Flowers green or brown, in axillary or terminal cymes, regular, 2 -sexual, bracteolate. Perianth inferior, scarious or coriaceous; segments 6 in 2 series, free, subequal, persistent, imbricate in bud. Stamens 6, inserted on the bases of the segments, rarely 3 on the outer only, filaments flattened ; anthers basifixed, usually linear, bursting inwards. Ovary free, of. 3 connate carpels, 1-3-celled; style short or 0 ,
stigmas 3 filiform papillose all over; ovules 3 basilar, or many on 3 parietal or axile placentas, erect, anatropous. Capsule 1-3-celled, loculicidally 3 -valved, 3-many-seeded. Secds erect, testa memhranous often lax at one or both ends, alburaen dense ; embryo next the hilum, usually small.Distrib. Chiefly temp. and Aretic ; genera 4-5, species about 130.Affinities. With Liliaceee.-Properties unimportant.

## 1. JUN'CUS, $L$. RUsH.

Glabrous herbs. Outer perianth-segments keeled or midrib thickened. Stamens 6, rarely 3. Ovary 3 -rarely 1 -eelled ; ovules many, placentas axile, rarely parietal. Capsule completely or incompletely 3-celled. Sceds many ; embryo minute.-Distrib. Of the Order; species 100.-Etym. jungo, from their use in tying.

Section 1. Rootstock perennial, usually creeping. Stems not septate within (nor appearing as if jointed when dry), terete, rarely compressed.

## * Leaves all reduced to sheaths. Cymes wholly lateral, many-flowered; flowers not clustered. Testa not produced at either end.

1. J. commu'nis, Meyer ; stems soft, pith continuous, perianth-segments lanceolate exceeding the obovoid retuse capsule, stamens 3.
Moist places ; ascends to $2,400 \mathrm{ft}$. in the Highlands; f. July-Aug. - Tufts circular, densely matted. Stems 1-3 ft., sometimes $\ddagger \mathrm{in}$. diam., green, very finely striate. Cymes very compound, variable in form and size. Perianth $\frac{1}{4}-\frac{1}{8}$ in. Stamens rarely 6. Seeds minute, yellow-brown.-Distrib. Europe, N. Africa, temp. Asia and America.

VAr. 1, effe'sus, L. (sp.); cymes usually lax effuse, perianth olive-green, anthers oblong, capsule not mucronate.-VAR. 2, conglom'eratus, L. (sp.) ; cymes usually dense subglobose, perianth tinged with brown, anthers longer linear, capsule mucronate.
2. J. glau'cus, Ehr.; stems rigid glaucous striate, pith interrupted, perianth-segments narrow-lanceolate about equalling the ovoid mucronate capsule, stamens 6 .
Wet, usually stiff soils, from Aberdeen and Lanark southwards, and in Ireland ; ascends to $1,200 \mathrm{ft}$. in N. England ; fl. July-Aug.-Habit of J. communis, but not so tall, and stems deeply grooved. Cymes effuse, suberect. Periunth brown.-Distrib. Europe, N. Africa, Siberia.
Sub-sp. ! diffu'sus, Hoppe (sp.) ; stems softer less glaucous and striate, pith continuous, cyme elongate, capsule more obovoid mucronate, seeds always imperfect. - Wet pastures, not common, very rare in Seutland and Ireland. A doubtful plant; perhaps a hybrid between $J$. glaucus and effiusus.
3. J. bal'ticus, Willd.; stems rigid, pith continuous, perianth-segments ovate-lanceolate about equalling the ovoid abruptly mucronate capsule, stamens 3. J. arcticus, Hook. not Willd.
Sandy sea-shores, rarely by inland lakes, from Forfar and Kincardine northwards ; fl. July.-Rootstock creeping, not tufted. Stems few, 1-2 ft., $1 \mathrm{~m}-\frac{1}{1} \mathrm{in}$ in. diam., pale green, searcely striate. Cymes small, corymbose, suberect, few-flowered. Perianth about $\frac{1}{6} \mathrm{in}$., dark brown, midrib pale. Anthers
much longer than the filaments.-Distrib. Shores of the Baltic and Scandinavia to the Arctic circle, N. America.
4. J. filifor'mis, $L$.; stems wiry pale green filiform, pith interrupted, cyme midway up the stem small, perianth-segments lanceolate exceeding the turbinate obtuse mucronate capsule, stamens 6.
Stony and gravelly margins of lakes in the N. of England and Kincardine ; absent from Ireland ; fl. July-Aug.-Rootstock loosely tufted. Stems 4-8 in., very slender, faintly striate. Sheaths often with subulate tips. Cyme sessile; flowers few, crowded, very pale. Anthers shorter than the filaments. Seeds very minute.-Distrib. Europe (Arctic), N. Asia, N. America.

## ** Leaves all reduced to sheaths, or a few elongate and stem-like. Cymes lateral, flovers clustered. Stamers 6. Testa produced at each end.

5. J. acu'tus, $L$.; stem rigid pungent, sheaths long shining, perianthsegments ovate-lanceolate, inner obtuse with a broad scarious margin half as long as the broadly ovoid mucronate capsule.
Sandy sea-shores from Norfolk and Carnarvon southwards, rare ; S. and S.E. of Ireland; fl. July-Aug.-T'ufts circular. Stems $2-4 \mathrm{ft}$., stout, terete, hardly striate, many flowerless. Cyme corymbose, dense-flowered, very large in fruit; bracts lanceolate-subulate, exceeding the flowers; flowers $\frac{1}{6}-\frac{1}{5}$ in. Periunth brown, inner segments retuse winged towards the tip. C'apsule nearly $\frac{1}{4}$ in., turgid, hardly 3 -gonous.-Distrib. Shores of Europe from France southwards, N. Africa.
6. J. marit'imus, $S m$.; stem wiry pungent, sheaths short pale, perianth-segments lanceolate all acute and without scarious margius equalling the elliptic-oblong acuminate capsule.
Salt marshes from Isla and Nairn southwards ; rare in Scotland ; common in Ireland ; fl. July-Aug.-Habit of J. acu'tus, but irregularly tufted; stems less rigid and usually more slender ; cyme more interrupted, branches long erect; bracts not exceeding the very pale flowers.-Distrib. Europe from Gothland southwards, N. Africa, W. Siberia, N. America.
*** Leaves all terete compressed or channelled. Cymes terminal or lateral, 1-3 (rarely 6-) flowered. Testa produced at each end.
7. J. triglu'mis, L.; stems terete, leaves radical subulate channelled, flowers usually 3 terminal equalling the membranous bract, perianthsegments obtuse much shorter than the ellipsoid beaked capsule.
Alpine bogs, from Carnarvon and Durham northwards, ascending to $3,000 \mathrm{ft}$.
in the Highlands ; absent from Ireland; fl. July-Aug.-Tufted, black;
stolons 0 . Stems 6-18 in., slender, wiry. Leaves very short, formed of 2 septate tubes, sheaths auricled. Flowers erect, $\frac{1}{6} \frac{-1}{5}$ in., pale, red-brown in fruit.-Distrib. Arctic and Alpine Europe, N. Asia, Himalaya, N. America.
8. J. biglu'mis, L.; stems $\frac{1}{2}$-terete, leaves radical subulate compressed, flowers nsually 2 shorter than the bract, perianth-segments obtuse nearly equalling the turbinate retuse 3 -lobed capsule.
Bogs on the Alps of Perth and Aberdeen, at 2,000-3,300 ft. ; fl. July-Aug.-
Not tufted, stoloniferous. Stem 2-6 in. Leaves shorter, septate within, sheaths not auricled. Flowers $\frac{1}{8}$ in., upper pedicelled, lower sessile, chesnutbrown. Capsule mucronate between the lobes.-Distrib. Alpine and A retic N. Europe, Asia, Himalaya, and N. Ameriea.
9. J. casta'neus, $L$.; stems terete leafy, leaves $\frac{1}{2}$-terete fistular, cymes 1-3 lateral and terminal 2-6-flowered, perianth-segments acute half as long as the elliptic-oblong beaked capsule.
Alpine bogs, very rare; Argyle, Perth, Forfar, Aberdeen, alt. 2,500$3,000 \mathrm{ft}$. ; fl. July-Aug.-Not tufted, stoloniferous. Stem 6-16 in. Leaves 2-3, variable in length, channelled above, sheaths not auricled, walls thin. Flowers $\frac{1}{8}-\frac{1}{6}$ in., bright brown. Capsule nearly $\frac{1}{4}$ in., 3 -gonous. Seeds large for the genus.-Distrib. Arctic and Alpine, N. and Mid. Europe and N. America, Siberia, Dahuria, Himalaya.
10. J. trifidus, $L$.; stems wiry terete, leaves subulate short mostly reduced to sheaths, flowers 1-3 between 2 filiform bracts, perianth-segments acuminate shorter than the ovoid beaked capsule.
Alpine rocks, from Dumbarton, Perth, and Forfar northwards ; alt. 1,200-
$3,000 \mathrm{ft}$. ; f. July-Aug.-Forms dense matted rigid masses of rootstocks
and sheaths. Stems $3-10 \mathrm{in}$. Upper leaf-sheath with one short subulate leaf; another leaf occurs on the stem beneath the inflorescence, with a tubular sheath, which has often scarious edges. Bracts 2-4 in., filiform.
Flowers $\frac{1}{6}$ in., pale brown; perianth-segments very narrow, margins pale. Style and stigmas long. Seeds large, appendages short.-Distrib. Arctic and Alpine Mid. Europe and N. America, Siberia, W. Asia to Persia.
**** Leaves chiefly radical, flat or grooved above. Cymes terminal, 3-manyflowered. Testa not produced at either end.
11. J. squarro'sus, L.; rigid, stem compressed, leaves subulate $\frac{1}{2}$ terete below channelled above, cymes terminal branched, clusters 2-3flowered, perianth-segments oblong obtuse equalling the obtuse mucronate capsule.
Moorlands, ascending to $3,200 \mathrm{ft}$. in the Highlands; fl. June-July.-Stems densely tufted, 4-10 in., stout, solid, naked or with 1-2 leaves. Leaves 3-7 in., most densely erowded, gradually recurved from the broad keeled sheath, striate. Cyme irregularly corymbose, branches erect ; bracts broad, scarious, shorter than the flowers. Flowers $\frac{1}{\frac{1}{i n} ., ~ p a l e . ~ C a p s u l e ~ o b t u s e l y ~}$ 8 -gonous.-Distrib. Europe, Siberia, Greenland.
12. J. compres'sus, Jacq.; slender, stem 1-2-leaved subcompressed, leaves slender teterete channelled above, cyme terminal branched, flowers subsolitary, perianth-segments oblong obtuse equalling or shorter than the ovoid obtuse mucronate capsule. J. bulbosus, L. (name given by error).
Marshy places; fl. June-July.-Rootstock creoping. Stems 6-24 in., tufted. very slender, hollow. Leuves narrow, flaccid, suberect, equalling the stem or shorter. Cyme irregularly corymbose ; branches suberect, slender, fewflowered ; bracts small. Flowers $\frac{1}{\frac{1}{2}} \frac{1}{6}$ in.; perianth-segments pale in the middle, with broad scarious pale or dark brown or purple margins.-Distrib. Europe, Siberia, Dahuria, W. Asia to Persia, N. America.
Sub-sp. compres'sus proper; stems tufted, capsule broader almost obovoid shortly mucronate much longer than the perianth.-Rather rare.
Sui-sp. Grrar'di, Loisel. (sp.); stems more remote, capsule narrower strongly mucronate not exceeding the perianth. J. bottnicus, Wall. ; J. coenosns. Bich. -Salt marshes. Also in N. U. States.

Section 2. Perennial, usually creeping. Stems jointed (hollow and septate) internally, joints rarely visible externally. Testa not produced.
13. J. obtusiflo'rus, Ehr. ; stem tall and leaves (few) erect terete, cymes lateral or subterminal in very compound corymbs, branches zigzag, perianth-segments obtuse equalling the ovoid mucronate capsule.
Marshy places, from Wigton and Haddington southwards; very rare in Scotland and in S.E. Ireland; fl. July-Aug.-Rootstuck widely creeping. Stems not tufted, 2-3 ft., usually stout, soft, hardly striate, sheathed at the base. Leaves 1-2, like the stem. Flovers $\frac{1}{8}$ in., sessile in dense peduncled or sessile clusters of $3-8$, pale; bracts small, obtuse, scarious.-DisTrib. Europe from Gothland southwards, except Greece Turkey and Russia, N. Africa.
14. J. articula'tus, L.; stem slender and leaves slightly compressed, cyme lateral or subterminal compound corymbose, perianth-segments acuminate not exceeding the obovoid narrow acuminate capsule.
Bogs, especially in mountain districts ; ascending to near $3,500 \mathrm{ft}$. in the Highlands ; fl. June-Aug.-Very variable in habit, size, robustness, amount of foliage, and size and composition of the cyme; the following sub-species express its principal modifications.-Distrib. Europe, N. Africa, N. and W. Asia to the Himalaya.

Sub-sp. ARTICULA'tus proper; tall, leaves very conspicuously jointed when dry, flowers in dense distant sessile or peduncled clusters of 3-12 dark chesnut, bracts acuminate $\frac{1}{2} \frac{2}{3}$ as long as the flower, perianth-segments equalling the narrow acuminate capsule. J. acutiflorus, Ehr.-Ascends to $1,200 \mathrm{ft}$. in the Lake District.
Sub-sp. supi'nus, Monch (sp.); rootstock sometimes tuberous, stems terete 3-10 in. often floating with flaccid straggling branches, joints very obscure, leaves slender, cyme terminal, branches few long suberect, bracts scarious acute sometimes equalling the flower, perianth-segments acute equalling the ovoid obtuse mucronate capsule.--Ascends to $3,400 \mathrm{ft}$. in the Highlands. -VAR. 1, uligino'sus, Sibth. (sp.); erect, stamens 3.-VAR. 2, subverticilla'tus, Wulf (sp.); decumbent or floating, stamens 3.-VAR. 3, Koch'íi, Bab.; stamens 6, filaments longer, capsule retuse. J. nigritellus, Koch, not Don. Devon and Galway.
Sub-sp. Lamprocar'pus, Ehr.; stem slightly compressed stout or slender, and leaves evidently jointed when dry, cyme terminal, branches long suberect, perianth-segments shorter than the narrow beaked glossy capsule, inner obtuse, stamens 6. - Ascends to $2,400 \mathrm{ft}$. in the Highlands ; also found in N. America.-Of J. nigritellus, Don, not Koch (of the Clova Mts.), referred to this by Syme, nothing satisfactory is known; garden specimens in Borrer's Herbarium from Forster (given to the latter by Don himself), have compressed stems, and seem the same as lamprocarpus.
Section 3. Annual. Stem hollow, jointed and septate within or not. Testa not produced.
15. J. bufo'nius, L. ; tufted, very pale, stems slender jointed upper part or cyne dichotomously branched, periar.th-segments subulate-lanceolate much longer than the obtuse mucronate capsule, stamens 6.
Moist piaces ; ascends to near 2,000 ft. in the Lake District ; fl. June-Aug.Very variable, densely aggregated, from the seedlings growing in masses. Stem 1-8 in., erect or ascending. Leuves few, setaceous, channelled above,
not jointed, pale green, very narrow, sheaths short. Cyme oceupying no.ot of the stem ; branches short or long, often flexuous; flowers $\frac{1}{8}-\frac{1}{3}$ in., solitary and distant, or in clusters of 2-4; bracts smell, scarious, obtuse. F/weeris usually secund, pale green. Perrienth-seyments very unequal, long-acuminate, sometimes much longer than the pale obovoid capsule.-Distinib. Europe, N. Africa, Siberia, Dahuria, Himalaya, N. America.
16. J. capita'tus, Weigel; tufted, stems setaceous grooved not jointed, heads terminal bracteate, perianth-segments elliptic-ovate acuminate awned longer than the broadly ovoid mucronate capsule, stamens 3 .
Sands inundated in winter, Jersey and Guernsey ; fl. May-July.--Very small,
1-4 in., tufted, reddish when dry. Stems strict, leafless above. Lcaies all radical, short, setaceous, channelled ; sheaths short. Huculs solitary, rarely $2-3,3-6$-llowered; outer bracts setaceous, about twice as long as the flowers, inner smaller, broadly ovate, aristate. Perianth $\frac{1}{8}$ in., pale, tips recurved.
-Distrib. Europe, N. Africa.

## 2. Lu'zula, DC. Wood-RUsh.

Characters of Juncus, but always perennial, foliage more grass-like, always more or less ciliate with long flexuous white hairs. Authers usually longer than the filaments. Ovary 1 -celled; ovules 3, subbasal, erect. Capsule 1 -celled, 3 -valved, 3 -seeded. Seed with a basal or terminal appendage.-Distrib. All temp. and cold regions; species about $40 .-$ ETYM. luciola, a glowworm.

1. L. sylvat'ica, Bich.; tall, cyme very compound, flowers clustered, perianth-segments awned hardly equalling the ovoid acute beaked capsule, seed tubercled at the tip.
Woods and heaths, especially uplands ; ascending to $2,300 \mathrm{ft}$. in the Highlands; fl. May-June.-Ruotstock short, tufted; stolons short. Stems few: $1-2 \mathrm{ft}$. Leaves, radical $\frac{1}{2}-1 \mathrm{ft}$., often $\frac{1}{2} \mathrm{in}$. broad, with scanty silky hairs. channelled ; cauline few, short. Cyme large, branches often 3-4 in., spreading in fruit. Flowers in in., pale, usually 3-4 torether; bracteoles ovate, acute, scarious.-Distrib. Europe (Arctic), excl. Russia.
2. L. pilo'sa, Willd.; slender, cyme lax, branches few reflexed in fruit, flowers subsolitary, perianth-segments acuminate shorter than the very broadly ovoid obtuse capsule, crest of seeds long curved terminal:
Shady places, ascending to near $1,900 \mathrm{ft}$. in the Highlands; fl. April-May.-.
Rootstock short, tufted; stolons slender. Stems many, $\frac{1}{2}-1 \mathrm{ft}$. Letrees about half as long as the stem, $\frac{1}{6}-\frac{1}{-1} \mathrm{in}$. broad, soft, sparingly hairy. Comm. with capillary branches and pedicels. Flovers $\frac{h-\frac{1}{i} \text { in., chesnut-brown. ravely }}{}$ in pairs; bracteoles broad, short. Cupsule very broad below, suddenly contracted to a conical top above the middle.--Distrib. Europe (Arctic), N. Africa, temp. Asia, N. America.-L. Borre'ri, Bromf., is a form chiefly found in S. England and Wicklow, with an acute shorter capsule that ripens no seed.
3. L. Forste'ri, DC.; characters of L. pilosa, but more slender, capsule acuminate, and seeds with a shorter terminal straight obtuse crest. Shaded places in chalky soil, from Essex and Cardigan southwards; fl. April-June.-Habit of L. pilasa. from which luxurant specimens can hardly be distinguished, except by the characters given above. - Distrib. France, Spain, Germany, Italy, Turkey, N. Africa,
4. L. campes'tris, Willd.; leaves very hairy, cyme short, flowers in dense clusters, perianth-segments acuminate longer than the broad obovoid obtuse apiculate capsule, seeds with a conical white basal appendage.
Heaths, meadows and pastures ; ascending to $3,200 \mathrm{ft}$. in the Highlands and
Wales ; f. April-June.-Rootstock creeping, tufted. Stems 4-12 in., stout or slender. Leaves shorter than the stem, usually copiously hairy. Cymes very variable ; clusters of flowers subsessile, or on long drooping branches. Flowers $\frac{1}{6}$ in., pale or dark ; bracteoles ciliate. Seeds with no terminal crest. Distrib. All temp. and cold regions.
Var. 1, compes'tris proper ; usually short, clusters usually 3-4-flowered, seeds subglobose.---Var. 2, conges'ta, Sm. (sp.) ; larger, stouter, cymes more contracted, flowers more in a cluster, perianth-segments narrower, filaments longer, cansule narrow, seeds oblong with a shorter basal appendage. $L$. multiflora, Lej.; sudeticu, DC. Most frequent on heaths.
5. L. spicata, $D C$.; leaves slender, cyme drooping dense-flowered spike-like, bracteoles silvery, perianth-segments awned exceeding the broad ellipsoid apiculate capsule, seeds with an obscure white basal appendage.
Mts. of Wales, Westmoreland, and Scotland, from 1,000 to $4,300 \mathrm{ft}$.; absent
from Ireland; fl. July.-Rootstock densely tufted; stolons short. Stems
6-12 in., slender. Leaves much shorter than the stem, small, hairy on the sheaths chiefly, coriaceous, recurved, narrow, channelled; cauline few, short. Cymes $\frac{3}{-1}-1 \frac{1}{2} \mathrm{in}$., shorter than the leafy bracts. Florrers $\frac{1}{8}$ in., usually shorter than the scarious transparent ciliate awned bracteoles. Seeds oblong.Distrib. Aretic and Alpine Europe, N. Asia, Himalaya, N. America.
6. L. arcua'ta, Hook.; dwarf, leaves short, cyme umbelled, branches few outer slender recurved, perianth-segments acuminate exceeding the broadly ovoid apiculate capsule, seeds with an obscure basal appendage. High alps of Aberdeen, Banff, and Sutherland, from 3,000 to 4,300 ft.; fl. July. -Ruotstock creeping, loosely tufted; stolons slender. Stem 1-4 in., rather stout. Leaves coriaceous, sparingly hairy, narrow, recurved, channelled. Cyme lax, outer branches 1-2 in., $1-3$-flowered. Flowers $\frac{1}{8}$ in., $3-5$ in a cluster, dark chesnut; bracteoles lanceolate, acute, not silvery. Seeds stnall, oblong.-Distrib. Mts. of Scandinavia, Aretic regions.

## Order X. aroi'dere.

Herbs with creeping or tuberous rootstocks. Leaves various. Spathe 1-leaved. Flowers on a spadix, 1- or 2 -sexual ; perianth 0 , or hypogynous and polyphyllous. Stamens few or many, filaments short free or 0 ; anthers 2 -celled, dehiscing outwards, or by terminal pores. Ovary 1- or more-celled ; style simple or 0 , stigma capitate or discoid; ovules 1 or more, veriously attached. Berry 1- or more-celled. Seeds 1 or more, testa thick, albumen abundant fleshy or mealy, rarely 0 ; embryo various.-Distrib. Trop. and temp. regions ; genera 100 ; species 1,000 .-Affinities. With Pandaneer and Typhaceer.-Properties. Acrid and poisonous.
SUb-order 1. ARoI'defer proper. Flowers 1 -sexual ; perianth $0 \ldots 1$. Arum. SUb-order 2. ORONTMA'CEAE. Flowers 2 -sexual ; sepals free...2. Acorus.

## 1. ar'um, $L$. Cuckoo-pint, Lords and Ladies.

Rootstock tuberous. Leaves radical, nerves reticulate; petioles sheathing at the base. Scape terete spathe convolute, contracted above the hase. Spadix contracted helow the middle, terminated by a naked cylindric. column, bearing from the lase upwards, 1stly a crowd of naked sessile ovaries; 2dly rudimentary ovaries; 3dly a crowd of naked sessile anthers; 4tnly stamiLodes. Anthers adnate, 2-4-celled, dehiscence terminal. Ovaries 1-celled; stigma sessile; ovules few, basal, erect, orthotropous. Berry fleshy. Seeds few, testa coriaceous thickened at the hilum, albumen mealy ; embryo short, radicle opposite the hilum. -Distrib. N. temp. and sub-trop. regions; species about 40.-Етуm. Doubtful.

1. A. macula'tum, $L$.; leaves vernal, petiole as long as the blade, basal lobes $\frac{1}{3}$ as long as the midrib, spathe twice as long as the spadix.
Woods and hedges, from Berwick and Roxburgh southwards; ascending to $1,000 \mathrm{ft}$. in the N. of England; doubtfully wild in Scotland ; all Ireland ;
fl. April-May.-Corms annual, new produced at the base of the stem.
Leaves 6-10 in., 2-4, hastate-cordate, often spotted black, lohes acute or obtuse. Scape short, lengthened in fruit. Spathe 6-10 in., erect, yellowgreen, edged and often syotted with purple, base persistent. Spadix above dull purple, rarely yellow. Berries $\frac{1}{2}$ in. diam., crowded, scarlet, bursting the base of the spathe. Seeds 2-3, testa reticulate. - Distrib. Europe from Gothland southwards, N. Africa.-Corms yield Portland arrow-root.
2. A. ital'icum, Miller; leaves hibernal, petiole longer than the blade, basal lobe $\frac{1}{2}$ as long as the midrib, spathe thrice as long as the spadix.
I. of Wight ; fl. July-Aug.-A larger, stouter plant than A. maculatum, well described by Syme, who observes that the leaves are more triangular; the spathe falls over at the top as soon as it expands; the pistillidia are much longer; the spadix always yellow; berries longer, and seeds larger. Distrib. Europe, excl. Russia, from Holland southwards, N. Africa.

## 3. A'CORUS, L. Sweet-flag.

Rootstock creeping. Leaves radical, ensiform, equitant. Scape flattened. Spathe continuous with the scape, 2 -edged. Spadix lateral, terete, narrowed upwards, covered with 2 -sexual flowers. Perianth-segments 6 , free, membranous, oblong, persistent. Stamens 6 , on the base of the segments, filaments flattened; anthers didymous. Ovary $2-3$-celled; stigma sessile minute ; ovules many, pendulous from the top of the cell, orthotropous. Berry 6 -gonous, full of mucus. Seeds 1-3, testa thin, albumen horny : embryo green, cylindric, radicle next the hilum.-Distrib. Europe, temp. Asia; species 2-3.-Etym. Classical.

## 1. A. Cal'amus, $L$.; midrib of leaf thick.

Sides of ditches, ponds, \&c. from York and Lancaster southwards, rare; naturalized in Scotland and Ireland ; f. June-July. Leares $3-6 \mathrm{ft}$., ${ }_{3}^{2}-1 \neq \mathrm{in}$. diam., margins waved. Scape leaf-like, $\frac{1}{3} \mathrm{in}$. diam. Spathe long. Spadix 3-4 in., $\frac{3}{3}$ in. thick, eurved. Perianth-segments not longer than the ovary. Fruit obovoid, top pyramidal.-Distrib. Europe, Siberia, Dahuria, Himalaya, N. America.-Aromatic, stimulant, tonic. I have never seen fruit.

## Ordeir XI. lemna'cere.

Minute floating solitary or fascicled green fronds, rootless or with capillary simple roots, propagated by budding from marginal clefts, and by autumnal hybernating bulbils, rarely by seed; vascular tissue 0 or rudimentary; roots tipped by a membranous sheatl. Flowers rarely produced, most minute, 1-3 in a spathe. Perianth 0. Stamens 1-2; anthers 1-2-celled, dehiscence transverse; pollen spherical. Ovary 1celled; style short, stigma truncate or funnel-shaped; ovules 1-7, orthotropous anatropous or $\frac{1}{2}$-anatropous. Utricle bottle-shaped. Seeds 1 or more, testa coriaceous, inner coat thickened and discoid over the radicle, albumen fleshy or 0 ; embryo axile, straight, stout, cylindric.-Distrib. All standing waters; genera 6 ; species about 20.-Affinities. With Pistiacece, Naiadece, and Aroidece.-Properties 0.

> Frond with 1 or more capillary roots. 1. Lemna.

> Frond rootless. 2. Wolffia.

## 1. LEM'NA, L. Duckweed.

Fronds with roots. Flowers in marginal clefts of the frond. Stamens 1-2, filaments slender; anthers 2-celled, didymous; pollen muricate. Ovules 1-7.-Distrib. All latitudes; species 12.-Etym. The Greek name.

Sub-gen. 1. Lem'na proper. Root single. Ovule 1, $\frac{1}{2}$-anatropous. Seed horizontal ; albumen copious.

1. L. mi'nor, $L$. ; frond obovate or oblong slightly convex below.

Still waters; fl. July.-Annual. Frond $\frac{1}{8} \frac{1}{4} \frac{\mathrm{in}}{}$., young sessile on the old, soon disconnected, green above, paler beneath; epidermal cells with flexuous walls. Spathe unequally 2 -lipped. Stamens 2, developed successively (each a male flower?), filaments slender. Style long.-Distrib. Almost ubiquitous.
2. L. trisul'ca, L.; frond flat obovate-lanceolate, tip serrate, young hastate persistent. Ivy-leaved lhuckweed.
Still waters, from Fife and Furfar to Devon and Kent, but rare in Scotland; local in Ireland; fl. June-July.-Frond $\frac{1}{2}-\frac{3}{4}$ in., submerged, narrowed at the base, without epidermis, proliferous on one or both sides; young fronds, numerous placed crosswise to the old. Style very short. Testa rough, grooved.-Distrib. Europe, Siberia.
Sub-gen. 2. Telmatopha'ce, Schleiden (gen.). Root single. Ovules 2-7, erect, anatropous. Seeds erect; albumen scanty or 0 .
3. L. gib'ba, L. ; frond obovate or orbicular tumid below, stamens 2, utricle bursting transversely.
Still waters, from Fife to Devon and Kent, E. of Scotland only ; rare and local in Ireland; fl. June-Sept.-Frond $\frac{1}{2}-\frac{1}{3}$ in., opaque, pale green, young sessile ; cells beneath very large, epidermal with flexuous walls.-Distrib.
Europe, Siberia, N. Africa, America.
Sub-gen. 3. Spirode'la, Schleiden (gen.). Roots many. Ovrules 2, erect, auatropous. Fruit unknown.
4. L. polyrhi'za, $L$.; frond broadly obovate plano-convex 7 -nerved. Ponds and ditches from Lanark and Edinburgh to Devon and Kent southwards ;
rare and local (if native) in Scotland; Mid. Ireland, rare. - Frond $\frac{1}{2} \frac{1}{2}$ in., dark green above, purple beneath, tracheæ abundant ; epidermal cells with flexuous walls. Sputhe 2 -lipped. Stamens $2 . .-$ Distrib. Europe, Siberia, Madeira, N. America.-Flower unknown in Britain.

## 2. WOLPF'1A, Horkel.

Fronds like grains of sand, rootless, oblong or subglohose, flattened above, proliferous, eleft near the base. Flowers bursting through the upper surface of the fronds. Spathe 0. Anther sessile, 1-celled; pollen smooth. Ovary globose ; style short, stigma depressel ; ovule 1, erect, orthotropons. U'tricle spherical, indehiscent. Seen oblique; albumen fleshy, seanty.Distrib. Europe local, W. trop. Africa.-Etym. J. F. Wolff, a writer ou Lemna.

1. W. arthi'za, Wimm.; frond loosely cellular beneath.

Ponds, Essex, Middlesex, Hants, Surrey, prohably common elsewhere.-The smallest known flowering plant. Froned $\frac{1}{3} \mathrm{in}$. long, को in. broad, youns solitary at the base of the old, soon detached; epidermal cells with straight walls. Flowers described from African specimens.

## Order XII. TYPHA'CERE.

Marsh or aquatic herbs. Rootstock creeping. Leaves narrow, linear, obtuse, bases sheathing. Spathe 0. Flowers monœcious, in eylindric spikes or heads, the males uppermost. Perianth 0 or of membranous seales or hairs, imbricate, persistent.-Male. Stamens few or many, filaments slender; anthers basifixed, oblong, 2-celled, dehiscence lateral. Female. Ovary sessile or stalked, 1-rarely 2 -celled, contracted into a simple persistent style, stigmas unilateral decurrent papillose ; ovule 1 , pendulous from the top of the cell. Fruit small, coriaceous, or a drupe. Socel pendulous, albumen fleshy or mealy ; embryo straight, terete, radiele next the hilum.-Distrib. Temp. and trop.; genera 2; species about 12.Affinities. With Aroidere and Pandaneer (screw-pines), of which Sparganium is almost a member.-Properties. The roits of Typha are farinaceous; and the pollen is made iuto cakes in Sind and New Zealand.
$\qquad$
Flowers in cylindric spikes 2. Typha.

## 1. Spargánium, L. Bur-reed.

Heads globose, subtended by leafy bracts. Perianth of 3-6 spathulate membranous scales. Stamens $2-3$, connective hardly produced at the tip . Ovary 1-rarely 2-celled. Drupe angled, small, 1-2-celled.-Distrib. Temp. and trop.; species about 10.-Етym. $\sigma \pi \alpha ́ \rho \gamma a \nu o \nu$, a band, from the form of the leaf.

1. S. ramo'sum, Hudson; erect, branched, leaves erect 3 -quetrous at the base keeled, stigma linear, drupes sessile broailly ovoid, beak short.
I'onds, ditches, and river-hanks ; fl. June-July.-Ntemt 1-4 ft. Leaves 2-5 ft., 1 in . hroad. Mule heads olive-brown, deciduous, $\frac{1-3}{2} \frac{3}{4} \mathrm{in}$. diam.; female as large, 1 in . when in fruit; bracts linear. Drupe $\frac{1}{\mathrm{i}} \mathrm{in}$.-Distrib. Europe, Siberia, N. Africa, N. America,
2. S. sim'plex, Hudson; erect, simple, leaves erect (sometimes floating) keeled 3 -gonous below, heads racemose, stigna linear, drupe shortly stalked fusiform, beak long.
Ponds, ditches, and river-banks, from Isla and Ross southwards; fl. June-July.
-Stem 1-2 ft. Male heads yellow, sessile; female peduncled. Drupe narrowed at both ends.-Distrib. Europe, N. and W. Asia, N. America.
3. S. na'tans, $L$.; floating, simple, leaves flat at the base not keeled, heads racemose, stigma tongue-shaped, drupe stalked, beak rather long. Lakes, ditches, \&c. from Dorset and Kent northwards ; ascends to near 1,600 ft. in the Highlands; fl. July-Aug.-Stem 1-3 ft., suberect in flower, leafy, flaccid, upper part floating. Leaves $\frac{1}{4}-\frac{1}{3} \mathrm{in}$. diam. Heads $\frac{1}{4} \mathrm{in}$. diam., female peduncled -Distrib. Europe, N. Africa, Siberia, W. Asia, N. America.Probably a form of S. simplex, as suggested by Bentham.
Var. 1, affi'ne, Schn. (sp.); sheaths rather inflated, male heads several, drupe fusiform. Lakes in Wales, N. of England, Scotland, and Ireland.-VAR. 2, min'imum, Fries (sp.); sheaths not inflated, male heads solitary, drupe more obovoid. Common.

## 2. TY'PHA, L. Reed-mace, Cat's-tail, Bulrush.

Spikes superposed, cylindric, with occasional deciduous leafy bracts. Perianth of 2-3 extremely slender jointed silky scales. Stamens several, monadelphous; connective produced. Ovaries stalked, many imperfect; style very slender, stigma unilateral, narrow. Fruit minute, stalked, dehiscent along the inner face. Seed cylindric, testa striate.-Distrib. T'emp. and trop. ; species 6 or 8.-Етум. тiфos, a fen.

1. T. latifolia, $L$.; leaves $\frac{1}{3}-1 \frac{1}{2} \mathrm{in}$. broad subglancous, spikes contiguous or nearly so. T. media, DC.
Lakes, river-banks, \&c. from Renfrew and Elgin southwards; fl. July-Aug.-
stem 3-7 ft., terete. Leaves distichous, 3-6 ft., linear, obtuse, nearly Hat.
Spikes $\frac{1}{2}$ to nearly 1 ft ., 1 in. diam., dark brown, silky from the copious filiform perianth scales. Stigma lanceolate.-Distrib. Europe, N. Africa, N. and W. Asia, N. America.
2. T. angustifo'lia, $L$; leaves $\frac{1}{4}-\frac{3}{4}$ in. broad dark-green not glaucous convex beneath, spikes separate.
Ditches and ponds, from Fife and Kirkcudbright southwards ; rare in Scotland ;
E. of Ireland, very rare ; fl. July.-Smaller in all its parts than T. latifolia;
leaves narrower, channelled towards the base ; spikes $\frac{1}{2} \frac{-3}{4} \mathrm{in}$. diam., separated by $\frac{1}{2}-1 \mathrm{in}$., female often interrupted; perianth-scales dilated towards the tip; stigmas broader.-Distrib. Europe, N. Africa, Siberia, Dahuria. India, N. America.

## Order XIII. ERIOCAU'LONE里.

Perennial, scapigerous herbs, usually marsh or aquatic. Leaves chiefly radical, often cellular, sheaths narrow. Flowers minute, usually monocious, in involucrate heads, 1-bracteolate.-Male. Perianth membranous or scarious, outer of 2-3 free segments ; inner a 2-3-lobed tube. Stamens $2-3$, inserted on the tube opposite its lobes, with sometimes alternate perfect or imperfect ones, filaments inflexed in bud; anthers fixed by the back, 2 -celled, bursting inwards. Ovary rudimentary.-Female. Peri-
anth inferior, persistent, outer as in the male, inner of 2-3 petals or pencils of hairs. Staminodes 0 . Ovary of 2-3 connate carpels; style short, terminal, persistent, stigmas 2-3 slender; ovule solitary, pendulous from near the top of each cell, orthotropous. Capsule membranous, 2-3-celled, loculicidally $2-3$-valved. Seed pendulous, testa coriaceous, epidermis hyaline splitting into hairs, albumen floury ; embryo outside and at the base of the allumen farthest from the hilum.-Distrib. Chiefly trop.; genera 5 ; species 300 .-Affinities. With Restiacece and Xyridece.Properties. Unimportant.

## 1. eriocau'lon, $L$. Pipe-wort.

Male fl. chiefly in the centre of the head. Outer perianth-segments subspathulate. Stamens 4 or 6.-Distrib. Of the Order ; species 50.-Etym. ${ }^{\prime} \rho^{\prime}$ iov and кaı入ós, from the woolly scapes of some species.

1. E. septangula're, With.; leaves subulate, seape $6-8$-furrowed. Lakes in Skye, the Hebrides, and W. of Ireland from Connemara to Antrim ; fl. Aug.-Rootstock creeping, branched ; roots white, cellular Stem very short, leafy. Leaves 2-4 in., compressed laterally, green, translucent, septate. Scape 6-24 in., rarely more, twisted. Head $\frac{1}{4} \frac{-3}{4} \mathrm{in}$. diam.; bracts lead-coloured, oblong-obovate, obtuse. Flowers 2-merous; outer segments dark, bearded at the tip, inner ciliate with a black spot towards the tip. Anthers dark. Ovary stalked.-Distrib. N. America.

## Order XIV. cypera'ces.

Grassy or rush-like herbs, usually perennial. Stems solid, often 3 -gonous. Leaves with closed sheaths. Flowers 1-2-sexual, in the axils of small bracts (glumes), which are arranged in terete angled or compressed spikelets, beyond which the stamens and pistils project. Glumes concave, often rigid, distichous or inserted all round the rachis, persistent or deciduous, lower of each spikelet often empty. Perianth 0, or of $3-6$ or more hypogynous scales or bristles. Stamens 1-6, hypogynous, filaments linear, flat ; anthers basifixed, pendulous, linear, dehiscing inwards, 2 -celled, often with a claw at the tip. Ovary 1-celled (in Carex enclosed in a coriaceous utricle (perigynium) formed of 1 folded or 2 connate bracteoles; style 1 , stigmas 2-3 filiform papillose all over; ovule solitary, erect, anatropous. Fruit small, coriaceous, indehiscent, compressed or 3 -gonous (in Carex enclosed in the perigynium). Seed erect, testa membranous, albumen floury; embryo minute, lenticular, at the base and outside of the albumen.Distrib. All climates; genera about 110 ; species about 2,000.-Affinities. With Graminea.-Properties. Unimportant.
Tribr I. SCirpe'fe. Spikelets terete. Glumes all but the $1-2$ lower flowering, persistent. Flowers 2 -sexual. Perian th 0 , or of bristles.

> * Bristles 0, or included vithin the glumes.

Spikelets fascicled, usually lateral. Bristles 6........................1. Scirpus.
Spikelets fascicled, lateral, rarely 1 terminal. Bristles 0.........2. Isolepis.
Spikelet 1, terminal. Bristles 3-6.....................................3. Eleocharis.
Spikelets alternate or spiked. Bristles 3-6...........................4. Blysmus.
** Bristles finally exserted far beyond the glumes...................5. Eriophorum.
Tribe II. RHYNCHOSPO'RERE. Spikelets terete. Glumes 1-2 only flowering persistent. Flowers all or some only 2 -sexual. Perianth 0 or of bristles.
Bristles 0. Pericarp corky
6. Cladium.

Bristles 6-12. Fruit compressed..................................7. Rhynchospora.
Tribe III. CYPE'REff. Spikelets compressed. Glumes distichous, all or most flowering. Flowers 2-sexual. Perianth 0 or of bristles.
Spikelets 1-2-flowered. Glumes persistent. Bristles 3-5.......8. Schœenus,
Spikelets many-flowered. Glumes deciduous. Bristles 0.........9. Cyperus.
Tribe IV. CARICI'NEs. Spikelets terete. Glumes many, all flowering. $F$ lowers 1 -sexual ; male perianth 0 .
Female fl. with a lateral scale
10. Kobresia.

Female fl. enclosed in a perigynium
11. Carex.

## 1. SCIR'PUS, $L$.

Leafy or leafless, usually tall, marsh- or water-plants; rootstock creeping. Spikelets several, in terminal or lateral cymes heads or clusters, terete. Glumes imbricate all round the rachis, often 2 -fid, all or the 1-2 lowest only flowerless. Flowers 2 -sexual. Bristles 6 or fewer, not exceeding the glumes. Stamens 3. Style 2 -3-cleft, not swollen at the base, deciduous. Fruit compressed or 3 -gonous, top not swollen.-Distrib. All climates; species about 50 .-Етуm. The old Latin name.

## * Cymes leafless.

1. S. lacus'tris, $L$.; stem terete or nearly so usually leafless, cymes terminal branched longer than the bracts, branches stout with solitary or clustered spikelets, glumes obtusely 2 -lobed mucronate ciliate. Bulrush.
Lakes, ditches, and marshes ; fl. July-Aug. -Stems 1-8 ft., spongy, as thick as the thumb or less at the base, sheathed. Leaves 0 , or short flat and keeled in still water, or long and strap-shaped in streams. Cyme lateral at first, then expanding and overtopping the stem; branches few, $\frac{1}{2} 3 \mathrm{in}$., strict, stout. Spikelets 1-6, $\frac{1}{4}-\frac{1}{2}$ in., sessile, cylindric in flower, ovoid in fruit, redbrown. ©ilumes mucronate or awned. Bristles 4-6, shorter than the broad fruit.-Distrib. Arctic Europe, all temp. and many trop. regions.
Sub-sp. Lacus'tris proper; stem terete green, leaves often floating, glumes glabrous, anther-tips ciliate, fruit 3-gonous.
Sub-sp. Tabernemon'tani, Gmel. (sp.); stem terete glaucous, floating leaves 0 , glumes scabrid, anther-tips glabrous, fruit compressed. S. glaucus, Sm..
-Usually near the sea, from Forfar and Isla southwards.
Sub-sp. carina'tus, $S m$. (sp.); stem green obtusely 3 -gonous above, glumes smooth, anther-tips glabrous, fruit compressed.-Tidal rivers from Middlesex and Kent to Sussex.
2. S. trique'ter, L. ; stem 3-quetrous usually leafless, cyme lateral, branches short stout, spikelets solitary or few elongate ovoid, glumes obtusely 2 -lobed mucronate.
Muddy tidal banks of the Thames and Arun; fl. Oct.-Rootstock slender. Stems 1-3 ft., strict, spongy, concave on one side. Leaves 0, or very short on the upper sheath. Spikelets in sometimes sessile clusters. Glumes obovate, brown, smooth. Anther-tip glabrous. Bristles 2-6. Fruit obovoid, 3-gonous, smooth, shining.-Distrib. Europe from Denmark southwards.
3. S. Roth'ii, Hoppe; stem 3-quetrous, leaves 2-3 linear, spikelets lateral sessile, glumes ovate acutely 2 -lobed mucronate. S. pungens, Vahi. Sandy banks of St. Ouen's pond, Jersey; fl. June-July.--Habit of S. triqueter, but smaller, more slender, 6-18 in. ; leaves 4-6 in., channelled, keeled; spikelets $\frac{1}{2}$ in., sessile ; glumes red-brown ; anther-tips acute ; bristles 1-2 ; fruit obovoid, pale.-DIstrib. Europe from Dermark southwards.

* Stem 3-gonous, leafy. Cyme terminal, leafy.

4. S. marit'imus, L.; leaves channelled, cymes corymbose, spikelets few cylindric red-brown, glumes acutely 2 -lobed awned.
Salt marshes from Ross and Skye southwards ; fl. July-Aug.-Rootstock often tuherous. Stems $1-3 \mathrm{ft}$., tufted, rigid, leafy below. Leaess often $\frac{1}{2} \mathrm{in}$. broad, elongate, keeled, dark green. Spikelets $\frac{1}{2} 1$ in., brown, peluncled or sessile ; bracts $\frac{1}{2}-1 \mathrm{ft}$.; glumes glabrous or pubescent. Bristles $1-6$. Fruit compressed or 3-gonous, truncate, dotted, shining.-Distrib. Europe (Arctic), N. Africa, W. Siberia, N.W. India, N. America.
5. S. sylvaticus, $L$.; leaves flat, cymes effuse, branches many divarieate, spikelets small ovoid green, glumes entire obtuse.
Moist shaded places, from Argyle and Banff southwards ; fl. July.-Stems solitary, $1-3 \mathrm{ft}$., stout, leafy. Leaves large, sometimes $\frac{3}{4} \mathrm{in}$. broad, keeled. Cymes 2-5 in. diam.; branches slender ; spikelets $\frac{1}{8}-\frac{1}{6}$ in., $3-5$ in a cluster. Glumes ribhed. Bristles 6, barbed. Fruit obovoid, mucronate, punctulate. -Disprib. Europe, Siberia, Dahuria, temp. N. America.

## 2. ISOLEPIS, $B r$.

Usually small, perennial, slender, tufted green herbs. Leaves narrow or 0. Spikelets fascicled, lateral, small, terete, rarely solitary or terminal. Glumes many or few, entire, imbricate all round the rachis, the 1-2 lowest sometimes flowerless. Bristles 0. Stamens 1-3. Style simple at the base, deciduous, stirmas 2-3. Frwit compressed or 3-gonous, usually tumid at the top.-Distrib. Temp. climates, rare in trop. ; species about 100.-Etym. Zoos and $\lambda \epsilon \pi i$ is, from the equal gliumes.

1. I. seta'cea, $B r$.; stems filiform, leaves 1-2 narrow channelled, spikelets 1-3 lateral, fruit obovoid 3-gonous ribbed and furrowed.
Gravelly and sandy damp places; ascending to $1,500 \mathrm{ft}$. in Yorkshire ; f. July-Aug-Stems 3-6 in., tufted, terete, rigid. Leaves short, setaceous. Sppikelets usually $2-3, \frac{1}{6}-\frac{1}{4}$ in., ovoid. Glumes ovate, obtuse, green and brown. Stamens 2-3. Stigmas 3. Fruit broad, brown, finely striate between the ribs.Distrib. Europe, N. Africa? Siberia.
2. I. Sa'vii, Schultes; stems filiform leaves 1-2 narrow channelled, spikelets 1-3 suhterminal, fruit subglobose 3 -gonous not furrowed.
Wet bogs from Isla southwards, chiefly in the West; fl. July.-Very sinilar to I. setacea, but larger, paler, often $10 \mathrm{in} .$, with longer leaves; fruit paler, shining, dotted in lines.-Distrib. France, Spain, Italy, Turkey, N. Africa.
Var. ; monostachys ; spikelet solitary. 1. pygmaea, Kunth.
3. 4. flu'itans, Br.; floating, leafy, spikelet terminal solitary, fruit ohovate compressed mucronate. Eleogiton, Link.
Marshes and pools, ascending to $1,200 \mathrm{ft}$. in Yorkshire ; fl. June-July.-Stem 6-18 in., compressed, slender, branched. Leaves 1-2 in., linear, very slender.

Spikelets $\frac{1}{8}-\frac{1}{6}$ in., narrow-ovoid, pale. Glumes 4-8, oblong. Stigmas 2. Fruit plano-convex, pale, smooth, tipped with the base of the style.Distrib. Europe from Gothland southwards, Azores.
4. I. Holoschoe'nus, $R$. and $S$.; stem tall terete stout, leaves few erect subulate rigid channelled, spikelets in compact globose cymose heads, fruit subglobose mucronate transversely wrinkled.
Sandy sea-coasts, N. Devon ; fl. Sept.-Rootstock creeping, stout. Stems $2-3 \mathrm{ft}$., as thick as a crowquill, tufted at the base, margins of sheaths united by reticulate fibres. Leaves on the upper sheaths only, shorter than the stem, $\frac{1}{2}$-terete, margins rough. Heads $\frac{1}{4} \frac{1}{2} \mathrm{in}$. diam., upper subse ssile; branches of cyme 1-3 in., $\frac{1}{2}$-terete, very stout. Spikelets minute. Glumes obovate, notched, mucronate, ciliate. Stigmas 3.-Distrib. Europe from France and Spain southwards and eastwards, N. Africa, Siberia.-Habit of Sctrpus.

## 3. ELEOCH'ARIS, Br .

Tufted, erect, usually perennial leafless glabrous herbs. Stems slender, sheathed at the base. Spikelets solitary, terminal, erect, terete angled or compressed. Glumes many, imbricate all round the rachis; lower 1-2, if any, flowerless. Flowers 2 -sexual. Bristles 3-6, not longer than the glumes. Stamens 3. Style deciduous, articulate with the top of the fruit, stigmas 3. Fruit compressed or 3 -gonous.-Distrib. All climates, especially temp.; species about 50.-Етум. є̀лos and $\chi$ aí $\rho \omega$, from delighting in marshes.

## * Fruit with a tumid top.

1. E. palus'tris, $B r$.; rootstock stout creeping branched with many tufts of leaves and stems, lowest glume broadest, bristles 4-6, fruit compressed, stigmas 2.
Marshes, lake borders and ditches ; ascending to $1,200 \mathrm{ft}$. in Yorkshire ; fl. June-July.-Rootstock elongate, black. Stems 6-18 in., stout or slender, slightly compressed. Sheaths 2 , brown, truncate, leafless. Spike $\frac{1}{-1} \frac{1}{2}$ in., terete, narrow-ovoid, red-brown. Glumes lanceolate, subacute ; lowest much shortest, broadest, obtuse and embracing the base of the spike. Fruit compressed, obovate, striate, tumid, top triangular compressed.-Distrib. Europe (Arctic), N. Africa, N. Asia, N. India, N. America.
$V_{\text {AR. }} 1$, palus'tris proper; glumes dark, keel green, edges pale, lowest suborbicular half-embracing the base of the spikelet, fruit faincly striate.-V $\mathrm{V}_{\mathrm{AR}}$. 2, uniglu'mis, Link (sp.); glumes brown, edges narrow pale, lowest ovate almost embracing the base of the spikelet.-Var. 3, Watso'ni, Bab. (sp.) short, more rigid, glumes dark brown, lowest embracing the base of the spikelet, fruit evidently punctate in lines. - Cantire and Lancashire.
2. E. multicau'lis, Sm.; rootstock short with one tuft of leaves and stems, lowest glume largest, bristles $5-6$, fruit 3 -gonous, stigmas 3 .
Marshes, pools, \&c., chiefly on moorlands ; fl. July-Aug.-Similar to E. palustris, but differs in habit, in the obliquely truncate leaf-sheaths, and usually blunter glumes with narrower margins. Fruit hardly striate.-Distrib. Europe from Gothland southwards, excl. Turkey, N. Africa, N. America.
3. E. acicula'ris, $S m$.; rootstock stoloniferous, stems setaceous obtusely 4 -gonous grooved, spikelets minute compressed, glumes ovate obtuse, lowest broadest, bristles 1-3, fruit 3-gonous ribbed tumid, top subglobose.

Sandy edges of lakes and pools, from Perth and Kinross southwards, rare in Scotland and (W. only of) Ireland ; fl. July-Aug.-Stolons capillary. Stems many, $2-8$ in., extremely slender. Sheaths membranous, acute. Spikelets $\frac{1}{8} \frac{1}{4}$ in., red-brown. Fruit very minute, pale.-Distrib. Europe (Arctic), Siberia, Dahuria, N.W. India, N. America.
** Spikelets few-flowered. Fruit beaked, top scarcely tumid. (Bæothryon, Dietr.) 4. E. cæspito'sa, Link; rootstock and leaves very short, 2 lowest glumes fertile equalling or exceeding the spike mucronate or awned, bristles $4-6$ smooth, fruit obovoid 3 -quetrous acuminate.
Heaths and moors, ascending to $3,500 \mathrm{ft}$; fl. June-July.-Stolons 0 . Stems 6-12 in., very densely tufted, wiry, grooved. Sheaths, lower split, large, stout, rigid, shining; upper slender, with an erect short subulate blade. Spikelets $\frac{1-3}{}$ in., erect, chesnut-brown, shining. Glumes few, rigid, lowest flowering with usually a long green point. Anthers long, exserted, muero long. Stigmas 3, very long. Fruit brown.-Distrib. Europe (Aretic), Siberia, temp, and cold N. America.
5. E. pauciflo'ra, Link; rootstock creeping, stolons long, upper sheaths truncate, lowest glume fertile obtuse not equalling the spikelet, bristles 3-6 barbed, fruit obovoid 3-gonous.
Moorlands, north to Ross, ascending to 2,100 ft. in Yorkshire ; fl. July-Aug. -Very similar to S. cerspitosus, but habit different, leafless, smaller; lowest glume obtuse, with the rib not produced to the top; and anthers not apiculate. Fruit pale, minutely striate ; beak slightly contracted at the base, and quite the representative of the tumid top of the first division of the genus. - Distrib. Europe (Arctic), except Turkey, N. and W. Asia, N. America.
6. E. par'vula, Hook.; minute, rootstock creeping, sheaths hyaline, leaves setaceous, spikelet minute, glumes pale lowest flowerless obtuse not exceeding the spikelet, bristles 4-8 barbed, fruit obovoid 3-gonous.
Muddy sea-shores, Hampshire (probably extinct), Wicklow ; fl. July.- Rootstock elongate, capillary, with distant tufts of a few soft stems and leaves, terminated by small tubers. Stem 1-2 in., grooved; sheath very inconspicuous, owing to its extreme tenuity. Leaves like the stems, slightly dilated at the base, recurved, subulate, channelled. Spikelets $\frac{1}{1}$ in., pale. (ilumes membranous, obtuse. Fruit pale.-Distrib. Europe froin Gothland southwards, exel. Spain and Turkey.

## 4. BLYS'MUS, Panzer.

Erect, perennial, glabrous herbs. Spikelets distichous, in a lateral or terminal erect bracteate spike. Glumes imbricate all round the rachis, all but the 2 lowest flowering, oblong-lanceolate, obtuse. Flowers 2 -sexual. Bristles 3-6. Stamens 3. Style-base not tumid, stigmas 2. Fruit planoconvex, beaked.-Distrib. Europe, Siberia, Himalaya; species 2.-Etym. Bגvojós, a spring.

1. B. compress'us, Panz.; leaves flat, edges rough, lower glume ribbed much shorter than the spikelet.
Wet pastures and marshes, from Ayr and Haddington southwards ; ascending to $1,500 \mathrm{ft}$. in Northumberland ; absent from Ireland ; f. June-July.-Rootstock elongate. Stems 4-10 in., solitary, sheathed at the base. Leaves shorter than the stem, grass-like, keeled. Bracts leafy, long or short. Spikes $\frac{1}{3}-1 \frac{1}{2} \mathrm{in}$.

Spikelets many, $\frac{1}{4}$ in., pale brown. Bristles barbed. Fruit pale.-Distrib. Europe, exel. Spain Greece and Turkey, Siberia.
2. B. ru'fus, Link; leaves $\frac{1}{2}$-terete smooth, lowest glume not ribbed equalling the spikelet.
Wet pastures, especially near the sea, from Anglesea and Durham northwards;
N. half of Ireland ; fl. July.-Rootstrck creeping. Stems tufted, 3-12 in. Leaves short, channelled. Spikes $\frac{1}{3}-\frac{2}{3}$ in., chesnut brown. Spikelets few, short. Bristles short, rough, very deciduous. Fruit brown.-Distrib. Scandinavia (Arctic), N. Germany, Siberia, Dahuria, Himalaya.

## 5. ERIOPH'ORUM, L. COTTON-gRASs.

Perennial, tufted herbs. Spikelets terminal or lateral, solitary or cymose, terete. Glumes imbricate all round the rachis, all but $2-3$ lowest flowering. Flowers 2-sexual. Bristles 4-6 or very many, capillary, flat, at length greatly exceeding the spikelets. Stamens 1-3. Style deciduous, base not tumid, stigmas 2-3. Fruit 3 -gonous or compressed.-Distrib. N. temp. and arctic regions; species about 12.-Etym. épıov and $\phi o \rho \alpha$, from the cottony heads.

> * Spikelet solitary terminal, ebracteate.

1. E. vagina'tum, L. ; stem glabrous, leaves filiform 3 -quetrous, spike ovoid many-flowered, bristles very many.
Boggy moors, ascending to near $3,000 \mathrm{ft}$. in the Highlands ; fl. A pril-May.Rootstock short. Stems many, tufted, 6-10 in., longer in fruit, terete below, 3 -gonous above, with 1-2 inflated leafless sheaths above the middle. Leaves very short. Spikelets $\frac{3}{4}-1 \mathrm{in}$., erect. Glumes hyaline, broadly ovate, olivegreen. Fruit obovoid, obtuse, mucronate, compressed.-Distrib. Europe (Arctic), excl. Turkey, Siberia, W. Asia, N.W. Tibet, N. America.
2. E. alpinum, $L$.; stem rough 3 -gonous, leaves setaceous, spike narrowoblong few-flowered, bristles 4-6 crumpled.
Spongy bogs, Forfar (now extinct), Sutherland? fl. June.-Rootstock creeping, producing a series of stems and leaves. Stems 6-10 in., very slender, rigid. Leaves short, rough, channelled, keeled. Spikes $\frac{1}{4}$ in., erect, oblong-lanceolate. Glumes yellow-brown. Fruit minute, obovoid, 3-gonous.-Distrib. Arctic and Alpine Europe, N. Asia, N. America.

> ** Spikelets in lateral corymbose cymes, drooping, bracteate.
3. E. polysta'chyon, $L$. ; stem rigid obtusely 3 -gonous, leaves smooth flat, tip 3 -gonous, bracts $2-3$, spikelets $4-12$, fruit obovoid mucronate.
Bogs, ascending to near 3,500 ft. in the Highlands ; f. May-June.-Rootstock stout. Stems 6-18 in., stout or slender, smooth, leafy. Leaves chiefly radical, variable in breadth. Heads rarely solitary, very variable in number, size, and length of peduncles. Glumes $\frac{1}{-\frac{1}{4}} \mathrm{in}$., lead-coloured, oblong- or ovate-lanceolate, membranous. Bristles when fully grown $1 \frac{1}{2}-2 \mathrm{in}$.-Distrib. Europe (Arctic), N. Asia, N. America.
Sub-sp. Angustifo' LiUM proper, Roth (sp.) ; rootstock long, stems not tufted solid, leaves channelled 3 -gonous above the middle, branches of cyme smooth, glumes ovate, margins broad scarious. E. gracile, Sm. not Koch.
Sub-sp. latifo' lium, Hoppe (sp.) ; rootstock short, stems tufted hollow, leaves flat tip short 3 -gonous, branches of cyme scaberulous, glumes lanceolate with very narrow scarious margins. E. pulescens, Sm.-Local ; ascends only to $1,500 \mathrm{ft}$. in the N. of England ; very rare in Ireland.
4. E. grac'ile, Koch; stem very slender 3 -gonous, leaves very narrow 3 -quetrous throughout channelled, bracts $1-2$ small, spikelets 3-6, fruit narrowly obovate-lanceolate obtuse not mucronate.
Bogs, very rare, Halnaby, Yorkshire, and between Guildford and Woking ; f1. June-July.-A doubtful species, intermediate between sub-sp. angustifolium and latifolium. Stem very slender, 1-2 ft.; leaves short, exceedingly narrow; peduncles seabrid; heads small; glumes broad, obtuse, distinctly ribbed, brown, without scarinus margins; fruit very narrow.-DisTrib. Europe (Arctic), Siberia, N. America.

## 6. CLA'DIUM, P. Brown.

Coarse, harsh, perennial, usually tall grassy herbs. Spikelets terete, usually panicled or cymose. Glumes few, concave, imbricate all round the rachis, 1-3 only flowering. Flowers 2 -sexual, or the lower male. Bristles 0. Stamens 2-3. Style deciduous, tumid but not jointed at the base, stigmas 2-3. Fruit globose ovoid or 3-gonous, mucronate or beaked, pericarp thick corky, endocarp hard. - Distrib. All climates except very cold ; species about 20.-Етум. к入áōos, a twig.

1. C. Maris'cus, Br .; stem terete, spikelets clustered on the branches of many crowded compound cymes.
Bogs and marshes, local ; Sutherland, Wigton, and Berwick only in Scotland ;
more frequent in Ireland; fl. July-Aug.-Rootstock stout, creeping. Stems
$2-5 \mathrm{ft}$., stout, erect, terete or obscurely 3 -gonous, very leafy. Leaves $2-4 \mathrm{ft}$., $\frac{1}{2}$ in. diam., rigid, glaucous, channelled, keeled, margins serrulate, points very long. Cymes axillary and terminal, corymbose ; branches $1-3$ in., erect or recurved, bracts setaceous. Spikelets $\frac{1}{4} \mathrm{in}$., crowded in pedicelled heads $\frac{1}{2} \mathrm{in}$. diam. Glumes 5-6, obtuse, pale-brown, lower short, upper oblong-lanceolate, flowering. Flowers about 2, one fertile. Stamens usually 2; anthers apiculate. Fruit small, ovoid, 3 -gonous, beaked, brown ; endocarp thick.-
Disitur. Europe from Gothland southwards, N. Africa, Siberia.

## 7. RHYNCHOSPORA, Vahl.

Perennial, tufted, leafy sedges. Spikelets terete, in axillary and terminal corymbs or panicles. Glumes imbricate all round the rachis, 1-2 only flowering. Flowers 2 -sexual, or the upper 1 -sexual. Bristles 6 or more, rarely 0. Style-base tumid, hardened, persistent, stigmas 3. Fruit com pressed or 3 -gonous, tipped by a tumid tubercle.-Distrib. Temp. and

1. R. al'ba, Vohl; spikelets pale 1 -flowered, bristles many barbed, stamens 2, fruit ohovoid contracted below equalling the tumid tubercle.
Spongy bogs and wet meadows ; fl. June July.-Rootstock short. Stems 6-18 in., very slender, 3 -gonous above. Leaves subsetaceous, very narrow, channelled. Corymbs small, $\frac{1}{2} \frac{-3}{1} \mathrm{in}$. diam., terminal and axillary, long-peduncled, flattopped ; bracts leafy. Spikelets in., erowded, white or pale brown. Glumes oblong-lanceolate, acuminate, keeled, membranous. - Distris. Europe (Arctic), excl. Greece and Turkey, Siberia, N. America.
2. R. fus'ea, $R$. and $S$.; spikelets dark-brown, bristles 6 barhed upwards, stamens 3 , fruit obovoid equalling the triangular serrulate tubercle. Bogs in Glamorgan, Somerset and Dorset, very rare ; more common in S.W.

Ireland ; f. July-Aug.-Similar to R. alba, but more slender and rootstock elongate.-Distrib. Europe, excl. Spain Greece and Turkey, N.E. America.

## 8. SCHE'NUS, $L$.

Perennial, often leafless, rigid, rush-like herbs. Spikelets in compressed terminal bracteate heads. Glumes subdistichous, rigid, the upper only flowering. Flowers 1-4, 2-sexual. Bristles 1-6. Stamens 3. Style deciduous, base not tumid, stigmas 3. Fruit 3 -gonous, obtuse or mucro-nate.-Distrib. Chiefly temp.; species about 10.-Etym. $\sigma$ Øoivos, from the use of some species as cordage.

1. S. nigricans, $L$.; stem terete, spike obovoid usually much shorter than the bract.
Bogs and wet moors, rather local ; ascending to upwards of $1,000 \mathrm{ft}$. in the Highlands ; fl. June-July.-Root tock short, stout, branched. Stems 6-24 in., in dense hard tufts of matted sheaths and leaves, terete, wiry, leafless above ; sheaths copious, red brown or black, shining. Leaves wiry, terete, margins convolute. Spikes $\frac{1}{2} \frac{3}{\frac{3}{4}}$ in., dark red-brown, shining; bract setaceous. Spikelets 4-10, erect, linear-oblong. Glumes irregularly distichous, oblonglanceolate, subacute; keel scaberulous. Bristles barbed upwards. Fruit small, ovoid, white.-Distrib. Europe, N. Africa, Siberia.

## 9. CYPE'RUS, $L$.

Perennial, rarely annual, rushy or grass-like herbs of various habit. Spikelets linear, compressed, in lateral or terminal usually bracteate heads, or branched umbels or panicles. Glumes many, distichous, concave, keeled, deciduous, all or most flowering. Flowers 2 -sexual. Bristles 0. Stamens 1-3. Style deciduous, not tumid at the base, stigmas 2-3. Fruit 3 -gonous or compressed.-Distrib. All climates but cold ; species about 300 .-Etym. The old Greek name.

1. C. lon'gus, $L$. ; perennial, tall, cyme umbellate, glumes erect redbrown. Galingale.
Marshes, very rare, Pembroke and from Kent to Cornwall; Channel Is., fl. Aug.-Sept.-Rootstock stout, creeping. Stems 2-3 ft., stout, erect, 3 -quetrous, leafy at the base. Leaves few, flat, keeled; margins hardly scaberulous. Rays many, 3-6 in., slender, again umbellate. Bracts leaflike, far exceeding the rays. Spikelets $\frac{1}{2}-\frac{3}{4} \mathrm{in}$., 4-8, linear, curved, distichously crowded at the top of the rays. Glumes lanceolate, midrib green scabrid. Fruit 3-quetrous, pale. - Distrib. Europe from France and Germany to Spain and Turkey, N. Africa.-Rootstock aromatic, formerly used as a medicine.
2. C. fus'cus, $L$.; annual, dwarf, spikelets corymbose or capitate, glumes at length spreading green or pale brown.
Ditches and wet meadows, very rare, Surrey and (formerly) Middlesex ; fl. Aug. Sept. -Stems 3-10 in., many ascending from a fibrous root, 3 -quetrous. Leaves flat, spreading, grass-like. Rays few, short, simple, rarely divided. Bracts 3, leaf-like, unequal, broad at the base, curved, spreading. Spikelets $t-\frac{1}{3}$ in., crowded, slender. Glumes many, oblong-ovate, subacute ; midrio broad or narrow, smooth, green. Fruit minute, white.-Distrib. Europe
from Gothland southwards, N. Afriea, Siberia, W. Asia.

## 10. KOBre'sia, Willd.

Small perennial sedges. Leaves rigid, keeled. Spikelets crowded in a terminal compressed ovoid spike, few-flowered, some male, others male (upper) and female. Glumes $2-3$, imbricate all round the axis, lowest flowerless. Bristles 0.-Male fl. Stamens 3.-Female fl. at the base of a convolute bract. Ovary 3 -gonous; style-base simple, stigmas 3. Fruit 3 -gonous.-Distrib. Arctic and Alpine Europe, N. Asia, Himalaya; species 2-3.-Etym. De Kobres, a German patron of botany.

1. K. carici'na, Willd.; lower spikelets with one female flower.

Upland moors, York, Durham, and Perth; ascending to about 2,500 ft. in the latter; fl. Aug. - Rootstock short. Stems 4-9 in., densely tufted, rigid, terete, leafy at the base only. Leaves $2-5 \mathrm{in}$., wiry, recurved, grooved, margins convolute. Spike $\frac{1}{2}-1 \mathrm{in}$., narrow. Spikelets subdistichous, sessile, cylindric ; bracts small, lowest with a rigid serrulate point. Glumes $\frac{1}{8} \mathrm{in}$., rigid, ovate-oblong, obtuse, pale brown, basal always empty, second of the lower spikelets female, the third male; in the upper spikelets both flowers are male. Fruit as long as the glumes, linear, beaked, pale.-Distrib. Arctic and Alpine Europe, Greenland, Rocky Mts.

## 11. CA'rex, $L$. Sedge.

Perennial grasslike herbs. Stems usually leafy. Spikelets 1-2-sexual, very rarely dioccious, terete, solitary or in heads spikes racemes or panicles, all 2 -sexual or lower female with often a few male fl. at the base or top, and upper male with often a few female at the top or base. Glumes imbricate all round the rachis, persistent or deciduous.-Male fl. Stamens $2-3$, without perianth or bristles. -Female fl. a compressed or 3 -quetrous ovary, included in an urceolate 2 -toothed sac, from which the 2-3 stigmas project. Fruit minute, coriaceous, compressed or 3gonous, included in the sac (perigynium).-Distrib. All climates, rare in trop., abundant in Aretic and cold; species about 1,000.-Етум. кєípш, from the cutting foliage.-Sometimes a slender rudimentary axis (racheola) occurs in the perigynium, at the base of the ovary.

## Section 1. Spikelet solitary, terminal.

1. C. pauciflo'ra, Light.; leaves involute, spikelet ebracteate, glumes 4-6, upper male, perigynia reflexed, stigmas 3 .
Moorland bogs from York and Dumfries to Sutherland ; ascending to 2,700 ft. in the Highlands; absent from Ireland; fl. June-July.-Rootstock slender, creeping, stoloniferous. Stems 3 -12 in., very slender, 3 -gonous, smooth. Leaves setaceous. Spikelets $\ddagger \mathrm{in}$. Glumes $1-\frac{1}{2}$ in., rather distant, oblonglanceolate, acute, pale, shorter than the fusiform pale beaked perigynia. Fruit 3-quetrous, pale.-Distrib. Europe, chiefly Alpine and Arctic, N. America.
2. C. pulica'ris, L.; leaves involute, spikelet ebracteate, glumes 6-12 upper male, perigynia reflexed, stigmas 2.
Bogs, asconding to $2,700 \mathrm{ft}$. in the Highlands; fl. May-June.-Rootstock tuftod; stolons 0 or short. Stems $3-5$ in., smouth, rather rigid, terete, grooved. Leaves setaceous, often exceeding the stem. Spikelets $\frac{1}{2}-1 \mathrm{in}$. Glumes $\frac{1}{\frac{1}{3}} \mathrm{in}$., lower sometimes remote, ovate-oblong, subacute, about $\frac{1}{2}$ as
long as the ovate-lanceolate stalked compressed beaked pale perigynia. Rucheola linear, sometimes floriferous. Fruit oblong, plano-convex, grey. -Distrib. N. and Alpine Europe, N. Asia.
3. C. dioi'ca, L. ; leaves setaceous, spikelet ebracteate diœecious or male below, glumes many, perigynia erect or spreading, stigmas 2.
Bogs and moorlands from Dorset and Sussex northwards; ascending to nearly $2,900 \mathrm{ft}$. in the Highlands; rarer in Ireland; fi. May-June. - Rootstock creeping, stoloniferous. Stem 6-12 in., terete, striate, wiry, smooth. Spikelets : male $\frac{1}{3}-\frac{2}{3}$ in., very narrow, cylindric, glumes oblong-lanceolate, pale; female $\frac{1}{3} \frac{1}{2}$ in., ovoid, glumes ovate, brown, deciduous, shorter than the sessile ovoid beaked ribbed plano-convex perigynia. Fruit lenticular, chesnut-brown,-Distrib. Europe (Arctic), Siberia, N. America.
4. C. rupes'tris, All.; leaves channelled, bract subulate or 0 , glumes few, upper male, perigynia erect, stigmas 3.
Ledges of Alpine rocks in Perth, Forfar, Aberdeen and Sutherland ; from 2,000-2,500 ft.; fl. July.-Rootstock creeping, tufted, stoloniferous. Stems 4-6 in., wiry, 3 -gonous, rather rough. Leaves curved, rigid, margins recurved. Spikelet $\frac{1}{2}-1 \mathrm{in}$., narrow, dark-brown, shining. Glumes, female few, broadly ovate, obtuse or mucronate, rather shorter than the elliptic, smooth, pale, abruptly beaked perigynia. Fruit 3 -quetrous, brown.-Distrib. Arctic and Alpine N. and Mid. Europe, N. Asia, N. America.
Section 2. Spikelets short, sessile, most or all 2 -sexual, all similar. Bracts 0, or setaceous or leafy, never sheathing. Stigmas 2.

* Spikelets in simple spikes or heads, male at the top only; (spike sometimes compound at the base in 7, disticha ; see also 11, muricata.)

5. C. incur'va, Light.; stem short, spikelets capitate, bract 0, perigynia longer than the ovate obtuse glumes, beak abrupt short smooth.
Sandy shores, E. coast, from Holy Is. northwards ; absent from Ireland; fl. June-July.- Rootstock very long, creeping. Stem stout, curved, subterete, smooth, leafless. Leaves spreading and recurved, margins involute. Spike $\frac{1}{2}-\frac{3}{4}$ in., broadly ovoid. Perigynia elliptic-ovoid, turgid, spreading, pale, much larger than the pale brown glumes. Fruit ferruginous, lenticular.-Distrib. Scandinavia (Arctic), Italy, Turkey, Germany, Siberia, N.W. India, N. America, S. Chili.
6. C. divi'sa, Huds.; slender, spikelets short crowded bracteate, perigynia ovoid equalling the ovate cuspidate glumes, beak 2 -fid serrulate.
Marshes, from York and Lincoln southwards; Dublin only in Ireland; fl. May -June.-Rootstock stout. Stems 1-3 ft., very slender, leafy, 3 -gonous, scabrid above ; basal sheaths leafless. Leaves long, very narrow, flexuous, margins involute. Spikes $\frac{1}{2}-1 \frac{1}{2}$ in., narrow, interrupted, pale brown ; bracts setaceous or filiform. Glumes membranous. Perigynia not margined. Fruit brown, plano-convex, orbicular.-- Distrib. Europe, from France and Germany to Italy and Turkey, N. and S. Africa, W. Siberia, N. W. India.
7. C. dis'ticha, Huds.; stems long, spikelets in an elongate head, bracts small, perigynia stipitate elliptic-ovoid ribbed exceeding the acuminate glumes, wing narrow and 2 -fid beak serrulate. C. intermedia, Good.
Wet meadows and marshes, from Isla and Kincardine southwards ; ascending to about $1,200 \mathrm{ft}$. in the Highlands; fl. June.-Rootstock creeping. Stems

1-3 ft., stouter than in C. divisa, leafy, 3 -gonous, scaberulous above. Leaves $\frac{1}{6}-\frac{1}{8} \mathrm{in}$. broad, flat. Spike $\frac{1}{2}-3 \mathrm{in}$., subdistichous, pale brown, sometimes compound at the base, the upper and lower spikelets usually wholly male, intermediate chiefly male; bract never large and leafy. Fruit ovoid, ferruginous.-Distrib. Europe, Siberia, Dahuria, N. America.
8. C. arena'ria, $L$.; stem short, spike oblong, bracts setaceous, perigynia substipitate elliptic-ovoid ribbed winged exceeding the subaristate glumes, wing broad and 2 -fid beak serrulate.
Sandy sea-shores; fl. June.-Very near C. disticha, but habit different, shorter; leaves rigid, curved; glumes more mucronate, and fruit with a broad coriaceous wing. Rootstock very long, stout, branched, binding the sands. Atems $8-12$ in., stout, curved, 3 -quetrous, scabrid above. Leaves chiefly radical, stiff, margins involute. Spike 1-3 in., compressed, pale brown. Spikelets many, lower female, upper usually male, intermediate 2 -sexual. Fruit plano-convex, chesnut, shining.-Distrib. Europe, Siberia.
** Spikelets male at the top only, in compound heads spikes or panicles, (rarely simply spiked or capitate in 11, muricata ; see also 7, disticha.)
9. C. panicula'ta, L.; stout, spikelets many in an elongate panicle, perigynia ovoid truncate below broadly 3 -gonous ribbed equalling the pale margined ovate subaristate glumes, beak slender 2 -toothed serrulate.
Wet copses and marshes ; fl. June-July. - Rootstock tufted, densely matted, forming large tussocks sometimes 2-4 ft. Stems 1-4 ft., leafy, stout, 3 -quetrous, scaberulous above. Leaves harsh, long, narrow, flat. Panicle 2-6 in., very variable, rarely reduced to a simple spike, pale brown. Brancles short; bracts 0 or setaceous. Spikelets crowded, pale brown. Perigynict truncate or cordate at the base, opaque, gradually narrowed into the long beak. Fruit ovoid, base narrowed, biconvex, base of style tumid. - Distrib. Europe from Swedon southwards, Canaries, W. Siberia.
10. C. teretius'cula, Good.; slender, panicle ovoid spikelike, spikelets few, perigynia spreading ovoid turgid ribhed below exceeding the ovate acuminate glumes, beak long rough 2 -toothed.
Bogs and wet meadows, from Lanark and Moray to Devon and Kent; fl. Junc. -Allied to C. paniculata, but habit different ; rootstock creeping; stems wiry, much more slender, never forming tussoeks; spike shorter, broader, more simple; perigynia brown, shining, ribbed only at the hase. Fruit obpyriform, biconvex.-DisTrib. Europe (Aretic), except Turkey, Canaries, Himalaya, N. America, N. Zealand. - C. Ehrhurtiana, Hoppe (C. pseudoparadoxa, Gibs.), with more numerous stems and a larger more interrupted spike, found near Manchester, seems hardly a variety.
Sub-sp. Paradox'a, Willd. (sp.); rootstock tufted, panicle elongate interrupted, fruit less shining more ribbed.-Bogs, very rare ; Norfolk, Yorkshire, Westmeath. - A dubious plant ; after examining specimens from all the localities, I regard it as a sub-species of teretinsculu, of which it has the foliage and most other characters.-Distrib. Europe (Aretic) Siberia.
11. C. murica'ta, L. ; slender, spikelets few green squarrose in spikes or slender panicles, bracts 0 or setaceous, perigynia spreading elliptic-ovoid smooth longer than the acuminate glumes, beak broad serrulate 2 -fid.
Marshes, copses, and wet meadows, from Elgin and Dumbarton southwards;
f. May-June.-Densely tufted, stolons short. Stems 1-2 ft., wiry, 3-gonous, scaberulous above. Leaves shorter than the stem, narrow, flat. Spike very variable. Perigynia narrowed below, sessile, faintly ribbed, beak deeply 2 -fid. Fruit brown, plano-convex, base of style clavate.-Distrib. Europe, N. Africa, N. Asia, Himalaya, N. America.

Sub-sp. MURICA'TA proper ; stem erect, spike more continuous, glumes brown with green keels, beak serrulate.
Sub-sp. DIVUL'SA, Good. (sp.); more slender, stem curved, spike elongate much interrupted, perigynia less spreading narrower and glumes paler, beak less serrulate.-From York and Denbigh southwards.
12. C. vulpi'na, $L$.; stout, leaves broad flat, spike subcylindric squarrose bracteate, perigynia spreading ovoid truncate below obscurely ribhed equalling the ovate awned pale brown glumes, beak long serrulate 2 -fid.
Marshy copses and saline ditches, from Elgin and the Hebrides southwards;
f. June.-Rootstock tufted, stoloniferous. Stems many, 3-quetrous, leafy, angles scabrid, faces convex. Leaves $\frac{1}{4} \frac{1}{2} \mathrm{in}$. Spikes $1-3$ in., variable; bracts setaceous, spreading, conspicnous. Glumes pale brown, midrib green, awns short scabrid. Perigynia compressed, ribs variable in stoutness. Fruit ovoid, brown.-Distrib. Europe, N. Africa, Siberia, N. America.
*** Spikelets male at the base, rarely at the top also, distant, alternate, (rarely close in 13, stellulata.) Bracts often long and foliaceous.
13. C. stellula'ta, Good. ; slender, leaves narrow, spikelets 3-5 subglobose squarrose, bracts small, perigynia broadly ovoid plano-convex striate exceeding the ovate acute glumes, beak 2 -fid broad scabrid. C. echinata, Murr. (an earlier name).
Moors and bogs, ascending to near $3,000 \mathrm{ft}$. in the Highlands; fl. May-June. -Rootstock densely tufted. Stems 6-18 in., 3-gonous, minutely scabrid above, stolons 0 . Leaves channelled, shorter than the stem. Spikes $\frac{1}{2}-1 \mathrm{in}$., usually rather dense ; upper spikelets more slender. Gilumes pale brown; midrib green. Perigynia olive-green, sessile, base rounded, ribs on the sides stout, on the faces faint. Fruit lenticular, pale olive.-Distrib. Europe (Aretic), N. Africa, W. Asia, Siberia, N. America.
14. C. remo'ta, L.; slender, leaves narrow, bracts long, spikelets oblong, perigynia erect narrow-ovoid plano-convex striate exceeding the ${ }^{\text {- }}$ oblong-ovate acuminate glumes, beak broad and margins above serrulate. Copses and shady places, from Argyle and Ross southwards ; ascending to $1,000 \mathrm{ft}$. in N. England; fl. June. - Rootstock tufted with spreading branches. Stems 1-2 ft., inclined, obtusely 3 -gonous. Leaves $\frac{1}{1 /-\frac{1}{y}} \mathrm{in}$. broad, equalling the stems, flat. Spike 2-5 in., rachis scabrid; lower bracts often exceeding the stem. Spikelets 3-9. Glumes pale brown, midrib broad green, margins white scarious. Perigynia pale, narrowed below. Fruit plano-convex, narrowed at the base.-DIstrib. Europe, N. Africa, N. A sia, Himalaya, N. America.-C. tenella, Sm. not Schk., is a starved form.
15. C. axilla'ris, Good.; slender, leaves narrow, bracts leafy, spikelets oblong, perigynia ovate-lanceolate plano-convex ribbed about equalling the ovate acuminate glumes, beak broad flat and margins above serrulate. Marshy meadows and damp places, rare ; from York and Lancashire to Kent and Devon; S. and E. of Ireland, very rare ; fl. June.-Similar to C. remota: but stem more 3 -quetrous, taller and stouter ,often very scabrid below thi
spike, though sometimes smonth; lower spikelets usually compound at the base. Fruit lenticular, ovoid.-Distrib. N. Germany, Tyrol.-Probably a hybrid between remota and either vulpina or muricata.
C. Benninghuasenia'ua, Weihe, is apparently a hybrid between C. axilluris and remota? having the 3 -quetrous scabrid stem and often compound lower spikelet of axilluris, and the more slender habit and smaller spikelets of remota. Bracts sometimes wholly suppressed; glumes very pale and membranous. Perigynia as in both, shining; ripe fruit (Herb. Buott.) small, almost orbicular, brown, smooth.-Wet copses, \&c. from Aberdeen and Banff to Kent and Sussex, not found in Ireland (rare on the Continent).

## **** Spikelets male at the buse, or both at the top and base, crowded into a compact head or spike. Bracts 0 or subulate.

16. C. lepori'na, L.; stout, leaves narrow, spike lobed compact, perigynia elliptic-ovoid plano-convex striate equalling the lanceolate acute glumes, margins winged and long 2 -fid beak serrulate. C. ovalis, Good.
Wet places, ascending to nearly $1,700 \mathrm{ft}$. in the Lake District ; f. June. - Rootstock tufted; stolons 0 . Stem 6-12 in., 3-quetrous, slightly seabrid above. Leaves shorter than the stem, flat, $\frac{1}{1-\frac{1}{8}} \frac{1}{8} \mathrm{in}$. broad, points fine. Nyike $\frac{3}{4}-1 \mathrm{in}$., often as broad, pale brown, compressed; spikelets male at the base only; bracts usually 0 , sometimes subulate ( C. argyroglockin, Lond. Cat. 1867, not Hornem.). Glumes pale brown, midrib green, edges whitish. acuminate or cuspidate. Perigynia sessile, with a thin wing from the base upwards. Fruit stipitate, oblong, lenticular, shining.-Distrib. Europe (Arctic), Siberia, W. Asia, Greenland, Rocky Mts.
17. C. canes'cens, $L$.; slender, leaves narrow, spike interrupted, bract 0 or minute, perigynia elliptic-ovoid plano-convex ribbed equalling the ovate acute pale glumes, beak short 2 -fid serrulate. C. curta, Good.
Bogs and marshes, from Isla and Elgin to Devon and Kent; ascending to nearly $2,200 \mathrm{ft}$. in the Highlands ; fl. June-July.-Rootstock tufted ; stolons 0 . Stems 12-18 in., 3 -quetrous, longer than the leaves, hardly scabrid above. Leuves flat, $x^{\frac{1}{-2}} \frac{3}{4}$ in. broad. Spike $\frac{1}{2}-1 \frac{1}{2}$ in., slender, spikelets 3-8, ovoid, male at the base only; bracts 0 , rarely 1 , subulate. Glumes very pale, edges broad scarious. Perinynia erect, pale olive, not winged, ribs slender, beak obscure. Fruit ovoid or obovoid, lenticular, pale.-Distirib. Europe (Arctic), except Spain and Turkey, N. Asia, N. America, S. Chill.
Var. 1, cumes'cens proper ; spikelets many-flowered. glumes nearly white, heak obscurely toothed.-VAR. 2, alpiciola, Wahl.; spikelets fewer few-flowered, glumes browner, beak deeply 2 -fid in fruit. C: vitilis, Fries. More Alpine, ascends to $3,660 \mathrm{ft}$. in the Highlands ; absent from Ireland.
18. C. lagopína, Wahl.; stem wiry, leaves flat, spikelets $2-4$ small crowded, hracts minute, perigynia elliptic-ovoid hiconvex ribbed exceeding the ovate acute glumes, beak short 2 -fid. C. leporina, L. in part.
Aberdeenshire Alps, at ahout $3,600 \mathrm{ft}$.; very rare ; fl. Aug.-Rootstork tufted; stolons short. Stems 6-10 in., 3-quetrous, often curved below, smooth or scabrid above. Leaves $\frac{1}{1}-\frac{1}{6} \mathrm{in}$. broad. Sipikclets $\frac{1}{\frac{1}{2}} \mathrm{in}$., ovoid. Glumes few, broad, dark brown, midrib green, edges white. Perigynia red-brown. Fruit obovoid.-Distrib. Arctic and Alpine Europe, N. Asia, N. America.
19. C. elonga'ta, L.; slender, leaves narrow, spike slender, spikelets many close, perigynia elliptic-lanceolate biconvex ribbed much exceeding the ovate acute glunes, beak subulate entire decurved.

Wet copses and meadows from York and Lancaster to Essex and Surrey; Lough Neagh in Ireland; fl. June.-Rootstock tufted, matted ; stolons 0 . Stems very many, $1-2 \mathrm{ft} ., 3$-quetrous, scabrid, graceful, leafy. Leaves longer than the stems, flaceid, flat, $\frac{1}{10}-\frac{1}{8} \mathrm{in}$. broad. Spike $1-2 \frac{1}{2} \mathrm{in}$. ; bracts 0 . Spikelets erect or spreading, lower rarely distant. Gllumes red-brown, midrib green, edges white. Perigynia pale, sessile, spreading, strongly ribbed, gradually narrowed into the beak. Fruit oblong, obtuse, plano-convex.Distrib. Europe (Arctic), Siberia, Dahuria, N.W. America.
Section 3. Spikelets 2-6, short, ovoid, approximate, all subsimilar, 2-4 lower wholly female, upper male at the base only (rarely at the top or throughout). Lowest bract foliaceous, sheath very short or 0. Stigmas 3.
20. C. Buxbaum'ii, Wahl.; leaves narrow, sheath-edges filamentous, spikelets $3-5$ subsessile, perigynia green ellipsoid nerved larger than the lanceolate dark glume, beak 0. C. canescens, Auct.; C. polygama, Schkuhr. Stony banks of Harbour Is., Lough Neagh; fl. July.-Rootstock short, creeping, stoloniferous. Stems $1-2 \mathrm{ft}$., rigid, 3 -quetrous, leafy below. Leaves flat, $\frac{1}{8}-\frac{1}{-1} \mathrm{in}$. broad ; sheaths red-brown, rigid, edges filamentous. Lower bracts leafy, often exceeding the spike. Spikelets $\frac{1}{3} \frac{3}{4}$ in., obtuse, conspicuous from the small dark glumes and large broad imbricating perigynia. Glumes rounded, mucronate acuminate or awned, dark red-brown, midrib green. Perigyniu plano-convex, beak reduced to a 2 -fid mouth, ribs slender. Fruit obovoid, 3 -quetrous, brown, covered with white dots.-Distrib. Arctic and Alpine Europe, N. Asia, N. America, Australian Alps.
21. C. alpína, Swartz; leaves short flat, spikelets $2-4$ sessile subglobose, perigynia ovoid nerveless much larger than the ovate acute blackish glumes, beak very short notched scabrid. C. Vahlii, Schk.
Rocky ledges of the Alps of Aberdeen and Forfar, alt. 2,400-2,600 ft.; ff.
Aug.-Rootstock with short stolons. Stem 6-18 in., subsolitary, rigid, 3quetrous, smooth or scaberulous above. Leaves short, recurved, $\frac{1}{8}-\frac{1}{6} \mathrm{in}$. broad, spikelets $\frac{1}{4} \frac{1}{3} \mathrm{in}$., close, lateral subhorizontal, black ; bract slender. Glumes crowded, subacute, broad, without a green midrib. Perigynia broad, yellow-brown, scaberulous. Fruit ellipsoid or ovoid, 3-quetrous, pale.-DISthib. Aretic and Alpine Europe, N. Asia, Himalaya, N. America.
22. C. atra'ta, L.; leaves broad, spikelets $4-6$ pedicelled inclined subcylindric, perigynia suborbicular 3 -gonous compressed smooth larger than the ovate subacute blackish glumes, beak short smooth.
Lerges of Alpine rocks, N. Wales, and from Dumfries to Aberdeen, alt. 2,400
$-3,700 \mathrm{ft} . ;$ fl. July-Aug.-Rootstock tufted, small, stoloniferous. Stem $10-28$ in., inclined, 3 -gonous, hardly scabrid above. Leaves rather large, $\frac{1}{6} \frac{1}{3} \mathrm{in}$. broad, flat, keeled. Spikelets $\frac{1}{2}-\frac{3}{4} \mathrm{in}$., rarely remote, uppermost sometimes wholly male; bracts usually exceeding the spikelets, sheaths very short. Glumes erect, imbricate. Beak short, slender. Fruit 3 -quetrous, elliptic.-Distrib. Arctic and Alpine Europe, N. Asia, Himalaya, N. America.-Diandrous and 2 -sexual flowers occur (Boott).
Section 4. Spikelets mainly 1 -sexual, lower all or chiefly female; upper different-looking, usually more slender, all or chiefly male.

Stigmas 2 (rarely 3 in 27, vulgaris). Bracts equalling the female spike, sheaths 0 . (See also 54 , vesicuria, sub-sp. saxatilis, and 57 , paludosa.)

+ Leaves with revolute or recurved margins (best seen when dry).

23. C. rigida, Good.; stout, leaves broad short recurved, sheaths all leafing, edges not filamentous, spikelets erect short, perigynia obovoid lenticular green equalling the obtuse dark glumes, beak very short smooth. Stony alpine localities, from N. Wales and Yorkshire northwards, ascending to $4,300 \mathrm{ft}$. in the Highlands ; W. and N. of Ireland ; fl. June-Aug. - Rootstock creeping, tufted or not. Stems rigid, 3 -quetrous, usually curved, nearly smooth. Leaves many, stiff, keeled, $\frac{1}{4} \frac{1}{4} \mathrm{in}$. broad. Bracts never much exceeding the stem. Spikelets very variable, subsessile ; male cylindric, clavate or fusiform, sometimes female below ; females 3-5, $\frac{9}{4}$ in., sometimes perdicelled, obtuse, cylindric or oblong, sometimes male at the top. Gilumes dark, mid-rib green, edges narrow, pale. Perigynia broad, smooth, substi-pitate.--Distrib. Arctic and Alpine Europe, N. Asia, Himalaya, N. America. 24. C. acu'ta, L.; rigid, leaves long broad, sheath-edges not filamentous, spikelets many long, perigynia compressed green broader than the dark narrow glumes, beak very short entire. C. gracilis, Curtis.
Watery places, from Argyle and Moray southwards ; fl. May-June.-Rootstock tufted, stoloniferous or not. Stem 2-3 ft., 3-quetrous, smooth or scaberulous. Leares equalling the stem, $\frac{1-\frac{1}{6}}{3} \mathrm{in}$. broad, flaceid, lowest sheaths sometimes leafless. Spikelets 1-4 in., many, inclined, subsessile, sometimes long-pedicelled; males 2-4, stout or slender ; females 3-5. Glames obtuse acute or cuspidate, midrib green. Perigynia elliptic or suborbicular, smooth, substipitate, variable in size and breadth ; ribs faint, beak smooth. Fruit planoconvex, orbicular or obovoid.-Distrib. Europe (Aretic), N. and W. Asia, E. and W. N. America.-Perigynia sometimes antheriferous.
24. C. stric'ta, Goorl.; slender, leaves long erect flat, sheath-edges filamentous, lower leafless, spikelets sessile, perigynia orbicular-ovoid rompressed green nerved much larger than the oblong obtuse dark glumes, beak very short notched. C. caspitosn, Gay not L.
Marshy places, local, from Durham and Westmoreland to Kent and Dorset ; common in Ireland; fl. May-June.-Rootstock in large dense tufts. Stems $1-3 \mathrm{ft}$., 3 -quetrous, slightly scabrid above. Leaves $\frac{1}{8}-\frac{1}{4} \mathrm{in}$. diam., long, flaccid ; leafless sheaths long, strict, red-brown, shining. Bvarts 0 , or very variable. Spikelets $\frac{3}{4}-2$ in., ereet, cylindric; males 1-2, slender; females 1-3, sometimes male above, stout. Glumes in about 8 rows, pitchy, midrib green; of the male very narrow, subacute. Perigynia large, much compressed, ribs slender. Fruit oblong.-Distrib. Europe, N. Africa.

+ Leaves with incurved or involute margins (best secn when dry).

26. C. aquat'ilis, Wahl.; stems stiff, leaves long erect flat, spikelets 3-6 cylindric, perigynia suborbicular compressed pale smooth nerveless rather larger than the dark obtuse glumes, beak short smooth or 0 .
Bogs and marshes in Lanark, Fife, Forfar, and Aberdeen ; ascending to 3,300 ft.; absent from Ireland ; fl. June-Aug.-Rootstock tufted, creeping, stoloniferous. Stem 10-24 in., 3-gonous, stout, polished, leafy below. Leaves $\frac{1}{6-\frac{1}{3}} \mathrm{in}$., broad ; sheaths all leafing, not filamentous. spikelets $1-2 \frac{1}{2} \mathrm{in}$., slender, lower usually pedicelled ; males 1-3, more slender and pale ; bracts long, leafy. Glumes oblong or ovate, midrib bright green, margins not pale. Perigynia much compressed, very pale brown. Fruit variahle, ovoid obovoid or orhicular, lenticular or 3 -quetrous. - Distrib. Scandinavia (Arotic), Greenland, N. America.

Var. 1, aquat'ilis proper ; stem tall scaberulous above, bracts long, spikelets large pale. Lowlands.-VAR. 2, mi'nor, Boott ; stem shorter smooth, leaves narrower, bracts shorter, spikelet smaller, glumes darker purple brown. Var. Wutsoni, Syme. Clova Mts.
27. C. vulga'ris, Fries; leaves very narrow erect, spikelets $3-5$ sessile short, perigynia suborbicular plano-convex nerved below larger than the obtuse dark glumes, beak very short terete smooth. C. coespitosa, Sm.; C. Goodenovii, Gay.

Marshes and wet meadows, ascending to nearly $3,000 \mathrm{ft}$; fl. May-July.Rootstock very variable, tufted or creeping, sometimes extensively. Stem 6-24 in., 3-quetrous, scaberulous above, rigid, short and curved or long slender and erect. Leaves usually very slender, $\frac{1}{1} \frac{1}{10}$ in. broad, at others short, recurved, $\frac{1}{6} \mathrm{in}$. broad. Spikelets $\frac{1}{4} 1 \mathrm{in}$., erect, close or rather distant. Glumes imbricate, concolorous or midrib green. Periygnia usually obtuse, green or olive, sometimes pitchy, much compressed, nerves slender, sometimes confined to the base. Fruit orbicular, lenticular, rarely 3 -quetrous. --Distrib. Europe (Aretic), N. America.
Var. ? Gibso'ni, Bab. (sp.) ; glumes $\frac{1}{3}$ shorter than the more elongate acute fruit. Hebden Bridge, Yorkshire ; now extinct. This I have not seen.
** Stigmas 3. Beak of perigynium short or 0 ; mouth truncate, entire or obliquely notched (rather long in 33, vaginata, and 34, capillaris.) (See also 27 vulgaris, 45 extensa, 53 strigosa, 54 vesicaria, sub-sp. saxatilis, 57 paludosa, and 58 riparia.)

## $\dagger$ Perigynia glabrous.

28. C. limo'sa, $L$.; stem filiform, leaves narrow glaucous, bracts short, female spikelets $1-2$ drooping short, pedicels capillary, perigynia ellipsoid green equalling the broad cuspidate pale glumes, beak very short entire. Spongy bogs, from Skye and Sutherland to Hants and Dorset; fl. June. - Rootstock slender, creeping. Stem 6-12 in., 3-quetrous, scabrid above. Leaves as long, $\frac{1}{2} \mathrm{in}$. broad, recurved, margins scabrous. Male spikelet solitary, erect, slender, sometimes female at the top; females $1-3$, $\frac{1}{3} \mathrm{in} .$, about equalling the pedicels, cylindric-oblong; bracts scarcely sheathing. Glumes few, large, lax, midrib greenish ribbed, edges brown. Perigynia obscurely 3 -gonous, not shining, cuspidate, glaucous. Fruit oval, 3-gonous.-Distrib. Europe (Arctic), excl. 'Turkey, Siberia, W. Asia, N. America.

Sub-sp. irrig'ua, Hoppe (sp.); stem almost smooth, leaves flat shorter scarcely glaucous, glumes larger, points elongate, midrib not green, perigynia more turgid.-Peat-bogs, Northumberland, Dumfries, Perth, Forfar, \&c.
29. C. rariflo'ra, $S m$.; stem wiry, leaves narrow erect, bracts short, female spikelets $2-3$ pendulous few-flowered, perigynia pedicelled elliptic or obovoid green embraced by the obtuse shining glume, beak short entire. Alpine bogs of Forfar, Aberdeen, Banff, and Moray, from 2,400-3,000 ft. ; fl. June-July.-Rootstock creeping. Stem 3 -gonous, 6-12 in., smooth, leafy below only. Leaves flat, $\frac{1}{2} \mathrm{in}$. Male spikelet 1 , short, suberect ; female $\frac{1}{3} \mathrm{in}$., about equalling the capillary pedicels, $6-8$-flowered. Gilumes pale brown, membranous, concolorous, midrib indistinct. Perigynia brown, 3 -gonous, smooth, obscurely nerved. Fruit oblong, 3 -gonous, dotted.-Distrib. Scandinavia (Arctic), Kamtschatka, N. America.
30. C. glau'ca, Murr.; stem wiry, leaves narrow flat glaucous, female spikelets 4-6 suberect cylindric many-flowered, perigynia sessile turgid equalling the short dark glumes, beak short terete deflexed entire.
Rocks, woods and pastures, ascending to $2,000 \mathrm{ft}$. in Yorkshire ; fl. June-July.-Rootstock creeping, stoloniferous. Stems few, $\frac{1}{2}-2 \mathrm{ft}$., trigonous, smooth. Leaves erect or recurved, $\frac{1}{8}-\frac{1}{4} \mathrm{in}$. broad. Male spikelets several ; femule $\frac{1}{-2}$ in., shortly perlicelled; bracts with short sheaths or 0 . Glumes close-set, acute or obtuse, dark brown, midrib greenish, margins green or not. Periyynia not ribhed, obovoid or orbicular, rough.-Distrib. Europe, N. Africa, Siberia.
$\mathrm{V}_{\mathrm{AR}} .1$, glau'cu proper ; spikelets cylindric, glumes acute. C. recurva, Huds. -VAR. 2, Michelia'na, Sm. (sp.); spikelets cylindric, glumes obtuse. Alpine.-VAR. 3, stictocar'pa, Sm. (sp.); spikelets short, glumes acute, fruit dotted. Alpine.
31. C. palles'cens, L.; stem wiry, leaves hairy erect flat, female spikelets $2-3$ close oblong, perigynia elliptic 3 -gonous obtuse smooth shining green larger than the ovate cuspilate glumes, beak obscure entire.
Marshy copses and meadows, ascending to nearly $1,900 \mathrm{ft}$. in the Highlands ; f. June-July.-Rootstock tufted, stolons 0 . Stems 1-2 ft., 3 -quetrous, slender, often leafy, scaberulous. Leaves $\frac{1}{\frac{1}{-}-\frac{1}{6} \mathrm{in} .}$ broad, green; hairs scattered, soft. Male spikelet ereet, pale yellow-red; female 2-3, $\frac{1}{2}$ in., shortly pedicelled; bracts foliaceous, sheaths short. Glumes few, very pale brown, margins whitish, midrib green. Fruit obovoid, 3 -quetrous, punctate and striate. -Disvrib. Europe (Arctic), excl. Spain, Siberia, N. America.
32. C. panic'ea, $L$.; stem curved, leaves glaucous flat, bract-sheaths long, spikelets oblong, perigynıa 3 -gonous smooth punctulate exceeding the ovate dark glumes, beak very short terete decurved obliquely notched. Wet meadows, marshes, \&c., ascending to nearly $2,300 \mathrm{ft}$. in the Highlands; f. June-July.-Rontstock tufted, creeping, stoloniferous. Stem 1-2 ft., leafy, 3 -gonous, smooth. Leaves :- $\frac{1}{6}$ in. broad, margins rough. Male spikelets 1-2, narrow, clavate ; female 2-4, $\frac{1}{2} \frac{3}{1}$ in., rather distant, inclined, oblong or cylindric, dark, lower rarely long-pedicelled; bracts variable. Glumes variable, obtuse acute or cuspidate, midrib broad grcen rarely concolorous, edges pale. Periqynia ovoid, pale brown, nerves obsolete. Fritit 3 -quetrous, brown, dotted.-Distrib. Europe (Arctic), N. Asia, N. America.
33. C. vagina'ta, Tausch; stem curved, leaves recurved keeled, bract long sheath loose, spikelets short lax-flowered, perigynia 3-gonous turgid smooth longer than the ovate brown obtuse glumes, beak cylindric decurved obliquely 2 -fid. C. salina, Don; C. Mielichoferi, and C. pheostachya, Sm. not Schk.; C. scotica, Spr.; C. sparsiflora, Steud.
Rocky ledges of the Alps of Loch Lomond, Perth, Forfar, Aberdeen, and Sutherland, at. 2,000-3,800 ft. ; A. July.-Habit, \&c. of C. panic'ea, but leaves more radical, broader, recurved, never glaucous ; bracts shorter, sheaths looser ; spikelets laxer-flowered; glumes paler and more obtuse; perigynia more elongate obovoid and decurved, beak longer, cylindric. Fruit elliptic 3 -quetrous, beaked.-Distrib. Scandinavia (Arctic), N. Russia, Austria, Germany, Siberia, Arctic America.-The stigmas vary from 2-4, Boott.
34. C. capillar'is, L. ; stem short, leaves recurved flat, bracts large sheath long, female spikelets few-flowered pendulous, perigynia pedicelled
elliptic-lanceolate 3 -gonous smooth shining much exceeding the pale hyaline obtuse glunes, beak thin slender entire.
Grassy, chiefly alpine banks and rocks, N. of England and throughout Scotland; ascending to $2,700 \mathrm{ft}$. in the Highlands; absent from Wales and Ireland ; fl. June-July.- Rootstock tufted. Stem 4-8 in., 3 -gonous, smooth. Leaves chiefly radical, soft. S'pikelets small ; male very slender; female 2-3, $\frac{1}{4} \frac{1}{3}$ in., shorter than the capillary pedicel ; upper bracts with hyaline tips, lower much larger. Gilumes scattered, embracing the fruit, caducous, margins broad pale, nerves brown. Perigynia slightly decurved, not ribbed. Fruit elliptic-ovoid, 3 -quetrous.-Distrib. Arctic N. and Alpine Europe, N. Asia, N. America.
35. C. pen'dula, Huds.; stems tall leafy, leaves broad flat, bractsheaths long, spikelets many very long slender drooping, perigynia ovoid turgid 3-gonous smooth membranous green much exceeding the awned glumes, beak short terete decurved smooth notched.
Damp woods, \&ec., from Lanark and Elgin southwards; local in Ireland ; fl. May-June.-Rootstock tufted, stolons 0 . Stem 3-6 ft., 3-gonous, smooth or scaberulous. Leaves pale-green, not glaucous beneath, $\frac{1-1}{3} \frac{1}{2} \mathrm{in}$. broad. $S$ pikelets 3-5 in., males 1-3, inclined, sometimes interruptedly male and fem., or fem. at the base only ; female subsessile, graceful, curved, obtuse, denseflowered, pedicels wholly included in the very leafy bracts. Glumes spreading, small, oblong, obtuse or 2 -fid, pale brown, awn hispid, midrib green, margins pale ragged. Perigynia narrow at both ends, gibbous above. Fruit short, broad, pale, 3•quetrous.-Distrib. Europe from Belgium southwards, N. Africa.

## $\uparrow \uparrow$ Perigynia hairy. Spikelets short in all but 41, 42.

36. C. præ'cox, Jacq.; leaves short flat curved, bract-sheaths short, spikelets few close, perigynia broadly ellipsoid turgid 3 -gonous hispid brown equalling the brown obtuse or cuspidate glumes, beak very short.
Moors, heaths, and pastures; ascends to nearly $2,300 \mathrm{ft}$. in the Highlands ; fl. April-May.-Rootstock creeping, stoloniferous. Stems 6-12 in., 3-gonous, quite naked above, smooth or slightly scabrid. Leaves $\frac{1}{8} \frac{-1}{6} \mathrm{in}$. broad, densely tufted, keeled. Spikelets crowded, subsessile ; male solitary, slender, erect; female 2-3, $\frac{1}{3}-\frac{1}{2}$ in., inclined, oblong, rather dense-flowered. Glumes small, broad, edges brown, midrib green ; bracts very variable. Perigynia subsessile, coriaceous, olive, opaque. Fruit 3 -gonous, short, brown, crowned with a minute ring.-Distrib. Europe, N. Asia ; introd. in N. America.
37. C. tomento'sa, $L$. ; slender, leaves glancous beneath, bractsheaths 0 , spikelets few short close, perigynia obovoid turgid 3 -gonous pubescent green exceeding the small acute glumes, beak very short notched.
Wet meadows, Marston Measey, Wilts ; fl. June.-Rootstock creeping, stoloniferous. Stems $10-18 \mathrm{in}$., 3 -quetrous, scaberulous above. Leaves $\frac{1}{8} \mathrm{in}$. broad, curved, glabrous, flat. Spikelets subsessile ; male solitary, erect; female 1-2, inclined, $\frac{1-\frac{1}{2}}{}$ in.; bracts long or short. Glumes very small, ovate, sometimes cuspidate, midrib green, edges brown. Perigynia coriaceous, beak distinct slightly decurved. Fruit 3 -gonous, obovoid, pale.-Distrib. Europe, from the Baltic Is. southwards to France, and E. to Italy and Turkey.
38. C. pilulif' era, $L$. ; slender, leaves recurved, bract-sheath 0 , spikelets
few short few-flowered close, perigynia stipitate subglobose pubescent equalling the ovate cuspidate brown glumes, beak very short notched.
Heaths, woods, and moors, ascending to $3,300 \mathrm{ft}$. in the Highlands ; fl. June. -Rootstock tufted, stolons 0 . Stem 6-20 in., 3-gonous, scaberulous. Leuves $\frac{1}{8}-\frac{1}{6} \mathrm{in}$. broad, ehiefly radical, short, flat, keeled. Spikelets sessile; male solitary, slender; female $\frac{1}{8}-\frac{1}{3}$ in., subglobose ; bracts hardly leafy. Glumes rather spreading, brown, midrib green, edges brown or narrowly pale. P'erigynia opaque, hardly 3 -gonous, pedicel flat. Frait subglobose, brown. -Distrib. Europe (Arctic), W. Asia, Kamtschatka, N. America.
39. C. monta'na, L.; slender, leaves narrow, bract glumaceous, spikelets few small close, perigyuia obovoid 3 -gonous hirsute ribhed exceeding the polished obovate mucronate gluines, beak notched.-C. collina, Willd. Heaths, woods, and fields, local ; Worcester, Hereford, Monmouth, Gloucester, and Sussex ; fl. April-May. - Rontstock very stout, creeping and tufted. Stems 6-18 in., 3 quetrous, strict, then curved, slightly seabrid above. Leaves $\frac{1}{1}-\frac{1}{\mathrm{~d}} \mathrm{in}$. broad, usually shorter than the stem, straight or flexuous; young pubescent. Spikelets sessile, usually very close, bright red-brown, polished; male $\frac{1}{3} \mathrm{in}$., solitary, stout ; females $1-3, \frac{1}{6}-\frac{1}{3} \frac{1}{3}$., more slender, few-flowered; bract broad, with or without a subulate awn or green point, sheath very short. Glumes broad, chesnut-brown, embracing the spreading substipitate perigynia, obtuse or retuse and mucronate, midrib pale, edges brown. Fruit pedicelled, pale.-Distrib. Europe, W. Siberia.
40. C. ericeto'rum, Poll.; stem short curved, leaves recurved keeled, bract glumaceous, spikelets few capitate, perigynia obovoid pubescent equalling the broadly ovate obtuse ciliate brown glumes, beak entire.
Chalk banks, Gogmagog Hills, Cambridge ; fl. May-June.-Rootstock branched, creeping and tufted. Stems $2-6 \mathrm{in}$., 3 -gonous, stiff, smooth. Spikelets sessile, small ; male $\frac{1}{2}$ in., solitary, fusiform ; female $\frac{1}{6}-\frac{1}{k}$ in., 6 - 10 -flowered ; bracts hardly sheathing. Glumes pale brown, midrib concolorous, margins broad, white, scarious. Perigynia subsessile, opaque, short. Fruit obovoid, sessile, pale, 3-quetrous.--Distrib. Europe (Arctic), Siberia, Dahuria.
41. C. digita'ta, $L$.; stem slender curved, leaves recurved flat, bract subulate, sheath long brown, spikelets slender curved, perigynia remote stipitate narrow-obovoid 3 -gonous pubescent embraced by the ${ }_{1}$ mucronate shining glumes, beak very short straight entire.
Copses on limestone, Yorkshire, Notts, Hereford, Gloucester, Somerset, Wilts; f. May.-Rootstock very stout, tufted. Stem 6-10 in., smooth, obtusely 3 -gonous. Leaves $\frac{1}{8}-\frac{1}{6} \mathrm{in}$. broad, soft, flat, linear. Spikelets and their slendes pedicels enclosed in the bracts; male solitary, $\frac{1-3}{3-\frac{3}{4}} \mathrm{in}$., female $\frac{1}{2}-1 \mathrm{in}$., 6-8-flowered; bracts membranous, brown, tip green subulate. Glumes convolute, broad, obtuse, scarious, pale red-brown, shining, midrib narrow green, margins hyaline. Perigynia concealed, curved, green, beak terete. Fruit stipitate, 3 -quetrous, brown.-DIstrib. Europe, Siberia.
42. C. hu'milis, Leyss.; stem shorter than the stiff involute curved leaves, bracts glumaceous, spikelets very remote slender lax-flowered, perigynia stipitate narrow-obovoid 3 -gonous pubescent embraced by the very broad scarious glumes, beak short entire or 0 . C. clandestina, Good. Dry grassy hills, Hereford, Gloucester, Wilts, Somerset, Dorset ; fl. May.-

Rootstock very stout, creeping, tufted. Stems 1-3 in., 3-gonous, smooth, concealed amongst the narrow leaves. Spikelets white, scattered up the whole stem ; male solitary, narrow, $\frac{1}{4}-\frac{1}{2} \mathrm{in}$. ; female $3-5$, $\frac{1}{6} \frac{1}{4} \mathrm{in}$., enveloped in the obtuse apiculate or truncate scarious silvery bracts. Glumes silvery, clouded with pink and green. Perigynia greenish, 1-ribbed on 2 faces, beak variable. Fruit 3 -quetrous, pale brown, smooth, beaked. - Distrib. Europe from Belgium southwards, Siberia.
*** Stigmas 3 (2-3 in 57, paludosa). Friuit with a long, usually slender, often forked beak (beak short in 45 extensa, 53 strigosa, 54 vesicaria sub-sp. saxatilis, 57 paludosa, and 58 riparia; see also 33 vaginata and 34 capillaris).

## + Perigynia hairy, nerved. Male spikelets several.

43. C. hir'ta, L.; leaves long flat hairy, bracts leafy, sheaths long, spikelets long-pedicelled erect cylindric, perigynia ovoid turgid ribbed usually hirsute much longer than the ovate awned glumes, beak 2 -cuspidate.
Damp copses, \&c. from Cantire and Moray southwards, and in Ireland; ascending to $1,200 \mathrm{ft}$. in N. of England; fl. May-June.-Rootstock long, creeping, jointed, scaly. Stem slender, $1-2 \mathrm{ft}$., leafy, glabrous, $3 \cdot \mathrm{gonous}$, shining. Leaves $\frac{1-1}{4}$ in. broad, sheaths split. Spikelets; male $2-3$, close, $\frac{1}{2}-1$ in., pale, glistening ; female 2-5, 1-1 $\frac{1}{2}$ in., green, distant; pedicels exserted; lower bract exceeding the stem. Glumes small, broad, scarious, midrib green herbaceous, awn rigid scabrid often spreading; of male lanceolate hyaline. Perigynia large, $\frac{1}{5} \mathrm{in}$., sessile, plano-convex, narrowed into the beak. Fruit 3-quetrous, beaked, pale brown.-Distrib. Europe, N. Africa, Siberia, Dahuria.-Syme describes a var. hirtiformis, Pers., with glabrous leaves and glumes ; and var. ebracteata (found near Epsom), with glabrous obtuse glumes and leaves and bracts reduced to a subulate point, which resembles C. ovalis.
44. C. filifor'mis, L.; slender, leaves very long involute, bracts long sheaths short, spikelets erect, perigynia narrow-ovoid turgid pubescent equalling the lanceolate acuminate glumes, beak 2-cuspidate.
Bogs and marshes, local ; rare in Ireland; fl. May. - Rootstock creeping, stoloniferous. Stem 2-3 ft., slightly scabrid above, 3-gonous, leafy. Leaves numerous, very slender, stiff ; sheaths red-brown, stout, lower 2-3 very long, edges filamentous, without a blade. Mule spikelets 2-3, very slender, $1-2 \frac{1}{2}$ in., brown ; female 1-3, $\frac{1}{3}-1 \mathrm{in}$. , rather lax-flowered; lower bracts filiform, overtopping the stem. Glumes chesnut-brown, with concolorous margins; midrib green, of male fl. narrower and more membranous. Perigynia $\frac{1}{6}$ in., plano-convex, green, narrowed into the beak. Fruit stipitate, 3-quetrous.--Distrib. Europe (Arctic), Siberia, N. America.
† Perigynia glabrous. Male spikelets solitary; females short, distant, pale.
Bracts leafy, sheaths long (except 45 extensa and 46 flava).
45. C. exten'sa, Good.; slender, leaves setaceous, bracts very long, sheaths short, spikelets subsessile dark, perigynia rhombic or ellipticobovate 3 -gonous inflated ribbed much larger than the broad mucronate glumes, beak short straight smooth 2 -toothed.
Brackish marshes; fl. June.-Rootstocle tufted. Stem 10-18 in., 3-gonous, smooth, slender. Leaves mostly below the middle, $\frac{1}{1-\frac{1}{1}} \mathrm{in}$. broad, rigid, flexuous, shorter than the stem; margins involute. Npikelets 3-4, sub-
sessile; male $\frac{1}{2}-\frac{3}{4}$ in., slender, brown; females $2-4, \frac{1}{3}-\frac{2}{3}$ in., 2 upper or all contiguous; bracts at length horizontal, sheath very variable in length. Glumes small, acute or mucronate, brown, midrib green, edges concolorous. Perigynia rather spreading, opaque, coriaceous, dull green, dotted, gradually narrowed into the beak. Fruit shortly elliptic, olive-brown, 3 -quetrous.Distrib. Europe, N. Africa, W. Asia, N. and S. America to Patagonia.
46. C. fla'va, $L$.; stem curved, leaves flat, bracts long, sheaths short, spikelets oblong green, perigynia spreading or deflexed ovoid 3-gonous inflated ribbed much exceeding the obtuse glumes, beak long slender scabrid 2-cuspidate.
Heaths, bogs, and marshes, ascending to near $2,900 \mathrm{ft}$. in the Highlands; fl. May-June.-Rootstock tufted, stolons 0. Stem 3-18 in., curved, 3-gonous, angles rather acute. Leaves $\frac{1}{8}$ to nearly $\frac{1}{4} \mathrm{in}$. broad, chiefly radical, often recurved, shorter than the stem, usually flat. Spikelets usually contignous, sessile or pedicelled ; male $\frac{1}{3}-1 \mathrm{in}$., fusiform ; females $2-4$, $1-\frac{1}{2} \mathrm{in}$., subcylindric, squarrose; bracts spreading, sheaths very variable. Gilumes small, obtuse or subacute, usually green clouded with brown. Perigynia sessile, variable in size, green, coriaceous, gradually narrowed into the beak. Fruit short, 3-gonous, olive-brown, angles acute.-Distrib. Europe (Arctic), Madeira, W. Asia to India, N. America.-In the following varieties the spikelets are so variable that I have not introduced them.
$V_{\text {AR. }}$ 1, fla'va proper ; beak of perigynium decurved seabrid.-VAR. 2, $G^{\prime}$ deri, Ehr. (sp.); usually smaller, beak of smaller perigynium straighter scabrid. --Var. 3, Lepi'docarpa, Tausch (sp.); perigynium small, beak short nearly straight almost smooth.
47. C. dis'tans, L. ; slender, leaves flat, bracts leafy, sheaths long, spikelets distant lower pedicelled, perigynia suberect ovoid turgid ribbed exceeding the ovate glumes, beak flat 2 -cuspidate scabrid.
Marshes and wet meadows, ascending to nearly $1,900 \mathrm{ft}$. in the Highlands; absent in Devon? and Cornwall ; fl. June. - Rootstock tufted, creeping. Stem 10-18 in., 3 -gonous, smooth or slightly seabrid above, leafy below the middle. Leaves in- $\frac{1}{6}$ in. broad, glaucous, often recurved. Spikelets, male $\frac{1}{2}-1 \mathrm{in}$. , long-pedicelled, slender; femules 1-3, $\frac{1}{3}-1$ in., very distant, erect, cylindricoblong; lower bract not equalling the stem, and often not its spikelet. Glumes broad, subacute, brown, midrib green, margins and tip white. Perigymia sessile, green, opaque, gradually narrowed into the slender flattened short straight beak, mouth membranous. Fruit broad, obovoid, 3 -quetrous, brown.-Distrib. Europe, N. America?
Sub-sp. dis'TaNs proper ; leaves darker, bracts usually longer, female spikelets 3-4 longer, glumes more obtuse mucronate or awned less hyaline at the tip, perigynia broader black-dotted. - Brackish marshes; extends to N. Africa. I do not find the fruit to differ constantly from C. fulea.
Sub-sp. rul'va, food. (sp.); bracts rarely equalling the stem, female spikelets 2-3, glumes obtuse or acute not mucronate, tips more or less hyaline, perigynia broad at the base not dotted. - VAR. 1, bracts long, female spikelets usually 2, edges of beak scabrid.-VAr. 2, Homschuchia'nu, Hoppe (sp.); bracts shorter, female spikelets usually 3 longer pedicelled, beak smoother. C. speirostachya, Sm. Chiefly subalpine.
48. C. biner'vis, $S m$.; slender, leaves rigid recurved flat, bracts leafy, sheaths long, spikelets all pedicelled cylindric, perigynia ovoid 3 -gonous
faintly ribbed green much exceeding the oblong-ovate glumes, beak flattened 2-cuspidate scabrid.
Heaths, moors, \&c. ; ascending to nearly $3,200 \mathrm{ft}$. in the Highlands ; fl. June-July.--Very similar to C. distans, and perhaps another sub-sp. of fulra, but much coarser, often 3 ft .; rootstock stout, tufted, creeping ; stem 3 -quetrous, smooth, leafy ; leaves often short, more rigid, keeled and recurved; female spikelets $\frac{1}{2}-1 \mathrm{in}$., browner, more numerous, stouter, longer ; beak stouter and more 2 -fid; glumes obtuse or mucronulate, red-brown ; perigynia and leaves beneath at times dotted ; I do not find the fruit always obovate, but like fulva.-Distrib. Europe excl. Turkey, N. Africa, W. Asia.
49. C. læviga'ta, Sm.; tall, leaves short broad, spikelets distant pedicelled inclined or drooping cylindric, perigynia subsessile ellipticoblong or ovoid turgid ribbed green dotted longer than the acuminate glumes, beak long slender 2 -cuspidate.
Wet copses and marshes, from Mull and Aberdeen southwards; ascending to $1,000 \mathrm{ft}$. in Northumberland ; fl. June.-Closely allied to C. binervis, but much larger, $1-3 \mathrm{ft}$., leaves almost $\frac{1}{3} \mathrm{in}$. broad, dotted beneath; sheath auricled opposite the blade ; male spikelets 1-24 in ., 3 -gonous, rarely 2 , with obtuse mucronate glumes; females $1 \frac{1}{2} 2 \mathrm{in}$., drooping ; perigynia nearly $\frac{1}{5}$ in., 3 -gonous, opaque, purple-dotted, beak obscurely scabrid, cusps long, nearly straight. Fruit stipitate, 3 -quetrous, dotted, pale.-Distrib. Europe from Holland southwards, N. Africa, N. America.
50. C. puncta'ta, Gaud.; slender, leaves short flat subrecurved, bracts leafy, sheaths long, perigynia spreading ovoid membranous turgid dotted not ribbed shining longer than the ovate glumes, beak slender 2 -fid smooth.
Marshy places near the sea, Cornwall? Kerry, Cork, Guernsey ; fl. June.Similar to $C$. distans, but very distinct in the tumid shining membranous hardly 3 -gonous perigynia, ribbed at the 2 obscure angles only, and the more slender smooth subterete beak. Glumes obtuse or mucronulate, mucro scabrid.-I do not find the fruit to differ materially from julva.-DIstrib. Norway, France, Italy, Switzerland, Azores.
51. C. depaupera'ta, Good.; slender, leaves long flat, bracts leafy, sheaths long, spikelets 3 -4-flowered green, perigynia pedicelled narrowed at both ends turgid ribbed green much larger than the lanceolate pale glumes, beak slender tip membranous.
Dry woods, Surrey, Somerset, and Kent, very rare ; fl. May-June.-Rootstock tufted, shortly creeping. Stems $10-24$ in., 3-gonous, slender, smooth, leafy. Leures $\frac{1}{8} \frac{-1}{6} \mathrm{in}$. broad. Bracts scabrous, almost equalling the stem, flat. Spikelets erect, very short and distant ; male very slender, $1-1 \frac{1}{4} \mathrm{in} .$, manyflowered ; temales $3-5$, $\frac{1}{3}-\frac{2}{3} \mathrm{in}$., perdicel of lowest sometimes 2-3 in. Glumes remote, membranous, acuminate, embracing the base of the perigynia, back green ; of the male numerous, obtuse, cilhate. Perigynia large, nearly $\frac{1}{3}$ in.; obscurely 3 gonous, polished, ribs many slender; beak very long, straight, ohscurely seahrid. Fruit obovoid, or obtusely 3 -gonous, pale.-Distris. Europe from France and Spain, eastwards to Russia, N. Asia.
> $\dagger+$ Perigynia glalnous. Male spikelet solitury; female long, curved or drooping. Bracts leafy, sheaits long.
52. C. sylvat'ica, Huds.; slender, leaves flat broad soft, spikelets long-pedicelled very slender drooping lax-flowered, perigynia stipitate
short turgid 3 -gonous equalling the lanceolate thin pale glumes, beak membranous very long slender 2 -fid.
Damp woods, from Lanark and Moray southwards ; ascending to $2,000 \mathrm{ft}$. in the Highlands; fl. May-June.--Rootstock tufted, shortly creeping. Stem $1-3 \mathrm{ft}$., very slender, 3 -quetrous, smooth. Leaves $\frac{1}{3} \frac{1}{\frac{1}{3}} \mathrm{in}$. broal, membranous, bright green. Spikelets 1-1.2 in., distant or contiguous; male slender, pale ; females very slender, sometimes branched at the base ; bracts leafy, shicaths long. Glumes lax or scattered, acuminate, membranous, with pale green back and keel; of the males brownish, obtuse, mucronate or subacute. Perigynia subsessile, elliptic, rather small, brown, straight, rather shorter than the slightly compressed herbaceous smooth beak, angles ribbed, faces quite smooth. Fruit broad, 3 -quetrous.-Distrib. Europe, N. Asia.
53. C. strigo'sa, Huds.; leaves flat broad, spikelets very slender drooping, perigynia remote elliptic-lanceolate 3 -gonous ribbed a little longer than the oblong-lanceolate acute glumes, beak obscure obliquely truncate smooth hyaline.
Woods and copses, from York and Chester to Kent and Dorset, rare and local in Ireland; fl. May-June.-Rootstock tufted, creeping., Stems $1-2 \mathrm{ft}$. , smooth, 3 -gonous, leafy. Leaves $\frac{1}{\frac{1}{2}-\frac{1}{2}} \mathrm{in}$. broad, usually short, pale green, flaccid; sheaths with 2 auricles opposite the blade. Male spikelet $1, \frac{1}{2}-2 \mathrm{in}$., slender, pale; females $1 \frac{1}{2}-3 \mathrm{in}$., lowest long-pedicelled, often flexuous; rachis evident between the glumes, many-flowered ; bracts leafy, usually shorter than the stem, sheaths long. Gilumes small, membranous, white, base enveloping the perigynia, centre pale green. Perigyniu $\frac{1}{8} \mathrm{in}$., membranous, green, slightly decurved, narrowed at both ends. Fruit narrow-elliptic, 3 -gonous, pale.-Distrib. Europe from Denmark southwards, excl. Spain Greece and Turkey, W. Asia, N. Africa.-Allied to C. sylvutica.
$1+1$ Perigynia glalrous. Male spikelets several (rarely one in 54 vesicaria); feniale stont, usually curved or drooping. Bracts leufy, sheath 0 .
54. C. vesica'ria, L.; stout, leaves flat, spikelets cylindric, perigynia large spreading conic-ovoid inflated ribbed pale exceeding the lanceolate subacute scarious-tipped glumes, beak stout 2 -cuspidate smooth.
Bogs and marshes, from Isla and Moray southwards; fl. May-June.-Rootstock tufted and creeping. Stem $1-2 \mathrm{ft}$., stout, scabrid, 3 -quetrous. Leaves leag, $6 \frac{1}{4} \mathrm{in}$. broad, soft, sheath-edges filamentous. Spikelets many, stout anctes $1-3,1 \frac{1}{2}-2 \frac{1}{2}$ in., slender, pale brown, sometimes female at the top; fenpule 1-3 in., shortly pedicelled, inclined or drooping, cylindric, $\frac{1}{2} \mathrm{in}$. diam. when ripe; bracts overtopping the stem, sheath 0. Gilumes much smaller than the peribuia, narrow, chesnut-brown, midrib pale, tip obtuse ; of the males linear-oblong. Perigynia nearly $\frac{1}{3} \mathrm{in}$., obscurely 3 -gonous, nerves faint, dull yellow, shining; beak rigid, brown, pungent. Fruit broadly elliptic, 3 -gonous, pale, beak long.-Distrib. Europe (Arctic), N. Africa, N. Asia, W. Asia to N.W. India, Greenland.- Batington gives a var. (C.. involuta, Bab.) which is intermediate between this and C. ampullacea, with involute leaves, found in Lancashire and Cheshire.
Sub-sp. vesica'ria proper; stem 1-2 ft , male spikelets 2-3, female large 1$2 \frac{1}{2}$ in. stout cylindric pale, perigynia elongate ritbed with a slender rigid 2 cuspidate beak, stigmas 3.-VAR. Gra'hami, Boott (sp.); perigynia brown less strongly nerved, beak shorter less strongly ouspidate more slender, stigmas 2. Highlands, rare.

Sub-sp. saxat'riss, $L$. (sp.) ; stem 4-10 in., male spikelet 1 rarely 2 , female small $\frac{1}{-1} \frac{1}{3} \mathrm{in}$. ovoid very dark, perigynia ovoid ribs faint or 0 with a short notched or 2 -fid beak, stigmas usually 2. C. pulla, Good.; C. vesicaria, var. alpigena, Fries.-Bogs in the Scotch Alps from Ben Lomond northwards, from $2,500 \mathrm{ft}$. to near $3,100 \mathrm{ft}$--Distrib. Scandinavia, N. Russia, N. America.-I cannot escape the conviction that this totally different-looking plant, with very different spikelets perigynia and stigmas, is an alpine form of C. vesicaria, to which var. Grahami forms a passage. I accept Boott's authority for its being the true saxatilis of Linn., from the testimony of both Linnæus' Herbarium, and of his pupil Solander (in Herb. Banks). The Swedish authorities, however, refer saxatilis to rigida.
55. C. ampulla'cea, Good.; stout, leaves involute glancous, female spikelets stout cylindric pale, perigynia spreading ovoid inflated ribbed exceeding the obovate-lanceolate scarious-tipped glumes, beak very slender 2 -cuspidate smooth.
Marshes and bogs, ascending to 2,700 ft. in the Highlands; fl. June.-Rootstock tufted and creeping. Stem 1-2 ft., 3 -gonous, smooth, angles obtuse. Male spikelets 2-3, slender, sometimes fem. at the base ; female 2-4, 1-2 $\mathbf{4} \mathrm{in}$., sessile or pedicelled, inclined, often squarrose, dense-flowered; bracts overtopping the stem, sheath 0 . Glumes much as in C. vesicaria, and perigynia similar and shining, but much smaller, yellow-brown, $\frac{1}{\frac{1}{2}-\frac{1}{6}} \mathrm{in}$., as broad as long, 3 -quetrous, horizontal or deflexed when ripe, abruptly contracted into the long beak. Fruit obovoid, yellow.-Distrib. Europe (Arctic), Siberia, Himalaya, N. America.
56. C. Pseudo-cype'rus, $L$.; stout, leaves broad, male-spikelets solitary, female very long-perlicelled drooping cylindric, perigynia stipitate spreading elliptic-lanceolate ribbed green equalling the narrow awned glumes, beak very long smooth 2 -cuspidate.
Banks of rivers, lakes, \&c. from York and Lancaster southwards to Kent and Devon ; local and rare in Ireland ; fl. June.- Rootstock tufted. Stems 1-3 ft., 3 -quetrous, scabrid. Leaves $\frac{1-1}{4} \frac{1}{2} \mathrm{in}$. broad, flat, scabrid. Spikelets towards the top of the stem ; male slender, 2-3 in., pale, often female at the top; female $4-5,2-3 \mathrm{in}$., subsquarrose, pale green ; pedicels capillary curved sometimes 4 in .; bracts overtopping the stem, very broad, sheath 0 . Glumes small, lanceolate or subulate, awn serrate. Perigynia $\frac{1}{\frac{1}{i n} \text {., slender, hori- }}$ zontal or deflexed, 3 -gonous, shining, ribs many close ; beak rigid, pungent, deeply split. Fruit pale, 3 -gonous, style persistent.-Distrib. Europe, Temp. N. and S. Africa, Asia, America, Australia.
57. C. paludo'sa, Good.; tall, stout, leaves broad glaucous, male spikelets stout, anthers mucronate, female erect dark cylindric, perigynia ovoid ribbed exceeding the lanceolate awned glumes, beak short 2 -toothed. River-banks and ditches, from Ross southwards ; ascending to $1,200 \mathrm{ft}$. in Northumberland ; E. and N.E. of Ireland, rare and local ; f. May-June.Rootstock creeping, stoloniferous. Stems $2-3 \mathrm{ft}$., 3 -quetrous, scabrid. Leaves erect, $\frac{1}{4}-\frac{1}{2}$ in. broad, flat, sheath-edges filamentous. Bracts erect, long, broad. Spikelets rather close ; males $2-3,1 \frac{1}{2}-2 \mathrm{in}$., dark brown, sometimes fem. at the base ; female shortly pedicelled. Glumes of male fl. obtuse, brown with hyaline tips, upper cuspidate ; of fem. cuspidate or with a serrulate awn (C. Kuchiana, DC.). Perigynia 3-gonous, gradually narrowed into the beak, angles acute, upper part granulate. Fruit lenticular or 3-
quetrous.-Distrib. Europe, N. Africa, W. Siberia, N. W. India, N. America. - Stigmas rarely 2.
58. C. ripa'ria, Curtis; tall, stout, leaves very broad, male spikelets stout, anthers cuspidate, female long stout cylindric, perigynia ovoid ribbed, a little exceeding the ovate-oblong cuspidate glumes, beak short 2 -toothed. River-banks and ditches, from Banff and Dumbarton southwards; local in Ireland; fl. May.-Much the largest British species, 3-5 ft. Rootstock creeping and tufted. Stem $2-5 \mathrm{ft}$., 3 -quetrous, scabrid. Leaves flat, $\frac{1}{2} \mathrm{in}$. broad and upwards, sheath-edges filamentous. Bract broad, overtopping the stem. Spikelets very large ; male $3-6$, crowded, $1 \frac{1}{2}-2$ in., $\frac{1}{2}$ in. diam., dark brown, acute, sometimes fem. at the base, mucro of anthers longer than in C. paludosa; female 4-6, 2-3 in., pedicelled, inclined, sometimes compound at the base or male at the top. Glumes narrow, margins brown, midrib green, tip scabrid; of male slender, acute. Periyynia $\frac{1}{6}$ in., erectopatent, dull green, narrowed into the beak; ribs many, elose. Fruit elliptic, 3-quetrous, yellow. - Distrib. Europe, N. Africa, Siberia, N. America, Chili, Brazil.-This and the preceding are allied to C. aquatilis.

## Order XV. GRamin'ess.

Herbs usually tufted and slender. Stem cylindric or compressed, jointed, usually hollow between the joints. Leaves alternate, narrow; sheath split to the base, with often a transverse membrane (ligule) or ring of hairs at its mouth. Spikelets in terminal spikes, racemes, or panicles, usually composed of one pair of flowerless (empty) glumes, enclosing or subtending one or more sessile or stalked normally flowerbearing (but sometimes also empty) glumes, which are distichously arranged on a slender axis. Flowering glume terete or laterally compressed, enclosing a 1-2-sexual flower, and a flat often 2 -nerved seale (pulea) with inflexed edges. Perianth of 2 (rarely 0 or 3 or more) minute scales, placed opposite the palea. Stamens 3 (rarely 1, 2, 6, or more), filaments capillary ; anthers 2 -celled, versatile, pendulous. Ovary 1 -celled, styles usually 2, either long with hairy or short with feathery stigmas ; ovule 1, basal, erect, anatropous. Fruit a membranous utricle, often adherent to the palea, and sometimes to the flowering glume. Seed usually adnate to the pericarp, testa membranous, albumen hard floury; embryo minute, on one side of the base of the albumen, suborbicular.-Distrib. All elimates ; genera 250 ; species about 4,500 . - Affinities. With Cyperacece, and distant with Palmece.-Properties. Nutritious herbage, and farinaceous seed; stems and leaves useful for various textile and other purposes.

The reluced and often complex inflorescence of grasses renders an intelligible arrangement of them very difficult. In the following I have been very much guided by the views of General Munro, F. L..S., as given by him in Harvey's "Genera of Cape Plants," the only deviation being in the extension of the tribe Phalaridea: this General Munro would confine to Phalaris and Anthoxanthum, referring Vardus to Hordencex; Spartina to Chloridece; Chamagrostis, Alopecurus, and Phleum to Agrostidece; Hierochloe to Avenacee; and Sesleria to Poacees; but besides the other
affinities of these plants, the nature of their styles and stigmas appears to remove them from the great tribe of Poacer.
Series I. CLISAN'THEA, Fries. Spikelets closed in flower. Styles usually elongate, stigmas slender, with short or long simple hairs, protruded at the top of the fl. glume.
Tribe I. PANICE'理. Spikelets dorsally compressed, articulate below the lowest glume, hence wholly deciduous. Lowest empty glume small or 0 ; 2d larger ; 3d glume with a palea and male fl. or 0 ; 4th with a palea and 2 -sexual flower, hardening round the fruit.
Spikelets with soft hairs on the pedicels or 0 .

1. Panicum.

Spikelets with stiff bristles on the pedicels
2. Setaria.

Tribe II. Phaliaride'fe. Spikelets laterally rarely dorsally compressed, usually articulate above the 2 empty glumes, which are hence persistent. Empty glumes large (0 in Nardus).

$$
\text { * Spikelets 1-fld. ; with no rudiment of a } 2 d \text { fl. glume. }
$$

Spikelets in 1 unilateral spike; empty glumes 0 .....................3. Nardus.
Spikelets in 2 or more unilateral spikes; empty glumes 2.....4. Spartina.
Spikelets in 1 sub-distichous spike; empty glumes 2.....5. Chamagrostis.
Spikelets in a cylindric close panicle ; palea 1
6. Phleum.

Spikelets in a cylindric close panicle ; palea 0.
7. Alopecurus.

> ** Spikelets 1-3-fld.; upper f. alone 2-sexual.

Fl. glumes 3 , upper 2 -sexual, 2 lower rudimentary ...............8. Phalaris.
Fl. glumes 3 , upper 2 -sexual, 2 lower large empty ......9. Anthoxanthum. Fl. glumes 3, upper 2 -sexual diandrous, 2 lower male ......10. Hierochloe.
*** Spikelets 3 fld., upper fl. imperfect.................................11. Sesleria.
Skries II. EURYANTH'Ee, Fries. Spikelets open in flower. Styles usually short or 0, stigmas long or short with long spreading hairs (feathery), protruded at the sides or base of the fl. glume.
Tribe III. POA'CEse. Spikelets 1- or more-flowered, articulate above the empty glumes, which are hence persistent (except Holcus). Lowest or all the flowering glumes 2 -sexual (except in Phragmites and Avenu $\S$ Arrhenatherum), upper often male or rudimentary or reduced to a pedicel at the back of the palea.
Sub-tribe Agrostide'æ. Spikelets 1-fld., with sometimes a rudimentary upper glume. Empty glumes 2, conspicuous. Fl. glumes often awned.

* Fl. glumes voith few or no basal hairs.

Empty glumes membranous, awnless; fl. membranous .......12. Agrostis.
Empty glumes coriaceous, awnless ; fl. hard 13. Milium.

Empty glumes membranous with simple awns.......................14. Polypogon.
Empty glumes membranous with feathery points ...............15. Lagurus.
Empty and fl. glumes rigid, coriaceous, awnless.................16. Psamma.
** Fl. glumes enveloped in sillky hairs.
Hairs longer or shorter than the glumes.
17. Calamagrostis.

Sub-tribe Oryze'æ. Spikelets 1-fld. Empty glumes 0 or rudimentary. Avn if present never twisted:
Fruit adnate to the rigid flowering glume and pale.
18. Leersia.

SUb-tribe Chloride'æ. Spikelets 1-fld., on the under side of a flat unjointed rachis (spike). Awn if present not twisted.
Spikes digitate, spikelets minute.
19. Cynodon.

Sub-tribis Avena'cere. Spikelets 2-3-fld., racemed or panicled, axis slender; lowest or all the flowers 2 -sexual (except Avena and Arrkenatherum). Empty glumes 2, large, usually much exceeding the flowering. Awn when present usually dorsal, bent, and twisted.
Fl. glumes (small) usually 2, awned, both 2-sexual

20. Aira.

Fl. glumes (large) usually 3 or more, awned ...........................21. Avena.
Fl. glumes (small) 2, awned, upper male.............................22. Holeus.
Fl. glumes (small) 3-5, notched or 3 -toothed, not awned …..23. Triodia.

> SUb-Tribe Festu'cese. Spikelets racemed or panicled, rarely spiked, 2-many-fld. (rarely 1-fld.), axis usually produced beyond the upper palea. Empty glumes usually shorter than the flowering. Lowest flowers or all 2-sexual (except Phragmites).
A. Fruit not adherent to the palea.

1. Axis of spikelet bearded with long silky bairs.

Lower flower in each spikelet male
24. Phragmites.
2. Axis of spikelet webbed or glabrous, not bearded.
a. One or both empty glumes 5 - or more-nerved
25. Melica.
B. Empty glumes never more than 3 -nerved.

* Fl. glumes acute; nerves 0 or converging to the tip.

Panicle dense, subunilateral. Spikelets compressed ............26. Dactylis.
Panicle contracted, spikelike. Spikelets compressed ..........27. Koeleria.
Panicle open. Spikelets terete, conical, coriaceous. .......... 28. Molinia.
** Fl. glumes obtuse or acute; nerves parallel.
Fl. glumes compressed, keeled, acute, 5 -nerved.
29. Poa.

Fl. glumes cuneate, convex, 5 -nerved, tip torn 30. Catabrosa.

Fl. glumes convex, 5 -7-nerved, tip acute or obtuse
31. Glyceria.
B. Fruit adberent to the palea.

* Spikelets all similar, fertile.

FL. glumes horizontal, inflated, obtuse
32. Briza.

Fl. glumes compressed or terete, acute, few-nerved ...............33. Festuca.
Fl. glumes compressed or terete, acute, $5-9$-nerved ............. 34 . Bromus.
** Outer spikelet of each fascicle deformed, pectinate.........35. Cynosurus.
Sub-tribe Hordea'cere. Spikelets 1-many-fld., solitary or 1-3-nate, sessile or subsessile on opposite (rarely on one) sides of a simple rachis; outer when 3 -nate sometimes reduced to a pair of bristle-like glumes. Empty glumes 1-2; awn straight not twisted or 0 .

* Spike distichons ; spikelets solitary.

Fmpty glumes 2, unequal; fl. glumes many .............36. Brachypodium.
Empty glumes 2, equal ; fl. glumes 2 or more ....................37. Triticum.
Empty glume 1; fl. glumes many......................................38. Lolium.
Empty glumes 2, both facing the rachis; fl. glumes 1-2 ...39. Lepturus.
** Spike distichous; spikelets 2-3-nate.
40. Elymus.

Fl. glumes 2 or more in each spikelet..
41. Hordeum.

## 1. PAN'ICUM, $L$.

Spikelets without bristles at the base, or with slender hairs only, spiked, racemed or panicled, 1 -fld., or if 2 -fld. the lower male. Empty glumes 2 in the 2 -fld. spikelets, 3 in the 1 -fld. ; lowest small or minute, 2 d larger,
strongly nerved. Fl. glume nerved, hardening and enclosing the palea and fruit. Scales 2, fleshy, truncate. Stamens 3. Ovary glabrous; stigmas penicillate, shorter than the style. Fruit compressed or plano-convex. -Distrib. Chiefly tropical ; species 500 .-Etym. The Latin name.
Sub-gen. 1. Digitar'ia, Scop. (gen.). Spikelets unilateral, on digitate spikes. Flowering glume not awned.

1. P. gla'brum, Gaud.; spikes about 3, spikelets 1-fld. Digitaria humifusa, Pers.
Sandy soil in the S.E. counties, from Norfolk to Hampshire, local ; a native or colonist, Watson; fl. July-Aug.-Annual. Root fibrous. Stems 6-12 in., prostrate or decumbent. Leaves narrow, flat; sheaths flat, mouth hairy; ligule short. Spikes 2-3 in., flexuous, channelled on the face. Spikelets $\frac{1}{1}$ in., in pedicelled pairs, plano-convex, elliptic, purplish; empty glumes hairy, lower minute appressed or 0.-Distrib. Most warm climates.
Sub-gen. 2. Echinochio'a, Beauv. (gen.). Spikelets in racemes or panicles. Flowering glume a:wned or pointed.
P. Crus-gal'li, $L$. ; spikelets panicled 1-fld.

Fields and waste places in the S.E. of England ; naturalized; fl. July.Annual. Stems 1-4 ft., stout, ascending. Leaves $\frac{1}{2} \mathrm{in}$. diam., flat, glabrous; edges rough, often waved; ligule 0. Panicle 3-6 in.; branches subunilateral ; rachis 3 -quetrous, pubescent ; pedicel hairy. Spikelets $\frac{1}{5} \mathrm{in}$., plano-convex, greenish; upper empty glume hispid, pointed or rigidly awned ; fl. glume polished.-Distrib. All temp. and trop. regions.

## 2. SETAR'IA, Beauv.

Spikelets in a dense cylindric spikelike panicle, as in Panicum, but awnless, and with stout rough bristles at the base on one side.-Distrib. All warm and trop. regions; species 20.-Etym. seta, a bristle.

## 1. S. vir'idis, Beauv.; bristles clustered scabrid.

Cultivated fields in Norfolk, Suffolk, and Surrey ; a colonist or native, Watson; fi. July-Aug.-Annual. Stems suberect, scaberulous above. Leaves flat, smooth, edges rough ; sheaths smooth, edges ciliate; mouth with a ring of hairs. Panicle 1-3 in., green; branches whorled, hispid, 3 -quetrous; bristles $\frac{1}{4} \frac{1}{3}$ in., flexuous, purplish. Spikelets $\frac{1}{2}$ in., elliptic, obtuse ; empty glumes membranous; fl. glumes shining, punctulate, striate.-Distrib. All warm climates ; introd. in America.
S. verticilla'ta, Beauv.; bristles single or in pairs barbed.

Cultivated fields, Norwich, Surrey, and Middlesex ; fl. July-Aug.-Habit of
S. viridis, but panicle usually narrower, and the bristles truly barbed, their asperities pointing downwards.-Distrib. As of S. viridis.

## 3. NAR'DUS, L. Mat-weed.

Spikelets solitary, sessile, secund, in a simple unilateral spike, placed obliquely and in excavations of the slender rachis, 1 -fld. Empty glumes 0. Fl. glume 1, slender, concave, keeled, shortly awned, persistent. Palea linear, entire, 2 -keeled. Scales 0. Stamens 3. Ovary narrow, glabrous, contracted into a slender style, stigma filiform hairy
persistent. Fruit adherent to the palea.-Distrib. Europe (Aretic), Azores, Greenland; the only species.-Etym. Obscure.

1. N. stric'ta, $L$.; glabrous, pereunial, leaves setaceous.

Heaths and dry pastures ; ascending to $3,300 \mathrm{ft}$. in the Highlands ; fl. June-July.-Rootstock stout, creeping, densely tufted. Stems $2-8$ in., erect, filiform, rigid, striate, angled; base with long pale sheaths. Leuces channelled, scaberulous, upper erect, lower divaricate, almost horizontal ; sheaths smooth ; ligule short. Spike 1-3 in., solitary ; rachis very slender, strict. Spikelets rather distant; fl. glume $\frac{1}{3} \mathrm{in}$., slender, reddish or purplish, divaricate after flowering, scabrid above, narrowed into the short awn.
-Rejected by sheep, on account of the harsh divaricate foliage.

## 4. SPARTI'NA, Schreber.

Spikelets long, laterally compressed, subsessile in 2 ranks on one-sided panicled erect 3 -gonous spikes, 1 -fld., with sometimes a rudiment of a 2 d at the base of the palea. Empty glumes 2, narrow, subequal, pointed or awned; upper 5 -nerved, exceeding the flowering; lower smaller. Fl . glume sessile, coriaceous, edges membranous, awnless, 1-nerved, not exceeding the 2 -nerved palea. Scales 0 . Stamens 3 . Ovary glabrous; styles long, connate below, stigmas long hairy. Fruit laterally compressed, enveloped in the palea and fl. glume.-Distrib. Chiefly warm climates; species 8.-Етум, $\sigma \pi a \rho \tau i \nu \eta$, a cord, from the use of the leaves.

1. S. stric'ta, Roth.; point of rachis of spike subulate.

Muddy salt creeks and marshes, Lincoln, and from Devon to Kent; rare; fl. July-Aug.-Rootstock long, branched, extensively creeping. Stems $1-3 \mathrm{ft}$., erect, strict, stout, polished, leafy throughout. Leaves $\frac{1-\frac{1}{4}}{4} \mathrm{in}$. broad, strict, erect, coriaceous, convolute, smooth, pungent, glaucous above ; ligule short, silky. Panicle 3-8 in., strict ; spikes $3-8,1-3 \mathrm{in}$. ; rachis angled, smooth, point equalling or twice as long as the upper spikelet; pedicel very short. Spikelets $\frac{1}{2}-\frac{2}{3}$ in., imbricate, yellowish green ; empty glumes acute, lowest acuminate, upper 2 -toothed and tipped with a stiff awn, a little silky; keel somewhat scabrid.-Distrib. W. Europe from Belgium and Spain to Austris and Italy, N. America.
Sub-sp. sTRIC'TA proper ; stem $1 \frac{1}{2}-2$ ft., lower leaves deciduous from the sheath, spikes $2-4$, tip of rachis equalling the upper spikelet.
Sub-sp. alterniflo'ra, Loisel. (sp.); stem 2-4 ft., leaves persistent, spikes 3-8, tip of rachis exceeding the upper spikelet.-Southampton.

## 5. CHAMAGROS'TIS, Borkh.

A minute annual. Spikelets Interally or distichously arranged in a simple slender flexuous rachis, dorsally compressed, very shortly pedicelled, 1-fld. Empty glumes 2, a little exceeding the flowering, broad, subequal, concave, not keeled, truncate, awnless, membranous, 1 -nerved, upper next the rachis. Fl. glume hyaline, very hairy, truncate, 5 -nerved. Palea 2-nerved or 0 . Scales 2, very minute. Stamens 3 ; anthers short. Ovary glabrous; styles 2, very long, stigmas slender hairy. Fruit obovoid, compressed, embraced by the fl. glume and palea.-Distrib. W. Europe from Hanover to Spain and Italy, N. Africa.-Etym. $\chi$ apal and ${ }^{2} \gamma \rho \sigma \sigma \sigma \tau s$, from its lowly habit.

1. C. min'ima, Borkh. ; stems capillary. Sturmia minima, Hoppe; Mibora verna, Adans.; Knappia agrostidea, Sm.
Wet sands, especially near the sea, Anglesea and Jersey; formerly in Essex; naturalized in Haddington ; fl. March-April.-Stems 1-3 in., tufted. Leaves short, strict, scaberulous, obtuse, setaceous, margins involute; sheaths white, inflated ; ligule short. Spike $\frac{1}{2}-1 \mathrm{in}$. Spikelets very minute.

## 6. Phle'um, L. Cat's-tail Grass.

Spikelets in spikelike panicles, 1 -fld., with rarely a rudimentary 2 d . Empty glumes exceeding the flowering, equal, much laterally compressed, keeled, awned, or mucronate. Fl. glume awned or not, 3-5-nerved, toothed. Palea small. Scales 2, hyaline, toothed on the outer margins. Stamens 3. Ovary glabrous; styles long, stigmas slender, hairy. Pruit compressed, enclosed in the fl. glume and palea.-Distrib. N. and S. temp. and Arctic regions ; species 10.-Етум. The old Greek name.

> * Empty glumes truncate, tip scarious. Fl. glume 3-nerved.

1. P. praten'se, $L$. ; leaf-sheaths appressed, panicle cylindric, keel of empty glumes hispid, awn rigid $\frac{1}{3}$ their length. Timothy-grass.
Pastures, \&c., ascending to nearly $1,400 \mathrm{ft}$. in the N. of England; fl. June-Aug.-Perennial. Stem 6-18 in., tuberous at the base, tufted, ascending, smooth. Leaves short, flat; ligule long. Panicle 1-6 in., obtuse, green. Spikelets crowded, shortly pedicelled; empty glumes with the awns $\frac{1}{6} \mathrm{in}$.; keel green, stout, ciliate with stiff setæ, sides pale; awns scabrid, rigid; fl. glumes membranous, cuspidate ; anthers oblong.-Distrib. Europe, N. Africa, Siberia, W. Asia; introd. in N. America.--An excellent fodder.
2. P. alpi'num, $L$.; upper sheaths inflated, panicle ovoid or oblong, empty glumes equalling their rigid awn, keel hispid.
Edges of alpine springs and rills; Perth, Forfar and Aberdeen, from 2,100 to $3,600 \mathrm{ft}$. ; fl. July.-Perennial. Stem 6-18 in., solitary, creeping below, smooth, ascending, rigid. Leares short, flat, spreading; lower sheaths appressed ; ligule short. Panicle $\frac{1}{3}-1 \frac{1}{4} \mathrm{in}$., dull purple and green. Empty glumes as in $P$. pratense, but larger, $\frac{1}{6}$ in. including the awn.-DIstrib. Arctic and Alpine Europe, N. and W. Asia to the Himalaya, N. America, Fuegia.

## ** Empty glumes gradually pointed; A. glume 3-nerved, with the pedicel

 of a $2 d$ at its base.3. P. arena'rium, L.; upper sheaths inflated, panicle cylindric-oblong narrowed at the base, empty glumes hardly awned, keel ciliate above.
Sandy dunes, \&c. on the E. and S. coasts, from Aberdeen to Kent and Cornwall, local ; and in Ireland; fl. May-June.-Annual, glabrous. Stems 2-6 in., crowded, leafy. Leaves broad, flat; sheaths smooth; ligule long. Panicle $\frac{1}{3}-1$ in., most contracted at the base, glaucous. Spikelets $\frac{1}{10}$ in., crowded; empty glumes lanceolate, acuminate, punctulate ; fl. glume very small, hairy ; anthers minute, short, yellow.-Distrib. Europe, W. Africa.
4. P. Bœhmer'i, Wibel; sheaths hardly inflated, panicle cylindric long, keel of shortly awned empty glumes almost smooth or ciliate.
Sandy and chalky fields in Norfolk, Suffolk, Cambridge, Essex, and Herts; Hi. July.-Annual, glabrous. Stems $10-18$ in., ascending, smooth. Leaves short, flat, scabrid, rather glaucous; upper ligules long. Panicle 2-4 in., rather narrow, obtuse, green, slightly interrupted. Spikelets, is in.,
fascicled; empty glumes linear-oblong, obliquely truncate below the short rigid subulate awn, very coriaceous, green ; margins white, punctulate ; fl. glume minute ; anthers linear-oblong.-Distrib. Europe, Siberia, Dahuria.

## 7. alopecu'rus, L. Fox-tail Grass.

Spikelets much laterally compressed, in spikelike cylindric panicles, 1-fld. Empty glumss subequal, often connate below, awnless, a little exceeiling the flowering. Fl. glume hyaline, 1-nerved, convolute, edges connate at the base; awn bent, inserted at the middle of the back. Palea 0 (in British species). Scales 0. Stamens 3. Ovary glabrous; styles connate, stigmas with short simple hairs. Fruit laterally compressed, enclosed in the palea.-Distrib. N. and S. temp. and cold regions; species 14.-Етум. $\dot{\alpha} \lambda \alpha^{\prime} \pi \eta \xi$ and oùpá, fox-tail.

* Empty glumes connate to or nearly to the middle.

1. A. agres'tis, $L . ;$ panicle acute, keel of subglabrous glumes narrowly winged shortly ciliate, awn twice as long as the fl. glume.
Fields and roadsides, common in England; rare and hardly indigenous in Scotland; not a native of Ireland; a colonist, Watson; fl. May-Oct.Annual, scaberulous. Stem 1-2 ft., lowest joint prostrate. Letues flat, edges rough; sheath smooth; ligule large, truncate. Puxicle $2-3 \mathrm{in}$., slender, often purplish, flexuous; branches very short, pilose, with 2 spikelets. Empty glumes $\frac{1}{\mathrm{i}} \mathrm{in}$., lanceolate, pale, connate to the middle, acute, incurved ; fll glume a little exserted, glabrous.-Distrib. Europe, N. Africa, Siberia; introd. in N. America. - A troublesome weed.
2. A. alpi'nus, Sm.; panicle short ovoid obtuse, keel of acute silky empty glumes silkily ciliate, awn very short.
Springs and edges of streams in the Alps of Ross, Aberdeen, Forfar, and Inverness, 2,100 to $3,600 \mathrm{ft}$; fl. July-Aug.-Perennial. Stem creeping below, then erect, 6-18 in., rather stout, smooth, contracted at the top. Leaves short, broad, flat; sheaths inflated, upper much longer than its leaf; ligule short, obtuse. Panicle $\frac{1}{2}-\frac{3}{4}$ in., $\frac{1}{3}-\frac{1}{2}$ in: broad, dense; branches with 4-6 spikelets, short, silky. Empty glumes $\frac{1}{8}$ in., ovate, very silky, shining; fl. glume glabrous, obtuse; awn variable, from the middle of the palea, rarely 0 ; anthers linear, yellow.-Distrib. Spitzbergen, Arctic Siberia,
Greenland, America, Fuegia.
** Enipty glumes free or connate torards the base.
3. A. praten'sis, L.; panicle slender cylindric obtuse, keel of pilose acute empty glumes villously ciliate, awn twice as long as the fl. glume.
Meadows and pastures, ascending to nearly $2,000 \mathrm{ft}$. in the N. of England;
ff . May-June.-Perennial, stoloniferous. Stemes 1-3 ft., erect or lowest joint inclined, smooth. Leaves seaberulous, flat; sheath smooth, upper inflated, longer than its leaf; ligule large, truncate. Panicle $1 \frac{1}{2}-2 \frac{1}{2}$ in., dense, soft, pale green ; branches very short, with 3-6 spikelets. Empty glumes $\frac{1}{\frac{1}{6}} \mathrm{in}$., ovate-lanceolate, acute ; fl. glume subacute, glabrous, ciliate, margins connate $+\frac{1}{3}$ of its length.-Distrib. Europe, N. Africa, Siberia, Dahuria, W. Asia to N.W. India; introd. in America.-A. pronus, Mitten, is a prostrate state. Babington states that the stems are tuberous at the base in salt marshes. An excellent fodder.
4. A. bulbo'sus, $L_{.}$; stem smooth base tuberous, apanicle slender
cylindric subacute, keel of pilose acute empty glumes shortly ciliate, awn twice as long as the fl. glume.
Salt marshes from York and Chester to Devon and Kent, rare ; absent from Ireland; fl. May-July.-Perennial, glabrous. Stem 3-16 in., slender, curved or bent below, smooth or slightly scabrid above; tuberous base narrow-ovoid, $\frac{1}{4} \frac{3}{4} \mathrm{in}$. long. Panicle $1-2 \frac{1}{2}$ in., very slender, dense, palegreen; branches with 1 spikelct and sometimes a $2 d$ imperfect one. Empty glumes $\frac{1}{10}-\frac{1}{8}$ in., acuminate, exceeding the palea, margins free to the base.-Distrib. W. Europe, N. Germany, France to Spain and Italy.
5. A. genicula'tus, L.; panicle cylindric obtuse, keel of pilose obtuse empty glumes villously ciliate, awn almost twice as long as the fl. glume.
Wet meadows and ditches, ascending to nearly $2,000 \mathrm{ft}$. in the N. of England;
fl. May-Aug.-Perennial, glabrous. Root fibrous. Stem 8-18 in., procumbent and rooting below. Leaves flat, scaberulous above and on the edges. Panicle $1-1 \frac{1}{2}$ in., slender, dense-fld.; branches with 1 spikelet. Empty glumes connate at the very base, hairy and silky as in A. pratensis, but smaller, $\frac{1}{6}$ in., obtuse ; awn shorter and more basal ; anthers purphsh, linear.-Distrib. Europe, N. Africa, Siberia, Dahuria, W. Asia to India; introd. in N. America.
6. A. ful'vus, Sm. ; panicle cylindric obtuse, keel of pilose obtuse glumes villously ciliate, awn a little exceeding the glume.
Wet meadows and ditches from Denbigh, Norfolk, and Leicester to Wilts and
Surrey ; fl. July.-Habit of A. geniculatus, but glaucous ; sheaths more inflated; leaves broader; panicle longer, often 2 in., paler; glumes $\frac{1}{12} \mathrm{in}$. (the smallest of the British species), very obtuse ; awn very short, inserted near the middle ; anthers shorter, yellow, oblong.-Distrib, Eurupe, Siberia.

## 8. PHAL'ARIS, $L$.

Spikelets much laterally compressed, in loose or spikelike panicles, 1-fld. with 2 or more rudimentary glumes (scales or pedicels) beneath it on one side. Empty glumes 2, enclosing the flowering, subequal, keeled. Fl. glume broad. Palea much smaller. Scales 2, minute. Stamens 3. Ovary glabrous; styles long, connate below, stigmas slender hairy. Fruit compressed, enclosed in the coriaceous glume and palea.-Distrib. Trop. and temp. regions ; species 16.-Etym. The old name.

Sub-gen. 1. Phal'aris proper. Panicle spikelike. Empty glumes broadlywinged.

## P. Canarien'sis, L. ; panicle ovoid. Canary Grass.

Fields and waste places, naturalized ; f. July.-Annual, glaucous. Root fibrous. Stems 1-3 ft., erect, scaberulous. Leaves flat, upper sheaths inflated ; ligule large. Panicle 1-1 $\frac{1}{2}$ in., ovoid or subcylindric, compact, pale green. Spikelets nearly $\frac{1}{4} \mathrm{in}$. diam., orbicular ; empty glumes membranous, acute, wings broad, keel green, nerves 2, stout ; fl. glume much shorter, silky, obscurely nerved, with 2 lanceolate acute scales at its base.-Distrib. Warm and temp. climates, Europe, N. Africa, W. Asia; introd. in America.
Sub-gen. 2. Digra'phis, Trin. (gen.). Panicle contracted, interrupted. Empty glumes hardly winged.

1. P. arundina'cea, $L$. ; panicle elongate, branches short.

Rivers, lakes, \&c., ascending to nearly $1,400 \mathrm{ft}$. in the N. of England ; ff. July-Aug.-Perenuial, glabrous. Rootstock creeping. Stems 2-6 ft., stout, ereet. Lerves $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. broad, flat ; sheaths smooth; ligule large. Puricle 4-8 in., suberect ; branches scabrid, spreading only when flowering. Sypilieletss $\frac{1}{6} \mathrm{in}$., ovate, often purplish ; empty glumes 3-nerved, acuminate, glabrous; fl. glume rather shorter, ovate-lanceolate, nerveless, silky, with 2 narrow silky scales at its base.-Distrib. N. temp. and Arctic regions.

## 9. Anthoxan'thum, L. Vernal Grass.

Sweet-scented. Spikelets in a spikelike panicle, 1 -fld. with a large 2 -fid awned glume on each side of the flowering one. Empty glumes 2, much exceeding the flowering, very unequal, membranous ; lower smaller, 1-nerved; upper 3-nerved. Fl. glume glabrous, obtuse, awuless. Pulea 1-nerved. Scules 0 . Stamens 2 ; anthers large, linear, yellow. Ocury glabrous; styles long, stigmas feathery. Fruit terete, acute, enclosed in the brown shining fl. glume and palea.-Distrib. N. temp. and cold regions of the Old World ; species 3.-Етум. ăvOos and $\xi$ gavoos, from the yellow anthers.

## 1. A. odora'tum, L. ; panicle interrupted below.

Meadows, woods, and banks, ascending to nearly $3,400 \mathrm{ft}$. in the Highlands; fl. May-June. - Perennial. Stem 6-18 in., shining. Letres flat, hairy ; sheaths furrowed, often pubescent, mouth pilose. Punicle 1-5 in., pulescent or villous ; branches short. Spikelets $\frac{1}{4} \frac{1}{3} \mathrm{in}$., fascicled, often squarrose, green ; empty glumes ovate, acute, upper lanceolate, almost awned ; two succeeding glumes 2 -lobed, pilose, awn in the sinus slender exserted; fl. glume smaller.-Distrib. Europe (Aretic), N. Africa, Siberia, Dahuria, Greenland ; introd. in N. America.-Odour of Woodruff.

## 10. hierochlo'e, Gmelin. Holy Grass.

Spikelets laterally compressed, panicled, 3 -fld.; upper flower 2 -sexual 2 -androus; 2 lower male, 3 -androus. Empty glumes subequal, about equalling the flowering, membranous, keeled, 3-nerved. Fl. glumes pedicelled, 5-nerved, awned or not. Palea of the 2 -sexual fl. keeled, 1-nerved; of the male H. 2-nerved. Scales lanceolate. Stemens 2-3. Ovary glabrous, styles long, stigmas hairy. Fruit terete, free. Distrib. Arctic and cold regions; species 10.-Etym. iepós and $\chi \lambda 6$, sacred grass, from its being formerly strewed on church floors.

1. H. borea'lis, $R$. and S.; fl. glumes shortly awned near the tip.

Wet banks, Thurso, and formerly in Forfarshire ; fl. May-June. - Rootstock creeping. Stems $10-18 \mathrm{in}$, tufted, smooth, glabrous. Leaves flat, ante, edges scabrid; sheaths smooth; ligule long. l'anicle pyramidal, subunilateral, sparin sly branched, pedicels smooth. Sprikelets $\frac{1}{f}$ in. broad, ovate, fulvous or brown, shining ; empty glumes membranous, translucent, acute, toothed, mucronate ; f. glumes similar, of the male fl. hispid, ciliate ; of the 2 -sexual fl. hairy above.-Distrib. Arctic, Alpine, and N. Europe, N. and W. Asia, N. America.

## 11. SESLE'RIA, Scop.

Spikelets compressed, in a contracted dense subcapitate bracteate panicle, 1 -2-fld.; bracts small, entire, toothed or multifid, sheathing the lower
peduncles. Empty glumes 2, longer than the flowering, subequal, 1- rarely 3 -nerved. Fl. glumes 2-3, the upper rudimentary, keeled, 3 -cuspidate, 5 -nerved. Palea 2-keeled. Scales 2, 3-5-toothed. Stamens 3. Ovary hairy at the top ; styles terminal, connate below, stigmas very long hairy. Fruit slightly compressed, free.-Distrib. Europe, N. Africa, W. Asia; species 8.-Etym. L. Sesler, an Italian botanist.

1. S. cæru'lea, Scop.; panicle oblong subsecund silvery-grey.

Hilly pastures, especially in limestone districts, from Ross to York and Westmoreland ; ascending to $2,500 \mathrm{ft}$. in the Highlands ; W. of Ireland, local; fl. April-June.-Perennial. Root fibrous. Stems 6-18 in., ereet, smooth. Leaves narrow, flat, glaucous above, tip scabrid mucronate, glabrous or pilose, upper very short ; sheaths compressed, breaking up into fibres; ligule short, ciliate. Panicle $\frac{1}{2}-1$ in., blue-grey, glistening. Spikelets of in., in subsessile fascicles, the lower embraced at the base by a small convolute bract or glume ; empty glumes ciliate, acuminate ; fl. glumes pubescent, 3 central nerves confluent; awn very short.-Distrib. Europe.

## 12. AGROS'tis, L. Bent.

Spikelets very small, in an open or contracted panicle, with whorled branches, 1 -fld., with or without the pedicel of a 2 d (upper fl. glume) at the back of the palea. Empty glumes 2, exceeding the flowering, unequal, membranous, awnless, convex, keeled. Fl. glume hyaline, awn slender; dorsal or 0 . Palea 2 -nerved or 0 . Scales glabrous, entire. Stamens 3. Styles 2, stigmas feathery. Fruit free, terete, glabrous.-Distrib. All temp. and cold climates; species 60.-Еtym. An old Greek name.

Sub-gen. 1. Tricho'dium, Michx. (gen.). Upper empty glume smaller than the lower. Palea very minute or 0 .

1. A. cani'na, $L$. ; leaves narrow flat smooth.

Moors, heaths, \&c. ; fl. July-Aug.-Perennial, glabrous, smooth. Stems 6-24 in., sometimes stoloniferous. Leaves $2-5$ in., $\frac{1}{18}-\frac{1}{12}$ in. broad; ligule oblong. Panicle 2-4 in., slender, flexuous, flowering open, fruiting contracted, purplish or green; branches capillary, scabrid. Fl. glume \& shorter than the empty, truncate, with 5 excurrent nerves; awn from above the base, variable in length, bent in the middle.-Distrib. Europe (Arctic), Siberia, W. Asia to the Himalaya, N. and S. America, Australia, New Zealand.

## 2. A. seta'cea, Curt. ; leaves setaceous involute scaberulous.

Dry downs, from Glamorgan and Cornwall to Sussex and Hants ; fl. June-July.-Perennial. Stem 8-12 in., strict, scaberulous. Leaves very many, erect, rigid ; ligule oblong. Panicle $1 \frac{1}{2}-3 \frac{1}{2} \mathrm{in}$., and spikelets much as in $A$. canina, but empty glumes scabrid, almost awned; fl. glume with a longer, rather twisted awn, and 2 minute tufts of hairs at the base ; palea minute.
-Distrib. Belgium, France, and Spain.
Sub-gen. 2. Agros'tis proper. Empty glumes subequal, or upper smaller than the lower. Palea 2 -nerved.
3. A. vulga'ris, With.; ligule short truncate, fruiting panicle spreading. Meadows and marshy places ; ascending to nearly $3,200 \mathrm{ft}$. in the Highlands; fl. June-Sept.-Perennial. Stems 6-24 in., ascending, smooth. Leaves short,
flat, scabrid ; sheaths smooth. Panicle l-3 in., narrowly ovate, but variable
in form. Empty glumes it in., subequal, ovate or lanceolate, acute, nearly smooth, dull red or purplish and green ; fl. glume a little shorter, truncate, 3 -nerved, 3 times longer than the palea ; awn 0 or short.-Disthib. Europe, N. Africa, Himalaya, N. America.

VAR. 1, vulga'vis proper ; slender, panicle usually elongate, fl. glume rarely awned.-Var. 2, pu'mila, L. (sp.) ; short, stout, panicle shorter, branches stouter, empty glumes broader, fl. glume usually awned.
4. A. al'ba, $L$. ; ligule long acute, fruiting panicle contracted. Fiorin Grass.
Pastures and waste places ; ascending to nearly $1,400 \mathrm{ft}$. in Yorkshire; fl. July-Sept.-Perennial. Stems 6-24 in., with or without stolons, more or less prostrate below, scaberulous above. Leaves flat, scabrid or not; sheaths smooth. Panicle 1-8 in., branched or lobed, green or yellowish; branches scabrid. Empty glumes much as in A. vulyaris, but rather larger, more rigid, not so shining ; fl. glume 5 -herved, rarely awned.-Distrib. Europe (Arctic), N. Africa, Siberia, Dahuria, N. America. A. stolonifera, L., is a more stoloniferous state.
Sub-gen. 3. Ape'ra, Beauv. (gen.). Upper empty glume larger than the lower. Fl. glume with the pedicel of a 2d flower at the base, awned.
5. A. Spica-ven'ti, L.; panicle large pyramidal effuse or contracted, awn much exceeding the fl. glume.
Sandy, often inundated fields, in the E. of England, from Northumberland to Kent and Hants; fl. June-July.-Annual. Stems 1-3 ft., densely tufted, stout or slender, erect from a decumbent base, smooth. Leaves flat, glabrous or pilose, scabrid below and on the edges; ligule short, torn. Panicle 3 in ., 1 -fd., sometimes 3 in . broad, green or purple; branches many in a whorl, capillary, scabrid. Empty glumes io in., lanceolate, acuminate, membranous, closed in fruit, nearly smooth, shining; fl. glume hairy, awn subterminal, 3 times its length, erect, very slender; palea with 2 tufts of silky hairs at the base.-Distrib. Europe, N. Africa, Siberia.
Sub-sp. Spica-ven'ti proper ; panicle large broad effuse, anthers linear.
Sub-sp. interrup'ta, L. (sp.); panicle contracted interrupted, anthers ohlong.-Rarer.
Sub-gen. 4. Gastrid'ium, Beauv. (gen.). Panicle contracted. Empty glumes closed, gibbous at the base.
6. A. austra'lis, L. ; glumes lanceolate, awn exserted. Gastridium lendigerum, Gaud. Nit-grass.
Maritime sandy marshes, \&cc., from Norfolk S. and W. to Cornwall ; a colonist, Watson; fl. June-Oct.--Annual. Stems 6-10 in., densely tufted, erect or ascending, slender, leafy. Leaves short, flat, scaberulous; sheaths smooth; ligule oblong. P'anicle large, 1-3 in., cylindric-fusiform, dense, pale green, glistening; branches scaberulous; pedicels swollen at the top. Empty glumes $\frac{1}{a}$ in., erect, lanceolate, very acuminate, the swollen base polished, keel obscurely scabrid; fl. glume minute, white, shining, truncate, 4toothed; awn near the top, very slender.--Distrib. Europe from France
Spain and Germany E. to Turkey, Asia Minor, N. Africa.

## 13. mil'ium, L. Millet-grass.

Spikelets in an effuse panicle, 1 -fld. ; branches in $\frac{1}{2}$-whorls. Empty glumes 2, equalling the flowering, broad, subequal, obtuse, awnless,

3-nerved. Fl. glume shortly pedicelled, rigid, ovate, tumid, convex, obscurely 3 -nerved, awnless. Palea 2-nerved. Scales 2, fleshy, acute, toothed on one side. Ovary glabrous; styles short, stigmas feathery. Fruit terete, included in the hardened glume and palea.-Distrib. Temp. and trop.; species 8.-Etym. The Latin name for the true Millet, misapplied.

1. M. effu'sum, $L$.; leaves broad flat thin.

Damp woods from Argyle and Moray southwards ; ascending to upwards of $1,000 \mathrm{ft}$. in the Lake district; rather rare in Ireland ; fl. May-June.-Perennial, pale green. Stems 2-4 ft., tufted, erect, smooth, shining, leafy. Leaves $\frac{1}{3} \frac{1}{2}$ in. broad, linear-oblong, acute, scabrid above; sheaths smooth; ligule long, truncate, torn. Panicle $5-10 \mathrm{in}$., very lax and slender; branches capillary, spreading or deflexed, in remote whorls, few-fld. Empty glumes $\frac{1}{10}$ in., elliptic-ovoid, obtuse, scaberulous, edges hyaline; fl. glume quite smooth, white, and polished when ripe.-Distrib. Europe (Arctic), Siberia, W. Asia, N. America.

## 14. POLYPO'GON, Desf. Beard-erass.

Spikelets in a contracted or spikelike panicle, 1-fld. Empty glumes 2, much exceeding the flowering, equal, concave, keeled, 2 -fid or notched, awned in the sinus. Fl. glume sessile, hyaline, naked at the base, broad, truncate, toothed, awned near the top. Palea small, 2 -nerved. Scales 2, falcate, entire. Stamens 3; anthers small. Ovary glabrous; styles long, stigmas feathery. Fruit terete, wrapped in the palea. Distrib. Warm and trop. regions; species 12.-Etym. $\pi 0 \lambda u ́ s$ and $\pi \omega \dot{\gamma} \omega \nu$, from the many awns.

1. P. monspelien'sis, Desf.; annual, awns much exceeding the scabrid deeply-notched glumes, fl. glume not awned.
Damp pastures on the S. E. coast; from Norfolk to Hants, rare; introduced as far north as Fife and W. as Devon; fl. June-July.-Annual. Stems $\frac{1}{2} 4 \mathrm{ft}$., erect, stout, smooth. Leaves large, broad, flat, seabrid; sheaths smooth; ligule large, obtuse. Panicle 1-6 in., oblong-ovoid or fusiform, cylindric or lobed, obtuse, pale greenish-yellow, dense, soft. Empty glumes nearly $\frac{1}{8}$ in., narrow linear ; awn straight, 2-3 times as long; fl. glume not $\frac{1}{4}$ as long as the empty, silvery.-Distrib. Europe from Holland southwards, N. Africa, W. Asia to India.
2. P. littora'lis, Sm.; perennial, awns as long as the nearly smooth acute obscurely notched glumes, fl. glume awned.
Muddy salt marshes from Norfolk to Hants, very rare; fl. July.-Perennial, variable in size. Stems 1-6 ft., erect or decumbent, usually more slender below than in $P$. monspeliensis; panicle smaller, more lobed, purplish; empty glumes much smoother, more acute, awns shorter, keel scabrid; fl. glume about $\frac{1}{3}$ shorter than the empty; awn exserted.-Distrib. W. Europe from France, Belgium, and Germany to Spain.

## 15. lagu'rus, $L$. Hare's-tail Grass.

A soft, hairy, annual, tufted grass. Spikelets in a dense feathery ovoid head, 1 -fld., laterally compressed ; pedicel not jointed at the top. Empty glumes 2, much exceeding the flowering, equal, loug, with slender feathery points. Fl. glume membranous, shortly stipitate, with the
pedicel of an upper flower at the back of the palea, narrow, terete, with 2 short awns and an intermediate long bent and twisted one at the tip. Palea 2 -nerved. Scales 2, fleshy. Stamens 3. Ovary glabrous; styles 2, very short, stigmas long feathery. Fruit smooth, embraced by the glume and palea.-Distrib. W. and S. Europe from Belgium southwards and eastwards, N. Africa, W. Asia.-Etym. $\lambda a \gamma \omega$ ós and oipá, hare's-tail.

1. L. ova'tus, L.; leaves short flat, ligule short.

Sandy places, Guernsey ; naturalized near Saffron Walden ; f. June.-Stems
6-10 in., very many, erect or decumbent below, stout, puhescent, leafy
below. Leares broad, and inflated sheaths pubescent or villous. Heads 1-1 $\frac{1}{2} \mathrm{in} ., \frac{3}{4} \mathrm{in}$. broad, white, obtuse. Empty glumes $\frac{1}{4}$ in., very slender; awn twice as long as the nearly glabrous fl. glume.

## 16. PSAM'mA, Beruv. Marrem-grass.

Spikelets in a contracted panicle, much laterally compressed, 1-fld., with sometimes the pedicel of an upper glume. Empty glumes 2, scarcely exceeding the flowering, rigid, subequal, long, narrow, keeled, subacute. Fl. glume rigid, shortly pedicelled, with an oblique callus and a short pencil of silky hairs at the base, 4-5-nerved; awn minute, subterminal. Palea equalling the glume, rigid, 2 -nerved. Scales very acuminate. Stamens, ovary, and fruit of Calamagrustis.-Distrib. Shores of Europe, N. Africa ; splecies 2.-Еtym. $\psi \alpha ́ \mu \mu o s, ~ s a n d . ~$
P. arena'ria, R. and S.; panicle subcylindric white. Ammophila arundinucea, Host.
Sand-hills and dunes by the sea; fl. July.-Rootstock widely creeping, binding the sand. Stems $2-4 \mathrm{ft}$., smooth or scahrid above. Leaces long, rigid, convolute, polished without, scahrid and glaucous within ; sheaths long; ligule very long, 2 -fid, torn. P'anicle 3-6 in., straight, broadest and sometimes lobed at the base; branches short. Spikelets erect, perlicels sealrid; empty glumes $\frac{1}{3}-\frac{1}{2} \mathrm{in}$., acute, keel scabrid ; fl. glume and palea quite like the empty glumes in colour and texture. Avthers $\frac{1}{4} \mathrm{in}$., linear, yellow.Distrib. Of the genus. - Extensively planted for binding sands.

## 17. CALAMAGROS'Tis, Adans.

Tall, perennial grasses. Rootstock ereeping, stoloniferous. Spikelets in a spreading subsecund panicle, with whorled branches, 1 -fld. with sometimes the pedicel of a 2nd (upper) flower. Empty glumes much exceeding the flowering, subequal, concave, aeute, upper 3-nerved. Fl. glume sessile or pedicelled, enveloped in a pencil of silky hairs from the axis, hyaline, 3-5nervel, truncate, 2 -fid, toothed, awned at the tip or back. Palea small, 2 -nerved. Scales entire. Stamens 3. Ovary glahrous; styles short, stigmas feathery. Fruit terete, grooved in front, enveloped in the fl. glume and palea.-Distrib. N. temp. regions; species 60.-Etym. ка́лapos and 'rpóates, reed-grass.

Sub-gen. 1. Calamagros'tis proper. Spikelet without the pedicel of a $2 \mathrm{~d} f$. glume. Hairs of the axis exceeding the fl. glumes.

1. C. Epige'jos, Roth; panicle open, empty glumes subulate-lanceolate and hairs twice as long as the flowering, awn dorsal inserted above the middle of the fl. glume.

Damp woods, from Mull and Aberdeen to Devon and Kent, local ; Derry in Ireland; fl. July-Aug.-Stem 2-6 ft., simple, stout, scabrid above. Leaves very long, flat, scabrid, glaucous beneath, point slender; ligule acute, torn. Panicle 4-12 in., purplish-brown; branches suberect. Empty glumes $\frac{1}{4}$ in., very narrow, tip and keel scabrid ; awn produced for $\frac{1}{2}$ its length beyond the fl. glume.-Distrib. Europe (Aretic), excl. Spain, Siberia, Dahuria Himalaya.
2. C. lanceola'ta, Roth ; panicle open, empty glumes lanceolate twice as long as the flowering, hairs rather longer than the fl. glume, awn terminal minute. Arundo Calamagrostis, L.
Damp copses, hedges, \&c. from the Border to Devon and Kent ; absent from Ireland ; fl. July-Aug.-Stem 2-4 ft., slender, erect, smooth. Leaves much narrower and smoother than C. Epigejos, more convolute; ligule shorter. Panicle 2-6 in., purplish; branches spreading, tip drooping. Empty glumes nearly as large as in Epigejos, but broader ; awn minute.-Distrib. Europe (Arctic), Siberia, Dahuria, W. Asia.-Andersson observes that the pedicel of an upper flower is sometimes present.
Sub-gen. 2. Deyeux'ia, Beauv. Sprikelets with the pedicel of a 2d fl. glume. Hairs of the axis shorter than the fl. glume.
3. C. stric'ta, Nutt.; panicle close, empty glumes oblong-lanceolate slightly exceeding the flowering, awn from below the middle of the fl. glume straight. C. lapponica, Hook. not Hartm.
Bogs and marshes, very rare ; Delamere Forest, Forfar (extinct) ; Lough Neagh ; fl. June-July.-Stems l-3 ft., strict, slender, smooth, polished. Leuves short, all flat or lower filiform with convolute margins, almost smooth ; ligule short. Panicle 2-6 in., narrow, erect, pale purplish and green. Empty glumes $\frac{1}{6}-\frac{1}{6}$ in., acute, nearly smooth.-Distrib. Scandinavia (Arctic), Dahuria, N. America.-Leaves in cultivated (Irish) specimens quite flat.
VAR. 1, panicle slender, glumes nearly $\frac{1}{\frac{1}{6}-\frac{1}{6}} \mathrm{in}$. Delamere and Lough Neagh. -Var. 2, panicle 1-3 in. narrow short, glumes $\frac{1}{10} \mathrm{in}$. broader. Forfar.

## 18. LEER'SIA, Soland.

Spikcetets panicled, much compressed, imbricate, gibbous, 1-fld. Empty glumes 0. F'l. glume hard, awnless, broad, 3-nerved. Palea as long, hard, 1-nerved. Sceles 2, ovate, entire, short. Stamens 1-6. Ovary glabrous; styles short, stigmas feathery. Fruit laterally compressed, enclosed in the hardened glume and palea.-Distrib. Temp. and trop. regions ; species 10.-Etym. J. D. Leers, a German botanist.

## 1. L. oryzoi'des, Swartz ; panicle effuse, stamens 3.

Wet meadows and watery places, rare ; Surrey, S. Hants, W. Sussex ; fl. Aug.-Oct.-Perennial. Root creeping. Stems $2-3 \mathrm{ft}$., decumbent at the base, smooth, shining, leafy, nodes villous. Leaves $\frac{1}{3} \frac{-1}{2} \mathrm{in}$. broad, flat, scabrid, glaucous; sheaths compressed, almost smooth ; ligule truncate, torm. Panicle 3-7 in., very lax and few-flowered, partially enclosed in the sheath when flowering, branches in $\frac{1}{2}$ whorls, capillary, flexuous; upper part open with imperfect ovaries ; lower part included in the sheath, with fertile ovaries. Spikelet $\frac{1}{5} \mathrm{in}$., dimidiate-oblong, thin but rigid, translucent, smooth or seaberulous, pale green, keels with long rigid cilia.-Distrib. Europe from Denmark southwards, trop. Asia, Africa, and S. America.

## 19. CY'Nodon, Rich. Dog's-tonth Grass.

Spikelets laterally compressed, on one side of radiating spreading spikes, 1 -fld. with the rudiments of an upper (rarely perfect) flower at the base of the palea. Empty glumes 2, much smaller than the flowering, awnless, spreading, subequal. Fl. glume convex, 3-nerved. Palea narrow, 2 -nerved. Scales fleshy, truncate. Stamens 3. Ovary glabrous; styles 2, rather long, stigmas feathery. Fruit laterally compressed, enveloped in the fl. glume and palea.-Distrib. Temp. and trop. regions; species 8.-Etтym. кúшд and ò ôoús, dog's-tooth.

1. C. Dac'tylon, Pers.; leaves short involute, tips obtuse.

Sandy shores of S.W. England, Dorset to Cornwall ; Channel Is. ; fl. JulyAug. -Perennial. Stems 4-10 in., stout, woody, prostrate and extensively creeping, with short suberect leafy and flowering branches, smooth ; fl. branches clothed with strongly furrowed sheaths. Leaves subulate, stiff, glaucous, strongly nerved; sheaths pale, mouth hairy. S'piliss 3-6, 1-2 in., radiating, purplish ; rachis convex, grooved above. Sypikelets $1_{12}^{1}-\frac{1}{10}$ in., imbricate ; empty glumes ovate, acute ; keel seabrid....Disturb. Europe from Holland southwards, Asia, Africa; introd. in N. America. The chief pas-
ture of many dry climates. Doab and Bermuda gruss.

## 20. $\operatorname{AIR}^{\prime} \mathbf{A}, L$.

Spikelets laterally compressed, panicled, 2 -fld. with sometimes a rudimentary terminal 3 d glume. Empty glumes 2, equalling the flowering, membranous, subequal, acute, 1-nerved. Fl.glumes pedicelled, membranous, subequal, convex, 3 -nerved, toothed, awned at the back. Pulea 2 -nerved, 2 -fid. Scales acuminate, entire or 2 -fid. Stamens 3. Ovary glabrous; stigmas subterminal, feathery to the hase. Fruit terete, free or alnate to the fl. glume and palea.-Distrib. Temp. regions; species 30.-Etym. A Greek name for some grass.

Sub-gen. 1. Deschamp'sia, Beauv. (gen.). Perennial. Fl. glumes trunrate, toothed, 3-5-nerved; awn from near the base. Scales entire. Fruit free, not grooved.

1. A. flexuo'sa, $L$.; leaves filiform terete solid, branches of panicle sprealing capillary, spikelets subterete.
Dry woods, heaths, \&e. ; ascending to nearly $3,700 \mathrm{ft}$. in the Highlands : f. June-Aug. Nitems $\frac{1}{2}-2 \mathrm{ft}$., erect, slender, polished, naked above. Lermss short, curved, oltuse. grooved (not involute), sheath of upper long; ligule short, obtuse. Pranicle 2-5 in.; branches 2-3-nate. Sprikelets $\frac{1}{6}$ in. ; purplish or yellow brown, shining ; empty glumes acuminate ; awn about $\frac{1}{2}$ as longas the spikelet, erect, then bent or twisted.-Distrib. Europe (Áretic), W. Siberia, W. Asia, N. America, Fuegia. --Often viviparous.
Var. 1, montamu, L. (sp.); subalpine, glumes larger more purple.-Var. 2, niiginosu, Weihe (sp.) ; leaves capiliary, upper fl. glume longer pedicelled.
2. A. cesspito'sa, $L$. ; leaves flat seabrid, branches of nodding panicle flexuous, spikelets much compressed.
Wet meadows, woods, \&.c.; ascending to nearly $3,000 \mathrm{ft}$ in the Highlands:
f. June-July.-Stems $2-4 \mathrm{ft}$., rather stout, leafy, shining, smonth. Leures
coriaceous; sheaths shining, smooth or rough, upper very long; ligule obtuse. Panicle 4-8 in., linear-oblong, spreading in flower. Spikelets $\ddagger$ in., very shining, fulvous or purplish; empty glumes narrow, obtuse, shorter than the flowering, keel seabrid or smooth, upper obscurely 3 -nerved; fl. glumes 1-3 (3d always imperfect), silky at the base ; awn short, inserted below the middle, variable in length.-Distrib. N. and S. temp. and aretic and mountain regions.-A variable grass.
Sub-sp. cesspito'sa proper; tall, leaves longer broader scabrid, branches of panicle rough, awn inserted below the middle usually equalling the glume.
Sub-sp. alpi'Nı, L. (sp.); short, leaves narrower channelled smooth, branches of panicle smooth, awn inserted at the middle shorter. A. laevigata, Sm.Usually viviparous. Wet alpine rocks of Perth, Aberdeen, and Sutherland ; ascending to $4,100 \mathrm{ft}$.
Sub-gen. 2. Airop'sis, Desv. (gen.). Annual. Learcs setaceous. Fl. glumes 2 , with no rudimentary 3 d , sessile, hardening, 2 -cuspidate, awned below the middle. Scales entire. Fruit grooved, adnate to the hardened fl. glume and palea. (Intermediate between Aira and Avena.)
3. A. caryophyl'lea, L.; sheaths scabrid, panicle spreading, branches long trichotomous.
Sandy meadows, \&c. ; ascending to nearly $1,400 \mathrm{ft}$. in the Highlands ; f. June-July.-Stems 2-10 in., tufted, leafless and scabrid above, bent below, often purplish. Leazes setaceous, short, seabrid, obtuse; ligule long. Panicle 1-2 in. Spikelets $\frac{1}{1} \mathrm{in}$., ovate, shining ; lower empty glume ovate, acuminate, exceeding the flowering, keel scabrid ; awn twice as long as its glume, twisted.-Distrib. Europe, N. Africa; introd. in N. America.
4. A. præ'cox, L. ; sheaths glabrous, panicle contracted, branches very short with 1-2 spikelets.
Dry pastures, \&c. ; ascending to $1,800 \mathrm{ft}$. in Yorkshire ; fl. April-June.Habit of A. caryophyllea, but panicle very different; whole plant greener; spikelets narrower; 2-fid points of flowering glume shorter; awn inserted higher up.-Distrib. Europe; introd. in N. America.
Sub-gen. 3. Coryneph'orus, Beauv. (gen.). Perennial. Leaves setaceous. Fl. glumes entire, upper pedicelled, awn clavate bent bearded above the base. Scales 2 -fid. Fruit grooved, enclosed in the glume.
5. A. canes'cens, L. ; tufted, leaves short rigid.

Sandy coasts of Norfolk, Suffolk, and Kent, rare ; Channel Is. ; fl. July. Tufts hard, rigid, pungent. Stems 4-8 in., rigid, bent below, glabrous above. Leaves 1-2 in., glaucous, involute ; upper sheaths long, scaberulous; ligule lanceolate. Panicle 1-3 in., narrow-oblong, spreading in flower; branches thickened at the forks, short. Spikelets $\frac{1}{8}$ in., narrow, pale silvery or purplish; empty glumes narrow, acuminate, tips hyaline ; fl. glumes shorter, villous at the base; keel channelled; awn included or shortly exserted, purple below, bearded at the middle where bent, above gradually thickened, white ; anthers purplish.-Distrib. Europe, Siberia.

## 21. AVE'NA, $L$.

Spikelets large, terete or laterally compressed, panicled or racemed; 2- or more-fld., upper flower usually imperfect, lower rarely male only. Empty
glumes 2, equalling the flowering, subequal, rather membranous, 1-11nerved. Fl. glumes pedicelled, more rigid, rounded at the back or 2 -cuspidate, 2 -fid with a long bent and twisted awn from the sinus. Palea 2-nerved. Scales 2-fid. Stumens 3 . Ovary hirsute at the top (except $A$. Alavescens) ; styles distant, stigmas feathery. Fruit furrowed, free or adherent to the glume, top usually hairy.-Distrib. Temp. and cold regions; species 33.-Еtym. The old Latin name.

Sub-gen. 1. Ave'na proper. Spikelets subterete. Fl. glumes not keeled ; lowest flower 2 -sexual. Fruit hairy at the top.

## * Annual. Spikelets at length drooping. Empty glumes 5-11-nerved.

1. A. fat'ua, $L$.; spikelets 3 -flowered, empty glumes 9 -nerved, fl. glume below and pedicels hairy.
Corn-fields ; common in Great Britain ; rare and local in Ireland ; a colonist,
Watson; fl. June-Aug.-Stem 1-3 ft., stout, smooth; nodes hairy. Leares
flat, scaberulous; sheaths smooth ; ligule short, torn. P'enicle 6-10 in., equally spreading; branches whorled, scabrid. Spilielets 1 in ., green. Fl. glumes 2 -id, with long fulvous hairs below; half as long as the brown awn. -Distrib. Europe, N. Africa, Siberia, N.W. India.
A. strigo'sa, Schreb.; spikelets 2 -flowered, empty glumes 7-9-nerved, fl. glumes and pedicels glabrous.
Corn-fields, rare, not indigenous ; fl. June-July.-Smaller and more slender than A. futua; leaves sometimes hairy ; panicle unilateral ; branches fewer ; fl. glume more deeply 2 -fid, segments awned.--Distrib. Of $A$. futua.
** Perennial. Spikelets suberect. Empty glumes 1-3-nerved.
2. A. praten'sis, $L$. ; leaves glaucous glabrous, lower branches of panicle 2-nate with 1-2 3-6-flowered spikelets.
Moors and dry pastures, from Ross and Skye to Devon and Kent ; ascending to about $2,200 \mathrm{ft}$. in the Highlands ; absent from Ireland ; fl. June-July.Root fibrous, stoloniferous. Stems $\frac{1}{2}-3$ ft., erect, scaberulous, hent at the base. Leaves flat or involute; lower sheaths more or less scabrid; ligule ovate, acute. Panicle racemose, contracted after flowering. S'pilelets $\frac{1}{2}-\frac{3}{3}$ in., pale, shining ; fl. glume scabrid ; pedicel silky ; awn faintly bent, equalling the glume.
VAR. 1, praterisis proper, leaves involute, sheaths terete nearly smooth.--Var.
2, alpi"nu. Sm. (sp.); leaves flat, lower sheaths much compressed. A. planculmis, Sm. not Schrad. Mountains.
3. A. pubes'cens, L.; leaves pubescent, lower branches of panicle

5-nate with 2-4 3 -flowered spikelets.
Dry pastures, especially on limestone and chalk ; ascending to $1,600 \mathrm{ft}$. in N . of England; fl. June-July.-Habit of A. pratensis, but less densely tufted; leaves flatter; sheaths very pubescent; awns more spreading.-Distrib. Europe, Siberia.
Sub-gen. 2. Trise'tum, Pers. (gen.). Perennial. Spikelets compressed. Fl. glume keeled, lowest flower 2 -sexual. Fruit glabrous, deeply furrowed, free.
4. A. flaves cens, L. ; panicle open, branches in $\frac{1}{4}$-whorls, fl. glume 2-cuspidate 3 -awned.

Dry pastures, from Aberdeen southwards ; ascending to $1,600 \mathrm{ft}$. in N . of England; fl. July-Aug.-Root tibrous, stoloniferous. Stem 1-2 ft., erect, smooth, glabrous. Leuces flat, and sheaths hairy; ligule truncate, ciliate. Punicle $2-4 \mathrm{in}$. ; branches many, capillary. Spikelets $\frac{1}{4} \mathrm{in}$., many, 3-4flowered, shining, yellowish; empty glumes ovate, acuminate ; awns very divergent.-Distrib. Europe, N. Africa, N. Asia, Himalaya.
Sub-gen. 3. Arrhenath'erum, Beauv. (gen.). Perennial. Spikelets subterete. Empty glumes unequal. Fl. glumes convex; lowest flower male. Fruit pubescent, furrowed, adherent to the fl. glume and palea.
5. A. ela'tior, L.; panicle narrow elongate nodding, lower fl. glume long-awned, upper usually awnless. Arrhenatherum avenaceum, Beauv.
Fields, hedgerows, and pastures ; ascending to 1,500 ft. in N. of England ; fl.
June-July.-Rootstock widely creeping, often tuberous at the nodes. Stems
$2-4 \mathrm{ft}$., erect, slender, smooth. Leuces flat, scabrid; sheaths smooth; ligule
truncate. Panicle 6-12 in.; branches 2-3-nate, suberect, very scabrid.
Spikelets $\frac{1}{3}$ in., pale, shining; lower empty glume much smallest; upper oblong-lanceolate, acute; fl. glumes subsessile, hairy below the middle, half as long as the dark twisted bent awn.-Distrib. Europe, N. Africa, W. Asia ; introd. in N. America.-A most troublesome weed. The 2 flowering glumes are sometimes equally awned.

## 22. HOL'CUS, $L$.

Spikelets much laterally compressed, in open panicles, 2 -fld.; lower flower 2 -sexual, upper male. Empty glumes 2, enclosing the flowering, boatshaped, strbequal, keeled, lower 1-nerved ; upper larger, 3-nerved, notched, with a small terminal awn. Fl. glumes 5-nerved, lower sessile, 2 -sexual, awuless; upper pedicelled, male, with a dorsal twisted awn. Palea 2nerved, 3 -toothed. Scales oblique, acuminate. Stamens 3. Ovary glabrous ; stigmas sessile feathery. Fruit laterally compressed, not enclosed in the fl. glume.-Distrib. Europe, temp. Asia, and N. and S. Africa; species 6.-Етум. Obscure.

1. H. lana'tus, $L$.; softly tomentose, root fibrous, awn of the flowering glume included curved, tip scabrolls.
Meadows, copses, waysides, \&c. ; ascending to 1,800 ft. in Yorkshire ; fl. June-Aug.-Stems 6-24 in., ascending, slender, leafy. Leaves flat, soft, upper sheaths inflated; ligule short. Panicle 2-5 in., pale green or pinkish; branches 2 -3-nate. Spikelets $\frac{2}{6}$ in., elliptic-oblong; empty glumes acute, nerves strong.-Distrib. Europe, N. Africa, Siberia ; introd. in N. America.
2. H. mol'lis, $L$. ; villous at the nodes, root creeping, awn of fl. glume inflexed exserted.
Sandy and waste places, woods, \&c.; less common than $H$. lanatus ; ascending to $1,500 \mathrm{ft}$. in the N. of England ; fl. June-Aug.-Similar to H. lanatus, but usually more slender; glumes more scabrid and very acuminate.-DISTRIB. Europe except N. Russia, N. Africa.

## 23. TRIO'DIA, Br .

Spikelets few, terete, in racemose panicles, 3-5-fld., upper flower imperfect. Empty glumes exceeding the flowering, subequal, herbaceous, acute ; upper 3 -nerved. Fl. glumes convex, 3-toothed, keeled, 7-nerved. Palea sub-
entire, ciliate. Scales broad, fleshy. Stumens 3. Ovary stipitate, glabrous; styles short, terminal, stigmas feathery. Fruit free, plano-convex. -Distrib. Europe, temp. Asia, N. Africa, Australia; species 6.-Etym. тpeis and òסoús, from the three teeth.

1. T. decum'bens, Beuuv.; spikelets 6-10 turgid. Danthonia, DC.

Dry pastures and moors ; ascending to $1,800 \mathrm{ft}$. in Yorkshire ; fl. July.-Perennial, bright green. Root fibrous. Stens $6-12 \mathrm{in}$., densely tufted, rigid, glabrous, leaty. Leaces obtuse, coriaceous, slender, at length involute, hairy below ; sheaths groovel, lower hairy ; mouth with a row of hairs. Pancicle 1-2 in., erect ; rachis and branches flexuous. Spikelets $\frac{1}{4}-\frac{1}{3} \mathrm{in}$., obovoid, shining, pale green and purplish, axis very short; empty glumes large, ovate, acute, keel scabrid, margins hyaline ; fl. glumes 3-4, ovoid, not keeled, coriaceous, imbricate, bearded at the hase, ciliate on the lower margins. Puleu broad.-Distrib. Europe, N. Africa.

## 24. Phragmi'tes, Trin. Reed.

Stout water-reeds. Spikclets subterete, panicled, 4-6-flowered; lower fl. male, the rest 2 -sexual ; branches in $\frac{1}{2}$-whorls. Empty glumes 2, much shorter than the flowering, unequal, membranous, keeled. Fl. glumes distant, pedicelled; lowest naked, 1-3-androus; the rest 3 -androus, enveloped in long silky basal hairs, very long acuminate, 3 -nerved, entire. Palea short, 2 -nerved. Scules qarge, obtuse. Stumens 3. Orary glabrous, styles short, stigmas feathery.-Froit terete, loosely wrapped in the fl. glume.-Dıśtrıb. Arctic and temp. zones ; species 5.-Etrim. Obscure.

1. P. commu'nis, Trin.; panicle very large soft dull purple nodding, silky hairs equalling the fl. glumes. Arundo Phragmites, L.
Edges of lakes, \&c. ; fl. July-Aug.-Rootstock extensively creoping, jointed.
Stem 6-10 ft., stout, terete, erect, smooth. Leuces $\frac{1}{2}-1 \mathrm{in}$. broad, flat, rigid, acuminate, glaucous beneath, edges hispid; sheath smooth, mouth bearded.
Punicle 10-18 in., ovoid, dense; branches smooth, with long seattered hairs.
Spikelets $\frac{1}{2} \frac{3}{4}$ in., $3-5$-fld., shining ; empty glumes lanceolate, $\frac{1}{3}$ the length of
the Howering, which are very narrow subulate.-Distrib. Europe (Aretic),
N. temp, and trop. Asia, Africa, America, Australia.

## 25. MEL'ICA, $L$.

Spikelets terete, racemed or panicled, 1-2-fld., with a terminal longpedicelled cuneate flowerless glume embracing 2-3 others. Empty glumes 2, longer or shorter than the flowering, membranous, convex, subequal, awnless. Fl. glumes cartilaginous, convex, 5-7-nerved, awnless. Palea 2 -nerved. Sectes fleshy, comnate. Ovary glabrous; stimnas sessile feathery. Fruit oblong, suhterete, loosely wrapped in the fl. glume.-Distrib. Temp. and subtrop. regions; species 20 .-Etym. An old name.

1. M. nu'tans, $L$.; spikelets drooping racemed secund ovoid 2 -fld. Woods, from Argyle and Ross to Shropshire and Derby, ascending to nearly $1,400 \mathrm{ft}$. in the Highlands ; absent from Ireland ; fl. May-June. - Stoloniferous. Stems $10-18$ in., filiform, inclined, 3 -quetrous, scabrid above, with scaly sheaths below. Leaves flat, slender, sparsely hairy, edge and keel scabrid ; ligule 0. Racemes, 1-2 in., drooping ; rachis flexuous. Spikelets 6-10, $\frac{-1}{3} \frac{1}{3}$ in., very shortly peduncled, broad ; empty glumes purple, oblong, edges
and tips broadly scarious ; fl. glumes greenish, strongly keeled, purple below the scarious tip, glabrous.-Distrib. Europe (Arctic), N. Asia.
2. M. uniffor'a, lectz; spikelets very few erect panicled on loug capillary peduncles 2 -fld., upper flower male.
Woods, from Elgin southwards ; ascending above 1,500 ft. in N. of England; common in Ireland ; fl. May-July.-Habit, foliage, spikelets, and colouring of $M$. nuturs, but inflorescence very different ; ligule long, from the auricles of the sheath; rachis of panicle capillary; lower branches 2-nate, 1-1 $1 \frac{1}{2}$ in. ; spikelets on capillary scaberulous peduncles. -Distrib. Europe.

## 26. DAC'TYLIS, L. Cock's-foot Grass.

Spikelets laterally compressed, secund, sessile, densely imbricate at the end of the branches of a one-sided panicle, 3-many-fld. Empty glumes 2, shorter than the lowest flowering, membranous, unequal ; upper larger, 3-nerved. Fl. glumes cartilaginous, keeled, 5-nerved ; awn subterminal, short, scabrid. Palea 2-fid, nerves ciliate. Scales 2, acutely toothed. Stumens 3. Ovary glabrous; styles terminal, stigmas feathery. Fruit loosely enveloped in the glume. - Distrib. Cold and temp. regions; species 6.-Etym. бактu入ís, a finger's breadth ; of obscure application.

## 1. D. glomera'ta, L.; rough, leaves broad flat.

Pastures, waste places, \&c. ; ascending to $1,600 \mathrm{ft}$. in the N. of England ; fl. June-July.-Perennial. Stems 2-3 ft., creeping below, erect, stout, smooth. Leaves long, flat, keeled, compressed ; sheaths scabrid: ligule long. Panicle strict, 1-6 in., graen and violet ; lower branches few, long, strict, scabrid, horizontal in flower, erect in fruit. Spilelets $\frac{1}{5}$ in., oblong, 4 -fld., scabrid. Distrib. Europe (Arctic), N. Africa, Siberia, N. India; introd. in N. America.

## 27. KOELE'RIA, Pers.

Spikelets oblong, compressed, in a contracted spikelike panicle, 2-4-fld. Empty glumes 2, rather shorter than the flowering, unequal, compressed, keeled, membranous; upper 3-nerved. Fl. glumes rather close, membranous, acuminate, obscurely keeled, 5 -nerved at the base, lowest sessile. Palea 2 -fid. Scales 2, oblique. Stamens 3. Ovary glabrous; styles terminal, stout, stigmas feathery. Fruit plano-convex, free.-Distrib. Temp. regions ; species 8.-Etym. G. L. Koeler, a German writer on grasses.

1. K. crista'ta, Pers. ; panicle silvery interrupted below.

Banks, pastures ; ascending to $1,800 \mathrm{ft}$. in Yorkshire ; fl. June-July.-Perennial, pubescent or silky, pale green. Root fibrous, stoloniferous. Stems 1-3 ft., slender. Leaves narrow, glabrous beneath, soon involute; sheaths striate ; ligule 0. Panicle 1-4 in., linear-oblong or lanceolate; branches $2-3$-nate, very short. Spikelets $\frac{1}{8} \mathrm{in}$., shining, pale green; empty glumes oblong-lanceolate, acute, broadly hyaline; keel minutely scaberulous; axis pubescent ; fl. glumes linear-lanceolate, scaberulous, mucronate.-DIsтrib. Europa, N. Asia Africa and America, Himalaya, temp. S. America, Australia, New Zealand.

## 28. MOLIN'IA, Schrank.

Spikelets subterete, in a slender panicle, 1-5-fld., upper fl. imperfect. Empty glumes 2, much shorter than the flowering, equal, convex, 1-nerved. Fl. glumes pedicelled, conical, acute, awnless, cartilaginous, with 3 very
strong nerves. Palea 2 -nerved. Seales membranous, 1-toothed. Stamens 3. Ovary glabrous; styles short, stigmas feathery. Fruit sub-4-gonous, furrowed, 2 -beaked with the persistent style-bases, enclosed in the cartilaginous fl. glume.-Distrib. N. temp. regions; species 4.- Etym. G. J. Molina, a writer on Chilian Botany, \&c.

1. M. cæru'lea, Moench; leaves flat, stem wiry. Enodium, Gaud.

Wet moors, \&c. ; ascending to nearly $3,000 \mathrm{ft}$. in the Highlands; fl. JulyAng. - Stems 1-3 ft., terete, striate, with but one node, and that towards the hase, naked above. Leaces smooth, rigid, hairy at the hase, tips very slender; sheaths smooth ; ligule 0. P'anicle 1-12 in., usually stout, very contracted; rachis flexuous, compressed; branches erect. Spikel.ts few, $\frac{1}{3}$ in., narrow, reddish or violet-purple or green ; empty glumes subacute; fl. glumes deciduous, ovate-lanceolate, subacute ; anthers violet-brown.Distrib. Europe (Aretic), Sileeria, W. Asia, N. Africa.
Var. 1, cervileut proper; spikelets blue-purple 2-3-fld., fl. glumes 3-nerved.Var. 2, depaupera'tu, Lindl. (sp.) ; spikelets green 1-fld., fl. glumes 3-5nerved.

## 29. Po'A, L. Meadow-grass.

Spikelets compressed, in branched usually effuse panicles, 2-manyflowered; branches 2-nate or in $\frac{1}{2}$-whorls. Empty glumes 2, shorter than the lowest flowering, unequal, acute or obtuse, keeled; lower 1-nerved; upper larger, 3 -nerved. FI. glumes often webbed below, keeled, aeute, 5 -nerved, tips hyaline. Palea 2 -fid, nerves ciliate. Scales tumid below. Stamens 3. Ocary glabrous; styles 2, short, terminal, stigmas feathery. Fruit obtusely 3 -gonous, grooved, glabrous, free.-Distrib. Chiefly cold and temp. regions; species 90.-Етум. пóa, fodder.

## * Annual. Branches of the panicle solitary or 2-nate. Fl. glunces nearly glabrous.

1. P. an'nua, L.; stems compressed leaves obtuse, ligule long acute, branches of panicle 2-nate at length deflexed, fl. glumes 3-7 5-nerved.
Waste places, \&ce. ; ascending to $3,200 \mathrm{ft}$. in the Highlands ; fl. April-Sept.Flaceid, hright green, sometimes glaucous, quite glabrous and smooth. Stems 6-12 in., weak. Leuces linear, subacute, often waved. P'uncicle 1-3 in., subpyramidal, subsecund, green or purplish. A'pelelets $\frac{1}{6}$ in., subsessile; empty glumes broadly hyaline, upper broadest in the middle; fl. glumes glabrous or hairy below the mitdle. --Distrib. N. temp. Europe (Aretic), Asia, and N. Africa; doubtfully native of N. America.

> ** Perennial ; rootstock creeping, stoloniferous.
2. P. praten'sis, L.; stem smooth terete, upper leaf shorter than its sheath, ligule long, branches of diffuse panicle 3-5-nate scabrid, fl. glumes 3-5 acute webbed, edges and keel silky, nerves 5 distinct.
Meadows, banks, and pastures ; ascending to 2,400 ft. in Yorkshire, and nearly $2,800 \mathrm{ft}$. in Ireland; fl. June-July.-Glabrous, pale green. Stems 1-2 ft., rather stout. Leuves linear, flat, acute, tip often concave; sheaths subcompressed. Panicle 2-6 in., pyramidal; branches long or short, rarely $2-3$-nate. Spikelets $\frac{1}{5} \frac{1}{3}$ in., green or purplish ; empty glumes acuminate, keel scabrid ; fl. glumes broadly hyaline.-Distirb. N. temp. and arctie regions.- $P$. subcarv'leu, Sm ., is a small glaucous state, and $P$. anyustifolia, L. (sp.), another with slender leaves.
3. P. compres'sa, $L$.; stem smooth compressed, upper leaf equalling or exceeding its sheath, ligule short, branches of effuse panicle 2-3-nate scabrid, fl. glumes 4-9 obtuse nearly glabrous, nerves obscure.
Dry banks, walls, \&ce. from Ross southwards; Londonderry only in Ireland; fl. June-July.-Smooth or slightly rough, glabrous, more or less glaucous. Stems. $1-2 \mathrm{ft}$., usually much bent towards the base. Leuves flat, rough or not. Panicle 1-3 in., usually more secund and contracted than in $P$. prutensis, but sometimes effuse. Spikelets $\frac{1}{6}$ in., green or bluish-purple; empty glumes subequal ; fl. glumes broadly hyaline, 3 -nerved ( $P$. subcompressa, Parn.) or 5 -nerved ( $P$. polynoda, Parn.) and then more usually webbed.-Distrib. Europe, N. and W. Asia ; doubtfully native of N. America.

$$
\text { *** Rootstock shortly creeping, stolons } 0 .
$$

4. P. trivia'lis, L.; stems and sheaths rough, ligule oblong acute, branches of effuse panicle 5 -nate scabrid, fl. glumes 3-5 acuminate glabrous or webbed, nerves 5 distinct.
Woods and meadows; ascending to nearly $2,500 \mathrm{ft}$. in the Highlands; fl . June-July.-Very near indeed to $P$. pratensis, and chiefly distinguishable by the roughness, and absence of stolons.-Distrib. Europe, N. Africa, Siberia, Dahuria ; introd. in N. America.
5. P. nemora'lis, L.; stems and sheaths smooth, ligule 0, branches of the subsecund panicle 2-5-nate scabrid, fl. glumes 1-5 subacute, edges and keel pubescent, nerves obsolete.
Copses and woods, from Skye and Elgin southwards; ascending to nearly $1,600 \mathrm{ft}$. in the Highlands ; E. and N. of Ireland, rare ; fl. June-July.Smooth, bright green, glaucous or not. Stems 1-3 ft., very slender, terete or slightly compressed. Leaves linear, very narrow, flaccid ; sheaths smooth, striate. Panicle 2-5 in., slender, nodding. Spikelets small, $\frac{1}{6} \mathrm{in} .$, yellowgreen and purplish; empty glumes often equalling the flowering, acuminate; fl. glumes $2-5$, scarcely hyaline at the tip or margins.-Distrib. Europe, N. Asia, Himalaya, N. America.

VAR. 1, nemora'lis proper ; upper leaf equalling the sheath, ligule very short, fl. glumes webbed.-VAR. 2, Parnel'lii, Bab. (sp.); upper leaf usually shorter than its sheath, ligule short, fl. glumes hardly webbed.-Var. 3, yluncu, Sm.; stem strict, base creeping, upper node very long, leaves glaucous, upper equalling the sheath, ligule ovate obtuse, fl. glumes webbed. $P$. Bulfourii, Parn. Alpine rocks, N. Wales, Yorkshire, northwards to Argyle, Perth, and Aberdeen ; alt. 2,000-3,000 ft.-P. montana, Parn., is intermediate between this and nemoralis proper. P. cessia, Sm., is a doubtful plant.
6. P. lax'a, Hoenke; stems slightly compressed smooth, leaves short, ligules long torn acute, branches of narrow lax subsecund panicle solitary or 2-nate smooth, fl. glumes 2-4, keel and margins villous, nerves 3-5 obscure. P. flexuosa, Sm.
Rocky shelves on the lofty Alps of Aberdeen and Inverness; ascending to about $3,600 \mathrm{ft}$; fl. July-Aug.-Flaccid, smooth, pale glaucous green. Stems 4-10 in., compressed and prostrate below. Leaves linear, obliquely mucronate, upper longer than its sheath; sheaths compressed. Panicle 1-3 in., drooping, lax or open, branches rarely scaberulous. Spikelets ro- in., often viviparous, green and purplish ; empty glumes acuminate, tips hyaline.Distrib. N. Alpine andiArctic Europe, Siberia, N. America.-Often with difficulty distinguished from $P$. alpina.

Var. 1, laz'a proper; leaves flat, fl. glumes not webbed.-Var. 2, minor, Gaud. (sp.) ; leaves keeled curved, fl. glumes webbed, nerves more distinct.
7. P. alpína, $L$. ; stem glabrous terete, leaves broad firm tip roundel, upper ligules long acute, branches of erect spreading panicle 2 -nate, fl. glumes 3-9, keel and edges pubescent, nerves 3-5 obscure.
Rocks, \&c. on lofty mts., from York and Westmoreland northwards ; ascending to $4,000 \mathrm{ft}$. ; W. of Ireland, very rare ; fl. June-Aug.-Smooth, glabrous. Ruotsturk stout, creeping. Stems $10-18 \mathrm{in} .$, stout. Leaces rather short, strict, rigid, keeled, mucronate, edges thickened scabrid, upper shorter than its sheath; lower sheaths broad, white, membranous, persistent, leafless, upper compressed smooth. P'anicle oblong or pyramidal, $1-3 \mathrm{in}$. broad. s'piliclets $\frac{1}{6}$ in., green and purplish, often viviparous ; empty glumes unequal. ovate, acute ; H1. glumes with hyaline tips, webbed, also broad.-Distrib. N. Alpine and Arctic Europe, Siberia, W. Asia, Himalaya, N. America.
8. P. bulbo'sa, L. ; stems tuherous below and terete sheaths smooth, leaves narrow, ligules all long acute, branches of panicle 2 -nate scabrid, fl. glumes 3-6, margins and acute keel pubescent, nerves obsolete.
Sundy sea-shores, E. and S. of England, from Norfolk and Kent to Devon ; ft. April-May.-Glabrous, rather rigid. Stens 6-10 in.; tubers ovoid, $.5-\frac{1}{3} \mathrm{in}$., covered with lax sheaths. Lenets $1-1 \frac{1}{2}$ in., very narrow, keeled, curved, upper very short ; lower sheaths short, upper long compressed. Pavicle $1-1 \frac{1}{2} \mathrm{in}$., ovate, compressed. Spikelets $\mathrm{i}^{1} \mathrm{~m}$ in. broad, green and purplishbrown; empty glumes ovate, acute, keel scabrid ; fl. glumes also broad, acute.-DIstrib. Europe, N. Africa, Siberia.-Very near P. ulpinu, but differing in locality, habit, and the close ovate panicle.

## 30. CATABRO'SA, Beawv.

Spikelets minute, subterete, obconic, in branched effuse panicles, 1- or more-fld. Empty glumes 2, much shorter than the flowering, unequal, scarious, convex, awnless ; upper truncate, crenulate. Fl. ylumes coriaceous, cuneate, terete, 5 -nerved, torn at the membranous tip, back smooth, awnless ; lower sessile ; upper pedicelled, often flowerless or male. Palea as long. Seales ovate-oblong. Stumens 3. Ocary ovoid, glabrous; stigmas sulsessile, feathery. Fruit compressed, not furrowed, free.-Distrib. Temp. and cold regions; species 5.-Еtym. катаßpáots, from the erose top of the glumes.

## 1. C. aquat'ica, Beauv. ; panicle pyramidal.

Watery places, from Devon and Kent northwards ; fl. May-June.-Terrestrial or aquatic, soft, bright green, flaceid. Rootstock stout, branched, creeping and rooting at the nodes. Stem 6-12 in., bent below, then erect, compressed, smooth, striate, leafy, sometimes much branched. Leaves flat, $\frac{1}{6}-\frac{1}{-1} \mathrm{in}$. broad, linear, obtuse, upper short; sheaths inflated, smooth; ligule ovate, obtuse. Pawicle 1-4 in., rachis stout, grooved; branches whorled, divided, slender. Spihelets in in., subsolitary, pedicelled, green and purplish ; empty glumes 1-nerved, green, tips very broad ; fl. glumes fulvous or purplish, smooth; nerves green ; anthers white.-Distrib. Europe, N. Africa, Siberia, Himalaya, N. America.-Var. littora'lis, Parn., has smaller 1 -fld. spikelets. W. coasts.

## 31. Glyce'ria, Br. Manna Grass.

Spikelets linear, sulterete, in effuse or contracted panicles, rarely spiked, 3 -many-flowered, branches in $\frac{1}{\frac{1}{2} \text {-whorls. Empty glumes 2, shorter than the }}$ lowest flowering, 1-3-nerved, unequal, membranous, convex, awnless; upper larger. Fl. glumes caducous, cartilaginous, convex, not keeled, tip obtuse usually scarious; nerves 5-7, parallel. Palea 2-fid, nerves ciliate. Scales fleshy, truncate. Stamens 3. Ovary glabrous; styles terminal, short or 0 , stigmas feathery. Fruit oblong, free, channelled or not.-
 allusion to the sweet grain.

Section 1. Glyce'ria proper. Perennial. Leaves flat; sheaths entire. Fl. glume strongly nerved. Hairs of stigma branched. Fruit grooved.

1. G. aquat'ica, Sm.; panicle much branched, spikelets oblong, fl. glumes 5-9 entire. G. spectabilis, Mert. and Koch.
Watery places; fl. July-Aug. -- Rootstock stout, extensively creeping. Stem 2-6 ft., stout, smooth, striate. Leaves 1-2 ft., $\frac{1}{3} \frac{-1}{2}$ in. broad, suberect, acute ; sheaths smooth; ligule short. Punicle 6-12 in. Spikelets $\frac{1}{4} \mathrm{in} .$, yellowgreen and purple ; glumes scabrid ; empty short, shining ; flowering rigid, obtuse ; nerves strong.-Distrib. Europe, Siberia, Himalaya, N. America.
2. G. flu'itans, $B r$. ; panicle subsimple, spikelets linear, fl. glumes 7-20.

Watery places ; ascending to $1,600 \mathrm{ft}$. in Yorkshire ; fl. July-Aug.-Rootstock stout, widely creeping. Stem 1-3 ft., stout, branched, terete, floating or creeping, sm joth. Learcs $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. broad, flat, acute, short, or the upper long and floating ; sheaths long, compressed; ligule broad, acute. Punicle 1-2 ft., simple or branched; rachis 3 -gunous; branches remote, smooth. Spikelets $\frac{1}{2}-2 \mathrm{in}$., erect, green or tips purplish; empty glumes unequal, tips torn; fl. glumes scabrid, tips often ragged. - Distrib. Europe, N. Africa, W. Siberia, Himalaya, N. America.
Sub-sp. Flu'itans proper; sheaths striate, branches of fruiting panicle erect, tip of fl. glume subentire, anthers purple very narrow.
Sub-sp. Plici'ta, Fries (sp.) ; sheaths furrowed, branches of fruiting panicle spreading, tip of f. glume 3 -toothed, anthers broader. ( $*$. pedicellatu, Towns.
Section 2. Sclerochlóa, Beauv. (gen.). Leaves with split sheaths. Fl. glume obscurely 5 -nerved. Stigmas subsessile, hairs simple. Fruit obscurely grooved.

* Empty glumes 3-nerved (Atropis, Rupr.).

3. G. marit'ima, Wuhlb. ; perennial, stolons long, leaves involute, ligule oblong, branches of panicle solitary or 2-3-nate, fl. glumes 4-12, tip subacute.
Muddy, \&c. sea-coasts; fi. July.-Rootstock widely creeping. Stems 8-16 in., terete, smooth. Leress involute or channelled, acute or pungent ; sheaths smoath ; ligule rather long, oblong. Panicle 1-3 in., oblong, contracted; branches appressed or horizontal, rarely deflexed, or more than 3 -nate; rachis subterete, grooved on one side. Spilietets $\frac{1}{4}-\frac{1}{2}$ in., ovate-oblong or linear-elongate, green or purplish; empty glumes subacute; H. glumes obscurely 3 -toothed, tip hyaline or not. - Distrib. Europe, N. Africa, Siberia. N. America.
4. G. dis'tans, Wahl. ; perennial, leaves flat, ligule short, branches of panicle 4-5-nate at length deflexed, ff. glumes 3-6 truncate.
Sandy chiefly maritime places in Great Britain; S. and E. of Ireland, rare; fl. July-Aug.-Very closely allied to G. maritima, but rarely stoloniferous; leaves broader and Hatter; stem in the typical states much taller and more slender ; panicle more branched with horizontal and deflexed branches, and spikelets much smaller, $\cdot \mathrm{b}-\frac{1}{1} \mathrm{in}$. or less. - Distrib. Europe, N. Africa, Siberia, Himalaya, N. America.
Sub-sp. Dis'Tans proper ; branches of panicle smooth, rachis furrowed, spikelets distant.-Common ; rarely found inland.
Sub-sp. cunfer'ta, Fries (sp.); stoloniferous, branches of panicle scabrid, rachis not furrowed, spikelets crowded smaller, fl. glumes 4-7, tips 3-toothed. G. Borreri, Bab.--Intermediate between G. muritima and distuns. S. coast chiefly; Ireland, Dublin only.-W. Europe.
5. G. procum'bens, Sm. ; annual, leaves flat, ligule short, sheaths inflated, branches of rigid panicle short solitary or 2-3-nate, fl. glumes 3-5 obtuse mucronate.
Muddy sea-shores of England ; S.E. of Ireland, rare ; fl. June-July.-Rnot fibrous. Stems 3-6 in., short, stout, rigid, spreading, erect or decumbent. Leaces short, subacute, glaucous ; sheaths large, grooved. Panicle 1-2 in., green ; rachis angular ; branches stout. erecto-patent, subdistichous, smooth. Spikelets $\frac{1}{6}-\frac{1}{4}$ in., subsessile, crowded.-Distrib. W. Europe from Holland to Spain and Italy, N. Africa, Siberia, Himalaya, N. America.
** Annual, rigid and wiry. Empty glumes 1-nerverl. (Catapodium, Link.)
6. G. rig'ida, Sm.; branches of panicle distichous with $3-5$ subsessile spikelets, fl. glumes $7-10$ acute, nerves faint.
Dry rocks, walls, \&c., from Ross southwards ; rather rare in Ireland ; fl. June. -Often purple, glabrous, smooth. Root fibrous. Stems 3-6 in. Lences involute, subsetaceous ; sheaths terete, grooved ; ligule oblong. Panicle 1. $\frac{1}{2}-$ $2 \frac{1}{2} \mathrm{in}$. , striet ; rachis broadly chamnelled, erlges seabrid. Syikelets $\frac{1}{6}-\frac{1}{4} \mathrm{in}$., rarely solitary (then spiked); pedicels short, stout, $\frac{1}{2}$-terete ; fl. glumes quite terete, shining, smooth.-Distrib. W. and S. Europe from Holland southwards, Canaries.
7. G. Iolla'cea, Watson ; spikelets spiked distichous, fl. glumes 8-12, obtuse mucronate, nerves faint. Poa, Huds.; Sclerochloa, Woods.
Sandy shores, from Fife southwards, and in Ireland ; fl. July-Aug.-Green, smonth, glabrous. Root fibrous. Stems spreading and erect, leafy. Lenzess small, flat or involute ; sheaths smooth; ligule oblong. Spikies strict, $1-2 \frac{1}{2}$ in.; rachis stout, $\frac{1}{2}$-terete, hardly flexuous, edges smooth. Špitelets $\frac{1-1}{-\frac{1}{3}}$ in., sessile, erect, green; fl. glumes broad, obtusely-keeled, smooth; lateral nerves strongest.-Distrib. S. and W. Europe from France to Dalmatia, N. Africa.

## 32. Briza, L. Quaking Grass.

Spikelcts large, ovate or cordate, compressed, pendulous, in effuse panieles, many-flowered; branches in $\frac{1}{2}$-whorls ; perlicels capillary. E'mpty glumes 2, longer or shorter than the lowest flowering, subequal, broad, rounded at the back. $k^{\prime}$. glumes imbrieate, boat-shapred or saceate, horizontal, very obtuse, many-nerved. Palea narrow, nerves ciliate. Scules 2, ovate-lanceolate. Stamens 3. Ocary glabrous; styles short,
terminal, stigmas feathery. Fruit broadly ovoid, compressed, adhering to the hardened glume.-Distrib. Temp. Europe, Africa, and Asia; species 6.-Etym. An old Greek name.

1. B. média, L.; perennial, lignle short, spikelets ovate, empty glumes shorter than the 1st fl. glume.
Meadows and heaths, \&c. from Ross southwards ; ascending to $2,100 \mathrm{ft}$. in Yorkshire ; fl. June.-Stems solitary, creeping below, 6-18 in., very slender, smooth. Leares flat, smooth or scabrid; sheaths smooth, upper inflated. Panicle pyramidal; branches very long, capillary. Spikelets $\frac{1}{4} \frac{1}{3}$ in., green or purplish, shining; fl. glumes $5-9$, sheathing one another.-DISTRIB. Europe, Siberia, W. Asia; introd. in N. America.
2. B. mi'nor, L. ; annual, ligule long, empty glumes longer than the 1st fl. glume.
Fields, from Hants to Cornwall ; Cork in Ireland ; Channel Is.; fl. July.Stems tuited, $4-10 \mathrm{in}$. Panicle almost as in B. media, but spikelets more numerous,, smaller, $\frac{1}{6} \mathrm{in}$. diam., broader than long.-Distrib. Europe from France and Spain to Turkey, N. Africa.

## 33. festu'ca, L. Fescue Grass.

Spikelets subterete, racemose or panicled, 3- or more-fld. Empty glumes 2 , rarely 1 , shorter than the lowest flowering, unequal, membranous, acute; upper larger, 3-nerved ; lower 1-nerved. Fl. glumes convex, 3-5-nerved, mucromate or awned at or near the tip. Palea 2 -fid, nerves hairy. Scales 2, notched. Stamens 1-3. Ovary glabrous; styles terminal, stigmas feathery. Fruit aduate to the fl. glume and palea.-Distrib. Aretic, cold and temp. regions ; species 125.-Еtym. An old Latin name.

Section 1. Schedono'rus, Beauv. Perennial. Leaves broad, flat. Awn 0 (except in F. gigantea). Flowers 3 -androus.

Ligule of upper sheath short.

1. F. ela'tior, $L$.; leaves flat, panicle diffuse nodding, fl. glumes $3-7$ glabrous acute or almost awned, ovary glabrous.
River-banks and wet places ; ascending to $1,300 \mathrm{ft}$. in the N. of England ; f. June-July. - Rootstock creeping, stoloniferous. Stem 2-6 ft., nodding, smooth. Leares $\frac{1}{4} \frac{1}{3} \mathrm{in}$. broad, smooth; sheaths smooth, striate. P'ericle 3-6 in., contracted after flowering; rachis 3-quetrous, smooth; branches 2 -nate, seabrid. Sypikelets many, $\frac{1}{2} \frac{3}{\frac{3}{2}}$ in., linear-oblong, green and dull purple; empty glumes broadly hyaline ; fl. glumes seabrid above, rarely awned ; margins hyaline.-Distrib. Europe (Arctic), N. Africa, W. Siberia, Himalaya, N. America.-A form with branches of panicle divaricate after flowering is the F. arundinacea, Schreb.
2. F. praten'sis, Huds.; leaves flat, panicle subsecund noddling close, fl. glumes 4-10 glabrous obtuse or mucronate, ovary glabrous.
River-banks and wet places ; ascending to 1,600 ft. in the N. of England; ff. June-July.-Very closely allied to $F$. elatior, and perhaps only a sub-species, but smaller, less stoloniferous ; panicle much narrower, more simple, sometimes 10 in., branches shorter, in pairs, one with 1 spikelet, the other with 2 or more ; fl. glumes more numerous, sometimes shortly awned.-Distrib. Europe (Arctic), Siberia, Dahuria; introd, in N. America.

Var. Loliacea, Huds. (sp.) ; inflorescence racemose or spiked, spikelets distichous, awn 0, 且. glumes more obtuse.
3. F. gigan'tea, Vill.; leaves flat, panicle very open nodding, fl. glumes 3-8 scabrid, awn double their length, ovary glabrous. Bromus, L. Damp woors and hedgebanks, from Argyle and Elgin southwards; ascending to $1,000 \mathrm{ft}$. in Yorkshire ; fl. July-Aug.-Habit of Bromens. Reot fibrous. Stem 2-4 ft., smooth, terete, nodding. Leaces flaccid, $\frac{1}{4} \frac{1}{2} \mathrm{in}$. broad, bright green, striate, scaberulous above; sheaths smooth. Penicle 8-12 in.; branches in pairs, and 3 -quetrous rachis long slender scabrid. Spilelets $\frac{3}{2}$ in., linear-ovate or -ablong, membranous, pale green ; empty glumes lanceolate, broadly hyaline; fl. glumes 2 -fid, awn variable in length, very slender, flexuous; styles subterminal. -Distrib. Europe, Siberia.-Flowers sometimes few ( $\vec{F}$. triflora, Sm.).

> ** Ligule of upper sheath long, not auricled.
4. F. sylvat'ica, Vill.; leaves involute, panicle open subsocund suberect, fl. glumes 3-5 acute scabrid, top of ovary hairy. F. Culamaria, Sm.
Woods in hilly districts, from Banff and Inverness sonthwards; rare in Ireland; fl. July.-Root fibrous, stolons short. Stem 2-3 ft., stiff, erect, smooth, terete. Leures $\frac{4-\frac{1}{2}}{} \mathrm{in}$. broad, glaucous above, edges scabrid; sheaths almost smooth, lower lax leafless brown. Panicle 3-6 in., ovate, much branched; rachis and 2-4-nate branches very slender, slightly scabrid. Spikelets f in., broadly ovate, small, flat, pale yellow-green ; axis scabrid; empty glumes linear-subulate; fl. glumes spreading, slender, acuminate, shortly awned, scaberulous.-Distrib. W. Europe to Austria, Germany, and Italy. $-F$. decidua, Sm., is a narrower-leaved 2 -flowered variety.
Section 2. Festu'ca proper. Perennial. Lower (or all) leaves setaceous; ligule auricled. Spikelets panicled. Flowers 3 -androus.
5. F. ovina, L.; glaucous, leaves setaceous or upper flat, ligule 2 -lobed, panicle subunilateral, spikelets 4 - 10 -fld. purplish, fl. glumes terete mucronate or shortly awned.
Dry hilly pastures, woods, \&c., at all elevations; fl. June-July.--One of the most ahundant grasses, $3-24 \mathrm{in}$., slender, variable in size. colour, and habit; the following sub-species express its principal modifications.-- Distrib. Europe, N. Africa, Siberia, Himalaya, N. and S. America, Mts. of Australia and New Zealand.
Sub-sp. ovi'Na proper ; densely tufted, leaves all setaceons, sheaths glabrous, panicle contracted subsecund, spikelets small, fl. glumes $\frac{1}{8} \frac{\mathrm{in}}{}$. awned often viviparous.-Upland eopses, moors and sandy places ; ascending to $4,300 \mathrm{ft}$. (Arctic).-Var. tenuifóliu, Sibth. (sp.); leaves very slender setaceous, fl. glumes awnless.
Sub-sp. DIrris'cula, L. (sp.); less densely tufted, stem-leaves flat, sheaths downy, panicle more open, fl. glumes $\frac{1}{4} \mathrm{in}$. narrow.-Moist hilly places ; ascending to $2,760 \mathrm{ft}$. in the Highlands.
Sub-sp. rébra, $L$. (sp.); taller, laxly tufted, stoloniferous, leaves flat or involute, lower sheaths hairy, panicle effuse subsecund, spikelets pale red, f. glumes $f-\frac{1}{2}$. broader awned. - Shaded places in low grounds.-Var. sabutićolu, Dusf.; creeping, leaves all involute. Sandy shores.
Sbetion 3. Vul'pia, Gmel. (gen.). Annual. Loaves setaceous. Spikclets racemose or spiked. Floneers 1-3-androus.
6. F. Myu'rus, L. ; panicle branched at the base only, very long and
slender, lower empty glume small, fl. glumes 5-8 equalling their slender awns, stamens 1-3.
Walls, sandy and gravelly pastures ; ascending to near $1,000 \mathrm{ft}$. in Yorkshire ; fl. June.-Root fibrous. Stems 6-18 in., very slender, leafy, glabrous, lower setaceous; upper sheaths long, terete, grooved, smooth ; ligule very short. Panicle 4-10 in., strict or flexuous, very narrow, opaque or shining, glabrous or pubescent, rachis and branches angular, smooth or scaberulous; lower branches appressed; upper very short. Spikelets with the awns $\frac{1}{2} \frac{3}{4} \frac{\mathrm{in} \text {., }}{}$ cuneate when expanded, axis smooth; empty glumes subulate; fl. glumes distant, terete, almost subulate, narrowed into the slender awn; nerves obscure.-Distrib. Europe, N. Africa ; introd. in N. America.
Sub-sp. Myu'rus proper ; slender, upper sheath exceeding the stem and often the long slender panicle, lower empty glume $\frac{1}{3}$ shorter than the upper. F. pseudo-myurus, Koch.-VAR. ambig'ua, Le Gall (sp.); upper empty glume 3-6 times as long as the lower. I. of Wight.
Sub-sp. scluroi'des, Roth (sp.) ; stem naked above, panicle more open, lower branches slender, lower empty glumes twice as long as the upper. $\boldsymbol{F}$. bromoides, Sm.
7. F. uniglu'mis, $L$. ; panicle or spike short, branches very short, lower empty glume minute or 0 , fl. glumes $4-10$ shorter than the awns, flowers 2-3-androus.
Sandy sea-coasts, from Lancaster and Norfolk to Devon and Kent; E. of Ireland, local and rare ; fl. June-July.-Root fibrous. Stems 4-10 in., bent below, slender, glabrous. Leaves setaceous, short; upper sheaths large, inflated ; ligule short, auricled. Panicle $1 \frac{1}{2}-2 \mathrm{in}$., oblong, unilateral, pale green, shining, rachis smooth; lower branches 2-nate. Spikelets with the awns $\frac{3}{4}-1 \mathrm{in}$. , almost subulate; fruiting cuneate; pedicels short, stout; axis smooth; empty glumes with subulate tips or awns, upper 3-nerved, broadly hyaline ; fl. glumes distant, very narrow, strongly nerved, scabrid, terete below, compressed above, gradually narrowed into the subulate awn; ovary glabrous.-Distrib. W. Europe from Belgium, France, and Spain, S. and E. to Turkey, N. Africa.

## 34. Brómus, $L$. Brome Grass.

Soikelets subterete or laterally compressed, panicled or racemed, 5- or many-fld. Empty glumes 2, shorter than the lowest fl. glume, unequal, coriaceous, acute, awnless; lower smaller 1-3-nerved ; upper 3-9-nerved. Fl. glumes convex or keeled, 5-7-nerved, tip entire or 2 -fid. Palea 2 -fid, nerves ciliate. Scales entire. Stamens 3, rarely 2. Ovary hairy at the top, styles short, inserted below the top, stigmas feathery. Fruit linear, grooved, oblong, adherent to the palea.-Distrib. Temp. and cold climates ; species 50.-Etym. The old Greek name for the Oat.

Section 1. Schedono'rus, Fries. Lower empty glume 1-nerved, upper 3 -nerved. Fl. glumes distant, narrow, convex below, keeled and compressed above, 5 -nerved, awn terminal. Styles lateral on the ovary.

* Keels of palea pubescent only. Fl. glumes spreading in flower, erect in fruit.

1. B. as per, Murr.; leaves flat and sheaths hairy, panicle secund nodding, fl. glumes 5-8 twice as long as the awn.
Damp woods, hedgebanks, \&c., from Elgin and Cantire southwards; ascending
to $1,200 \mathrm{ft}$. in Yorkshire ; fl. June-July.-Annual or perennial. Root fibrous. Stem 2-6 ft., smooth. Leaves $\frac{1}{1-\frac{1}{2}}$ in. diam., green, long, hairs seattered, reflexed on the sheath; ligule short. Panicle 3-5 in., lower branches 2-3-nate, long, lax, capillary, and rachis scabrid. Spikelets 1 in ., narrow, glaucous green, axis scabrid ; empty glumes acuminate, hairy or glabrens; A. glumes with the awn $\frac{1}{2} \frac{-2}{3}$ in., diverging in flower, then ereet, more or less hairy, lateral nerves strong, tip 2 -toothed ; awn variable in length.--Distrib. Europe, Siberia; introd. in N. America.
2. B. erec'tus, Huds. ; leaves involute hairy, panicle erect narrow, fl. glumes villous twice as long as the awn.
Fields and waste places in dry soil, from Fife and Kirkcudbright southwards to Kent and Sussex ; S. and Mid. Ireland, rare ; fl. June-July.-Perennial. Rootetock stout, creeping; stolons 0 . Stems $1-3 \mathrm{ft}$., rigid, smooth, bent below, then erect. Leaves narrow, rigid, almost subulate, hairy; hars scattered on the upper sheaths, erect; ligule short. Panicle 4-6 in., subsimple, strict, branches $2-3$-nate and rachis scabrid. Spikelets $\frac{2}{3}-1 \frac{1}{3}$ in., subsolitary, green or purplish; empty glumes longer than in B. usper; f. glumes much the same in both.-Distrib. Europe, N. Africa.

## ** Annual. Keels of palea pectinate-ciliate. Fl. glumes erect both in floner and fruet (except B. maximus).

3. B. ster'ilis; $L$.; leaves flat pilose, sheaths compressed, panicle very lax, branches few very long in $\frac{1}{2}$-whorls, spikelets subsolitary, fl. glumes 7-10 much shorter than their awns.
Fields and waste places, from Banff and Elgin southwards; fl. June-July.Root fibrous. Stem $1-2 \mathrm{ft}$., erect, smooth, leafy. Leaves $\frac{1-\frac{1}{3}}{} \mathrm{in}$. broad, flaccid, ribbed; sheaths glabrous or pubescent. Panicle 6-10 in. broad, nodding, very lax and open; branches horizontal and drooping. Spikelets with the awns 2 in ., nodding, green ; empty glumes long, narrow, upper twice the longest; fi. glumes very narrow, gradually narrowed into the very slender straight awn, strongly ribbed, margins hyaline.-Distrib. Europe, W. Siberia, N. Africa ; introd. in N. America.
4. B. madriten'sis, $L$.; leaves narrow flat hairy, sheaths terete, nanicle erect, branches few strict erect, fl. glumes $6-8$ half as long as the straight stout awn.
Sandy waste places in Pembroke, Devon, Surrey, Kent, and Hants ; Channel Is. ; Tipperary in Ireland; a doubtful native, Watson; fl. June-July. -Stems 6-14 in., strict from an ascending base, smooth, leafy. Leaves if $\frac{1}{8}$ in., more or less hairy or tomentose; hairs on sheaths reflexed; ligule short, truncate. Panicle 2-4 in., oblong, compressed; branches appressed, short, and slender rachis scabrid. Spikelets $\frac{1-\frac{3}{3}}{3} \mathrm{in}$. excluding the awns, dull green, axis smooth; lower empty glume subulate, half as long as tho narrow linear upper ; fl. glumes $\frac{1}{2}$ in., very narrow, scabrid, margins and 2 -fid tip broadly hyaline ; awn slender; stamens usually 2 .-DisThib. Europe from France and Spain to Turkey, N. Africa.
Vir. 1, dian'drus,Curt. (sp.); rachis and pedicels scabrous.-Var. 2, rig'idus, Roth ; rachis, pedicels, and glumes pubescent. Channel Is.
5. B. max'imus, Desf.; leaves flat hairy, sheaths terete, panicle erect, branches few strict, fl. glumes 4-6 not $\frac{1}{3}$ as long as the long straight awn.

Sandy shores, Jersey; fi. June July. - Root fibrous. Stems 6-10 in., terete, pubescent. Leaves $\frac{1-1}{4} \mathrm{in}$. broad, bright green ; hairs on sheaths spreading or reflexed; ligule short, truncate. Panicle 4-7 in., at length nodding; branches short, appressed, and rachis pubescent. Spikelets with the awns 2-3 in., pale green or purplish; axis glabrous; empty glumes hyaline, very narrow, awned; upper twice as long as the lower, almost equalling the lowest fl. glume ; fl. glumes thin, narrow, scabrid, narrowed into the scabrid awn; nerves faint ; stamens 2-3.-Distrib. France, Spain, Mediterranean.
Section 2. Serrafal'cus, Parl. Annual or perennial. Lower empty glumes 5-, upper 7-9-nerved. Fl. glumes close, convex, 5-7-nerved, 2 -fid, awned in the sinus. Palea with pectinate-ciliate nerves. Styles inserted below the top of the ovary.

## * Fl. glume longer than its palea.

6. B. mol'lis, $L_{\text {. }}$; pubescent or tomentose; panicle ovoid strict, lower empty glume broadly ovate, fl. glumes 6-10 densely imbricate pubescent opaque equalling the slender awn.
Roadsides and waste places; ascending to $1,800 \mathrm{ft}$. in the N. of England; fl. May-July.-Glaucous green. Stems 4-24 in., terete. Leaves flat, $\frac{1}{6}-\frac{1}{3}$ in. broad, soft, edges scabrid; sheaths terete, villous; ligule short. Punicle 1-3 in., erect or nodding; branches very short, subsimple. Spikelets $\frac{1}{2}-\frac{3}{4}$ in., compressed, oblong, tips covic; empty glumes broadly ovate, acute, strongly nerved, upper much largest ; fl. glumes caducous, broadest and obtusely angled above the middle, 2 -fid, pubescent.-Distrib. Europe, N. Africa, W. Siberia ; introd. in N. America.-A glabrous variety has been called subglaber.
7. B. racemo'sus, $L$.; leaves and sheaths glabrate or hairy, panicle narrow, lower empty glume lanceolate, fl. glumes 6-10 imbricate scabrid shining equalling the slender awn. B. pratensis, Ehr.
Fields and waste places, from Moray southwards; ascending to $1,200 \mathrm{ft}$. in the Highlands; fl. June-July.-Very similar to B. mollis, but subglabrous, often $2-3 \mathrm{ft}$., rigid ; leaves rigid, more ciliate ; branches of panicle 3-5-nate, long and slender ; spikelets narrower, more acute, scabrid; empty glumes narrower, especially the lower ; fl. glume broadest above the middle, margin obtusely angled.-Distrib. Europe exel. Russia, N. Africa; introd. in N. America.
VAR. commutatus, Schrad. (sp.) ; stouter, panicle more compound, spikelets shorter, margins of caducous fl. glume less rounded at the broadest part.
8. B. secali'nus, $L_{\text {. }}$; glabrate or sheaths hairy, panicle effuse hairy, fl. glumes 5-8 not imbricate terete scabrid longer than their awns.
Corn-fields, from Isla and Ross southwards; hardly established in Ireland ; a colonist, Watson; fl. June-July.-Root of stout fibres. Stems $1-4 \mathrm{ft}$, strict, rigid, smooth, rarely pubescent (B. velutinus, Schrad. and B. multitlorus, Sm.). Leaves ${ }^{\frac{1}{-1}} \frac{1}{3} \mathrm{in}$. broad, glabrous or slightly hairy, scabrid above ; sheaths grooved ; ligule short. Panicle $3-5$ in., oblong; branches 3 -5-nate and rachis flexuous, scabrid, subsimple. Spikelets $\frac{1-3}{3-\frac{8}{4}} \mathrm{in}$., compressed ; empty glumes unequal, broadly oblong, scal rid, mueronate, upper larger; fl. glumes spreading, linear-oblong, $7-9$-nerved, margins incurved, straight, hyaline, notched, at length coriaceous; awn variable.Distrib. Europe, N. Africa, W. Siberia ; introd. in N. America.

> ** Fl. glume not longer than its palea.
B. arven'sis, L. : leaves and sheaths hairy, panicle pyramidal effuse, branches horizontal, fl. glumes imbricate equalling the straight awn.
Introduced in various localities from Fife southwards; not naturalized; fl. July-Aug.-Root fibrous or creeping. Stems 1-2 ft., smooth. Leuves $\frac{1}{6}-\frac{1}{4} \mathrm{in}$. broad, flat, short, hairy beneath; sheaths grooved, pubescent; ligule obtuse. Panicle 4-8 in., 3-5 in. broad, branches $5-7$-nate, widespreading, very long, capillary, scaberulous, with a few spikelets towards the tips. Spikelets $\frac{1}{2}$ in., lanceolate, compressed, green or dull violet; axis smooth; empty glumes ovate-oblong, keel scabrid; upper much the largest, acute or shortly awned ; ft. glumes ${ }^{3} \frac{3}{10}$ in., imbricate till quite mature, then rather distant, oblong, 2 -fid, strongly nerved; awn dark.-Distrib. Europe.

## 35. CYNOSU'RUS, L. Dog's-tail Grass.

Spikelets fascicled and forming a unilateral spike or contracted panicle; fascicles composed of 2 or more sessile spikelets, of which the outer (involucre of authors) is deformed, being reduced to subulate pectinately arranged empty glumes; inner terete, 2-5-fld. Empty glumes 2, shorter than the lowest fl., unequal, spiny, herbaceous. Fl. glumes terete, 3 -nerved, mucronate, coriaceous, opaque. Palea with 2 ciliate nerves. Scales with a basal lobe. Stamens 3. Ovary glabrous; styles short terminal, stigmas feathery. Fruit adherent to the fl. glume and palea, Distrib. N. temp. regions; species 5.-Etym. киढ́v and oúpá, dog's tail.

1. C. crista'tus, L.; spike linear unilateral, fl. glumes shortly awned. Dry pastures and banks ; ascending to $1,800 \mathrm{ft}$. in the N. of England ; fl. July-Aug.-Perennial. Root tufted, stoloniferous. Stems tufted, 1-2 ft., terete, strict, smooth, naked above. Leaves almost filiform, slightly hairy; sheaths smooth ; ligule 2-fid. Spike 1-2in., strict, rigid; rachis flexuous ; branches pectinate ; spikelets $\frac{1}{\boldsymbol{1}} \mathrm{in}$., sessile between $6-10$ rigid scabrid serrulate concave segments, and as long as these; empty glumes cuspidate; fl. glumes scabrid above, obscurely 3 -nerved.-Distrib. Europe, N. Africa.
2. C. echina tus, $L$.; panicle dense, awn equalling the fl. glume.

Sandy sea-shores, Channel Is. ; introduced on the British coasts; fl. July.Annual ; larger and more robust than C. cristatus; leaves broad, flat; panicle $\frac{8}{4}-1 \frac{1}{2}$ in., ovoid, lobed, squarrose, shining ; branches $\frac{1}{3}$ in., pectinate; segments of branches $\frac{1}{4} \frac{1}{2}$ in., subulate, slender, scarious, scaberulous; spikelets fewer on each branch, $+\mathbf{i n}$. Empty glumes hyaline; fl. glumes green.--Distrib. Mid. and S. Europe, N. Africa, W. Asia.

## 36. BRACHYPO'DIUM, Beauv.

Spikelets subsessile, distichous, terete, spiked, inserted broadside to the rachis, very many-fld. Empty glumes 2, rarely 1, much shorter than the flowering, straight. Pl. glumes densely imbricate ; awn terminal or 0, nerves converging to the tip. Palea with ciliate nerves. Scales 2, ovate. Stamens 3. Ovary hairy at the top; styles distant, stigmas feathery. Fruit adhering to the palea.-Distrib. Europe, temp. Asia, N. Africa; species 12.-Etym. Bpađús and noס̀óv, from the subsessile spikelets.

1. B. sylvat'icum, R. and S.; root fibrous, leaves broad hirsute, spike drooping, awn equalling its fl. glume.

Copses, hedgerows, \&c. ; ascending to $1,000 \mathrm{ft}$. in the N. of England ; fi. June-July.-Perennial. Stems 1-3 ft., very slender, terete, inclined, leafy. Leaves $\frac{1}{3}-\frac{2}{3} \mathrm{in}$. broad, flat, bright green, ciliate ; sheaths terete; ligule obtuse. Spike 2-6 in.; rachis flattened, smooth, slender. Spikelets 8-18, 1-2 in., appressed, linear, very shortly pedicelled, hirsute, green ; empty glumes cuspidate, strongly $3-5$ nerved; fl. glumes $8-10$, $\frac{1}{3}$ in., linear-oblong, nerves strong, tip acuminate awned ; palea ciliate at the tip, equalling the glume.-Distrib. Europe, N. Africa, N.W. Himalaya.
2. B. pinna'tum, Beauv.; rootstock creeping, leaves narrow involute, spike erect, awn shorter than its fl. glume.
Downs, hedgerows in chalky soil, from York to Devon and Kent; absent from Ireland; fl. July.-Glaucous. Stems 1-3 ft., very slender, terete, naked, smooth. Leaves rigid, almost glabrous, terete, rarely flat; ligule ciliate. Spike 1-6 in., rachis flattened, smooth. Spikelets $\frac{3}{4}-1 \frac{1}{2}$ in., erect, curved away from the rachis, glabrous or nearly so, green and purplish; empty and fl. glumes much as in B. sylvaticum, but glabrous or nearly so, and tips of the latter suddenly contracted into the short awn.-Distrib. Europe, N. Africa, Siberia.

## 37. TRITICUM, $L$.

Spikelets solitary, sessile, distichous, compressed, spiked, inserted broadside to the rachis, 3 -many-fld. Empty glumes 2, shorter than the flowering, unequal. Fl. glumes herbaceous, rigid, many-nerved, awned or not. Palea with ciliate nerves. Scales ovate, entire, ciliate. Stamens 3. Ovary hairy at the top; stigmas distant, subsessile. Fruit grooved, usually adherent to the palea.-Distrib. All temp. climates ; species 20.-Etym. The classical name.

1. T. cani'num, Huds.; root fibrous, stolons 0 , empty glumes 3-5ribbed, fl. glumes 2-5-awned.
Woods, banks, and waste places ; ascends to $1,300 \mathrm{ft}$. in Yorkshire ; fl. July. - Bright green. Stems 1-3 ft., slender. Spike 2-10 in., very slender, often flexuous and nodding ; rachis with scabrid edges. Spikelets $\frac{1}{2} \frac{-3}{4} \mathrm{in}$., green, rather slender ; pedicel very short, pubescent or glabrous; empty glumes scabrid, cuspidate or shortly awned, nerves usually 3, very firm ; fl. glumes linear-lanceolate, smooth except at the 5-nerved tip ; awn scabrid, longer or shorter than the palea.-DisTrib. Europe, Siberia, Himalaya, N. America.
2. T. re'pens, $L$. ; rootstock creeping, empty glumes 5 -ribbed, fi. glumes 4-5 rigid cuspidate or acuminate rarely awned. T. alpinum, Don MS.
Fields and waste places ; ascends to $1,300 \mathrm{ft}$. in the N. of England ; fl. June-Aug.-Excessively variable. Rootstock stout, long, creeping, jointed. Stems 1-4 ft., bent and ascending, smooth, glabrous. Leaves very variable, flat or involute, usually scabrid above and glabrous beneath, sometimes hairy ; sheaths terete; ligule very short. Spike 2-10 in., rigid, slender or robust, strict or curved, not nodding, rachis glabrous or pubescent. Spikelets $\frac{3}{4}-1 \mathrm{in} .$, very rigid ; empty glumes acute obtuse or notched, rigid short points or awns of variable length ; fl. glumes quite similar, but nerved only at the tip, awn nearly as long as the glume.-Distrib. Europe, N. Africa, N. Asia, Himalaya, N. America.-T. caninum, var. bijlorum, Mitt. (T. alpirum, Don MSS.), found on Ben Lawers, and said to want the creoping rootstock, is only T. repens.

Var. 1, littore'um, Schum. (sp.); glaucous, leaves involute, rachis of spike smooth. T. littorale, Host. Intermediate between T. repens and junceun. Sea-shores.-VAR. 2, nemora'le ; rootstock less creeping, spike more slender, rachis often pubescent, spikelets narrower, awns longer. Woods, \&e. Very like T. caninum, but cresping and glumes 5 -ribbed.
3. T. Jun'ceum, L. ; rootstock creeping, spike fragile, spikelets large shining, empty glumes 5-11-ribbed, fl. glumes 4-10 obluse acute notchad or truncate rarely mucronate.
Sandy sea-shores ; fl. July-Aug. -Often glaucous, rigid, forming dense masses.
Rootstock stout, extensively creeping. Stems bent below, ascending, smooth, sheathed at the base. Leaves coriaceous, involute, pubescent above, glabrous beneath; sheaths smooth, rather inflated; ligule short. Spike 24 in ., stout, curved ; rachis very stout, smooth. Spieielets $\frac{3}{4}-1 \frac{1}{4} \mathrm{in}$., distant, very stout, pale, rigidly coriaceous, smooth, shining; empty glumes strongly or faintly nerved ; flowering obscurely so.-Distrib. Europe, N. Africa, N. America?-A most variable grass. The above diagnosis refers to its more typical state; the following sub-species diverge towards T. repens, var. littoreum, under which they had best perhaps be placed.
Sub-sp. ACU'TUM, DC. (sp.); ascending, leaves scabrid, empty glumes 5-7ribbed obtuse, flowering 5-8 obtuse mucronate or shortly awned.
Sub-sp. pungens, Pers. (sp.) ; suberect, leaves very scabrid pungent, spikelets much smaller, empty glumes shorter stoutly 7-9-ribbed, flowering 5-12 acute.

## 38. LO'LIUM, L. RIE-GRASS.

Characters of Triticum, but upper empty glume absent except in the terminal spikelet; lower persistent, facing the rachis.-Distrib. N. temp. regions ; species 4.-Etym. An old Latin name.

1. L. peren'ne, $L$.; rootstock perennial, empty glume shorter than the 8-15-fld. spikelet, awns short or 0 .
Waste places ; ascending to $1,600 \mathrm{ft}$. in the N. of England; fl. May-June.Rort fibrous, stolons leafy. Stems 18 in ., bent below, ascending, smooth, slightly compressed. Leaves flat, edges and upper surface seabrid; sheaths smooth, compressed ; ligule short. Sypike 4-10 in., strict, very slender; rachis smooth, channelled on one side. Spikelets $\frac{1}{3}-\frac{1}{2} \mathrm{in}$. (much longer in var. italicum), quite smooth, shining ; empty glumes strongly ribbed, linear-lanceolate, fl. glume linear-oblong, terete, obtuse or cuspidate or awned, ribbed.-Distrib. Europe, N. Africa, W. Asia ; introd. in N. America. -L. italicum, A. Br.; L. multiforum, Lamk. ; and L. perenne, var. aristutum, are cultivated annual or biennial forms of this species, with many flowers, not known in a wild state.
2. L. temulen'tum, L.; annual, empty glume equalling or exceeding the 5-7-fld. spikelets, awn long. Darnel.
Corn-fields, from Isla and Elgin southwards ; a colonist, Watson; fl. June-Aug.-Very similar to $L$. perenne, but always annual, without stolons, empty glume longer, and flowering glumes more turgid.-Distrib. Europe, N. Africa, W. Siberia, India ; introd. in N. America.-Very porsonous.
Var. arven'se, With. (sp.); awn short or 0. L. linicola, Sond.

## 39. LEPTU'RUS, $B r$.

Spikelets solitary, sessile, distichous, alternate in a small spike, placerl broadside to and in excavations of the jointed rachis, 1 -fld. Empty glumes 2 (rarely 1) enclosing the flowering, equal, hard, coriaceous, ribbed, placed in front of the spikelet, except in the terminal one. Fl. glume keeled. Polea 2-nerved. Scales glabrous, entire. Stamens 3. Ovary glabrous; stigmas sessile distant and terminal, feathery. Fruit free.-Distrib. Europe, N. and S. Africa, Australia; species 7.-Etym. $\lambda \in \pi \tau$ ós and ò̀pd, from the slender tail-like spikes.

1. L. filifor'mis, Trin. ; annual, glabrous, spike slender.

Waste places by the sea, from Linlithgow southwards; all round Ireland ; fl. July.-Root fibrous. Stems 4-10 in., bent or curved below, ascending, stout or slender, shining, terete, leafy. Leaves short, coriacoous, scaberulous, soon involute ; sheaths slightly compressed, smooth, upper inflated; ligule very short, auricled. Spike 2-6 in., straight or curved, short or long ; rachis rigid, grooved, hollowed on one side. Spikelets $\frac{1}{2}$ in., green, appressed or spreading; empty glumes rather oblique, linear-oblong, pointed; fl. glumes with 1 green nerve; palea with glabrous keels.-Distrib. Europe from Gothland southwards, excl. Russia, N. Africa.
VAR. 1, filifor'mis proper; stem and spike slender, the latter nearly straight.Var. 2, incurva'tus, Trin. (sp.), stem and spike stouter, the latter strongly curved.

## 40. ELi'yMus, $L$. Lyme Grass.

Spikelets 2-3-nate, sessile, distichous, compressed, spiked, inserted broadside to the rachis, 2-7-fld. Empty glumes 2, equalling or exceeding the flowering, equal, placed in front of the spikelet. Fl. glumes 5 -nerved, coriaceous, awned or not. Palea with 2 ciliate keels. Scales ovate, usually ciliate. Stamens 3. Ovary hirsute; stigmas sessile distant feathery. Fruit alnate to the fl. glume and palea.-Distrib. N. temp. regions; species 22.-Etym. é $\lambda$ úw, the fruit being rolled up in the palea.

1. E. arena'rius, L. ; fl. glumes rigid acuminate, awn 0.

Sandy sea-shores, from Essex and N. Wales northwards ; fl. July.-Perennial, g aucous. Rootstock stout, creeping, stoloniferous. Stems 3-6 ft., very stout, smooth, terete. Leaves rigid, strict, pungent, $\frac{1}{3}-\frac{2}{3} \mathrm{in}$. diam. ; sheaths smooth, grooved ; ligule very short. Spike 6-12 in., stout, strict, rachis flexuous, plano-convex, hirsute. Spikelets 1 in., imbricate, appressed ; axis stout, pubescent ; empty glumes linear-lanceolate, purplish ; fli. glumes 1-3, lanceolate, ciliate and hirsute, keeled towards the cuspidate tip; palea as long as the glume.-Distrib. Europe, N. Asia, N. America.

## 41. HOR'DEUM, L. Barley.

Spikelets 3-nate, subsessile, distichous, compressed, spiked, inserted broadside to the rachis, 1 -fld., with often the subulate rudiment of a 2 d fl. glume ; lateral spikelets, rarely the central, male or 2 -sexual. Empty glumes 2, exceeding the flowering or not, equal, collaterally placed in front of the spikelet, awned. Fl. glume awned. Palea as long, narrow, with 2 keels. Scales 2, ciliate. Ovary hirsute; stigmas 2, subsessile, feathery. Fruit adherent to the palea.-Distrib. N. temp. and warm regions, S. America; species 10.- Etym. The old Latin name.

* Floners of lateral spikelets 2-sexual, of middle male.

1. H. sylvat'icum, Huds.; perennial, spike subterete, empty glumes setaceous scabrid. Elymus curopœus, L.
Copses and woods in chalky soil, from Chester and Northumberland to Wilts and Kent; Dublin (native?) only in Ireland ; fl. June-July.-Perennial, bright green. Stems 1-3 ft., strict, erect, smooth. Leaves $\frac{1}{3} \frac{2}{3} \mathrm{in}$. broad, flat, thin, scaberulous; sheaths hispid, hairs reflexed ; ligule very short. Spikes 2-4 in., strict, erect, terete, green. Spikelets $\frac{3}{4}$ in., erect, subsessile ; empty glumes subulate, awned, scabrid, 3 -nerved ; f. glumes linear-oblong, dorsally compressed, scabrid, shorter than the straight flexuous awn, nerved towards the tip; palea with smooth keels. Fruit very narrow.-Distrib.
Europe from Gothland to Spain, Italy, and Russia.
** Lateral spikelets flowerless or mule, middle 2 -sexual.
2. H. praten'se, Huds. ; perennial, spike compressed, outer empty glume setaceous scabrid.
Wet meadows, \&cc. ; E. of Scotland from Forfar and Perth to Devon and Kent; S. and E. of Ireland, local ; fl. June-July.-Rootstock creeping. Stems very slender, 1-2 ft., terete, scabrid above. Leaves $\frac{1}{\frac{1}{-}-\frac{1}{b}} \mathrm{in}$., narrow, flat, at length involute, scabrid above, hairy beneath, as are the narrow sheaths; ligule very short. Sprike $1-3 \mathrm{in}$., $\frac{1-\frac{1}{2}}{} \mathrm{in}$. broad, inclined, linear, yellow-green. Spikelets with the awns $\frac{\pi}{3}$ in., rather spreading, scabrid all over, not ciliate; fl. glumes terete, smooth, about equalling the awn, obscurely nerved; palea as long, acute, keels not ciliate.-Distrib. Europe from Gothland to spain and Russia, Siberia, Dahuria, N. W. India, N. America.
3. H. muri'num, $L$. ; annual, spike compressed, outer empty glume of the mid. spikelet lanceolate ciliate, of the lateral setaceous scabrid. Waybent, Barley-grass.
Waste places, E. of Scotland from Kincardine to Kent and Cornwall ; S. and E. of Ireland, very rare; fl. June-July.-Root fibrous. Stems ascending, 6-18 in., smooth, glabrous. Leaves small, narrow, scabrid ; sheaths inflated, glabrous ; ligule very short. Spikes $1 \frac{1}{2}-2$ in., stout, inclined, green. Spukiwlets 1 in ., densely imbricate ; empty glumes filiform; fl. glumes lanceolate, flattened, much shorter than the straight awn ; palea with distantly ciliate keels.-Distrib. Europe from Gothland southwards, N. Africa.
4. H. marit'imum, With.; annual, spike subterete, empty glumes scabrid, upper of the mid. spikelet $\frac{1}{8}$-lanceolate, the rest setaceous. Squirrel-tail Grass.
Waste maritime localities, from Chester and Durham southwards; absent from Ireland; fl. June.-Stems 6-12 in., bent below, then erect, terete, smooth, leafy. Leaves short, straight, narrow, flat, glaucous, scabrid; lower sheaths pubescent, upper inflated; ligule very short. Spuke 1-2 in., stout, erect, subterete, at length yellow-brown. Spikelets $\frac{1}{1} \mathrm{in}$. without the awns, rather spreading, rigid; larger empty glume of mid. spikelet green with searious margins, shorter than the rigid awn ; fl. glume lanceolate, flattened, about equalling the rigid awn.-Distrib. Europe from Denmark southwards, N. Africa.

# Class III. ACOTYLE'DONES or CRYPTOGAMS. 

Division I. VASCULA'RES.

## Order I. FIL'ices.

Herbs, rarely shrubby or arborescent, with fibrous roots, or perennial short or loug and creeping rootstocks. Leaves (fronds) tufted or alternate on the rootstock, simple pinnatifid or 1-4-pinnate, usually circinate in vernation ; petiole (stipes) sometimes jointed at the base and rachis grooved on the upper surface. Fructification of microscopic spores, contained in usually minute capsules that are collected in masses (soni) on the under surface or edge of the frond, or rarely on separate fronds or parts of the frond, and are naked or covered with an involucre formed of or upon the margin or back of the frond. Capsules membranous, sessile or stalked, often mixed with jointed club-shaped hairs or imperfect capsules. Spores usually obtusely 4 -hedral. -Distrib. Chiefly humid temp. and trop. regions; genera 75 ; species 2,500.-Affinities. With Lycopodiacee.
In germination the spore bursts, and develops a flat cellular scale (prothal-
lus), on the under surface of which are formed cavities some containing male and some female organs. The male cavities (antheridia) contain spermcells (spermatozoids or antherozoids), which enclose a spiral filament. The female cavities (archegonia) contain a solitary free germ-cell. The antherozoids find their way into the archegonia and fertilize the germ-cell, which thereupon develops into a plant, the prothallus withering away.
Tribe I. HYMENOPHYL'LE.E. Frond very membranous, translucent, reticulate. Involucre 2 -valved, urceolate or 2 -lipped. Capsules minute, membranous, reticulate, sessile on a clavate or filiform receptacle, girt by a complete horizontal or oblique ring. Vernation circinate.
Involucre 2-valved

1. Hymenophyllum.

Involucre urceolate ..........................................................2. Trichomanes.
Tribe II. polypódiefe. Frond more or less coriaceous, opaque. Involucre marginal or dorsal or 0 . Capsules minute, membranous, reticulate, not raised on an elevated receptacle, stalked, partially girt by a vertical ring, bursting transversely. Vernation circinate.

* Sori marginal ; involucre continuous with the reflexed or recurved margin of the frond.

Involucre hooded, on one side of the sorus

10. Cystopteris.
Involucre orbicular, peltate, superior ..... 11. Aspidium.
Involucre reniform, superior 12. Nephrodium.
**** Sori dorsal; 0 involucre (see Ceterach under Asplexiume).
Sori globose or oblong. 13. Polypodium.
Sori linear 14. Gymnogramme.Tribe III. OSmUN'de平. Frond coriaceous or membranous. Incolucre 0.Capsules sessile or shortly stalked, vertically 2 -valved, with a short lateralor subterminal striate areola. Vernation circinate ...........15. Osmunda.
Tribe IV. Ophioglos'seze. Capsules large, 2-valved, without a ring orareola, coriaccous, in spikes or panicles. Vernution straight.
Frond ovate, simple. Capsules spiked 16. Ophioglossum.
Frond pinnate. Capsules panicled ..... 17. Botrychium.
11. HYMENOPHYL'Lum, Sm. Filmy-fern.

Rootstock filiform or capillary, creeping. Fronds usually matted and 2-4-pinnatifid or -pinnate, pellucid, reticulate; segments with a midrib ; veins 0 . Sori marginal, axillary or terminal ; involucre free or sunk in the frond, 2 -valved or 2 -lipped, opening outwards; capsules sessile on a columuar receptacle; ring complete, oblique.-Distrib. Chiefly trop. and
 branous fronds.

1. H. tunbridgen'se, $S m$.; frond ovate pinnate below pinnatifid above, pinnæ spreading spinulose-serrate, lips of involucre toothed.
Moist shaded rocks or copses, from Mull and Argyle southwards, and in Ire-
land, rare ; Channel Is. ; ascends to 1,000 ft. in Cornwall ; frt. June-July.--
Rootstocks capillary, interlaced. Stipes 1-2 in., winged above. Frond 1-3 in.,
glabrous ; pinnæ distichous, flabellately pinnatifid, lobes linear ; involucre solitary, axillary, suborbicular, lips strongly irregularly toothed.-DIsTR1B. Belgium, France, Germany, Italy, Canaries, S. temp. regions.
2. H. unilatera'le, Willd.; frond oblong pinnate below or throughout, pinnules decurved spinulose-serrate, lips of involucre entire. II. Wilsoni, Hook.
Shaded rocks and copses, extending to Orkney and Shetland, and in Ireland; ascending to $2,800 \mathrm{ft}$. in the Hebrides ; fit. June-July.-Very near $H$. tunbridgense, and perhaps only a sub-species, but more rigid, darker green; involucre more ovoid and turgid ; pinne pinnatifid chiefly on the upper side.-Distrib. As $H$. tunbridgense.

## 2. TRICHOM'ANES, $L$. Bristle-fern.

Rootstock creeping or tufted, stout or slender. Fronds erect or pendulous, simple pinnate or $1-4$-pinnatifid, usually pellucid, reticulate; segments with 1 stout simple or forked midrib. Sori marginal, axile or terminal ; involucre elongate, free or sunk in the frond, tubular or campanulate, mouth entire or 2 -lipped, opening outwards; capsules sessile on a long often exserted receptacle.-Distmib. Chiefly trop. and damp warm climates ; species 78.-Етум. Obscure.

1. T. radicans, $S w$.; rootstock creeping, frond $2-3$-pinnatifid. Wet shaded rocks, S. and S.W. of Ireland, local ; formerly at Bingley, York-
shire ; lately found in Wales; frt. July-Sept. - Rootstock slender, wiry, extensively creeping, tomentose. Stipes 2-6 in., stout, wiry, ascending, naked below, winged above. Frond 4-12 in., membranous, firm ; rachis winged ; lower pinnæ 1-4 in., rhomboid-ovate; pinnules the same shape, pinnatifid, toothed, nerves 1 to each segment. Sori lateral, 1-4 to each pinnule; tube of involucre short, lips small ; receptacle exserted.-Distrib. W. Europe, trop. Africa and America, Himalaya, Japan, Polynesia.
Var. 1, speciosum, Willd. (sp.) ; fronds deltoid, involucre scarcely winged. T. brevisetum, Br.; Hymenophyllum alatum, Sm.-VAR. 2, Andrend'sii, Newm. (sp.); frond lanceolate, involucres many winged, receptacle larger. Kerry.

## 3. adian'tum, L. Maiden-hair.

Rootstock tufted or creeping. Fronds compound, 2-4-pinnate, rarely simple; rachis and petioles capillary; veins forked or netted. Sori rounded or oblong, parallel with and on the margin; involucre formed of the reflexed often kidney-shaped coriaceous margin of the frond, opening inwards, surface veined.-Distrib. All temp. and hot climates ; species 62. -Etym. The old Greek name.

1. A. Capil'lus-Ven'eris, L.; frond 3-4-pinnate, pinnules cuneate lobed crenate glabrous.
Damp rocks, walls, \&cc., especially near the sea, rare and local, Dorset to Cornwall, I. of Man, Glamorgan; W. of Ireland, local ; frt. May-Sept.Rootstock creeping, scaly. Stipes 4-9 in., slender, black, polished, naked. Frond 4-12 in., ovate, with a short terminal and many spreading capillary branches, the lower pinnate; pinnules $\frac{1}{2}-1$ in., membranous, outer edge rounded; petioles $\frac{1}{4} \mathrm{in}$.; veins repeatedly forked. Sori in the crenatures of the pinnules; involucre subreniform.-Distrib. Europe from France southwards, W. Asia, N. S. and trop. Africa, W. Siberia, India, Himalaya, trop. and subtrop. America, Polynesia.

## 4. ptéris, L. Brake or Bracken.

Rootstock usually creeping. Fronds various; veins free, forked or netted. Sori continuous; involucre scarious or membranous, confluent with the recurved margin of the frond, not recurved in age.-Distrib. All regions; species 80 .-Etym. $\pi \tau \epsilon \rho o{ }^{\nu}$, from the wing-like fronds.

1. P. aquili'na, $L$.; frond coriaceous $3-4$-pinnate, veins free.

Forests, heaths, moors, \&cc.; ascending to nearly $2,000 \mathrm{ft}$. in the Highlands ; frt. July-Aug.-Rootstock stout, subterranean, extensively creeping. Stipes 1-6 ft., stout, erect, pale, dark at the base. Frond $2-3 \mathrm{ft}$.; rachis glabrous or pubescent; upper pinne simple, next cut into linear pinnules, lower petioled, 1 ft . or more, again pinnate; pinnules 1 in ., sessile, auricled at the base; veins close, $1-2$-forked. Involucre glabrous villous or ciliate, sometimes double, inner very narrow.-Distrib. Arctic Europe and all temp. and many trop. regions.

## 5. CRyptogram'me, Br. Parsley-fern, Rock-brakr.

Rootstock tufted, often elongate. Fronds, outer barren, inner fertile, 2-4 pinnatifid; veins forked, free. Sori terminal on the veins, subglobnse, afterwards confluent along the margins of the fertile pinnules; involucre membranous, continuous with the recurved margin of the frond, spreading
in age.-Distrib. N. temp. and arctic regions, W. Asia, Himalaya; species 1.-Etym. кри́лтos and $\gamma \rho a \mu \mu \dot{\eta}$, from the concealed sori.

1. C. cris'pa, $B r$. ; fertile pinnules fusiform. Allosorus, Bernh.

Loose stony places in mt. districts, from Harris and Sutherland to N. Devon; ascending to nearly $3,500 \mathrm{ft}$. in the Highlands; E. and N. E. of lrelund, very rare ; frt. June-July.-Rootstock scaly, clothed with broken bases of fronds. Stipes of barren fronds 1-2 in., of fertile 2-5 in., slender, naked, pale brown. Fronds deltoid-ovate, submembranous; barren 2 -pinnate, pinnules 2-3-pinnatifid, cuneate or oblong, 2-3-toothed ; fertile 2-3-pinnate; pinnules fusiform or oblong-lanceolate, obtuse, entire, subpetioled.

## 6. lomária, Willd. Hard-fern.

Rootstock usually short or creeping. Fronds tufted, of 2 kinds; outer barren or fertile below only; inner fertile; veins free, simple or forked. Sori linear, close to the margin, continuous round the pimnule, often covering its lower surface ; involucre linear, close to and parallel with the margin, opening inwards, scarious.-Distrib. Trop. and temp. chiefly South regions; species 40.-Етум. $\lambda \omega \mu \alpha$, from the marginal sori.

## 1. L. Spicant, Desv.; barren fronds narrow-lanceolate pinnatifid above

 piunate below. Blechnum boreale, Sw.Heaths, woods, banks, \&c.; ascending to nearly 2,000 ft. in the Highlands ; frt. July-Aug.-Rootstock stout, creeping, scaly. Stipes of barren fronds $2-3 \mathrm{in}$., of fertile 6-9 in., polished, red-brown. Fronds ereet or spreading ; barren 6-9 in., narrowed to the base, coriaceous, green, glabrous ; pinnules $\frac{1}{2}-\frac{3}{3} \mathrm{in}$., linear-oblong, sessile by a broad base, obtuse, quite entire, sinus narrow, veins inconspicuous ; fertile pinnate, pinnæ distant, falcate, narrow, obtuse, dilated at the base, lower minute very distant. Involucre close to the margin in a young state.-Distrib. Europe (Arctic), Canaries, N.E. Asia, Japan, N.W. America.

## 7. ASPle'NiUM, $L$. Spleenwort.

Rootstock usually short, tufted. Fronds various. Sori dorsal on the veins, linear or oblong, oblique, distant from the midrib, except when the frond is much divided ; involucre oblong or linear, membranous, laterally attached to the vein, opening towards the midrib.-Distrib. All climates but very cold; species 280.-Етум. a and $\sigma \pi \lambda \eta \dot{\eta}$, having been a reputed spleen medicine.

Sub-gen. 1. Asple'nium proper. Involucre straight, narrow, margin entire or cruse. Frond not scaly beseath. Veins free.

* Ultimate pinnules without a distinct múdrib.

1. A. Ru'ta-mura'ria, $L$.; frond oblong or ovate rigid irregularly 2 -pinnate, pinnæ 3-7 obovate-cuncate, tip rounded or truncate toothed.
Walls and rocks ; ascending to nearly $2,000 \mathrm{ft}$. in the Highlands ; frt. June-Oct.-Rootstock stout, shortly creeping, without scales. Stipes tufted 2-4 in., wiry, black below. Fronds 1-2 in., recurved, often deltoid ; pinna petioled, upper entire, lower agrain pinnate ; piunules $\frac{1}{3}-\frac{1}{2}$ in., often rhomboid ; midrib obsolete ; veins flabellate, forked. Sori many, linear-ohlong, 2-5 on each pinnule ; involucre entire or margins erose.-Distrib. Europe (Arctic), N. and S. Africa, Siberia, N. Asia to the N. W. Himalaya, N. America.
2. A. german'icum, Weiss; frond oblong-lanceolate pinnate, pinnæ few distant alternate cuneate-lanceolate simple toothed or lobed. A. alternifolium, Wulf.
Rocks, very rare, Wales, N. of England, Roxburgh, Perth, and Fife; absent from Ireland; frt. June-Sept.-Rootstock densely tufted, creeping, without scales. Stipes $2-4 \mathrm{in}$., very many, slender, erect, black below. Fronds rather flaccid, 2-3 in. ; pinnæ 7-9, $\frac{1}{3}-\frac{3}{4}$ in., very variable in form, sometimes fan-shaped, lower shortly petioled, irregularly $2-3$-lobed; lobes crenate or toothed ; midrib obsolete, veins forked. Sori 2-4 on each pinna or segment, parallel, linear-oblong; involucre entire, at length covering the breadth, but not the length of the segments.-Distrib. Europe, excl. Greece and Turkey.
3. A. septentriona'le, Hull ; frond linear-lanceolate inciso-pinuatifid, pinnæ narrow erect, tips incised.
Walls and rocks, rare, N. Devon, Wales ; ascending to about 3,000 ft. northwards to Perth and Aberdeen; absent from Ireland; frt. June-Oct.Rootstock densely tufted, hardly scaly. Stipes many, 3-4 in., erect, rigid, black below. Frond coriaceous, 1-2 in., lanceolate, simple or cleft into slender subpetioled segments; midrib obsolete; veins forked. Sori 1-4 on each pinna, parallel, at length covering the pinna; involucre narrow.Distrib. Europe, Siberia, W. Asia to the Himalaya, N. America.

## ** Ultimate pinnules with a distinct midrib.

4. A. Trichom'anes, $L$. ; fronds linear pinnate, rachis rigid chesnuthrown, pinnæ $\frac{1}{4} \frac{2}{3}$ in. many subsessile.
Walls and rocks; ascending to nearly $2,000 \mathrm{ft}$. in Wales ; frt. May-Oct.-Rootslock stout, shortly creeping ; scales few, subulate, blackish. Stipes 1-4 in., crowded, naked, polished, red-brown. black below. Frond 6-12 in., rigid; pinnæ 15-40, horizontal, dark green, lower smaller, base obliquely cuneate truncate rounded or auricled, sometimes incised ; midrib subcentral ; veins few, oblique, forked above the middle. Sori oblique, short; involucre pale brown, entire or erose.-Distrib. Europe, N. Africa, N. and W. Asia, N. America, S. temp. regions.-Var. anceps, Sol. (sp.), is simply a larger form.
5. A. vir'ide, Huds.; fronds linear pinnate, rachis green slender, pinnæ $\frac{1}{4}-\frac{1}{2}$ in. many subpetiolate rhombic-ovate crenate.
Wet rocks in mt. districts, from S. Wales northwards ; ascending to nearly $2,800 \mathrm{ft}$. in the Highlands; W. of Ireland; frt. June-Sept.-Allied to A. Trichomanes, of which it may be regarded as an alpine sub-species, distinguished by its more flaceid habit, pale rachis, shorter paler and subpetioled pinnæ.-Distrib. Europe (Arctic), Siberia, W. Asia, N. America.
6. A. mari'num, $L$.; frond oblong or lanceolate coriaceous pinnate below, pinnæ 1-2 in. oblong-ovate crenate.
Sea-cliffs and caves ; frt. June-Sept.- Rootstock stout, inclined, clothed with purple-brown chaffy scales. Stipes 3-6 in., many, red-brown below, stout, polished. Frond 3-10 in., coriaceous ; rachis stout, winged, green ; pinnæ few or many, acute or obtuse, base truncate cuneate or cordate, auricled above, margin sinuate-lobed or serrate, upper confluent ; midrib and forked veins obscure. Sori large, oblique ; involucre coriaceous.-Distrib. France, Spain, Italy, N. Africa, Brit. N. America.
7. A. lanceola'tum, Huds.; frond broadly lanceolate membranous 2 -pinnate, pinnules broad crowded acutely serrate.
Wet rocks, from N. Wales and Gloucester southwards; Cork only in Ireland ; frt. June-Sept.-Rootstock short, stout, elothed with subulate scales. Stipes 2-4 in., chesnut-brown, glossy. Frond 6-9 in., bright green ; pinnæ many, shortly petioled, lower smaller distant, cut to the rachis into broad-acutelytoothed crowded ovate or obovate pinnules ; veins forked. Sori short, at length confluent.-Distrib. Europe from France, Spain, and Germany to Turkey, N. Africa.
8. A. Adian'tum-ni'grum, L.; frond deltoid-ovate $2-3$-pinnate, pinnules petioled inciso-pinnatifid and serrate.
Banks, rocks, and walls ; ascending to $1,900 \mathrm{ft}$. in the Highlands ; frt. JuneOct. - Rootstock stout, oblique, seales subulate. Stipes 6-9 in., alnost naked, polished, chesnut-brown. Fronds 6-12 in., coriaceous; rachis brown below, winged and compressed above ; pinnre polished, ovate-lanceolate, pinnules $\frac{1}{3} \frac{2}{3}$ in.; veins pinnate and forked. Sori copious, short, crowded, at length confluent ; involucre free, pale brown, edyes entire. -Distisib. Europe, N. Africa, W. Siberia, W. Asia to the Himalaya.
Var. acu'tum, Bory (sp.) ; lower pinnæ triangular acuminate, segments narrow, very acute.
Sub-gen. 2. Athy'rium, Roth (gen.). Involucre short, oblong or obliquely reniform, reflexed after dehiscence, margin laciniate. Frond not scaly beneath ; veins free.
9. A. Fi'lix-fom'ina, Bernh.; frond large membranous oblong-lanceolate $2-3$-pinnate, pinnules very many close-set subsessile oblong serrate.
Moist woods, rocky places, \&c.; ascending to 2,200 ft. in the N. of England; frt. July-Aug. - Rootstock stout, ascending, often 6-8 in., clothed with broad ferruginous scales. Stipes $6-12 \mathrm{in}$., stout, copiously scaly below, brittle, brown or pale yellow. Frond 1-5 ft., bright green, flaccid, waving; pinnw sessile, close-set, lanceolate, acuminate, spreading and ascending; pinnules $\frac{1}{2} \frac{3}{4}$ in., sessile, spreading, obtuse, lower pinnatifid, upper coarsely serrate; veins pinnate in the segments. Sori many, small ; involucre variously curved, membranous, very convex, margin fringed or erose.Distrib. Europe (Aretic), N., S., and trop. Africa, N. Asia, W. Asia to the Himalaya, N. and trop. America.
Var. 1, Fi'lix-fuem'ina proper; frond 2 -pinnate, pinnules separate pinnatifid obtuse, basal shorter, sharply toothed at the sides and tip. Athyrium latifolium, Bab.--Var. 2, rhéticum, Roth. (sp.); frond 2-pinnate, pinnules narrow convex toothed, basal longest. Var. convexum, Newm. - Var. 3, mol'le, Roth. (sp.) ; stipes short, frond small pinnate, pinnules oblong flat confluent below loss toothed.-Var. 4, inci'sum, Hoffm. (sp.); frond very large 3 -pinnate, pinnæ broad, lower pinnules again pinnate flat toothed.
SUB-GEN. 3. Ce'terach, Willd. (gen.). Involucre almost obsolete. Frond covered with chaffy scales beneath. Veins anastomosing. Hemidictyum, Presl.
10. A. Ce'terach, L.; frond pinnatifid. Ceterach officinarum, Desv. Rocks and walls, especially in the W. counties, from Argyle and Perth southwards ; and in Ireland ; frt. April-Sept.-Rootstock short, stout. Stipes 1-3 in., wiry, blackish, chaffy. Frond 4-6 in., erect or spreading, leathery,
linear-lanceolate or oblong, bright opaque green above, beneath densely clothed with rusty ovate toothed scales ; segments $\frac{1}{3}-\frac{1}{2}$ in., horizontal, broadly ovate or oblong, quite entire, lower segments free; sinus broad, deep, rounded. Sori linear, hidden under the scales; involucre a very narrow membrane, or a mere ridge on the swollen nerve.-Distrib. Europe from Belgium southwards, N. Africa, W. Asia to the N.W. Himalaya.

## 8. SCOLOPEN'DRIUM, $S w$. Hart's-tongue.

Rootstock stout, short, inclined. Fronds tufted, simple, coriaceous; veins free or anastomosing. Sori linear on opposite contiguous veins, almost confluent; involucre linear, attached to the vein, those of the contiguous sori opening opposite one another.-Distrib. Temp. and trop. regions; species 9.-Етум. The old Greek name.

1. S. vulga're, Sm.; frond oblong-ligulate, base cordate.

Hedgebanks, rocks, copses, \&c.; frt. July-Aug.-Rootstock very stout and stipes and often midrib clothed with subulate scales. Stipes very stout, 4-8 in. Fronds 6-18 in., broadest in the middle, coriaceous, flaceid, bright green ; basal lobes usually auricled, converging ; margin undulate ; midrib stout, veins in groups of 2-4, indistinct, free or casually anastomosing, horizontal. Sori parallel, at right angles to the midrib, very variable in length and number.-Distrib. Europe from Gothland southwards, N. Africa, W. Siberia, Japan, W. Asia, N. W. America. - A multitude of varieties of this plant are cultivated, presenting a wonderful series of interesting variations from the normal state of the plant.

## 9. WOOD'SIA, Br.

Rootstock short, tufted. Stipes usually articulate above the base. Fronds pinnate. Sori glohose : involucre inferior, membranous, at first calyciform, then usually breaking up into capillary segments.-Distrib. Arctic and N. temp. regions, Andes, S. Africa; species 14.-Etym. J. Woods, an eminent English botanist.

1. W. hyperbo'rea, $B r$.; frond linear-lanceolate pinnate, pinnæ ovatecordate with few broad entire lobes.
Wet alpine rocks of Carnarvon and Perth, alt. 2,000-3,000 ft.; absent from Ireland ; fl. July-Aug. - Rootstock stout, subelongate. Fronds 3-6 in., densely tufted. Stipes shining, fragile at the base, clothed with ferruginous scales. Pinnoe subdistant, $\frac{1}{2} \frac{1}{2}$ in., pubescent and ciliate ; veins simple and forked. Sori 3-5 on each lobe.-Distrib. Aretic, N. and Alps of Mid. Europe, N.E. Asia, Himalaya, N. America.
2. W. ilven'sis, $B r$.; frond broadly lanceolate, pinnæ ovate-oblong obtuse deeply pinnatifid with many oblong subcrenate lobes.
Wet alpine rocks, from N. Wales and Durham to Dumfries, Perth, and Forfar ; absent from Ireland; frt. July-Sept.-Very nearly allied to W. hayperborea, but more erect and sealy ; pinnæ narrower, more deeply divided.Distrib. Alps of Scandinavia (Aretic), S. Germany, N. Asia, Himalaya, N. America.-Probably a subspecies of $W$. hyperborea.

## 10. CYSTOP'teris, Bernh. Bladder-fern.

Delicate flaccid ferns. Rootstock short or creeping. Fronds tufted or scattered, 1-4-pinnate; veins pinnate or forked, venules free. Sori small,
dorsal on the middle of a venule, globose; involucre membranous, attached by a broad base to the venule below the sorus, ovate, convex, acute, at length reflexed.-Distrib. Cool damp regions; species 5.-Etym. кíбтis and $\pi \tau \eta \rho$ is, from the bladder-like involucre.

1. C. frag'ilis, Bernh.; rootstock tufted, frond ovate-lanceolate 1-2pinnate, pinnæ deltoid-ovate.
Rocks and walls in mountain districts, from Sussex and Kent northwards; ascending to nearly $4,000 \mathrm{ft}$. in the Highlands; frt. July-Aug.-Rootstock densely clothed with pale brown lanceolate membranous scales. Stipes 2-4 in., brittle. Frond $4-8 \mathrm{in}$. ; rachis slightly winged above, larger pinnæ $1-1 \frac{1}{2}$ in., lobes or teeth obtuse or acute. Nori $2-12$ on each segment.-Disтrib. Europe (Arctic), N. Africa, N. and W. Asia, N. America, trop. mts. and S. temp. regions.
Sub-sp. FRAG'ILIS proper ; fronds broadly lanceolate, pinnæ obovate or lanceolate, segments incised or pinnatifid, sori distant from the margin.
Sub-sp. denta'ta, Hook. (sp.); fronds sub-2-pinnate, pinnæ ovate-lanceolate obtuse obtusely unequally toothed, sori submarginal.
Sub-sp. Dickiea'Na, Sim (sp.) ; frond ovate-oblong obtuse membranous, pinnæ ovate obtuse subdeflexed, segments broad crowded obtuse crenate.
2. C. montána, Link; rootstock creeping, frond deltoid 3-4-pinnate, pinnæ and pinnules spreading.
Alpine wet rocks, alt. $3,600 \mathrm{ft}$., very rare ; Perth, Forfar, and Aberdeen; absent from Ireland; frt. July-Aug.-Rootstock widely creeping, sparingly scaly. Stipes 6-9 in., very slender. Frond $4-6 \mathrm{in}$., as broad as long, lowest pinnæ 1-1 $\frac{1}{2}$ in., segments cut to the rachis, deeply sharply toothed, especially towards the tip. Sori small, 18-24 on the lowest pinnules. Involucre cut at the edge.-Distrib. Arctic and alpine regions of Mid. and S. Europe (excl. Russia), N.E. Asia, Rocky Mts., Canada.

## 11. ASPId'tum, Sw. Shield-fern.

Habit various. Sori dorsal, globose; involucre superior, orbicular, peltate. - Distrib. All regions; species 55. - ETYM. d $\sigma \pi$ is a shield, from the form of the involucre. -The British species belong to the section Polystichum, having free veins.

1. A. Lonchi'tis, $S w$. ; frond linear-oblong pinnate.

Clefts of Alpine rocks and amongst large stones, from N. Wales and York northwards ; ascends to $3,200 \mathrm{ft}$. in the Highlands; W. and N.W. of Ireland; frt. June-Aug.-Rootstock densely tufted, oblique, scaly. Fronds densely tufted, 6-18 in., coriaceous, bright green, glabrous except the scaly short stout stipes and rachis and veins beneath. Pinno many, $\frac{1}{2} 1 \mathrm{in}$., narrow-ovate, base auricled and obliquely rhomboid, falcate, acuminate, spinulose-serrate. Sori in 2-3 rows on each side the midrib.-Distrib. Europe (Arctic), Siberia, Dahuria, W. Asia, Himalaya, N. America.
2. A. aculea'tum, Sw. ; frond ovate-lanceolate 2-3-pinnate.

Woods, shaded hedgebanks, \&c. from Skye and Ross southwards; ascending to nearly $2,500 \mathrm{ft}$. in Yorkshire ; frt. July-Aug. - Rootstock short, stout, and stipes and rachis densely clothed with ferruginous scales. Frond 6-12 in., sealy beneath ; lower pinnee 4-6 in., close-set, lanceolate; pinnules obliquely rhomboid-ovate auricled, teeth mucronate or awned. Sori 1 -
seriate on each side the midrib, dorsal on the veins.-Distrib. Europe from Belgium southwards, W. Asia, N. America, S. terap. regions.
Sub-sp. Loba'tom, $S v$. ; frond 2 -pinnate, pinnules very rigid sessile decurrent confluent below, upper basal longest.-Var. lonchitidoides ; narrower, approaching A. Lonchitis.
Sub-sp. ACULEA'TUM proper ; rather flaccid, pinnules sessile, lower free, serratures spinulose.
Sub-sp. angula're, Willd.; submembranous, pinnules small petioled lax with large awned teeth.

## 12. NEPHRO'DIUM, Rich.

Sori subglobose, dorsal or terminal on the venules; involucre reniform, superior, attached by the sinus.-Distrib. All regions; species 224. -Etym. $\boldsymbol{\nu} \in \phi$ pós, from the kidney-shaped involucres. -The British species all belong to the sub-genus Lastrea, Presl, with free veins.

1. N. Fi'lix-mas, Rich.; rootstock tufted, stipes and rachis with lanceolate scales, frond sub-2-pinnate (rarely pinnate), pinnules deeply obtusely lobed contracted at the base, involucre convex eglandular. Male Fern.
Woods and shaded places ; ascending to 2,400 ft. in Yorkshire ; frt. July-Aug.-Rootstock sometimes 6-10 in., solid and woody. Fronds 1-3 ft., and stipes more or less scaly beneath, oblong-lanceolate, rather rigid; segments entire or serrate at the tip; veins simple or forked. Sori large, 1 -seriate. Involucre smooth, firm.-DIsTRIB. N. temp. regions, India, N., trop., and S. Africa, Andes.

Var. 1, Filix-mas proper; frond 2-pinnate, pinnæ long crowded acuminate, pinnules obtuse serrate, lower distinct. A. cristatum, Sw.-VAR. 2, affi'ne, Fisch. (sp.) ; pinnules oblong-lanceolate incised less crowded (var. incium, Newm.-VAR. 3, Borréri, Newm.; rachis very sealy, frond bright golden yellow, pinnules very obtuse almost truncate less serrate.-Var. 4, abbrevi$a^{\prime}$ tum, DC. (sp.) ; frond pinnate, pinnæ pinnatifid or crenate oblong obtuse with one row of sori along the midrib.
2. N. crista'tum, Rich. ; rootstock shortly creeping, stipes with ovate or oblong scales, rachis naked, frond oblong-lanceolate sub-2-pinnate, pinnules deeply obtusely lobed toothed attached by a broad base, involucre flat eglandular.
Bogs and marshes in the E. counties, Nottingham, Chester, and Lanark; absent from Ireland; frt. Aug.-Rootstock and stout pale stipes clothed with large bullate acuminate pale scales. Frond $1-1 \frac{1}{2} \mathrm{ft}$., narrow, glabrous; pinnæ shortly petioled, oblong, base truncate obtuse apiculate, teeth short not awned, veins forked. Involucre quite glabrous, entire.-Distrib. Europe, W. Siberia, N. America.

Var. uligino'sum, Newm. (sp.); pinnules mare divided, teeth slightly spinulose; (intermediate between spinulosum and cristatum.) Occurs with the typical form.
3. N. rig'idum, Desv.; rootstock tufted and stipes scaly below, frond oblong-lanceolate, lower pinnæ rhomboid lobed to the rachis with mucronate pinnules flat subglandular beneath, involucre gland-ciliate.
Rocks and mountain districts of Lancashire, York, and Westmoreland, rare, ascending to about $1,500 \mathrm{ft}$; absent from Ireland ; frt. July-Aug.-Koot-
stock and stout stipes densely clothed with long concolorous scales. Frond 12-18 in., subglandular beneath, narrow ; pinnæ 2-3 in. ; pinnules acutely toothed, lower with subpinnate venules. Sori close to the midrib. Involucre firm, convex. -Distrib. W. Europe to Greece, W. Asia, N. America.
4. N. spinulo'sum, Desv.; rootstock tufted, stipes sparingly scaly, frond oblong-lanceolate, lower pinnæ subdeltoid, pinnules lobed to the rachis flat, teeth awned, involucre smooth entire or gland-ciliate.
Woods and damp shaded places, from Perth and Inverness southwards ; frt. Aug.-Sept.-Rootstock stout, suberect, and stout pale stipes 1 ft ., sparingly clothed with ovate scales. Fronds 12-18 in., glabrous or glandular beneath; lower pinnæ 2-4 in., subdeltoid; pinnules 1 in ., ovate-lanceolate, pinnatifid to the rachis, lobes oblong spinulose-toothed. Sori chiefly on the upper half of the frond.-Distrib. Europe (Arctic) excl. Turkey and Greece, S. Africa, N.E. Asia, N. America.
Sub-sp. spinitoo'sum proper ; scales ovate concolorous, frond oblong-lanceolate eglandular beneath, pale green, involucre not gland-ciliate.
Sub-sp. dilata'tum, Desv. (sp.); scales denser narrower centre dark brown, frond larger ovate-lanceolate or subdeltoid 2-3-pinnate more deeply cut darker and brighter green, pinnæ closer glandular beneath, involucre evanescent gland-ciliate.-VAR. 1, glandulo'sum, Newm. ; more glandular beneath, frond broader.--Var. 2, na'num, Newm. ; smaller.-Var. 3, Boott'ii, Tuck. (sp.) ; pinnules subentire. Lastrea collina, Newm.-Var. 4, dumeto'rum, Sm. (sp.), connects this with dilatatum. Ascends to $3,700 \mathrm{ft}$. in the Highlands, and extends into W. Asia and E. N. America.
Sub-sp. REMO'tum, Braun (sp.) ; scales lanceolate concolorous extending up the rachis, frond oblong-lanceolate, pinnæ close lanceolate, pinnules ovateoblong cut half away to the rachis eglandular beneath, lower only free, involucre eglandular.-Intermediate between $N$. spinulosum and Filix-mas.
5. N. æ'mulum, Baker ; rootstock tufted, stipes densely scaly below, frond subdeltoid 3 -pinnate, pinnules triangular-ovate concave above glandular beneath, lowest largest spinous-serrate, edges of involucre eglandular. N. foenisecii, Lowe; Lastrea recurva, Bree ; L. æmula, Brack. Hilly districts, local, throughout Great Britain and Ireland; frt. July-Sept. - Hardly distinct from N. spinulosum, frond more triangular and divided, remarkably concave and curved upwards; scales more fimbriate and undulate, glands of involucre sessile.-Distrib. Europe, Madeira, Azores.Whole plant smells of hay.
6. N. Thelyp'teris, Desv.; rootstock creeping, stipes naked, frond lanceolate pinnate, pinnæ deeply pinnatifid, margins entire recurved.
Bogs and marshes, from Forfar to Kent and Dorset ; local and rare in Ireland; frt. July-Aug.-Rootstock long, black, hardly scaly. Stipes 1 ft. , slender, straw-coloured. Frond 1-2 ft., membranous, glabrous or sparingly hairy below ; pinnæ2 2-3 in., spreading, cut to the rachis into narrow oblong entire obtuse lobes; upper venules simple, lower forked. Sori small, dorsal on the venule. Involucre gland-ciliate.-Distrib. Europe, N. and S. and trop. Africa, Siberia, Himalaya, N. America, New Zealand.
7. N. Oreop'teris, Desv.; rootstock short tufted, stipes naked above, frond pinnate, pinnæ pinnatifid glandular boneath, margins entire flat. N. montanum, Baker.

Heaths and pastures in mountain districts ; ascending to nearly $3,000 \mathrm{ft}$. in the Highlands; local and rare in Ireland ; frt. July-Aug.-Rootstock erect or decumbent, and short stout stipes and rachis below scaly. Frond $1 \frac{1}{2}-2 \mathrm{ft}$., broadly oblong-lanceolate ; pinnæ 3-4 in., spreading, sessile, lanceolate, lower smaller more obtuse and distant; lobes flat, obtuse, entire, costa pubescent; lower venules forked. Nori near the margins. Involucre membranous.-Distrib. Europe (excl. Sweden), W. Asia.

## 13. POLYPO'dIUM, L. Polypody.

Ferns of various habit. Fronds simple, lobed, pinnatifid or compound. Sori dorsal, globose ; involucre 0.-Distrib. All regions, but chiefly trop.; species 390 .-Etym. $\pi$ o $\lambda$ ús and $\pi$ oús, from the many stipes of some.

Section 1. Polypo'dium proper. Stipes articulate with the rootstock.

1. P. vulga're, $L$.; rootstock creeping densely scaly, fronds alternate pinnatifid, segments linear-oblong obtuse or acute entire crenate-serrate.
Walls, banks, trees, \&ce. ; ascending to 3,400 ft. in Yorkshire ; frt. June-Sept.-Rootstuck stout; scales pale brown, lanceolate. Stipes stout, 3-4 in. Frond 6-12 in., linear-oblong or ovate-oblong, coriaceous, naked and glabrous; segments $\frac{4-\frac{1}{2}}{} \mathrm{in}$. broad; venules pinnate, tips thickened. Sori large, 1 -seriate, terminal on a lateral venule.-Distrib. Europe, N. and S. Aírica, Siberia, Dahuria, Japan, W. Asia, N. America.
Var. cam'bricum, L. (sp.); segments pinnatifid.
Section 2. Phegop'teris. Stipes not articulate with the rootstock.
2. P. Phegop'teris, L. ; rootstock creeping scaly, fronds alternate pinnate, pinnæ pinnatifid, lowest pair deflexed, segments obtuse ciliate. Damp shaded places in mountain districts, from Sussex and Cornwall northwards ; ascending to nearly $3,500 \mathrm{ft}$. in the Highlands; local in Ireland; frt. June-Aug.-Rootstock long, slender; scales seattered. Stipes 6-9 in., slender, scaly at the base. Frond 6-9 in., subdeltoid, slightly hairy below, rather membranous, pinnate below, pinnatifid above; pinnæ subopposite, elongate, sessile ; lower 2-3 in. ; segments subentire; venules 6-8 on each side, lower forked, tips thickened. Sori near the margin, dorsal on the venules.-Distrib. Europe, N. and W. Asia, N. Ameriea.
3. P. Dryop'teris, L. ; routstock creeping scaly, fronds alternate deltoid 2 -pinnate, pinnæ deeply pinnatifid, segments obtuse suberenate.
Dry shaded places in mountain districts from S. Wales and Gloueester northwards ; ascending to $2,700 \mathrm{ft}$. in the Highlands ; N. of Ireland, very rare ; frt. July-Aug.-Rootstock long and slender; seales orange-brown. Stipes very slender, 6-12 in., scaly towards the base. Frond 6-12 in., thin and flaccid, glabrous; lower pinnæ the largest ; lowest segments sometimes free ; venules forked, tips thickened. Sori submarginal, dorsal on the venules.Distrib. Europe, N. and W. Asia, Himalaya, N. America.
Sub-sp. Dryop'teris proper ; frond glabrous flaccid.
Sub-sp. Robertia'num, Hoffm. (sp.) ; rootstock stouter, frond more coriaceous glandular-pubescent. P. calcareum, Sm. -Limestone rocks from Somerset and Bucks to Westmoreland and Durham ; ascending to $1,200 \mathrm{ft}$. in Northumberland ; absent from Ireland ; extends to Tibet.
4. P. alpes'tre, Hoppe; rootstock stout oblique, frond oblong-lanceolate 2 -pinnate, pinnules deeply pinnatiid, lobes toothed. Pseudachyrium, Newm.

H H 2

Shaded alpine rocks and streams, in Argyle, Perth, Forfar and Sutherland,
from $1,200-3,600 \mathrm{ft}$.; absent from Ireland ; frt. July-Aug. - Rootstock stout, scaly. Stipes 4-6 in., tufted, stout, scaly below. Frond 1-2 ft., herbaceous, glabrous ; pinnæ 3-4 in., lanceolate, deeply pinnatifid, lobes tonthed, rachis nearly naked ; venules pinnate in the lobes. Sori small, 1-4 on each lobe, marginal in the sinus, dorsal on the venule.-Distrib. W. Europe (Aretic), from Lapland to Spain, and E. to Germany and Austria, W. Asia, Greenland, N.W. America.-Closely resembles Asplenium Filixfuemina.
VAR. 1, alpes'tre proper ; stipes short, pinnæ spreading or ascending narrowlanceolate broadest at the base, pinnules crowded.-VAR. 2, hu'mile ( tlecile, Moore), (sp.) ; stipes very short, pinnæ short spreading or deflexed, pinnules rather distant.
14. GYMNOGRAM'ME, Desv.

Fronds of various habit, 1-3-pinnate ; veins free or anastomosing. Somi dorsal, oblong or linear, usually spreading in irregular lines, branched and confluent on or between the veins; involucre 0.-Distrib. Chiefly warm regions; species 84.-Етчм. $\gamma v \mu \nu$ ós and $\gamma \rho a \mu \mu \gamma$, from the naked sori.

## 1. G. leptophyl'la, Desv. ; glabrous, annual, frond 2-3-pinnate.

Moist banks, Jersey ; frt. March-May. - Fronds fragile, 1-3 in., shortly
stipitate, broadly ovate-oblong; inner with longer stipes, narrower, more
fertile; pinnules obovate-cuneate, $2-3$-lobed, lobes obtuse decurrent; veins dichotomous. Sori oblong, simple or confluent.-Distrib. S. Europe, N. and S. Africa, W. Asia, Peninsula of India, W. Indies, Andes, Australia, New Zealand.

## 15. OSMUN'DA, L. FERN-Royal.

Rootstocks often very large, tuberous or massive. Fronds coriaceous, tufted, 1-2-pinnate, some of the pinnæ altered, contracted, and covered with naked confluent sori; veins forked, free. Capsules globose, subsessile, with a short lateral or subterminal striate areola (an incomplete contracted ring).-Distrib. Temp. and trop. regions; species 6.-Etym. After the god Thor (Osmunder).

1. O. rega'lis, L. ; fronds 2 -pinnate fertile at the top.

B ugs, marshy woods, \&ce. ; ascending to nearly $1,000 \mathrm{ft}$. in the N. of England ; frt. June-Aug.-Rootstock large, lohed, densely clothed with matted fibres, many-headed. Stipes 2-10 ft., stout, erect, naked, brown. Frond glabrous; barren pinnæ 3-12 in., sessile or shortly petioled, oblong, obtuse, truncate corlate or auricled at the of cen unequal base, sorrulate ; fertile pinnules subcylindric, lobed.-Distrib. Europe, N. S. and trop. Africa, N. and W. Asia to N.W. Himalaya, China, Japan, N. and trop. America.

## 16. OPHIOGLOS'SUM, L. ADDER'S-TONGLE.

Rootstock short, with fleshy fibrous roots. Fronds consisting of a harren oblong linear or lanceolate reticulately-veined blade, and a fertile flattened distichous spike of opposite confluent globose capsules that burst transversely and are obscurely striate at the top. Spores minute.-DisTRIB. All climates; species 3 or 4.-Еtym. $\delta \phi$ is and $\gamma \lambda \omega \dot{\omega} \sigma \sigma \alpha$, snake's tongue.

## 1. O. vulga'tum, L. ; blade ovate linear or elliptic-oblong.

Damp pastures, banks, woods, \&cc. ; ascending to nearly $1,000 \mathrm{ft}$. in the Lake
district; frt. May-July.-Rootstock not tuberous. Frond 6-9 in., stout or slender. Blade 2-4 in., obscurely petioled, coriaceous, midrib obsolete. S'pike 1-2 in., peduncled; capsules 6-20.-Distrib. Europe, Madeira, W. Asia to the Himalaya, W. Siberia, N. America, S. temp. regions.
Sub-sp. velga'tum proper; blade large ovate or oblong, spike 2-4 in.
Sub-sp. Lusitan'icum, L. (sp.) ; rootstock more tuberous, blade $\frac{1}{2}-1 \mathrm{in}$. oblong or lanceolate, spike $\frac{1}{4} \frac{1}{2}$ in. -Guernsey, frt. January-February.-W. Europe, W. Africa.

## 17. BOTRYCH'IUM, Sw. MOONWORT.

Rootstock small, tuberous; roots of thick fleshy fibres. Fronds consisting of an erect barren 1-4-pinnate flabellately-veined blade, and a fertile panicle, covered on the surface facing the blade with small globose coriaceous capsules which burst transversely. Spores minute.-Distrib. Temp. and trup. regions; species 6.-Етум. Bútpus, from the clustered sori.

1. B. Luna'ria, $S w$.; blade about the middle of the frond pinnate.

Pastures and grassy banks; ascending to $2,700 \mathrm{ft}$. in the Highlands; frt. June-Aug.-Rootstuck tuberous, enclosing at its top the bud of the next year's frond. Frond 3-6 in., stout, terete, fleshy, glabrous; blade $\frac{1}{2}-2 \mathrm{in}$., oblong; pinnæ $\frac{1}{2}$-circular or lunate, close-set, entire, crenate toothed or subpinnatifid. Receptacle $\frac{1}{2}-3$ in., ereet, segments narrow, incurved. Capsules sub-2-seriate on the segments.-Distrib. Europe (Arctic), N. and S. temp. and cold regions.
Vir. ruta'cerm, Sw. (sp.) ; fronds deltord, pinnules 3-4 pairs incised or pinnatifid, lobes linear or cuneate 1-nerved. - Sands of Barry.

## ORDER II. LYCOPODIA'CEFE.

Rootstock running, creeping, or a corm, or 0 . Stem dichotomously branched, usually rigid, leafy throughout, 0 in Isoetes. Leaves imbricate all round, or 2-6-fariously, small, simple, nerveless or 1-nerved. Capsules (sporangia) sessile in the axils of the leaves or of the seales of a terminal or axillary sessile or peduncled cone, $1-3$-celled, of 1 or 2 kinds; 1 , compressed often reniform, 2 -valved, containing microscopic 4 -hedral spores (microspores) ; 2 (when present), larger capsules, containing 3-4 much larger spores (macrospores or oophoridia), marked with 3 radiating lines at the top.-Distrib. All climates ; genera 4-5 ; species 220.-Affinities. With Marsileacece and Filices.

In germination, the macrospores of Selaginella and Isoetes develop a cellular prothallus under the integuments, in the position of the radiating lines; this is extruded, and upon its surface are developed many archegonia along the above lines, one only of which is fertilized. The microspores burst, and emit cells containing each an antherozoid, which, gaining access to the cavity of the archegonium, fertilizes its contained germ-cell, as in Filices. The method of reproduction in Lycopodium is unknown.

[^2]
## 1. LYCOPO'DIUM, $L$. Club-moss.

Perennial. Stem erect prostrate or creeping. Leaves small. Capsules of one kind, coriacenus, flattened, reniform, 1 -eelled, 2 -valved.-Dintrib. Of the Order; species about 50.-Etym. גúkos and roûs, from a fancied resemblance to a wolf"s foot.

## * Stem creeping. Capsules in terminal cones.

## 1. L. clava'tum, L. ; leaves hair-pointed, cones peduncled.

Heaths and moors, from Sussex and Cornwall northwards; ascending to $2,500 \mathrm{ft}$. in Yorkshire ; frt. July-Aug. . Stems 1-3 ft., rigid, flexuous, much branched, densely leafy. Leaves imbricate all round, $\frac{1-1}{4} \mathrm{in}$., subsecund, incurved, linear-oblong or lanceolate, acuminate, hair-point variahle in length. Cones 1-3 in., solitary or in pairs on a rigid erect peduncle covered with minute appressed subulate leaves, cylindric, obtuse ; scalos appressed, broadly ovate or cordate, acuminate. C'apsules orbicular-reniform.-Distrib. Europe (Arctic), N. and S. temp. and cold regions.
2. L. annoti'num, $L$.; leaves acuminate entire or serrate, cones sessile, scales broadly ovate toothed.
Rocks and stony alpine moors, from N. Wales and Leicester northwards; ascending to $2,700 \mathrm{ft}$. in the Highlands; absent from Ireland; frt. June-Aug.-Habit of L.clavatum, but less branched, branches constricted here and there ; leaves more lax, obscurely 5 -farious, somotimes spreading, linearlanceolate; scales of obtuse cone broad, abruptly acuminate.-DISTRIB. Europe (Arctic), W. Asia, Himalaya, N. Asia and America.
3. L. alpi'num, $L$.; leaves 4 -farious lanceolate quite entire, cones sessile, scales broadly ovate subentire.
Open stony moors, heaths, \&c. in alpine distriets, from N. Wales, Somerset, and Derby northwards; ascending to nearly 4,00$) \mathrm{ft}$. in the Highlands; local and rather rare in Ireland ; frt. July-Aug.-Stem 6-18 in., rigid, wiry, flexuous, sparingly leafy ; branches fastigiate, much forked, 4-gonous, ascending or erect. Leaves $\frac{1}{8}-\frac{1}{1}$ in., dark green, appressed, of 2 sizes ; larger (lateral) adnate, subdecurrent, concave, obtuse; smaller shorter, more subulate, free. Cones on ra'her elongate leafy branchos, $\frac{1}{2}-1 \mathrm{in}$., oblong. obtuse, terete.-Distrib. W. Europe (Arctic) from Lapland and Spain to Italy and Austria, N. and W. Asia to the Himalaya, N. America.
4. L. inunda'tum, L. ; leaves secund on the sterile branches subulatelanceolate quite entire, scales of cone subnlate with much-dilated spinous-twothed bases.
Wot heaths and bogs, from Ross southwards, local ; Connemara only in Ireland ; frt. June-Aug.-Sthems short, 2-6 in., closely appressed to the ground. Leaves secund, though inserted all round the stem, dark green, midrib indistinct. Cones 1-3 in., fusiform, on strict erect leafy branches, the leaves of which are erect and not secund ; seales erect, narrow, much longer than the leaves, bases sometimes cordate.-Distrib. Europe, temp. and trop. N. and S. regions.
** Stem decumbent at the base. Capsules axillary in the upper leaves.
5. L. Sela go, L. ; branches stout unifurm in height, leaves subulatelanceolate quite entire.

Moors and heaths in mountain districts, from Sussex and Cornwall northwards ; ascending to ncarly $3,500 \mathrm{ft}$. in the Highlands; frt. June-Aug.Stem stout, rigid, shortly creeping at the base ; branches $2-8$ in., $\frac{1}{3}-\frac{2}{3} \mathrm{in}$. diam., densely leafy, erect, strict, obtuse. Leaves erect, appressed, incurved squarrose or spreading, acuminate, pungent or not; midrib 0 ; upper capsuliferous sometimes yellower.-Distrib. Temp. and cold N. and S. regions.

## 2. SELAGINEL'LA, Beauv.

Capsules of 2 kinds, in terminal cones; 1, minute, oblong or globose, containing microspores; 2, larger $2-4$-valved capsules containing 1-6 macrospores.-Distrib. Chiefly trop. ; species about 150.-Etym. Diminutive of Selago, an old name for Lycopodium.

1. S. selaginoi'des, Gray; decumbent, leaves lax lanceolate and ovate, scales of cone spinulose-ciliate. S. spinosn, Beauv.
Bogs and marshes, from N. Wales northwards, and in Ireland ; ascending to nearly $3,300 \mathrm{ft}$. in the Highlands; frt. July-Aug.-Stems 2-6 in., slender, sparingly branched ; branches aseending. Leaves inserted all round, $\frac{1}{8}-\frac{1}{3} \mathrm{in}$., incurved or squarrose, pale yellow-green, acuminate, midrib obscure. Cones on elongate erect branches, 1-3 in., terete, rather stouter than the branch ; scales erect or spreading, broader and longer than the leaves, with long spinulose teeth. Microspores echinate, in 2 -valved reniform capsules. Macrospores globose in 3-4-valved and -lobed capsules.-Distrib. N. and W. Europe, Siberia, Himalaya, N. America.

## 3. ISOETESS, L. Quillwort.

Aquatic or terrestrial stemless plants. Corm depressed. Leaves long, subulate or filiform, often tubular and septate, base sheathing. Capsules sessile in the axils of the leaves, partially enclosed by and adnate to their sheathing bases, traversed by transverse threads; those of the outer leaves containing globose macrospores, those of the inner oblong 3-gonous microspores. Macrospores with a crustaceous integument, marked on the upper hemisphere with 3 radiating lines, and bursting by 3 valves.-Distrib. Chicfly N. temp. and warm regions ; species 6 or 8. Etym. ̌oos and étos, ever-green; of obscure application.

1. I. lacus'tris, $L$.; aquatic, leaves subulate, macrospores covered with crested ridges or tubercled.
Bottoms of alpine and subalpine lakes, from N. Wales northwards ; ascending to $2,000 \mathrm{ft}$. in the Highlands ; and in Ireland; frt. May-July.-Corm often as big as a hazel-nut. Leaves $10-20,2-6 \mathrm{in}$., rigid, obscurely 4 -gonons, dark green, of 4 septate tubes. Capssele ovoid or globose, partially covered ly the inflexed edges of the sheath. Macrospores tubercled by the protrusion of the inner wall through perforations of the outer. Microspores granular.Distrib. Europe (Arctic) N. of the Alps, W. Siberia, N. America.
Sub-sp. lacus'tris proper ; leaves erect green, capsules $\frac{1}{3}$ covered by the edges of the leaf-sheath, tubercles of macrospore short.
Sub-sp. echinospo'ra, Durieu (sp.) ; leaves spreading paler, capsules almost enclosed in the leaf-sheath, tubercles of macrospore longer more acute.
2. I. Hys'trix, Durieu ; terrestrial, leaves filiform, macrospores obtusely tubercled. I. Duricei, Hook.

Sandy soil, inundated at times, Guernsey ; frt. May-June.-Corm short, stout, subglobose, 1 in . diam., clothed with the old spinescent dark horny leaf-bases, which consist of lateral subulate processes, and an intermediate tooth. Leaves 1-2 in., slender, plano-convex, obscurely tubular, sheath enveloping the capsule. Macrospores white.-Distrib. S. Europe, N. Africa.

## Order III. marsileacerx.

Aquatic plants of various habit. Rootstock or stem creeping. Leaves filiform or bearing 4 obovate leaflets; vernation circinate. Fructification of 2- or more-celled coriaceous oblong or globose capsules (formed of a metamorphosed leaf) placed near or on the rootstock, and containing on parietal placentas many membranous saes, enclosing macrospores and micruspores. -Distrib. Temp. and trop. regions; genera 2 ; species 40.-Affinities. With Lyconodiaceos.

In germination the macrospores develop a prothallus, the archegonia of which are fertilized by the contents of the microspores, as in Lycopodiaces.

## 1. pilulia'ria, $L$. Pillwort.

Rootstock filiform, creeping. Leaves subsolitary, erect, setaceous. Capsutes globose, 2-4-celled, 2-4-valved at the top; cells each with a longitudinal parietal placenta, on which are inserted many pyriform membranous sacs ; sacs in the upper part of the cell full of microspores immersed in mucilage ; those in the lower part contain each one macrospore. Microspores globular, full of antherozoids. Macrospores ovoid, with an outer coat of prismatic cells, pierced by a funnel-shaped opening, through which an inner glassy coat finally protrudes.-Disticib. N. and S. temp. and cold regions; species 3.-Etym. pilula, from the form of the capsule. In germination a prothallus is developed at the top of the protruded portion of the inner coats of the macrospore, which bursts and frees it. After expulsion an archegonium is formed on the prothallus, and fertilization takes place by the contents of the microspore.

1. P. globulif'era, $L$.; leaves setaceous, capsules pubescent.

Edges of lakes and ponds, from Skye and Sutherland southwards; N. E. and W. of Ireland, very rare; frt. June-Aug.-Rootstock or stem 2-6 in., glabrous, cylindric. Leeves 2-4 in., green. Capsules $\frac{1}{4} \mathrm{in}$. diam., ovoid or globose, shortly pedicelled, in the axils of the leaves or on the rootstock, pubescent, brown, 4 -celled.-Distrib. Europe N. of the Alps.

## Order IV. equiseta'cere.

Rootstock creeping. Stems erect, terete, jointed, grooved, hollow except at the joints, and with air-cells in their walls under the grooves, joints terminating in toothed sheaths; teeth corresponding with the ridges; brauches if present arising from the sheath-bases, solid. Capsules 6-9, 1 -celled, on the under surface of the peltate seales of a terminal cone. Spores of one kind, attached to 4 clubbed elastie threads (elaters), which are eoiled round the spore when moist, and uncoil when dry.-Distrib. Chieliy temp. N. regions, a few are sub-trop.; none are high southern;
genus 1 ; species 25. - Affinities. None direct. - Properties. The cuticle abounds in siliceous cells; whence the stems of some are used for polishing.

Germination and impregnation as in Filices; but the spores are usually (functionally) 1 -sexual.

## 1. Equise'tum, $L$. Horse-Tail, Paddock-pipes.

Characters of the Order.-Etym. equus, seta, horse bristle.

> * Fruiting stems simple or rarely branched, succulent; barren appearing later, branched; branches simple.

1. E. arven'se, $L$. ; barren stems $6-19$-grooved, branches spreading, sheaths of fruiting stems distant loose with teeth ribbed to the tip.
Roadsides, banks and fields ; ascends to nearly 2,000 ft. in the N. of England; frt. April. - Burren stems erect or decumbent, slightly scabrid, usually ending in a long naked point; branches crowded, erecto-patent, 4-gonous; fertile stems (rarely with branches) stouter, shorter; sheaths scarious.-Distrib. Europe (Arctic), N. Africa, N. Asia, Himalaya, N. America.
2. E. praten'se, Ehr.; barren stems scabrid 8 -20-grooved, branches spreading, sheaths of fruiting stems close-set, ribs of teeth not reaching the tip. E. umbrosum, Willd.; E. Drummondii, Hook.
Marshes, rare, from Perth and Aberdeen to York and Lancashire ; ascending to $1,200 \mathrm{ft}$. in the N. of England; N. of Ireland, local ; frt. April.Closely allied to $\boldsymbol{E}$. arvense, but greener, less glaucous, more scabrid, with more numerous ribs and branches; the barren stem terminates in an abrupt brúsh of branches as in E. sylvaticum. Barren stems 1-2 ft., sometimes bearing a cone, slender, abrupt; branches simple, slender, usually spreading, 3-4-gonous, sheaths very short; fertile much stouter, sheaths very lax, funnel-shaped. Cones $\frac{3}{4}-1 \frac{1}{2}$ in.-Distrib. Europe (Arctic) N. of the Alps, Italy, Siberia, N. America.
3. E. max'imum, Lamk. ; barren stems 20-40-grooved, branches suberect, sheaths of short fruiting stems close large loose, teeth 2 -ribbed. E. Telmateia, Ehr. ; E. fluviatile, Sm. not L.

Bogs, ditches, \&c. from Skye and Aberdeen southwards; ascending to $1,200 \mathrm{ft}$. in Yorkshire ; frt. April.-Burren stems $3-6 \mathrm{ft} ., \frac{1}{2} \mathrm{in}$. diam.; branches 4-gonous, slender, erecto-patent, sheaths very short; fertile 8-10 in., $\frac{1}{2} \frac{3}{4} \mathrm{in}$. diam. including the large lax sheaths. Cone $2-3 \mathrm{in}$., obtuse.-Distrib. Europe from Denmark southwards, N. Africa, W. Asia, Siberia, N. America.
** Fruiting and barren stems subsimilar, simple or branched.
4. E. sylvat'icum, L. ; stems $10-18$-grooved, branches recurved or deflexed divided, stem-sheaths lax, teeth long obtuse, teeth of branchsheaths 3 -ribbed to the tip.
Copses and hedgebanks, from Devon and Kent northwards ; ascending to $2,700 \mathrm{ft}$. in the Highlands; frt. April-May.-Readily recognized by the elegant appearance of the whorls of compound recurved branches. Stem $1-2 \mathrm{ft}$., nearly smooth. Teeth of branch-sheaths 3-5, large. Cones $\frac{3}{4}-1 \mathrm{in}$., short, ovoid-oblong, obtuse.-Distrib. Europe, N. Asia, N. America.
5. E. palus'tre, L.; stems 5-12-grooved, branches simple, stemsheaths short appressed, teeth acute, tips membranous.

Bogs, marshes and wet sandy places; ascending to $2,500 \mathrm{ft}$. in the Highlands; frt. June-July.-Very variable. Stem 6-18 in., deeply furrowed, branched throughout, slightly rough. Cones short, blunt, those on the branches small.-Distrib. Europe, N. and W. Asia, N. America.
Var. 1, palus'tre proper (or vulgare) ; cones terminating the stem.-Var. 2, polystachyon; cones on the branches also.-Var. alpinum (or subnudum) is a stunted state.
6. E. limo'sum, L. ; stems smooth faintly 10-30 striate, branches simple erect or 0 , sheaths short appressed, teeth short rigid.
Sides of lakes and ditches ; ascending to $2,100 \mathrm{ft}$. in the Highlands; frt. June-July.-Easily distinguiched by the hardly furrowed stems, and close and short sheathis. Stems stout, 1-3 ft., slender, with short suberect branches or none. Cones short, oblong, obtuse.-Distrib. Europe, N. Asia, N. America.
Var. 1, lino'sum proper; smooth, branches short rigid equalling the internodes, cones subsessile.-Var. 2, fturiut'ile, L. (sp.); scaberulous above, branches tapering longer than the internodes, cones peduncled.
7. E. hyema're, L. ; stems seabrid 8-34-grooved, branohes all suhradical or 0 , sheaths white with black tip and base, teeth black with deciduous tips. Dutch Rush.
Marshes in woorls, from Kent and Hereford to Ross and Moray ; rare in Ireland ; frt. July-Aug.-Exsily distinguished by its size, glaucous colour, scabridity, and stems simple or branched at the base only. Stems $1-3 \mathrm{ft}$.; branches simple, grooves shallow. Cones small, conoid, acute.-Distrib. Europe, N. Africa, N. Asia, N. America.
Var. 1, hyema'le proper ; stems perennial or biennial, sheaths close, tip of teeth black.-VAR. 2, paleaceum, Schleich. (sp.) ; stems annual, sheaths loose, teeth truncate, tip white. E. Moor' ei, Newm. Banks near the sea, Wicklow.
8. E. variegatum, Schleich.; steuns filiform more or less seabrid

4-14-grooved, hranches basal, sheaths green below black above, teeth obtuse. apiculate membranous.
Wet places and sandy shores, local, from Ross to Devon ; frt. July-Aug. Usually small. Stems 4-12 in., often decumbent and branching dichotomously below. Sheuths short, rather distant, appressed ; teeth membranous, white, or edges black. Cone small, ovoid, acute.-Distrib. Europe, N. Africa, Siberia, N. America.
Var. 1, variega'tum proper; erect, 1-2 ft., teeth of sheaths short acute. Wet banks, \&'c.-VAR. 2, arena'rium, Newm. (sp.) ; stems decumbent more slender, teeth of sheaths 6-8 cuneate. Sandy shores, from Laneashire northwards.-VAr. 3, Wilso'ni, Newm. (sp.) ; tall, erect, 2-3 ft., teeth of sheaths short obtuse. Watery places.-Var. 4, trachyo'don, Braun (sp.); stem erect or almost decumbent stouter, branches longer flexious, sheaths black, teeth at length white. E. Muckayi, Newm. Damp woods, N.E. Ireland, Scotland.

## APPENDIX.

## EXCLUDED SPECIES.

## DICOTYLEDONS.

## Ranunculacer.

A nemone ranunculoides, L. In plantations only.
Thatictrum majus, Jacq. Confounded with T. tlexuosum.
" nutans, Desf. A S. European species, not known as British.
Ranunculus alpestris, L. Clova Mts., Don ; never confirmed.
" gramineus, L. Said to have been found in Wales a century ago, but not confirmed.
Pcoonia corallina, Retz. Steep Holmes, known since Ray's time, but as an introduced plant only.
Delphinium Consolida, L. Confounded with D. Ajacis; see p. 11.
Berberide.e.
Epimedium alpinum, L. On rock-works, old castle gardens, \&c.
Papaveracee.
Papaver nudicaule, L. W. of Ireland, Giesecke; never confirmed. setigerum, DC. A garden escape in the Fens.
Glaucium phoeniceum, Crantz. Casually introduced into Norfolk. Fumariacete.

Fumaria spicata, L. Authority unknown to me. agraria, Lag. Confounded with a form of $F$. capreolata.
Crucifere.
Vella annua, L. Reported from Salisbury Plain long ago ; never verified.
Hutchinsia alpina, Br. Reported from Ingleborough; never veritied.
Lepidioum hirtum, L. Confounded with L. Smithii. sativum, L. A garden escape.
Clypeola Jonthlaspi, L. Authority unknown to me.
Cardamine bellidifolia, L. Confounded with a form of C. hirsuta.
Erysimum virgatum, Roth. A garden escape. orientale, Br . An alien, casual in various localities.
Alyssum incanum, L.
Malcolmia maritima, Br. Shores of Kent; not native.
Resedaces.
Reseda Phyteuma, L. A casual on ballast heaps, Yorkshire.
Cistinter.
Helicnthemum ledifolium, L. Brean Downs; never confirmed.
Violariete.
Viola epipsila, Led. Confounded with V. palustre.
" stricta, Hornem. Confounded with V. stagnina.

## Frankentaces.

Frankenia pulverulenta, L. Reported from Sussex ; never confirmed.
Caryophyllef.
Silene annulata, Thore. Occurs in flax-fields.
" alpestris, Jacq. One of Don's reputed discoveries ; never confirmed.

Caryophyllee (continued).
Silene Armeria, L. A casual.
" italica, Pers. Between Darenth and Dartford; not wild.
Saponaria Vaccaria, L. A casual in corn-fields.
Cucubalus bucciferus, L. Isle of Dogs; introduced.
Arenaria fastigiata, Sm. Scotch Mts., Don ; never confirmed.
Spergula pentundra, L. Reported to have been found in Ireland ; probably confounded with a Spergularia.
" pilifera, DC. Authority unknown to me.
Buffonia tenuifolia, Sm. Hounslow Heath, Dillenius ; never confirmed.
Paronychies.
Hermaria lirsuta, L. A casual in Warwickshire.
Hypericineas.
Hypericum hircinum, L. A shrubbery plant. " elutum, Ait.
" barbatum, Jacq. Perthshire, Don; never confirmed.
Malvaces.
Malva borealis, Wallm. Reported from Kent ; but never confirmed.
" verticillata, L. Corn-fields in Wales.
" parviftora, L. ; not known as British.
Geraniacee.
Geranium nodosum, L. Garden stray in shrubberies, \&c.
" angulatum, Curt. striutum, L.
Impatiens parveflora, DC. A weed near London, \&cc.

## Celastrinee.

Staphylea pinnata, L. Shrubberies.
Liguminosse.
Coronilla varia, L. Confounded with Hippocrepis, and other plants.
Medicago muricata, Willd. Confounded with M. denticulata.
Melitotus parviflora, Lamk. A casual on ballast heaps, \&ce.
Trifolium puroiflorum, Ehr. A casual, near Dublin.
" stellatum, L. A casual, Shoreham
", resupinutum, L. A casual, near Liverpool and elsewhere.
". tomentosum, L. Authority unknown to me.
Vicia liybridu, L. Reported from Somerset and Lincoln; never confirmed.
" lexiyata, Sm. " from Weymouth;
Lathyrus latifolius, L. A garden escape.
Rosacee.
Aremonia agrimonioides, DC. A garden escape.
Potentilla allla, L. Reported by Hudson from Wales. ", tridentuta, Sm. Clova Mts., Don ; never confirmed. " opaca, Sm. Ditto ditto ; but the specimens are $P$. intermediu.
Rosa Dicksoni, Lindl. Reported from the S. of Ireland; not confirmed.
", pomifera, Herm. A garden escape.
", prooncialis, Ehr.
" cinnamomea, L. "
" austriaca, Crantz. "
" lucida, Ehr.
" rubella, Sm. Reported from Shields ; not confirmed.
Sangnisorlia media, L. One of Don's reputed discoveries; not confirmed.
Rubus arcticus, L. Roported long ago from the Highlands; not confirmed.
P'yrus domestica, Sm. An introduced tree in W yre forest.

Saxifragere.
Saxiftraga Silthorpii, Boiss. Argyleshire; a garden escape.
", Cotyletlon, L. Reported from the Lake district; never confirmed. " rotundifolia, $\mathbf{L}$.
" leucanthemifolia, Scop. Authority unknown to me.
" muscoides, Wulf. One of Don's reputed discoveries ; and reported from Westmoreland by Hudson.
", pygmaza, Haw. Altogether obscure.
" pedatifida, Sm. One of Don's reputed Scotch discoveries; his specimens are the common garden S. trifurcata.
Crassulaces.
Sedum Cepara, L. A garden escape in Bucks.
" stellatum, L. " in Sussex.
Onagrariee.
Enothera odorata, Jacq. A garden escape.
Umbellifera.
Bupleurum prostratum, Link. A corn-field casual.
Trinia Kitaibelii, Bieb. Confounded with T'. vulgaris.
Ammi majus, L. An alien weed by the Severn.
Tordylium officinale, L. Recorded from near London; but confounded with $T$. maximum.
Echinophora spinosa, L. Reported from Dorset, \&c. ; not confirmed.
Charophyllum aureum, L. Scotland, Don; not confirmed. aromaticum, L.
Angelica Archangelica, L. A garden escape. Caprifoliacees.

Diervilla canadensis, Willd. In shrubberies only. Rubiacee.

Asperula arvensis, L. A casual in corn-fields.
taurina, I. In shrubberies only.
Falium spurium, L. A casual flax-field plant.
", saccharatum, All. One of Don's reputed discoveries.
" cinereum, Sm.
Crucianella stylosa, DC. A garden escape.

## Valerianee.

Centranthus Calcitrapa, Dufr. A garden escape. Walls at Eltham.
Valerianella eriocarpa, Desv. A reputed casual in Worcestershire.
Dipsacee.
Dipsacus Fullonum, Mill. An escape from cultivation.

## Composite.

Petasites albus, Gaertn. In shrubberies.
Nardosmia fragrans, Reich.
Tussilago alpina, L. One of Don's reputed discoveries.
Aster brumalis. A garden escape (American).
Erigeron uniflorus, L. By error for E. alpinus.
Solidago lanceolata, L. A garden escape (American).
A nacyclus radiatus, Loisel. Ballast heaps, Cork.
Anthemis tinctoria, L. Ballast heaps, \&c.
A chillea tanacetifolia, All. A garden escape near Sheffield.
" decolorans, Schrad. Known only in cultivation; of uncertain origin.
" tomentosa, L. A garden escape ; reported from several localities.
Artemisia carulescens, L. Reported by Gerard, from Lincolnshire, Kent, \&ic.
Senecio erraticus, Bert. A large state of S. aquaticus.

Composite (continued).
Calendula officinalis, L. A garden escape. arvensis, L .
Arctium tomentosum, Pers. Reported by error from E. of England.
Centaurea Jacea, L. A garden escape.
" montuna, L.
" paniculata, L. Reported from Jersey.
" intybucea, L. One of Don's reputed discoveries.
Curlina racemosa, L. Once found in Arran (Ireland), a single specimen.
Carduus oleraceus, Pers. Once found in Lincolnshire.
Crepis pulchra, L. One of Jon's reputed discoveries.
Prenanthes purpurea, Lamk. Naturalized in Skye and near Edinburgh.
Hieracium amplexicaule, L. Old castle walls.
" cerinthoides, L. One of Don's reputed discoveries.
" villosum, L. Reported from the Highlands.
Xanthium strumarium, L. A casual weed.
spinosum, L.
Erices.
Erica multiflora, L. Authority unknown.
Ledum palustre, L. N.W. Ireland, Giesecke ; never confirmed.
Oxycoccos macrocarpus, Pers. Flintshire ; introduced.
Gentianee.
Gentiena acaulis, L. Reported from Wales ; not confirmed.
Svertia perennis, L.
Convolvulacee.
Cuscuta approximata, Bab. A garden plant. hassiaca, Pfeiff. A casual on Lucerne.
Borraginee.
Echinospermum Lappula, Lehm. An alien ," ballast. deftexum, Lehm.
Symphytum orientale, L. Shrubberies only. asperrimum, Bieb.
Cynoglossum omphalodes, L. A garden escape.
Pulmonaria virginicu, L.
Solanee.
Nicandra physaloides, Gaertn. A garilen escape.
Datura Stramonium, L. A casual weed.
Physalis Alkekengi, L. A casual.
Lycium barbarum, L. A cottage ornament.
Hyoscyuntus albus, L. Ballast hills, Sunderland.
Plantagines.
P'luntago Psyllizm, L. Ballast hills, Jersoy. argentea, L. A casual, Ireland. arenaria, L. A casual, sandhills, Somorset.
Scrophularines.
Verbuscum thupsiforme, Schrad. Reported by Hudson; not confirm d.
", phlomoides, L. An alien on Clapham Common.
" phuenteren, L. Reported in 1803 from Wales.
Linaria supinu, Desf. A casual on ballast, Plymouth, and in Cornwall.
" purpurea, L A garden escape, old walls, \&c.
" spartea, Hoffm. Walton Heath, a casual.
Veronica peregrina, L. A casual weed of cultivation.
" fruticulosa, L. Reported from Seotland; never confirmed.

Orobanchear.
Orobanche lucorum, Koch. Confounded with O. elatior. ramosa, L. A casual on hemp.
Adanthacee.
Acanthus mollis, L. Scilly Is., an escape.
Labiate.
Origanum Onites, $\mathrm{L}_{\mathrm{L}}$ Confounded with 0 . vulgare.
virens, Link.
Tencrium reyium, Schreb. Reported from Wales by mistake.
Salvia clandestina, L. A doubtful Guernsey plant.
Staclys annua, L. An alien in corn-fields in Kent.
Primulacee.
Lysimachia ciliata, L. An American plant, introduced into Cumberland. punctata, L. Introd. near Newcastle.
Polygonem.
Polygonum Fagopyrum, L. An escape from cultivation.
Rumex scutatus, L.
Amaranthacee.
A naranthus retroflexus, L. A casual weed.
Chenopodiacees.
Atriplex hortensis, L. A garden escape. nitens, Reb.
Chenopodium ambrosioides, L. A casual weed. " multifidum, L.
Santalacee.
Theszum lumile, Vahl. Devonshire ; not indigenous.
" intermedium, Schrad. No authority for Britain.
Euphorbtaceet.
Eupliorlia dulcis, L. An escape from cultivation in Scotland.
", salicifolia, Host. An alien in Forfarshire.
" Characias, L. Mistaken for E. amyydaloides.
Salicines.
Salix dasyclados, Wimm. See S. acuminata, Sm.
", grandifolia, Ser. Authority doubtful.
", hastata, L. Reported from sands of Barrie ; never confirmed.
"petiolaris, Sm. An American willow.
" plicata, Fries. Authority doubtful.
" pontederana, Willd.
" serpyllifolia, Scop. Inserted by error.
Cupulifera.
C'astanea vulgaris, Lamk. Parks, \&cc. only.

Orchidem.

## MONOCOTYLEDONS.

Gymanadenia odoratissima, Reich. Authority doubtful.
Iridea.
Crocus sativus, L. Cultivated at Saffron Walden.
", aureus, Sibth. Parks only.
" biflorus, Mill.
Iris tuberosa, L. Authority doubtful.
". Xiphium, L. Reported by error from Worcestershire.
pumila, L. Reported from Leicestershire ; no doubt introduced.
" germanica, L. Reportad from Staffordshire ;

Amarylididere.
Nurcissus pooticus, L. Shrubberies, parks, and sites of old gardens.
" conspicuus, Don. " ".
" minar L " "
" lobularis, Haw. (A variety of pseudo-narcissus.)
Naiadre.
Potamogeton gracilis, Fries. Confounded with pusillus.
Liliacee.
Scilla bifolia, L. Reported a century ago from W. of England.
Litium pyrenaicum, Gouan. A garden escape in Devonshire.
Allium ambiguum, Sm. A garden escape, Rochester and Suffolk.

## Junces.

Juncus tenuis, Willd. One of Don's reputed discoveries.
Luzula nivea, Desv. A garden escape in Forfarshire, \&c.
Typhacee.
Typha minor, Sm . Reported by Dillenius from Hounslow Heath.
Cyperaces.
Eriophorum capitatum, Host. One of Don's reputed discoveries.
Ciurex Davalliana, Sm. Reported from Bath; confounded with C. diovica.
" brizoides, L. Reported from Yorkshire; no doubt introduced.
", cuspitosa, Fries. Confounded with vulgaris.
", ustulata. Wabl. One of Don's reputed discoveries.
", hordeiformis, Wahl.
" Mcencliuna, Wendl. A form of acuta.
Graminee.
Panicum sanguinale, Scop. A corn-field casual.
Setaria ylauca, Beauv.
1'halaris paradoxa, L. Only once found.
Stipa pennata, L. Reported last century.
Phleum asperum, Jacq. A casual, not found lately.
" Michelii, All. One of Don's reputed discoveries.
Avena planiculmis, Schrad. Arran 1s. (Scotland); never confirmed.
" subspicata, Link. No authority.
Bromus putulus, Reich.
", squarrosus, L.
tectorum, L.
Ballast, or corn-field casuals.
Triticum cristutum, Schreb. One of Don's reputed discoveries.
Ayjilops ovata, L. No authority.
Elymus geniculatus, Curt. Gravesend ; never confirmed.

## ACOTYLEDONS.

Filices.
Asplenium Petrarcha, DC. Authority unknown.
fontanum, Presl. On old walls ; only where "planted.
Cystopteris alpina, Desv.
Oroclea sensibilis, Willd. Near Warrington; no doubt an escape.
Lycopodiacens.
Lycopodium complanatum, L. No doubt confounded with L. alpinum. Equisitices.

Equisetum ramosum, Sohkuhr. Wales, Schkuhr; no authority given.

## THE END.

## WORKS BY DANIEL OLIVER, F.R.S., F.L.S.

Keeper of the Herbarium and Library of the Royal Gardens, Kew, and Professor of Botany in University College, Londion.

## LESSONS IN ELEMENTARY BOTANY. With nearly

 Two Hundred Illustrations. Eighth Thousand. 18mo. cloth, 4s. 6 d .
#### Abstract

This book is designed to teach the Elements of Botany on Professor Henslow's plan of selected Types and by the use of Schedules. The earlier chapters, embracing the elements of Structural and Physiological Botany, introduce us to the methodical study of the Ordinal Types. The concluding chapters are entitled, "How to dry l'lants" and "How to describe Plants." A valuable Glossary is appended to the volume. In the preparation of this work free use has been made of the manuscript materials of the late Professor Henslow.

[^3]
## FIRST BOOK OF INDIAN BOTANY. With numerous

 1llustrations. Extra feap. 8vo. 6s. 6d.-This manual is, in sulstance, the author's "Lessons in Elementary Botany," adapted for use in India. In preparing it he has had in view the want, often felt, of some handy résumé of Indian Botany, which might be servicealle not only to residents of India, but also to any one ahout to proceed thither, desirous of getting some preliminary idea of the Botany of that country."In nothing is Professor Oliver's book more satisfactory than the succoss with which, within so small a compass, it illustrates the vast and varied botany of India. Such a work has long bren wanted by amateurs and college professors and students in India."-A thenumm.
"Will enable the learner at once to master the elements of his study, and to apply his new knowledge to a practical examination of the plants and flowers that theet his eye in any part of fudia. .... It contains a well digested summary of all essential knowledge pertaining to Indian botany, wrought out in accordance with the best principles of scientific arrangement."-Allen's Indian Mail.
"The descriptions are all written in a popular style, so that they can be followed and understood hy every moderately educated man. ... It ought to eommand an extensive crreulation in the edueated circles of the Indian community."-Caleutta Englishman.

## CLASSICAL.

ESCHYLI EUMENIDES. The Greek Text, with English Notes and English Verse, Translation, and an Introduction. By Bernard Drake, M.A., late Fellow of King's College, Cambridge, 8vo. 3s. $6 d$.

The Greek text adopted in this Edition is based upon that of Wellauer, which may be said, in general terms, to represent that of the best manuscripts. But in correcting the Text, and in the Notes, advantage has been taken of the suggestions of Hermann, Paley, Linwood, and other commentators. In the Translation, the simple character of the Eschylear: dialogues has generally enabled the author to render them without any material devision from the construction and idioms of the original Greek.

## ARISTOTLE ON FALLACIES; OR, THE SOPHISTICI ELENCHI. With a Translation and Notes by Edward Poste, <br> M.A., Fellow of Oriel College, Oxford. 8vo. 8s. $6 d$.

Besides the doctrine of Fallacies, Aristotle offers, either in this treatise or in other passages quoted in the commentary, various glances over the world of science and opinion, various suggestions or problems which are still agitated, and a vivid picture of the ancient system of dialectics, which it is hoped may be found both interesting and instructive.

## Aristotle. - AN INTRODUCTION TO ARISTOTLE'S RHETORIC. With Analysis, Notes, and Appendices. By E. M. Cope, Senior Fellow and Tutor of Trinity College, Cambridge. 8 vo .14 s .

This work is introductory to an edition of the Greek Text of Aristotle's Rhetoric, winzch is in conrse of preparation. Its object is to render that treatise thoroughly intelligible. The author has aimed to illustrate, as preparatory to the delailed explanation of the work, the general bearings and relations of the Art of Rhetoric in itself, as well as the special mode of treating it adopted by Aristotle in his peculiar system. The evidence upon obscure or doubtful questions connected with the subject is examined; and the relations which Rhetoric bears, in Aristotle's view, to the kindred art of Logic are fully considered. A connected Analysis of the work is given, sometimes in the form of paraphrase; and a few important matters are separately discussed in Appendices. There is added, as a general Appendix, by way of specimen of the antagonistic system of Isocrates and others, a
 aiscussion of its authorship and of the probable results of its teaching.

Cicero.-THE SECOND PHILIPPIC ORATION. With an Introduction and Notes, translated from the German of Karl Halm. Edited, with Corrections and Additions, by John E. B. Mayor, M.A., Fellow and Classical Lecturer of St. John's College, Cambridge. Third Edition, revised. Fcap. 8vo. 5 s.
This volume opens with a List of Books useful to the Student of Cicero, including History, Chronology, Lexicons, and some account of various editions, mostly German, of the works of Cicero. The Introduction is
based on Halm: where Halm gives a reference to a classic, the passage has been commonly printed at length; where the reference is to Halm's notes on other Ciceronian speeches, or to modern books, the additional matter has been incorporated: and the numerous Greek quotations have been rendered into English. The English editor has further illustrated the work by additions drawn, for the most part, (1) from the ancient authorities; (2) from his own private marginal references, and from collections; (3) from the notes of previous commentators. A copious 'argument' is also given.
DEMOSTIIENES ON THE CROWN. The Greek Text with English Notes. By B. Drake, M.A., late Fellow of King's College, Cambridge. Third Edition, to which is prefixed ÆSCHINES AGAINST CTESIPHON, with English Notes. Fcap. 8vo. 5 s.
An Introduction discusses the immediate causes of the two orations, and their general character. The Notes contain frequent references to the best authorities. Among the appendices at the end is a chronological table of the life and public career of Aschines and Demosthenes.

## Hodgson.-MYTHOLOGY FOR LATIN VERSIFICATION,

A brief Sketch of the Fables of the Ancients, prepared to be rendered into Latin Verse for Schools. By F. Hodgson, B.D., late Provost of Eton. New Edition, revised by F. C. Hodgson, M. A. 18 mo . $3^{\mathrm{s}}$.

The late Provost of Eton has here supplied a help to the composition of Latin Verse, combined with a brief introduction to Classical Mythology. In this new edition a few mistakes have been rectified; rules have been added to the Prosody; and a more uniform system has been adopted wilh regard to the help aforded.
Juvenal.-Thirteen Satires of JUVENAL. With a Commentary. By John E. B. Mayor, M. A., Fellow of St. John's College, Cambridge. Second Edition, enlarged. Part I. Crown 8vo. sewed. 3s. $6 d$.
The text is accompanied by a copious Commentary. For various notes the author is indebted to Professors Munro and Conington. All the citations have been taken anew from the original authors.

Marshall.-A TAble of IRregular greek verbs, classified according to the arrangement of Curtius' Greek Grammar. By J. M. Marshall, M. A., Fellow and late Lecturer of Brasenose College, Oxford ; one of the Masters in Clifton College. 8vo. cloth. Is.
The system of this table has been borrowed from the excellent Greek Grammar of Dr. Curtius.

Mayor, John E. B.-FIRST GREEK READER. Edited after Karl Halm, with Corrections and large Additions by John E. B. Mayor, M.A. Fellow and Classical Lecturer of St. John's College, Cambridge. Fcap. 8vo. 6s.
A selection of short passages, servong to illustrate especially the Greek Accidence. A good deal of syntax is inculentally taught, and Madvig and other books are cited, for the use of masters: but no learner is expected to know more of syntax than is contained in the Notes and Vocabulary. A preface "To the Reader," not only explains the aim and method of the volume, but also deals with classical instruction generally. The extracts are uniformly in the Attic dialect, and any Hellenistic forms occurring in the original classic authors, such as Elian and Polybius, have been discurded in favour of the corresponding Attic expressions. This book may be used in connexion with Mayor's "Greek for Beginners."

## Mayor, John E. B.-See Juvenal.

Mayor, Joseph B.-GREEK FOR BEGINNERS. By the Rev. J. B. Mayor, M.A. Fcap. 8vo. 4s. 6 d .
The distinctive method of this book consists in building up a boy's knowledge of Greek upon the foundation of his knowledge of English and Latin, instead of trusting coerything to the unassisted memory. The forms and constructions of Greek have been thoroughly compared with those of Latin, and no Greek words have becn used in the earliur part of the book except such as have connexions either in English or Latin. Each step leads naturally on to its successor, grammatical forms and rules are at once applied in a series of graduated exercises, accompanied by ample
vocabularies. Thus the book serves as Grammar, Exercise book, and Vocabulary. Where possible, the Grammar has been simplified; the ordinary ten declensions are reduced to three, which correspond to the first three in Latin; and the system of stems is adopted. A general Vocabulary, and Index of Greek words, completes the work.

## Peile (John, M.A.)-an introduction to greek

 AND Latin etymology. By John Peile, M. A., Fellow and Assistant Tutor of Christ's College, Cambridge, formerly Teacher of Sanskrit in the University of Cambridge. 8vo. 10s. 6 d .These Philological Lectures are the result of Notes made during the author's reading during the last three or four years. These Notes were put into the shape of lectures, delivered at Christ's College, during the last May term, as one set in the " Intercollegiate" list. They are now printed with some additions and modifications, but substantially as they were delivered.

Plato.-THE REPUBLIC OF PLATO. Translated into English, with an Analysis and Notes, by J. Ll. Davies, M.A., and D. J. Vaughan, M.A. Third Edition, with Vignette Portraits of Plato and Socrates, engraved by Jeens from an Antique Gem. 18 mo . 4s. $6 d$.
An introductory notice supplies some account of the life of Plato, and the translation is preceded by an elaborate analysis. "The translators have," in the judgment of the Saturday Review, "produced a book which any reader, whether acquainted with the original or not, can peruse with pleasure as well as profit."

Plautus (Ramsay).-THE MOSTELLARIA OF PLAU-
TUS. With Notes Critical and Explanatory, Prolegomena, and Excursus. By William Ramsay, M.A., formerly Professor of Humanity in the University of Glasgow. Edited by Professor George G. Ramsay, M.A., of the University of Glasgow. Svo 145.

#### Abstract

" The fruits of that exhaustive research and that ripe and well-digested scholarship which its author brought to bear upon evervthing that he undertook are visible throughout it. It is furnished with a complete apparatus of prolegomena, notes, and excursus; and for the use of veteran scholars it probably leaves nothing to be desired."-Pall Mall Gazette.

## Potts (Alex. W., M.A.)-HINTS TOWARDS LATIN prose Composition. By Alex. W. Potts, M.A., late Fellow of St. John's College, Cambridge ; Assistant Master in Rugby School ; and Head Master of the Fettes College, Edinburgh. Extra fcap. 8vo. cloth. 2s. $6 d$.

Those engaged in Classical teaching seem to be unanimously of the opinion that Composition in Latin Prose is not only the most efficient method of acquiring a mastery of the Latin Language, but is in itself a valuable means of mental training, and an admirable corrective of some of the worst features in English writing. An attcmpt is here made to give students, after they have mastered ordinary syntactical rules, some idea of the characteristics of Latin Prose and the means to be employed to reproduce them. Some notion of the treatment of the subject may be gathered from the 'Contents.' Chap. I.-Characteristics of Classical Latin, Hints on turning English into Latin; CHAP. II.-Arrangement of Words in a Sentence; Chap. III.-Unity in Latin Prose, Subject and Object; Chap. IV.-On the Period in Latin Prose; Chap. V.-On the position of the Relative and Relative Clauses.

Roby.-A LATIN GRAMMAR for the Higher Classes in Grammar Schools. By H. J. Roby, M.A.
[In the Press.

Sallust.-CAII SALLUSTII CRISPI CATILINA ET JUGURTHA. For Use in Schools. With copious Notes. By C. Merivale, B.D. (In the present Edition the Notes have been carefully revised, and a few remarks and explanations added.) Second Edition. Fcap. 8vo. 4s. 6d.

## Sallust-continued.

The JUGURTHA and the CATILINA may be had separately, price 2s. 6 d. each.

This edition of Sallust, prepared by the distinguishied historian of Rome, contains an introduction, concerning the life and work's of Sallust, lists of the Consuls, and elaborate notes.

## Tacitus.-THE HISTORV OF TACITUS TRANSLATED INTO ENGLISH. By A. J. Church, M.A., and W. J. Brodribb, M.A. With Notes and a Map. 8vo. ios. $6 d$.

The translators have endeavoured to adhere as closely to the original as was thought consistent with a proper observance of English idiom. At the same time, it has been their aim to reproduce the precise expressions of the author. The campaign of Civilis is elucidated in a note of some length, which is illustrated by a map, containing the names of places and of tribes occurring in the work. There is also a complete account of the Roman army as it was constituted in the time of Tacitus. This work is characterised by the Spectator as "a scholarly and faithful translation."

THE AGRICOLA AND GERMANIA OF TACITUS. A Revised Text, English Notes, and Maps. By Alfred J. Church, M.A., and W. J. Brodribb, M.A. Fcap. 8vo. 3 s. $6 d$.
"We have endeavoured, with the aid of recent editions, thoroughly to elucidate the text, explaining the various difficulties, critical and grammatical, which occur to the student. We have consulted throughout, besides the older commentators, the editions of Ritter and Orelli, but we are under special obligations to the labours of the recent German editors, Wex and Kritz." Two Indexes are appended, (1) of Proper Names, (2) of Words and Phrases explained.

THE AGRICOLA and GERMANIA may be had separately, price 2s. each.

## Tacitus-continued.

THE AGRICOLA AND GERMANIA. Translated into English by A. J. Church, M.A., and IV. J. Brodribb, M.A. With Maps and Notes. Extra fcap. 8vo. 2s. $6 d$.
The translators have sought to produce such a version as may satisfy scholars who demand a faithful rendering of the original, and English readers who are offended by the baldness and frigidity which commonly disfigure translations. The treatises are accompanied by introductions, notes, maps, and a chronological summary. The Athenæum says of this work that it is " a version at once readable and exact, which may be perused with pleasure by all, and consulted with advantage by the classical student."

Thring.-Works by the Rev. E. THRING, M.A., Head Master of Uppingham School.
A LATIN GRADUAL. A First Latin Construing Book for Beginners. By Edward Thring, M.A. Fcap. 8vo. $2 s .6 d$.
The Head Master of Uppingham has here sought to supply by casy steps a knowledge of grammar, combined with a good Vocabulary. Passages have been selected from the best Latin authors in prose and verse. These passages are gradually built up in their grammatical structure, and finally printed in full. A short practical manual of common mood constructions, with their English equivalents, forms a second part.
A MANUAL OF MOOD CONSTRUCTIONS. Fcap. 8vo. is. $6 a$.
Treats of the ordinary mood constructions, as found in the Latin, Greek, and English languages.
A CONSTRUING BOOK. Fcap. 8vo. 2s. $6 d$.
Thucydides.-THE SICILIAN EXPEDITION. Being Books VI. and VII. of Thucydides, with Notes. A New Edition, revised and enlarged, with a Map. By the Rev. Percival Frost, M. A., late Fellow of St. John's College, Cambridge. Fcap. 8vo. 5 s.
This edition is mainly a grammatical one. Attention is called to the force of compound verbs, and the exact meaning of the various tenses employed.

Wright.-Works by J. WRIGHT, M.A., late Head Master of Sutton Coldfield School.
hellenica ; OR, A history of greece in greek, as related by Diodorus and Thucydides ; being a First Greek Reading Book, with explanatory Notes, Critical and Historical. Third Edition, with a Vocabulary. 12mo. 3s. 6 d.
In the last twenty chapters of this volume, Thucydides sketches the rise and progress of the Athenian Empire in so clear a styleand in such simple language, that the editor has doubts whether any easier or more instructive passages can be selected for the use of the pupil who is commencing Greek. This book includes a chronological table of the events recorded.

A HELP TO LATIN GRAMMAR ; or, The Form and Use of Words in Latin, with Progressive Exercises. Crown 8vo. 4s. 6d.
This book is not intended as a rival to any of the excellent Grammars now in use; but as a help to enable the beginner to understand them.

THE SEVEN KINGS OF ROME. An Easy Narrative, abridged from the First Book of Livy by the omission of Difficult Passages; being a First Latin Reading Book, with Grammatical Notes. With Vocabulary and Exercises. Fourth Edition. Fcap. 8vo. 5s.
This work is intended to supply the pupzl with an easy construing book, which may at the same time be made the vehicle for instructing him in the rules of grammar and principles of composition. The notes profess to teach what is commonly taught in grammars. It is conceived that the tupil will learn the rules of construction of the language much more easily from separate examples, which are pointed out to him in the course of his reading, and which he may himself set down in his note-book after some scheme of his own, than from a heap of quotations amassed for him by others.
Or, separately,

SEVEN KINGS OF ROME. 3 s.
vOCABULARY AND EXERCISES TO "THE SEVEN KINGS." 2s. 6 d .

## CLASSIC VERSIONS OF ENGLISH BOOKS, AND LATIN HYMNS.

The following works are, as the heading indicates, classic renderings of English books. For scholars, and particularly for writers of Latin Verse, the series has a special value. The Hymni Ecclesiæ are here inserted, as partly falling under the same class.
Church.-HORE TENNYSONIANE SIVE ECLOGE E tennysono. Latinæ Reddite A. J. Church, A.M.
[7ust ready.
Latham.-SERTUM SHAKSPERIANUM, Subnexis aliquot aliunde excerptis floribus. Latine reddidit Rev. H. Latham, M.A. Extra fcap. 8vo. 5 s.
Besides versions of Shakspeave this volume contains, among other pieces, Gray's "Elegy," Campbell's "Hohenlinden," Wolfe's "Burial of Sir Yohn Moore," and selections from Cowper and George Herbert.
Lyttelton. - THE COMUS OF MILTON, rendered into Greek Verse. By Lord Lyttelton. Extra fcap. 8vo. 5 s.
THE SAMSON AGONISTES OF MILTON, rendered into Greek Verse. By Lord Lyttelton. Extra fcap. 8vo. 6s. $6 d$.
Merivale.-KEATS' HYPERION, rendered into Latin Verse. By C. Merivale, B.D. Second Edit. Extra fcap. 8vo. 3s. $6 d$.
Hymni Ecclesiæ. - Edited by Rev. Dr. Newman. Extra fcap. 8vo. 7s. $6 d$.
Hymns of the Mediaval Church. The first Part contains selections from the Parisian Breviary; the second from those of Rome, Salisbury, and York.
Trench (Archbishop). - SACRED LATIN POETRY, chiefly Lyrical, selected and arranged for Use ; with Notes and Introduction. Fcap. 8vo. 7 s.
In this work the editor has selected hymns of a catholic veligious sentiment that are common to Christendom, while rejecting those of a distinctively Romish character.

## MATHEMATICS.

Airy.-Works by G. B. AIRY, Astronomer Royal :-
ELEMENTARY TREATISE ON PARTIAL DIFFERENTIAL EQUATIONS. Designed for the Use of Students in the Universities. With Diagrams. Crown 8vo. cloth. 5s. 6 d .
It is hoped that the methods of solution here explained, and the instances exhibited, will be found sufficient for application to nearly all the important problems of Physical Science, which require for their complete investigation the aid of Partial Differential Equations.

ON THE ALGEBRAICAL AND NUMERICAL THEORY OF ERRORS OF OBSERVATIONS AND THE COMBINA. TION OF OBSERVATIONS. Crown 8vo. cloth. $6 s .6 \mathrm{~d}$.

In order to spare astronomers and observers in natural philosophy the confusion and loss of time which are produced by referring to the ordinary treatises embracing both branches of prababilities (the first relating to chances which can be altered only by the changes of entire units or integral multiples of units in the fundamental conditions of the problem; the other concerning those chances which have respect to insensible gradations in the value of the element measured) the present tract has been drawon ut. It relates only to errors of observation, and to the rules, derivable from the consideration of these errors, for the combination of the results of abservations.

## Airy, G. B.-continued.

UNDULATORY THEORY OF OPTICS. Designed for the Use of Students in the University. New Edition. Crown 8vo. cloth. 6s. $6 d$.
The undulatory theory of optics is presented to the reader as having the same claims to his attention as the theory of gravitation: namely, that it is certainly true, and that, by mathematical operations of general elegance, it leads to results of great interest. This theory explains with accuracy a vast variety of phenomena of the most complicated kind. The plan of this tract has been to include those phenomena only which admit of calculation, and the investigations are applied only to phenomena which actually have been observed.

ON SOUND AND ATMOSPHERIC VIBRATIONS. With the Mathematical Elements of Music. Designed for the Use of Students of the University. Crown 8vo. 9s.
This volume consists of sections, which again are divided into numbered articles, on the following topics: General recognition of the air as the medium which conveys sound; Properties of the air on which the formation and transmission of sound depend; Theory of undulations as applied to sound, $\mathcal{S}_{\mathrm{c}}$. ; Investigation of the motion of a wave of air through the atmosphere; Transmission of waves of soniferous vibrations through different gases, solids, and fluids; Experiments on the velocity of sound, \&c.; On musical sounds, and the manner of producing them; On the elements of musical harmony and melody, and of simple musical composition; On instrumental music; On the human organs of speech and hearing.

Bayma.-THE ELEMENTS OF MOLECULAR MECHANiCS. By Joseph Bayma, S. J., Professor of Philosophy, Stonyhurst College. Demy 8vo. cloth. IOs. 6 d .
Of the twelve Books into which the present treatzse is divided, the first and second give the demonstration of the principles which bear directly on the constitution and the properties of matter. The next three books contain a series of theorems and of problems on the lazus of motion of elementary substances. In the sixth and seventh, the mechanical constitution of mole-
cules is investigated and determined: and by it the general properties of bodies are explained. The eighth book treats of luminiferous ather. The ninth explains some special properties of bodies. The tenth and eleventh contain a radical and lengthy investigation of chemical principles and relations, which may lead to practical results of high importance. The twelfth and last book treats of molecular masses, distances, and powers.

## Beasley.-AN ELEMENTARY TREATISE ON PLANE

 trigonometry. With Examples. By R. D. Beasley, M. A., Head Master of Grantham Grammar School. Second Edition, revised and enlarged. Crown 8vo. cloth. 3s. 6d.This treatise is specially intended for use in schools. The choice of matter has been chiefly guided by the requirements of the three days' examination at Cambridge. About four hundred examples have been added to this edition, mainly collected from the examination papers of the last ten years.

Boole.-Works by G. BOOLE, D.C.L., F.R.S., Professor of Mathematics in the Queen's University, Ireland.

A TREATISE ON DIFFERENTIAL EQUATIONS. New and Revised Edition. Edited by I. Todhunter. Crown 8vo. cloth. 145.

Professor Boole has endeavoured in this treatise to convey as complete an account of the present state of knowledge on the subject of Differential Equations, as was consistent with the idea of a work intended, primarily, for elementary instruction. The earlier sections of each chapter contain that kind of matter which has usually been thought suitable for the beginner, while the latter ones are devoted either to an account of recent discovery, or the discussion of such deeper questions of principle as are likely to present themselves to the reflective student in connexion with the methods and processes of his previous course.
A TREATISE ON DIFFERENTIAL EQUATIONS. Supplementary Volume. Edited by I. Todhunter. Crown 8vo. cloth. 8s. $6 d$.
This volume contains all that Professor Boole wrote for the purpose of enlarging his treatise on Differential Equations.

## Boole, G., D.C.L.-continued.

THE CALCULUS OF FINITE DIFFERENCES. Crown 8vo. cloth. $10 s .6 \mathrm{~d}$.

In this exposition of the Calculus of Finite Diferences, particular attention has been paid to the connexion of its methods with those of the Differential Calculus-a connexion which in some instances involves far more than a merely formal analogy. The work is in some measure designed as a sequel to Professor Boole's Treatise on Differential Equations.

CAMBRIDGE SENATE-HOUSE PROBLEMS AND RIDERS, WITH SOLUTIONS:-
1848-1851.-PROBLEMS. By Ferrers and Jackson. 8vo. cloth. 15s. 6 d .
1848-1851.-RIDERS. By Jameson. 8vo. cloth. 7s. 6 d .
1854. - PROBLEMS AND RIDERS. By Walton and Mackenzir. 8vo. cloth. 1os. 6 d .
1857. - PROBLEMS AND RIDERS. By CAMpion and Walton. 8vo. cloth. 8s. $6 d$.
1860.-PROBLEMS AND RIDERS. By Watson and Routh. Crown 8vo. cloth. 7s. 6 d .
1864.-PROBLEMS AND RIDERS. By Walton and Wilkinson. 8vo. cloth. Ios. 6 d.

These volumes will be found of great value to Teachers and Students, as indicating the style and range of mathematical study in the University of Cambridge.

CAMBRIDGE COURSE OF ELEMENTARY NATURAL PHILOSOPHY, for the Degree of B.A. Originally compiled by J. C. Snowball, M.A., late Fellow of St. John's College. Fifth Edition, revised and enlarged, and adapted for the MiddleClass Examinations by Thomas Lund, B.D., Late Fellow and Lecturer of St. John's College, Editor of Wood's Algebra, \&c. Crown 8vo. cloth. 5 s.

This work will be found adapted to the wants, not only of University Students, but also of many others who require a short course of Mechanics and Hydrostatics, and especially of the candidates at our Middle Class Examinations. At the end of each chapter a series of easy questions is added for the exercise of the student.

CAMBRIDGE AND DUBLIN MATHEMATICAL JOURNAL. The Complete Work, in Nine Vols. 8vo. cloth, 7l. 4 s.

Only a few copies remain on hand. Among Contributors to this work will be found Sir W. Thomson, Stokes, Adams, Boole, Sir W. R. Hamilton, De Morgan, Cayley, Sylvester, Yellett, and other distinguished mathematicians.

Candler.-HELP TO ARITHMETIC. Designed for the use of Schools. By H. Candler, M.A. Mathematical Master of Uppingham School. Extra fcap. 8vo. 2s. $6 d$.
This work is intended as a companion to any text book that may be in use.

Cheyne.-AN ELEMENTARY TREATISE ON THE PLANETARY THEORY. With a Collection of Problems. By C. H. H. Cheyne, M. A., F.R.A.S. Crown 8 vo . cloth. $6 s .6 d$.
In this volume, an attempt has been made to produce a treatise on the Planetary theory, which, being elementary in character, should be so far complete, as to contain all that is usually required by students in the University of Cambridge.

THE EARTH'S MOTION OF ROTATION. By C. H. H. Cheyne, M.A., F.R.A.S. Crown 8vo. 3s. $6 d$.
The first part of this work consists of an application of the method of the variation of elements to the general problem of rotation. In the second part the general rotation formula are aptlied to the particular case of the earth.

## Childe.-THE SINGULAR PROPERTIES OF THE ELLIP. SOID AND ASSOCIATED SURFACES OF THE NTh DEGREE. By the Rev. G. F. Childe, M.A., Author of "Ray Surfaces," "Related Caustics," \&c. 8vo. Ios. 6 d .

The object of this volume is to develop peculiarities in the Ellipsoid; and, further, to establish analagous properties in the unlimited congeneric series of which this remarkable surface is a constituent.

Christie.-A collection of elementary test. QUESTIONS IN PURE AND MIXED MATHEMATICS; with Answers and Appendices on Synthetic Division, and on the Solution of Numerical Equations by Horner's Method. By James R. Christie, F.R.S., late First Mathematical Master at the Royal Military Academy, Woolwich. Crown 8vo. cloth. 8s. $6 d$.
The series of Mathematical exercises here offered to the public is collected from those which the author has, from time to time, proposed for solution by his pupils during a long career at the Royal Military Academy. A student who finds that he is able to solve the larger portion of these exercises, may consider that he is thoroughly well grounded in the elementary principles of pure and mixed Mathematics.

Dalton.-ARITHMETICAL EXAMPLES. Progressively arranged, with Exercises and Examination Papers. By the Rev T. Dalton, M.A., Assistant Master of Eton College. 18mo cloth. 2s. 6 d .
Answers to the Examples are appended.

## Day.-PROPERTIES OF CONIC SECTIONS PROVED Geometrically. part I., the ellipse, with Problems. By the Rev. H. G. Day, M.A., Head Master of Sedburgh Grammar School. Crown 8vo. $3^{5}$. 6 d .

The object of this book is the introduction of a treatment of Conic Sections which should be simple and natural, and lead by an easy transition to the analytical methods, without departing from the strict geometry of Euclid.

## Dodgson.-AN ELEMENTARY TREATISE ON DETERMINANTS, with their Application to Simultaneous Linear Equations and Algebraical Geometry. By Charles L. Dodgson, M.A., Student and Mathematical Lecturer of Christ Church, Oxford. Small 4to. cloth. $10 s .6 d$. <br> The object of the author is to present the subject as a continuows chain of argument, separated from all accessories of explanation or illustration. All such explanation and illustration as seemed necessary for a beginner are introduced either in the form of foot-notes, or, where that would have occupied too much room, of Appendices.

Drew.-GEOMETRICAL TREATISE ON CONIC SECTIONS. By W. H. Drew, M. A., St. John's College, Cambridge. Fourth Edition. Crown 8vo. cloth. $4 s .6 d$.

In this work the subject of Conic Sections has been placed before the student in such a form that, it is hoped, after mastering the elements of Euclid, he may find it an easy and interesting continuation of his geometrical studies, With a view, also, of rendering the work a complete manual of what is required at the Universities, there have either been embodied into the text or inserted among the examples, every book-work question, problem, and rider, which has been proposed in the Cambridge examinations up to the present time.

SOLUTIONS TO THE PROBLEMS IN DREW'S CONIC SECTIONS. Crown 8vo. cloth. 4s. 6 d .

Edgar (J. H.)-NOTE-BOOK ON PRACTICAL SOLID GEOMETRY. Containing Problems with help for Solutions. By J. H. Edgar, M.A. Lecturer on Mechanical Drawing at the Royal School of Mines. 4to. 2 s .

> In teaching a large class, if the method of lecturing and demonstrating from the black board only is pursued, the more intelligent students have generally to be kept back, from the necessity of frequent repetition, for the sake of the less promising; if the plan of setting problems to each pupil is
adopted, the teacher finds a dificulty in giving to each sufficient attention. A judicious combination of both methads is doubtless the best; and it is hoped that this result may be arrived at in some degree by the use of this book, which is simply a collection of examples, with helps for solution, arranged in progressive sections.

## Ferrers.-AN ELEMENTARY TREATISE ON TRILINEAR CO-ORDINATES, the Method of Reciprocal Polars, and the Theory of Projectors. By the Rev. N. M. Ferrers, M. A., Fellow and Tutor of Gonville and Caius College, Cambridge. Second Edition. Crown 8vo. 6s. 6d. <br> The object of the author in writing on this subject has mainly been to place it on a basis altogether independent of the ordinary Cartesian system, instead of regarding it as only a special form of Abridged Notation. . 4 short chapter on Determinants has been introduced.

Frost.-THE FIRST THREE SECTIONS OF NEWTON'S PRINCIPIA. With Notes and Illustrations. Also a collection of Problems, principally intended as Examples of Newton's Methods. By Percival Frost, M. A., late Fellow of St. John's College, Mathematical Lecturer of King's College, Cambridge. Second Edition. 8vo. cloth. IOs. 6 d .
The author's principal intention is to explain difficulties which may be encountered by the student on first reading the Principia, and to illustrate the advantages of a careful study of the methods employed by Newoton, by showing the extent to which they may be applied in the solution of problems; he has also endeavoured to give assistance to the student who is engaged in the study of the higher branches of mathematics, by representing in a geometrical form several of the processes employed in the Differential and Integral Calculus, and in the analytical investigations of Dynamics.

## Frost and Wolstenholme.-A Treatise on solid

 geometry. By Percival Frost, M.A., and the Rev. J. Wolstenholme, M.A., Fellow and Assistant Tutor of Christ's College. 8vo. cloth. 18s.The authors have endeavoured to present before students as comprehensive a view of the subject as possible. Intending to make the subject accessible, at least in the earlier portion, to all classes of students, they have endeavoured to explain completely all the processes which are most useful in dealing with ordinary theorems and problems, thus directing the student to the selection of methods which are best adapted to the exigencies of each problem. In the more difficult portions of the subject, they have considered themselves to be addressing a higher class of students; and they have there tried to lay a good foundation on which to build, if any reader should wish to pursue the science beyond the limits to which the work extends.

Godfray.-A TREATISE ON ASTRONOMY, for the Use of Colleges and Schools. By Hugh Godfray, M.A., Mathematical Lecturer at Pembroke College, Cambridge. 8vo. cloth. 12s. 6 d .

This book embraces all those branches of Astronomy which have, from time to time, been recommended by the Cambridge Board of Mathematical Studies: but by far the larger and easier portion, adapted to the first three days of the Examination for Honours, may be read by the more advanced pupils in many of our schools. The author's aim has been to convey clear and distinct ideas of the celestial phenomena.

AN ELEMENTARY TREATISE ON THE LUNAR THEORY, with a Brief Sketch of the Problem up to the time of Newton. By Hugh Godfray, M.A. Second Edition, revised. Crown 8vo. cloth. 5s. 6 d .

These pages will, it is hoped, form an introduction to more recondite zorks. Difficulties have been discussed at considerable length. The selection of the method followed with regard to analytical solutions, which is the same as that of Airy, Herschel, \&oc. was made on account of its simplicity; it is, moreover, the method which has obtained in the University of Cambridge.

## Hemming.-AN ELEMENTARY TREATISE ON THE DIFFERENTIAL AND INTEGRAL CALCULUS, for the Use of Colleges and Schools. By G. W. Hemming, M. A., Fellow of St. John's College, Cambridge. Second Edition, with Corrections and Additions. 8vo. cloth. 9s.

Jones and Cheyne.-ALGEBRAICAL EXERCISES. Progressively arranged. By the Rev. C. A. Jonfs, M. A., and C. H. Chevne, M.A., F.R.A.S., Mathematical Masters of Westminster School. New Edition. 18mo. cloth. 2s. $6 d$.

This little book is intended to meet a difficulty which is probably felt more or less by all engaged in teaching Algebra to beginners. It is, that while new ideas are being acquired, old ones are forgotten. In the belief that constant practice is the only remedy for this, the present series of miscellaneous exercises has been prepared. Their peculiarity consists in this, that though miscellaneous they are yet progressive, and may be used by the pupil almost from the commencement of his studies. They are not intended to supersede the systematically arranged examples to be found in ordinary treatises on Algebra, but rather to supplement them.

The book being intended chiefly for Schools and Funior Students, the higher parts of Algebra have not been included.

Kitchener.-A GEOMETRICAL NOTE-BOOK, containing Easy Problems in Geometrical Drawing preparatory to the Study of Geometry. For the Use of Schools. By F. E. Kitchener, M. A., Mathematical Master at Rugby. 4to. 2s.

It is the object of this book to make some way in overcoming the difficulties of Geometrical conception, before the mind is called to the attack of Geomelrical theorems. A few simple methods of construction are given; and space is left on each page, in order that the learner may draw in the figures.

## Morgan.-A COLLECTION OF PROBLEMS AND EXAM-

 PLES IN MATHEMATICS. With Answers. By H. A. Morgan, M.A., Sadlerian and Mathematical Lecturer of Jesus College, Cambridge. Crown 8vo. cloth. 6s. 6 d .This book contains a number of problems, chiefly elementary, in the Mathematical subjects usually read at Cambridge. They have been selected from the papers set during late years at Yesus College. Very few of them are to be met with in other collections, and by far the larger number are due to some of the most distinguished Mathematicians in the University.

Parkinson.-Works by S. Parkinson, B.D., Fellow and Prælector of St. John's College, Cambridge.

AN ELEMENTARY TREATISE ON MECHANICS. For the Use of the Junior Classes at the University and the Higher Classes in Schools. With a Collection of Examples, Fourth edition, revised. Crown 8vo. cloth. 9s. $6 d$.
In preparing a fourth edition of this work the author has kept the same object in view as he had in the former editions-namely, to include in it such portions of Theoretical Mechanics as can be conveniently investigated without the use of the Differential Calculus, and so render it suitable as a manual for the junior classes in the University and the higher classes in Schools. With one or two short exceptions, the student is not presumed to require a knowledge of any branches of Mathematics beyond the elements of Algebra, Geometry, and Trigonometry. Several additional propositions have been incorporated in the work for the purpose of rendering it more complete: and the collection of Examples and Problems has been largely increased.
A TREATISE ON OPTICS. Second Edition, revised, Crown 8vo cloth. IOs. 6 d .
A collection of examples and problems has been appended to this work, which are sufficiently numerous and varied in character to afford useful
exercise for the student. For the greater parl of them, recourse has been had to the Examination Papers set in the University and the several Colleges during the last twentv years.

## Phear.-ELEMENTARY HYDROSTATICS. With Numerous

 Examples. By J. B. Phear, M.A., Fellow and late Assistant Tutor of Clare College, Cambridge. Fourth Edition. Crown 8vo. cloth. 5s. 6 d .This edition has been carefully revised throughout, and many new illustrations and examples added, which it is hoped will increase its usefulness to students at the Universities and in Schools. In accordinnce with suggestions from many engaged in tuition, answers to all the Examples have been given at the end of the book.

## Pratt.-A TREATISE ON ATTRACTIONS, LAPLACE'S FUNCTIONS, AND THE FIGURE OF THE EARTH. By John H. Pratt, M. A., Archdeacon of Calcutta, Author of "The Mathematical Principles of Mechanical Philosophy." Third Edition. Crown 8vo. cloth. 6s. 6d.

The author's chief design in this treatise is to give an answer to the question, " Has the Earth acquired its present form from being originally in a fluid state?" This Edition is a complete revision of the former ones.

## Puckle.-AN ELEMENTARY TREATISE ON CONIC SEC.

 TIONS AND ALGEBRAIC GEOMETRY. With Numerous Examples and Hints for their Solution ; especially designed for the Use of Beginners. By G. H. Puckle, M.A., Head Master of Windermere College. Third Edition, revised and enlarged. Crown 8vo. cloth. 7s. 6 d .This work has been completely rewritten, and a large amount of new matter has been added to suit the requirements of the present time. The author has written with special reference to those difficulties and misapprehensions which are found most common to beginners. The treatise is complete as far as regards Cartesian Co-ordinates.

Rawlinson.-ELEmentary statics, by the Rev. George Rawlinson, M.A. Edited by the Rev. Edward Sturges, M.A., of Emmanuel College, Cambridge, and late Professor of the Applied Sciences, Elphinstone College, Bombay. Crown 8vo. cloth. 4s. 6 d .

Published under the authority of Her Majesty's Secretary of State for India, for use in the Government Schools and Colleges in India.

## Reynolds.-MODERN METHODS IN ELEMENTARY GEOMETRY. By E. M. Reynolds, M.A., Mathematica Master in Clifton College. Crown 8vo. 3s. 6 d .

Geometry has received extensive developments in modern times, but in England there has been no corresponding improvement in elementary teaching.

> Routh.-AN ELEMENTARY TREATISE ON THE DYNA. MICS OF THE SYSTEM OF RIGID BODIES. With Numerous Examples. By Edward John Routh, M.A., late Fellow and Assistant Tutor of St. Peter's College, Cambridge; Examiner in the University of London. Second Edition, enlarged. Crown 8vo. cloth. 14 s.

In this edition the author has made several additions to each chapter. He has tried, even at the risk of some little repetition, to make each chapter, as far as possible, complete in itself, so that all that relates to any one part of the subiect may be found in the same place. This arrangement will enable every student to select his own order in which to read the subject. The Examples which will be found at the end of each chapter have been chiefly selected from the Examination Papers which have been set in the University and the Colleges in the last few years.

Smith (Barnard).-Works by BARNARD SMITH, M.A., Rector of Glaston, Rutlandshire, late Fellow and Senior Bursar of St. Peter's College, Cambridge.

## Smith (Barnard)-continued.

ARITHMETIC AND ALGEBRA, in their Principles and Application ; with numerous systematically arranged Examples taken from the Cambridge Examination Papers, with especial reference to the Ordinary Examination for the B.A. Degree. Tenth Edition. Crown 8vo. cloth. IOs. 6 d .

This manual is now extensively used in Schools and Colleges, both in England and in the Colonies. It has also been found of great service for students preparing for the Middle Class and Civil and Military Service Examinations, from the care that has been taken to elucilate the principles of all the rules. The present edition has been carefully revised. "T'o all those whose minds are sufficiently developed to comprehend the simplest mathematical reasoning, and who have not yet thoroughly mastered the principles of Arithmetic and Algebra, it is calculated to be of great advantage."-ATHENAEUM.

Of this work, also, one of the highest possible authorities, the late Dean Peacock, writes: "Mr. Smith's work is a most useful publication. The mules are stated with great clearness. The examples are well selected, and worked out with just sufficient detail, without being encumbered by too minute explanations; and there prevails throughout it that just proportion of theory and practice, which is the crowning excellence of an elementary work."

ARITHMETIC FOR SCHOOLS. New Edition. Crown 8vo. cloth. $4 s .6 d$.

Adapted from the author's work on "Arithmetic and Algebra," by the omission of the algebraic portion, and by the introduction of new exercises. The reason of each arithmetical process is fully exhibited. The system of Decimal Coinage is explained; and answers to the exercises are appended at the end. This Arithmetic is characterised as "admirably adapted for instruction, combining pust sufficient theory with a large and well-selected collection of exercises for practice."-Journal of Education.

## Smith (Barnard)-continued. <br> COMPANION TO ARITHMETIC FOR SCHOOLS.

[Preparing.

#### Abstract

A Key to the arithmetic For SChools. Seventh Edition. Crown 8vo. cloth. 8s. 6 d.

EXERCISES IN ARITHMETIC. With Answers. Crown 8vo. limp cloth. 2s. 6 d .
Or sold separately, Part I. is. ; Part II. Is. ; Answers, $6 d$.
These Exercises have been published in order to give the pupil examples in every rule of Arithmetic. The greater number have been carefully compiled from the latest University and School Examination Papers.

SCHOOL CLASS-BOOK OF ARITHMETIC. 18mo. cloth. 3 s . Or sold separately, Parts I. and II. Iod. each ; Part III. is

This manual, published at the request of many schoolmasters, and chiefly intended for National and Elementary Schools, has been preparea on the same plan as that adopted in the author's School Arithmetic, which is in extensive circulation in England and abroad. The Metrical Tables have been introduced, from the conviction on the part of the author, that the knowuledge of such tables, and the mode of applying them, will be of great use to the rising generation.

KEYS TO SCHOOL CLASS-BOOK OF ARITHMETIC. Complete in one volume, 18 mo . cloth, 6 s .6 d. ; or Parts I. II. and III. $2 s .6 d$. each.

SHILLING BOOK OF ARITHMETIC FOR NATIONAL AND ELEMENTARY SCHOULS. 18mo. cloth. Or separately, Part I. 2d. ; Part II. 3d. ; Part III. 7d. Answers, $6 d$.

## Smith (Barnard)-continued.

THE SAME, with Answers complete. 18 mo . cloth. Is. 6 d .
This Shilling Book of Arithmetic has been prepared for the use of National and other schools at the urgent request of numerous masters of schools both at home and abroad. The Explanations of the Rules, and the Examples will, it is hoped, be found suited to the most elementary classes.

KEY TO SHILLING BOOK OF ARITHMETIC. 18mo. cloth. 4s. $6 d$.

EXAMINATION PAPERS IN ARITHMETIC. I8mo. cloth. 1s. 6d. The same, with Answers, 18mo. 1s. 9 d.

The object of these Examination Papers is to test students both in the theory and practice of Arithmetic. It is hoped that the method adopted will lead students to deduce results from general principles rather than to apply stated rules. The author believes that the practice of giving examples under particular rules makes the working of Arithmetic quite mechanical, and tends to throw all but very clever boys off their balance when a general paper on the subject is put before them.

## KEY TO EXAMINATION PAPERS IN ARITHMETIC.

 18mo. cloth. $4 s .6 d$.
## Snowball.-THE ELEMENTS OF PLANE AND SPHERI-

 CAL TRIGONOMETRY; with the Construction and Use of Tables of Logarithms. By J. C. Snowball, M.A. Tenth Edition. Crown 8vo. cloth. 7s. $6 d$.In preparing the present edition for the press, the text has been subjected to a careful revision; the proofs of some of the more important propositions have been rendered more strict and general; and a considerable addition of more than two hundred examples, taken princi-
pally from the questions set of late years in the public examinations of the University and of individual Colleges, has been made to the collection of Examples and Problems for practice.

## Tait and Steele.-DYNAmICS OF A PARTICLE. With numerous Examples. By Professor Tait and Mr. Steele. New Edition. Crown 8vo. cloth. Ios. 6d.

In this treatise will be found all the ondinary propositions, connected with the Dynamics of Particles, which can be conveniently deduced without the use of D'Alembert's Principle. Througriout the book will be found a number of illustrative examples introduced in the text, and for the most part completely worked out; others with occasional solutions or hints to assist the student are appended to each chapter. For by far the greater portion of these, the Cambridge Senate-House and College Examination Papers have been applied to.

Taylor.-GEOMETRICAL CONICS; including Anharmonic Ratio and Projection, with numerous Examples. By C. Taylor, B. A., Scholar of St. John's College, Cambridge. Crown 8vo. cloth. 7s. 6 d .

This work contains elementary proofs of the principal properties of Conic Sections, together with chapters on Projection and Anharmonic Ratio.

## Tebay.-ELEMENTARY MENSURATION FOR SCHOOLS. With numerous Examples. By Septimus Tebay, B.A., Head Master of Queen Elizabeth's Grammar School, Rivington. Extra fcap. 8 vo . $3^{s .} 6 d$.

The object of the present work is to enable boys to acquire a moderate knowledge of Mensuration in a reasonable time. All difficult and useless matter has been avoided. The examples for the most part are easy, and the rules are concise.

Todhunter.-Works by I. TODHUNTER, M. A., F. R. S., of St. John's College, Cambridge.

THE ELEMENTS OF EUCLID. For the Use of Colleges and Schools. New Edition. 18mo. cloth. 3s. 6 d .

As the elements of Euclid are usually placed in the hands of young students, it is important to exhibit the work in such a form as will assist them in overcoming the difficulties which they experience on their first introduction to processes of continuous argument. No method appears to be so useful as that of breaking up the demonstrations into their constituent parts; a plan strongly recommended by Prafessor De Morgan. In the present Edition each distinct assertion in the argument begins a new line: and at the ends of the lines are placed the necessary references to the preceding principles on which the assertions depend. The longer propositions are distributed into subordinate pa,ts, which are distinguished by breaks at the beginning of the lines. Noles, appendix, and a collection of exercises are added.

MENSURATION FOR BEGINNERS. With Numerous Examples. 18 mo . cloth. 2 s .6 d .

The subjects included in the present work are those which have usually found a place in Elementary Treatises on Mensuration. The mode of trentment has been determined by the fact that the work is intended for the use of beginners. Accordingly it is divided into short independent chapters, which are followed by appropriate examples. A knowledge of the elements of Aritlmetic is all that is assumed; and in connexion with most of the Rules of Mensuration it has been found practicable to give such explanations and illustrations as will supply the place of formal mathematical demonstrations, which would have been unsuitable to the character of the work.

## ALGEBRA FOR BEGINNERS. With numerous Examples. New Edition. 18 mo . cloth. 2 s .6 d .

Great pains have been taken to render this work intelligible to youns students, by the use of simple language and by copious explanations. In

## Todhunter (I.)-continued.

determining the subjects to be included and the space to be assigned to each, the Author has been guided by the papers given at the various examinations in elementary Algebra which are now carried on in this country. The book may be said to consist of three parts. The first part contains the elementary operations in integral and fractional expressions; the second the solution of equations and problems; the third treats of various subjects which are introduced but rarely into examination papers, and are more briefly discussed. Provision has at the same time been made for the introduction of easy equations and problems at an early stage-for those who prefer such a course.

KEY TO ALGEBRA FOR BEGINNERS. Crown 8vo. cloth. 6s. $6 d$.

TRIGONOMETRY FOR BEGINNERS. With numerous Examples New Edition. 18mo. cloth. 2s. 6. .

Intended to serve as an introduction to the larger treatise on Plane Trigonometry, published by the Author. The same plan has been adopted as in the Algebra for Beginners : the subject is discussed in short chapters, and a collection of examples is attached to each chapter. The first fourteen chapters present the geometrical part of Plane Trigonometry; and contain all that is necessary for practical purposes. The range of matter included is such as seems required by the various examinations in elementary Trigonometry which are now carried on in the country. Answers are appended at the end.

MECHANICS FOR BEGINNERS. With numerous Examples. 18 mo . cloth. 4 s .6 d .

Intended as a companion to the two preceding books. The work forms an elementary treatise on demonstrative mechanics. It may be true that this part of mixed mathematics has been sometimes made too abstract and speculative; but it can hardly be doubted that a knowledge of the elements at least of the theory of the subiect is extremely valuable even for those

## Todhunter (I.)-continued.

who are mainly concerned with practical results. The Author has accordingly endeavoured to provide a suitable introduction to the study of applied as well as of theoretical mechanics. The work consssts of two parts, namely, Statics and Dynamics. It will be found to contain all that is usually comprised in elementary treatises on Mechanios, together with some additions.

ALGEBRA. For the Use of Colleges and Schools. Fourth Edition. Crown 8 vo. cloth. 7s. 6 d .
This work contains all the propositions which are usually included in elementary treatises on Algebra, and a large number of Examples for Exercise. The author has sought to render the work easily intelligible to students, without imparring the accuracy of the demonstrations, or contracting the limits of the subject. The Examples, about Sixteen hundred and fifty in number, have been selected with a view to illustrate every part of the subject. Each chapter is complete in itself; and the work will be found peculiarly adapted to the wants of students who are without the aid of a teacher. The Answers to the examples, with hints for the solution of some in which assistance may be needed, are grven at the end of the book.

## AN ELEMENTARY TREATISE ON THE THEORY OF EQUATIONS. Second Edition, revised. Crown 8vo. cloth. 7s. $6 d$.

This treatuse contains all the propositions which are usually included in elementary treatises on the theory of Equations, together with Examples for exercise. These have been selected from the College and University Examination Papers, and the results have been given when it appeared necessary. In order to exhibit a comprehensive view of the subject, the treatise includes investigations which are not found in all the preceding elementary treatises, and also some investigations which are not to be found in any of them. For the second edition the work has been revised and some additions have been made, the most important being an account of the researches of Professor Sylvester respecting Newton's Rule.

## Todhunter (I.)-continued.

## PLANE TRIGONOMETRY. For Schools and Colleges. Fourth Edition. Crown 8vo. cloth. $5^{5}$.

The design of this work has been to render the subject intelligible to beginners, and at the same time to afford the student the opportunity of obtaining all the information which he will require on this branch of Mathematics. Each chapter is followed by a set of Examples: those which are entitled Miscellaneous Examples, together with a few in some of the other sets, may be advantageously reserved by the student for exercise after he has made some progress in the subject. In the Second Edition the hints for the solution of the Examples have been considerably increased.

A TREATISE ON SPHERICAL TRIGONOMETRY. Second Edition, enlarged. Crown 8vo. cloth. 4s. $6 d$.
The present work is constructed: on the same plan as the treatise on Plane Trigonometry, to which it is intended as a sequel. In the account of Napier's Rules of Circular Parts, an explanation has been given of a method of proof devised by Napier, which seems to have been overlooked by most modern writers on the subject. Considerable labour has been bestowed on the text in order ta render it comprehenswe and accurate, and the Examples (selected chiefly from College Examination Papers) have all been carefully verified.

PLANE CO-ORDINATE GEOMETRY, as applied to the Straight Line and the Conic Sections. With numerous Examples. Fourth Edition, revised and enlarged. Crown 8vo. cloth. 7s. 6d.
The Author has here endeavoured to exhibit the subject in a simple manner for the benefit of beginners, and at the same time to include in one volume all that students usually require. In addition, therefore, to the propositions which have always appeared in such treatises, he has introduced the methods of abridged notation, which are of more recent origin; these methods, which are of a less elementary character than the rest of the work, are placed in separate chapters, and may be omitted by the student at first.

## Todhunter (I.)-continued.

A TREATISE ON THE DIFFERENTIAL CALCULUS. With numerous Examples. Fourth Edition. Crown 8vo. cloth. Ios. 6a.

The Author has endeavoured in the present work to exhibit a comprehenstve view of the Differential Calculus on the method of limits. In the more elementary portions he has entered into considerable ditail in the explanations, with the hope that a reader who is without the assistunce of a tutor may be enabled to acquire a competent acquaintance with the subject. The method adopted is that of Differential Coefficients. To the different chapters are appended examples sufficiently numerous to render another book unnecessary; these examples being mostly selected from College Examination Papers.

## A TREATISE ON THE INTEGRAL CALCULUS AND ITS APPLICATIONS. With numerous Examples. Third Edition, revised and enlarged. Crown 8vo. cloth. 1os. $6 a$.

This is designed as a work at once elementary and complete, adapted for the use of beginners, and sufficient for the wants of adzunced students. In the selection of the propositions, and in the mode of establishing them, it has been sought to exhibit the principles clearly, and to illustrate all their most important results. The process of summation has hern repeatedly brought forward, with the view of securinis the altention of the student to the notions which form the true foundation of the Calculus itself, as well as of its most valuable applications. Every attempt hat brent made to explain those difficulties which usually perplex heginners, especially. with reference to the limits of integrations. A new method has been adoptiad in regard to the transformation of multiple integrals. The last chaptur deals with the Calculus of Variations. A large collection of exercises, selected from College. Examination Papers, has been appended to the several' chapters.

EXAMPLES OF ANALYTYCAL GEOMETRY OF THREE DIMENSIONS. Second Edition, revised. Crown 8vo. cloth. $4^{\text {s }}$

## Todhunter (I.)-continued.

A Treatise on analytical statics. With numerous Examples. Third Edition, revised and enlarged. Crown 8vo. cloth. Ios. 6 d .

In this work on statics (treating of the laws of the equilibrium of bodies) will be found all the propositions which usually appear in treatises on Theoretical Statics. To the different chapters examples are appended, which have been principally selected from University Examination Papers. In the Third Edition many additions have been made, in order to illustrate the application of the principles of the subject to the solution of problems.

Wilson, J. M. - Elementary Geometry. Angles, Parallels, Triangles, and Equivalent Figures, the Circle and Proportion. By J. M. Wilson, M.A., Fellow of St. John's College, Cambridge, and Mathematical Master in Rugby School. Second Edition. Extra fcap. 8vo. 3 s .6 d .

The distinctive features of this work are intended to be the following. The classification of Theorems according to their subjects; the separation of Theorems and Problems; the use of hypothetical constructions; the adoption of independent proofs where they are possible and simple; the introduction of the terms locus, projection, \&c.; the importance given to the notion of direction as the property of a straight line; the intermixing of exercises, classified according to the methods adopted for their solution; the diminution of the number of Theorems; the compression of proofs, especially in the later parts of the book; the tacit, instead of the explicit, reference to axioms ; and the treatment of parallels.

[^5]Wilson (W. P.) - a treatise on dynamics. By W. P. Wilson, M.A., Fellow of St. John's College, Cambridge, and Professor of Mathematics in Queen's College, Belfast. 8vo. 9s. $6 d$.

Wolstenholme. - A BOOK OF MATHEMATICAL PROBLEMS, on Subjects included in the Cambridge Course. By Joseph Wolstenholme, Fellow of Christ's College, sometime Fellow of St. John's College, and lately Lecturer in Mathematics at Christ's College. Crown 8vo. cloth. 8s. 6 d .

Contents:-Geometry (Euclid)-Algebra-Plane TrigonometryGeometrical Conic Sections-Analytical Conic Sections-Theory of Equa-tions-Differential Calculus-Integral Calculus-Solid Geometry-Statics -Elementary Dynamics-Newton-Dynamics of a Point-Dynamics of a Rigid Body-Hydrostatics-Geometrical Optics-Spherical Trigonomedry and Plane Astronomy.

## SCIENCE.

The importance of Science as an element of sound education is now generally acknowledged; and accordingly it is obtaining a prominent place in the ordinary course of school instruction. It is the intention of the Publishers to produce a complete series of Scientific Manuals, affording full and accurate elementary information, conveyed in clear and lucid English. The authors are well known as among the foremost men of their several departments ; and their names form a ready guarantee for the high character of the books. Subjoined is a list of those manuals that have already appeared, with a short account of each. Others are in active preparation ; and the whole will constitute a standard series specially adapted to the requirements of beginners, whether for private study or for school instruction.

## ASTRONOMY, by the Astronomer Royal.

POPULAR ASTRONOMY. With Illustrations. By G. b. Airy, Astronomer Royal. Sixth and cheaper Edition. 18mo. cloth. 4s. 6 d.
This work consists of six lectures, which are intended "to explain to inteillgent persons the principles on which the instruments of an Obscrzatory are constructed (omitting all details, so far as they are mercily sulb.
sidiary), and the principles, on which the observations made with these instruments are treatod for deduction of the distances and weights of the bodies of the Solar Systom, and of a fow stars, omitting all minutive of formula, and all troublesome details of calculation." The' speciality of this volume is the direct reference of every step to the Observatory, and the full description of the methods and instruments of observation.

## ASTRONOMY.

MR. LOCKYER'S ELEMENTARY LESSONS IN ASTRONOMY. With Coloured Diagram of the Spectra of the Sun, Stars, and Nebulæ, and numerous Illustrations. By J. Norman Lockyer, F.R.A.S. Fourth Thousand. 18mo. 5s. 6 d .

The author has here aimed to give a connected view of the whole subject, and to supply facts, and ideas founded on the facts, to serve as a basis for subsequent study and discussion. The chapters treat of the Stars and Nebulie; the Sun; the Solar System; Apparent Movements of the Heavenly Bodies; the Measurement of Time; Light; the Telescope and Spectroscope; Apparent Places of the Heavenly Bodies; the Real Distances and Dimensions; Utriversal Gravitation. The most recent astronomical discoveries are incorporated. Mr. Lockyer's work supplements that of the Astronomer Royal mentioned in the previous article.

## PHYSIOLOGY.

PROFESSOR HUXLEY'S LESSONS IN ELEMENTARY PHYSIOLOGY. With numerous Illustrations. By T. H. Huxley, F.R.S. Professor of Natural History in the Royal School of Mines. Twelfth Thousand. 18mo. cloth. 4s. 6 d .
This book describes and explains, in a series of graduated lessons, the principles of Human Physiology ; or the Structure and Functions of the Human Body. The first lesson supplies a general view of the subject. This is followed by sections on the Vascular or Veinous System, and the Circulation; the Blood and the Lymph; Respiration; Sources of Loss and of Gain to the Blood; the Function of Alimentation; Motion and

Locomotion; Sensations and Sensory Organs; the Organ of Sight; the Coalescence of Sensations with one another and with other States of Consciousness; the Nervous System and Innervation; Histology, or the Minute Structure of the Tissues. A Table of Anatomical and Physiological Constants is appended. The lessons are fully illustrated by numerous engravings. The manual is primarily intended to serve as a text-book for teachers and learners in boys' and girls' schools.

## QUESTIONS ON HUXLEY'S PHYSIOLOGY FOR SCHOOLS.

 By T. Alcock, M.D. 18 mo . $1 s .6 d$.These Questions were drawn up as aids to the instruction of a class of young people in Physiology.

## BOTANY.

PROFESSOR OLIVER'S LESSONS IN ELEMENTARY BOTANY. With nearly Two Hundred Illustrations. By Daniel Oliver, F.R.S., F.L.S. Seventh Thousand. 18mo. cloth, 4 s .6 d .
This book is designed to teach the Elements of Botany on Professor Henslow's plan of selected Types and by the use of Schedules. The sarlier chapters, embracing the elements of Structural and Physiological Botany, introduce us to the methodical study of the Ordinal Types. The concluding chapters are entitled, "How to dry Plants" and "How to describe Plants." A valuable Glossary is appended to the volume. In the preparation of this work free use has been made of the manuscript materials of the late Professor Henslow.

Oliver (Professor).-FIRST BOOK OF INDIAN BOTANY. By Daniel Oliver, F.R.S., F.L.S., Keeper of the Herbarium and Library of the Royal Gardens, Kew, and Professor of Botany in University College, London. With numerous Illustrations. Extra fcap. 8vo. 6s. 6 d .

This manual is, in substance, the author's "Lessons in Elementary Botany," adapted for use in India. In preparing it he has had in view the want, often felt, of some handy' résumé af Indian Botany, which might
be serviceable not only to residents of India, but also to any one about to proceed thither, desirous of getting some preliminary idea of the Botany of that country.

## CHEMISTRY.

PROFESSOR ROSCOE'S LESSONS IN ELEMENTARY CHEMISTRY, INORGANIC AND ORGANIC. By Henry E. Roscoe, F.R.S., Professor of Chemistry in Owens College, Manchester. With numerous Illustrations and Chromo-Litho. of the Solar Spectrum, and of the Alkalies and Alkaline Earths, New Edition. Twenty-first Thousand. 18mo. cloth, 4 s .6 d .

It has been the endeavour of the author to arrange the most important facts and principles of Modern Chemistry in a plain but concise and scientific form, suited to the present requirements of elementary instruction. For the purpose of facilitating the attainment of exactitude in the knowledge of the subject, a series of exercises and questions upon the lessons have been added. The metric system of zveights and measures, and the centigrade thermometric scale, are used throughout the work. The new Edition, besides new wood-cuts, contains many additions and improvements, and includes the most important of the latest discoveries.

## MISCELLANEOUS.

Abbott.-A SHAKESPEARIAN GRAMMAR. An attempt to illustrate some of the differences between Elizabethan and Modern English. By the Rev. E. A. Аbbott, M.A., Head Master of the City of London School. For the Use of Schools. Second Edition. Extra fcap. 8vo. $2 s .6 d$.

The object of this work is to furnish students of Shakespeare and Bacon zwith a short systematic account of some points of difference between Elizabethan syntax and our own. A section on Prosody is added, and Notes and Questions. To the new edition a complete index to all the lines of Shakespeare's plays referred to has been added.

ATLAS OF EUROPE. GLOBE EDITION. Uniform in size with Macmillan's Globe Series, containing 45 Coloured Maps, on a uniform scale and projection : with Plans of London and Paris, and a copious Index. Strongly bound in half-morocco, with flexible back, 9 .

This Atlas includes all the countries of Europe in a series of 48 Maps, drawn on the same sale, with an Alphabetical Index to the situation of more than ten thousand places; and the relation of the various maps and countries to each other is defined in a general Key-map. The identity of scale in all the maps facilitates the comparison of extent and distance, and conveys a just impression of the magnitude of diferent countries. The size suffices to show the provincial divisions, the railways and main roads,
the principal rivers and mountain ranges. "This atlas," writes the British Quarterly, "will be an invaluable boon for the school, the desk, or the traveller's portmanteau."

## Bates \& Lockyer.-A CLASS-BOOK OF GEOGRAPHY.

Adapted to the recent Programme of the Royal Geographical Society. By H. W. Bates, Assistant Secretary to the Royal Geographical Society, and J. N. Lockyer, F.R.A.S.

[In the Press.

CAMEOS FROM ENGLISH HISTORY. From Rollo to Edward II. By the Author of "The Heir of Redclyffe." Extra fcap. 8vo. Second Edition, enlarged. 5 s.
The endeavour has not been to chronicle facts, but to put together a series of pictures of persons and events, so as to arrest the attention, and give some individuality and distinctness to the recollection, by gathering together details at the most memorable moments. The "Cameos" are intended as a book for young people just beyond the elementary histories of England, and able to enter in some degree into the real spirit of events, and to be struck with characters and scenes presented in some relief. "Instead of dry details," says the Nonconformist, "we have living pictures, faithful, vivid, and strikine."
Delamotte.-A BEGINNER'S DRAWING BOOK. By P. H. Delamotte, F.S.A. Progressively arranged, with upwards of Fifty Plates. Crown 8vo. Stiff covers. 2s. $6 d$.
This work is intended to give such instruction to Beginners in Drawing, and to place before them copies so easy, that they may not find any obstacle in making the first step. Thenceforward the lessons are gradually orogressive. Mechanical improvements too have lent their aid. The whole of the Plates have been engraved by a new process, by means of which a varping depth of tone-up to the present time the distinguishing character. istic of pencil drawing-has been imparted to woodcuts.

## Freeman (Edward A., M.A.). - old ENGLISH

HISTORY FOR CHILDREN. By Edward A. Freeman, M. A., late Fellow of Trinity College, Oxford. With Five Coloured Maps. Extra fcap. 8vo., half-bound. 6s.
> " Its object is to show that clear, accurate, and scientific views of history, or indeed of any subject, may be easily given to children from the very first. . . . . I have, I hope, shown that it is perfectly easy to teach children, from the very first, to distinguish true history alike from legend and from wilful invention, and also to understand the nature of historical authorities and to weigh one statement against another. . . . I have throughout striven to connect the history of England with the general history of civilized Europe, and I have especially tried to make the book serve as an incentive to a more accurate studv of historical geography."-PREFACE.

HISTORICAL SELECTIONS. Readings from the best Authorities on English and European History. Selected and Arranged by E. M. Sewell and C. M. Yonge. Crown 8vo. $6 s$.

When young children have acquired the outlines of History from abridg. ments and catechisms, and it becomes desirable to give a more enlarged vew of the subject, in order to render it really useful and interesting, a difficulty often arises as to the choice of books. Two courses are open, either to take a general and consequently dry history of facts, such as Russel's Modern Europe, or to choose some work treating of a particular period or subject, such as the works of Macaulay and Froude. The former course usually renders history uninteresting; the latter is unsatisfactory, because it is not sufficiently comprehensive. To remedy this difficulty selections, continuous and chronological, have, in the present volume, been taken from the larger works of Freeman, Milman, Palgrave, and others, which may serve as distinct landmarks of historical reading. "We know of scarcely anything," says the Guardian, of this volume, "which is so likely to raise to a higher level the average standard of English education."
Hole.-A GEnEalogical stemma of the kings of ENGLAND AND FRANCE. By the Rev. C. Hole. On Sheet. Is
The different families are printed in distinguishing colours, thus facilitating reference.

A BRIEF BIOGRAPHICAL DICTIONARY. Compiled and Arranged by Charles Hole, M.A., Trinity College, Cambridge. Second Edition, 18 mo . neatly and strongly bound in cloth. $4 s .6 \mathrm{~d}$.

The inquiry is frequently made concerning an eminent man, when did he live, or for what was he celebrated, or what biographies have we abour him? Such information is concisely supplied in this dictionary. It contains more than 18,000 names. Extreme care has been bestowed on the verification of the dates, and thus numerous errors current in prevoous works have been corrected. Its size adapts it for the desk, portmanteau, or pocket.
"An invaluable addition to our manuals of reference, and from its moderate price cannot fail to become as popular as it is useful." -Times.

## Jephson.-SHAKESPEARE'S TEMPEST. With Glossarial

 and Explanatory Notes. By the Rev. J. M. Jephson. 18 mo . Is. $6 d$.It is important to find some substitute for classical study, and it is believed that such a substitute may be found in the Plays of Shakespeare. Each sentence of Shakespeare becomes, like a sentence in Thucydides or Cicero, a lesson in the origin and derivation of words, and in the fundamental rules of grammatical construction. On this principle the present edition of the "Tempest" has been prepared. The text is taken from the "Cambridge Shakespeare."

Oppen.-FRENCH READER. For the Use of Colleges and Schools. Containing a graduated Selection from modern Authors in Prose and Verse ; and copious Notes, chiefly Etymological. By Edward A. Oppen. Fcap. 8vo. cloth. 4 s .6 d .
This is a Selection from the best modern authors of France. Its distinctive feature consists in its etymological notes, connecting French with the classical and modern languages, including the Celtic. This subiect has hitherto been little discussed even by the best-educated teachers.

A SHILLING BOOK OF GOLDEN DEEDS. A Reading Book for Schools and General Readers. By the Author of "The Heir of Redclyffe." 18 mo . cloth.

A record of some of the good and great deeds of all time, abridged from the larger work of the same author in the Golden Treasury Series.

## Sonnenschein and Meiklejohn. - THE ENGLISH

 method of teaching toread. By A. Sonnenschein and J. M. D. Meiklejohn, M.A. Fcap. 8vo.
## Comprising.

The Nursery Book, containing all the Two-Letter Words in the Language. $\mathrm{I} d$.
The First Course, consisting of Short Vowels with Single Consonants. 3 d.
The Second Course, with Combinations and Bridges, consisting of Short Vowels with Double Consonants. $4 d$.
The Third and Fourth Courses, consisting of Long Vowels, and all the Double Vowels in the Language. 6 d .
A Series of Books in which an attempt is made to place the process of learning to read English on a scientific basis. This has been done by separating the perfectly regular parts of the language from the irregular, and by giving the regular parts to the learner in the exact order of their difficulty. The child begins with the smallest possible element, and adds to that element one letter-in only one of its functions-at one time. Thus the sequence is natural and complete.

## Vaughan, C. M. - A SHILLING BOOK OF wORDS <br> FROM THE POETS. By C. M. Vaughan. 18mo. cloth.

It has been felt of late years that the children of our parochial schools, and those classes of our countrymen which they commonly represent, are capable of being interested, and therefore benefited also, by something higher in the scale of poetical composition than those brief and somewhat puerile pragments to which their knowledge was formerly restricted. An attempt has here been made to supply the want by forming a selection at once various and unambitious; healthy in tone, just in sentiment, elevating in thought, and beautiful in expression.

Thring.-Works by Edward Thring, M.A., Head Master of Uppingham.
THE ELEMENTS OF GRAMMAR TAUGHT IN ENGLISH, with Questions. Fourth Edition. 18mo. 2s.

## Thring-(continued).

This little work is chiefly intended for teachers and learners. It took its rise from questionings in National Schools, and the whole of the first part is merely the writing out in order the answers to questions which have been used already with success. A chapter on Learning Language is especially addressed to teachers.

THE CHILD'S GRAMMAR. Being the Substance of "The Elements of Grammar taught in English," adapted for the Use of Junior Classes. A New Edition. 18mo. Is.

SCHOOL SONGS. A Collection of Songs for Schools. With the Music arranged for four Voices. Edited by the Rev. E. Thring and H. Riccius. Folio. 7s. 6d.

There is a tendency in schools to stereotype the forms of life. Any genial solvent is valuable. Games do much; but games do not penetrate to domestic life, and are much limited by age. Music supplies the want. The collection includes the "Agnus Dei," Tennyson's "Light Brigade," Macaulay's "Ivry," Eoc. among other pieces.

## Trench, Archbishop.-HOUSEHOLD BOOK OF ENG.

 LISH POETRY. Selected and Arranged, with Notes, by R. C. Trench, D.D., Archbishop of Dublin. Extra fcap. 8vo. 5s. 6d.This volume is called a "Household Book," by this name implying that it is a book for all-that there is nothing in it to prevent it from being confidently placed in the hands of every member of the household. Specimens of all classes of poetry are given, including selections from living authors. The Editor has aimed to produce a book "which the emigrant, finding room for little not absolutely necessary, might yet find room for it in his trunk, and the traveller in his knapsack, and that on some narrow shelves where there are few books this might be one."
"The Archbishop has conferred in this delightful volume an important gift on the whole English-speaking population of the world."-PALL. Mall Gazette.

## DIVINITY.

Hardwick.-A HISTORY OF THE CHRISTIAN CHURCH. Middle Age. From Gregory the Great to the Excommunication of Luther. By Archdeacon Hardwick. Edited by Francis Procter, M.A. With Four Maps constructed for this work by A. Keith Johnston. Second Edition. Crown 8vo. ros. $6 d$.

The ground-plan of this treatise coincides in many points with one adopted at the close of the last century in the colossal work of Schröckh, and since that time by others of his thoughtful countrymen; but in arranging the materials a very different course has frequently been pursued. With regard to the opinions of the author, he is willing to avow distinctly that he has construed history with the specific prepossessions of an Englishman and a member of the English Church. The reader is constantly referred to the authorities, both original and critical, on which the statements are founded.

## A HISTORY OF THE CHRISTIAN CHURCH DURING THE

 reformation. By Archdeacon Hardwick. Revised by Francis Procter, M.A. Second Edition. Crown 8vo. Ios. 6 d .This volume is intended as a sequel and companion to the "History of the Christian Church during the Middle Age." The author's earnest wish has been to give the reader a trustworthy version of those stirring incidents which mark the Reformation period, without relinquishing his former claim to characterise peculiar systems, persons, and events according to the shades and colours they assume, when contemplated from an English point of view, and by a member of the Church of England.

Maclear.-Works by the Rev. G. F. MACLEAR, B.D., Head Master of King's College School, and Preacher at the Temple Church.

A CLASS-BOOK OF OLD TESTAMENT HISTORY. Fourth Edition, with Four Maps. 18mo. cloth. $4 s .6 \mathrm{~d}$.

This volume forms a Class-book of Old Testament History from the earliest times to those of Ezra and Nehemiah. In its preparation the most recent authorities have been consulted, and wherever it has appeared useful, Notes have been subjoined illustrative of the Text, and, for the sake of more advanced students, references added to larger works. The Index has been so arranged as to form a concise dictionary of the persons and places mentioned in the course of the narrative; while the maps, which hate been prepared with considerable care at Stanford's Geographical Establishment, will, it is hoped, materially add to the value and usefulness of the Book.

A CLASS-BOOK OF NEW TESTAMENT HISTORY, including the Connexion of the Old and New Testament. With Four Maps. Third Edition. 18 mo . cloth. 5 s .6 d .

A sequel to the author's Class-book of Old Testament History, continuing the narrative from the point at which it there ends, and carrving it on to the close of St. Paul's second imprisonment at Rome. In its preparation, as in that of the former volume, the most recent and trustworthy authoritues have been consulted, notes subjoined, and references to larger works added. It is thus hoped that it may prove at once an useful class-book and a convenient companion to the study of the Greek Testament.

A SHILLING BOOK OF OLD TESTAMENT HISTORY, for National and Elementary Schools. With Map. 18mo. cloth.

A SHILLING BOOK OF NEW TESTAMENT HISTORY, for National and Elementary Schools. With Map. 18mo. cloth.
These works have been carefully abridgred from the author's larger manuals.

## Maclear (Rev. G. F.)-continued.

CLASS-BOOK OF THE CATECHISM OF THE CHURCH OF ENGLAND. Second Edition. 18mo. cloth. 2s. $6 d$.

This may be regarded as a sequel to the Class-books of Old and New Testament History. Like them, it is furnished with notes and references to larger works, and it is hoped that it may be found, especially in the higher forms of our Public Schools, to supply a suitable manual of Instruction in the chief doctrines of the English Church, and a useful help in the preparation of Candidates for Confirmation.

A FIRST CLASS-BOOK OF THE CATECHISM OF THE CHURCH OF ENGLAND, with Scripture Proofs, for Junior Classes and Schools. 18 mo . $6 d$.

THE ORDER OF CONFIRMATION. A Sequel to the Class Book of the Catechism. For the use of Candidates for Confirmation. With Prayers and Collects. 18 mo . 3 d .

## Procter.-A HISTORV OF THE BOOK OF COMMON

 Prayer, with a Rationale of its Offices. By Francis Procter, M.A. Eighth Edition, revised and enlarged. Crown 8io. 10s. $6 d$.In the course of the last twenty years the whole question of Liturgicat knowledge has been reopened with great learning and accurate research, and it is mainly with the view of epitomizing extensive publications, and correcting the errors and misconceptions which had obtained currency, that the present volume has been put together.

## Procter and Maclear.-AN ELEMENTARy INTRO-

 dUCTION TO THE BOOK OF COMMON PRAYER. Third Edition, re-arranged and supplemented by an Explanation of the Morning and Evening Prayer and the Litany. By the Rev. F. Procter and the Rev. G. F. Maclear. Fourth Edition. 18 mo . 2s. $6 d$.
## Procter and Maclear-continued.

As in the other Class-books of the series, notes have also been subjoined, and references given to larger works, and it is hoped that the volume will be found adapted for use in the higher forms of our Public Schools, and a suitable manual for those preparing for the Oxford and Cambridge local examinations. This new Edition has been considerably altered, and several important additions have been made. Besides a re-arrangement of the work generally, the Historical Portion has been supplemented by an Explanation of the Morning and Evening Prayer and of the Litany.

## PSALMS OF DAVID CHRONOLOGICALLY ARRANGED.

 BY FOUR FRIENDS. An Amended Version, with Historical Introduction and Explanatory Notes. Crown 8vo. ios. $6 d$.To restore the Psalter as far as possible to the order in which the Psalms were written,-to give the division of each Psalm into strophes, of eack strophe into the lines which composed it,-to amend the errors of translation, is the object of the present Edition. Professor Ewald's works, especially. that on the Psalms, have been extensively consulted.

This book has been used with satisfaction by masters for private work in higher classes in schools.

Ramsay.-THE CATECHISER'S MANUAL; or, the Church Catechism illustrated and explained, for the use of Clergymen, Schoolmasters, and Teachers. By the Rev. Arthur Ramsay, M.A. Second Edition. 18mo. Is. 6 d .

A clear explanation of the Catechism, by way of question and answer.

Simpson.-AN EPITOME OF THE HISTORY OF THE christian church. By William Simpson, m.a. Fourth Edition. Fcap. 8vo. 3s. 6 d .
A compendious summary of Church History.

Swainson.-A HANDBOOK to BUTLER'S ANALOGY. By C. A. Swainson, D.D., Norrisian Professor of Divinity a Cambridge. Crown 8vo. Is. 6 d .
This manual is designed to serve as a handbook or road-book to the Student in reading the Analogy, to give the Student a sketch or outline map of the country on which he is entering, and to point out to him matters of interest as he passes along.

Westcott.-A GENERAL SURVEY OF THE HISTORY OF THE CANON OF THE NEW TESTAMENT DURING, the first four centuries. By Brooke foss Westcott, B.D., Canon of Peterborough. Second Edition, revised. Crown 8vo. Ios. 6 d .
The Author has endeavoured to connect the history of the New Tistament Canon with the growth and consolidation of the Church, and to point out the relation existing between the amount of evidence for the authenticity of its component purts, and the whole mass of Christian literature. Such a method of inquiry will convey both the truest notion of the connexion of the written Word with the living Body of Christ, and the surest conviction of its divine authority.

Of this work the Saturday Review writes: "Theological students, and not they only, but the general public, owe a deep debt of gratitude to Mr. Westcott for bringing this subject fairly before them in this candid and comprehensive essay.... As a theological work it is at once perfectly fair and impartial, and imbued with a thoroughly religious spirit; and as a manual it exhibits, in a lucid form and in a narrow compass, the results of extensive research and accurate thought. We cordially recommend it."

INTRODUCTION TO THE STUDY OF THE FOUR GOSPELS.
By Brooke Foss Westcott, B.D. Third Edition. Crown 8vo. 10s. 6 d.
This book is intended to be an Introduction to the Study of the Gospels. The author has made it a point carefully to study the researches of the great writers, and consciously to neglect none. There is an elaborate discussion appended "Un the Primitive Doctrine of Inspiration.'

## Westcott (Canon)-continued.

## A GENERAL VIEW OF THE HISTORY OF THE ENGLISH

 Bible. By Brooke Foss Westcott, B.D. Crown 8vo. ios. $6 d$."The first trustworthy account we have had of that unique and marvellous monument of the piety of our ancestors."-Daily News.

THE BIBLE IN THE CHURCH. A Popular Account of the Collection and Reception of the Holy Scriptures in the Christian Churches. Second Edition. By Brooke Foss Westcott, B.D. 18mo. cloth, 4 s. 6 d .

The present book is an attempt to answer a request, which has been made from time to time, to place in a simple form, for the use of general readers, the substance of the author's "History of the Canon of the New Testament." An elaborate and comprehensive Introduction is followed by chapters on the Bible of the Apostolic Age; on the Growth of the New Testament; the Apostolic Fathers; the Age of the Apologists: the First Christian Bible; the Bible Proscribed and Restored; the Age of ferome and Augustine: the Bible of the Middle Ages in the West and in the East, and in the Sixteenth Century. Two appendices on the History of the Old Testament Canon before the Christian Era, and on the Contents of the most ancient MSS. of the Christian Bible, complete the volume.

THE GOSPEL OF THE RESURRECTION. Thoughts on its Relation to Reason and History. By Brouke Foss Westcott, B.D. New Edition. Fcap. 8vo. 4s. $6 d$.

This Essay is an endeavour to consider some of the elementary truths of Christianity as a miraculous Revelation from the side of History and Reasor. If the arguments which are here adduced are valid, they will go far to prove that the Resurrection, with all that it includes, is the key to the history of man, and the complement of reason.

Wilson.-AN ENGLISH, HEBREW, AND CHALDEE LEXICON AND CONCORDANCE, to the more Correct Understanding of the English translation of the Old Testament, by reference to the Original Hebrew. By William Wilson, D.D., Canon of Winchester, late Fellow of Queen's College, Oxford. Second Edition, carefully Revised. 4to. cloth. 25 s.

The aim of this work is, that it should be useful to clergymen and all persons engaged in the study of the Bible, even when they do not possess a knowledge of Hebrew; while able Hebrew scholars have borne testimony to the help that they themselves have found in it.

Wright, W. Aldis (Co-Editor of the "Cambridge Shakespeare"). -THE BIBLE WORD-BOOK. A Glossary of Old English Bible Words. By J. Eastwood, M. A., of St. John's College, and W. Aldis Wright, M.A., Trinity College, Cambridge. 18 mo . 5s. $6 d$.

It is the object of this Glossary to explain and illustrate all such words, phrases, and constructions, in the Authorized Version of the Old and New Testaments and the Apocrypha, and in the Book of Common Prayer, as are cither obsolete or archaic. Full explanations are supplied, and these illustrated by numerous citations from the elder writers. An index of editions quoted is appended. Apart from its immediate subject, this work serves to illustrate a well-marked period in the historv of the English language. It is thus of distinct philological value.

## BOOKS OF EDUCATION.

Arnold.-A FRENCH ETON; OR, MIDDLE CLASS education and the state. By Matthew Arnold. Fcap. 8vo. cloth. 2s. $6 a$.
"A very interesting dissertation on the system of secondary instruction in. France, and on the advisability of copveng the system in England."Saturday Review.

## SCHOOLS AND UNIVERSITIES ON THE CONTINENT. 8vo. Ios. $6 d$.

The Author was in 1865 charged by the Schools Inquiry Commissioners with the task of investigating the system of education for the middle and upper classes in France, Italy, Germany, and Szuitzerland. In the discharge of this task he was on the continent nearly seven months, and during that time he visited the four countries named, and made a careful study of the matters to which the Commissioners had directed his attention. The present volume contains the report which he made to them. It is here adapled to the use of the general reader.

ESSAYS ON A LIBERAL EDUCATION. Edited by the Rev. F. W. Farrar, M.A., F.R.S., Assistant Master at Harrow, late Fellow of Trinity College, Cambridge, and Hon. Fellow of King's College, London. Second Edition. 8vo. cloth. IOs. 6 d .

Contents:-History of Classical Education, by Charles S. Parker, M.A.; Theory of Classical Education, by Henry Sedgwick, M.A. :

Liberal Education in Universities, by Fohn Seeley, M.A.; Teaching by means of Grammar, by E. E. Bowen, M.A.; Greek and Latin VerseComposition, by the Rev. F. W. Farrar ; Natural Science in Schools, by 7. M. Wilson, M.A., F.G.S.; The Teaching of English, by 7. W. Hales, M.A.; Education of the Reasoning Faculties, by W. Fohnson, M.A.; The present Social Results of Classical Education, by Lord Houghton.

The Authors have sought to hasten the expansion and improvement of liberal education by showing in what light some of the most interesting questions of Educational Reform are viewed by men who have had opportunities for forming a judgment respecting them, and several of whom have been for some time engaged in the woork of education at our Universities and Schools.

## Farrar.-ON SOME DEFECTS IN PUBLIC SCHOOL

 EDUCATION. A Lecture delivered at the Royal Institution. With Notes and Appendices. Crown 8vo. is.
## Jex-Blake.-A VISIT TO SOME AMERICAN SCHOOLS and Colleges. By Sophia Jex-Blake. Crown 8vo. cloth.

 $6 s$.> "In the follownng pages I have endeavoured to give a simple and accurate account of what I saw during a series of visits to some of the Schools and Colleges in the United States. . . . I wish simply to give other teachers an opportunity of seeing through my eyes what they cannot perhaps see for themselves, and to this end I have recorded just such particulars as I should myself care to know." -A UTHOR's Preface.
> " Miss Blake gives a living picture of the Schools and Colleges themselves in which that education is carried on."-Pall Mall Gazette.

Thring.-EDUCATION AND SCHOOL. By the Rev. Edward Thring, M.A., Head Master of Uppingham. Second Edition. Crown 8vo. cloth. 5 s. $6 d$.

## EDUCATIONAL BOOKS.

Youmans.-MODERN CULTURE: its True Aims and Requirements. A Series of Addresses and Arguments on the Claims of Scientific Education. Edited by Enward L. Youmans, M.D. Crown 8vo. 8s. 6 d .

Contents:-Professor Tyndall on the Study of Physics; Dr. Daubeny on the Study of Chemistry; Professor Henfrey on the Study of Botany; Professor Huxley on the Study of Zoology; Dr. 7. Paget on the Study of Physiology; Dr. Whewell on the Educational History of Science; Dr. Faraday on the Education of the Fudgment; Dr. Hodgson on the Study of Economic Science; Mr. Herbert Spencer on Political Education; Professor Masson on College Education and Self Education; Dr. Youmans on the Scientific Study of Human Nature. An Appendix contains extracts from distinguished authors, and from the Scientific Evidence griven before the Public Schools Commission.
